the right place and operated by a man who knows his business, is a good thing to own.

* * *

In the December issue of American Poultry Journal I note your kind offer to give any of the readers information in regard to the conditions and climate in Southern Florida and I am going to avail myself of the opportunity.

I sold my poultry farm here last September but not my stock and I am looking for a new location. The feed proposition here is frightful. Have to pay three prices for all feed and beg to get it besides. I am more than breaking even and I guess I can't complain, as my pullets are giving me a 50 percent yield under the unfavorable feed and weather conditions. My circulation is so poor that I can't stand cold weather and I would like to move South if I can find a year-round home where the health conditions are good. I know the winters around Miami must be fine, but how about the summers? Do you think that there is any section of Florida that is free from malaria and insect pests that would make me a desirable year-round home? Eustis and Leesburg, in Lake County, have been suggested to me as being ideal. What do you know about them? Has the colony that settled the new town of Detroit, just south of Miami, on the drained land there, been successful? What do you think of that section? I would like to increase my income by keeping a flock of poultry wherever I go as I enjoy the work with them. What are the conditions for profitably raising poultry around Miami? What are the prevailing prices of bran, grain, etc., there? Are the summers excessively hot, and can you grow grass of any kind there successfully and keep it growing on a poultry range? If you will be kind enough to answer these questions and give me whatever advice you have to offer in regard to moving to Florida, I will appreciate it.

Maryland.

J. E. Moore.

I will take up the questions in order asked:

1. The summers in the vicinity of Miami are not at all oppressive or disagreeable. The ocean breeze is always doing duty and prevents the temperature from running high. In fact, severe warm weather is almost unknown here, within a reasonable distance of the ocean. Of course, further in the interior of Dade County, of which Miami is the hub, the heat would be oppressive.

2. There is no malaria in this part of the state. The soil is porous and underlaid with a porous limestone. This makes it impossible for malaria to exist here.

3. Lake County is one of the very best sections of Florida. The land is high, has a clay subsoil and is exceptionally adapted to the production of citrus fruits and agricultural crops. The county has numerous beautiful lakes. The summers there are warmer than on the coast but are not objectionable. I am sure that you will find if you investigate that people there are prosperous and contented.

4. The Detroit project to which you refer has not been much of a success. I strongly advise you to have nothing to do with any of the Everglade propositions.

5. I know of no one who is engaged in the poultry business in a commercial way in this section. As I have so often stated, I do not think it wise for a man to go into the poultry business commercially here. My opinion is based upon facts gathered after eight years of careful research. Of course, the boomers and the hirelings will tell you of the great profits to be made here by poultrymen. Don't you believe it.

6. The following are the prices at which grains are now selling at retail in Miami: Corn, \$4.50 per hundred pounds; oats, \$3.50 per hundred; corn

Ready-Built Philo System POULTRY HOUSES

Save Time and Money

AS WELL as provide the best possible conditions for the fowls. A trial side by side with old style houses will prove that fowls in the Philo System Coops will mature more quickly, gain more pounds at less cost, lay more eggs, and are freer from disease. Coops come ready to set up; built in complete sections that are quickly screwed together. Cost less than to build old style houses. Sizes from six to 25 hens. Prices \$8.00 to \$35.00.

meal, \$5 per hundred; bran, \$2.70 per hundred, and hay, \$45 per ton.

7. There are no grasses here as we know them in the North. It is hard, in fact almost impossible, to keep up a green growth of grass here for poultry.

I most strongly advise my correspondent to make a careful personal inspection of Florida before deciding to remove to the state. It is simply impossible to get the true facts in the case in any other way.

* * *

I wish to ask your advice in regard to taking up farming. I am 36 years old and have a wife and two children, a girl nine years and a boy five. My family are accustomed to all city conveniences. I own my house and am at present employed in an office doing clerical work which does not seem to agree with me and I do not like it. I am very fond of Nature and dearly love outdoor work of all kinds and most of all I like farming. I always feel fine when I can work around my chickens, a few of which I keep in the back lot. I have kept chickens for many years and understand the care of them quite well. I also have berries and plant all kinds of vegetables. I helped to raise potatoes and beans on a couple of acres near Detroit. The work was most agreeable to me. I have a

The Little Putnam Stove, used to keep water from freezing and to furnish heat for the Putnam Oat Sprouter. Patented by I. Putnam, Route 305, Elmira, N. Y.

brother-in-law who would like to go farming with me but our ideas do not seem the same on the subject. I favor a small farm and want to keep a few hundred chickens, some berries, a garden and orchard, with a comfortable home, with as many city conveniences as possible. Want to be reasonably near schools, churches and stores. The land around Detroit is very high—\$200 to \$250 per acre. My brother-in-law favors raising cattle or general farming on about 160 acres, paying not more than \$50 or \$60 an acre for the land. He has had some experience in farming and is very ambitious, quite agreeable and very determined. Would you advise me to go with him on his proposition or would you favor my idea? I would be willing to try general farming. I feel it would do me good and my family also. I am not very robust but am fairly strong. If we went into this together, we could raise \$8,500 to \$9,000.

Michigan. W. Demeske.

I cannot decide the question for you as you put it to me. And I do not know that I would care to assume the responsibility of doing so if I could.

I feel that your brother-in-law is perfectly sound in his contention that the

Hatching Eggs from 200 to 267 egg record trapnested

S. C. White Leghorns

Our years of trap-nesting and experimenting has produced layers that can't be beat. Our layers have records from 200 to 267 big white eggs in one year. These egg machines are mated to vigorous males bred from 267-egg record hens. A visitor to our farm always means a buyer. They are always singing, scratching and laying big white eggs. It's not the way we feed, it's the way we breed. We will furnish you with hatching eggs at these low prices: Eggs from 200 to 220-egg stock, \$2 per 15, \$10 per 100; from 220 to 267-egg stock, \$3 per 15, \$15 per 100. You need hatching eggs from our stock if you want winter layers. Order now and get your eggs when you want them. Safe arrival guaranteed.

W. A. Weber, Box 50, Mankato, Minn.

160-acre stock and general farm is the better proposition. I also feel that you would not be able to satisfy your demands and your wants on the income from a small farm, managed as you evidently would manage the small farm to which you refer. A few chickens, a few berry bushes, a few vegetables and a small orchard could yield but a small income.

I think that the man who buys a farm in any of those sections suitable to growth and market development of cattle and hogs will be the one most favored in the years to come—as they are today. There are many sections of the country where there can be bought for less than \$60 an acre some extra good land of this character. I am fully convinced that it is to one's advantage to get into the mid-south where the winters are not so severe. Of all of the sections of the country—and I have seen and examined conditions in all of them—I consider Southwestern Virginia, the most favored spot for the raising, marketing and finishing off of beef cattle. The winters are mild, the air is pure, as is the water, which is abundant. Grasses grow to perfection in that section. There is no better climate in all the world. It is near the best markets in America. Cattle can be fattened on the pasture there and placed on the market directly from the grass. It is the only section that can produce export beef cattle directly from the pasture and top the Liverpool market. I know that in due time this will be a wonderful cattle country and the men who get in on the ground floor now will be very fortunate.

* * *

I attended a meeting of the Chamber of Commerce of Miami last evening. This body is interesting the farmers here in the raising of the castor bean. More than 10,000 acres will be planted in this county. The Chamber of Commerce furnishes the seed to the planters at \$3.50 per bushel and agrees to pay them \$3.50 per bushel for the beans when harvested. The product of this bean is castor oil, and the Government is using many thousands of barrels of this oil annually in the operation of its war flying machines.

Dampness in the poultry house at this season usually means not enough fresh air, or too many fowls in the house for the contained cubic air space. If the house is shut up snugly at night, by curtains or otherwise, there is bound to be frost and dampness on the walls. A little frost may show in any house in severe weather, but it is seldom troublesome and never dangerous in a properly constructed always-open-front house. Cloth curtains do not permit any worthwhile ventilation. If used, they should never be wholly closed.

* * *

Uncle Sam wants you to "raise more poultry." He says: "More poultry means more eggs and more eggs and poultry meat means a greater food supply." The world needs food, more food, much more food than is in sight. "Raise more poultry and help win the war." Start with an incubator and eggs for hatching. Grow the chicks in a good brooder. For a quick start buy a brooder and a brood of 25 to 50 baby chicks. Act now. Today.

Dr. Globe Says:

"It's your duty to raise more poultry. Help feed yours and others."

Increase the Egg Yield

Because the Ideal Sanitary Fountain keeps water at the right temperature in zero or the hottest weather, it conserves the health of the hens and greatly increases the egg yield. The Ideal is made of galvanized iron and built to last a lifetime. See your dealer. Write us for complete information.

Rockford Poultry Supply Co.
Lock Box J. O. 201
Rockford, Illinois

GREAT INJUSTICE TO PATRIOTIC POULTRYMEN.

Food Administration Edict Against Sale of Live Poultry Will Defeat Its Own Stated Purpose. — Should be Withdrawn at Once.

By PRINCE T. WOODS, M. D.

IF THE United States Government wants increased poultry production, there is just one way to bring it about, and that is *give the poultrymen a square deal* and a chance to secure fair and just returns.

Poultrymen do not lack patriotism. They possess an abundance of it. They are willing to work hard from 16 to 18 hours a day to help increase production of the necessary poultry and poultry products. They have had mighty hard sledding for the past year. Many of them have lost heavily because of grain prices quite 200 percent above normal, while poultry and egg prices have shown no proportionate increase. Most of the year there was no increase in prices of poultry produce and it is only within the past three months that prices of poultry and eggs have averaged about 25 percent to 35 percent above the normal of other years for the same season.

This is the time of the year when poultrymen everywhere are starting more hatches for early chicks and have some broods already growing to make the early pullets for next fall and winter's egg production. When greatly increased production is wanted and needed, this is a poor time to slap the poultryman in the face with most discouraging interference with his business. Interference that is ill-advised, absurd from a practical point of view, unjust, and certain to do untold harm. If we want production we cannot afford to injure and discourage skilled producers. Back-lot poultry work should undoubtedly be stimulated, back-lottery should keep poultry to be sure of a home supply of eggs, but that alone will not solve the problem of eggs and poultry meat for the Nation.

News dispatches to the daily press on February 12 state that:

The United States Food Administration announced tonight that it has forbidden licensed trading in live or freshly killed hens and pullets. Dealers have been notified that fresh stock of this kind already purchased must be disposed of by February 23 and that additional stocks may not be purchased. They may still handle stored or frozen stocks.

By restricting the killing of chickens, which should soon be heavy layers, the Food Administration hopes to increase the production of eggs, adding to the available market supply and at the same time allowing them to go into storage during the season of high production at a price which will not necessitate unreasonable figures for storage eggs next fall and winter. Further slaughter would possibly reduce this year's production to the danger line.

Both the Food Administration and the Department of Agriculture have advised saving all hens and pullets for egg production.

The Food Administration some time ago requested dealers to reduce the killing of possible egg producers, urging them to confine their purchases to cocks and cockerels. It now has made the request a definite prohibition. Failure to observe this order would constitute a violation of the Food Control Act. It would be followed by revocation of license or could be punished by a fine of not more than \$5,000, by imprisonment for not more than two years, or by all three.

New York, February 12.—Maximum wholesale prices for poultry in New York and vicinity have been fixed as follows by the Federal Food Administration, according to notice received by Local Administrator Arthur Williams: Fowls, 36 cents; chickens and young roosters, 35 cents; old roosters, 27 cents; turkeys, ducks and geese, 35 cents.

I want to show you how to make Money with Poultry T. E. Quisenberry

What Others Say.

I can now ease enough on feeds to pay for the entire course. **C. M. HILL,** LaGrange, Ill.

I would not take the price of the whole course for the lessons on breeding and mating. **F. L. NOYES,** American Fork, Utah.

I could have saved about \$400 had I taken your course before I started. **FRANK SAWYER,** North Woburn, Mass.

The knowledge I have gained from the disease lesson is worth the price of the course. **GEORGE W. MORRIS,** Russellville, Ky.

I have been in the building business for 30 years but your lesson on poultry house construction is the best I have ever saw. **E. M. WIGGIN,** Kansas City, Kas.

Your lesson on baby chicks is just what we have been looking for. Last year we lost 650 chicks out of 1500. This year we lost 66 out of 1800. This is the result of just one of your lessons. **GEO. M. JONES,** Escondido, Calif.

IT is my earnest desire to put a real—useful—practical poultry education before every man and woman who is interested in poultry raising. I want to see more and better poultry raised—I want to see more people making money with chickens—I want to eliminate the losses and disappointments that so many poultrymen experience—I want to help you solve your poultry problems—and I can do it.

A Complete Poultry Education

I have made it possible for you to obtain right in your own home, during spare time, a complete—thorough—and practical a knowledge of poultry husbandry such as you could get nowhere else except at an agricultural college.

In a course of lessons taught by mail, I have completely covered the science of poultry husbandry and made it so plain and simple that anybody can understand it. I give you knowledge it has taken me a lifetime to acquire.

I show you how I make hens pay a big profit each year. I show you how I got 2,354 eggs from ten hens in a year. I show you how to feed for a big egg and meat production, how to select a site for your poultry plant and how to how to get winter eggs and spring broilers—how to incubate and raise baby chicks—how to mate and breed—how to avoid and treat poultry diseases—how to show and win at poultry shows—how to dress and market poultry for the highest profits. In other words there is no phase of poultry culture that you are not taught thoroughly. Hundreds of our students tell us that each lesson is worth the price of the whole course.

You cannot afford to be without these lessons. They pay for themselves many times each season in increased egg yield—in preventing losses from disease—in knowledge. The broadest guarantee it is possible to write covers this course. If you are not satisfied you do not pay.

Get Our Free Book Today

Our Free Book "Dollars and Sense in the Poultry Business," fully explains how we can help you to make more money and save money raising chickens. It explains in detail just what our lessons teach you and what they can do for you. ROGERS' POULTRY PUNCH

ROGERS' Money-Back Poultry Punch has proven to be the ideal punch for the fancier. It is without doubt the handiest, neatest and most convenient punch on the market. It punches the hole right—just the right size, and in the right place. Handle never in the way. Used by thousands of poultrymen. Beautifully nickel plated, 45c postpaid; plain, 35c postpaid. Circular giving system of punch marking with every order.

T. W. ROGERS Box A LAMONT, IOWA

Why Poultry Pays and How to Make It Pay

By Morgan Bates. A "straight from the shoulder" talk on raising poultry from the money-making point of view. It gives the beginner sound advice about starting in. Covers all subjects. Price 50c. AMERICAN POULTRY JOURNAL PUB. CO., 542 South Dearborn Street Chicago, Illinois

We look upon this order as a very grave mistake and a great injustice to thousands of loyal, patriotic poultrymen. We believe it will defeat its own stated purpose, and that, instead of adding even a very few eggs to the National supply, it will discourage producers and speedily bring about a real egg famine. The rule does not place any restraint upon the sale of fowls for layers or for breeding purposes, but it does definitely prohibit the sale of fowls—hens or pullets—to be killed, and forbids the sale of fresh-killed poultry except cockerels and cocks. A very severe penalty is attached, but it would seem that this penalty is only for dealers and does not apply to producers of poultry. We do not believe that any Government can stimulate and encourage increased production of poultry

and winter, he now has many overfat birds about to stop laying and some ready to break down from excess of internal fat. As every practical poultryman knows, such birds must be marketed promptly to avoid loss. All such birds stop laying, they will not again begin laying in all probability, at least not for 60 days or more, and it is more likely that they will begin a gradual wasting process or die quickly from effect of excess of internal fat. Many actually have fatty degeneration of heart and liver and are certain to become a dead loss and waste if not marketed when "ripe for market." This excessively fat condition in no wise injures them for food purposes, in fact it makes them more desirable if marketed at the right time, but it does unfit them for use as breeders, lay-

First prize White Orpington cockerel at Indianapolis, Ind., February, 1918. Owned by Wm. N. Otto, 4815 Central, Indianapolis, Ind.

try and eggs by such drastic interference with the poultryman's normal method of doing business.

On the morning when this order appeared in the newspapers our telephone began to ring very early and many were the complaints we listened to from poultrymen about this "latest outrage." One man said he should at once stop all hatching operations and prepare to close out his business. Another most loyal and patriotic poultryman, who has a big plant and has been running it at capacity in spite of difficulties and the fact that it was not paying expenses, told us that he had been averaging to pay \$500 a month for grain. He had been looking forward to this spring season to help him to make good on his fall and winter losses. Having forced his layers for egg production thru late summer, fall,

ers or even as broody hens. Should they by any chance live thru until warm weather they would then "go to pieces" with the first hot wave—a loss of the carcass as food, and a waste of the high-priced grain fed to keep them alive while non-productive. This poultryman who is so loyally "carrying on" and paying such heavy expenses told us that this Food Administration edict means a loss of from \$50 to \$100 a week to him for the ten weeks it will be in force, or until after May 1. That it will not give the increase of an egg in the output of his plant, but that it easily may mean a dead loss to him of over \$1,000 in feed wasted and lost sale of fat hens and pullets that are thru laying and "ripe for market." There are many, many poultrymen in the same unfortunate position. We shall lose heavily ourself, for it means loss of

all the best live poultry trade of the season—the sales of fat hens for the Jewish holiday trade. It also means the loss of all regular sales of dressed fowl at a season when the fowls should be sold and when we need the money to devote to the hatching and rearing of a new flock. Several market poultrymen have told us that “This latest outrage settles it for me, I am thru, will not raise a chick this year.” And these men, who have stuck to the job all thru the difficult times, since we entered the war, are quitting food production, where they are sadly needed, and seeking easier work where they can have an eight-hour day and good pay.

It is reported that the Food Administration expects this order to result in the saving of at least five million hens and pullets for egg production and that by May 1 these hens will yield at least 30 eggs each to be put into storage at a “reasonable” figure. There never was a greater fallacy. The actual temporary saving of eggs will be negligible, there will not be enough eggs saved to pay for one-quarter of the feeding grain wasted, and the actual loss to the Nation, in both meat and eggs, will be so great that it will take several years to recover from this most unwise and unwarranted interference with the normal conduct of the business of poultry production.

The immediate result of the advance news that the order was about to be issued—it was first made known in Mr. Priebe's letter of February 2 to the New York live poultry dealers and was later denied as late as February 10th—was the greatest rush to sell off both large and small farm flocks and poultry plant surplus that we have ever known. In our county alone thousands of fowls and pullets were thrown on the market and the local live poultry price dropped in consequence from 32 cents to 28 and 26 cents a pound. There were many poultry keepers who felt that if they were to be forced to keep their fowls until after May 1, whether the birds were productive or not, that they would get out of the business at once “while the getting was good,” and not risk being forced to feed non-productive fowls for ten weeks and then be compelled to accept half of the February prices. The announcement of the fixing of maximum prices on poultry and poultry produce also had a discouraging effect and tended to make people lessen the size of their flocks or get rid of their fowls altogether.

Those who like eggs for breakfast and who need eggs to supply the family, will be wise to secure a flock of layers and to rear a back-lot flock of chickens this season. This latest error in judgment of the Food Administration is almost cer-

Why Keep Hens Why Not Let Hens Keep You

LEGHORNS—BARRON—WYANDOTTES

The stock on this farm is in the habit of paying its way, even when feed prices are more than double. A customer at McKeesport, Pa., wrote us that five pullets hatched from our eggs laid a total of 105 eggs in the month of January. We have a fine lot of cockerels, cocks, hens and pullets; prices very reasonable. We have bred straight English Barrons for five years and among 50 imported birds have many records over 260, including two 282 egg record hens, also many of their sons and daughters. For early delivery we offer attractive prices on hatching eggs from pedigreed pens only.

tain to create the worst poultry and egg famine which has ever been known. The price fixing is bad enough and will not encourage production, but this attempt to compel people to keep and feed their fowls, without taking into consideration that "slacker hens" and overfat hens and pullets should be promptly sold as a measure of saving and economy, as well as a source of income to a sorely har-

The Putnam Home-made Oat Sprouter and Seed Tester. Designed by I. Putnam, Route 305, Elmira, N. Y.

rated producer, this most unwise interference with the sane and sensible management of laying flocks, certainly oversteps the limit.

We hope that the Food Administration, and the Department of Agriculture, will see the great mistake which has been made and withdraw the order as soon as possible, before more harm is done to the poultry industry and to loyal, patriotic poultrymen.

WINNINGS OF A. P. J. ADVERTISERS

This column is open to all American Poultry Journal display advertisers and is compiled from information furnished by the advertiser. Complete winnings of all exhibitors at the larger poultry shows as New York, Chicago, Boston, etc., are published in the issue following the show dates, together with a report of the show by an American Poultry Journal representative.

Leigh Bickett, R. R. 9, Xenia, Ohio, reports the following winnings by his pullet-bred line of Barred Rocks: Dayton, Ohio, December, 1917, 1-2-3 hen, 1 pullet, 2-3 pullet-bred cock; special best Plymouth Rock in show. Columbus, Ohio, January, 1918, 1-3 hen, 2 pullet-mated pen; special best display females. Springfield, Ohio, January, 1918, 1-4-5 hen, 3 pullet, 1 pullet-mated pen.

Louis H. Perry, Clay, N. Y., reports the following winnings on Rose Comb White Leghorns: At Chicago Coliseum, December, 1917, 1-5 ckl, 2 pl. At Vermont State Show, January, 1918, 1 ckl, 1 pl.

H. V. Tormohlen, Portland, Ind., Everlay strain of S. C. Brown Leghorns won at Madison Square Garden Show: 1-2-5 cock, 2 hen, 1-2-3-4-5 ckl, 3-4 pl, 1-5 pen; best display.

J. H. Bates, 305 Broadway, Watervliet, N. Y., reports the following winnings on S. C. R. I. Reds: At Boston, 4 old pen and 6 young pen. At Utica, N. Y., 1 cock, 1 young pen, 3-4 pullet, 3-4 hen, 3 ckl. At Troy, N. Y., 1 cock, 1 hen, 1 ckl, 1 pullet.

F. M. Gensch, Omro, Wis., has been elected secretary-treasurer of the American White Orpington Club in place of E. S. Aldrich, who resigned. Mr. Gensch will be pleased to hear from all those who are interested in White Orpingtons.

Attention—Breeders of Speckled Sussex.

At the annual meeting of The Sussex Club of America, at Cleveland, January 10, 1918, the matter of the proper color description of Speckled Sussex was discussed. Communications were read from leading breeders of these birds in the United States, Canada and England, and it was voted unanimously to recommend to the revision committee of the Standard of Perfection to substitute in the description of color of these birds, the words "dark mahogany" for the words "reddish brown" wherever the latter words appear, and to substitute the words "slate or slate and red" for the words "slate shading into white" wherever the latter words appear in the description of undercolor.—A. C. Williams, President.

For the Information of Poultry Secretaries.

The tenth annual exhibition of the Great Mid-West Poultry and Pet Stock Association will be held in the Coliseum Building, Chicago, December 3-4-5-6-7-8, 1918. Like the show of 1917, it will be held on the same dates as the International Stock Show at the Stock Yards. A complete list of judges has not been made up to date, but this information will be furnished later and this notice is published in order that local associations thruout the Mid-West may avoid the dates. By looking at the calendar, you will note that the show opens on Tuesday and closes Sunday night.—Theo. Hewes, Sec'y, Indianapolis, Ind.

Milwaukee Dates for 1919.

The fourth annual exhibition of the Auditorium Poultry Show will be held in Milwaukee, January 1-2-3-4-5, 1919. The following judges have been selected—others may be added later: Geo. Hackett, W. H. Laabs, Jas. A. Daley, Geo. Wells and Geo. E. Greenwood. The Milwaukee Show will be considered as the big Wisconsin exhibition and a number of the specialty clubs will hold their state branch meetings in connection with the fourth annual exhibition. Several new members have been added to this association and it is the intention to have one stockholder in each congressional district in the state. Theo. Hewes will hold the controlling interest in the stock and the show will be under his management, as in the past.

The Chicago Pet Stock Club, with a membership which now amounts to 140, will be known hereafter as the Chicago Breeders' and Fanciers' Association, affiliated with the National Breeders' and Fanciers' Association, an association for the betterment and improvement of rabbits, cavies and small fur-bearing animals. At the next meeting, which will be held at the Fort Dearborn Hotel, on Saturday, March 16, 8 P. M., an expert rabbit dresser will demonstrate his skill. Anyone who is interested will be welcomed upon presenting this notice.

POULTRY YARD TREE PLANTING.

By F. A. KUHN, Williamsville, N. Y.

THE WRITER, having had very good results in planting trees in his poultry yard, will explain how he did it. Before going into details a few words about shade will not go amiss.

Shade is beneficial and should be provided for the hens. That shade is necessary to good poultry raising has been proved. Hens that have no other shade than what they can get by going into the hen house soon become lazy. We always find the hens that have an orchard or a shady yard to roam around in, very active. They are active because they can move around in comfort. Young chicks also need shade. You will find the birds which are given a comfortable house in winter, a shady yard in summer and wholesome food and fresh water all year round are the birds with a good record.

Poultry raising and fruit growing go well together. For that reason the writer planted apple trees. After four years' growth they bore their first fruit. As labor was scarce and having to do all the work alone, the quickest and easiest method of tree planting was used. Bore holes were made just where the trees were to be planted. These holes were made three feet deep and about two inches in diameter.

Into each hole was placed a charge of half a stick of 20 percent dynamite, well tamped. After the blasting the holes were dug and the top soil was kept separate from the subsoil. In planting a tree the top soil was used under and around the roots. The subsoil was put in last. All the soil was well packed down up to within six inches from the top. To prevent the hens from digging or scratching out this loose earth some stones were placed at the base of the tree.

The blasting of these tree holes improved the drainage where these trees were planted. We all know the conditions that prevail in the poultry yard when it rains. Some water and much mud. After the sun shone on it for a week or so we find a very hard soil. Unless the drainage is improved a tree would have a hard time making growth. As the blasting opened up the subsoil and made it porous, it also created a moisture reserve from which the trees drew at the time of driest weather. The tree extended its roots freely, having a good root bed in that topsoil, and later on in the blasted subsoil. The writer found out that with a little care at planting time, very good results can be obtained.

Doing your bit for Uncle Sam? He wants you to raise more poultry. Get that incubator ready and start a hatch to produce early chicks. Keep the incubators going, your should be able to sell all the chicks you hatch. Grow as many chickens as you can properly care for.

The Hill Colony and Magic Brooders

famous for high grade construction and efficiency. They hold the fire, automatically regulate the heat and are positively gas proof. They brood chicks which will produce a profit.

The brooder is actually the starting point of success in the poultry business. If our brooders do not do all we claim after thirty days' trial we will cheerfully refund the money and pay freight both ways.

Send for free catalogue describing both the Hill Colony and Magic brooders. It also shows plans how to build colony and laying houses together with other appliances. Agents Wanted.

Illinois Poultrymen Organize for Increased Production.

THE PRESIDENT of the American Poultry Association has requested a statement of the methods being pursued in Illinois in the war emergency campaign to increase poultry and egg production and the co-operation that is being extended by the Illinois State Association of the American Poultry Association.

The wheels of progress began to move lively at the recent annual meeting of the Association when the following resolution was presented by O. L. McCord, and adopted unanimously:

The Illinois State Poultry Association in convention assembled, January 20, 1918, at Peoria, Illinois, unanimously approves the poultry work being done by the Animal Husbandry Division of the U. S. Department of Agriculture and pledges its support and co-operation in the work and calls on its members individually and the poultrymen in Illinois to help, as they may be requested, the representative of the U. S. Department of Agriculture in poultry work for Illinois, Frank L. Platt, that the poultry and egg production of Illinois may show the necessary increase in both quantity and quality.

We bespeak the effective help of the poultrymen of the state even to the point of personal sacrifice of time and effort.

The next thing was to carry out the spirit of the resolution. The Executive Committee did this by listing a splendid lot of vice-presidents. These vice-presidents are scattered thru the twenty-five congressional districts of the state with the exception of districts 1 to 10, which includes Chicago, and D. E. Hale is local leader for this city. The vice-presidents of the Illinois Poultry Association become our local leaders and they will be asked to appoint additional local or community leaders. They will be able to pick the best men in their respective districts because they know their locality best.

Thus, the Illinois Poultry Association has developed a skeleton organization that will automatically enlarge itself into a large organization of county workers. These men and women, being themselves poultrymen, will freely carry the advice and sound judgment, bulletins and posters of the United States Department of Agriculture to every nook and corner of the state. That is what

That's why they are conceded to be America's Oldest Laying Strain. They easily out-layed the 2600 birds in the five Missouri Laying Contests, officially making them America's Greatest Layers, as these contests were made up of the best layers from 37 states and eight foreign countries. Also Winners of the Three Silver Cups for Heaviest Winter Laying—December, January and February. After all it's really the winter laying that counts. The sparrows lay in summer. You've read our advertisements longer than any other bred-to-lay breeders. That hundreds with broader laying claims than ours should come and go seems strange. Yes, Parks' Rocks are now being fed by the third generation of Joes. High normal laying is our stronghold. A flock of 128 averaged 208 eggs in a year. In phenomenal laying they have records up to 290 eggs and the greatest sworn continuous laying record of 148 eggs in 148 days was made by a Parks' Rock. Heavy laying is bred in the strain and the name Joe in the family.

Large copyrighted catalog tells all about their breeding, laying contest winnings and customers sayings since 1889. With general utility comments and gossip. It's a dime.

J. W. PARKS

BOX J, ALTOONA, PA.

is meant by extension work, i.e., to extend the work over an entire area.

Of course, it is especially important that poultry and egg production should be maintained in Illinois. The farmers of this state are selling about \$24,000,000 worth of poultry and eggs a year—\$2,000,000 a month. When the hungry faces of the Allies look toward America, they look across the Alleghenies to the fertile fields of the Mississippi Valley. Illinois is organizing to do more than her share—to do her best.

FRANK L. PLATT,

Extension Poultry Husbandman for Illinois, U. S. Department of Agriculture.

January 31, 1918.

Poultry Husbandry in Public Schools.

FOR A LONG time the need of practical training along the lines of agriculture and shop work in our common and graded schools has been felt. This need has been, and is being supplied in the schools all over the country. One of the most important of vocational studies—that of poultry husbandry—has been almost entirely overlooked.

The Emerson School at Gary, Indiana, has a poultry plant and the work is looked upon with favor by the many visitors who come to study the Gary schools, and by all of the pupils (both grade and high school students) who participate in the work.

The equipment consists of poultry houses, brooder, incubator and egg storage rooms, coops, poultry yards, colony house, covered pens and runways for pheasants and pigeons, artificial ponds for ducks, etc., and, in fact, every commodity necessary to carry on the work in a practical and scientific way. Pure-bred Single Comb White Leghorns, Anconas, Langshans, Light Brahmans, Campines and several breeds of bantams, all of which came from the leading poultry farms, are found in the school yards.

The actual work of feeding, watering, cleaning dropping boards, dressing chickens for market, testing eggs, running incubators and artificial brooders, is the type of work that the boys and girls do each day. Besides this, they have classroom instruction, where the vital questions of poultry raising are studied and discussed.

Our desire in carrying on this work is to interest and at the same time give the boys and girls instruction and a definite knowledge as to how to really raise and care for poultry satisfactorily and

Another Great Victory

At the Greater Chicago Poultry Show, 1918, Wilburtha's S. C. White Leghorns won 1st, 2nd and 4th cocks; 1st and 4th hens; 4th, 6th and 7th cockerels; 2nd pullet; 1st old pen; 1st young pen, and the special prize for the best exhibit in the entire show. This remarkable showing, following our sensational victory at Madison Square Garden, proves conclusively the supremacy of Wilburtha Farms in the show room.

Our birds are bred just as carefully for the useful qualities as for exhibit. We have pens of all our breeds in the egg-laying contests this year. They are making commendable records as heavy layers. One customer writes that a R. I. Red pullet purchased from us laid 27 eggs in February, 1917, and was leading hen that month at one of the National egg laying contests.

Our best eggs are \$10.00 per setting and more than worth it. Write for our 1918 Mating List, which gives complete information.

**White Plymouth Rocks

"Superior Strain" Columbian Wyandottes

First Prize Winners, Madison Sq. Garden, '18, Chicago Coliseum, '17-'18

My recent winnings at these largest shows in America are conclusive proof that my strain has everything desired in this beautiful breed. I have also improved the egg production and have individual records well over the 200 mark. As my strains have been bred that way for years, it stands to reason that this quality is inherited by the progeny. My pens are mated and contain the best birds in the United States.

STOCK AND EGGS FOR HATCHING

from the finest matings in the country are now offered to those desiring fowls that are "profit producers." I have just added the entire flock of Columbian Wyandottes of the Wilburtha Farms, Trenton Junction, N. J. All their winners are in my yards. This magnificent strain added to my own gives me the largest and best flock of Columbian Wyandottes in the country.

The Quality is Exceptionally Good. The Prices I Ask Extremely Reasonable.

TURN CASH INTO GUN FIRE.

By FRANK A. VANDERLIP.

WE FOUGHT and won the Spanish War with 150,000 soldiers and a \$200,000,000 bond issue. In men under arms we now have ten times that number. We issued ten times that amount of bonds in the first Liberty Loan. We are proposing to spend and loan to the Allies in the first fiscal year of the war \$19,000,000,000. From now until the end of this fiscal year the treasury anticipates needing \$300,000,000 a week—that is, the treasury has got to fight financially a Spanish War every four days. That indicates a money measure of the size of this work, but that is not the real measure. We have just seen that one might have plenty of money, but an empty coal bin. In just the same way the Government can have plenty of money, but an unequipped army. This army cannot be equipped as modern warfare demands if the man power of the country is at the same time called upon to produce all of our ordinary comforts and luxuries. It is as plain as two and two that all of us must make personal sacrifices, must give up comforts and luxuries, even necessary expenditures that can be postponed if there is to be labor and material enough to equip the army in time for it to fight while it will do some good to have it fight.

In war the only effort that is of any value is that which is ultimately translated into gun fire on the field of battle. The gun fire that will win this war cannot be delivered until all America recognizes individual responsibility, until the whole people join in the effort by giving up things that they can do without, so that the labor that would have been employed in making those things can do work that will ultimately result in gun fire. The Government has offered the opportunity to translate at once every one's personal patriotism into the sort of help that will win the war. Forego buying something that is unnecessary; loan the money you would have used to the Government by buying \$5 war savings certificates. You will thus have released labor, you will have given credit to the Government, you will have acquired the best security in the world, a United States Government bond.

Uncle Sam says: "Raise more poultry on farms and in back yards." Are you doing your bit? Everybody must do his share to win the war. If you cannot join the army or the navy, keep a war flock and produce meat and eggs to help win the war. If you only produce a part of your own food, it will help in saving other food for National use. Do your bit.

Better buy that incubator now. You will need it soon. Broody hens are scarce. To make sure of early chicks, get an incubator.

A Flock of Pullets from Seven to Nine Months Old

There are great laying breeds and varieties, but most of the "egg machines" are worthless for the table. There are fine table birds, but many of these are poor layers. There is no need of more simple egg machines—the world is full of them. There is no call for table birds that will not lay—they are legion. But there is room for a splendid table fowl that is a prolific layer of

Large White Eggs and the WHITE HOUDANS

fulfill these requirements. These beautiful birds are destined to fill a big place in the poultry world. They are now in the Standard, with 15/16 Mottled Houdan blood, with all the best Houdan characteristics, combined with pure white plumage and pink-white skin and improvement in table qualities and egg production. A limited number of eggs is offered, to increase the interest in the variety. But few can be spared this season and those who secure a start with this magnificent fowl now will be fortunate. Eggs are \$1 each, with full guarantee as to fertility and quality of stock. Correspondence is invited and circular will be mailed.

FROM THE PACIFIC COAST

THE ART OF BROODING CHICKS.

By CHARLES WEEKS, Palo Alto, Cal.

PRODUCING high grade poultry and eggs is fast growing to be a science, and the knowledge of how to apply this science is an art.

A scholarly scientific knowledge of poultry raising does not always make an artist in poultry production. Doing is the art. Science is the accumulated truths that bear upon a subject. All the truths of poultry raising can be com-

mitted to memory and yet this will not make a successful poultryman. We need practice which makes the poultry artist and which is the art of poultry raising.

Each department of poultry keeping has its art. One may be proficient in the feeding and care of laying hens and get a high percentage of eggs with low death rate and yet be a failure in brooding chicks.

Brooding chicks is an art which no careless person will ever learn. Successful brooding depends upon three things being correct to start with. First, that the parent stock of the chick shall have generations of careful breeding for vigor behind it. This parent stock must be in the pink of condition at the time the eggs are to be incubated. This parent stock must be at least two years old with every condition for health.

Second, the incubation of this egg from correct stock must be done exactly right or no brooder on earth will make a good chick from this egg. The temperature should be held as steady as a clock between 102 and 103 degrees. If it runs above this or below, the chick will never be as good as it might be.

Third, the construction of the brooder must give natural comfort to the chick with plenty of fresh air and no dust. Right here is where too many fall down in brooding. A well-bred chick, correctly incubated, placed in a diabolical brooder, is certain failure. True, many good chicks squeeze thru to maturity in spite of the crowded brooder conditions. The brooder season is so short as compared to the success or failure of the balance of the season that one cannot afford to neglect the slightest

detail. Good pullets at the beginning of the laying season is the end in view, and no stone should be left unturned to make them the best possible. You can well afford to put much stress on this short six weeks brooding period, for does not your whole year's profit depend upon the kind of pullets that come from this brooder? How many extra good pullets would it take to pay the hire of an extra man during this short brooding period? The hardest part of the poultryman is to reproduce productive hens in large numbers.

The man who advocates placing a

a thousand little chicks walking over each other trying to find the correct heat, first too hot on inside, then too cold on outside of this circle, and all the clammy, dusty, rotten air drawn over their little backs continually toward the stove, I say that the man who advocates this inferno for baby chicks should be made to pass just one week in this tuberculosis factory and he would never

SHIPPING COOPS For Fancy Stock. Lightest and strongest coop on the market. Weighs only 10 lbs. 12 x 24 x 20 in. high, \$4.80 per doz., \$35.00 per 100. 18 x 24 x 20 in. high, \$5.70 per doz., \$42.00 per 100.

Folding Egg Crates 3, 6, 9, 12, 15 and 30 doz. sizes. Also a complete line of market egg cases, fillers and flats at lowest prices. See catalog for prices.

BROOD COOPS Two styles as illustrated. Size 17 x 23 inches. Made of heavy galvanized iron. Price \$2.50 each, 1 doz. \$13.00, 1 doz. \$25.00. Catalog describes Setting Coops, Chick Runways, Colony Coops and all the equipment you need to raise chicks successfully.

Electric Incubators All sizes from 60 to 500 eggs. Also lamp heated incubators from 60 to 2500 egg capacity. We guarantee them to hatch good.

BROODERS All kinds - Fireless, Coal Burning, Oil Burning, Electric. Capacities from 50 to 1000 chicks. Prices \$2.75 up.

BROODER HOUSE EQUIPMENT Hot water heating systems for brooder houses, complete with flovers and all necessary equipment. Write for prices.

EGG CANDLERS We carry a complete line at all prices from 35c to \$7.50. Be sure to send for catalog describing them.

THERMOMETERS For any make of incubator or brooder. Price 85c each. Also thermometers with electric light attachments and others that ring bell if temperature gets too high.

Moisture Gage Keep the correct amount of moisture in your incubator by using one of these moisture gages. Price only \$1.50.

EGG STAMP Name and address with dates \$1.75. Without dates \$1.35.

LICE KILLING NEST EGG Place in nests and rid your fowls of lice. 75 cents per dozen.

TOE PUNCH For marking little chicks. As shown in illustration. Price 35c postpaid. Several other styles at low prices.

Cellulose Leg Bands For Chicks, 10c doz., 50c per 100. For Hens, 15c doz., 75c per 100. Catalog describes 14 kinds of bands.

WATER FOUNTAIN For Chicks Used in connection with an ordinary Mason Jar. Price 15c each, \$1.50 per doz.

Feeding Troughs For Feed, Wet Mash or Water. Three sizes - 12, 18 and 24 inches long. Lowest prices.

FEED HOPPERS We have so many kinds of hoppers and grit and shell boxes that there isn't space to list them here.

HOPPER with Rain Guard For outdoor use. 20 quart capacity. Price \$3.50.

Crockery Fountains Never wear out. Sizes from one quart at 35c to two gallon at 60c.

Thermos Fountains Keep water cool in summer and warm in winter. Three sizes. Catalog gives particulars.

Satisfaction or Money Back

If you are not fully satisfied with any articles you buy from us you can return them at our expense and we will refund your money.

We carry only the best quality goods—the kind we can recommend and guarantee.

We buy in carload lots, sell for cash, and quote lowest prices.

Prompt shipment is one of our features, all orders being filled within 24 hours.

Eighteen years of steadily increasing business assure you careful attention to all orders you send us.

FOWL CATCHER Catches fowls around the leg as shown in illustration. Price 35c postpaid.

NESTS Metal or wood. Several kinds at lowest prices. See catalog for particulars.

TRAP NEST (front) Fastens to orange crate or other box. Price 50c each, \$5.50 doz. Wood and metal trap nests—all kinds.

ROOSTING OUTFITS Equip your poultry house with these outfits. Several styles. Also lice proof roosts.

CLOVER CUTTERS Root Cutters, Oat Sprouters. Every modern method of supplying your fowls with green food.

GRINDING MILLS Grind your oyster shell, grain, etc., in one of these mills. Price only \$3.75.

FEED MIXERS Several styles—both hand and power. Properly mixed mash gives best results.

FEED COOKERS Several different kinds, from the cauldron cooker as illustrated, at \$13.50 to steam cookers at \$135.

BONE CUTTERS Fresh cut bone is better and cheaper than meat scrap. One of these cutters will soon pay for itself.

Round CHICK FEEDER A great feed saver as the chicks cannot get into it. Large size, 35c each, \$4.00 per doz. Small size, 20c each, \$2.25 per doz.

AUTOMATIC FEEDERS If you do not have time to feed your birds regularly, you need these feeders. Several sizes and kinds from \$1.65 up.

POULTRY BOOKS We carry a complete line of Poultry Books. Over 50 books listed in catalog. Also Egg Record Cards and Trappert Record Blanks.

POULTRY REMEDIES We handle only the best remedies and guarantee them to give good results or your money back.

DISINFECTANTS and Lice Destroyers Get our prices before you buy. We have several kinds. Our Carbolineum Lice Killer at \$1.35 a gallon will keep mites away an entire year with one application.

live to tell the tale. It will take us too many centuries to make moles and bats out of chicks, so why not give them their natural conditions of sunshine and fresh air and work along the lines of least resistance? Success is always easy along Nature's way. If we work with Nature we cannot make a mistake, for she has been so long at the game. Every time a chick sticks its head from under the brooder it should have pure air free from dust to breathe. It should have heat enough in the brooder to keep the body warm while its head is outside breathing air that had never been in a pair of lungs before. A thousand pairs of lungs in one hermetically sealed room pumping the air over and over again until there is hardly enough oxygen left to keep the fire burning, with only a shaft or two to grudgingly let in a little of all the great ocean of fresh air on the outside—free air, too. If we had to pay for it we would fight for it. Plants and animals need sunlight and fresh air and will not reach their full stature without it. Why are we so slow to learn the value of fresh air in our poultry keeping?

I admit there are many thousand chicks raised by the stove system or rather in spite of it, for from all the thousands and thousands dumped around the stoves many are raised, but of this number how many contract tubercular germs that make them one by one fall by the wayside during their laying career. The loss among laying hens on egg farms is terrific on account of bad ventilation all along the line.

The baby chick needs a high degree of heat during the first week. It should have a brooder with parts as high as 100 degrees in heat down to 90, so that a comfortable temperature can be chosen. The temperature must be high enough so that the chicks will not need to huddle to keep warm. Neither must they be so crowded that they cannot find comfort without too much bunching. Nature never intended that chicks should be raised in large flocks. It is against all reason. Simply a survival of the fittest and these fittest are often ruined for a profitable career. From seventy to one hundred and fifty chicks to each flock is enough. Probably one hundred is a good average. The fewer together the better the results. These should have enough heat so that they will be perfectly comfortable without huddling, and the brooder must be so constructed that they can stick their heads out to the fresh air and still be warm. This brooder should be in an open-front pen which allows the healthful sunlight to warm it up first thing in the early morning so that the chicks can have an early sun bath without having to hang around artificial heat all day. Sunlight, fresh air and no dust and a comfortable hover to rest under and the chick has ideal conditions to grow into a vigorous, productive fowl.

As I sit and write this article on brooding chicks the early morning sunlight is pouring directly into fifty open-front pens eight feet square, warming and cheering the six thousand comfortable chicks which are taking their morning sun bath. I have just been "the rounds" and to see them sporting themselves in fresh air and sunlight with no dust certainly is a cheerful prospect after twelve years of searching after the natural way. And not one of these six thousand chicks will have

GEORGE B. FERRIS, 605 Shirley St., Grand Rapids, Mich.

to be taught "to roost." They have the going-up habit from the very first day. Their brooder is a 14-inch board eight feet long over two hot water pipes upon the dropping board, which is two feet from the ground floor and three feet wide. On this floor is their feed and water and comfortable hover. They are already "up" where they are soon expected to perch, and as a chick seldom forgets what he learns it behooves us to form the right habits from the start.

They have a 10-inch board running from this floor to the ground floor, which they slowly learn to run up and down. This gives them exercise as well as entertainment and forms the "going-up" habit.

On the brooder floor they have fine cut straw or alfalfa and scratch for chick feed in this. They also have troughs of dry mash by them all the time. As soon as they will take to green feed they have all they will clean up twice per day. On the ground floor they have clean, sharp sand and here they take their baths in the warm sun and as they must always run "up" to eat and drink they never forget their true home.

I keep plenty of good, sharp sand by them all the time, with charcoal and oyster shell. A well-bred chick, well incubated and brooded, and the feeding question is very simple. Give them all they will eat of any good, clean, wholesome feed and they will thrive. I do not feed wet mash at all. I have tried it off and on for years, and have at last decided that a wet mash creates too many bacteria.

THERE IS MONEY IN EGGS

BIG YEAR for POULTRYMEN
IF YOU KNOW HOW

The man who *knows* how can make more from his poultry today than ever before. I. K. Felch, the veteran poultry breeder and judge, said: "At this time, here in New England where grain prices are at the very pinnacle, any healthy hen will earn between \$3 and \$4 above the cost of feed."

Knowledge and training bring success. But those who use haphazard and untried methods will fail in the poultry business. This School will *start you right and keep you right*. The cost of our practical training, our up-to-the-minute books and lessons and personal assistance, is small. **We guarantee to satisfy you or the course costs you nothing.**

We Teach You How

to successfully manage an exclusive poultry plant, the poultry flock on the general farm, or the home flock in your backyard. How to get fertile eggs—to get big hatches of vigorous chicks—how to prevent chicks dying in the shell and in the brooder—to avoid and cure diseases—to weed out the "loafers"—to produce heavy layers—to breed show-room winners—to judge poultry—to market your products to advantage. In short, everything you should know in order to make the greatest success of the business, to produce profits where ordinary poultrymen fail.

Get our 2 booklets—
"How To Save Money on Feed and Produce Eggs at a Profit" and facts about our School. Send 10c to pay mailing costs.

MINORCAS Giant Single Comb BLACKS

EGGS—EGGS—EGGS—Do your bit. Start a flock of Minorcas and conserve. My conservation mating list is now ready. The demand for quality eggs this season will be greater than ever before. But in the face of this, I will furnish all the eggs I can at prices that will interest you.

JOHN L. BROWN 1515 W. 7th Street ANDERSON, IND.

You Can't Go Wrong If You Buy A Newtown Colony Brooder

- Coal-Burning
- Self-Feeding
- Self-Regulating
- Efficient
- Economical
- Durable
- Safe

The first successful coal-burning colony brooder. Imitated but never equalled.

The modern coal-burning colony brooder is the most satisfactory brooding equipment ever produced. And the Newtown is acknowledged to be *the most efficient brooder of this type*. In all parts of the world, under all conditions, the Newtown "raises the most chicks, the best chicks, with least labor and at lowest cost." Ask any Newtown owner!

The Newtown was the first successful coal-burning colony brooder on the market. The first Newtown was a wonderful brooder, but through years of experience we have improved it in various details until today it is scientifically and mechanically perfect—the one perfect brooder.

Made in five sizes, for any number of chicks to 1000. Carefully constructed of superior materials, built to last for years. Burns coal, either hard or soft. (Gas burner can be furnished.) Fuel self-feeding. Self-regulating. Freely ventilated. Safe. Easy to install. Requires no special building. Simple in operation. Efficient to the highest degree. **GUARANTEED.**

Not the cheapest brooder in price or construction. But priced moderately and greatest value for the money. Tell us about how many chicks you plan to grow this year and we will mail brooder catalog free.

The Newtown Giant Incubator, like the Newtown Colony Brooder, is the choice of the most successful poultry raisers. Built in many sizes, 600 to 24,000 egg capacity. Let us know which size interests you and we will promptly forward full information regarding it.

NEWTOWN GIANT INCUBATOR CORP'N

21 Warsaw St., Harrisonburg, Virginia

As the chicks grow older they need less and less heat and the hover board is raised accordingly. They soon have enough animal heat to almost keep them warm. By thus gradually raising the hover board as they require less and less artificial heat, they become accustomed to rely on their own body heat, and it is only a simple thing to move them into another pen exactly the same except it is without heating pipes. I have a little coop that I drive them into, all at one time, and they are carried around to their new quarters and hardly know the change. They are changed to these quarters without heat at between three and four weeks old, depending upon the weather. Here the

CHARCOAL FOR POULTRY

Extra fine, fine, medium and coarse \$2.00 per hundred at Ironton. Cash with order.

John Silliman - Ironton, Ohio

cockerels are placed in one pen and the pullets another, thus making about fifty chicks to the pen. Between eight and twelve weeks the cockerels are sent to market and the pullets again are divided, making about twenty-five to the pen. This is their last move and their permanent quarters for the first laying year. As they have had the "going-up" habit from their first day, they naturally take to the perches which they have played on so many days.

One of the greatest problems of the poultryman has been to get the chick from the brooder to the perches. Many a promising lot of chicks have been ruined at this particular stage. By dividing them up into lots of fifty at this stage there is no loss whatever and they grow into vigorous birds that show stamina.

It must not be forgotten that cleanliness is next to Godliness in brooding

chicks as in all other things, and with the help of fresh air and sunshine these pens are kept clean enough for a man to sleep in.

The gravest danger in brooding in large flocks comes when they must be taken from this close, hot room, to which they have so long been, to their perching quarters. Here they are at a loss to know what to do because all is so strange, and consequently they huddle and crowd to death at night in the corners, and the chickens, the boss and all, sweat, and the man himself sweats blood, too, before he gets them all to perch.

Sooner or later you must divide them into small flocks to get many raised, so why not do it on the start and teach the baby chicks while they are at the learning age? You cannot tell an old hen anything.

To sum up the brooder proposition: Chicks must be from vigorous, well-mated breeding stock of mature age. Eggs must be incubated correctly, to make strong chicks. Brooder must have plenty of heat with fresh air conditions. Do not run too many chicks in one flock. Feed good, wholesome dry feeds in large variety as possible. A good variety of succulent green feed is imperatively necessary. If all these conditions, along with cleanliness, are adhered to, there should be no trouble in raising almost all the chicks hatched. Attention to cleanliness and bodily comfort of chicks is absolutely necessary, and bear in mind that first, last and always, sunshine and fresh air are the freest and most necessary things to chick life.

"Gas" the Poultry Lice

Declare war upon these destructive, profit-killing vermin. Adopt a policy of "frightfulness." Kill them by wholesale with LICECIL vapor. Merely hang a bottle of LICECIL near the roosts as directed. The vermin-killing "gas" will be delivered constantly in sufficient quantities to exterminate the lice and mites, to keep birds and roosts free from these trouble-makers.

Effective—No Trouble—Little Cost

Not necessary to handle each bird separately to dust or grease. The LICECIL vapor works all the time. No injury to the birds—sure death to vermin. LICECIL evaporates slowly, so bottle lasts for many weeks.

Tested for years—highly endorsed by leading authorities. Price—delivered—1 bottle, 75c; 3 bottles, \$2. Order now—adopt the better way. Circular free. Address nearest office.

LICECIL MANUFACTURING COMPANY

BOX 35 QUINCY, ILL. BOX 55 GERMANTOWN, PHILA., PA.

Andrews Egg Carrier

Saves Money by Saving Eggs

There's no getting away from it, men, this new Andrews Egg Carrier is the greatest device of its kind in the Poultry World today. Its strong, tough, thick but cushion-like construction eliminates the enormous egg loss so common to ordinary carriers.

Poultrymen the country over are beginning to realize the safety—the durability—the economy of my new and perfect carrier. Just see how every egg is protected. Jolts and jars never have a chance against such protection.

The new Andrews Egg Carrier is shipped flat and can be put into shape in a jiffy.

The first cost is the last cost because every carrier can be used over and over again, always assuring you that every egg will get there *whole*. Now get these prices:

Commercial—per doz.		Hatching—per doz.
1 doz. size \$.60	4 doz. size \$1.55	15 egg size \$1 10
2 doz. size .95	5 doz. size 1.85	30 egg size 1.95
3 doz. size 1.25	10 doz. size 3.60	50 egg size 2.60
		100 egg size 4.90

In ordering please send sufficient amount to cover parcel post charges, otherwise goods will be sent express collect.

If you're a poultryman, I don't need to tell you twice that my brood coop, liceproof roosts, liceproof nest, poultry remedies and other accessories are the biggest money savers you've ever struck in the poultry business. Order direct from me. Catalogue free.

THE O. B. ANDREWS COMPANY

4

Last of all the egg box wrapped for mailing. See how the short flaps on the top and bottom bend over. They form a spring that saves the box from the ordinary disaster caused by dropping.

Protection number 4.

THE GOLDEN LACED WYANDOTTE.

By MELVIN F. UPHOFF,
Leavenworth, Kansas.

IN THIS day when slackers in every line of work are being eliminated, when the call comes to every poultryman to weed out the drones, to increase production at the least cost, to double the egg production and the production of market poultry—in other words, to win the war—then comes the question to the beginner, "Which breed is the most profitable?" Thousands and thousands of men and women will take up the raising of poultry this year in answer to the call to produce more poultry and eggs. One of the first questions that will come into their minds will be the choice of breed. In the selection of a breed there are many things to consider, but the one that interests most of those who will start in this year will be, "How do they lay?"

As a laying proposition the Golden Laced Wyandotte cannot be excelled. For the production of a large number of eggs at the smallest cost they stand alone; in other words, they are the real profit producers. They are not a new breed; thirty-seven years ago they were originated—the product of American ingenuity. Large flocks of them may be seen in the central states where thousands of them are raised by farmers who demand a breed that can produce a large number of eggs under average farm conditions at the least cost. Their meat producing qualities, hardiness and their ability to produce a good profit under adverse conditions have won them a place in the heart of the farmer as well as the fancier. Going back to the days of the egg-laying contests in the latter part of the nineteenth century in England, we find that in 1898-99 they were awarded third place in the contest held by the Utility Club of England with all of the leading breeds competing. Then, in the same contest in 1901-02 they captured first place and won the blue again in 1906-07. In the Australian contest of 1905-06 they won fourth place with an average of 203 eggs per hen and the records of the 1907-08 contest show that they won third place with an average of 222 eggs per bird with six birds to the pen. Thirteen hundred and thirty-two eggs in one year by six birds is a record that any breed can well be proud of.

Skipping over a few years we find that they are still holding their own with the country's best at the All-Northwest Egg-Laying Contest. The report of this contest for 1917 (January) says: "A sensation was created by the work of the Golden Wyandotte pen No. 128 which laid 93 eggs for the month of January. These birds have shown that good looks are not incompatible with January egg production for they are high-class exhibition birds." In the latter part of September, 1917, two Golden Laced Wyandotte hens arrived at the American Egg-Laying Contest, direct from the New York State Fair, where they had won second and third in a large class. The official record of the contest for October shows that the second prize hen laid 22 eggs and the third prize hen laid 20 eggs. These are only a few instances of the laying ability of the Golden and I could give

ENGLISH 200 EGG STRAIN

S. C. White Leghorns
S. C. Rhode Island Reds

White Wyandottes
Buff Orpingtons

**ANOTHER PROOF
Our 1917 Egg Competition Winners**

Our entry of five Wyandotte hens in the North American Egg Laying Competition, just ended, won First Prize and Three Silver Cups. These hens laid 1165 eggs, having these high individual records: 294, 267, 221, 220 eggs. Contest under government supervision.

Our Champion Wyandotte hen, "Liberty Belle," laid 294 eggs, winning first prize and cup, and establishing World's Highest Official Wyandotte Record. Her sister laid 267 eggs, winning third prize and cup against 500 competitors.

Merely another proof of our success in breeding 200-egg layers. Other competition winnings:

LEGHORNS—Highest award North American Egg Laying Competition, 100 pens competing, five hens laying 251, 250, 224, 222 and 192 eggs.

REDS—Highest award, in their class, N. A. Contest, five hens laying 1043 eggs, an average of over 200 eggs per hen. Highest Official Red Record known.

WHITE WYANDOTTES—Missouri International Contest, ten birds laid 2006 eggs, over 200-egg average. One layer made a record of 265 eggs.

If you want Leghorns and Wyandottes that lay, if Official Records mean anything to you, you should secure our strain. Our Reds and Orpingtons are also wonderful layers. We have many individuals that hold remarkable official records, and this bred-to-lay blood is strong in every bird in our flocks; acknowledged by poultry experts to be the **Most Profitable Poultry in America.**

you hundreds of such, but these will suffice.

After seven years of breeding the Goldenes, I am more in love with them than ever before. From the time they kick out of the shell to the time they are ready to lay they are a never ending source of interest and wonder. When the little chick is first hatched it is a brownish black with two little fine stripes of lighter brown extending from

the top of the head to the tail. The breast is usually gray, sometimes dark and sometimes light. Feet and legs are bright yellow, sometimes shaded with horn. When they are a week old little feathers with golden centers and black edging begin to appear in the wings and tail. Then the body, back, breast and neck feathers begin to grow out, but these are usually black and sometimes mixed with golden. Nothing can be

told by the color of these chick feathers as they all drop out later and are replaced by the adult plumage. White often appears in the wing feathers of chicks but does not usually appear in the adult plumage. However, some strains of Goldenes have white in the wing and tail feathers, but I have always discarded any breeders showing this defect and soon had birds that never showed any white in any part of the

body. Injury to a wing will result oftentimes in the feathers turning white in the injured wing, but the other wing will not show the white, while if it is inherited the white will show in both wings alike.

I have found the Golden to be very hardy as chicks if properly hatched. In tests with many other varieties the Golden has always shown the least percentage of mortality. I have raised many flocks of them with a mortality of less than 5 percent of the number hatched. When the chicks are forty-eight hours old I feed them a mixture of two parts of rolled oats and one part bran with a very small amount of ground bone and charcoal. This is fed five or six times daily for the first week, feeding just what they will eat up clean in fifteen or twenty minutes. A clean board is the best thing to feed it on. Skim milk and water is kept before them in a fountain that does not permit them to get wet. Coarse sand is used on the floor and this also provides grit. When they are a week old I begin feeding a commercial chick feed, the best obtainable, and keep a dry mash before them all of the time, composed of 2 parts wheat bran, 1 part shorts, 1 part cornmeal and one-half part of rolled oats. The chick feed is fed in a litter of fine cut clover about an inch deep, gradually deepening the litter as they learn to scratch in it. For the early chicks which cannot get out on range I add a very small amount of beef scrap when they are two weeks old and increase it until they are getting 15 percent when they are a month old. Milk is very essential to the growth of the chick. I find the chicks are larger in size and better in color where milk is kept before them from the time they are hatched until they are full grown.

Sprouted oats are given the early chicks after they are two weeks old, just the ends at first and later the whole oat, root and all. Chicks hatched the first of March should be on range by the fifteenth of April. At this time I gradually change both scratch feed and dry mash. The dry mash is fed in hoppers and kept before them all of the time. It is composed of equal parts of bran, shorts, ground oats and cornmeal and one-half part of beef scrap, one-quarter part of bone meal, two pounds of fine charcoal and a half pound of salt to each one hundred pounds of the mash. The cracked grain is composed of equal parts of cracked corn and wheat, kept before them in an open hopper. When they are two months old I start feeding wet mash. This is made by moistening the dry mash with milk, and is fed in the afternoon at about two o'clock. They are given just what they will eat up clean in fifteen or twenty minutes. This makes them grow faster and also makes them grow a little larger, I believe. Skim milk and pure water are kept before them at all times.

Birds intended for early fall fairs are kept in very small flocks, not over fifteen to a flock, and given the very best of care. I never cage my exhibition birds before sending them to the fall fairs; simply put them in a large pen and give plenty of green food and make them work for their grain in a deep litter. A good feed of moist mash is given at noon to bring them up to standard weight or as near as possible. Standard weights do not apply to young birds

Stop Hatching Weak Chicks

With Cheap Incubators

Remember it is not how many you hatch that counts, but how many you raise. Chicks that hatch out weak and wobbly, and live but a few days, mean nothing to you except trouble and loss. They make one sick of the poultry business. Most of the chicks you lose in the first two weeks die because they did not hatch out with enough vitality or strength for a good start.

Queen Incubators

Hatch Chicks That Live and Grow

The Queen is accurately regulated—taking care of a temperature variation of 70 degrees without danger. It is built of genuine California Redwood—very scarce in these days of imitation and cheap substitution. Redwood does not absorb the odor from the hatching eggs. Cheaper woods, and pasteboard lining in iron and tin machines, retain the odors, to weaken and kill the hatching chicks.

Start your chicks with a Queen constitution and they will make money for you. The Queen is not a cheap incubator, compared with many of the cheaply constructed machines on the market, but it is cheap in the long run. It will be turning out high percentage hatches years after the cheap machines have been junked.

Sold by dealers. Catalog sent free on request.

1st Buff Orpington Hen
Indianapolis, 1917

No, I did not sell my

Buff Orpingtons

on the market because feed prices advanced.

I have the best lot of young birds I ever raised, bred from hens like the one illustrated in this ad and sired by my first Indianapolis cock.

Other Breeders May Have Better Birds,
But These Look Good to Me.

I have a lot of March and April hatched cockerels you can have your pick for \$10.00, \$15.00, \$20.00 and \$25.00. No more, no less. You can order direct from this advertisement. Your money back if not satisfied.

No, this price does not govern in females. Eggs are now selling at 50 cents per dozen and they will sell for \$1.00 this winter, so I am not crazy to sell females from the greatest winter layers that wear feathers.

Yes, I won at the Indiana State Fair, 1917: Five ribbons in the strongest class of Buff Orpingtons ever caged in this State. At the February show I won 1st cock; 1st and 2d hen; 2d cockerel; 1st old and 2d young pens. The young males I am offering in this advertisement were bred from these winners.

"Just shove your money under the door" and I will send you birds worth a little more than you pay for them. DO IT NOW!

in the fall but the more developed the bird is the better chance it will stand of winning. When I was but sixteen years old I defeated an old veteran at the game, simply because I had big, husky, well-developed birds for the fall fairs while his birds were late hatched and had not reached the size necessary to win. I find that one fall fair and a single winter show is all that a bird can stand. To show them at more than two shows in the season is liable to ruin the bird for use as a breeder. Showing immature birds at the fall shows is very injurious to the birds as well as the owner. It seems to stop their growth and they never reach the size that they would if left to develop on range. Size is one thing that we Golden Wyandotte breeders have to watch out for. Too many of the birds seen at the shows lack the size of the other varieties of Wyandottes and the public soon gets the impression that all Golden Wyandottes are smaller than the other varieties of Wyandottes.

Crowding a large number of birds in one coop will result in a flock of birds with white wing feathers. For best results do not keep more than 15 birds in one flock. Of course, if you are raising hundreds of them you cannot keep them all in such small flocks, but the thing to do then is to pick out fifty or sixty of the very best and most promising birds and house them in small flocks and put the others in a large house, but see that they have plenty of roost room. Single comb sports seem to be more numerous in the Golden than in any other variety of the Wyandottes. Do not think you have been cheated if you get one or two single comb sports out of a hatch. Ofttimes the beginner will write me and say, "The eggs hatched fine, got twelve chicks but one of them has a single comb. How does this come when I bought eggs from rose comb birds? Your birds must have got crossed with some single comb birds." Then I will have to write and explain to him that the Golden were made up of single comb birds when they were originated and that it is simply due to Ativism. All varieties of Wyandottes throw single combs more or less, but I think you will find that the Golden throw more single combs than any of the other varieties. Some years I will have very few single combs and then again I will have as many as 15 percent.

Mossiness is one of the worst defects that we have to fight against. The pullets will have beautiful clear open laced feathers, but when they molt one would think they were some other kind of fowl. Of course, not all hens are mossy but you will find that a pullet with narrow feathers that are heavily laced with black will invariably be mossy. A bird with wide feathers and open centers but the black edging not quite so prominent, will molt out clear in the majority of cases. It is, therefore, much better to breed from hens only and use only breeders that show clear open laced feathers. Use clear cushioned hens for breeders and males with saddle feathers free from an outside edging of black and you will soon have a strain that will throw large percentage of hens free from mossiness.

Breed for egg production as well as exhibition. Select for breeders hens with thin pelvic bones and plenty of

POULTRY BOOK Latest and best yet; 144 pages, 215 beautiful pictures and color plates. Hatching, rearing, feeding and disease information describes the busy Poultry Farm handling 68 varieties including Indian Runners, Stella how to properly choose fowls, eggs, incubators and secure cheap feed. This practical book worth dollars mailed for 10 cents.
Berry's Poultry Farm, Box 115, Clarinda, Iowa

space between the rear of the breast bone and the two pelvic bones. Use birds that come nearest to the Standard weight for breeders. If you are going to breed Wyandottes, use birds the size of Wyandottes and not the size of Leghorns. Make the breeders take plenty of exercise and do not force them for egg production. Let them rest during the winter and they will be ready to lay a good number of fertile, hatchable eggs that will develop into big, husky chicks that are easy to raise and worth something after they are raised.

Properly handled and cared for, the Golden will show more real profit at the end of the year than any other breed that I have ever handled. Hardy, easily confined, great layers, and a fine fowl for the table, they are the ideal bird for either the farmer or the backyard poultry plant.

WHITE WILSONS.

A New Breed of Single Comb Layers and How I Produced Them.

By N. W. WILLIAMS.

I HAVE been asked a great many times to tell why I originated the Single Comb White Wilsons and in what way they are superior to other breeds. The story is a long one, but I will tell it here as briefly as I can.

Poultry has been my work and play ever since I was a mere boy and I have bred and handled many of the best standard breeds. I learned early in my career that each breed has at least one good quality that is not found in all the others but lacks other qualities that are equally as desirable, and I soon found myself breeding the three standard varieties best known because of their utility values—the Single Comb White Leghorn, the Single Comb White Orpington and the Single Comb White Minorca.

When bred to Standard requirements the White Leghorn is a beautiful bird and they are great layers of large white eggs, but as winter layers they are not as satisfactory as some of the larger breeds. As a market fowl the Leghorn makes a very good appearance, but is not popular on account of its small size. The Orpington proved to be a good winter layer, a fact that is brought out by the egg-laying contests being conducted in various parts of the country. However, during the spring and summer months they are more inclined to become broody than the smaller breeds and cannot be classed as persistent layers. While of good size, the Orpington does not make an attractive market bird on account of its skin being white. The eggs are brown and rather small. In most markets a premium is paid on large, white shelled eggs. The White Minorca is well known as a producer of great numbers of large, chalk white eggs. Like the Orpington they have a white skin and are not raised extensively as a market fowl.

The saying is "The hen that lays is the hen that pays," but at the same time everyone favors the fowl whose carcass is large enough and plump enough to make a respectable Sunday dinner. When we take hold of the drumstick and find it small and lean we soon forget what a good layer this particular hen has been. However, "it

LOUIS H. PERRY Route No. 8 CLAY, N. Y.

is cheaper to raise beef on four legs than on two." In producing the Single Comb White Wilsons I used the three breeds I have named above. My foundation stock was of the best laying strain I could secure of each breed. I wanted to give them the best start possible. I had in mind at all times a white bird of good appearance: one that would lay an abundance of large, chalk-white eggs, not only in the spring but also in the summer, fall and winter—partic-

laying and they are extremely hardy. They are a non-sitting breed and altho an occasional hen will become broody late in the season it is very easily broken up. They are great foragers when allowed free range, but do well when confined. They are equally adapted to the farm and the small yard on a town lot.

While growing the Single Comb White Wilsons is similar in appearance to the Leghorn. In fact, anyone familiar with

The great South American forage plant as grown on the farm of W. W. Kulp, Pottstown, Pa. It provides excellent green food and shade for growing chicks. This plant requires no attention after the first year.

ularly in the winter—one that was large enough to make a good market fowl but not large enough to become lazy and unprofitable; a bird with a rich yellow skin and shank—in fact, an all around family fowl. By scientific breeding and intelligent selecting and mating I have brought out these desirable qualities to a very marked degree in my White Wilsons. They compare favorably with the Minorca in size, cocks weighing about 8 lbs. and hens 6 lbs. They grow quickly, making broilers at eight to ten weeks, and pullets commence laying at an early age—often at 5½ months. They have a beautiful yellow skin and their flesh is fine grained and of excellent flavor. On account of using two white-skinned breeds I experienced some trouble at first in producing the yellow skin and orange slanks of the Leghorn, but by careful selection I have gradually established the desired color. However, an occasional bird will show the color of the Orpington and Minorca.

As layers they are unsurpassed as heavy producers of large white eggs, laying well thru the winter months when eggs are high and scarce at any price. Their eggs are uniform in shape and often weigh 30 to 32 ounces to the dozen. Cold weather has little effect on their

Leghorns but not understanding the Standard requirements would probably class them as such. As they grow older they become larger than the Leghorn—their backs longer and wider, their bodies deeper and their tails not so full. They are not quite as erect in carriage as the Leghorn. During the past five years I have greatly improved their type and Single Comb White Wilsons now breed as true in type as many of our standard breeds. I have kept my breeding stock in the best of health and condition at all times, realizing that good, strong, vigorous, healthy stock was necessary to produce fertile eggs, strong chicks and breeders that were fit for use in building up a new variety.

The name "Wilson" is taken from my home town, Wilson, Va. Good fortune has decreed that I should introduce these remarkable layers at a time when a man by the same name—President Wilson—occupies the most responsible position of this and many other ages and at a time when the Nation truly feels the need of a fowl that will prove profitable when grains are high. Our Food Administrator is calling for more eggs and more chicken meat and I am proud of the fact that Single Comb White Wilsons are more capable of meeting the crisis than any other breed.

South Plainfield, N. J.

THE INDIANAPOLIS POULTRY AND PET STOCK SHOW.

One of the Most Successful Exhibitions Ever Caged in the Capital City. Attendance Good. Many Sales Made in All the Leading Varieties.

THE SECOND annual exhibition under the new management in Indianapolis proved to be the most successful show that has ever been pulled off in the capital city. While the entries were not up to standard as compared to former years, the quality in all of the leading varieties was better than at any February show that has been held here in recent years and there was sufficient birds in all the classes in the important breeds to make competition keen and a winning at this show carries with it a great an advertising value as any exhibition held in the Middle West, aside from the Coliseum at Chicago.

The weather conditions for the past two months have been very discouraging to the fanciers. Then, again, the prices of feed has frightened many on account of the price of market poultry not keeping up with this increased price in poultry feeds, but when the matter was put up to the fanciers of this state as a patriotic proposition, in which they as Hoosiers were expected to do their bit at this particular time to maintain the reputation that this state has always held among the fancy poultry breeders of this country, there were no slackers. In every instance, the breeders were more than pleased that they made their entries, as there was a better demand and at reasonably good prices than has been paid in Indianapolis for the past five years.

Men who have financed the large exhibitions this year and have quit at the close of the season with the balance on the right side of the ledger, can certainly shake hands with themselves. On the other hand, the poultry breeders of this country should not lose sight of the fact that it is these successful shows, properly managed and properly conducted, that creates enthusiasm and brings into the fold the new breeder and the new buyer.

Looking back to the Coliseum in December, many readers of the AMERICAN POULTRY JOURNAL know full well that you visited that exhibition with the determination to give the show the "once-over," and if it was not up to standard, to discontinue the breeding of fancy fowls and dispose of your surplus, but after staying there for a few days, you realized that the business was not as dead as you imagined and you went home encouraged to go ahead and you are going ahead as indicated by the liberal amount of advertising that appears in this issue of this publication and what has been said of the Coliseum in Chicago can be truthfully said of the Indianapolis show.

While this exhibition cannot be classed with the Coliseum or with Madison Square Garden, it is one of the big little shows that has been held annually for more than thirty years and where buyers from all sections of the United States have got in the habit of coming to buy first-class breeding stock and hatching eggs.

The classes this year were about the same as we usually find in the Middle West; in other words, the popular or

TWENTIETH CENTURY HATCHERY

Box 1

NEW WASHINGTON, OHIO

Fourth prize Barred Plymouth Rock hen at Madison Square Garden, 1917-18. Owned by C. N. Myers, Box A, Hanover, Pa.

every-day breeds were most in evidence.

The Plymouth Rocks, Barred, White and Buff, were a credit to any exhibition and there was sufficient competition to keep the exhibitors on the anxious-seat until all awards were made. In the Barred variety, we do not believe there has ever been a better quality string shown than that cooped this year by Mr. C. E. Spaugh, of Rugby, Indiana, and regardless of the fearful weather conditions we had for sixty days prior to the opening of this exhibition, there was not a frosted comb in his exhibit and his birds were shown in as good show condition as any exhibition at the Coliseum. Buff Rocks, not quite so large an entry as in 1917, but equal in quality.

White Rocks, not quite so large a class as 1917.

The Reds, both combs, were out in

force. Single comb variety leading in number of entries and a good demand from hundreds of buyers for all the surplus stock that was offered for sale.

In the Brown Leghorn class, we had undoubtedly the best quality show that has been staged in Indianapolis for the past five years, Herman Rickoff showing a full class, and it is generally conceded that Mr. Rickoff today has the best pullet line of Single Comb Brown Leghorns to be found anywhere in this country, and this year's exhibition proved that he is very nearly, if not quite, as strong in the male line as well.

The White Leghorn class was a sad disappointment. A very small entry and not enough birds in the class to make competition even exciting for the exhibitors.

Buff Orpingtons, the largest entry in the show. This variety of the Orping-

ton family has found a strong foothold in Indiana and any number of breeders are devoting their entire time to the production of first-class exhibition specimens. While many of the males in this class show the effects of the cold weather, having frosted combs and wattles, the exhibition was certainly one of the best that has ever been held in Indianapolis, and there was a demand here for the good ones in excess of the supply.

White Orpingtons, not so large a class, but many birds of exceptional merit.

Black Langshans, a show of themselves. Many of the old-time exhibitors out and it reminded one of old times when Ben Myers was in the ring.

Bantams, all varieties, strong. The entire stage was devoted to this entry and we understand the Middle West

Bantam Association held one of the best meetings they have ever had and plans were perfected for even a larger entry for 1919.

Turkeys and water-fowls of the several varieties were well represented.

The Indianapolis show for 1919 will open on the first Wednesday in February. Other associations are requested to keep off this date.

NOTES OF THE SHOW.

The leading shows of the country have been favored this year by very liberal space thru legitimate concessionaires and Indianapolis is no exception to this rule. This year we had the following well-known feed manufacturers represented on the floor of Tomlinson Hall: The Quaker Oats Company, Albert Dickinson Company, Hales & Edwards and the Park & Pollard Company, all of Chicago; also the famous G. E. Conkey Company of Cleveland, demonstrating their own goods in their own booth, while the Buckeye Incubator was represented by the O. K. Seed Company of Indianapolis. The Queen Incubator and brooders displayed by the Southern Seed Company; the Petaluma Incubator Company, with a fine line of incubator and poultry supplies. The Simplex Incubator Company of Indianapolis, with one of their most attractive exhibits; the Oakes Manufacturing Company, with a full line of their poultry feeders and fountains, and last, but not least, the Poultry Doctor in the form of John Brinkama, with his full line of remedies and his glad hand for everybody.

A Correction.

In the advertisement of the Kam Poultry Yards, Fort William, Ont., Canada, in our February issue, we made the error of stating that their prize-winning Red Sussex were all from F. L. Pratt's stock. This should have read Frank L. Platt's stock.

Editor American Poultry Journal.

Dear Sir—In January issue of your journal, Mr. Plummer McCullough relates some experience with S. C. Black Minorcas molting out and some white feathers coming in in the place of black, and asks to hear from any other breeders of Black Minorcas that have had this experience. About 15 years ago I was line-breeding some high scoring S. C. Black Minorcas from one of the foremost breeders of the United States. I was surprised one fall at a cockerel after molting to see pure white feathers, not mottled as an Ancona, but two-thirds of his body was covered with pure white feathers, white to and including quill, the remaining feathers pure black; not any feathers with white and black.

As I had been breeding these birds for six years and was sure of my matings, decided it was some freak of the color pigments and did not want to chance any of his blood further in my strain and killed him, but was sorry later on that I had not kept him for another year to see what his next molt would do. I continued breeding that strain 12 years longer and no trace of white ever showed or any sign of color trouble.

I always won a good share of 1st prizes and for 8 years won 1st on heaviest dozen of white eggs in N. B. exhibitions, eggs weighing 2 lbs. 5 1/2 ozs. to the dozen. These birds were scored by Judges Felch, Maye and others of like note.

A. E. S. HATFIELD.

If after that time you are not entirely satisfied with it, return it to me—at my expense—and I will refund the purchase price without a quibble. I also pay the freight both ways. Can anything be more fair than that?

The Eureka Colony Brooder

Price \$17.50 and \$21.50

is a brooder that I have absolute confidence in. I am a large manufacturer of stoves and make every part that goes into it. I eliminate useless expense. This brooder has a corrugated fire pot, is self regulating and is made of solid cast iron, burns hard coal or natural gas as desired. I honestly believe it will raise more chicks and better chicks at a lower cost and with less labor than any other brooder on the market. I have testimonials from many users of the Eureka Colony Brooder and will gladly send them, together with full information about the brooder, if you write today requesting same. Don't forget my honest offer, 30 days' free trial without costing you a penny. Write now for descriptive literature. AGENTS WANTED EVERYWHERE.

Brood Your Chicks

Simplex Brooder Stove

30 Days FREE

Use the new 1918 Simplex Brooder Stove on your own hatch for thirty days free. Raise 20 to 50 per cent more chicks at 1-5 the cost, 1-10 the work and 1-4 the operating expense. Small and large broods. Three sizes of stoves. Try our stove under all conditions and if you are not delighted send it back and we will cheerfully refund your money.

Turn Losses Into Profits

This wonderful brooder will raise 50 per cent more of your chicks than you have been able to raise under the old fashion methods. No more deaths from white diarrhoea and poor ventilation. It turns the losses from dead chicks into big profits for you. The Simplex soon pays for itself by the extra money it makes for you. The Simplex Brooder Stove burns kerosene oil, natural or manufactured gas, automatically regulated to insure an even temperature with the least possible attention.

Free Brooder Book

Write today for valuable free brooder book and catalog. It tells how to "increase your profits by decreasing mortality." Tells how to save chicks you have been losing each year through disease and faulty brooding. How to make more money. Also catalog and details of 30 days trial free. No obligations. Write now.

THE MOTTLED ANCONA.

By R. W. VAN HOESEN,
Franklinville, N. Y.

THE FIRST impression people have of Ancona fowls is a lasting one, and invariably it is their striking beauty that catches the eye of the fancier. Nothing in poultrydom excels the contrast of black and white of the beautiful Ancona, so prettily mottled with little triangular white feather-tips on the shining black background, with a suspicion of green in the luster. And being one of the sprightliest of the Mediterranean breeds, a proud carriage, a white or creamy ear lobe, a light leg, a moderate angle tail—no wonder Anconas have become one of the large and popular classes in the show-room.

But the Anconas have more than beauty to recommend them. For more than a dozen years I have contended that the Ancona produces eggs at the least cost per dozen of any known fowl. This has been the experience of myself and scores of other Ancona breeders who have carefully compared them to other breeds. But it was not until recently that this rather strong claim was officially verified, when in January, 1915, the report of the 1914 Missouri Egg-Laying Contest at Mountain Grove, Mo., gave to the world exact figures that are indisputable. It must be taken into consideration that this report is not particular performances of certain birds, but the average by flocks for 365 consecutive days, of twenty of the best-known standard breeds. And there is no more reliable source known in the world than this Missouri experiment station. The report is verified and certified to by the professor in charge. Here are the figures: One hundred pounds of feed produced 300 eggs when fed to Anconas; 268 eggs when fed to Leghorns; 251 eggs from Wyandottes; 230 eggs from Orpingtons; 225 eggs from Campines; 203 eggs from Minorcas; 201 eggs from Rhode Island Reds; 188 eggs from Plymouth Rocks; 179 eggs from Langshans, etc. Furthermore, when all the eggs were weighed it showed that the Anconas laid the largest eggs of all the breeds tested. And the Anconas laid the largest percentage of eggs from November to May, when eggs are highest in price and most in demand for hatching.

No words that I may add can give greater emphasis to the value of Anconas.

A few words about the history of this breed. Their native home is the province of Ancona, on the east coast of Italy. They were imported into England in 1848, and from England to America in 1890. They were admitted to the American Standard of Perfection in 1895. There are but two varieties—Single and Rose Comb. The Standard weights are: Cocks, 5½ lbs.; hens and cockerels, 4½ lbs.; pullets, 3½ lbs. Chicks develop very early, and the pullets begin laying at from 16 to 20 weeks old.

The Ancona breeders are associated in one of the strongest poultry clubs in the country, and have for seven years published a monthly magazine devoted exclusively to this breed.

During the 1917-18 show season, at many of the large poultry shows Anconas were one of the large classes, and

at several of the big meets they outnumbered any other breed. They have been increasing in popularity each succeeding year, and without doubt will continue to do so until they are as generally bred as any Mediterranean or American breed.

White Plymouth Rocks.

THE origin of the White Plymouth Rock dates back to about the year 1876 and there is no variety of poultry that has reached a higher average quality up to this time. They are one of the most beautiful breeds of poultry that exists. The male birds with their pure white plumage, neat low comb, bright red eye and long broad back, and the females of the same description, make as beautiful a breed of fowls as anyone could wish. The standard weight of the cock is 9½ pounds and of the hen 7½ pounds. In mating to produce exhibition stock, one should select a male with good color, free from creaminess or brassiness in all sections of the plumage, a good red eye, a four or five-point comb, which should be low and neat, a good long and broad back, full breast and rich yellow legs. A male of this description mated to females with full breasts, broad backs and well spread tails will produce good results.

The White Rock eggs vary from light brown to a dark rich brown in color and are of good size. The general average of eggs produced by the White Rocks is from 150 to 175 per year. They are excellent layers the year round, which has been shown at the leading laying contests. The eggs also run very strong in fertility.

The fowls should be housed in substantial houses, built to face the south, with plenty of windows to admit all the fresh air and sunshine possible. Most houses are now being built with open fronts and have curtains to drop over the openings in stormy weather. The houses should be built not less than ten feet in width and more if possible, as this keeps the fowls farther away from the windows than in a narrow house and makes it warmer for them when on the roosts. Drop boards should be placed where the fowls are to roost and the perches placed from six to eight inches above the drop boards. Curtains can be made to drop down in front of the perches and this makes it more comfortable to the fowls by keeping the bodily heat in a smaller space. A good way to keep the perches free from lice and mites is to paint them with tallow. This will keep the perches entirely free from the pests. The floors of the house can be of ground, wood or cement, cement probably being the best, as it does away with rats working under the houses. If ground floor is used, ground should be filled in from four to six inches above the outside level, as this keeps the floor from becoming damp. A good litter of straw or leaves about ten inches in depth should be kept on the floor at all times, as this gives the fowls exercise in scratching out the grain when thrown

Smith Standard BABY CHICKS

America must grow more poultry this year. We will help by producing nearly

2,000,000 Chicks in 1918

Big, strong, vigorous chicks of unusual utility value and priced extremely low, quality considered. The great volume of business we do makes low prices possible. Our marvelous

Incubator Holds Forty Tons of Eggs

or 666,000, at once! Largest in America—best system of incubation ever devised. The air in the huge egg-chambers is completely renewed every three minutes and moisture furnished by live steam.

We ship any number of chicks. These breeds:

Save the Babies

Don't hatch eggs or buy baby chicks until you are properly prepared to raise them

SUCCESSFUL HATCHES are of less value than total failures if the chicks do not live to maturity, as a failure in the hatch is far cheaper than a gradual diminishing of the brood thru leg-weakness, bowel trouble, diarrhœa, smothering, chilling or of any other affliction.

It is safe to say that 90% of these troubles are due to improper brooding.

Not only artificially hatched but also hen hatched chicks require proper care. Nature gave the hen feathers to protect her chicks but neglected to give the sense necessary to keep her from leading her brood into damp grass or sometimes deserting them.

Simplex Feather Brooders & Hovers

Combine Nature's Gift with Common Sense

They embody the use of natural feathers which have been thoroly cleansed, renovated and fumigated. The brooders are made in both artificially heated and fireless construction. The hovers are suitable to be placed in any old brooder and are just the thing for breeders having heated brooder houses. They are inexpensive, light, sanitary, easy to handle and easy to clean.

You will not only raise more chicks, but your chicks will be stronger and larger than chicks raised in the average heated brooder if you use Simplex Perfection Feather Brooders or Hovers.

Chicks cannot crowd in these feather brooders. They cannot chill or smother. They just seem as contented between the feathers as a cat behind a kitchen stove.

Don't take our word for it, but ask the folks who use them.

Simplex Feather Hovers are being used on some of the most successful poultry farms in the country since 1910.

SEND FOR OUR CATALOG. It will tell you all about these wonderful chick raisers, as well as our automatic baby chick feeder and other poultry appliances. Send today—it's free.

SIMPLEX SUPPLY HOUSE

Pontiax Building

Chicago, Illinois

in the litter. The houses should be built so as to be entirely free from drafts, as fowls can stand very much cold so long as there is no draft. Corn-stalks placed around the north, west and east sides of the house will make it much warmer. One nest should be provided for each four or five hens and should be placed in a slightly dark place. Nests can be placed under the drop boards so the hens can enter from the rear. This way the nests are kept slightly dark and the hens will not learn to eat eggs as quickly as if in a light place where the eggs can be seen.

A variety of feed is needed to keep fowls in laying condition, corn, oats, wheat and barley being the principal grains used. A good daily feeding plan is to give an equal mixture of wheat and oats or commercial scratch feed, about a handful to each fowl in the winter and a handful to each two fowls when on range, scattered in the litter each morning; then at noon a mash mixture of equal parts of bran, middlings, corn meal, ground oats and meat scraps. This can be fed dry in hoppers or can be made into a wet mash by using water, or milk, if possible. Then at night all the whole corn they will clean up, especially in the winter months, as corn is a great heat-producing grain. Green feed in the way of cabbage, beets or sprouted oats should be fed as much as possible in the winter months. Lawn clippings also make an excellent green feed in winter if the clippings are dried in the shade and then put in a pail and pour boiling water over them and left to steam. They can then be fed this way or mixed with bran and fed as a mash. Green cut bone is also good for laying fowls or young stock. Fresh water should be kept before the fowls at all times.

Eggs can be hatched by using either hens or incubators, incubators being the best, as they are less trouble than hens and the hens can be kept at laying while the incubators are hatching the eggs. The White Rock chicks are not white when hatched, but are light brown or yellow, but this color soon gives way to the white. The chicks should not be fed for the first twenty-four to thirty-six hours, as the yolk of the egg is absorbed by the chick before it is hatched and this forms food for the chick for the first days. The first feed given can be infertile eggs taken from the incubator and hard boiled and then mixed with dry bread crumbs. This can be fed for the first few days and then they can be fed commercial chick feed or cracked wheat and steel-cut oats. Screened meat scraps should also be fed after the first week or so. This can be fed in hoppers. The chicks mature quickly and can be placed in colony houses which can be moved wherever convenient. The cockerels and pullets should be separated as soon as they can be distinguished and the cockerels can be fattened and sold if not wanted for breeders. The pullets should be placed in winter quarters when fully matured, which will be in about six months, and will be soon producing their share of eggs. If you are not breeding White Rocks, make a start by buying a trio, pen or a few settings of eggs, and you cannot help but be pleased with the results you will get. A few White Rock pullets will help cut the high cost of living next fall.

S. C. W. LEGHORNS—OHIO'S BEST

Our breeding pens contain our winners at National All Leghorn Show and Ohio State Fair and our price is but \$2 and \$3 per setting. Splendid cockerels at \$3.50, \$5 and \$7.50 each. Sold up on W. F. B. Spanish eggs for this season.

EGGS FREE — Hall's famous Barred Plymouth Rocks. In order to induce more poultry, I am going to reduce the price of eggs from my famous winning line of cockerel-bred Barred Rocks, including World's Fair and champion Chicago winners, to \$5 per 15 eggs. With every order of \$5 I will give five free eggs from the daughters of "Liberty," egg record 294 eggs in one year. Several of those yards are headed by 12-16, cocks, sons of champion female, Chicago Coliseum. I have formerly sold at \$10 to \$20 per 15. Everything goes this spring after March 1st, \$5 per 15, with five free eggs, giving you 20 eggs in all. 19 years line-breeding on my farm for size, eggs, production and exhibition quality has produced a line unexcelled by any breeder in America. We are prepared to take care of thousands of orders promptly. You may order any amount you wish; price is the same; with every \$5 sent for eggs I will send free five eggs. Catalog free. Luther J. Hall, Box 7, Kenney, Ill. 3-5

The RELIABLE
Blue Flame, Wickless,
Oil Heated
Colony Brooder

Burns Coal Oil. Safety.
Comfortable. Easy to Operate.
Self Regulating. Convenient.
No Wicks to Trim.
No Coal Smoke or Gas.
Economy of Operation.
Steady Blue Flame.
Gives Abundance of Heat.
Positively Has No Fumes.

The Reliable Blue Flame, Wickless, Oil Heated Colony Brooder, is the latest, best and most efficient Brooder ever offered for sale.

After a year of experience in testing out and operating this Brooder we are offering to the trade, knowing that such a Brooder is needed by the poultry raisers in general.

We will furnish this Brooder, equipped with our Blue Flame, Wickless, Coal Oil Heater, which has positively no fumes, as it consumes all the smoke, soot and gas and it feeds itself automatically. You can gauge your heat by the flow of oil by our safety valve.

This Colony Brooder is far more efficient than the Coal Burning Brooder. There is no danger of fire going out and chilling the chicks. We guarantee that you get any amount of heat needed at all times, and our regulator will take care of all surplus heat and will do equally as good as a Coal Burning Brooder and more, with less trouble, less risk of fire going out and with equal success of comfort of chickens entrusted to its care and with less cost.

Guaranteed as Represented or Money Refunded

These Brooders are shipped direct from factory and will be furnished with everything complete, and ready for operation. Now is the time to purchase. We are offering special inducements in order to introduce this Brooder.

HOW TO MAKE CHICK GROWING EASIER

Published Monthly by the American Poultry Journal Publishing Company, 542 So. Dearborn St., Chicago, Illinois. For Subscription Rates See Editorial Page

Mash Makes Eggs—Mash Makes Chicks Grow

If you would be successful as a poultry raiser, take for your feeding motto—M-A-S-H—whether for egg production or growing chicks.

Remember that Mash, not Scratch Grains, is the proper feed to make hens lay, and that a good growing mash is the ideal feed for young growing chicks.

To get MORE eggs from your hens, feed FUL-O-PEP DRY MASH—the famous egg-making feed.

It is a soft feed, finely ground and correctly balanced—a feed composed of animal food, green food, grain protein food and other egg-making elements—a feed as near like the hen picks up herself in the spring as it is possible for expert science to produce.

It is the raw material from which eggs are made. Keep it before your hens all the time and you will get eggs in abundance.

FUL-O-PEP

GROWING MASH

is without a doubt the finest quality growing mash for chicks ever placed on the market. It has for its base OATMEAL, ground fine and we have nicely balanced it with other bone and muscle forming ingredients which promote rapid, healthy growth. When the chicks are 10 days old place FUL-O-PEP GROWING MASH where they can help themselves at will—keep it before them

day in and day out—the more they get away with the better and faster they will develop and grow. To the chick it is just like getting out on free range and feasting on bugs, worms, green stuff, etc., only in FUL-O-PEP GROWING MASH we have gone the free range one better and given him many good things that he could not possibly pick up shifting for himself.

The Big Poultrymen's Secret

The secret of FUL-O-PEP GROWING MASH is the same secret such experts as Thompson, Fishel, Felch, Dann, Kempster and Lambert have used in feeding chicks. They all agree that OATMEAL is one of the finest known ingredients for growing chicks. Our feed experts after making exhaustive tests discovered that by using OATMEAL for the base and adding beef scraps, bone meal, green food, etc., in the correct proportion, that they could produce a feed that was far ahead of any known feed for chicks—the result is FUL-O-PEP GROWING MASH. Get it at your dealer's and you will be astonished how your chicks will thrive and grow.

Free Poultry Calendar Book

Fill out and mail coupon and we will send you free, postpaid, our FUL-O-PEP POULTRY CALENDAR BOOK, which tells you the simple methods by which poultry raising can be made profitable. Contains a daily egg record calendar—gives successful feeding methods—tells how to get more eggs—proper care of young chicks—how to best break hens from setting—in fact, it answers practically all of your poultry problems—a book you will value and keep. Send for it today.

FRANK E. HERING'S WHITE LEGHORNS

have been purchased by

GEORGE B. FERRIS

To My Patrons:

I have sold my Single Comb White Leghorn flock to Mr. George B. Ferris, of Grand Rapids, Michigan. One immovable fact dictated this action: the pressure of work of patriotic, civic and business activities.

I have assumed the general management of the War Savings Committee for the State of Indiana during the year of 1918, and the demands of this office, added to other interests, leave no time for supervision of the poultry business.

I sincerely believe that I have on my plant one of the two greatest Single Comb White Leghorn flocks in the country. The matings have been most carefully made; the eggs are showing a high degree of fertility; the incubators are working satisfactorily; and as Mr. Ferris has retained the plant organization, his customers are assured of getting the quality of stock, baby chicks and eggs advertised in my poultry literature. He has leased my plant and the flocks and matings will not be disturbed.

Cordially yours, **FRANK E. HERING.**

The winnings of Mr. Hering's flock at the Chicago Coliseum the past three years show the unusual quality of the flock. In December, 1915, he won:

- First and third cocks
- First and fourth cockerels
- First young pen
- Second and third old pens
- Silver cup for best five cockerels
- Silver cup for best display

In December, 1916, there were 158 Single Comb White Leghorns entered, yet Mr. Hering won all trophies and specials, silver cup for best cock, hen, cockerel and pullet and the following regular prizes:

- First, second, third, fourth and fifth cocks
- First, second and fourth hens
- First, second and third cockerels

- First, second, third and fourth pullets
- First and second old pens
- First, second and fifth young pens

At the last Chicago Show, December, 1917, the winnings were as follows:

- First, second, fourth, fifth and sixth cocks
- Second, fourth and seventh hens
- First, fourth and fifth cockerels

- Second and third pullets
- First, third and fourth old pens
- Second, fourth and fifth young pens.

We have leased Mr. Hering's \$30,000 poultry farm at South Bend, Indiana, and will operate it in addition to our extensive Grand Rapids plant. The pens will be left this season just as mated by Mr. Hering and the prices of eggs and chicks are less than half what they should be considering the unusual quality of the stock.

April and May.			After June 1		
15 Eggs	\$10.00		10 Chicks	\$12.00	\$ 8.00
30 Eggs	18.00	13.00	25 Chicks	25.00	16.00
50 Eggs	26.00	16.00	50 Chicks	50.00	30.00
100 Eggs	50.00	30.00	100 Chicks	90.00	50.00

Eight weeks old cockerels, \$10; pullets, \$5. Breeding pen of 10 pullets and cockerel, \$50. Four pullets and cockerel, \$25.

We are now booking orders for exhibition stock for the fall fairs and can furnish winners for any show in the United States or Canada.

1916
\$1 WORTH
GRAIN

1916
\$1 WORTH
MEAT FEED

\$1.00 Buys More Meat Feed Now Compared to the Cost of Grain

Grain prices have gone up 200 to 300 per cent. Meat feed prices have gone up only 40 per cent. While meat feed was always the most economical considering the nourishment it furnished, it is now even more economical compared to grain because it has advanced relatively little in price.

DARLING'S MEAT CRISPS

is a pure, sweet, greaseless, odorless, concentrate of fresh meat, cooked and prepared for every day feeding for all kinds of poultry. It contains 50 per cent more nourishment than the best meat scrap on the market (75 per cent protein guaranteed) and is thoroughly digestible. A small measure in the ration supplies all the necessary protein and makes the whole ration more nourishing. Write for our free book entitled "Feeding Secrets of Famous Poultrymen." Please give your dealers' name.

DARLING & CO., Dept. 3 CHICAGO, ILL.

Oat Sprouter \$2

For \$2.00 you can build the simplest, most efficient, easiest to operate and best oat-sprouter ever constructed. A boy can make one in an evening with no tools but saw and hammer. Thousands in successful operation. Plans with plain directions for building, 10c postpaid.

Felch's Egg List Revised

Pens 1, 2 and 3 so mated that chicks will be pure Felch cocks or mated to granddaughters of Mollie Wellington. Prices \$7 for 11, \$10 for 15, \$15 for 30, \$25 for 50, \$35 for 100 eggs. Pens 4, 5, 6 are my old Felch line that are bred the same as sire and dam of Mollie the Champion—325 eggs a year—mated to Mollie's cockerels and those of my Duke B Strain—\$6 for 15, \$10 for 30, \$12 for 50 and \$20 for 100. Special White and Barred Rock pen same price. Also pens strictly pure bred of all four breeds, \$4 for 15, \$7 for 30, \$10 for 50, \$15 for 100. Utility Flocks, \$3 for 15, \$5 for 30, \$7.50 for 50, and \$12 for 100. Send three-cent stamp for Booklet of Fowls.

56 first prize State Fair winners sold customers last fall and some 240 winners sold customers past winter (including both Chicago Shows) is my record. Think that over. This season my matings surpass those of former years. I happen to know there are none better. This means winning success for my egg customers of 1918. EGGS from finest special EXHIBITION MATINGS \$10 per 15, \$19 per 30, \$30 per 50. Fertility guaranteed. (All other Eggs \$15 per 100). AND NOTE THIS—If the product from my finest Eggs is not satisfactory to you next fall I will then send you absolutely free a bird or birds equal in value to the entire cost of the Eggs to you. I am the first noted breeder in all America to completely guarantee the quality of high priced Orpington Eggs. Order or ask for Mating Booklet.

INDEX TO GUARANTEED ADVERTISERS

The guarantee of American Poultry Journal Pub. Co., is back of every advertisement and every advertiser in American Poultry Journal. We will not knowingly accept advertising from a dishonest concern. Advertisements for patent medicines, whisky, beer or mining schemes, or any other questionable advertising, are not accepted under any conditions. We will not knowingly introduce a dishonest advertiser into the home of one of our subscribers. We refuse many thousands of dollars worth of advertising during the year because we are not willing to guarantee these advertisers to our subscribers. When answering advertisements mention American Poultry Journal and refer to this guarantee.

Has Aldrich Made Good with His Combination Strain?

HIGH RECORD LAYERS - EXHIBITION QUALITY

Aldrich pen at American Egg Laying Contest at Leavenworth, Kansas, ties for first place with White Wyandotte pen against all competitors in January, the coldest month known in many years.

FROM ONE SETTING OF EGGS

Quincy, Ill., Dec. 12, 1917.

Aldrich Poultry Farm, Columbus, Ohio.

Dear Sirs: Here's to you. 1st Pen, 1st and 2nd Pullet, 2nd Cockerel at the Quincy, Ill., Poultry Show, November 28th to December 2nd, 1917, in strong competition. These birds were hatched from eggs bought from you. Thanking you, I am,

Respectfully yours,

HERMAN J. WULFMEYER,

938 Ohio St., Quincy, Ill.

need Nature's food—the perfectly balanced ration that Mother Nature and science say is perfect—

MILKOLINE

We all know how the small flock of chicks kept by the farmer's wife thrive and grow—no sickness—no trouble. Why? She feeds them skim milk—buttermilk—sour milk, and you can see them grow. It is impossible for everyone to have a home supply of milk products for their chicks. Milkoline solves the problem. It is made from pure, fresh buttermilk, modified and condensed for cheap shipping and easy handling. Just mix

1 Gallon Milkoline and 50 Gallons of Water

and you have the most healthful and cheapest feed possible. **White Diarrhoea is unknown where Milkoline is fed.** It is the ideal feed from the shell to the killing block. The backyard poultry keeper and the big packer both use it. **Young pigs and hogs thrive on Milkoline.**

"Signal" Aluminum Leg Band

The band that gives universal satisfaction. Price, 12¢ per 25-30¢; 50-35¢; 100-40¢; postal note, 10¢ a letter per hundred bands. "Silver-Tip" pliers, especially for applying all kinds poultry leg bands. Price, 10¢ each, 3¢ extra for postage. W. J. Ball, 198 Ellsworth Ave., Salem, O.

Riverside Rose and Single Comb White Leghorns and White Plymouth Rocks

First prize winners at Chicago, Milwaukee, San Francisco, Oshkosh, Beloit and many other shows. At National Rose Comb White Leghorn Club Meet, Chicago, 1917, on 15 entries placed every bird. Won 3 firsts, 3 seconds, etc. Also champion male and female, best shaped female and best display. Day-old chix and eggs for hatching from our fine matings.

RIVERSIDE POULTRY FARM, R. 6, Box 3, OSHKOSH, WISCONSIN

A Wonderful Buff Leghorn Male

heads our pen No. 1. He is a dream. We never thought such a bird could be bred. We doubt if there is a better one living. His sire is owned by Dr. Heasley and has been heading one of his best pens three years in succession. He is a descendant from a hen that made a record of 283 eggs in a year, and was sired by the blood of a hen making a record of 262 eggs. He is also a grand show bird. If you want show and laying qualities combined, we can please you. No. 2 Pen is headed by a son of this bird in Pen No. 1. Not over 15 eggs sold to one customer from each pen. All infertile eggs refilled free. Pen No. 1, \$10 per 15; Pen No. 2, \$5 per 15.

Owen Farms Matings for 1918

are the finest ever put together. They combine thorobred and line-bred utility and beauty qualities to a degree that is excelled by no other flock in existence.

It is the earnest desire of each one of us to help win this war, and to help win it as quickly as it can be won and won conclusively. Our Government tells us that food will win it. You and I know that more meat food can be produced in a shorter time with poultry than with any other bird or animal. Furthermore, you are advised by the authorities at Washington to raise Standardbred birds. It costs no more for food and labor to produce good poultry than it does ordinary mongrels. The slightly increased first cost for Standardbred birds or eggs for hatching is a mere fraction of the increased value of such a flock when reared. Owen Farms Standardbred flocks have been line-bred for many generations to produce size, bone, stamina, vigor and egg production. Combined with these cardinal requirements are Standard qualities that make them unequalled in the show room. YOU WANT THIS PAYING kind of fowls and you will find here at Owen Farms six of the seven most popular and profitable varieties in existence.

White Plymouth Rocks S. C. White Leghorns White Wyandottes White Orpingtons Buff Orpingtons S. C. R. I. Reds

No flocks have given a higher egg yield in the trapnets of customers and no flocks have produced as high a percentage of winning birds in large and small shows in the United States, Canada, Australia, Mexico, South Africa and South America.

Thousands of Owen Farms birds have won the blue ribbons at Madison Square Garden, Boston, Chicago, Minneapolis, Toronto, The Guelph, Dallas, Los Angeles, Portland, Seattle and at every other show you can name. Many more thousands have laid and paid in every State in the Union, Province of Canada and foreign countries all over the globe.

My mating list will give you in complete and interesting form the history of Owen Farms flocks in each variety and a careful description of the finest matings in existence. You will find eggs listed from superbly mated pens in each variety at

\$6, \$10, \$15, and \$20 per 15

At this writing I have orders booked for a large percentage of my March output. Orders are coming every day and if you wish your eggs on any given date I would advise ordering at once. My satisfied customers of former years have taken over 60 percent of my output to date. This speaks volumes for the results from Owen Farms eggs for hatching.

Breeding Stock

My surplus breeders are nearly all gone. Can furnish you with very choice cocks and cockerels in Reds, Buff Orpingtons and White Leghorns. Have about 100 fine Leghorn females that I can sell you properly mated for best results. No more females in other varieties until after June 1.

HALF PRICE STOCK SALE

Will book your order for delivery in early June for males and females from my matings at just one-half the price they will cost you now. This is your opportunity to secure choice birds at small cost and early over for breeding and showing next year.

Every Owen Farms customer is sure of absolute satisfaction and that his money will buy more real value and lasting satisfaction here than the same amount would buy elsewhere. If possible, come and see my farms. If you cannot come, write and receive my printed matter. We both lose if you do not carefully consider Owen Farms value before you place your order.

OWEN FARMS Office at 107 William St., Vineyard Haven, Mass.
Maurice F. Delano, Proprietor Frank H. Davey, Superintendent

AMERICAN POULTRY JOURNAL

Entered as Second-Class Matter August 9, 1886, at the Postoffice at Chicago, Ill., under Act of March 3, 1879.

Volume 49

Chicago, Ill., April, 1918

No. 4

PRESENT-DAY POULTRY FARMS

LOCATED on an island, off the coast of Massachusetts, is one of the largest poultry farms in the world, and probably the largest that is devoted exclusively to the production of Standard-bred poultry. This is Owen Farms at Vineyard Haven, Mass., which is devoted exclusively to the production of six of the most popular varieties that are recognized by the American Standard of Perfection; namely, S. C. Rhode Island Reds, Buff and White Orpingtons, White Plymouth Rocks, S. C. White Leghorns and White Wyandottes. These varieties are recognized as general dual-purpose fowls, which produce both meat and eggs.

Owen Farms is owned and is under the direct management of Maurice F. Delano, who is, without doubt, one of the ablest poultry breeders in the country today. Associated with Mr. Delano is Frank H. Davey, who is superintendent of the farms. Mr. Davey bears the reputation of being the most expert breeder of White varieties in the country. We present herewith the photographs of these two poultry experts.

Probably many poultrymen have wondered why Owen Farms was situated on an island, which to intending visitors is not easily reached. Despite this fact, however, express and postal service is very regular and rapid, in fact just as quick as tho the place were situated in the rural districts of the mainland. There is a great advantage in the climatic conditions out there on the Island of Martha's Vineyard. The winters are never severe, and the temperature is 10 degrees milder than that of Boston in the coldest weather. Heavy snow is seldom seen and soon disappears under the action of the salt air. The Gulf Stream comes up, flows all around the island, and striking the south shore of Cape Cod is sent eastward across the Atlantic to England. This tempered climate affords Owen Farms an advantage in having an open fall and short mild winters, while the ground is clear of snow and ice much earlier than in other sections in the same latitude, all of which tends to aid in the better development of the stock raised on this farm. They are also far removed from the soot and smoke of the mainland and therefore the White birds are not only bred white, but stay white.

Owen Farms does not approve of marketing "fancier's culls" as "utility stock." All culls are disposed of as market poultry, for which there is an unusually fine demand in summer, the summer residents on the island regularly paying from 35c to 40c per pound for fowls and chickens. Very little business is

done in market eggs, except to dispose locally of eggs not suitable for hatching purposes. While a considerable number of day-old chicks are sold, Mr. Delano does not favor this branch of the business and much prefers to sell breeding stock and hatching eggs.

Owen Farms has incubator capacity for 3,000 at one setting. The brooder houses are equipped with International hovers and have an auxiliary heating system by a bank of hot water pipes on rear wall. Preference is given to hen hatching and hen brooding and long houses are equipped with conveniences for natural brooding of large numbers of chicks with hens, during the winter and early spring season.

The soil of the farm is sandy, but sufficiently substantial to carry a good growth of grass. There is sufficient woodland to afford ample shelter and plenty of shade with enough sunshine for good results.

The U. S. Government, thru the Department of Agriculture, is urging the people, back-yarders, as well as the practical poultrymen and women of the country, to raise more poultry and produce more eggs, and are advising the use of "American Standard-bred Poultry" as the best method to bring about the desired results. The source of supply from whence this stock will come will naturally play a very important part in the success of the movement, and on the influence of this splendid poultry movement thruout the country. For this reason, the better quality produced and distributed by the breeders, the better will be the standard of poultry wherever their stock

FRANK H. DAVEY

The two experts behind Owens Farms, are here seen at work, deciding between two remarkably good White Plymouth Rock cockerels to head a breeding yard.

is shipped. Those of us who have watched poultry conditions since the war began know very well that a very large percentage of our poultry was rushed to market and cold storage as soon as grain prices began to soar. Today we are facing a great shortage of fowls from which to produce eggs and meat, with the consequent results that those breeders who have held on, and are now being asked to supply the demand for breeding birds and eggs for hatching are in the fortunate position of being able to do a great deal of good for the future of Standard-bred Poultry. Owen Farms is in this position, as they have held on in the face of all the trying conditions of the past several months, and are now in a position to supply the wants of the large army of poultrymen who are becoming interested in thorbred poultry as a result of the efforts of the Department of Agriculture.

Mr. Hoover and the American Hen

Attitude of the Food Administration Toward Poultry Industry.
A Defense of Criticism.

By J. P. Henry, Chestnut Hill, Pa.

A POULTRY dealer, in Greenwich, Pa., writes to the *Produce Review*: "In my opinion the government should have put an embargo on the price of corn instead of on the sale of poultry, because it would not have oppressed so many millions of poor families in the United States."

There is much that might be said in favor of this dealer's opinion, altho there seems to be reason enough for the high price of corn. Many poor families depend upon poultry for a part of the income. To forbid them a market is unjust. In large cities and towns, in Jewish and Italian quarters, the shutting off of sale of live poultry for a period of ten weeks—live poultry being one of their chief sources of meat supply—is discrimination which imposes great hardship and is most unwise.

The following statement is credited to the poultry department of Cornell, and presents the producers' view of the ban on sale of live fowls:

"A worthy object wrongly administered. Undoubtedly the

already seriously reduced in number, sacrificed. The final effect will be less mature stock kept, less eggs and poultry meat to sell and to eat and, consequently, higher prices to hungry consumers. Valuable grain will be fed to unprofitable hens kept until April 30, instead of being released for human consumption. Other kinds of poultry, such as ducks and geese, will be sacrificed during the breeding season to satisfy demand for live poultry. The ruling will not apply equally to all parts of the country, on account of a marked difference in normal laying season. Hence the burden will not be distributed alike upon all producers. Let the American farmer know what the Nation needs, keep him informed as to crop and stock conditions, market prices, facilitate production and distribution, prevent monopolistic speculation, and trust in him to furnish the food to save the world. In an enlightened democracy, education and national spirit will accomplish more than arbitrary legislation."

One frequently runs up against good people in these days who assume the position that *any* criticism, however impersonal and void of malice, of the orders from "the powers that be," is unwise and unpatriotic. That any such criticism is untimely, obstructive and a comfort to the enemy.

The loyalty and patriotism of those who thus depreciate and protest against any criticism of official orders is not to be questioned, but their attitude of finger on lip reflects the survival of that sentiment that is inviting the ultimate downfall of the German nation, namely that "the King can do no wrong!"

There is, however, another class of citizens that object strenuously to any criticism from motives not so free from suspicion. Having obtained "a place in the sun," or hoping to do so, they are ever ready to applaud and uphold what their better judgment and experience condemn. Rather than risk "getting in dutch" with the "main guys" they are willing "to go along" and endorse all official action taken or proposed and label every protestant, however honest and able, as lacking in patriotism.

Obedience to orders is as obligatory upon the citizens of a Republic in time of war as it is upon the subjects of a Monarchy, but not the blind, unquestioning obedience of the latter. And, furthermore, with this vital exception—a Republic has the power, if objectionable and unwise and oppressive orders continue to be issued, to transfer the authority to issue orders to more capable hands.

A true republican form of government "lives and moves and has its being" in an all embracing atmosphere of intelligent, constructive criticism. If ever elective and appointive office holders come to be regarded as not open to criticism, God help the Republic!

In this connection, Theodore Roosevelt, in the *Kansas City Star*, lately said:

"It is not agreeable to keep insisting on the need of doing better than we have done. It is not agreeable to keep pointing out our shortcomings. But to do so is the only way of remedying them and of securing better action in the future. The people, some of them well meaning, some of them anything but well meaning, who denounce criticism and who object to telling the minimum of truth necessary to correct our faults, are the efficient allies of Germany and the foes of the United States.

"This is the people's war. It is not the president's war any more than it is congress' war—it is America's war. We are in honor bound in conducting it to stand by every official who does well and against every official who fails to do well. Any other attitude is a servile attitude.

"Let us quit being content with feeble mediocrity. Let us demand really first-class efficiency in both preparation and performance. That is the only way to do what we must do and see this war thru to a triumphant conclusion."

And we note in February 22nd issue of *Wallace's Farmer*, the same view:

"No government official should object to having his work investigated and criticised if criticism is deserved. The fact that he resents such investigation by the representatives of

Also winner of first and shape special at Madison Square Garden, 1917-1918, and first shape and color special at Providence, December, 1917.

ruling will prevent the killing of some laying hens and thereby secure the eggs that they will lay. However, the probable major effect will be to increase the price of present storage stock and to congest the live and dressed poultry market after the law is lifted, with consequent reduction in price to producer, a condition which legitimate cold storage facilities might not overcome, or monopolistic speculators might take advantage of, in which case both producers and consumers will lose. It will tend to further frighten producers who are already alarmed on account of the shortage and high prices of feed and fuel, difficulties of transportation, and uncertainty as to future price fixing. The inevitable result will be less eggs incubated, less chickens reared and more mature stock,

the people is prima facie evidence that he is not the right man for the place he is filling. We are in a life-and-death struggle, the great battle for the ideals of Christian civilization. Incompetents must get out of the way. Explanations and excuses are not acceptable. We must have results, and men who can get results.

"The farmers of the country will have no patience with destructive criticism, or mere fault-finding. They will hold to strict account those whose criticism is for the purpose of holding back war preparation and thus giving aid and comfort to the enemy. But they will stand firmly back of their representatives who expose incompetency and drive out the inefficient."

Albert Shaw, the editor of *Review of Reviews*, in the March number, expresses himself forcibly on the same subject, as follows:

"In these days when every mistake means the death of brave men, we should be very cowardly, if we shrank, from telling the truth merely because to state the facts might imply criticism of somebody.

"Officials should not be sensitive in War times except upon the one point as to whether they could not best serve their country by insisting upon the acceptance of their resignations."

It is over a year now since Mr. Hoover issued his first appeal to the poultrymen of the country to speed up production. It did not fall upon deaf ears or unresponsive hearts and yet we face the fact that day by day, week by week, and month after month strictly commercial poultrymen have been forced out of the business and those that have weathered adverse conditions up to now instead of increasing the size of their flocks have reduced them at least 50 percent, until it is estimated that in Pennsylvania alone there are 5,000,000 less mature fowl than the state maintained two years ago. So much for the first year's campaign for increase production.

Is it possible to conceive that if Mr. Hoover's advisors, aids, and assistants in the Poultry Division represented experience, ability, foresight and grasp of the essentials, that we would today be facing a serious shortage?

There has been ample time to have placed poultry production on a foundation, not necessarily promising "unprecedented prosperity," but guaranteeing a living profit which in turn would automatically bring about the desired increase in production.

Up to the present the *only* foundation offering security—either a lower feeding cost or a higher selling price, has been denied. True, the former has been promised, but, due doubtless to conditions temporarily beyond control, has not yet appeared to a degree affording any real relief. The latter, despite the prevalent impression to the contrary, poultrymen do not demand.

Instead of \$1 per dozen eggs when they have few eggs to sell and 50 cents per pound poultry at a time they have few fowls fit to market, they much prefer a stabilized market that will forbid the disastrous spring slump in eggs and provide a remunerative price for market poultry at other than special seasons.

They realize that too high prices to the consumers curtail consumption and demand, just as the Food Administration ought to know that increased production cannot be brought to pass unless producers can see their way clear to financial returns at least equal to the cost of production.

Labor is protected by the Government; the packer is protected; steel products, sugar, wheat, and copper are protected, but the producers of poultry meat and eggs, representing far more in money value than any of these save labor and vastly more urgently important in the present and impending food shortage of the world, remain absolutely without protection and at the full fell mercy of the profiteers in food stuffs and cold storage. *Why?* Primarily, because the true attitude of the Food Administration to the great Poultry Industry is, not consciously but subjectively, precisely the same attitude manifested by business men in other lines of trade and industry having no relation to the poultry business, and millions of poultry product consumers.

To the average citizen and the aforesaid business man, the poultry industry as an important National Industry is *non-existent!!* It is but a fad, a fancy, a hobby, a farm wife's side line, a millionaire's amusement, but only a d—fool's sole occupation.

They will open their mouths in amaze when told that the annual trading in the poultry products of the United States represents nigh to a billion dollars and that no single product of the soil, output of mine or factory equals the poultry industry in financial importance—but will swallow the words with a grain of salt and never sense their savor.

Speaking of the part the American hen must play in the war, the *Wall Street Journal* recently eulogized her as follows: "She is not near maximum production when she turns out two billion dozen eggs a year, equivalent to that many pounds of meat. What would that much meat look like on the hoof? Imagine three million head of cattle and you come near it. That may be worth crowing over, but Biddy does not crow! Neither does she rest. Instead, she devotes time to production of poultry meat, weighing two billion, five hundred million pounds, equivalent to twelve million five hundred thousand squealing pigs dressing two hundred pounds each. The civil population can eat this enormous mass of food and save

Second prize S. C. White Leghorn hen at Greater Chicago Show, January, 1918. Owned by Meadow Lark Farm, Box 3, R. 3, Elgin, Ill.

beef and pork to nourish the fighting men to go over the top. Meat, not talk, will win the war. The American eagle may scream at the front, but the American hen adding to the meat supply is capable of doing a big bit in winning the fight. *Why not encourage her?"*

The Food Administration have given ample evidence of appreciating the importance of the hen and figures quoted by this Wall St. scribe may have been furnished by Washington, but nevertheless their knowledge does not go any deeper than statistics or otherwise the encouragement solicited would have long since materialized.

In their campaigns of publicity and pleading for increased production as "a patriotic duty," they officially recognize what she has done and what she is capable of doing and place her in a class by herself as superior to wheat and steel and copper and sugar and the payroll, in that they regard her as *needing* neither encouragement nor protection, but on the other hand to be closely watched and securely yarded lest she fly the coop and demand for her lightly prized products prices "above a reasonable maximum."

Let us for the purpose of establishing our present conten-

tion that Food Administration, while sincerely and consciously exploiting the hen, sub-consciously depreciates her importance and absolutely disregards her interests as a *business* proposition, review briefly a few of the several outstanding activities of the Poultry Division indicating this attitude of mind.

Just about a year ago the appeal went forth from Washington for increased production of poultry products. Poultrymen, farmers and back-lotters were prompt to respond and increased millions of pounds of poultry were produced, but with greater demand up soared the price of all feeding stuffs. Never was grain higher nor market poultry lower. Storage houses stocked up to their capacity at 15, 16 and 17 cents a pound that did not cost the producers less than 25 cents. But it is to be remembered that the great proportion of the increase of poultry came from novices in the business and alarmed over the mounting costs of feed, they wanted to get out "while the getting was good."

The sub-conscious mind must surely have been on the job, when in answer to the protest of the New York dealers in live poultry, the Administration justified this order in the following statement: "To us the killing of hens just before and during the heavy spring lay is a wasteful practice—just as wasteful as the killing of fresh milk cows for beef; and we are appealing to the farmers from a patriotic standpoint *not to sell these hens while laying freely.*"

Evidently they have a poor idea of the farmers' or poultry-

man's mentality. Why in the name of common sense should a hen have been fed all thru the winter at a cost of not less than 1 cent a day, only to kill in the spring "*while laying freely.*" Investors do not rush to sell interest paying securities. Evidently the fall campaign to weed out the slacker hen, the non-producing pullet, the old fat hen and the surplus rooster in order to *reduce the cost of production* was lost sight of. Likewise the urging of early hatches in order to produce pullets that would begin to shell out the eggs in the late fall and early winter, the season of greatest scarcity. But possibly that sub-consciousness was still active and it seemed quite reasonable that pullets and hens could be pushed for winter eggs and yet continue to shell them out "*freely*" in the spring clear up to the Jewish Passover.

However let us hope that good may come of what evil is spoken of. This Rule 14, foredoomed to defeat the very purpose of its enactment, namely the conservation of laying hens and the substitution of their output for "red meat," has aroused poultrymen to give voice to their grievances. Hitherto they have suffered in silence misunderstood, and their sacrifices, in their effort to do well their part in this war for food, to a great extent not only unappreciated but unrecognized. Perhaps their belated protests will bring the urgently needed help and consideration and 1918 may yet exhibit a splendid showing for the American hen and the energy, efficiency, and patriotism of the American poultryman.

How to Make Chick Growing Easier

Efficiency in Supplying Green Food, Water and Dry Mash, Methods of Dealing with Feathered and Four-Footed Pests, Diarrhoea and Gapes.

By Maurice H. Decker, La Porte, Ind.

EARLY hatched chicks that have been more or less closely confined to the brooders during the cold and stormy weather that prevails prior to April first, should now be gotten out upon the ground as much as possible. Chicks confined upon board floors never grow or thrive like those with ample opportunity to get their feet in actual contact with the bare ground. Before the chicks are old enough to be trusted to seek shelter in case of sudden storms or thunder showers, a little forethought will enable the poultryman to avoid serious losses from these causes with a minimum of confining care and attention. A reliable barometer should be part of every progressive poultry keepers' equipment, as it will enable him to keep a fairly accurate tab upon the approaching weather changes and eliminate all indcision and hesitation as whether the flocks should be turned loose or kept confined to the brooders each morning. The last thing we do before we leave our chicks for any length of time is to look at the barometer and if it has begun to fall, in go the flocks at once.

We feed our chicks mostly in their brooders, even after they have been turned out a couple of weeks, for if they are accustomed to receiving their meals inside, it is an easy matter to coax them all in with a little feed. Never attempt to rig

up any shelter out in the brooder yards until the chicks are well feathered out. They will usually run for the nearest shelter in case of a storm and, considering the temper of the majority of our spring storms, the only safe place for the chicks is inside. All brooders with removable lids or roofs should be fitted with strong hooks and eyes or these covers may be blown off and the chicks deluged with rain. We even find it necessary to stake down our small brooders and colony houses, for we have wind storms that would roll them over and over as easily as a feather. We drive down two large flat stakes at each front corner and nail them securely to the brooders.

The cockerels should be removed just as soon as they can be picked out. The pullets will grow much better and the cockerels themselves will prove most profitable when marketed at the earliest weight possible. Each succeeding pound, after the first two, costs considerable more to put on, and beside the prices for young fowls decline steadily after the month of April.

We should encourage growing chicks to eat all the green food they possibly can, as by doing this we will save much of the more expensive grain and produce hardier chicks as well. Growing chicks, as well as laying hens, will consume green feed in quantities up to as much as one-third their total ration with excellent results in health, growth and production, and in doing so lessen the cost of an all-grain ration one third to one-half. After the chicks are given outside runs the best and easiest way to supply them with green stuff is to keep it growing in the yards. When large flocks of 300 to 400 chicks are brooded with the coal-burning brooders it is comparatively easy to supply each brood with two, three or even four separate yards. These yards of a fair size for the same number of chicks, separated in flocks of fifty, would require an equal amount of ground with considerable more fencing. Green crops can be planted in these yards which will supply a continual growth of greens until the snow flies in the fall. Oats are fine for early spring, rape and sweet corn fodder for early summer, turnips can be sown in mid-summer and rye in early fall. These may be planted separately or mixed together and will yield heavy returns in poultry meat and good health. The best green crop we have ever seen or used is grown from a hog pasture seed mixture which is sold by some of the large

When the brooder houses sit in a row it is easy to put the outdoor runs between the sides of two buildings. The coal-burning stoves give ideal results in well-lighted, well-ventilated houses.

seed companies and which is composed of about twenty different varieties of forage plants, including amber cane, turnips, oats, rye, broom corn, speltz, peas, beans, rapc, vetch, millet, etc. This is balanced and assorted with the purpose of furnishing a continual and steady growth of green fodder, many plants of which will grow as fast as they are eaten off, provided, of course, the chicks do not dig them out roots and all. These mixtures have the added value of furnishing an almost unlimited variety for the chicks and they will not become tired of them as they do of one sort, such as rye or oats. The plants are also rich in protein, something lacking from the usual green crop grown for chicks. The chick yards being rich in nitrogen, this mixture will make a rapid heavy growth and by planting three or even two fair sized yards at intervals of two or three weeks, the chicks will have something to keep them busy all summer. We believe 100 pounds of chick grains or chick mash will go as far when the fowls have access to a pasture of this nature as 150 pounds will fed to chicks upon bare range. Seed mixtures of this nature should be treated with inoculating bacteria which is necessary for a heavy growth of the legumes they contain. The special mixture prepared for vetch, field peas and beans is appropriate.

Up until this year we have always had considerable trouble in finding the proper equipment for feeding our chicks water and dry mash without continual attention and waste. We are now using a number of steel troughs which, altho not perfect, are by far the best thing we have tried. These troughs are about three feet long, $3\frac{1}{2}$ inches wide and $2\frac{1}{2}$ inches deep, are riveted together in pairs and being made of reclaimed metal are very low-priced. We make wooden covers for them out of half-inch stuff, with one-inch holes bored along the edges an inch and one-half apart thru which the chicks eat and drink. We put water in one trough and dry mash in the other, set the covers on and let the chicks help themselves. When the mash is nearly all consumed and begins to be mixed with litter we feed it to the older fowls and put in fresh for the chicks. A small wooden partition can be put in one side and the trough used for serving charcoal and grit or oyster shells. The chicks cannot pull the feed out thru the holes and waste it, neither can they get wet while drinking.

Every spring the poultry raiser is troubled with feathered and four-footed pests which eat his grain and mash, introduce and distribute lice and mites among his buildings and harass his chicks and grown fowls. We have found the most effective weapon for dealing with these intruders is a small caliber single barrel shot gun of 41 bore or .44 caliber which shoots a paper shell loaded with a small charge of powder and shot. These weapons are far superior to the small caliber rifle commonly used for this purpose, as the spreading charge of shot makes close aiming unnecessary and their range being short, there is little danger of accidents from a poorly aimed or glancing bullet. Their report is light and possessing no recoil or "kick" they are entirely suitable for boys or women to use. These guns are inexpensive, the ammunition can be cheaply reloaded at home if desired, and all told they form one of the most effective means for cleaning up the poultry yard and farm premises we have ever used.

Our two most common chick ailments are gapes and diarrhoea and altho these disorders are largely preventable with a few simple precautions, they annually are the cause of serious losses of chicks. Diarrhoea of the common variety can be prevented by first seeing that the baby chicks are neither over-heated or chilled the first few weeks of brooding. We have found a dependable coal-burning brooder of large grate diameter set in a 12x12 ft. building will attend to this. Second, by feeding nothing but sound grain, free from mustiness and "heat." This is a matter of judgment upon the part of the poultryman and a clear understanding of the correctness of the phrase "the best is always the cheapest." When chicks are raised upon the same ground, year after year, gapes are of common occurrence and may be expected to appear regularly. As is the case with most other poultry ailments, measures to prevent gapes are better than to attempt to cure individual cases. If the brooders and brood coops are placed upon fresh ground or if the old ground is given a coat of lime, plowed up and planted to some green stuff as mentioned before, there will be no trouble whatever with gapes. We have not had a

case in the past six years when previous to that we suffered severe losses each season. Chicks that already have the gapes should be fed upon soft feed in which has been mixed a liberal quantity of young onions, tops and all, chopped up fine. Their fumes will so affect the parasitic worms that infest the walls of the windpipe that they will loose their hold and the chicks are able to cough them up. Cases that are not too far advanced may be cured in this manner with a minimum of trouble for the poultryman.

One of the most common causes of poultry flocks failing to prove profitable is the use of breeders which lack the necessary sturdy health and vigor. A fowl which has at any period in its life suffered from any serious disease, or has suffered a setback in growth and development thru unfavorable conditions, should never be used in the breeding pen if permanent success is desired. Tendencies to susceptibility to disease and disorders are transmitted from parent to offspring as surely as tendencies toward heavy laying and quick maturity and by

careful culling all individuals that show undesirable qualities, the poultryman can gradually build up a hardy strain of fowls which will prove practically immune to the commoner poultry ailments, so long as the individuals are accorded reasonable care and management. To make sure of the fowls used for breeders all the undesirables should be promptly and accurately marked in such a manner they will at no time in the future be mistaken for an eligible. This may be done with little trouble and expense by using red celluloid leg bands which slip upon the fowl's leg after the manner of a key ring. These are obtainable at low prices in many sizes to fit any fowl or breed from a day-old chick to a full grown Brahma, and a supply of several sizes should be kept on hand. Then, when one detects a fowl which is not doing its best, it can be permanently marked with one of these bands whose color constantly sounds a warning against the individual's desirability to perpetuate its kind. Bands of blue color can be used in the same manner to distinguish fowls that are doing exceptionally well and the bands can be saved and used from year to year. Fowls whose legs are banded when young should be examined at intervals to discover if they are outgrowing their bands, in which case a larger size should be substituted.

Breeding and Judging Silver Gray Dorkings

By Watson Westfall, Sayre, Pa.

IT IS now approaching thirty years since we first took up this grand old fowl. We have made a faithful study of them during all this time and in this article will endeavor to tell some of the things we have learned, especially as relates to breeding and judging. These days we hear much about double matings; about pullet-bred cockerels and about cockerel-bred pullets and the like; but none of this applies to Dorkings, we are very pleased to know. The best male to breed from is the one that is nearest to Standard every time and a good Standard male may be depended upon to do his part in producing both sexes show birds.

SELECTING THE MALE—THE COLOR.

In points of color (especially on cock birds) his black parts should be as free from white as possible and his white parts as free from black as possible, with the lines dividing the two colors as clean cut and as distinct as possible. The white parts should be a silvery white, not a brassy, creamy or dirty white, and the black parts should be a greenish black and not a purple or bluish black. Our Standard gives the undercolor as a slaty gray. This we find correct for the female, but quite far from right for the male. Examination of a good male will show a white base to his black feathers and a black base to his white feathers and the stronger he is with his surface colors the deeper down and the less will he have of the base colors. With a weak colored male there will be an excess of the base colors and the weaker he is with his surface colors, giving splashes of white on his breast and stripes of the black in his hackle.

THE FORM.

In points of form: On a side view he should look long, with a big proportion of his body in front of his legs. Tak-

ing a line from the base of his hackle to point of his breast and from base of his tail to the base of his rear parts, the distance should be equal and any failure of the breast measure to equal that of the rear is just that much short of a correct form. On a front view he should look broad, with no appearance of flatness to his breast, but on the contrary, very full and nicely rounded. His tail should be carried moderately low so as to help in showing a long back. The back should be long and broad, not merely broad at the shoulders, but should hold out width from front to rear, making all in all a square, full, blocky shape form. Or, as the Englishman has said, a "cart-horse type." The legs should be short and well set apart and the fifth toes of good length. The toes should turn up the leg slightly and also backward enough so that the spurs grow out in front of the toes.

SELECTING THE FEMALES—COLOR, ETC.

We say females, because on this side there are two quite distinct types to be considered. One will be intended to breed best males and the other best females. It will not be difficult to note these two separate types and especially where a good Standard colored male has been bred from for any length of time. The female breeder, like the male, should be the best Standard color to be had. Her wings and back should be very finely stippled and quite free from shaft lines, giving an even color of bright silvery gray. Her breast should be a bright salmon-red shading to gray at the sides and practically free from mealiness or edgings of a lighter color. Her hackle, where she differs mostly from her sister breeder, should be very distinctly striped, which is a most important show point, as it helps so much in giving the great contrast so much wanted between the colors of the hackle, breast and back. The male breeding female, color, etc.—Her back and wings

should be as finely stippled as can be had. Her hackle should be as white and as free from striping as can be had and her breast should be as rich and pure in red and as free from mealiness or edgings of a lighter color as can be had. Now as for color of this male breeder, she need not necessarily be of the finest shade of silvery gray, but her marking (stippling) particularly over the back should be fine and her breast must be a rich red, even tho the red runs up in the lower part of the wings. In general appearance the exhibition female will look darker than her sister breeder, mostly because of her striped hackle. There will always be more or less of these light colored females, but only those having good color on breast should be used as breeders, as a mottled breasted female will be very sure to breed the same thing in her males. On account of good breast color many of the exhibition females will breed good pure breasted males, but their top color does not come pure enough in white.

JUDGING SILVER DORKINGS.

During the time we have been exhibiting Dorkings since 1892, we find that thirteen different judges have placed the awards. Four of them were Englishmen, two were Canadians and the remainder were Americans. Now just why it seemed to be necessary that either an Englishman or a Canadian must judge our fowls in order to have it a success I at first could not understand, but at last the real reason became very plain. I noticed that the English or Canadian judges would be sure to take a good look at the Dorkings, but rarely ever would I see an American judge look at them. Again early in the 1900's, another English fowl was introduced in America, the Orpington, and the same difficulties have taken place as to judging them. No one ever sees an American judge earnestly studying these fowls and how, therefore, can they expect to successfully judge them. Surely if a boy in school simply studies a part of his lessons he won't be apt to know much about the ones he does not study. Certainly it does require some study to even judge a chicken correctly and the Dorking and Orpington are not excepted. America (like in everything else) surely has some of the best poultry judges in the world and no mistake, but regardless of their claims to judge all varie-

ties they are, as a matter of fact, too much specialists. Just go over among the Rocks, the Reds and the Dottes, if you want to see them study. There you will find them digging up the undercolor, counting the bars and the spangles and they don't ever seem to get tired of it. Now if some of them had ever spent time digging up the undercolor of a Silver Dorking they would have known that the right color was not slate. But now just one sample to show how little they study this particular fowl. One year the Canadian judge, Mr. Oke, was not among the judges in New York and a prominent American judge had the Dorkings—a nice class of 5 cocks, 10 hens, 5 cockerels and 8 pullets. The thing noticed was, he was not handling any of the birds at all and when spoken to about it his very surprising answer was that none of the meat breeds required handling. When his awards went up, it was found the cock he gave first had wing flights more than half white. That the third hen was decidedly more brown than gray. That the third pullet was very plainly disqualified because of a lacking of properly formed fifth toes. Also that the first pullet was exactly like one of the hens and this hen got no prize at all. Now we are liberal enough to admit that it does not take the greatest amount of study to judge the male class fairly well, but this is not the case with the female class. As we have already explained, there are two quite distinct types on the female side. One is the female breeder, which is for exhibition, and the other is the male breeder, which should be left at home, but many times is not, and here is where the unlearned judge gets mixed. Several years ago a pair of Silver Dorkings was sent from England to compete in the New York show. Our American judge made the cockerel second and the pullet first. Now in our humble opinion this pullet was the kind to leave at home. She was very weak in both hackle and breast color and the stippling on her wings and back was very coarse. The best we could make her was third and the Englishman who brought them over admitted he was fairly beaten. Now, the color of these male breeders is quite far from Standard requirements and have no right to win over regular exhibition specimens any more than a cockerel-bred pullet of the Barred Rock breed has a right to win over exhibition females. A good exhibition female will

have the color of her hackle, breast and body as distinctly different as possible, giving the great contrast in color so much wanted, while the other female will be quite the opposite, her colors all fading to gray and approaching more to a sameness on all parts. Some judges are very serious when they see any white on the ear lobes. We wish this section had been left as the old Standard had it, which simply gave a preference for the pure red. We fully believe the partially white lobe rightfully belongs to the Silver Dorking. Surely if we get rid of it we then can't say they lay a pinkish white egg,

because they won't. The color will be changed, as some are now, to a light yellow. The lobes on most females do not show their color because of being quite small and also folded up. I suppose this is why they have fared better than the male, whose lobes show more plainly. I should object to a large prominent white lobe, but never to a small lobe only partially white. The Dorking has well earned the reputation of being the greatest table fowl and we say, wise is the man who invests in them and especially just now when good meat is so extremely high and scarce.

Rose Comb R. I. Reds—Why I Breed Them

The Handwriting on the Wall Proclaims the Future of the Breed.

By J. E. Moore, Princess Anne, Maryland.

IT WOULD be hard to say much about the Rose Comb Rhode Island Reds that has not been said many times before, but it is like a good story, worth telling over, so what appears here to be worn out from the telling, please bear with me and remember it is for the good of the grandest breed of fowl that have ever been bred.

My experience with poultry goes back over many years. Well do I remember the first I ever raised, they were Black Breasted Red Games; I bought two settings of eggs and with what interest and care I placed them under the hens that were to hatch them, and when they hatched what a spry little bunch, but "woe is me," for it was not many days until they found they had bills to pick with and that there was Irish blood in their veins, and it was fight from morning until night. It kept me busy with a vaseline bottle in my hands greasing sore heads and prying open blood-covered eyes, but after all when they were matured the pullets got on well together and were good layers of extra large eggs. I soon tired of them and changed to R. I. Reds (we would call them Buffs now). I liked them, but they did not come up to my expectations (I expected much then), so I changed to another breed, which proved good winter layers and were hardy quick-maturing fowls, but I soon tired of them, went back to the Reds, the Single Comb variety. That was seven years ago.

I bought an eight-acre farm, the house on the bank of a river, a mile wide. I built two large poultry houses; all the buildings on the place were painted white, the land was all green with grass and alfalfa and when I turned that flock of Reds out and gave them free range of the place, I realized I had found the breed that I had been looking for. They had the color that nature intended to fit in with the white buildings and the green fields, it made a picture that was restful to the eyes. I then made up my mind to stick to the Reds and began to breed with type and color the main objects, but soon I found when I had a good specimen in type and color there was the comb to be reckoned with. Some were ungainly in size, some had sprigs, thumb marks or were too lopy, so I changed to the Rose Combs and have never regretted it, as now I think I have the ideal fowl. I think we would have a hard time to show the public just how the beautiful rich red color and the oblong bodies of the present day Reds were evolved from the original Reds of the Little Compton district.

Now as to some of the good points of the Rose Comb Reds. They rank with the best as standard market poultry. Baltimore is considered one of the best live poultry markets and many times my Reds have sold there for from two to three cents above the market quotations, especially during the Jewish holidays, the Jews are excellent judges of table poultry and buy only the best the market affords and appreciate the quality of the Reds. The Reds hold a place in the "king row" among broilers, squabs and green roasters and even a two-year-old hen when roasted is as juicy and sweet as some green roasters.

The yellow skin, the plump bodies, when properly dressed and placed on the butcher's counter, is an awful temptation if you have the price in your pocket. As a breed they mature early, possess stamina, and the pullets will lay at five and one-half months of age if properly handled and will produce as many or more eggs as any other breed.

Much has been accomplished along utility lines with the

Rose Comb Reds. Each year more of them get into the two hundred egg class. Not many years ago in the best flocks in the country, out of one hundred pullets held over for breeders you would only find eight or ten that were of the same color and fit to go in a breeding pen, but today it is different, you see whole flocks all of the deep even red color and alike in shape. By scientific breeding all obstacles can be overcome, it has been the rule to mate imperfect birds to produce Standard specimens, aiming to overbalance the defects in mating them so as to overcome the imperfections. Buff specimens are rarely met with any more and smut peppering and shaftiness are being overcome.

But the Rose Comb breeders of today are looking farther than type and feathers. It is the utility side of the breed that is paying the feed bills. The disposition of the Reds along with their being good foragers, good setters, and good mothers, make them a very desirable breed for the back lot raiser, as well as the commercial poultry farm. In fact, they seem to fit in anywhere you put them.

Some time ago I sold a dozen and a half hens to a man who moved to Edmonton, Alberta, Canada. He took them with him in a freight car and the weather was very cold. Tho shut in close quarters, they kept him and his brother (who went in the car with him) in eggs to eat for the entire trip, and in his letter to me he says he could not see as moving them interfered with their laying in the least. This plainly shows how easily the Reds adapt themselves to circumstances and that their combs are practically immune to frost bite.

In breeding Rose Comb Reds one will occasionally run up against a snag, as he will with any other breed, for instance in the winter of 1916 I purchased the first prize pullet and first prize cockerel from one of Maryland's best shows, claimed to be from a mating from the first prize cock from one of the country's biggest shows, I mated this pullet and cockerel and what I got from them are fine for type and they have the good dark red color, but not a feather on them, *just fur*, and for prime quality they have a mink beat a mile. I intend to breed the pullets back to their father and hope when they go thru a molt they will have feathers in place of fur, as they have proved to be wonderful layers.

In the Rose Comb Red we have the greatest fowl of all time in my estimation and their increasing popularity is easily accounted for. Take the Reds out of any of the shows and note what a vacant place it would leave, and again, what other breed brings the fancy prices for high class show specimens as the Rose Comb Reds do?

Why do I breed them? Because I can see "the handwriting on the wall" that they have a great future in front of them.

If I were a sculptor I would make a life size image of a Rose Comb Red and have it on a pedestal at the entrance to my house.

Yes, I believe in the future of the breed.

If the capable and productive Little American Hen were treated as an "enemy alien," she might be living on the fat of the land in luxurious idleness. Madam Hen, being only an unassuming, hard working, staunch and reliable patriot, gets but scant consideration and is not appreciated. Madam Hen and her value to the Nation need to be well advertised in the right way.

Packing the Poultry Industry

Reader, if you bought an 8-quart can of milk and, on emptying it, you found a live trout flapping in the bottom of the can, would you not consider it as pretty good evidence that somebody had watered the milk?

Rule 14, which places the ban on selling hens or pullets alive or dressed for food purposes, until after April 30, has developed some interesting results—trout in the bottom of the milk can, so to speak. In the first place it promptly shut fresh-killed dressed poultry off the market and removed all real competition of cold storage poultry. At the same time there developed an officially conducted campaign to educate consumers to "Eat poultry and plenty of it." A singular coincidence: the poultryman's fresh-killed fowl forbidden the market; cold storage poultry jumping to prices higher than ever before known; the producer frozen out and not permitted to sell; the public urged to buy and "eat poultry and plenty of it." Quite a string of fish!

Mr. Priebe, in charge of poultry and eggs for the food administration, was quoted in newspapers as predicting an egg famine, said that by January 1, 85 percent of supply of cold storage eggs was consumed, and other 15 percent would soon be gone, with no relief in sight. Urged the public to stop eating eggs. This "information" given wide publicity in newspapers. Eggs then 75 cents per dozen. Watch the next fish please. In the brief seven days ending March 3, the egg market goes to smash. In New York City eggs made a sensational tumble of 27 cents knocked off the wholesale dozen price. In our market eggs dropped from 70 cents to 43 cents during the week and hit 40 cents at present writing (March 7). Poultryman in Wisconsin reports on

March 4 getting only 40 cents, with 35-cent price in sight and markets indicating a 25-cent price soon. Similar reports from all over the United States. March and April are the months when packers buy up eggs for cold storage and insist on buying them cheap, no matter what they may cost the poultry keepers to produce. Same official predicted last fall that January 1 and thereafter grains and feeds for poultrymen would be 40 to 50 percent cheaper than 1917 fall prices. Grain prices have gone up and seem to be going higher. Yet we are forbidden to sell our fowls, which should be sold, and are told that the food administration wishes to "encourage producers." Drastic interference and persecution is grand encouragement, is it not?

Let's get another trout on the screen. Prof. F. H. Stoneburn visits Mr. Priebe and reports that Mr. Priebe wishes wide publicity given to the statement "that this Rule No. 14 was 'fathered' by the Department of Agriculture and only 'adopted' by food administration at the request of the parent." "Passing the buck!" A friend of ours in Washington called upon Harry Lamon, of "Poultry Investigations," Department of Agriculture, and advises us that Mr. Lamon knew absolutely nothing about Rule 14 until he received a copy of it. It is positively asserted that the rule did not originate in the Poultry Husbandry Division. Where did that Rule 14 originate? The "buck" keeps passing. We pass on to the Chemistry Division and find that Dr. Pennington has for a long time been in close touch with the packing interests and the wholesale butter, eggs and poultry trade. The Doctor was author of a bulletin or circular, widely quoted, recommending as a matter of economy housewives use cold storage or frozen poultry; urged the housekeeper to buy storage packed frozen chickens by the box of a

dozen or more chickens, and let them thaw out in the family refrigerator to be used as wanted. We have always wondered why consumers were urged to buy large quantities of frozen poultry, which spoils quickly, in preference to good, wholesome, fresh-killed stock. Then there was that little matter of prohibiting shipments of ice-packed poultry and the strenuous objections to chilling fresh-killed fowl in ice water. The urging that dressed fowl must be dry chilled. No one but a packer, or a big killing and dressing establishment, can afford to maintain a dry-chilling plant. If such regulations should be forced, the poultryman would have to sell all his fowl alive to the big killing and dressing establishments. Have we located a trout this time?

Now Attorney Heney, of the Federal Trade Commission, investigating the big packers, presents a whole creel full of trout, see evidence printed in *Chicago Tribune*, February 26 to March 6, inclusive. Atty. Heney presents as evidence some most interesting and enlightening letters seized from packers' files. He claims that half a dozen or more of the volunteer "dollar a year men" on the food administration are "confidential men" in employ of the big packing interests on salaries around \$10,000 a year and extras besides. Atty. Heney very confidently alleges that Mr. Priebe has been in the employ of the packers for some time and has been especially active in the campaign against small concerns. He alleges that this gentleman's "independent" plants are in reality owned by Swift & Co., and that they have been operated under "dummy" names "to fool the farmers and the public." The investigation has not been completed, yet all this may be labeled "interesting and important if true."

Of course it will be urged, and rightly, that we need the most experienced men we can get in an important body like the food administration. Yet it does seem strange to select a "big business middleman" when we have been cautioned so much from headquarters about "middlemen" and "speculators." Unfortunately for poultrymen, the food administration's acts to date have not been encouraging to poultrymen, they have seemed to favor always the packers' interests, and have demonstrated not only a great lack of sympathetic understanding of poultrymen's problems, but have also displayed a gross ignorance of the regular routine business of practical poultrymen and of the poultry industry as a whole from a producer's standpoint. This failure to gain the confidence of the poultryman, this attitude toward producers which has led them to feel that they cannot expect to get simple justice and a square deal, is not confined to poultrymen alone, it reaches into all branches of the live stock and agricultural industry. It is a most unfortunate and disastrous situation at the beginning of the 1918 growing season, a year in which the nation needs the utmost in efficient production.

We need representation by real practical poultrymen, farmers and live stock men on the food administration. Men who have proved their right to such a position thru practical and successful work in food production—not as profiteering middlemen and distributors. If Atty. Heney's allegations are true, or even approximately so, then there are men in the food administration who should resign or be retired by popular protest, if for no other reason than to help restore confidence.

Messrs. Pinchot and Lasater, both men who had

the confidence of farmers and live stock men, were on the food administration but resigned last fall. We would like to know why. It was reported that they disapproved of the attitude of the administration toward the real producers of food, and the failure of the administration to render aid to prevent loss of the drouth starving cattle and sheep in the Southwest had something to do with it. The *Tribune* publishes a letter which Atty. Heney claims was addressed to Swift & Co. and signed by C. A. Hamilton, which reads in part as follows:

"I learn that the letter which Lasater wrote Hoover, in response to the latter's request for a bill of specifications, was a most severe roast upon the packing industry of the country. Mr. Lasater goes so far as to make accusations against one of Mr. Hoover's closest associates, and even says that this gentleman is directly connected with banks which handle packers' paper.

"The letter is a loud one, and its publication has been suppressed. * * * * If, as is possible, a copy of the Lasater letter should get into the hands of some of the gentlemen in congress who are always looking for ammunition with which to attack the packing industry, it may lead to further congressional investigation and further embarrassment to business."

These "trout in the milk" do not look right and do not smell right. Neither does it look well for the packers' attorney to refuse to allow the commission to see certain correspondence on ground that it might bring criminal proceedings against his employers. It is not so very long since the Spanish war and some of us can remember the packing house scandals of that time, the "embalmed" beef, our sick and dying boys in camp, and the investigation which came to nothing and was hushed up. It looks as if we need to clean house to make America "safe for democracy." If there is any truth in Atty. Heney's allegations before the Federal Trade Commission give us the whole truth, and then apply the remedy. We will make much more progress toward winning the war if we have a clean slate, clean hands and a clean bill of health. Either we have been told too little or too much.

How "The Trade" Does It

If the producing end of the poultry industry had a really progressive, practical, and down-to-date national organization, something worth while toward putting the business on a substantial foundation might be accomplished. We need right now a united organization and the co-operation of all poultrymen, whether fanciers, utility breeders, egg farmers, market poultrymen, or back-lotters.

Our A. P. A., instead of getting down to brass tacks and really doing something for the good of the industry and to benefit real poultrymen, seems to be whiffing around with each wind that blows, adopting the methods employed by the Florida land sharks in "planting and selling orange groves to people who think they want to sell oranges," providing an income for its president, and muddling along in the same aimless way which seems to have become a habit.

We could learn a good lesson from the activity of the National Poultry, Butter and Egg Association, whose members represent "the trade" which handles and distributes the eggs and poultry sent to market. This association is conducting a vigorous, active campaign to educate the public as to the value of cold storage products. It is presenting a series of five-reel educational films in movie theaters thruout

Trapnests used on Bayville Farms, Bayville, N. J.

the country. Their film "Food Will Win the War," boosting cold storage foods, ran for several weeks in Chicago theaters, and it was reported that there was considerable competition for the bookings, a rare occurrence for educational films. Five copies of this five-reel film were sent to Boston to be used in local theaters, and "the trade" was assured that these pictures would "go far in assisting the consuming public to realize the benefits to be derived from cold storage products."

Can you imagine the A. P. A. doing anything really practical toward a national campaign, to urge the public to eat more "nearly" new-laid eggs and fresh-killed poultry direct from the producer? There was a much-talked about, much-paid for, market poultry and egg standard about to be prepared and published by the association, but we have never seen it, heard of anybody who has seen a completed manuscript, nor do we know when it may be expected to see the light, if ever. It must have gray hair and long whiskers by this time, it has been growing for so many years.

The National Poultry, Butter and Egg Association even advertises when collecting tithes for its educational campaign. A round rubber stamp is made to be used on all packages of packers or shippers who contribute and it bears this legend:

FUND OF
THE NATIONAL
POULTRY, BUTTER
AND EGG
ASSOCIATION
Give It Preference

The tithes on every package will net a very satisfactory total, which will be used not only to keep up an effective educational campaign to stimulate consumption by the buying public, but will be employed effectively in maintaining committees to look out for all legislative measures which may affect the trade.

Mr. Producer, where do you come in? You need an effective co-operative association actively at work to look out for all producers' interests. You still seem

apathetic and luke-warm in this matter which vitally concerns your interests. An International Poultry Federation, a co-operative organization of poultrymen, is being organized with headquarters in Topeka, Kansas, to aid poultrymen in buying and selling. Have you done anything about it? Have you investigated? Are you establishing a local co-operative exchange? Do you still buy your grain, feeds and supplies at retail prices and sell your produce at wholesale prices, whatever you can get, set by "the trade?" If you will not make a strenuous effort to help yourself, you can scarcely expect someone to call on you and hand

Loyalty is an inherent characteristic of the human being. We are born with a spirit of loyalty. That spirit of loyalty is fostered and developed only by kindness and justice. Loyalty is like a sensitive high-powered motor, which will work well in three speeds forward and an efficient reverse. Give it a square deal and common sense consideration, and it will work well for you to the end of its days. Abuse and neglect it, and it simply won't work—or it may backfire and prove exceedingly dangerous.

Injustice and tyranny have never yet compelled or cajoled people into being loyal to their persecutors, or those who exploit their victims for personal gain. History is replete with records of revolt against tyranny and injustice, some successful and some not, but all recording loyalty unto death is the cause of justice and right. The parent cannot compel loyalty in his children, but if he exercises common sense in his everyday dealings with the children, is just, honest, fair and square in even little things, he will secure unswerving loyalty which grows stronger every day. Loyalty cannot survive distrust, loss of confidence, injustice and tyranny, when the one seeking loyalty is proved to be secretly working, or permits others to work, to the injury and disadvantage of the one expected to be loyal.

Loyalty is one of the finest traits in human character. It works both ways. If we would secure and keep loyalty we must be loyal to those from whom we expect it.

What Happened to Eggs?

POULTRYMEN are likely to remember the first week in March, 1918, for some time to come. Probably never before in the history of the egg business has there been such a collapse of the market—the bottom dropped out—we hope it will never happen again.

The early reports came from New York City, where it was said that un-

CHAS. NIXON.

The above is an excellent photo of Chas. Nixon, Washington, N. J., the well known breeder of White Wyandottes. Mr. Nixon is also a poultry judge of national reputation.

you large bunches of success on a golden platter. Why not wake up and *do* something?

Loyalty.

WHAT is loyalty? Ever since we can remember some people have been endeavoring to teach and to compel loyalty on the part of others. Loyalty to home and parents. Loyalty to the nation. Loyalty to the government. Loyalty to the educational institution, to the business concern, to the fraternal organization. We do not believe that loyalty can be taught by force, or some compulsory form of nagging which continues from childhood to old age. We do not believe it can be successfully built up and maintained by psychological influence and propaganda. Loyalty to one's self-respect is a normal state.

A good type of full Barron S. C. White Leghorn male. Record of dam, 272 eggs; record of sire, 288 Owned by Bayville Farms, Bayville, N. J.

Send 25c for Sample Something New!

THE SEFTON EGGSSELL

You can now ship eggs by express or parcel post with absolute **SAFETY**. Use the Sefton **EGGSSELL**, the new, economical and most practical way to ship eggs. No more breakage! Note the construction. Not one egg touches the outer wall. Protection on every side. **Absolutely Safe!** Made of heavy, corrugated fibre board to stand rough handling and hard knocks. Comes to you knocked down to save space. Nothing like it ever shown before. Prices are quoted below for dozen lots. Order direct from this ad. If you are not satisfied that it is the best egg carrier that you have ever used, we will return your money. Be sure to send for a sample if you do not order a dozen. This offer is for a limited time, so act at once. Send 25 cents with the order blank below for a sample of the six-dozen size—we pay postage on sample.

Use the Order Blank—Order by Number

- 110—Five birds—medium.

EYRIE SHIPPING COOP

For Shipping Fancy Fowl

You need the Eyrrie if you ship fancy fowl. Thousands now in use all over the United States. The most practical coop made. Comes to you knocked down in three pieces—top, bottom and body. Top and bottom made of wood, body made of strong, reinforced corrugated fibre board. Open top construction for ventilation. Smooth, solid sides of corrugated body saves plumage and prevents draft or uneven temperature. The economy of the Eyrrie coop is easily seen. You cannot afford to take chances when shipping valuable fowls—buy the Eyrrie. Send your order direct, it will be filled at once. Use the order blank below. Order by number.

An additional charge of 25 cents per dozen is made where less than one dozen of a size is ordered.

EYRIE EGG BOX

Safely Carries Eggs for Hatching

Great care is necessary in the packing and shipping of hatching eggs. The Eyrrie box is constructed to give the greatest possible protection in transit. Made of the strongest double faced corrugated fibre board and covered with heavy grained jute paper. The egg is protected on four sides. When filled for shipping the Eyrrie will withstand an actual pressure of 1,000 lbs. This is the box you should use. The insertion of the wooden handle automatically seals the box and prevents the substitution of eggs while en route in shipment. This box is for Express Shipment Only. The locking feature prevents its use for parcel post. Order from this advertisement right now. Be sure to order by number. Use the order blank.

usually heavy receipts had knocked 27 cents a dozen off the wholesale price of eggs. Later it developed that this slump did not occur in New York alone, but was experienced very generally, at about the same time, in all big egg markets—and back in the country producing districts.

Shippers' reports and market receipts did not indicate any sudden and unprecedented outpouring of eggs. How did it happen that country buyers had been advised to "keep the buying price down?" Of course that particular trick is a hardy perennial to be expected at this season, but most of us were so interested in protesting the unjust ban on selling hens that we were caught unawares. Considering this slump in egg prices from a nation-wide viewpoint, it looks like an artificial and arbitrary lowering of prices with intent to get cheap eggs with which to fill storage. If there was any over-supply of eggs in any market it must have developed from marketing of eggs diverted from normal use for hatching purposes at this season. If any considerable number of eggs have been turned away from chick production into market channels, the consumer may benefit temporarily, but he will pay high for his eggs later on when the storage men get the crop bottled up, unless a maximum price is fixed, in which case it means bad times for both producers and dealers, while the consumer will go short when the supply runs out. It would have been better for everybody concerned, both now and in the year to come, if egg prices had been kept up to at least 70 cents a dozen at the farm.

We advise everybody who can to preserve new-laid eggs in water-glass solution during April. Put down all the good, clean, new-laid eggs you are likely to need between the coming summer and the spring of 1919. Next winter you will be very glad you have a supply of preserved eggs. Hatch as many eggs from pure bred stock as you can afford and properly grow the chicks. Put down in water-glass as many of the remaining new-laid eggs as you are likely to need. It will pay and it will make you independent of the storage egg market. Further it is better to preserve your own eggs than to sell them below production costs, and a wide-spread campaign of

First prize and champion White Plymouth Rock hen, Chicago Coliseum Show, 1917. Owned by U. R. Fishel, Box A, Hope, Ind.

home preservation of eggs will not only conserve food in your locality, but it will help to prevent further smashing of the prices paid for new-laid eggs. If things continue as they now seem headed, some folks are going to be hungry before many months, but the man who produces food will have the decided advantage of a home supply.

Plant Corn for Poultry.

REPORTS of the condition of the winter wheat are not encouraging. The fixed price on wheat did not have the

expected stimulating effect in increasing production and the acreage in winter wheat was much smaller than hoped for. Cost of farming operations increased much more rapidly than anyone expected. Fully 26 percent of the drafted men were drawn from farms. Farm labor not taken by draft turned to the shorter hours, easier work, and much higher pay, to be had in factories and munitions plants. The fixed-price on wheat proved to be both a maximum and minimum price instead of a minimum price as at first reported. With the lid off, other grains, corn and oats, jumped

WE WIN

AGAIN!!

At Cleveland, Ohio, 1918, "HILLVIEW" S. C. WHITE LEGHORNS won 3 "BLUES" in the hands of one customer. Here is the letter:

"Hurrah for you and Hillview—won 1st cockerel, 1st cock, 1st pullet and 3d hen at Cleveland. We certainly put one over on the bunch here, and thank you from the bottom of our hearts for the splendid specimens you sent us."

YOU CAN DO THE SAME in your city if you get "Hillview" White Leghorns—the pleasure derived out of winning the "blue" over your fellow townsman will be yours. I furnish more winners annually than any other farm for the largest shows in the United States and Canada. I can furnish YOU with blue ribbon winners!

And, My Leghorns Are Real Winter Layers

They prove it by winning **Three Years in Succession** at the Missouri Laying Contest, because they have this year—in the present contest (the fourth year) made the best record for December, and are again **LEADING** all Leghorns in this contest. In the American Contest my pen also made the best December record, and laid double the number of eggs laid by any other Leghorn pen entered. My birds **LAY IN WINTER!**

My beautifully illustrated catalog, just off the press, tells you completely all about my Leghorns. My mating list is ready and will be enclosed with the catalog. Don't hesitate; write today; just send a post card and in return get an introduction to AMERICA'S FINEST WHITE LEGHORNS. See Feb. ad for description of matings.

to a point out of all proportion to wheat, with apparently the sky the only limit.

In the present state of agricultural unrest, lack of confidence, and woeful lack of encouragement and skilled labor, we will be exceedingly fortunate if we do not have greatly decreased production. Certainly we are not likely to get an increase over 1917. Too many producers went broke or had difficulty in breaking even, to warrant great expectations this season. Authorities are urging each community to endeavor to become as nearly self-supporting in production of foodstuffs as possible. Officials make press statements to the effect that the war may be expected to last fully two or three years. If official predictions are based on same grounds as similar prophecies in Britain three years ago, this prediction simply indicates that no end is in sight, and the present state of affairs may go on indefinitely until either exhaustion or food shortage compels a truce.

How does that affect the poultryman? It means that he must adjust himself to the war conditions. He must make his poultry work adapt itself to local conditions, and not depend too much on supplies from or shipments to distant points. He will have to get the bulk of his supplies nearer home. He will have to sell most of his product within a restricted or comparatively local area, or he will be forced to sell to the big concerns which have practically gained a monopoly of control and distribution of foodstuffs, grains, feeds and supplies. He will have to take what he can get for his produce, and production costs will receive scant consideration. An official prominent in the food administration was reported as telling an audience in a Boston hotel on March 4, that we may expect present conditions of food control to continue for twenty years after the war. If he was correctly reported, the producer can figure out the conditions he is likely to be up against. We are not quite that pessimistic, for we do not believe that present attitude toward production and producers can last longer than one or two seasons more, without those in authority experiencing a change of heart.

Whatever the future holds for us, we have to deal with the present. To be safe we must grow as much grain as we can for our poultry, or contract with someone to grow it for us. Corn and oats are the most dependable grains to grow for poultry feeding. With these we can get along very well. In the short seasons of our Northern States the early varieties of flint corn, either white or yellow, will give most satisfactory returns. Seed corn is none too abundant and we would recommend securing a supply locally, if possible, from some de-

HARRIET J. FELLOWS - Route 2 - ROCKFORD, ILLINOIS

pendable farmer who grows it for seed. If in doubt as to variety to buy, ask your nearest Agricultural Experiment Station about most reliable sort for planting in your section. The same with oats or other seed. Reliable seed houses will, of course, be glad to give information and to sell you seed selected if they have it. But good seed is not plentiful, and, altho we made our purchases early, we found on testing that a good deal of it is far from satisfactory.

Be sure to plant a garden for the family and if you have the room be sure to plant both grain and vegetables with which to feed the poultry.

Automobile a Necessity.

THE automobile or modern auto-truck is now more than ever a necessity for the poultry breeder, egg farmer, or market poultryman. We dislike to hear an auto termed a "pleasure vehicle." That suggests a luxury and, while the automobile will provide pleasure and health-

ful outings for the whole family, it has long since outgrown the "luxury" stage and become a downright necessity for the man who lives in the country, for city man who must do business in the country, and for any worker who must travel some distance to and from work.

With the miserable transportation facilities now afforded by our railroads and trolley lines, with freight tied up and utterly demoralized on even short haul lines, the automobile is an absolute necessity to make it possible to do business and relieve congested traffic.

We are located on a farm only 30 miles by rail from a big city. Before the war the passenger, express, and freight service was far from good, but was tolerable. Now it is almost impossible. We have only three freights from the city each week. Carlot shipments come thru in a few days or a week, but less than carlot shipments may be over a month making the 30 miles. Express shipments are uncertain and always going astray, besides the rough handling

packages receive is most destructive and it is difficult to get any redress or satisfaction.

Our farm is about a mile from post office and railroad station and nearly four miles from village center and stores. Horses cannot cover distance economically and are very expensive luxuries in these days of oats at \$1.25 per bushel and hay shortage, to say nothing of blacksmith bills. It costs less to keep and maintain an automobile than it does to have a driving horse. The auto means quick trips to town or city with produce to be marketed and opportunity to bring home needed supplies on the return trip. It opens up an easily accessible market covering all territory within a fifty mile radius of the farm or home poultry plant. It makes one almost independent of the inefficient rail service of present day suburban lines. Everybody needs an automobile this year. There are useful cars to be had for all purposes and at prices to fit all pocket-books. Better get yours now "while the getting is good."

Our Monthly Prize Contest.

BEAUTY and UTILITY WHITE WYANDOTTES

First Prize Cuck at Madison Square Garden, December, 1916

Regal White Wyandottes have a magnificent show record and this record was made by birds that have the vigor and stamina to reproduce themselves. For twelve years, 1906 to 1917, my birds have won Best Display, also First Cuck and First Cockerel at the New York State Fair in the keenest kind of competition. This success has not been accidental but proves beyond a doubt that my line breeds true and also that it has the vigor to reproduce itself. Canadian winters are severe and it takes strong, rugged birds to thrive and to give results. When you buy eggs from my pens you get them from birds that are bred right, raised right and correctly mated. Can you not reasonably expect better success by starting with an established strain? If you are not satisfied with the results you are getting, why not start all over again with pure Regal blood? A few settings of eggs will not cost you a great deal and will prove a good investment. They can be shipped anywhere in America and I guarantee the hatch. Note the following letters from customers:

Kilmarnock, Va., October 4, 1917.

Dear Sir—I got from my pullet today her two hundredth egg, exactly nine months and three days since she began laying. The pullets from the last setting of eggs are beauties; hope I'll get another such layer. Yours most respectfully, B. B. EDMONDS.

P. S.—The setting of eggs I purchased from you last season gave me twelve fine chicks.

Dear Mr. Martin: Buckingham, Ill., February 6, 1917.

I suppose you would be pleased to know whether the birds purchased of you some time ago for my foundation stock proved satisfactory or not. To say that I am pleased would be putting it mildly. They certainly are heavy layers of nice brown eggs, and are quick to mature, very vigorous, of good size, with fine exhibition quality. The Regals are certainly all anyone could wish. I would like to also add that my dealings with you have been most pleasant. You certainly have always given me full value for my money. Thanking you for past favors, and with best wishes, I beg to remain Respectfully, A. H. SWOPE.

EXHIBITION MATINGS (as they run) \$5.00 per 15; \$15.00 per 50; \$27.00 per 100. **SPECIAL MATINGS**—\$10.00 per 15; \$18.00 per 30; \$25.00 per 45; \$50.00 per 100.

RECORD LAYING PENS (Dorcas Line)

Pens 21 to 32 are headed by males from females with high records, mated to hens with high trapnest records and pullets of the same breeding. From these pens, eggs are \$5 per 15, \$15 per 50, \$27 per 100, \$50 per 200. Utility Matings, \$6.50 per 50, \$12 per 100, \$100 per 1,000.

Special—50 big, vigorous, stay white cockerels, \$5, \$10, \$15, \$20 and \$25 each. Pullets, \$4, \$5, \$8 and \$10 each.

Free—20-page illustrated catalog and mating list. It gives full description of my matings for 1918.

compete. The rules of the contest are easy to observe.

Make your article a story of actual experience with poultry, or something helpful to poultry keepers. Nearly every poultry keeper has some particular home-made equipment, house, coop, brooder, nests, method of breeding or pedigreeing, or method of care and management, which has contributed to his success. Written out in letter form, plainly worded, so that all who read can understand, or, perhaps, illustrated with photos or pencil sketches, real poultry experiences make the best kind of articles.

Write on one side of the paper only. Write plainly with pen and ink or with a typewriter. Try to tell your story briefly and to the point. If you can tell it in 600 to 800 words, well and good; if you need to write 1,000 to 1,500 words do so. All articles become the property of AMERICAN POULTRY JOURNAL, to be used or not, as we see fit. Prizes are awarded monthly. No articles are returned. Address articles for this contest to Dr. Prince T. Woods, AMERICAN POULTRY JOURNAL Monthly Contest Department, Silver Lake, Massachusetts.

A VICIOUS TAX.

(Editorial from *Boston Herald and Journal.*)

WHAT is Congress going to do about the zone system of postal taxes on second-class mail matter? As the war revenue law now stands, that system will go into effect July 1. Its effect may be imagined from the statement that it will increase postage on periodicals from 50 to 900 percent. Perhaps there are too many magazines. No doubt, there are some that serve small purpose, or only an evil purpose. But there ought to be a way to kill them off without including in the slaughter the reputable magazines of the country.

The zone system was forced into the revenue laws by the House, which refused to give hearings or to consider the merits of the case, after the Senate, following full hearings, had rejected the measure. The idea of the zone system is nothing new. On the contrary, the policy of zone rates in postage was followed in the early history of our postal system and was abandoned in favor of a uniform rate for obvious advantages to the country as a whole. When it was proposed a decade ago to establish zone rates for second-class matter a joint commission of Congress condemned it as an artificial barrier in the way of national unification and solidarity. It was thought then, in a time of peace, to be socially and politically unwise. Was there ever greater need of national unification and solidarity than today?

In 1912 another commission, of which Charles E. Hughes and President Lowell were members, likewise condemned the plan as entirely impractical. When Mr. Wilson was Governor of New Jersey he discussed the subject and said the plan would be a mischievous blunder that would attack and embarrass the free processes of opinion. He also opposed vigorously any such tax on the advertising pages of magazines as this law carries. What is his attitude now that the magazine publishers, threatened with the operation of this crippling and even confiscatory law, are trying to win fair play for their business and fair play for those in California, for example, who are read-

SOME OF
**THE GREATEST LIVING
BARRED ROCKS**

were produced by my customers from Aristocratic eggs last season.

This statement means that my customers produced some of the very greatest Barred Rocks in all America—in all the world—from Aristocrat eggs. Hundreds of prize-winners—prize-winners in the biggest, largest shows of the entire continent—were hatched and raised and exhibited—by my customers—from regular Aristocratic eggs purchased last spring. (Note: The same identical hens and cock birds which produced those great winners this past season are again mated up right now.)

While you are breeding and raising chickens, why not breed, feed and raise THE BEST? Why not? It costs no more to feed and raise the very richest Aristocrats than to raise scrubs. **THINK!**

Send today for big, beautiful new catalogue and special booklet (FREE) and read THE CONVINCING PROOFS, under such headings as these: "Purchases Aristocrat eggs and wins out at the biggest show in America"; "A simply phenomenal record in Texas"; "First and second cockerel in New Jersey from Aristocrat eggs"; "Figure out this phenomenal record in Canada"; "Thirty-six ribbons, three championships"; "A great victory in Pennsylvania"; "Four first prizes at State Show"; etc., etc. If you are in a special hurry order direct from this ad at the following prices: 15 eggs for \$10; 30 for \$17.50; 50 for \$25; 100 for \$50; 500 for \$200.

REMEMBER, I am supplying many of the breeders who are winning out at the world's foremost shows.

WALHALLA

Buff Orpingtons

Buff Minorcas

The Strains of Quality

You Don't Speculate when you buy Stock, Eggs or Baby Chicks of Us

Whether you are starting in the poultry business, or you wish to introduce new blood into your flock, you will be sure to get the best possible quality by buying of us. Under present conditions it is more important than ever before to breed birds that are profitable producers, and of the kind that make good wherever you put them, either in the show room or in the laying house. Isn't it sound judgment in breeding for production to combine Utility with Show Quality? For instance, our **Queen of Walhalla**, the world's greatest Buff Orpington hen alive, she holds the record of being the only Buff Orpington hen ever produced to win **first prize** at America's two greatest shows, Madison Square Garden and Chicago Coliseum, besides winning **2 silver cups** for best shaped and best colored female. This wonderful hen is the best laying hen we have in our flock. She commenced laying as soon as we brought her home from the Chicago Coliseum Show and is still at it. Her daughter, **second prize pullet** at Chicago Coliseum, 1917, commenced laying during that show and is still doing so without interruption. This improvement in heavier egg production of the daughter shows the result of careful breeding. We have many daughters and sons from this wonderful hen in our breeding pens, which will stamp the producing quality in the offspring. Show Quality as well as the egg laying habit is inherited in our strains, and the quality of our strains is proven without doubt by their last year's work in winning

16 Firsts, 14 Seconds, 11 Thirds, 11 Fourths, 6 Fifths and all 5 Silver cups offered, at only 2 shows.

Buy into strains which have been carefully line-bred and developed for many years for show quality as well as heavy egg production. They will transmit their own good points and qualities to their progeny, particularly their breeding and blood lines will make their producing qualities certain as show birds, breeders and heavy layers. We not only have a few good birds from which we supply Quality Hatching Eggs and Baby Chicks, but every pen we have mated is headed by a **prize winner** and the customers are sure of getting exceptional good quality in Hatching Eggs and Baby Chicks by placing their order with us. Our vigorous Northern bred birds are very active breeders. They insure a high percentage of strong fertility in their eggs. Baby Chicks hatched from such eggs are full of "pep," as lively as crickets and stand shipment to any part of the country and will develop into great show birds, breeders and layers. Every one should make an effort to produce all the poultry that he possibly can during 1918 to help the country in producing food. To help everyone to start a nice flock of chickens of the best possible quality, we will sell our Eggs and Baby Chicks after April 15th at reduced prices. When you start, start right.

PRICES ON HATCHING EGGS AFTER APRIL 15

NEW ENGLAND POULTRY INDUSTRY'S APPEAL.

Asks Government for a Square Deal.
—An Epistle of the Times.

By HOWARD P. GILMORE.

(Note—This "Epistle of the Times," by the manager of the Pittsfield Poultry Farms Co. Hatchery, Holliston, Mass., and owner of one of New England's largest poultry farms, was published in the Boston Sunday Herald, March 10, 1918, and fairly presents the sentiment of the majority of New England poultry-keepers and is supported by similar testimony from poultrymen on the Pacific Coast also. Some of our largest and best egg farms and market poultry plants, including large farms like Pittsfield, which specializes in Standard-bred fowls for both beauty and practical qualities, are to be found in poultry producing communities thruout New England and also in Pacific Coast states. These farms are much more seriously injured by arbitrary interference with the poultry industry than are the poultrymen in the grain producing sections of the country, where poultry keeping is carried on more as a side line than as a specialty. Yet we have many vigorous complaints from poultrymen in the grain farming states. Our big productive specialty poultry farms should be protected and encouraged. Thus far they have only been hampered and injured by unwise interference on the part of the food administration. This is the hatching and growing season; and specialty poultry farms, which are a most important source of food supply, should receive every encouragement from the government instead of being discouraged. In New England, which only produces about 25 percent of the food it consumes in normal times, these poultry farms are of vital importance for supplying food to the hungry public. Can Uncle Sam afford to remain deaf and blind to the appeals and needs of patriotic poultrymen? —Editor A. P. J.)

IN REGARD to the poultry conditions in New England, I believe that a great effort must be made at once to save the industry and that we must all work together to encourage the poultrymen and to ask our government at Washington to change certain regulations that at present tend to discourage the poultrymen and kill the industry here in New England.

I own and run one of the largest poultry farms in New England, and have 3,500 Single Comb White Leghorn hens, which produced about 30,000 dozen eggs last season. I have kept accurate accounts for the past seven years.

I am also part owner and manager of the largest hatchery in the world, the Pittsfield Poultry Farms Company of Holliston, Mass. We hatched 400,000 chicks last season, and have about 35 branch farms with a total of over 20,000 laying hens.

I made a trip thru Maine, New Hampshire and Massachusetts, visiting over 100 of the largest poultry farms, and I believe the poultry situation today is more serious than ever before in our history. About 50 percent of the poultrymen have sold out because they have lost money in the business.

The government has asked the farmers and poultrymen to increase their flocks. We are right back of the government in this and are willing to do our share and more, if the government will show us the way.

Something big must be done at once to encourage what poultrymen are left in the game to keep at it.

Some of the remedies are as follows,

Barred Plymouth Rocks

BUY your exhibition and breeding birds from us. No matter what you pay, no one can furnish you better quality than we can. We are specialists in Barred Rocks, have bred them in large numbers for twenty-five years and can give you selection no small breeder possibly can. Our quality is wonderful, yet our prices are the lowest of any of the big breeders.

Winings Ky. State Fair Sept. 1917

3 firsts; 6 seconds; 4 thirds; 2 fourths; 3 fifths.

If you are interested in fine Barred Plymouth Rocks, write us, and we will send you the handsomest and most complete catalogue published of this breed. You will make a great mistake if you place order before getting our prices and catalogue No. 3.

**Order from this ad
or send for catalog**

and I urge that a great effort be made along these lines at once:

First—Corn must be rushed to New England at once. We poultrymen have only a few days' supply left and our grain dealers cannot obtain grain for us. There is no corn in this section and altho we have had some ordered for months it has not been shipped on account of embargoes.

We must have grain at once or sell our stock. Lift the embargo on corn.

Second — Let the poultrymen have wheat enough to mix in 10 percent in their ration. At present the grain dealers cannot sell wheat to the farmers on account of government regulations. This forces the poultrymen into the hands of the big grain dealers to buy ready mixed feeds and pay exorbitant prices. Most poultrymen mix their own feeds.

If the poultrymen are forced to buy ready mixed feeds, the high price will force them to sell out.

Third—The American Express Company refuses to take our eggs except subject to delay and freezing. This means a total loss to the poultrymen; frozen eggs are worthless and we can-

Second prize Sicilian Buttercup pullet at Madison Square Garden, 1918. Owned by Hiddenhurst Buttercup Yards, Sharon Station, N. Y.

Baby Dux and Chix for Meat and Eggs

Meat and eggs are the crying need of the world. Are you going to do your share? Are you helping raise what you eat yourself? Our baby chix and dux have the necessary vim, vigor, vitality and "livability" to assure you of the greatest degree of success possible, whether you handle them for "green dux," broilers, roasters, or egg production.

They have 32 years of expert breeding along practical lines back of them. As our plant is right across the road from the express office, our chicks do not suffer the usual handicap of being held in boxes for hours waiting for train time.

BUTTERCUPS

101 BIRDS PLACED — 117 EXHIBITED

Is our record during the past season at Madison Square Garden, N. Y., State Fair, Oxford, N. Y., (Club Show), and other places. Largest breeders of Buttercups in New York and New England. 20 pens mated for breeding.

1918 Catalogue Free. Inquiries promptly answered.

HIDDENHURST BUTTERCUP YARDS, Box A2, SHARON STATION, NEW YORK

not collect from the express company. We have had several large losses on this account. We cannot ship eggs to the cities under these conditions, as it would bankrupt us. This same condition applies to all perishable produce.

Fourth—The poultryman cannot make a profit with the present price of grain; corn last sold for \$4.15, oats \$3, and wheat \$4.15 per 100 pounds.

Where is the big corn crop? If we can buy corn at a fair price, we can make a fair profit and will increase our flocks.

Fifth—We must have coal for our incubators and brooders. The day of the setting hen has gone by. The large poultryman cannot depend on the hen to hatch eggs and rear chickens any more than our large factories can depend on wood for fuel or hand labor to hew out the timbers with which our great fleet of ships is being built. We hatch over 400,000 chicks per year. Needless to say, this would be impossible by the hen method. These chicks supply thousands of farmers with their stock, and save them time that can be put to better advantage.

RESULTS

Greenville, Mich.,
March 3, 1918.

J. G. Poorman,
Tinley Park, Ill.

Dear Sir—Please find inclosed Money Order for \$15, for which please send me a Barred Rock cock, Grade A, to mate with my B. Rock pullets. I have sold my old birds which I bought of Wm. Bradley. He bought the cock from you three years ago. One of his sons took sweepstakes at the Greenville Fair over all breeds, and the two pullets he entered got first prize. Now I would like to get a bird to mate with my pullets that is from heavy layers, and also one that will score up pretty well if I should enter him at the show here. There are quite a few Rock fanciers here and, of course, they all think they have the best. Now I'll leave it to you to pick out the bird, as I know your judgment will be right. My eight pullets laid ten dozen and one egg in January, and did better than that last month. Hoping to hear from you soon, I remain,

Special Pair Mating—S. C. White Leghorns

Respectfully,
L. F. M.

My 18 Years

of practical poultry experience has been incorporated into my bred-to-lay strains in such a manner that brings forth unsolicited hundreds of repeat orders from customers of many years standing. My catalog contains descriptions of my plant by representatives of the leading poultry publications, reports from many of my customers, and also my methods of breeding, care, and management. It is fully illustrated, and very instructive, and will prove to you that my prices on eggs at 15c and 30c each, baby chicks at 25c and 50c each, and breeding and laying stock at \$2.50 and up, are very reasonable.

Start right, by writing for my instructive catalog today. It has helped others and will undoubtedly help you.

JOHN G. POORMAN, BOX 100, TINLEY PARK, ILLINOIS, U. S. A.

RESULTS

Toronto, Canada,
March 1, 1918.

Mr. John G. Poorman,
Tinley Park, Ill.

Dear Sir—I had not intended to have you send me on any eggs this year, as I wrote you that help was so scarce I could not increase my plant, but the chicks you have sent me have been making such exceptionally good records in laying, the total pen averaging over 65 percent and none of them less than 50 percent for the months of January and February, I feel it to be better for me to cut out some of the other varieties and have you send me on, say, 50 more eggs, if you could, about the middle of this month. I would want these eggs to be the very best egg producers you have. I have Barred Rocks and White Wyandottes in competition with your Reds and they are from the high class stock, but your Reds have beaten them out in the production of eggs. If there is any better grade than what you have sent me I would be glad to have them and I am inclosing \$5 in the interval. Let me know when you can ship the eggs and how much they will be. I want them at least from your A Grade pens and if you have others that are even higher class I would be glad to have them.

Yours very truly,
R. J. L.

BABY CHIX

Our 19th Year

← This mark has stood for honesty and square dealing in the baby chick business for 19 years. Our old customers look for it every year. They order from us with the knowledge that they will get full value.

Hatched from the Best Utility Stock

bred under ideal conditions, our chicks are strong and healthy—they stand shipment exceptionally well and are full of "pep" when you take them out of the box. We specialize in the following varieties:

- S. C. White Leghorns
- S. C. Brown Leghorns
- Barred Plymouth Rocks
- Partridge Rocks
- Rose Comb Rhode Island Reds
- Broiler Chicks
- S. C. W. Leghorns from all trapnested 200-egg hens

Send for our price list today and get started immediately. Remember, every week earlier you get started this spring means that your pullets will lay that much sooner next fall.

J. S. PENNINGTON Box A PLAINFIELD, ILL.

I suggest that the government give out some actual figures on the cost of production of poultry products with the following: Number of pounds of grain required to feed a hen, cost of grain, cost of labor, cost to raise a pullet, number of eggs laid by average hen, average price net per dozen, and cost of overhead, including taxes, depreciation and insurance on buildings and stock.

My records show that it takes 90 pounds of grain to feed a hen a year at present cost of \$3.50; labor costs 30 cents per hen, and overhead, including taxes, insurance, interest on investment and depreciation on buildings costs 25 cents per hen. Total cost, \$4.05 per hen per year. I cannot average over nine dozen eggs at 45 cents per dozen, or \$4.05. This leaves no profit for the poultryman.

I am sure that with cheap corn and good shipping facilities to our markets, poultry production will be greatly increased and that there will not be this increase until we have these conditions. Unable to get corn, forbidden to feed wheat, poor shipping facilities, and with poultry dealers forbidden to receive or sell our fowl, the poultry industry seems doomed to destruction. The only way possible to stimulate the industry at the present time is to insure a fair profit to the poultryman.

Again I urge that we ask the government to act at once to relieve the extreme conditions in this section and save the poultry industry.

Conflicting Grain Stories.

PERSONAL letters from the grain growing sections of the country received by AMERICAN POULTRY JOURNAL; editorials, special articles, and letters from grain farmers published in leading representative farm papers like the *Orange Judd* publications and *Wallace's Farmer*, and the crop reports of the representatives of the American Steel & Wire Company, all indicate that the government overestimated, and that the 1917 grain crop was not nearly as large as expected, taking the country as a whole.

Apparently authentic reports from real farmers all over the country indicate that the grain crop was a bitter disappointment. The corn crop never recovered from the unfortunate weather conditions and a very large percentage was soft. Much of the corn was not harvested owing to lack of labor. Much corn spoiled in the crib and much spoiled in the field, largely because of the excess of moisture in corn which did not ripen and dry properly. Large quantities of corn were moved to kilns to dry and save it, but drying facilities were

The RELIABLE Blue Flame, Wickless, Oil Heated Colony Brooder

Burns Coal Oil. Safety.
Comfortable. Easy to Operate.
Self Regulating. Convenient.
No Wicks to Trim.
No Coal Smoke or Gas.
Economy of Operation.
Steady Blue Flame.
Gives Abundance of Heat.
Positively Has No Fumes.

The Reliable Blue Flame, Wickless, Oil Heated Colony Brooder, is the latest, best and most efficient Brooder ever offered for sale. After a year of experience in testing out and operating this Brooder we are offering to the trade, knowing that such a Brooder is needed by the poultry raisers in general.

We will furnish this Brooder, equipped with our Blue Flame, Wickless, Coal Oil Heater, which has positively no fumes, as it consumes all the smoke, soot and gas and it feeds itself automatically. You can gauge your heat by the flow of oil by our safety valve.

This Colony Brooder is far more efficient than the Coal Burning Brooder. There is no danger of fire going out and chilling the chicks. We guarantee that you get any amount of heat needed at all times, and our regulator will take care of all surplus heat and will do equally as good as a Coal Burning Brooder and more, with less trouble, less risk of fire going out and with equal success of comfort of chickens entrusted to its care and with less cost.

Guaranteed as Represented or Money Refunded

These Brooders are shipped direct from factory and will be furnished with everything complete, and ready for operation. Now is the time to purchase. We are offering special inducements in order to introduce this Brooder. The No. 1, Blue Flame, Wickless, \$12-25 The No. 2, Blue Flame, Wickless, \$14-10 Oil Heated Colony Brooder, 42-inch Hooper

RELIABLE INCUBATOR & BROODER COMPANY Box A-1 QUINCY, ILLINOIS

not adequate to the task. Much of the soft corn has been fed to fatten hogs and cattle. There has been an unprecedented demand for corn and oats for shipment overseas.

At this late day it is hardly wise to "kid" ourselves into the belief that we are going to have cheaper grain soon. We may get cheaper grain thru price regulation, but that seems unlikely. From the evidence thus far presented by men in the field who should know, we will be lucky if we can keep supplied with grain at present prices until the 1918 crop is available.

The food administration, however, talks "famine" one day thru one official and "plenty" another day thru another official, and apparently is still basing some of its views upon the original optimistic forecast statistics.

G. A. Chapman, of the food administration, has made the following statement in reply to inquiries of Eastern dealers:

"This country raised last year the largest crops of coarse grains on record, and very moderate prices undoubtedly would have prevailed had it not been for the unprecedented railroad situation. The crippling of our railroads because of the extremely severe winter weather and the overcrowding of them owing to war conditions, has made it impossible for these very large crops to be marketed with anywhere near their normal movement. It is hoped, now that milder weather is here, and railroads are showing much improvement, that these coarse grains can be marketed sufficiently fast to have some marked effect on the prices of these grains.

"In regard to bran and middlings, on December 25, prices for wheat mill feeds were fixed at the mill. Resales within the trade have been stopped, and the profits which the jobbing trade may take on such commodities have also been fixed. State Food Administrators are now authorized to fix the price which retail dealers may take on wheat mill feeds, and such profits will be fixed in the very near future. As soon as the higher priced bran, which is in the hands of dealers or under contract to be shipped from the mills, is cleaned up the low fixed price on wheat feeds should reach the consumer. The flour mills, owing to their inability to secure wheat are now operating at a very small capacity and there is a shortage of bran and middlings, and this small grind is also prolonging the contracts at the higher prices which prevailed prior to fixing of mill price on December 25."

The above is sufficiently interesting to be worthy of a second reading. The poultryman and farmer is expected to forego profits and increase production "as a patriotic duty," but the big flour mills must have their contracts at high prices and their profits protected on mill wheat feeds, even if the cattle and poultry starve.

While railroad transportation conditions are undeniably bad, "passing the buck" to the railroads does not seem to satisfactorily settle the matter. The prompt statement of the Director General of Railroads, "Show me the food and I'll move it," in response to Mr. Hoover's predicted 90-day famine for the East on account of railroad troubles, is now a matter of history. The East has not yet had to go on rations, and, while rail shipments are slow and most exasperating, no one seems to have pointed out any vast stores of food or grain waiting shipment East.

We hope that there are great stores of coarse grains, and an abundance of mill feeds, soon to be made available for poultrymen and dairy and stock farms. We would welcome cheaper grain. But we really do not see where it is to come from, and, if it is in sight would like to know where. We hope that the food officials are not "kidding" themselves and us because of bureau-made crop statistics.

STARKS FARM
Box 100 - STARKS, WIS.

Department of Agriculture statistical estimates are fearfully and wonderfully made and for years have been notorious for inaccuracies, both underestimates and overestimates when compared with actual census count. Only recently we had a most striking example. On September 1 the estimated number of hogs in the United States was 60,218,000. On January 1 the number of hogs was estimated at 71,374,000, in spite of the fact that in last third of year there are normally slaughtered as many hogs as there are fall pigs farrowed. Yet here we have a miracle and have gained 11,156,000 pigs made out of thin air with a few magic strokes of a pen. Not real pigs, camouflage pigs. Let us hope that no one is trying to "kid" themselves or us with camouflage grain. It is far easier to face a known difficult situation than to continually have hope shattered and suffer the discouragement of inflated figures and self-deception.

Meanwhile let us be thankful that things are no worse than they are, and we will be all the more pleased with cheaper grain and feeds, if we get them.

DR. WOODS' NOTES AND COMMENT

WORK.

With hand on the spade and heart in the sky
Dress the ground and till it;
Turn in the little seed, brown and dry,
Turn out the golden millet.
Work, and your house shall be duly fed:
Work, and rest shall be won;
I hold that a man had better be dead
Than alive when his work is done.
—Alice Cary.

* * *

As a matter of food conservation and for the good of the country, we would approve a law providing that those who do not and will not find regular employment in some useful work shall not eat.

* * *

If such a law were put into effect there are a lot of office holding parasites and political spell-binders who would have to get busy or starve. Better blisters on the hands than "chair blisters" or overworked jaw-tackle.

* * *

We would not mind working to supply food at cost to useful people, real workers, if others will forego all their profits also and work for the common good of all, but we certainly do hate to be taxed to feed some useless loafer or ornamental slacker, whether male or female.

* * *

How about the home garden and chickens for this 1918 season? We have garden plans well under way and will be ready to plant when the soil is warm enough. This year we expect to content ourselves with a family flock and a few broods of chicks for early pullets and to supply chicken for the home table. Quite a drop from our customary large flocks, but local conditions do not warrant attempting extensive operations.

* * *

Male birds are scarce now since the ban was put on selling hens, but permitted killing of male birds. There were not many cocks and cockerels held over except for breeding purposes.

Over 15,000 Farms

LARGE AND SMALL
Are Using Our Strain of

Single Comb White Leghorns

Here is what Raymond Geddes of Swan Creek, Michigan, wrote us March 2:

"We are getting better than 65 percent egg yield from your stock. After breeding your strain of Leghorns for several years I could never be content with any other, as I have bred seven of the leading strains, and yours is in a class by itself. They can certainly lay, and lay large nice eggs, too."

This is just one of thousands of testimonials we have received from our customers. This is the kind of stock we urge you to buy.

Buy your Baby Chicks and Hatching Eggs from Headquarters

Grade A—Trapnested hens with records of 150 to 200 eggs, mated to cocks and cockerels bred from hens with records of 200 to 265 eggs. \$23.00 a hundred, \$220.00 a thousand.

Grade B—Cocks and cockerels in this mating the same as in Grade A, but bred to one-year-old pullets, daughters of hens with records of 150 to 265 eggs. \$20.00 a hundred, \$190.00 a thousand.

Grade C—High class farm raised stock, not trapnested. \$17.00 a hundred, \$165.00 a thousand.

Hatching Eggs—\$8.00, \$10.00 and \$12.00 a hundred. 90 percent fertility guaranteed.

Special 200 to 265-Egg Stock—Every hen in this mating has a record of over 200 eggs. Not over 100 chicks or 200 eggs to a customer. Eggs, 25c; Chicks, 50c.

Reduced Prices after May 15

Your success depends on where you buy your chicks and eggs. Don't be "penny wise and pound foolish." You can't make any mistake buying too good chicks. Old established farms that know their business trade with us year after year. Our chicks and eggs have made a standard for themselves not approached by any other farm.

LORD FARMS, INC.

Box 240-M Methuen, Mass.

Many of these have been sacrificed upon Hoover's altar, by poultry keepers who found 23 to 30 cents a pound live weight, for any sort of "roosters," attractive and who felt uncertain as to what drastic measure might come next. As a sample of the strenuous efforts made to secure male birds to be sold as live and dressed poultry, see following ad. clipped from Boston Sunday paper:

WANTED—2000 Roosters, Young or Old
GEESE, DUCKS and pigeons, we pay highest cash prices, we send autos 40 miles out; write or phone. P. T. WELSH & SONS, Harvey st., N. Cambridge; tel. 1484-M.

* * *

Tons of wheat in foreign lands, waiting for ships to transport it, are said to have been ruined by weevils. Gen. Sherman was right!

* * *

If Disraeli were alive today he could easily find a fourth variety to add to his famous classification: "There are three kinds of lies; lies, damn lies, and statistics." "News" from Russia could qualify for fourth place.

* * *

April hatched chicks are good chicks and May hatched chicks of the Mediterranean varieties will give a good account of themselves. Dan Young told us that he prefers May hatched Leghorns and he insists on having them hen hatched.

* * *

We have learned of several cases where parties are contracting for early hatched pullets to be delivered in September at \$2.50 and \$3 each. In normal years these figures would look attractive, but this season the grower will not find himself getting rich off the profits at these prices. We would like to have accurately kept records from various parts of the country this season of the actual cost of rearing chickens, including all expenses and first cost of the chicks.

* * *

Our thanks and appreciation are extended to all readers who have so kindly sent us reports of poultry conditions in their section this season and clippings from local papers covering news of interest to poultrymen. Many important and interesting items have been sent us, all of which have been put to good service. If you see anything in your local paper or your farm journal which you think we ought to read, please send it to us and do write often reporting local poultry conditions. While results thus far have been negative, the many letters sent us from all parts of the country about Rule 14, have helped in protesting this unjust edict. Our congressman wrote us that we might look for repeal of the ruling or a substantial modification of it, but we are not over-sanguine about it, for there have been so many meddlers, with axes to grind, running down to Washington frequently that they have muddled the situation, altho they are not really poultrymen. Real poultrymen could well say: "We can meet our enemies without fear, but save us from our friends (?), the sort so active on the side lines."

* * *

Edwin C. Smith, of Limerick, Maine, wants to know if the big packers are trying to put Eastern poultry farmers out of business so that they can sell

The Spring Clean-Up

of poultry houses, dairies, stables, creameries, cellars, factories, garages, out-buildings, etc., can be done with less labor, in less time, and you will get better results if you will use Carbola instead of whitewash and disinfectants. Besides painting a clear snow-white Carbola also kills lice, mites, fly-eggs, etc., and prevents the germs of contagious diseases that affect poultry, livestock and human beings, from getting a foot-hold and spreading in your buildings.

Carbola is used by thousands of poultrymen, dairymen and farmers—by the man with a few chickens in the backyard, by the largest poultry farms in the country, by Experiment Stations, by farmers with just a few cows, and by dairy and stock farms with herds of three or four hundred—and Carbola gives such satisfactory results, is so convenient to use, that even though every day brings new customers, over half our sales go to people who have had Carbola before. It makes no difference how large or how small your plant is, Carbola will make your work easier.

Carbola will increase the light in your buildings,—brighten up dark corners—make them sweet-smelling and sanitary—put them in shape to pass the inspection of milk company or health authorities—improve their appearance. Poultry and live stock never produce their best in dirty, dark and gloomy living quarters. The liberal use of Carbola means more dollars and cents in your pocket.

Carbola is a finely-powdered, snow-white, mineral pigment combined with a germicide many times stronger than pure carbolic acid but not poisonous or caustic. It can be applied to wood, brick, stone or cement, or over whitewash just as soon as it is mixed with water—no waiting, straining or bother. Use a brush or spray pump to put it on. One gallon covers about 250 square feet. Will not blister, flake or peel off. Has no disagreeable odor to taint milk or other food products. Does not spoil by standing so can be kept ready to use when wanted or on a rainy day. Harmless to smallest chick and to stock that lick it. The dry powder is an unexcelled lice powder for use on poultry, horses, cattle or hogs. Give it a trial.

10 lbs. (10 gals.) \$1 and postage 20 lbs. (20gals.) \$2 delivered
 50 lbs. (50 gals.) \$4 delivered

Trial package and interesting booklet for 25c postpaid.

Your hardware, seed, paint or drug dealer has Carbola or can get it. If not, order direct—shipment by parcel post or express the day order is received.

Keeler's Vigorous White Wyandottes

= The Aristocrat of the White Wyandotte World =

WINNERS OF 5 FIRSTS, CHICAGO

THE WORLD'S GREATEST STRAIN

First Cockerel, Chicago

Before you buy a single White Wyandotte send for my new, large, 64-page, instructive catalog and mating list giving the full history of my birds. A winning and breeding record of 24 years will convince you that I not only have birds that will win in any show-room but also fill the egg basket, some of my birds laying as high as 273 eggs a year. My prize-winning females are selected from among these layers. Here is the proof:

Box 18, Luseland, Sask., Canada, January 3, 1918.

Chas. V. Keeler, Esq.,
 Winamac, Ind.

Dear Sir—I trust you will mail me a 1918 mating list. Am figuring on placing another order for eggs with you this spring. The birds I got from the eggs last spring are certainly dandies. Have had 15 of your pullets in a Woods' open-front (single wall) house all winter. Got 270 eggs in December from them. Two days of last month 50 degrees below zero, or average temperature for the month 28 degrees below zero. A steady cold month, with three blizzards. I am going to buy your eggs again this year. Wishing you every success during the coming year.

Yours truly, (Signed) E. T. Hughes.

Eggs Eggs Eggs Eggs Eggs

The pens that will produce the 1918-19 winners and layers mated December 15th. I am in a position to furnish you eggs from the sixteen best matings in America. The best birds reared during the past three years are mated in these pens. My 1918 catalog and mating list of America's FINEST WHITE WYANDOTTES ready now. Send for YOUR COPY today. Eggs, \$5.00 per 15; \$9.00 per 30; \$14.00 per 50; \$25.00 per 100. A limited number will be spared from special matings at \$10.00 and \$15.00 per 15. State wants plainly and address.

BOOK YOUR ORDER EARLY
English 200-Egg Strain

S. C. W. Leghorns White Wyandottes
 S. C. R. I. Reds Buff Orpingtons

"World's Champion Layers"

Our Certified Contest Records are PROOF

Our Leghorns lead at Leavenworth, 1918, defeating 500 competitors, from every state.

Our champion pullet 1104 lays 28 eggs in 31 days, in the coldest January in 98 years—beating all birds of all breeds.

Our pen No. 110, 5 Leghorn pullets, lays 105 eggs this January; an average of 21 eggs per pullet—putting our pen 30 eggs ahead in the contest to date.

Our entry of five Wyandotte hens in the North American Egg Laying Competition, just ended, won First Prize and Three Silver Cups. These hens laid 1165 eggs, having these high individual records; 294-267-221-220 eggs. Contest under government supervision.

Our Champion Wyandotte hen "Liberty Belle" laid 294 eggs, winning first prize and cup, and establishing World's Highest Official Wyandotte Record. Her sister laid 267 eggs, winning third prize and cup against 500 competitors.

Merely another proof of our success in breeding 200 egg layers. Other competition winnings:

Leghorns—Highest award North American Egg Laying Competition, 100 pens competing, five hens laying 251-250-224-222 and 192 eggs.

Reds—Highest award, in their class, N. A. Contest, five hens laying 1043 eggs, an average of over 200 eggs per hen. Highest Official Red Record known.

White Wyandottes—Missouri International Contest, ten birds laid 2006 eggs, over 200 egg average. One layer made a record of 265 eggs.

THE PENNA. POULTRY FARM
 Box M, Lancaster, Pa.

their Western-packed eggs and poultry here to better advantage. It certainly looks that way. He reports that poultry keepers in Maine have had great difficulty in getting coal and oil for incubators and brooders, and that grain and feeds are very short supplies and not of good quality. Similar reports have come from all over New England.

* * *

The Rural New-Yorker states: "The meat packers control a large bulk of cold storage eggs. Up to December 15 this season cold storage eggs could not be legally sold in New York state and city except when marked with the words 'cold storage' on the shell. At that time the storage houses were bulging with eggs. This law was enforced and the storage eggs were selling at 42 to 45 cents per dozen. After Mr. Dillon retired from the Department of Foods and Markets, the law was not enforced, and the cold storage eggs were sold all over the city at 65 cents per dozen under the disguise of 'strictly fresh state eggs.' To make the deception all the more complete, the Food Commission cards were displayed with the eggs. The packers sold their cold storage eggs at a liberal profit, but the really fresh eggs that were being produced in the cold weather on grain at \$4 a hundred dropped from 10 to 15 cents a dozen."

* * *

If you want to better understand the strenuous times in which we live and the significance of events, read the "History of Civilization" by Henry Thomas Buckle, with an introduction by Arthur Brisbane, the popular low-priced edition published by Hearst's International Library Co., of New York. It is not "light reading" and must be read carefully in "small doses," but it is intensely interesting and, read understandingly, will help the one who reads it. It is a fine work to read aloud to the family circle.

* * *

This is the month to pack eggs in water-glass solution for next winter's use. Begin now.

* * *

Do not stop hatching altogether because of the unfortunate official interference which seems to threaten the poultry business. To get discouraged and quit now is suicidal. It is bad enough to have all white civilization seemingly bent on suicide, without giving up the fight and quitting in things we can help. Do not lie down and curl up like a caterpillar ready to be smashed. Get together with other poultrymen, organize, co-operate, and put up a good stiff fight for justice and right. We all must eat and we will all need food. What better than good poultry products? Be sure to grow enough chickens for the home supply. Grow good stock while you are about it, pure breeds cost no more to rear than mongrels and yield better results. Be sure to have some good April hatched pullets from heavy laying stock, and grow them well. You will appreciate their eggs next fall.

* * *

Do not sacrifice your carefully bred poultry which has taken years of skillful breeding to produce. Hold on to the best of your breeding stock, grow chicks from your best matings. The hard sledding cannot last always and there are good times coming. It is easy to "come back" if you have a small flock

* * *

According to the editor of the *Poultry World*, London, English poultry keepers have their difficulties. The British poultry industry is seriously threatened by grain and feed shortage, proposed rationing, and interference with poultry keeping by the Board of Agriculture. The editor assumes the "Little British Hen" to be on trial for her life and with much wit reports the case, in part, thus:

"Prisoner at the Bar! You are charged with one of the gravest crimes of which any British subject can be guilty at the present time, the crime of eating the Nation's bread. You are charged with being an uneconomic, greedy and generally useless and flighty little creature, deserving only a speedy death. * * * Authorities declare that there are insufficient feeding stuffs in the Kingdom to maintain existing stocks of animals and poultry until this season's crop becomes available in September. * * * What have you to say for yourself before the Court decrees sentence upon you of death that you appear to have well merited at a far earlier date? Little British Hen, reply!"

At these words the Hen answers:

"John Bull and Gentlemen of the Jury, at a moment when the fate of the British Empire hangs in the balance, it may seem impertinent of me to wish to breathe a word in defense of my poor existence. It must seem ridiculous to debate for one moment on such a comparatively trivial thing as the life of a hen in times when all life appears of so little value, and when so many of our most useful and bravest men have gone down like corn before the scythe of war. In normal peace times I am too often an object of ridicule, a peg upon which to hang cheap humor, how shall I in such dreadful days as these hope to be able to claim your kind attention or arrest the dread sentence which you in prejudice and impatience have already prepared against me?"

"I was made by God. I came from the most mysterious thing in the world—an egg, at least I think I did, but the cleverest of your scientists cannot decide whether I came first or the egg. At any rate here we are, the egg and I, at least for the present. How long we are to remain here seems to depend upon you."

"I am charged with eating the people's bread. I plead guilty, but my answer is, I am entitled to do so. I reply that there are other animals which also eat the people's bread, that there are thousands of men and women who eat bread which have far less right to do so, far less solid claim upon corn as a right than I have."

"Of course, I eat bread. When your soldier fights for you in the field do you deny him food? When your munition worker sweats for you in the factory, do you refuse him bread?"

"I am charged with greediness, but am I greedier than other birds and animals, not forgetting the greatest animal of all—Man? And when I admit eating bread, I do not want anyone to misunderstand me, I eat bread, but I give bread back, and much more than I consume. * * *

"I want for my ration but the smallest share of human food, and shall I tell you what I do in return?"

"I provide the Nation with fourteen and a half million pounds sterling worth of food every year. I am necessary to you in peace time, but a thousand times more so in war time."

"Seventy-five percent of the food I consume and can subsist on is waste and surplus food unfit for human consumption, which I thus render profitable."

"Within the London Metropolitan area there are tons and tons every day of dropped food from horses' nose bags, all of which could be utilized for my benefit if systematically collected."

"I bring the means of quick recovery and nourishment to thousands of your hospital."

"I provide a form of food best suited for invalids and growing children."

"I have saved the lives of thousands of your soldiers broken in war."

"On meatless days I provide eggs, the most necessary substitute."

"I am the most neglected of British industries, yet in proportion to the expense involved the most productive."

"I yield in manure value four million pounds sterling per year. And my manure is richer in fertilizing value than any other."

"My value in feathers amounts to one million and a half pounds."

"Kill me and you will have to pay the foreigner fifty million pounds sterling per year or more to replace me. The result of centuries

SCOTT'S S. C. R. I. REDS World's Champions

Eggs for Hatching

from blue ribbon winners at the late National Meet of the Rhode Island Red Club at Minneapolis, Greater Chicago Show, 1917, Chicago Coliseum, 1916, and World's Fair, 1915.

SCOTT'S REDS are being recognized from Coast to Coast as the Best

They excel in color, are big and vigorous and produce few culls. They have good range, shade, proper care, correct mating—all of which produces Reds that win and lay. *They please my patrons.* We guarantee a good hatch regardless of shipping distance.

My mating list, which describes my pens, will be sent on application

of British thought and careful scientific breeding will be thrown away never to return.

"Are they killing hens in Denmark. If any neutral country has suffered thru food shortage, it is Denmark, yet there they recognize the hen's value and provide for it in economical rationing of the Nation. To kill hens in Denmark would mean a sacrifice to them on the egg importations into this country alone of two and a quarter million pounds sterling.

Are they killing hens in America? No! They are encouraging production despite the fact that the Nation has been put on short commons to feed the Allies. And American poultry produce in 1905 was valued at £100,000,000. You think, some of you, that I do not matter because of Danish, Dutch, Canadian and American hens. Kill off all the British birds, there are plenty more hens in the world. If we want fowls let us import them in cold

store. If we want eggs bring consignments from Buenos Aires or the uttermost ends of the earth in pickle. We shall never be short of them, but for heaven's sake let us keep ourselves, our cattle and horses on full corn rations, and that brings to me a few questions I want to ask you:

"Must I die before the racehorse?"

"Must I die before the fancy pigeon?"

"Must I die before the brewer? Is it more

essential to have beer than a fresh egg?
 "Must I die before pet cats and dogs?
 "Must I die rather than that the German prisoners should have their rations reduced?
 "Must I die before Prothero or his Advisory Committee?
 "These are questions that I beg of you to carefully weigh in the balance before answering."

"I have a friend called Carl. The Government have just given him the Order of the British Empire. What for? Because I have laid and given to the wounded British soldiers in France and at home—GIVEN mind you, not sold, over 36 millions of my eggs through the National Egg Collection for the Wounded. This blessed Order should have been conferred upon me; for upon such indefatigable little workers as I, the British Empire has been constructed. But now, Farmer Prothero stands by with a knife in his hand ready to cut my throat because I pinch a few odd grains from his stack.

"Whether I live or die is of little consequence to me, but it may have the gravest consequences to you and to those poor fellows who have been wounded in your interests. "Remember I multiply and increase myself very rapidly. In twelve months from maturity I can have 150 descendants, in 2½ years I can have 11,250 descendants, and with submarine warfare so active, food production must be a matter of immediate consideration. I only cost an egg a week to keep, but in six months I lay on the smallest average 75 eggs, and I have been known to lay up to 140 in the same time. Surely instead of importing eggs and sending money out of the country to the foreigner for eggs, more than 50 percent of which are unfit for food, by the time they reach our tables, it would be more economic to import in the same tonnage a low grade of corn wherewith to feed me? Remember I can give you under proper organization and intelligent scientific direction increased food value of some £40 million sterling a year. Surely in the present critical state of affairs you ought to organize a supply of waste food in every municipal center for my benefit in the same manner as is done at Liverpool? You ought to ascertain exactly how many there are of me and just where I am badly looked after, you ought also to give me cheap railway facilities and generally learn to get the best out of me. I am only like you humans, neglect me and I neglect you. Study me and I am most practical in my gratitude.

"But such is life. Here I must stand arguing and pleading as if I were the veriest criminal, some horrible little pest deserving of annihilation instead of being the real benefactor to my country that I am.

"Well! if I must go under, I can at least console myself by the reflection that I am not the only victim of official stupidity, prejudice and shortsightedness. I shall die in good company, and I shall rise again and flourish. But let me tell you this, I do not intend to die without making a jolly good fight for it. And I call upon my good friends the poultrykeepers of this country to stand by me and not desert me in my hour of need."

* * *

We believe that the eloquent "Little British Hen" has pleaded her case so well that "John Bull and the Jury" will not only quash the charges against her, but will award Madam Hen special honorable mention with the right to use such "bread" as she may need. Certainly this will be done if Britons live up to their traditions.

The Service that Satisfies

A report from Maine.

"O. C. Frantz:—

The 50 eggs I bought May 14, hatched 46 chicks, raised 21 pullets; Oct. 11th they began to lay. From Nov. 1st to present date (Jan. 6th) I have gathered 10 to 17 eggs per day." *Our Leghorns Lay in Winter. Our Eggs Hatch regardless of distance shipped. See Adv.*

2 for 35c

Here is the Feeder and the Fountain

for which every poultryman has been looking. It combines all the good qualities of the ordinary Mason jar fountain and feeder with the good qualities of the best baby chick feeders on the market. The bottom of the feed pan slopes from the center to the edges, thereby insuring a free flow of feed from the jar to the edge of the pan, where the chicks can reach it thru the openings. The small openings prevent dirt from getting into the pan—prevent the chicks from getting into the feed or water and prevent them from crowding too close around the feeder, thereby giving the weaker chicks an equal chance with the stronger ones. This overcomes every objection to the ordinary open pan Mason jar feeder and fountain. It fits any Mason jar.

3 for 50c

The top of the pan can be removed in a second to clean or fill. It is the most inexpensive, most practical and most sanitary feeding and watering device on the market and is fully covered by U. S. letters of patent. If ordered from this ad we will send them postpaid to any address in the United States. **SIMPLEX SUPPLY HOUSE 1300 Pontiac Bldg. CHICAGO, ILLINOIS** Send for our complete Catalog of Poultry Supplies and find out about our marvelous Feather Brooders; also Automatic Grain Feeders and Non-Freezing Water Fountains.

Send for a Copy of New Am. Poultry Journal Cut Catalog.

WORLD'S BEST BY ACTUAL TEST

In the Official Skimming Tests made by Jury of Dairy Experts at the World's Fair Exposition, the **"IOWA"** CREAM SEPARATOR, outskimmed all competing separators. Questions and Answers
Conducted by Prince T. Woods, M. D.

Questions about poultry are answered in this department free for all readers of American Poultry Journal. Where answers are desired by mail, a stamp for reply is requested. Address all query letters to the managing editor, Dr. Prince T. Woods, Lock Box 4, Silver Lake, Mass.

Poultry Edict No. 14.

Q. (1) How are poultrymen going to sell breeding stock this spring, when the government has forbidden the sale of live poultry?

A. (1) Rule 14 prohibits the sale of hens or pullets, either alive or dressed, for food purposes. There is nothing in the rule to prevent the sale of hens or pullets for breeding and laying purposes.

Q. (2) Is it any worse to kill hens against the law than to let the hens starve?

A. (2) Instructions to federal food administrators state that the rule "is designed to prevent the slaughter of hens and pullets" between Feb. 11 and April 30. The further statement is made that: "The Poultry and Egg Division has found difficulty in formulating a general rule to cover every condition, but this rule should be interpreted with due regard to its purpose. This is to prevent the sale immediately by farmers and poultry owners of hens and pullets. Country packers, however, must be allowed a reasonable length of time in which to dispose of live hens or pullets, or freshly killed

hens or pullets, which they have already purchased; and distributors must also have time, extending to February 23rd, in which to move stock to consumer."

From the above it will be seen that the design of the rule was to prevent farmers and poultry owners from selling. Country packers and distributors were protected and given time to dispose of stocks contracted for. After that cold storage poultry, having no competition from any appreciable offerings of fresh-killed fowls, was unloaded on consumers to the satisfaction of those most interested in enforcing the poultry edict.

At present writing (March 12), this Rule 14 applies only to dealers licensed under the Food Act. There is no authority and no law which forbids any poultryman killing his own fowl for his own use, nor does it prevent him from selling such dressed fowl to his neighbors. The penalties mentioned in case of violation of Rule 14, under the Food Act, apply only to licensed dealers. Under the constitution, we doubt if there is any way in which the government could legally prevent a farmer or poultryman from using or selling food-

You Can't Go Wrong If You Buy A Newtown Colony Brooder

- Coal-Burning
- Self-Feeding
- Self-Regulating
- Efficient
- Economical
- Durable
- Safe

The first successful coal-burning colony brooder. Imitated but never equalled.

The modern coal-burning colony brooder is the most satisfactory brooding equipment ever produced. And the Newtown is acknowledged to be *the most efficient brooder of this type*. In all parts of the world, under all conditions, the Newtown **"raises the most chicks, the best chicks, with least labor and at lowest cost."** Ask any Newtown owner!

The Newtown was the first successful coal-burning colony brooder on the market. The first Newtown was a wonderful brooder, but through years of experience we have improved it in various details until today it is scientifically and mechanically perfect—*the one perfect brooder*.

Made in five sizes, for any number of chicks to 1000. Carefully constructed of superior materials; built to last for years. Burns coal, either hard or soft. (Gas burner can be furnished.) Fuel self-feeding. Self-regulating. Freely ventilated. Safe. Easy to install. Requires no special building. Simple in operation. Efficient to the highest degree. **GUARANTEED.**

Not the cheapest brooder in price or construction. But priced moderately and greatest value for the money. Tell us about how many chicks you plan to grow this year and we will mail brooder catalog free.

The **Newtown Giant Incubator**, like the Newtown Colony Brooder, is the choice of the most successful poultry raisers. Built in many sizes, 600 to 24,000 egg capacity. Let us know which size interests you and we will promptly forward full information regarding it.

NEWTOWN GIANT INCUBATOR CORP'N

21 Warsaw St., Harrisonburg, Virginia

stuffs or animals which he has produced. It can restrain him by refusing to permit his produce to pass inspection, where inspection is required. It can take away his market for produce in quantity, as has been done in case of Rule 14, which, by making it unlawful for licensed dealers to deal in hens and pullets as live or fresh-killed food poultry, prevents the marketing of any considerable numbers of such fowls thru the usual market channels. The farmer and poultryman is urged "as a patriotic duty" not to kill or sell for food purposes any hens or pullets. Obviously it cannot be considered as either "patriotic" or a "duty" to feed high cost grain in time of shortage to unproductive or overfat hens and pullets which are past their usefulness as layers. It is a matter of common sense to market such fowls if you can find a market. There is no patriotism and no good purpose served in letting hens starve. If starving hens were found on any man's premises the S. P. C. A. would quickly have him in court for cruelty to animals.

Q. (3) In this part of the country there is practically no grain at all for sale. One dealer told me he had a car of grain go through Portland about three or four weeks ago and he has not yet received it at Lincoln. What are the poultry raisers going to do?

Lincoln, Me. R. H. Y.

A. (3) The only thing to do is to protest against unjust interference with normal manner of conducting your business. Put up a strong protest to the authorities and state facts, give a plain statement of local conditions, and the number of fowl you have to market, and which should be marketed. Your protest will do some good, even if you do get a reply which is a meaningless confusion of words, winding up with advice to adjust your business to the new conditions.

Milk in Mash.

Q. (1) When mash is moistened with milk, but milk is not always sour, how should you feed it?

A. (1) Alternating sour and sweet milk is likely to cause diarrhoea in chicks or young stock. You can let milk sour before mixing with mash. Or, you can heat the sour milk to separate curd from whey; squeeze the curd until dry and feed this plain; use the whey for mixing mash.

Q. (2) Should one mix milk with mash when it is sweet and then let the mash stand until milk is sour before feeding it?

A. (2) No. Soured mash is dangerous for adult fowls and may kill chickens.

Q. (3) What is a good general-purpose duck for laying and for market?

A. (3) The Pekin.

Q. (4) I do not want Indian Runners and I have heard that the Rouen when dressed has a poor appearance, owing to its dark plumage. How are Buff Orpington Ducks?

Ravena, O. H. F. J.

A. (4) The Buffs are very good ducks. Rouen Ducks are an excellent variety and in skilled hands make a good market duck. The Pekin Duck, however, is the popular market duck in this country. The Aylesbury, while a very excellent white duck, is not so generally popular as the Pekin with growers of green ducklings for market.

The Hill Colony and Magic Brooders

famous for high grade construction and efficiency. They hold the fire, automatically regulate the heat and are positively gas proof. They brood chicks which will produce a profit.

The brooder is actually the starting point of success in the poultry business. If our brooders do not do all we claim after thirty days' trial we will cheerfully refund the money and pay freight both ways.

Send for free catalogue describing both the Hill Colony and Magic brooders. It also shows plans how to build colony and laying houses together

with other appliances. Agents Wanted.

United Brooder Co., 348 Pennington Avenue Trenton, N. J.

Practical Organization Needed.

Q. Is it possible to get some concerted action to secure repeal of recent rule prohibiting selling of hens and pullets? There seems to be no organization out here to work thru.

Black Diamond, Wash.

O. F.

A. Unfortunately there is at present no effective organization of practical poultrymen, including the large number of poultry keepers who produce eggs and raise market chickens. There is great need of such an organization, particularly at the present time, when big business interests seem bent upon forcing the commercial poultry and egg farms out of business. *American Poultry Journal* and a few, very few, other poultry papers have protested the unjust Rule 14, and the leading agricultural publications have entered vigorous protest. A very considerable number of progressive poultrymen and fanciers have individually protested to representatives in congress and direct to food administration. The daily newspapers in New York, Boston and Baltimore have carried letters from poultry keepers, making vigorous protest against the injustice of the rule. To the credit of the Agricultural Department of Cornell University, and Prof. James Rice in particular, their poultry department issued a statement showing the rule to be unwise and calling attention to some of its far-reaching and harmful effects. So far as we know, the A. P. A. has not done anything about it. That organization seems to be too busy just now trying to get people into the poultry business, to be interested in the welfare of those already engaged in poultry keeping. A considerable number of poultry papers have been lukewarm on this edict, which has worked so much injury to the poultry industry, and some have seemed to approve of it. Their attitude can only be explained by the fact that egg farmers and market poultry growers do not, as a rule, carry much advertising, and the interest of these publications does not extend beyond their immediate cash receipts. While congressmen have stated that we may hope for repeal, or a substantial modification of Rule 14, the time is so short now until the lifting of the ban thru self-limitation (April 30), that about all we can hope for is that we get no more of this sort of unjust discrimination against producers.

In Eastern Massachusetts the ban on sale of hens has not seemed to prove very effective. Italian and Jewish traders, with auto-trucks, have bought up large numbers of fat old hens and sold same alive to their customers through house to house trading. Apparently the law gave no power to control this sort of trade in live fowl. There would be no sense in stopping it anyway, for most of the fowl handled were overfat, unproductive birds which had stopped laying. Naturally, no one could stop the customers from killing and eating their own fowl. It is quite probable that Rule 14, and fear of further more drastic ruling, may have led to heavy selling and unloading of fowls through such channels which would otherwise have been kept for stock purposes. It is a peculiar and common characteristic of human nature, that when you forbid a man to do a certain thing, or attempt to apply force instead of common sense reasoning, he immediately determines to do that thing even though he had not thought of doing so before someone tried to compel him not to. Legislation will not immediately change human na-

YOU WILL

-they don't "lay down"—they just LAY!

You Don't Enjoy a Losing Game

"Slacker" hens take most of the pleasure out of poultry raising and are an expense rather than a paying proposition.

What makes a "slacker" hen? It's not her fault—don't blame her.

You've got to have skillful, patient breeding behind the bird—breeding for systematic seeking of the nest, for the "laying habit"—breeding for sufficient vitality so that the small body may be drained daily, if well fed, without great depreciation.

Look at the hen as an "egg machine"—and thousands would be on the "scrap heap" today.

There is something Efficient

about the Ancona—about her trim appearance—her thorobred bearing—that appeals to the eye—and, much more, appeals to the pocket-book, after her merits have been proven.

Anconas do not "lay down"—they JUST LAY. Not "gold bricks" either, but big white eggs. You can bank on the Ancona as the bird to help solve your food problem. You can afford to EAT EGGS when Anconas lay them. My book tells the story.

turc, even tho some capitalists who buy it seem to think so.

Contamination.

Q. On page 323 of March A. P. J. is a letter by Stella Shrock, Peru, Ind.,

in which she claims that Light Brahma hens, which had been running with Barred Rock males, when mated with a White Rock cockerel, gave progeny which were all Barred Rocks through a six month's breeding season. This is

wholly contrary to my experience. I have repeatedly crossed fowls and then after a reasonable time mated them with males of their own variety and had no trouble from chicks which did not run true to parent stock. What do you think of the case reported?

Cleveland, O.

C. H.

A. We do not believe that there was any contamination from the first cross due to running with Barred Rock males. Almost any market poultryman in our South Shore district could give the true explanation. Here we cross Brahma males on White Rock females to get chickens for roasters. Sometimes a White Plymouth Rock male is used with Light Brahma hens, but not often because of difficulty in securing sufficient Brahma hens which will produce fertile eggs in summer, the time eggs are required for hatching "winter chickens." Both of these crosses yield Barred chickens. The Light Brahma male upon White Rock hens gives many barred or partly barred cockerels; the pullets come solid white, black, barred and mixed; white predominating in most flocks. The White Rock male on Light Brahma female gives a large proportion of barred chickens of both sexes and a smaller number of mixed and solid colored specimens. Crosses sometimes yield surprising results. Almost any cross made on Barred Rock hens yields a considerable percentage of black pullets. A Rhode Island Red on a Buff Wyandotte will yield chickens with plumage like Columbian Wyandottes. Recently we had brought to our attention a case where mating two strains of Reds, both closely bred for exhibition quality, yielded a large proportion of silky-plumaged chickens of good Red color. It is not always safe to predict what sort of progeny a cross will bring forth. We do not take any stock in the theory of contamination. That theory, and the one where the white hen is supposed to produce a black chick because she happened to see a black cock bird on the other side

The Morris White Orpingtons

"The Proven Leaders"

have become the **Real Repeaters** in the show room. In 1917 they won Best Display at Madison Square Garden, New York; Chicago Coliseum, December, 1916; New York State Fair, September, 1916, and they again went "over the top" January 1, 1918, winning at Madison Square Garden:

- | | |

Leaders as Exhibitors — Leaders as Layers A DUAL-PURPOSE STRAIN

In the American Egg Laying Contest now being conducted at Leavenworth, Kansas, for the first three months, November, December and January, 51 pens competing, all varieties being represented, our pen of White Orpington pullets ranks second. Our pullet No. 273 laid 19 eggs in November, 23 in December and 24 in January, despite zero weather.

EGGS FOR HATCHING

BABY CHICKS

We have 12 pens containing the World's Best in White Orpingtons, and headed by winning males, Madison Square Garden, New York, and Chicago Coliseum shows. These grand pens are producing chicks full of life and vitality. We will sell a limited number of Baby Chicks from each of these matings. Place your order early for real value in either Chicks or Eggs. Mating list free.

FERRIS
WHITE
LEGHORNS

Chicks and Eggs At Reduced Prices

After May 1 we sell eggs and day-old chicks at reduced prices. May hatched chicks will lay in October or November, the June hatched in December, and will make just as good winter layers as earlier hatched chicks.

We can furnish chicks from 200 to 230-egg stock early in May—25 chicks \$7, 50 for \$13, 100 for \$25, 1,000 for \$200. From 230 to 264-egg stock, 25 chicks \$9.50, 50 for \$18, 100 for \$35, 1,000 for \$275. Utility chicks, 25 for \$5, 50 for \$9.50, 100 for \$18, 1,000 for \$160. Safe arrival guaranteed. We can also fill a few more orders during April. See catalog for April prices.

We can fill all egg orders promptly, and we guarantee fertility and safe arrival. 230 to 264-egg stock, 15 eggs, April \$5, May \$3.50; 100 eggs, April \$25, May \$16; 1,000 eggs, April \$200, May \$135. 200 to 230-egg stock, 15 eggs, April \$3.50, May \$2.50; 100 eggs, April \$16, May \$12; 1,000 eggs, April \$135, May \$110. Utility matings, 15 eggs, April \$2.50, May \$2; 100 eggs, April \$12, May \$9; 1,000 eggs, April \$110, May \$80.

Eight-Week-Old Pullets

One of the most satisfactory ways to start with Ferris Leghorns is to buy a pen of 8-week-old chicks. At this age the pullets weigh about ¾ lb. and the cockerels about 1 lb. The pullets can easily be distinguished from the cockerels and the trouble and loss that sometimes occur in hatching and raising chicks is avoided, for at this age the birds are ready to go on the roosts, no longer require such close attention and are practically out of danger if given proper feed, a good coop and reasonably good care. We guarantee safe arrival anywhere. We can ship any time you want them after May 20.

From 230 to 264-egg stock, 10 pullets and 1 cockerel \$33, 100 pullets \$225. From 200 to 230-egg stock, 10 pullets and 1 cockerel \$23, 100 pullets \$175. From good stock without records, 10 pullets and 1 cockerel \$18.50, 100 pullets \$125.

Exhibition Stock

We have purchased Frank E. Herings' entire flock of White Leghorns, including all of his Chicago winners. Eggs from these Chicago winners \$10 per setting. We can furnish winners for any show in the United States. Write for special circular describing our exhibition matings and quoting prices on stock.

THIS FREE CATALOG

tells all about Ferris White Leghorns and how we breed them for egg production; describes the eggs, chicks and 8-week-old stock priced above; and the liberal guarantee under which we sell them. Write for it—a post card will do—and let us show you why you should breed Ferris trap-nested laying stock.

GEORGE B. FERRIS

905 Union Ave. Grand Rapids, Mich.

of a high fence, had their birth back in feudal times when it was exceedingly convenient for the gentry to impress such belief on the unsophisticated common people.

Cock Bird Which Has Mated With Mongrels.

Q. I have 9 S. C. R. I. Reds, two years old, and the mother of them mated to their sire, a three-year-old cock, no relation to the mother of the hens. I mated same birds in spring of 1917, but sold all the chicks when day old. I want to raise about a dozen pullets this season to breed from next year and do not want to introduce any new blood. One of my neighbors has a cockerel hatched from my 1917 mating. He will mate this Red to mongrel hens and I can get him next fall. Would he be all right to mate to my 1918 pullets in spring of 1919? He will be a brother to them, but one year older. Does it make any difference about his being mated to mongrels this season?

Galeton, Pa.

E. B.

A. The fact that the Red cockerel has been running with mongrels will not affect his breeding qualities or his progeny. If he is strong, healthy and vigorous in 1919 and the sort of bird suitable to mate with your pullets, would not hesitate to use him. If you only want a few chickens this season, you would do well to mate the old cock bird to his original mate and four or five of the best of the nine hens. You will probably get better results from him when running with not over six females.

Pedigree Breeding.

Q. Please tell me how to start a pedigree strain. I have two pullets and a cockerel grand for looks and pullets fine layers. I have bred them this way: the daughters to the father and the son to the mother. We owned the grandparents, but that is all we know about them.

Brooklyn, N. Y.

G. B. D.

A. Leg band your birds and record their numbers. Provide trap nests and keep a trap-nest record of eggs from each hen. When hen and egg are taken from nest, also record leg band number on the egg. Hatch such eggs separately—all from one hen in same nest or in pedigree tray of an incubator. Toe-mark the chicks—by punch mark in web between toes—and make a record of the marks for identification of each chick and the mating from which it was produced. As chicks grow, supplement the toe marks by use of numbered leg bands. By keeping accurate records, so that you can easily trace the pedigree of each chick back to your original trio or pen, you can successfully build up a pedigree strain in which you will know the parentage and ancestry of each individual, and just what results you have secured and may expect from each mating.

Housing and Comb Freezing.

Q. I have a poultry house, 12x30 ft., shed type, facing south. Three openings 2x5 ft. I have blinds that let down nights when very cold, and part way down on stormy days to keep out storm, also burlap curtains that I let down in front of roosts. Have 60 Leghorns here. Last winter had cotton over windows and combs froze badly and house was damp. House not damp now, but combs freeze some. Can I help it at 30 degrees below zero? Some keep Leghorns here

without freezing, but crowd them very close, not more than one square foot per bird.

Swanton, Vt. O. H. B.
 A. Comb freezing is not so much a matter of housing as it is of condition. Birds that are a little out of order are very apt to have frostbite. Getting wet with drinking water and exposure to cold wind are fertile causes of frosting. When temperatures of 30 to 40 degrees below zero are common, it is a difficult problem to prevent this trouble. We would not want to encourage crowding the houses, for that invites more serious troubles. We believe that there will be less trouble from frosting in a house that is kept always partly open, so that the air is dry, live and sweet, than in closed house where air is stale and damp. Curtains about the roost may make the birds a bit tender and more liable to frosting in day time. We have seen Leghorns in your state housed in open-front scratch shed houses, with door at rear between roost room and scratch shed—the door never closed—where frosting of combs was of rare occurrence.

Early and Late Molters

Q. (1) I have charge of 1,100 White Leghorns, 500 yearling hens, about half of which completed their molt in October, and 600 late hatched pullets. I expected the hens to be completely over molt by the last of November and that I would get a fair egg yield through the winter, but to date, Feb. 25, they have reached only 43 eggs in one day, which was two days ago.

There is a great deal of talk now-a-days about the late molter being the best hen, but I know of hens which have molted early and done well, laying while eggs were high, and the late molters did not get to laying until spring. My impression is that if a pullet begins laying early in the fall, molts early the next fall, and then lays again through the winter when eggs are high, she would be most profitable. What is your opinion?

A. (1) This has been a very severe winter in this section. As a rule Leghorns are better summer layers than winter layers. We prefer to have birds molt out clean before severe cold weather. The birds which molt early and get to laying in October and early November suit us best. We would much prefer to have a hen which molted early and turned out 100 eggs when eggs averaged 5 cents each or better, than to have a hen we had to feed while loafing all winter and wait for her to shell out 150 eggs when prices average 2½ cents per egg. The winter layer would yield \$5 worth of eggs to pay for her keep, while the spring layer yields only \$3.75 from 50 percent more eggs. Of course, if we were catering to a summer colony trade in eggs, where the summer folks would pay fall and winter prices, we would want summer layers, but in that case the heavy spring layer might be a disappointment. She would be likely to be thru laying when most needed, for the bulk of the summer colony egg trade comes between June 1 and October 1. It takes nice management to get a good egg flow during this summer season and the same may be said of fall and winter egg production.

Q. (2) Pullets came to farm June 20 as day-old chicks. They were grown in close confinement, besides not having a good start. They are quite small and

BABY CHICKS
For April and May Delivery

Listen to the appeal of your Government. Be patriotic and raise poultry. No other meat is so quickly produced. Every pound you produce means more available meat for our fighting men. Every chicken you raise is a shot at the Kaiser. A dozen fresh eggs is equal to two pounds of meat.

We Ship Chicks by Parcel Post

This service has been recently granted us by the Post Office Department. Deliveries will be made to your door in the city and to your post office on rural routes. The postage will be much less than express charges and chicks will reach you in better order. We have shipped successfully over a million and a half of chicks. We have a capacity this season of a half million. One hundred and fifty flocks of pure bred stock all on free range. That means health, vigor and vitality. We ship two grades of chicks—"Exhibition" and "Select." The "Exhibition" quality is as good as any sent out by specialty breeders at much higher prices; they are not bred for "fuss and feathers" alone, but for high laying qualities, in addition to Standard requirements. Our old customers state that our "Select" quality is away above the average and continue to order each year in increased numbers. We believe it will be to your advantage to send for our descriptive catalog and prices before ordering. It's free.

Warning! Chicks are scarce—don't wait.

about 35 percent of their eggs will average 18 ounces to the dozen. What is the cause of so many small eggs?

A. (2) You cannot expect stunted, late-hatched pullets to lay large eggs. The pullets never had a chance to develop properly.

Q. (3) Would you dispose of the hens in summer as fast as they stop laying, or would you wait until they begin to molt?

Wilbraham, Mass. J. C. Q.

A. (3) Would want to replace all of that stock, except a few of best hens producing large eggs, with April or early May hatched pullets of a good laying strain. Would watch the market, fatten the birds, and market at most favorable opportunity after they stop laying. Forcing them for eggs will fat them. As they have loafed all winter, you may be able to keep them laying well into the summer.

Market for Poultry Manure.

Q. I have been drying the night droppings of a flock of 150 hens for some time. Can you give me address of someone in Ohio who would buy same?

Columbiana, O. Rev. C. D. Fischer.

A. We do not know of a buyer in your locality. At one time we used to dispose of manure to tanneries. Of late years we believe it to be more valuable to us to use on the land, since we moved to this farm. Truck growers, florists and operators of hot houses where vegetables are grown under glass, will usually buy poultry manure at a good price. Any farmer should be glad of opportunity to buy dry well-cared for hen manure in this season of high cost fertilizers.

Breeding Young Stock.

Q. (1) I have a small flock of Anconas which are 8½ months old and a cockerel of same age. All are well-grown and in best of health. Pullets began laying at 6 months old. Would you advise using their eggs for hatching? Would same answer apply to Brown Leghorns?

A. (1) Yes, to both questions.

Q. (2) About what should be average weight of Anconas one year old, male and female?

Youngstown, O. B. H. K.

A. (2) Female, 4 to 4½ pounds. Male, 5 to 5½ pounds.

Scaly Legs.

Q. What is a good remedy for scaly legs?

Dunellen, N. J. C. C. D.

A. Get some compound sulphur ointment (Hebra's itch ointment) of your druggist. Apply this to affected parts every other day until three applications have been made. In three or four days after last application bathe parts with warm soapy water.

Cut Green Bone.

Q. I have 20 S. C. White Leghorns on a town lot 50x150 ft. These pullets are from a heavy-laying strain and yielded me 3,400 eggs last year. Grain bought cost me \$59.09. These 20 pullets were selected from a flock of 75 birds. I am thinking of getting a bone cutter, as beef scraps are hard to get around here. I can get all the fresh beef bones I want right at home for one cent a pound. Please compare the value of beef scrap and cut green bone. What

percentage of green bone should be fed with the mash?

T. R. C.

A. Where you do not count your labor as costing you anything, and you can secure good, sweet beef bones at one cent a pound, the green bone is so much cheaper than beef scraps at present prices, there is no comparison. Feed the green cut bone fresh daily, allow about one ounce per hen. If looseness of bowels results, feed less bone. Would prefer to feed it separately at one feeding—it can be mixed with mash, but there is no advantage in doing this, as mash is likely to be wasted by birds scratching for the bone. Do not cut too much at one time, as it will heat and spoil. Cut fresh as needed. Green bone yields about 69 calories to the ounce; beef scrap, 154 calories. Green bones show: Ash, 24.5 percent; protein, 22.3 percent, and fat, 16.5 percent. Beef scrap: Ash, 8 percent; protein, 58 percent; fat, 32.9 percent. Green bone has a nutritive ratio of 1:1.8; beef scrap, 1:1.4. Buy the bone in small quantities as needed to make sure that it is always fresh and sweet.

Artificial Hatching of Goose, Duck and Turkey Eggs.

Q. (1) Please tell me if an ordinary incubator is suitable for hatching goose, duck and turkey eggs.

A. (1) For hen and duck eggs, yes. Goose and turkey eggs may be incubator hatched, but to date few have made a success of it.

Q. (2) Where can I obtain a table showing temperatures, moisture readings, periods of incubation, etc., for the four kinds of eggs?

A. (2) Manufacturer of machine should be able to supply you. Apply also to "Poultry Investigations," U. S. Dept. of Agriculture, Washington, D. C.; also Poultry Husbandry Dept., Cornell Univ., Ithaca, N. Y.

Q. (3) Can you recommend an inexpensive book on incubation, brooding and rearing?

Cottonwood, Mont. E. C.

A. (3) Apply to American Poultry Journal Book Dept., 542 South Dearborn St., Chicago, Ill., for book "How to Raise Chicks," which will be supplied for 75 cents postpaid.

Seed of White Flint Corn.

Q. Please tell me where I can get seed of Rhode Island white flint corn. Woodbury, Conn. H. L. G.

A. Good flint corn seed is very scarce. Seed houses have been buying up about everything that looks like white or yellow flint corn, and some are selling seed that will prove a disappointment. He may not thank me for telling you, but last year I got a supply of Rhode Island white flint corn from F. W. C. Almy, Tiverton Four Corners, Rhode Island. He grows it for himself and does not offer it for sale, but might possibly be persuaded to part with a little seed to help a brother poultryman.

Fresh Eggs with Foul Odor and Taste.

Q. (1) Last summer for the first time, eggs laid and boiled on the same day, on being opened smelled and tasted badly. The smell nearly made me sick. When I first noticed it, I leg-banded every hen and for two days I trap-

nested every hen, marked band number on egg and boiled every egg. All eggs that proved strong I took the number and went out at night and killed the offending hen and buried her. The birds were on free range when tested and had skim-milk and clean oats to eat. Last fall I killed every hen and kept only 40 of the best pullets out of 90. Now we get 30 eggs a day and sometimes ten eggs smell badly as before. They are fine birds and good layers. I never force them and at present time no males are running with this flock.

A. (1) It is possible that the fault is not wholly with the hens. Nothing smells much worse than an egg that is not properly boiled. Eggs should be put in water just below the boiling point and cooked—not boiled—about 5 to 8 minutes for soft boiled and 10 to 15 minutes for hard boiled, depending upon how you like them.

Of course, it is possible that some of your hens had vent gleet, a contagious catarrhal disease of vent and often extending into oviduct. Hens with this disease will sometimes lay very ill-smelling eggs. There is a foul odor to the moist discharge from vent not unlike putrid fish. The disease may be spread

**Heat Proof Shock Proof
 Chill Proof Fool Proof**

Don't run the risk of losing valuable hatching eggs by shipping them in old fashioned, inferior carriers. Armingers Carrier is the best thing ever invented for the purpose. All eggs are protected by air cushions and suspended in individual compartments, thus preventing all of the eggs getting soiled in case one is broken; however, accidents of this kind seldom occur. These carriers are made of material which is a non-conductor of heat or cold, and therefore there is little danger of eggs becoming overheated when placed near steam pipes or of becoming chilled when exposed to cold.

They cost no more than others, but are years ahead in safety.

Satisfaction Guaranteed or Money Refunded. RICHARD M. SEWARD, R. 1, Lewisstown, Ill.

through the flock by the cock bird. We prefer to kill birds so affected as treatment is seldom satisfactory.

Q. (2) How do you count on male birds running with the flock before you use the eggs, to make sure of good fertility?

Two Creeks, Man.

D. R.

A. (2) If no other male has been running with the hens eggs should be all right at end of first week. If other males have been with the flock, it may be two weeks to a month before you can be reasonably certain that eggs are fertilized by male last introduced.

Cockerel Doesn't Take on Flesh.

Q. I have a year old cockerel that has always been fed on scratch grain and chicken chowder, with greens once a day. He is large but light in weight, and his crop always seems to be empty. Bowels are all right. He does not appear to have anything the matter with him. Can you tell me why he does not put on flesh?

Little Rock, Ark.

R. H. P.

A. Try giving him a change from ready mixed food. Mix 10 percent good fish scrap or fine beef scrap with the mash and feed it moist. Give him what he will clean up promptly once a day. Give oats for a morning feed and a full feeding of corn at night. Feed him apart from the hens. Often a very gallant male will not eat enough while running with the hens and needs to be fed a few extras out of sight of his mates. Give green food daily.

Ducks and Geese.

Q. (1) We have both ducks and geese housed together to save room. Is there any danger of the gander and the duck hens mating, and would it affect the goose eggs any?

A. (1) No.

Q. (2) We have three geese and a gander, and eight ducks and a drake. Is this all right? Was not going to set any duck eggs, but wish to hatch the goose eggs.

Mt. Vernon, O.

C. T. T.

A. (2) Goose eggs should be all right. If you intend to hatch the duck eggs you should have two drakes for ducks. One drake to four or five ducks is about right.

House for Colony Brooder.

Q. We want to do our bit raising chickens and have bought an oil burning colony brooder. Shall buy about 400 chicks, as we have no place to operate incubators. We are undecided about the sort of house for a colony brooder. Thought of building one 10x20 ft. in size, with a partition in middle. Do not know whether to make it a shed roof or double pitch. Can you recommend any special make of stove brooders?

Gridley, Ill.

G. H. S.

A. Obviously, we cannot recommend any particular make of colony brooder. Most of those with which we have had experience are good, but different users have different likes, and what suits one man may not suit another. A good colony brooder house is shown in illustrations on pages 150-151 February issue; and you will find a good colony brooder article on page 324, March Journal; also most of the colony brooder manufacturers supply plans for houses recommended by them. With a 10x20 ft. house, we think you will find a shed roof cheaper and quite as satisfactory as a double pitch roof.

Horticulture for Poultry Keepers
 Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

AT THIS writing, February 28, we are still in Florida and enjoying to the full the advantages of this most wonderful climate. But the home call is beginning to sound in our ears once in a while and I am anxious to get out among my trees and vines to give them the usual spring attention and care. There is always so much to be done if one would reap a full crop. It is real pleasure to do these offices for the fruit trees and berry bushes, for they appreciate all the kindnesses bestowed upon them. In a large portion of the northern states the fruit trees and vines and bushes should be sprayed with either lime sulphur or scalecide in March, before growth starts. Any needed pruning of fruit trees and vines should also be attended to at that time.

* * *

We have just returned from a cruise among the Florida Keys. It was a delightful week. The weather was glorious, the sea calm and the good boat "Silver Tip" behaved splendidly. We caught as many fish as we cared to, taking twenty-two varieties by rod and reel. I was very anxious to secure a tarpon, but could not get a strike by this, the gamiest of all fish. Mrs. Rigg caught her full share, landing a twenty-two pound King fish. I have fished in many waters, but nowhere do I enjoy fishing as I do here. I think the Florida waters the best fishing grounds in the entire country.

* * *

Vegetables by the car load are coming into Miami from Cuba. Here the cars are distributed to northern points. The Cuba growers made a killing last season because of the damage by frost to the Florida crop, and this season are doing the same thing. Tomatoes are now being sent north from here and the Florida growers who escaped frost damage

are getting big returns. New potatoes have been on the market for some time. In the Hastings district the growers are going to market a very profitable crop. Owing to the shortage of cars, the frost damage here, and the extreme cold weather in the north, the grape fruit growers have had great trouble marketing their crop this season.

* * *

I am a minister, and I own an acre of ground at the edge of Des Moines, which I intend to make my home when I retire from the ministry. I am going to put out some fruit upon this acre, and desire to make as few mistakes as I can. I desire very much the help of your experienced judgment. Would it be too much to ask you for the following, to me, very necessary information? What would you suggest to be the most profitable varieties of strawberries? What is the most profitable blackberry? Grape? Red Currant? Where can one get the Royal Purple raspberry, which I note you recommend so highly? Are you free to suggest to me the most reliable nursery company for stock to plant in my locality? Is northern grown better than Missouri grown stock for Central Iowa? What is the most helpful horticultural periodical? What is the best garden magazine? What is the best horticultural handbook or guide? Which is the better, one year or two-year-old apple trees? Iowa.

Roy W. Thomas.

You will find the following varieties of strawberries the most profitable: Haviland and Senator Dunlap, early; Brandywine and Sample, late. Haviland and Sample are imperfect in flowers and Dunlap and Brandywine will fertilize the bloom. These four varieties will give you an abundance of fruit and are especially well adapted to your soil and climatic conditions.

In blackberries I advise you to plant Eldorado and Mersereau. Would put in a few Snyder, for they will give you a crop every year, as they are extremely hardy.

For commercial planting the Concord and Worden are the best grapes. Of course you will want a few each of Delaware, Diamond, Niagara and Brighton.

The above pen of R. C. Reds in Missouri National Egg Laying Contest showed a 66 percent egg production during the four winter months and today holds the highest official record of the world. Owned by Riverview Poultry Farm, Klondike, Mo.

Jim Brown.

No home yard is complete without these varieties.

In red currants, the Ded Cross and Diploma are the very best.

You can get Royal Purple raspberry bushes from any reliable eastern nurseryman.

No, Iowa grown apple trees are no better for Iowa planting than the nursery trees grown in Missouri. I believe the best apple trees grown in America are those grown in the Ozark Mountains of Missouri. That section has ideal soil for the producing of a wonderful root system and this means a hardy, thrifty tree for the orchard. No one section or soil can produce the best of nursery stock in all kinds of fruit trees and vines. New York produces the best grape vines and cherry trees in the United States, and a portion of Arkansas and Maryland the very best peach trees. This nursery stock is the very best for planting as orchard stock in all fruit producing sections of the country.

The American Fruit Grower and *The Garden Magazine* will best suit your needs. *Commercial Fruit Growing* is a very good book. You can get a copy thru your local book seller.

I advise you to plant two-year-old apple trees. Do this by all means. There are very few one-year-old apple trees offered by the nurserymen that are fit to plant.

* * *

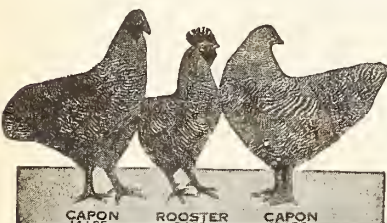

Please give me some information of More Haven, Fla., as it is being advertised as the richest land on earth. Would you think it advisable to locate there? Or do you think the highland of Polk or Lake County would be better for stock raising and fruit growing? Claims are made that it is more frost proof for citrus fruits than further south. Is that really so? I do not plan to go into fruit raising entirely. Would Northern Florida be just as good for stock raising and dairying with some fruit as a side line?

Kentucky, Gust Soder.

For fruit raising the lands in Polk and Lake Counties are far better than are the lands in the More Haven district. The Polk and Lake County land is ideal for fruit raising, being a sandy loam with a clay sub-soil. The More Haven land is a vegetable deposit and is extremely rich, being well adapted to vegetable raising. It is now producing some wonderfully productive crops. Many growers have paid for their lands in one potato crop. If you desire to produce vegetables, the More Haven land will give you desirable returns. The fruit producer should not locate there, but should plant his orchard in Polk or Lake County in preference. Personally, I think the best and most profitable citrus orcharding will always be on the lands such as are found in the Highlands of the state in these and one or two other counties.

You refer to the frost line. I have been coming to Florida each winter for many years. I have found by personal observation (the Government weather reports tell it) that there is no such thing as a frost line in the state. The entire state is subject to frost now and then. This season Avacada pear trees were severely injured as far south as Homestead. I am informed by the men in charge of the U. S. Experiment Station here that the frost killed some of the young pear trees in that most southern locality. Don't believe the land agent when he tells you there is no danger of loss of crop by frost. The land agent always places the frost line just north of where the land he is disposing of is located.

EAT A CAPON SAVE A PIG

A BOOK that explains everything you will ever want to know about CAPONS, 50 pictures from life that show each step in the operation. List of Capon Dealer's addresses. O. M. BROWN **Box G** **SLATER, IOWA**

Northern Florida is the best stock raising section of the state. The cattle industry is growing rapidly in that section. The raising of citrus fruits in that part of the state is very limited. There are no commercial orchards there.

* * *

Strawberries are retailing here at 65c to 80c per quart box. Why not plant an acreage of strawberry plants and get rich? Men have planted largely in a commercial way, but not one of them has remained long in the business. And the best answer to the why of this is that berries are selling at 80c per quart.

* * *

H. J. G., of Ohio, wants to know how much hen manure he shall use on a garden plot 40x80 ft. It is difficult to answer the question when put just that way. It depends somewhat on the nature of the soil and what crop is being raised. Hen manure can be used quite heavily if it is plowed under in early spring. If used as a top dressing it should be applied lightly and frequently.

* * *

The fishermen going out from this port are making a good deal of money. Never before have they received such prices for King fish and Spanish mackerel. Each night more than a hundred boats come in, each one bringing many hundreds of pounds of these fish. It is a wonderful sight to us northerners. These fish are sent to New York, largely.

* * *

I am writing for information in regard to peach borers. Should the gum spots on the limbs near the branches be dug out or are they near the surface of the ground?

Also are Houdan chickens as easy to raise as others and how will they compare against Rhode Island Reds? Would like to try some, but had some eggs last year that were hard to hatch, and those I did hatch, died after three months from lack of vitality. Please give me the name of a good Houdan breeder near Ohio.

Frank H. Panther.

As a rule the peach tree borers are found in the trunk of the tree both above and below ground. On badly affected trees some borers are found on limbs. The best method is to dig them out with a stiff wire. So far no wash has been found that is an effectual remedy against these borers. Sulfocide is the best thing so far discovered. In a peach orchard six years old, where each tree was painted with sulfocide twice a year, 96 percent of the trees are free from borers.

The Houdan chick is not hard to raise. In fact a well bred, well born Houdan chick is an extremely active and vigorous youngster.

The Houdan is a good layer of extremely large, pure white eggs. They will not lay as well in winter as will the Rhode Island Reds, but will produce more eggs in spring and summer than the Reds. As a table fowl they are far superior to the Reds. Consult advertising columns of AMERICAN POULTRY JOURNAL for names of Houdan breeders.

* * *

Your plum comments are interesting. Give us more data about varieties suitable for our climate—that of Northern Illinois and Iowa. What do you think of the Admiral Schley plum which a big seed house at Shenandoah says took first premium for two years at Iowa State Fair? In a planting of plums for Northern Illinois, which would you favor, the Americans or natives, the Europeans or the hybrids? I note of natives you put the Surprise at the top of the list. You have good company. Prof. Goff, of Wisconsin, did the same thing.

What do you think of the judgment of Prof. F. A. Waugh as given in his book, "Plums and Plum Culture," page 52, which says,

"I have said elsewhere that in my opinion the finest quality known among plums—that is

Grow your own Vegetables

Gardening logically goes with poultry-raising. Planet Jr tools make gardening easy, resultful, and profitable. They are scientific tools invented by a practical farmer and manufacturer. They make every minute, every ounce of energy, every foot of soil yield its utmost. They enable you to save time, labor, money, and get bigger, better crops.

Planet Jr Garden Tools

No. 25 Planet Jr Combined Hill and Drill Seeder, Double and Single Wheel Hoe, Cultivator and Plow sows all garden seeds from the smallest up to peas and beans, in hills or in drills, rolls down and marks next row at one passage, and enables you to cultivate up to two acres a day all through the season. A double and single Wheel Hoe in one. Straddles crops till 20 inches high, then works between them. Steel frame and 14-inch steel wheels. A splendid combination for the family garden, onion grower, or large gardener.

No. 17 Planet Jr. is the highest type of single-wheel hoe made. It is a hand-machine whose light durable construction enables a man, woman, or boy to do the cultivation in a garden or plow up the scratching yard in the easiest, quickest and best way. We make 24 styles—various prices.

New 72-Page Catalog, Free!

Illustrates Planet Jrs in action and describes over 55 tools, including Seeders, Wheel Hoes, Horse-Hoes, Harrows, Orchard-Beets, and Pinot-Wheel Fading Cultivators. Write for it today!

How to Raise Chicks

128 pages, profusely illustrated. An a to z manual for everyone who keeps fowls. Written by Prince P. Woods, a man who knows how and how to teach others. Cloth bound, price 75c. American Poultry Journal Pub. Co., 542 S. Dearborn St., Chicago, Illinois.

to say, in the whole kingdom of fruit—is to be found in some of the fine Americans when they are 'just right.' Other plums are more meaty, some are sweeter, many are better for eating out of hand, but the fine bouquet of flavors presented by the Americans cannot be surpassed."

What is your opinion of the Davenport plum? Its propagators at Des Moines say it is the best yellow native, almost as good as their favorite, the Terry, a red plum. Illinois. W. V. S.

I am always pleased to enter into a discussion on the plum. It is not only a valuable fruit, but a most interesting one. I think less attention is paid to this fruit than to any of the other fruits. "W. V. S." in the above letter and in his former letter discusses the subject so ably and so earnestly that I am sure he and I can be of some service to AMERICAN POULTRY JOURNAL readers.

I have tried out practically all the varieties of plums on my grounds. There are some good plums which we cannot raise in Iowa and Northern Illinois, but there are many of the best which we can produce there. For the commercial planting of plums in those states I would recommend the following:

Omaha, Surprise, Wyant and Desota. An orchard of those varieties will give more baskets of plums than any other like number of trees, I care not what varieties or families they may be. The Omaha is a marvel in productiveness. The tree is entirely hardy and the plums are extremely large, of a beautiful coral red. The Surprise is as large and as productive. The Wyant is really as large and in quality extra good. In dollars these five varieties are the big winners. The Desota is enormously productive and the tree is hardy. I name it as it is a fine variety to use as a pollinizer of the other varieties. The fact is coming home to our authorities that the native plums are in all practical ways the most profitable. The Japanese plums are commercially worthless in the Mid-West. The European family are too tender for commercial planting and too subject to disease. I agree fully with Prof. Waugh. I have not yet fruited the Admiral Schley plum. I have seen fruits of this variety and I consider it inferior in fruit to the Omaha, the Wyant and the Surprise. Neither have I fruited the Davenport plum. It may be all that its originators claim. I am going to plant it in my trial grounds.

I want to strongly urge my readers to stick to the American family of plums in their plantings in the Mid-West. We want the plum orchard to produce an annual crop of plums and dollars, and these varieties will surely do this for the thoughtful, thoro orchardist. No other family of plums will do this.

Of course the home garden should have a tree or two of Gold, America and Endicott. They are fine plums and well worth the extra care they require. The America is practically free of blight and of rot. I intended to say when speaking of the Omaha that unlike most plums this variety can be picked while green and will ripen up nicely. In a season when the brown rot is extremely severe, this is a big advantage. Plum rot has no power to frighten or damage me now. I spray each tree with sulfocide just as the bloom is falling, and about twice during the growth of the fruit.

* * *

Resolve to plant a few currant, gooseberry and raspberry bushes and grape vines in the home yard this spring. No home is complete without these fruits. It is a duty every man owes his family.

Would it be wise to put out an apple orchard of about 1,500 trees with conditions as they are at present? How is the climate and soil in this vicinity in regard to orcharding? What effect has the sea air on apple growing? What varieties of apples would you recommend?

I see that American Poultry Journal encourages fruit and poultry growing. Would you advise buying pullets or chickens? I am thirty years old, married and have two children. We are all healthy. I have been in the grocery business for six years. I have \$3,000 to invest in starting a fruit and poultry farm. How big a farm would you advise me to buy for this purpose?
Massachusetts.

J. M. Duphily.

As I do not know the character of the soil and am unacquainted with other local conditions in your immediate vicinity, I cannot advise you regarding the planting of an apple orchard in the vicinity to which you refer.

Nearness to the sea is not detrimental to an orchard if the orchard is situated on the proper kind of soil and has air drainage. In fact, nearness to the sea would be beneficial. Of course I cannot advise you as to what you should do in this matter of establishing a home for your dear ones.

However, I am sure that any man of thirty years can hardly build better for the future maintenance and happiness and comfort of his family than by planting a 1,500 tree apple orchard in the proper soil and location in Massachusetts.

1,500 apple trees will occupy thirty acres of ground. I certainly would advise, no less an acreage. You should figure on a complete home farm in making your calculations. You will want to keep a cow or two, enough hogs to supply your family with different pork products. Then the poultry must be considered. How much more land you will need in addition to the orchard land you alone can decide.

You ask if it be wise to plant an apple orchard under present conditions. I want to answer "Yes," most emphatically. I believe the present to be the most favored time to plant an apple orchard. There has never been a time in the past, and in my judgment there never will be a time, when extra choice apples will be plenty enough to supply the demand.

America must not only raise the apples to supply our own people, but for the next twenty-five years must supply the whole world with this most popular of all fruits. The orchards of Europe are shot to pieces. It will be years before much planting of trees over there is attempted on a large scale, and many, many years before normal crops will be produced there.

The man who at thirty years of age plants an apple orchard of the right varieties in the right place at this time, and gives the trees proper care, is laying a foundation for a business which is bound to give him big returns in the near future. I know of no other business which gives such assurance of success.

As to varieties to plant in your state. Were I to put out an orchard in Massachusetts, I would plant McIntosh Red and Wealthy. I am aware that the Baldwin is popular in your state, but I would leave the growing of that variety as well as the R. I. Greening to the New York fellows. The McIntosh Red is thoroely hardy in your state. It is an apple which people demand and for which they will pay the very top price. The demand has always been far greater than the supply and this will always be so. It is an early winter apple. It is

RAISE EVERY CHICK

More chickens this year than ever before. More for your table, more for market.

That's the demand. You need them to replace high-priced meats. The country needs them for the same purpose.

The opportunity to make money and save money with poultry was never so great as now. But you must make every chick from your high-priced eggs grow, and every ounce of your high-priced feed produce meat.

Certainty of success—of raising every chick that is right to marketable age quickly—is insured when you use the

STANDARD Colony Brooder

It stops the frightful losses so common to the brooder period. Makes three chicks grow where one grew before. Broods 100 to 1000 chicks with equal success, at a cost of less than 6 cents a day. Burns hard or soft coal. Fire lasts 24 hours from one filling. Cuts installation and operating cost to less than half—labor cost to less than a fourth.

Absolutely safe and sanitary. Nothing to catch fire; no corners where chicks may be crushed; no wooden walls or curtains to harbor vermin and dirt. Complete ventilation without drafts. Nothing to it but a smooth, solid cast iron stove, a clean galvanized steel hover, and the regulating apparatus. Nothing to wear out. Positively self-feeding and self-regulating.

It is so good that it has many imitations. But our patents will be protected. Make sure you get the Standard. We are so certain that it is the best brooder ever built, so sure it will satisfy, that we let you

Write Your Own Guarantee

What do you want a brooder to do for you? Write it down. We'll sign it. And if the Standard does not fulfill your guarantee in every particular we will return your money without argument.

The Standard is endorsed by all agricultural colleges and experiment stations. Among more than 30,000 enthusiastic users, big and little, not one failure has ever been reported.

Over 6000 dealers sell it. The one nearest you will be glad to show you the Standard in operation.

Write for the Buckeye Catalog and get the most wonderful testimonials of chick raising success you ever read.

A post card request will bring it.

The Buckeye Incubator Co.

11 Euclid Ave., Springfield, Ohio

Pacific Coast Branch, Box 11
Oakland, California

not a good keeper, but no grower of McIntosh Reds will be obliged to worry about that because he will never need to keep these beautiful, high quality apples for any length of time. The wealthy is a fall apple, very productive, hardy, of high quality and brings fancy prices in the market.

You should figure on quite a large planting of small fruits. Also make use of the land occupied by the young trees until they come to bearing age. It requires fine judgment to inter-crop a young apple orchard and I am not going to go into that so far as your case is concerned. I advise you to consult with the horticultural authorities of your state. Do not fail to do this. It is of the greatest importance.

Buffalo, N. Y., February 20, 1918.
Editor AMERICAN POULTRY JOURNAL.

Dear Sir—The unfortunate and deluded Russians are now looking for a master leader; the drowning man reaches out for even a straw; the poultryman paying the highest price for feed in his existence, hoping against hope for relief and no one to even offer a suggestion that looks like real money. This is a day of conservation in poultry raising. Not one kernel of grain must be wasted on unprofitable hens. Not a thimbleful of mash to a puny chick and not one puny chick for the mash. Not one egg for incubation that either will not hatch at all, or, if hatched, propagate the weaklings. Debility in chicks is transmitted thru the low specific gravity eggs incubated. Avoid the cause and you avoid such results. As manager of incubation in one of the largest poultry plants in the world, for seven years, my experience should be of value as a guide to beginners, particularly.

I was deeply interested in the findings of M. M. Jacobs as set forth in his article, which appeared in a leading poultry journal for February, on his experience in hatching eggs of high specific gravity. His unqualified support of that system of egg selection accords with my practice before incubation and during incubation as a daily register of proper moisture.

A completely normal egg is of high specific gravity, and a completely normal chick comes from no other kind of egg, therefore conservation of eggs for hatching compels the selection of high specific gravity eggs exclusively, and table use of all others.

Conservation of eggs along these lines will result in a saving of every feature of poultry culture and organize victory out of defeat. The practical instrument for registering the specific gravity of eggs is the same as I have used for ten years and sold, generally, by large poultry supply houses.

Buffalo, N. Y. JAMES G. DUNHAM.

SAVE FEED MONEY

Conserve now by using IDEAL Economy Dry Feed Hopper—stops waste, keeps out rain, rats and birds. Weight of fowl on step opens door inward when feeding; automatically closes upon leaving. Roll bottom prevents fowl from hooking out or wasting feed. Constructed of galvanized iron, designed for feeding whole or cracked grain, dry mash, grit, oyster shells, etc. It saves work, can't clog or get out of order. See your dealer today; write for information and literature.

Satisfaction Guaranteed or Money Refunded

ROCKFORD POULTRY SUPPLY CO.
Box J0201 ROCKFORD, ILL.

Rhode Island Whites in the Egg Laying Contests.

The Rose Comb Rhode Island Whites made an average of 226 eggs per hen in the National Egg Laying Contest at Mountain Grove, Mo., which closed November 1, 1917. An average of 31 eggs per hen more than any other variety. Every hen proved to be more than a 200-egg hen and one laid 268 eggs. This pen won both the December and January cups. Does this sound like *winter egg production*?

At the International Egg Laying Contest, Victoria, Canada, the Rhode Island Whites made the best record for eggs during the five winter months, making an average of 4.4 eggs more than their nearest competitor. They finished the contest holding third place for the entire year.

During the month of February, 1917, at a preliminary egg laying contest at Phoenix, Arizona, the two highest hens were Rhode Island Whites. At the close of the second month the Rhode

Island Whites held first, second and third places.

The Rhode Island Whites are in the contests again this year and are nobly holding their own. One pen is listed among the five best pens at the American Contest for the first month. And one pen at the All Northwest Contest has shown up three excellent layers during the first month. Truly they are the patriotic breed, the breed that is forging ahead and proving its value during these times "when men's souls are tried."

MRS. C. M. UNTRUS.

Save the Unhatched Chick

Don't Be Content with Medium Hatches and Weak, Crippled Chicks. Get the Real Profits from Your Time and Investment

Egg-O-Hatch Helps the Chicks Through the Critical Stage of Incubation. It makes no difference what machine you use, or if you depend entirely upon hens, Egg-O-Hatch will bring you 10 to 40 per cent larger hatches and your chicks will be stronger and easier to raise.

I will take all the risk just to prove that Egg-O-Hatch is a big profit maker for you

There is nothing mysterious or unnatural about Egg-O-Hatch. During incubation fresh air for the chick goes in and the poisonous gas exhaled passes out, through the pores of the shell. Breathing is accomplished by blood vessels in the inner membrane just within the shell.

Often during this period many of the shell pores become clogged or closed, partly suffocating and weakening the chick. As a further handicap, the shell itself tends to become tougher and more difficult to break.

Under perfect conditions, a chick has just barely sufficient strength to get out at hatching time. Partly strangled and weakened and held by a hard, leathery shell, its chances are greatly lessened. Usually these chicks die. The few that do get out are too frail and puny to raise.

Egg-O-Hatch Strengthens the Chick and Weakens the Shell

EGG-O-HATCH applied to eggs during incubation furnishes free oxygen and absorbs the poisonous carbon

dioxide, thus greatly strengthening the chick. At the same time it disintegrates or rots the shell, making it easy for the chick to break. With this help through the critical period more of the chicks hatch and are stronger and easier to raise.

Egg-O-Hatch is tried and proven—not an experiment. I know it will do all I say it will; thousands of users the country over tell me it does even better. I am so confident of satisfactory results with you that I make this proposition:

Give Egg-O-Hatch what you consider a fair trial, following my simple instructions, and if you do not get more and better chicks than you can get without it, return the jar to me and I will refund your money.

Egg-O-Hatch comes in powder form. It is mixed with water and applied by dipping, sprinkling or spraying. One size only—50c. Get a jar now from any Lee dealer or send to us. Use the attached coupon.

302

GEO. H. LEE CO., Omaha, Neb.

Gentlemen: Enclosed find 50c. for which send me a jar of Egg-O-Hatch.

Enclosed find 5c stamps, for which send me the Lee Library and full information about the LEE WAY to Poultry Success.

THE LEE WAY TO POULTRY PROFITS

Raising chicks is a highly profitable business, if conducted in a systematic, businesslike way. It should be vastly more profitable this year than ever before.

I have prepared a series of booklets which point out the pitfalls in this work and tell how to avoid them. They explain how you can get more and better chicks from every hatch, how you can easily keep your flock healthy and free from vermin, how you can keep the hens laying regularly all year 'round, how you can preserve spring and summer eggs perfectly nine months to a year, how to house chickens properly, etc.

This information is based upon more than thirty years' practical experience. I have arranged it so as to give you a definite plan to follow. This plan I have called the LEE WAY.

I want you to have this information. It is free at any dealer handling Lee preparations or, for 5 cents stamps to cover postage, I will mail it to you. Use the attached coupon.

WHAT'S THE MATTER WITH THE POULTRY BUSINESS?

By GEORGE BEVOY, Cedar Vale, Kas.

MARKET poultry was sold at an actual loss by the producer last season (1917). It is to point out the reason why and to suggest a remedy that I write this article. A farmer and a poultry raiser all my life, I have often faced the same situation in previous years. As long as it was a matter of only my personal gain I hesitated to call attention to the actual facts.

A patriotic duty now confronts me, it is no longer a matter of personal choice. I have been appointed on a National Committee and it is a part of my duty to help increase the poultry and egg supply. This I know should be done and it demands quick action at once.

The American poultry raiser will respond to this call, there is no doubt about that, once he is assured of a fair deal. Without that assurance how can these things be asked of him? Last year that assurance was lacking, hence the loss to the market poultry grower and the present crisis in that industry.

The consumer says he paid enough to cover all cost of producing the poultry and eggs. He is right, he certainly did pay enough. The selling prices to the consumer are high enough to allow everybody handling poultry and eggs a fair profit.

The trouble can be located in or at the packing or cold storage plants. No great knowledge of the poultry business is necessary to arrive at this correct conclusion. In Kansas during the year just passed the average price paid for the bulk of the egg crop to the actual producer was less than 25 cents a dozen. Those eggs are now (February 5) selling to the consumer at an average price of 60 cents a dozen. Or 35 cents a dozen more than the actual farmer or poultry raiser received. Those eggs could and should have been handled at a cost not to exceed 5 cents a dozen. Allowing an added profit of ten cents a dozen, which is too much, and there is a rake-off to some one of 20 cents a dozen. More than \$6.00 per case that should have been divided between the producer and the consumer.

If that had been done then everybody interested would have handled poultry at a profit and would be happy and contented in so far as the poultry situation is concerned. The producer would be anxious to raise more poultry and eggs. Then it would not be necessary to get after us and yell for increased poultry production.

The above prices refer to eggs; poultry on the market is even worse. In Kansas last year the average price paid for live poultry was around or less than 15 cents a pound to the actual producer.

Right now those same chickens held in storage are selling for around 35 cents a pound or over. And the producer and the consumer have both been pinched in an easy smooth sort of way. The producer has just sold out his supply of poultry as the easiest way out. Hence the present shortage and the demand for increasing production.

I have summed up the situation as a whole. The United States is a big country, and I know that there are some exceptions to above statements. In some places it is not so bad, in other places it is worse, but as a whole the above is a fair average condition in the states that produce the bulk of our poultry.

On behalf of the poultry raiser, the American farmer and as a patriotic duty, I make this appeal: Give the poultry consumer and producer a Government Guarantee of a fair, honest, comparative price for buying and selling poultry and eggs or Government operation of the cold-storage and packing plants. The producer must have this assurance if productions are increased as they should be.

The way to get this thing done is to ask for it at the proper place. If enough of us make the request it will be granted. If you desire an increased egg and poultry production do your part, write at once to Hon. Mr. Hoover, Food Controller, Washington, D. C., ask that the poultry products be guaranteed a fair price or that the Government take control of the packing and cold storage plants.

Give the producer this assurance and the increased production will be assured. To get this is necessary. Write at once.

Do you breed S. C. W. Leghorns?

Would you like to have a fine catalog of your own, handsomely illustrated in colors, but find the cost too much? If so, send for a sample and prices of my special catalog for S. C. White Leghorn breeders. Catalogs in colors from \$7.00 up. THOS. NASH, 542 S. Dearborn St., CHICAGO, ILL.

H. H. JOHNSON "The Incubator Man"

"While my husband farms I make expenses with Old Trusty"

As "Incubator Man" I am glad to own the title. A good incubator man is destined to stay in business. We made our first incubator in 1891.

"I am only a renter's wife, but while my husband farms I make expenses at home and hope to help buy a farm soon. I am not tied at home because of an incubator. I go away for a home day. I have three children under 7 years of age and there are three others in our family. I couldn't do without Old Trusty." Mrs. Maude Huffman, breeder of S. C. White Leghorns, Eagletown, Okla.

THIS letter squarely answers the poultry question on your farm. Please read it. There are two points to this letter—More Chickens and Old Trusty. More chickens mean a bigger income, and the easiest way to get them is with Old Trusty as proved again and again by over 750,000 owners. Send me your name and

Get This New Johnson Book of Poultry "Know-How" FREE

and learn why Old Trusty owners succeed so well and raise big flocks of money-making chickens year after year. The secret is in the way Old Trusty is built. Firm and substantial—to last for years. Oldest machines are still doing as good work as ever. Many have been in constant use 10 to 14 years.

You see Old Trusty was invented by an engineer and poultry raiser, and it just had to be right. You want Old Trusty this year. With big profits and valuable books at stake you want Old Trusty to make every hatch count. Old Trusty makes big average hatches even in coldest weather. We pay the freight or express. Quick shipment from Clay Center, or warehouse at St. Joseph, Mo. Write today. Yours truly, H. H. JOHNSON, Mgr.

Recent Inventions for Poultrymen
By Lester L. Sargent, Patent Attorney, Washington, D.C.

A NEW water fountain and feed hopper, invented by Harry A. Stevens, of Batavia, Illinois, is constructed to hold an ordinary glass milk bottle in inverted position with its mount in the pan which forms the base of the device. The fountain is especially adapted for feeding sour milk, by reason of its capability

Water Fountain and Feed Hopper, patented by H. A. Stevens, Batavia, Ill. Patent No. 1,251,935.

for holding the ordinary milk bottle. Patent No. 1,251,935.

A fountain in which a constant level of drinking water may be maintained for a considerable time, supplied automatically from a second container, has been devised by Lot A. Hufferd, of Detroit, Michigan. It is available for watering poultry, and also as a general watering trough for larger animals on the farm. The apparatus consists of an upper tank and a lower tank, with an open-ended pipe connecting the two tanks and having its upper end located above the level of the liquid in the upper tank and its lower end located below the level of the liquid in the lower tank. A float movable with the rise and fall of the liquid

Drinking Fountain, patented by Lot A. Hufferd, Detroit, Mich. Patent No. 1,241,982 and supplemented by patent No. 1,249,404.

in the lower tank, a siphon carried by the float and arranged to convey liquid from the upper tank into the pipe, provides the means for automatically regulating the supply of water to the lower tank or drinking fountain as it is required. The patent is No. 1,241,982, which is supplemented by patent No. 1,249,404, the latter including as a part of the apparatus an intermediate chamber or water column adapted to be sealed by the water flowing into it and including an inner pipe extending not quite to the top of the outer column, the intermediate chamber serving to maintain a condition of equilibrium between the different water levels of the supply tank and the feed or lower watering tank or trough, the air trapped in the intermediate chamber serving to control the passage of water thru this intermediate chamber. Water in the feed trough remains constant, however much water in supply tank varies.

A portable fence invented by Alexander H. Schlesinger, of New York City, is, made in rectangular sections which are bolted together and which permit of

be attached to opposite sides of the end posts of the crate. Patent No. 1,253,723.

A new egg-turning mechanism for incubators, devised by A. T. Pope, of Louisville, Kentucky, has transversely extending bars between which the eggs in each egg drawer are located, the eggs resting on the bottom of the egg drawers. When the frame is moved the eggs will be turned. The various rolling frames are connected by suitable rods so that all may be operated simultaneously. Patent No. 1,254,273.

A chicken exerciser and feeder of the automatic type, invented by W. H. Collins, of Summit, New Jersey, has a cylinder of wire mesh in which the bait grain is kept. The usual distributing cone is provided above this bait container. The feed distributing apparatus in the bottom of the main container includes a cup having bridged openings in the bottom, while the pendulum carrying the bait has attached to it a cup disposed above the bridged opening of the first mentioned cup, adapted to be separated therefrom sufficiently to permit of escape and distribution of the grain on the ground when the poultry peck at the bait in the small wire receptacle at the lower end of the pendulum which carries the distributing cone. Patent No. 1,253,002.

A simple trapnest has recently been invented by Lucius H. Bell, Fort Dodge, Iowa. It has an entrance door hinged to a treadle which is supported at the side distant from the entrance door. As the latter is pivotally supported by a rod attached to the nest frame, the weight of the hen on the treadle as she enters the nest will overbalance the open door and cause it to close. Patent No. 1,251,327.

Poultry Feeder and Drinking Fountain Combined, patented by George W. Beach, Saybrook, Connecticut. Patent No. 1,254,193.

A combined poultry feeder and drinking fountain has been patented by George W. Beach, of Saybrook, Connecticut, and Clayton von Culin, of New York City, joint inventors. The feed hopper encircles the drinking fountain. Both have circumferential troughs at the base of the trough, being separated into compartments for water and for grain. The feed in the hopper serves to protect the water tank which it encircles, from heat and cold, so as to maintain the water at a desirable temperature in midsummer or midwinter. Patent No. 1,254,193.

A simple heating system for drinking fountains, invented by John W. Campbell, Adams, Nebraska, includes an excavation shaped rectangularly, preferably to correspond with the shape of the base of the drinking fountain boards, closing the space between the sides of the fountain pan and the opening into the ground, in which the heating lamps are placed, and an air tube connected with one of the boards and extending into the excavation to supply air to the heater. Patent No. 1,251,338.

A Bit of Experience.

I HAVE been interested in many experiences which have appeared in American Poultry Journal from time to time and as I recall some interesting personal experiences I thought others might like to hear of them.

In 1894, I was at home in Minnesota with my parents and there were hard times on the farm. I made three incubators and my mother and I raised 800 chickens. In the fall we dressed 200 of them and had to sell them for 4c a pound. In the spring of 1895 we got only 5c a dozen for eggs and the following June we could not sell them at any price, and father and I took the eggs by the wheelbarrow load and dumped them in the hog yard. That fall I took 2,000 lbs. of dressed pork to the city and received just 2 1/2c per pound for it.

In 1896 I went to North Dakota, working in the building trade, twelve hours a day for \$1.75. I am still in North Dakota and like it. I think it is the finest state in the Union. I am too old to go to the war, and all I can do is to buy some Liberty Bonds and raise poultry to help kill off the Prussians.

Up to 1887 I lived in France and am well acquainted thruout the districts where the Prussians are devastating one of the finest countries in the entire world. I remember seeing French poultry there in quantity, which I admired very much in my heart at that time. I feel very sorry for good, dear old France and her fine people.

No. Dakota.

Nickolas Thill.

Working Under Difficulties.

This has been the coldest winter on record here, the temperature going as low as fifty below zero. We have had no corn to feed our poultry until lately, when some soft, moldy stuff was shipped in and is selling for \$4.25 per hundred. Laying mash is \$3.85, bran \$2.75 and oats is to be \$3 for the next lot. One of our stores is selling a scratch feed for \$4.45 per hundred. Eggs are 60c (February 13) and I have managed to get nearly enough from the sale of eggs to pay for the grain the hens eat.

Now I have just been reading that we cannot sell any hens or pullets to market until May 1. No matter how hard we are getting stung, we have got to take it. Must be patriotic and raise chickens, the experts tell us. I think that we poultrymen are about the biggest fools in the country. Not being properly organized we take what is handed us, which is a very small mite. Isn't it preposterous to have a butter and egg packer representing us in the Food Administration at Washington? It is one thing to feed a lot of poultry and do the work and quite another to sit at a desk in a nice warm office and advise some one else what they have got to do.

Why doesn't the government compel the woollen and clothing manufacturers to sell their clothing at a loss? It looks very much to me as tho the whole thing is being run for the benefit of the grain and food pirates. I have a neighbor who has 700 hens and is going in the hole at the rate of \$5 a day. Where does he come out?

The day-old chick business is all done in this section of the country. Grain is too high, poultry products too cheap.

Maine.

Edwin C. Smith.

A City Lot Flock.

Buffalo is a great poultry, as well as a live stock market. Large shipments of live poultry from Ohio, Indiana, Illinois, Michigan, Pennsylvania, Canada, and Western New York can be found on this market at nearly all seasons of the year. While much of it is what may be called "culls" and so suitable only for slaughter, some crates arrive with birds showing good breeding and from which a selection of good laying stock can be made.

If I were so situated that I could keep poultry the year round I would have a strain of thorobred poultry, but as I am situated, I find it best to buy ten or twelve laying hens about April first each year. These usually are laying when I get them, or, if not, begin very soon. If I find any of them not inclined to lay I dress them for the table and buy others to take their place. This includes those which molt early and stop laying. In this way I always have good layers and no drones. My neighbors enjoy their singing and cackling in our yard and often send over table scraps, stale bread and the like for the poultry.

No male bird is kept in the flock. One of my neighbors said to me the other day, "You don't pretend to say that you get eggs without a rooster with your hens?" When I told him that the hens laid just as well without a rooster, he was somewhat surprised and said he never knew that before. He is a man over fifty years old.

A house 1x6 ft. with a runway 3x20 ft. keeps eight to ten hens for me from April to November or December and furnishes my family of four or five with fresh eggs during that time, as well as fifteen dozen extra from them, which we put down in water-glass for winter use.

The house is made of thin boards and the roof covered with three-ply roofing paper. It has roosts, place for feeding and laying and is about six feet high. Has an open front with canvas to drop at night if necessary. The house is not just suitable for extreme cold

weather, but for the eight or nine months which I use it for the hens it provides suitable protection for a small flock. All the birds are disposed of as cold weather comes on, but this year two White Plymouth Rock hens persisted in laying right up into zero weather and I sold them to a man who has a suitable place for winter layers.

I feed a light supply of scratch grain morning and night, more at night. I give them sprouted oats for green stuff and they get them at noon. They also are fond of lettuce. During the warm season I have a little bed of lettuce growing in different places for table use and the hens. The center of my lot is kept seeded for a croquet ground, but around the edge I grow some flowers, rhubarb, radishes, lettuce, swiss chard, beets, etc. A war garden is no comparison to the advantage of a few laying hens. I keep sifted coal ashes before the birds all the time. If I find a soft shell egg during the heavy laying period I give them a tablespoonful of ground bone in soft feed for three days and after this the same amount twice each week. This with plenty of crushed oyster shell and grit will put a stop to soft shelled eggs. The birds are always kept supplied with fresh water, oyster shell, grit and dry mash.

I have found nothing which will give as great returns in pleasure and profit as my back yard flock of laying hens.

New York.

Frank H. Britt.

BABY CHICKS
Single Comb White Leghorns

When you want honest value, the kind of chicks that will return your dollars many fold, think of

"IDYLVILD"

This name stands for honestly trapnested dyed-in-the-wool layers bred from stock purchased from the highest-record laying strains in the world. While their egg records are very high, this is not the only item to receive consideration. We also pay strict attention to vigor and type, and we feel safe in saying that nowhere in the world can you get more value for your money in baby chicks than from Idylwild Farm. Three hundred baby chicks of our strain are better than 600 from a haphazard breeding. Come here for your

FOUNDATION STOCK

and build upon a substantial base. Don't waste your time trying to make a profit with unproductive stock—it can't be done.

EGGS FOR HATCHING

We also sell eggs for hatching in case you do not want baby chicks. Our eggs, stock and chicks are securely packed in the best method and will reach your safely. We guarantee 90 percent fertility on our hatching eggs.

Send for our handsome catalog and mating list.

Race Horse Games.

Not long ago I read a suggestion in American Poultry Journal that it would be a good idea for breeders and lovers of poultry to write more of their favorites. I am fifteen years old and have been interested in poultry for five years. I have been breeding White Plymouth Rocks and have received a great deal of help from your magazine. Have had it for three years. I have not seen much in print about the Race Horse Games. I am interested in them.

Race Horse Games as utility fowl sounds ridiculous, but never-the-less they have proved themselves worthy of the title. I have given them a thoro tryout. The hens are first-class layers. When properly bred they weigh the same as the Leghorn. They closely resemble the Brown Leghorn. They are seldom troubled by hawks or crows, as they so closely resemble the ground they are difficult to see from a distance. If the chicks are attacked by hawks, the mother is a real fighter and well able to protect her young.

The fault found with the Race Horse Game is that they will fly over fences and scratch out the neighbors vegetables and flowers. The way to remedy this is to supply them with what they need and keep them contented in their own yards. The contented hen is always the laying hen. I have a pullet of this variety which layed 23 eggs during the month of January, which I consider good laying. Some object to this variety because the male birds are apt to fight a good part of the time and kill one another. I agree that the Game is the greatest "scrapper" in poultrydom, but I find that the males do not bother each other much except during the breeding season and other varieties will do the same unless they are kept separated. There is no breed more hardy and they are always down-right hard workers. They are off the roost early and work until dark. The females certainly pay their board bill by laying eggs when eggs are high. They are also plump and neat in appearance when dressed.

Kansas. Richard C. Wilson.

Plea for Effective Organization.

We fear very much the disastrous effect which the recent ruling, prohibiting selling of hens and pullets to market, by the Food Administration, will have upon the poultry industry and we think that some concerted effort should be made to obtain some kind of assurance from the Food Administration that their policy of persecution is at an end, and that the poultrymen are free to do what they can to get the industry back on its feet. We also think that it would be altogether fitting and proper that the representative of poultry interests on the Food Board should be a producer and trust that something can be done to this end.

Incidentally it seems that that great organization, the American Poultry Association, has been fiddling while Rome burned, and while they have been quibbling over "down between the toes" and "under barring" the industry has suffered thru meddlesome interference. We cannot recall anything that has been done by them that is in any way benefitting the industry—the only thing we recall is plans for a knockdown poultry house.

There has been considerable change of heart among poultrymen in this section of the country, and we hear less and less about the wonderful profits that are being made. And we have been advised by Helen Dow Whitaker, the Superintendent of the All Northwest Laying Contest, that "the word profit does not appear in their report." Which is a step in the right direction—only the horse has already been stolen.

Now that the industry has been reduced to the irreducible minimum, would it not be possible to start the growth sure to come in time, along the right lines, and get away from the charlatanism of the past which has been responsible for so many, many failures in this business? It seems that this part of the country from the standpoint of the poultry industry is in the same boat as is Russia.

Incidentally the ruling prohibiting the killing of hens and pullets having already come into effect, we wonder if they will succeed in making the ruling force the hens to lay. Patriotic American people accept wheat and coal orders without undue remonstrance, but we think the powers that be are reckoning without their host when they try to save the industry by passing rules affecting the American hen, which knows neither patriotism nor loyalty. Perhaps after all the poultrymen have been wrong in trying to cajole the hen to work, and it may be that stern measures will bring about better results. As we have said before, time will tell, but we wonder if the aforesaid powers will assume the responsibility for what happens. It has been pointed out that the poultry industry will win the war, whether this could be so or not we do not know, but if it is

The 1918 CHICK-ECONOMY COMBINATION

- 1 Chick Feeder (without jar) 15c
 - 1 Chick Fountain (without jar) 15c
 - Head Lice Ointment . . . 15c
 - White Diarrhea Remedy . . . 30c
 - 50 New Coil Leg Bands . . . 50c
 - 50 Key-Ring-O Bands . . . 50c
- Value . . . \$1.75
Our Advertising Offer . . . 1.22
You save 30% or . . . 53c

Every year we get out a Key-Ring-O Combination to advertise and introduce this celebrated leg band. This year's offer is one for safety and economy. You must raise your chicks this year safely and economically. For safety we include a regular 15c tube of Conkey's Head Lice Ointment and a regular 30c package of Pratt's White Diarrhea Remedy. Then you get a Drinking Fountain and a Chick Feeder—the latest style out, and a good one. Then we include 50 New Coil Chick Bands that will last for years and enable you to mark each chick easily and quickly. And then in addition to the above you get a coupon that we will exchange (after you know just what colors and size you want) for 50 of the celebrated Key-Ring-O Leg Bands any size or color.

Surely you will agree that this year's KEY-RING-O COMBINATION gives you SAFETY and ECONOMY when we tell you that the entire outfit will be mailed postage paid for only \$1.22 and if you can duplicate this combination elsewhere for \$1.75, you may return it to us and we will immediately return your money, together with all postage you have paid. Isn't that fair? This is our method of advertising and you get the standard line of goods at our expense. However, we reserve the right to return money when our supply is sold out. Last year we returned 2527 orders that came too late.

C. H. GORDINIER, Dept. J, TROY, N. Y.

RILEY'S WHITE WYANDOTTES

Won Best Display at the Chicago Coliseum Poultry Show, Dec. 1916

This, added to my record of six firsts, three seconds, two thirds at the Ohio State Fair the year before, proves their quality as breeders. They are bred-to-lay with the same care they are bred to win.

My 1918 Matings

are better and stronger than ever before. They include my 1st and 2nd cocks, 1st pen cockerel, 2nd pen cock at Chicago and my other winning males and females. Will sell you eggs from every pen I own. Eggs for hatching, \$3, \$5 and \$10 per 15. From \$5 and \$10 matings I guarantee 100 percent fertility, a chick in every egg, replacing every infertile egg returned to me. Some strong, sturdy, selected cockerels, exceptional quality for the price at \$5, \$7.50 and \$10. Write your wants and for catalog; it will pay you.

H. J. RILEY Box A BRYAN, OHIO

true, then we are a long way from victory and going further.

We do not doubt that some efficiency expert posing as a poultryman had something to do with getting this thru, as really it seems that some who should know better have a leaning this way.

While it may not be possible to sell off hens and pullets before the last of April as the order now stands, but tell me what is to prevent the man who is up against it from hypothecating his stock, and then when the time is up selling them to satisfy indebtedness. And those who would have to move old stock to make room for chicks, what will they do? For instance, the brooder house we used last year contains several hundred pullets. If we depend upon this building for this purpose, it will be impossible for us to hatch anything for our own use till in May. A neighbor who has to sell off some stock (death taking away the two members of the family who took care of the poultry) is between the deep sea and the iron works.

I am sure it would not require much imagination to call up all the instances where it will absolutely prevent rearing an adequate amount of young stock and thousands of cases more where they fear to take a chance of raising a lot of stock, for should crops be poor this year, prices would be prohibitive for feeding grains, and what, pray, would prevent "Jack-in-the-office" from clapping on another ruling to "save the industry?"

Incidentally the day the ruling went into effect, we had a letter from W. F. Priebe of the Food Administration, wherein he closed with this sentence: "Please bear in mind that we realize the trouble of the poultry and egg producers and we are doing everything possible to encourage this industry."

Needless to say we are unable to reconcile words with deeds!

Washington,

E. R. Johnson.

Drop in Egg Prices.

It should be apparent to anyone that the tremendous drop in egg prices is not the result of over-production but of clever manipulation by the packing interests. The receipts of eggs in leading markets shows a shortage of eggs. The prices of feeding grains continue to go up in price. It looks as tho "our representative" on the food administration who is serving our interests (?) for the princely salary of \$1 per year, while drawing \$10,000 or more annually from the packing interests, is working for the interests which pay him the better salary.

Many regrets have been expressed that the poultry producers of the nation have no organization to back them in bringing about a change in the present chaotic condition of affairs. But we need not worry over a lack of organization, for at any time like this each producer is a power which no combination of interests can control or overthrow. While we are gladly giving our sons and freely giving of our stores to "make the world safe for Democracy," let us not be slow to demand a full measure of true Democracy at home and the consequent removal from the Food Administration of the packing house representatives. Our Milk Producers' Association has just been told that we should be glad to produce milk and sell it below production cost at this time, but in the face of the packing interests controlling the Food Administration for private gain this suggestion will not be responded to with enthusiasm.

We are all ready and willing to help feed the world and shoulder our full share of the world's burdens, but we ask in all fairness that the administration of food be removed from the control of the profiteers, who are even now working overtime to cover over their tremendous profits by an increase of capitalization.

This is a time when all the players should be required to place all their cards on the table in plain sight.

Maryland.

S. P. Brown.

Gardner, Ill., March 7, 1918.

American Poultry Journal:

Your paper certainly gets the business. The two small ads I have carried in your paper for the last four months have got me inquiries from nearly every state in the Union. I have sold all my surplus stock and could have sold a lot more, for the Dark Cornish and Mottled Houdans are in great demand.

Yours very truly,

L. MADSEN.

THE HOME FLOCK.

By CHARLES J. FISK,
Vice-President American Poultry Assn.

THE keeping of a small home flock of laying hens by every family living in a suburban town or village or having a small back-yard in connection with a city home will do more to help provide food necessary to maintain our men in the army and feed the people at home than can be accomplished by any other means. At the same time it is a practical way of reducing home expenses and regulating the cost of living.

The size of the flock should be regulated by the number of persons in the family to be fed and the amount of table scraps, kitchen and garden waste (that otherwise would be thrown away) which can be used for feed. From two to three hens for each person in the household should keep a family supplied with all the fresh eggs they require.

THE SPACE REQUIRED IS VERY SMALL.

A house with a floor space 8 feet by 8 feet in connection with a yard 20 feet by 25 feet will be about what is required for a flock of 20 hens. In other words, about three square feet floor house space and 25 square feet yard space for each hen. In cases where yard space is not available, small flocks, have been successfully taken care of in a house allowing 10 square feet of floor space to each hen—say a house 8x16 ft. or 10x12 ft. could be used for a flock of 10 to 12 hens—where they are to be kept confined at all times to the house. A number of manufacturers now make portable houses especially adapted for the above purposes at very reasonable prices, which can be put together by the purchaser very easily without the need of a mechanic.

Houses can also be very simply constructed at home. Description, plans and directions can be obtained free by writing the Bureau of Animal Industry, U. S. Department of Agriculture, at Washington, for Farmers' Bulletin No. 889 "Back-yard Poultry Keeping."

A home flock of hens is a small number kept by each householder practically to produce eggs for home consumption. The time to start keeping such a flock is in the late summer or early fall. The birds should be strong, vigorous, well grown matured pullets from chicks that were hatched early in the spring. For the best results they should be one of the Standardbred varieties, from a good heavy laying strain that have been raised on an open range and kept constantly growing from the start. The best way to procure such birds is to order now from responsible breeders and have them raised especially for you.

Unless a person has had some previous experience in breeding and raising chicks it is not advisable for the amateur to start by trying to raise the baby chicks. Chicks should be raised in the country on farms — where they have plenty of place to range and grow in the natural way—not in a confined space. The variety or breed best adapted for the "home flock" depends very much on conditions and location. For many reasons what are known as American and English general purpose breeds are preferable, such as the Plymouth Rocks, Rhode Island Red, Wyandottes, Sussex, Orpingtons, etc., these are more easily confined and kept within bounds. They

Baby Chicks

Graduation Day at Uhl's

50,000 Baby Chicks are graduated from our HATCHERY every week

They go out to face their battle with the world, backed up by the strongest constitutional vigor and the best breeding. Many of them make their mark — see the testimonial below. They are from 18 varieties of

Rocks, Leghorns, Wyandottes, Reds, Orpingtons, Anconas, Minorcas, Spanish, Brahmas

We receive hundreds of reports stating how well pleased our customers are with the fine quality and laying ability of the birds they raised from our chicks.

THIS IS OUR 18TH YEAR

M. Uhl & Co.

*From the fifty baby chicks bought from you, I won seven prizes and a handsome silver loving cup for best display on an entry of thirteen of your birds; 2d and 3d cockerel; 2d, 3d and 4th pullet; cockerel 2d pen and four pullets 3d pen. I am highly pleased to recommend your concern for this high quality and the fairness shown me. Respectfully yours,
P. M. Griffin, Ft. Wayne, Ind.*

BEST DISPLAY AT THE CHICAGO COLISEUM SHOW, on Rose Comb Reds

has been won for

Five Successive Years by Longfield REDS

A record, to the best of our knowledge, never duplicated by any R. C. Red breeder at any National Show. Twenty of the first premiums at this great Red show in the last seven years have been won by us. Another record, LONGFIELD REDS, the strain that comes back and wins year after year where the competition is strongest.

Write for catalog giving winnings in detail and our interesting guarantee of 15 chicks from each setting of our best eggs.

Longfield Poultry Farm, Box 321 Bluffton, Ind.

PURITAN POULTRY FARM Single Comb White LEGHORNS

The kind that lay at 4 to 4½ months of age, bred exclusively by us for the last 18 years on the largest poultry farm in S. E. Ohio. We are selling

Baby Chicks and Eggs

from 200-egg record pens, all from our own nests, standard-bred stock, the same as we use in our own flocks, at very reasonable rates. We have

bred for years for heavy egg-production, and our birds have heavy laying ability bred in the bone. A limited amount of breeding stock for sale. Send for our literature. We guarantee to please.

PURITAN POULTRY FARM - Newark Road - ZANESVILLE, OHIO

S.C. White LEGHORN EGGS

FROM McCORMICK POULTRY YARDS COFFEYTON, MO.

From Heavy Laying, Range Raised Hens

For 11 years on our farm we have bred for production alone. Every hen that we have mated for this year's setting egg business has been bred on our farm. Every one is 3 years old. Every one a 200-egg a year hen in her pullet year. Every one mated to cockerels of our own breeding that possess the heavy-laying ancestry. EGGS, f. o. b. our station, \$7.50 per 100; \$3.00 per 30. Our sales of table eggs from our farm during 1917, in St. Louis alone exceeded 12,000 dozen.

McCORMICK POULTRY YARDS - COFFEYTON, MO.

Rose QUALITY R. I. REDS Single

At the late Cleveland Show, with 30 head shown, 29 were under the ribbons. My 1st prize and color special Rose Comb cockerel was pronounced by the judge a wonder; one brilliant even shade of red, splendid markings; head and comb can't be beat. Every female in my 5 best pens of each Rose and Single Combs has a dark, glossy hackle, mated with males of a dark, even velvety red, and chuck full of quality. Eggs from best matings, \$5 and \$10 a setting. Other good matings, \$8.00 per 100. B. M. BILLINGS, Box A, Elyria, Ohio

Everlay Br. Leghorns

Opportunity knocks! Don't be deceived in the contents of an egg because it is cheap. Disappointment is sure to follow. Place your order for EVERLAY eggs now. America's greatest winning-laying strain. Madison Square Garden record never equalled. Laying ability unquestioned. Eggs from special matings or bred to lay flock priced reasonable and shipped safely anywhere. Catalog. H. V. TORMOHLEN, Box 2, Portland, Indiana

lay a large rich brown shelled egg. If white shelled eggs are more desired, the Mediterranean breeds, Leghorns, Anconas, Campines, etc., these, however, will require yards or runways to be covered, otherwise they will fly out and become troublesome.

WHAT IS THE REASON AT THIS TIME FOR RECOMMENDING AND URGING THE KEEPING OF A "HOME FLOCK" OF HENS?

This is a most natural question and most easily answered.

The United States is now involved in the greatest war for freedom and liberty the world has ever known. The war will and must be won. There is no compromise and no going back. The future peace and prosperity of all nations on the globe depend on the outcome—the final victory. Hundreds of thousands, yes, millions of our growing and best young men and also women will be called upon to go to the front, giving up their families, their business, their very life for this great cause. Some are already on the fighting line, others in camps both here and on the other side—preparing. Not only this great army, but the armies of our Allies must be fed. The United States must furnish the greater amount of food required. Every pound of beef, mutton, pork, wheat, and many other commodities must be reserved for this purpose. Those of us at home that cannot go—for reason of health, age, or any other just cause—must not only do our bit, but our all, to win. The United States Food Administration asks us to substitute poultry and poultry products to as large extent as possible—to take the place of the other food that is so much needed. In order to do this, the amount of poultry raised must be increased—not only doubled, but trebled or quadrupled, the larger the amount the better. Chicken can be matured in five to six months—cattle, hogs, sheep, etc., take much longer. Everyone that has 20 feet square of yard space can keep chickens to advantage. Everyone should.

IT IS A PATRIOTIC DUTY.

Every farmer and poultry breeder should hatch and raise every chicken possible. Write the United States Department of Agriculture or your State Agricultural College for instructions and methods of back-yard poultry keeping.

Be a patriot—order your flock at once and make your preparations to care for them.

Poultry can and will help win the war.

"P" stands for Poultry, Patriotism, Pleasure, Profit.

FROM BOSTON TO A POULTRY FARM.

By EMORY H. BARTLETT, Enfield, Mass.

I WAS living in Boston, Mass., up to 1908, when I took my grandfather's farm of 200 acres and started with poultry. Had always spent my school vacations on the farm, as well as the college vacations, so had learned to love nature. The freedom of life in the country is not a reality until you try it. Mine may not be exactly a specialty farm, as I have egg-bred S. C. White Leghorns, apple orchards and am starting a Holstein dairy herd. I think in war times it is well not to have your eggs all in one basket, and as long as you don't neglect your birds, everything works together. Last year I raised thirteen acres of Sanford White Flint corn, Rhode Island strain, and, believe me, my little Italians have appreciated it this winter. I bred White Plymouth Rocks first and they were good birds, but one year I was obliged to leave home, for three weeks, when I should have been starting my incubators, and the thought came to me, Why not raise some Leghorns this year? They will mature in time for November layers and the Rocks won't, at this late date, so I ordered eggs from two prominent breeders, got a good hatch, and have never had any reason to regret starting with them. I had used trap-nests to some extent with Rocks, so started with trapping the Leghorns, and the next year I trapped my breeders and pedigreed the chicks. It is very interesting and in no other way can you learn as many things as the trapnest teaches you. You learn to select the birds that can and do produce their own equals or better, and use that blood to increase flock average. To be sure, it takes time that not every man can give to the work, and might in my own case, were it not that my mother is the trapnest artist and skilled in her profession, a lover of good birds and an expert raiser of baby chicks, which means everything to me. We start our chicks on sour milk, which is the best food I have ever used. Give them all they can eat the first two days. I give no water until the third day and

A Healthy Army of Baby Chicks — that's what we need this spring

Chicks with perfect digestion—all around sound health—that flourish instead of flounder in those first six weeks.

We need them to meet the demand of "Poultry—more poultry" which the nation is making.

COMMON SENSE BABY CHICK and Developing Feed

—is not only a nourishing, balanced ration—but it a **health creating** feed—clean, fresh, sweet—every fraction of every grain of it! It has been **tried** and **proved**. On the Walter E. Flanders farm, where the largest flock of S. C. White Leghorns in the world is bred—you'll find **COMMON**

SENSE FEED is the every day diet.

We guarantee better results with it. If you don't get them we buy back the feed you have left and pay freight charges **both ways**.

Send in your order now—and guarantee yourself a lower mortality rate among your chicks this year.

they have learned to like the milk, so that they are always crazy for it. After this I use commercial chick feed, feeding carefully, five times a day. Of course I give them grit, fine oyster shell and charcoal all the time. After they are old enough to take wheat and fine cracked corn, equal parts, that has always been my feed, with soaked oats once a day. Just what it will be this year, minus wheat, no one can tell, but we will be able to get something to take the place of our good wheat, as long as it is needed by our boys "over there." I do not trapnest my entire flock, as one house, near our dwelling house, will only house 125 birds, and this furnishes me with the necessary breeding birds and some to spare, as I keep all my exceptionally good producers as long as I can. Have four year-old hens in every pen but one this year. Last year I had twenty-eight birds, out of 119 trapped, that laid over 200 eggs, 279 being the highest record. The best record hen I have ever trapped laid 288 eggs from November 16 to November 15, and 307

First Buttercup pullet at Chicago Coliseum, December, 1917, and first at Greater Chicago Show, January, 1918. Owned by O. B. Disenroth, Lawrence, Mich.

up to December 14, when she stopped laying. This bird grew most of her new coat while laying. She was the daughter of a July hatched chick, who laid 233 eggs after January 6. This was a partial record, as she was in one of my laying houses; on that date I noticed her and picked her off the nest to see what she was made of. She was very wide between the pelvic bones, had extreme distance between the pelvic bones and keel, with that soft fine skin that is characteristic of the heavy layer. Twelve of her daughters that I trapped last year averaged 224 7/12 eggs. This was when she was mated to a high record male, sire's dam 287 eggs. She was exhibition type, a beautiful head, long body, low tail, well spread and no break at base of tail, a blood-red eye, and yellow shanks, which proved to me that beauty and utility could be combined. I made an interesting trade recently, when I exchanged six cockerels and two hundred eggs for hatching for an A. R. O. four months old bull calf, a son of a \$15,000 bull and grandson of King Segis Pontiac Alcartra, the famous \$50,000 bull. So you see even chickens can be used to advantage in a general farming plan. I wanted a herd sire and my customer wanted my birds and came to buy, with no idea I wanted anything he had to sell. This may be digressing, in a way, from poultry, but not as poultry keeping includes general farming. Possibly

THE PARCEL POST BAG CO
MANUFACTURERS OF
EGG CARRIERS—LAUNDRY CASES.
SOUTH BEND, INDIANA.

Mr. Poultryman:
Dear Sir:

We have had a number of inquiries from purchasers of our Parcel Post Egg Carriers asking where eggs may be purchased. We will in the future please in each case send a list of poultrymen and farmers who desire to sell eggs direct to the consumer by using the Parcel Post Service.

WE WANT YOUR NAME ON THESE LISTS. The trade going to you in this way will be from the best class of reliable buyers who will gladly pay the mailing charges both ways and from 10% to 25% MORE THAN YOUR LOCAL MARKET PRICE for fresh eggs.

Placing your name on these lists does not place you under obligations to sell, though by doing so you will have an opportunity to establish a trade with reliable people who will pay you well for the large trouble in packing these cases.

THE MONEY FOR YOUR EGGS WILL COME WITH THE CASE unless you and your customers make other arrangements or payments. No matter where you live if you have a dozen or more eggs for sale each week just send us a postal stating about how many you can sell per week and we can soon locate a steady reliable customer for you. THIS SERVICE IS FREE TO YOU.

Yours very truly

it may be an incentive to other farmers to raise more and better poultry (accent the word *better*). At the present time it is not much use to tell anyone what your system of feeding is, as you never can tell what a car will unload in shape of grain. All I can say is that I try to feed a ration as well balanced as possible, with plenty of mangel beets, turnips or cabbage for green feed. Give them plenty of fresh water, with grit, shells and charcoal, a good scratch litter to work in and an egg-bred Leghorn will pay you a good profit. There is a good living to be made from poultry alone, if one is not situated so that he wishes to carry on general farming. The only thing needed is good stock and energy. Without the latter no one makes a success in any line of work. Trapnest your pullets if you possibly can, but if you cannot do that, select your breeders from the late layers. The birds that are laying after October will give you stock worth while and the birds that are laying in November and December will be still better. Select a few December layers, and if you are not sure of your own stock, get an egg-bred cockerel from some reliable breeder and mate him to that pen of birds, saving cockerels from that pen to mate with your other birds. I cannot imagine a more beautiful sight than a flock of well bred S. C. White Leghorns on range, green grass, apple blossoms and the white beauties. An apple orchard is the ideal place to raise them, as it benefits both trees and birds. Even if one has not a large amount of land, he can raise a few chickens to his own advantage, and I am sure that when Uncle Sam needs our help, as he does now, no loyal man or woman will fail in doing his bit, be it large or small.

First Missoula Public Schools Egg-Laying Contest.

THE following is the first report of the Missoula, Mont., Public Schools Egg-Laying Contest. It covers the month of February, 1918. Not only has the contest aroused a great amount of interest among the students, with the result that many of them are already planning on raising more and better poultry, so that they will be better equipped for the next contest, but it has also brought out many points of information of general value, among which are: Number of pounds of feed consumed by the average bird of the large breeds and of the small breeds, also cost of food per bird; number of eggs laid by the average farm hen; average food cost to produce a dozen eggs on the farm, especially in winter when the birds do not have the advantage of free range and all of their food has to be provided. All of these and other points are being brought out and worked upon by the students.

Just a word regarding the contest, *the first to be held by a grade school in America*. The building is after the plan of the Missouri "Farmers' Fool Proof" hen-house, the style of house used at the America Contest being held at Leavenworth, Kansas; size of house is 14x14 feet, divided into two pens 7x14, one for the light flock and one for the heavy flock. The lumber for the building was purchased by the Board, the boys of the 7th and 8th grades built the house, also the feeders and trapnests as a part of their manual training work; the boys and girls of the 6th, 7th and 8th

Enlist!

in the Poultry Producers Brigade

And help win the war by raising chickens in a

Liberty Colony Brooder

Build it yourself. Easy! Requires a few feet of lumber, a few joints of stovepipe. We send complete plans and all equipment. Gives you a brooder 44 inches square with all space under canopy available for brooding purposes. Has capacity of average coal-heated brooder. Uses Sol-Hot Oil Lamp and stovepipe hot air system.

Writes: "Have your Colony Brooder running. 410 chicks under it. It's a splendid brooder. Work is less than with coal stoves." Equipment consisting of Sol-Hot Lamp, Regulator and Thermometer, \$5.00.

SOL-HOT WICKLESS BLUE FLAME OIL GAS LAMP

Burns coal oil but by combining about 95% air with 5% vapor from this inexpensive oil, produces a perfect blue and Sol-Hot flame. New automatic oil filter enables it to burn low grade oil perfectly. Visible oil feed gives absolute flame regulation and prevents flaring or creeping of flame. Equipped with safety shut-off and automatic flame control. Leaves no residue, smoke or soot. No wicks to trim--no danger.

Made in three sizes. Will increase the efficiency of any standard incubator or brooder. Write for booklet describing it.

Liberty Hatcher

is made in two sizes, 70-egg and 100-egg capacity. Nest type. Eggs held in circular rows by inclined rings in deep hatching tray. Chicks drop into nursery beneath as they hatch. Combined damper and flame regulation and construction of egg chamber give uniform heat and save fuel. Surplus heat and foul gases escape automatically. Has standard first class equipment. Durably built--heating system welded by electricity. Costs little--takes little space. Try for one hatching. If not satisfied, return and money will be refunded.

Write for literature on Liberty Hatcher, Liberty Colony Brooder, Sol-Hot Lamp, Regulators, Lamps, Tanks, Heaters, etc. Free plans for building your own incubators and brooders.

send the two children passing the best examination in poultry work, together with a model of the house, trapnests, feeders and the hens laying the most eggs, to the fair. The examination papers will be graded at the Bozeman Agricultural College.

Regarding the birds in the contest: Twelve of the children brought three birds each, 36 in all; one-half being from the heavy breeds and the other half from the light breeds. Each child selected their own birds, which, I believe, are fairly representative of the standard of poultry kept on the average Western farm with regard to breeding, raising and care. Some were good, some fair and the others poor, very poor, especially in the case of the Leghorns.

None of the egg records made for the month were very startling; five birds, or only 7 percent, laid enough eggs to pay for their feed and a little over. The rest were kept at a loss. Figuring the contest as a whole, each bird was kept at an average loss of 24½ cents each, or at the rate of \$24.50 on one hundred birds per month, which amount will fairly represent the loss on every 100 hens kept on the average farm for at least each of the months of November, December, January and February. Yet the government has prohibited the slaughter of these very birds until after the breeding season is over and ninety percent of the farmers will keep and breed their next season's layers from this stock. *The pity of it!* If the American farmer is going to produce eggs as a part of his share in winning the war he will surely have to change his stock and manner of caring for his birds. For he is rendering scant aid when every dozen eggs he produces is costing on an average of \$1.37 for feed alone, to say nothing of labor, interest and depreciation charge. The best layer produced a dozen eggs at a feed cost of 30 cents a dozen, not including the cost of the straw for litter and returned a balance of 32¾ cents for the month or at the rate of \$32.75 for one hundred like birds.

A summary of the total number of eggs laid and feed costs for the 36 birds for February follows:

Total eggs laid.....116, or 9¾ dozen
Average selling price.....57½c per dozen
Value of eggs.....\$ 5.60
Cost of feed for February.....14.32
Loss for month.....8.72

The dry mash contains material for 2½ whites to every 1 yolk. We have tried to make the white and yolk material as nearly equal as possible by the feeding of other feed, oats and corn, which are higher in yolk than white material. However, the birds seemed to relish the mash, especially the heavy birds, and consumed nearly as much mash as grain, with the result that they got more white than yolk material. This month we will keep the dry mash hopper in the heavy pen closed until noon and increase our sprouted oats, will also feed carrots and in this way hope to get the ration more evenly balanced. The amount of feeds consumed in February, with their white and yolk content follows:

Oats 70 lbs. 137 yolks 108 whites
Corn 119 lbs. 270 yolks 159 whites
Mash 158 lbs. 304 yolks 648 whites

711 yolks 915 whites

The Burlington Smashes All-Watch Competition Look!

21 Ruby and Sapphire Jewels—Adjusted to positions—Adjusted to temperature—Adjusted to isochronism—25-year gold strata case—Genuine Montgomery Railroad Dial—New Ideas in Thin Cases.

Only \$ **2.50** A Month

And all of this for \$2.50—only \$2.50 a month for the masterpiece of watch manufacture—direct to you—positively the exact price that the wholesale dealer would have to pay. Think of the high-grade, guaranteed watch we offer here at such a remarkable price. And, if you wish, you may pay this price at the rate of \$2.50 a month. Indeed, the days of exorbitant watch prices have passed. Write today—now.

The Newest Cases

In our new watch book, that we will send to you free and prepaid, you will see illustrated the newest ideas in watch cases. The latest triumphs of the master goldsmiths. Notice especially the Inlay Enamel Monograms, Block and Ribbon Monograms, Lodge Emblems and Diamond Set Cases. All offered direct to you on this startling offer. Send the coupon today.

See It First!

You don't pay a cent to anybody until you see the watch. You don't buy a Burlington watch without seeing it. Hold it in your hand and admire it. Notice the design, handsomely shaped—aristocratic in every line. Then look at the work! There you will see the masterpiece of the watch makers' skill. A perfect timepiece adjusted to positions, temperature and isochronism.

Free Watch Book

Get the Burlington Watch Book by sending this coupon now. You will know a lot more about watch buying when you read it. You will be able to "steer clear" of the over-priced watches which are no better. Send the coupon today for book and our offer.

Shoemaker Poultry Farm

Freeport Illinois

Established Over 28 Years

NOW is the Time to Hatch

Don't put off ordering your eggs any longer. Hatch this month and have your pullets large enough to lay next fall and winter when eggs are high. The freezing cold is now past and the chances of accident are reduced to a minimum. The supply of breeding stock in the country is getting smaller and smaller every day. Are you going to be one of the far-sighted ones and have a good-sized flock established when the rush comes? Start right. Buy

C. C. SHOEMAKER, Box 605, FREEPORT, ILL.

An Appeal and a Warning.

Editor American Poultry Journal.

Dear Sir—I have mailed to you copy of the appeal of the Hon. Frank O. Lowden, Governor of Illinois, to the farmers of the state to produce a normal crop of poultry and eggs and make increases whenever possible.

In behalf of the Department, I want to urge upon you the importance of giving this appeal of the Governor as much publicity as you can. The very serious shortage of the wheat crop, which has come to light the last few days as the figures have been compiled and made available, simply means that we must eat more meat and less wheat, and the animal industry of this country cannot stand the drain under present conditions unless every effort is made to maintain a normal production in all lines and make material increases in poultry and eggs.

The burden of doing this falls upon the farmers of the Mississippi Valley. Here we have the feed and there is some balance existing between the feed produced and the poultry that is grown and kept. The situation is becoming serious and we all know that this is the time when the farmers and poultry people either get out a big hatch or they do not.

I sincerely trust that you will take up the appeal of the Governor of this state and give it the proper publicity.

I have also sent to you a copy of a short item which is something in the nature of a warning to poultrymen and farmers not feed moldy corn. The condition of the corn crop is the worst in the history of the state. Unless a great deal of this corn is kiln dried it cannot be cracked. I understand that there are poultry feed people who are taking this soft corn which cannot be cracked and smashing it, and making mixed poultry feed. As a necessary precaution, they are putting on the bag, so I have been told, a statement to the effect that the bag of feed should be emptied at once. This rotten, moldy, poisonous corn can be purchased at as low a price as 50 cents a bushel. It is especially important that we warn all feeders against the use of moldy corn. As feed on the farm gets scarce before the next crop comes along, and it is very likely to be because the corn is not keeping, the temptation to feed this poisonous stuff to chickens will be very great.

I earnestly hope that this circular letter will enlist the co-operation and public service of each of the four poultry papers published in

No. 20, 200-Egg Improved X-Ray Incubator, 1918 model. Manufactured by X-Ray Incubator Co., Dept. 10C, Des Moines, Iowa.

the State of Illinois. What I alone can do is very limited. It is only thru the co-operation of all the agencies in the state, including the poultrymen, the farm advisers, the daily press, the farm papers and the poultry papers that we can hope to make this poultry campaign measure up in some way to the importance of the great industry in which we are all so vitally interested. Yours truly, Frank L. Platt.

Raise Poultry as Aid in War, Lowden Advice.

Springfield, Ill., March 15.—Farmers of Illinois are told in a statement issued today by Gov. Lowden that they can do a real war service by raising poultry. The statement given at the request of Frank L. Platt, Extension Poultry Husbandman, U. S. Department of Agriculture, in co-operation with the State

College of Agriculture, Urbana, follows:

"I cannot too strongly urge upon the farmers of the state to give special attention to poultry raising this year. I do not mean by this commercial poultry raising upon a large scale. But every farm can carry a considerable amount of poultry, with but little care and little expense. Poultry will subsist largely upon what would otherwise go to waste on the farm. To this extent, we may regard poultry as a by-product. And, to this extent, it is the cheapest food produced upon the farm. The value of the annual poultry production of Illinois is somewhere near \$25,000,000, as I am informed. This could be greatly increased. The reason why the production is not larger is that the farmer, usually regarding it as a mere incident to his work, keeps no accurate account of the value which he produces in this way. If he did, he would be amazed to find how substantial a part of his living comes from this source.

"The food question looms larger and larger all the time. The largest production possible, within the limit above suggested, may mean, another winter, the difference between ample food and real want."

(Signed) Frank O. Lowden.

Licene

Exterminates all Chicken Lice as if by Magic

When such breeders as Mrs. Helen Dow Whitaker, E. B. Thompson, Dr. N. L. Smith, A. C. Hawkins, O. F. Mittendorf, Prof. T. E. Quisenberry, Len Rawnsley, U. R. Fisbel, A. A. Carver and thousands of other big breeders that have had years of experience in raising poultry, endorse and use a preparation as the best, it must have exceptional merit, and will do all that is claimed for it.

LICENE Makes Hens More Profitable

No hen can lay her best when tormented by lice. Kill the lice and watch the increase in your egg production. E. B. Thompson, breeder of Barred Rocks, writes:

I have tried LICENE with the very best of results; it is a most excellent preventive of lice and a quick exterminator. LICENE should have a great sale to poultrymen who must appreciate its value after being tried.

LICENE Cheapest Lice Killer Known

Price, 60c a Tube, Postpaid Sufficient for 150 to 200 Fowls

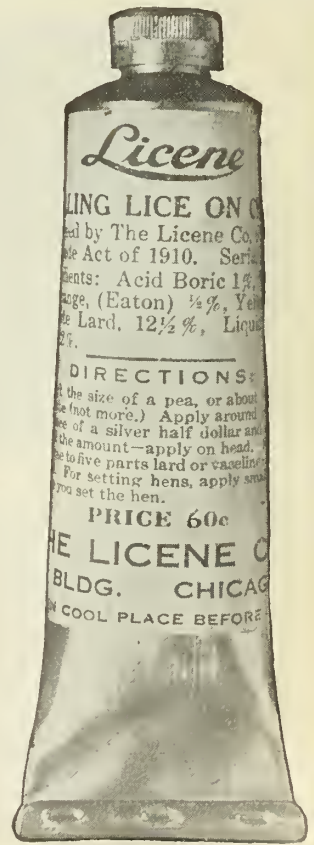

LICENE is applied twice a year, but many report that they have found one application a year sufficient. When you stop and consider that one tube is sufficient for 150 to 200 birds, you must realize that LICENE is cheaper than lice powder and liquid lice killers. It is also more conveniently handled and more easily applied, saving time, labor and money, making LICENE not only the best but cheapest lice exterminator the world has ever known. Put up in collapsible tubes, which prevents waste. Remember LICENE will not injure the birds in any way or destroy fertility of eggs, so with our positive guarantee you take absolutely no risk in giving LICENE a trial.

Positive Satisfaction Guaranteed or Money Back

If Licene does not destroy every louse and "nit" (egg of a louse) or does not clean scaly legs on your chickens, or if applied on sitting hens, and does not prevent head lice on chicks—you are the judge—we will refund your money if you notify us (or our agent) within one month after receiving Licene and no questions will be asked.

The Poultry Doctor FREE This little book is worth its weight in gold to any one raising poultry. Thousands of poultry breeders are following its suggestions with success and profit. It contains 16 different tested and proven formulas of remedies for diseases common among fowls. It is invaluable to the beginner and experienced breeder alike. Remember it is absolutely FREE, so just send your name and address for it

FOOD ADMINISTRATION EXPLAINS POULTRY EDICT.

HOUSE OF REPRESENTATIVES, U. S. COMMITTEE ON THE JUDICIARY.

Washington, D. C., March 13, 1918.
Dr. Prince T. Woods,
Silver Lake, Plymouth County,
Massachusetts.

Dear Dr. Woods:

Supplementing my recent letters, the Food Administration advises me as follows:

"The live hen killing order (Rule 15, marked 14 in error) which prevents licensees from handling live or freshly killed hens or pullets until after April 30, was promulgated to stop the enormous slaughter of hens during the laying period, especially in the corn belt and Southern States, from which the great bulk of the commercial supplies of poultry and eggs are derived. The order does not apply to the sale of pullets below 2 pounds in weight, to the local sale of poultry by the farmer, to the retailer or consumer who is not licensed, or to the sale of pullets or hens for egg producing purposes.

"There has been a steadily increasing sale of poultry on account of the increasing cost of feed and labor, and the high prices paid for poultry. It is estimated by the Department of Agriculture that the United States is now at least 50 percent short on poultry on farms. Every effort is being made by the Department and by the poultry departments of the agricultural colleges to check this rapidly increasing slaughter during the egg-laying season. The order supplements this effort.

"It is estimated that 95 percent of the live poultry shipped during the period comes from Texas and the states each and west to the Carolinas and Tennessee. From one of these states 40 carloads of live hens, or 160,000 in all, were shipped during the month of January, thereby destroying approximately 5,000,000

eggs before May 1. An investigation of the hens on arrival in the markets showed that 25 per cent were laying eggs and that a large proportion of the balance were about to commence laying. In the territory west and east of the Ohio, the order has no particular economic effect, because less than 5 percent of the commercial live hen movement takes place during this period from this region.

"The order is having the desired effect in keeping the laying hens on the farms to increase the national egg supply and to provide the broods of chicks for next year's layers. It is preserving one of the greatest agricultural industries from demoralization similar to that which has taken place in our allied countries, in some of which the supply of poultry and eggs is confined almost wholly to hospital and invalid use."

This is very little satisfaction for the complaints that have been lodged and it does not appear to me that true appreciation of the situation is possessed by the officials.

Yours very truly,
Joseph Walsh,
16th District, Massachusetts.

The Food Administration asks us to believe that farmers in the "corn belt" were sacrificing laying hens and that this brought about the order. As if the government could legislate the American hen into profitable productivity, even "in the corn belt and Southern states." Of course, the hens marketed were being culled out to make room as is usual in the spring. The season in the South and Southwest is considerably in advance of ours in the North. Certainly farmers were not marketing profitable layers. Such a conclusion is absurd.

We would like to know about the poultry in those "states East and West to the Carolinas." Probably the man who gave birth to that has a bright vision of crossing the American hen with Massa-

100% Brooder

SEE THESE FEATHERS?

They raise chicks to maturity with the least mortality.

The little chicks are helpless and cannot prevent you from housing them wherever you please, but instinct tells them that feathers will keep them warm and for this reason they take to the Simplex Perfection Feather Brooders like young ducks take to water—and they are perfectly contented and well cared for when they get inside.

Raising baby chicks to maturity assures your success as a poultryman, the loss of baby chicks predicts failure. You cannot afford to experiment. Experiments are costly. Nature did the experimenting long before you were born—therefore raise the chicks the way Nature intended them to be raised—under feathers.

What Feathers Really Are

Perhaps you are one of the many people who do not realize that that a feather is entirely different from any manufactured ma-

terial. It is one of Nature's products and when analyzed it will be found that feathers are composed of nothing but air, with the exception of the quill. They are also non-conductors of heat and cold and therefore are perfect retainers of body heat; that is reason why

"Simplex Way is Nature's Way"

No matter whether the chicks were hatched with incubators or hens, the Simplex Perfection Feather Brooders will take care of them and raise them into strong, healthy, vigorous birds; the kind that count. If you hatch with hens take the chicks away, put them in one of our feather brooders and they will not bother their mother. Let her start laying again and make egg money for you. She won't do it as long as the chicks hover around her, but she will if the chicks are put in the Simplex Perfection Feather Brooders.

This shows The heating attachment

SIMPLEX BROODERS are made in both heated and fireless construction. Also in hover form for heated brooder houses. The Prices range from \$3.00 to \$11.00. The sizes from 50 to 150 chicks.

Investigate these brooders before your next hatch comes off. Send for our complete catalog—you will not regret it.

SIMPLEX SUPPLY HOUSE 1300 Pontiac Bldg. Chicago, Ill.

chusetts' Sacred Codfish, in order to secure the wonderful egg yield of the latter.

It is rank humbug to try to make anyone believe that the 40 carloads of live poultry, containing 160,000 hens, were examined on arrival at market to determine their fecundity. Who were these "experts," with X-ray eyes, who discovered that "25 percent were laying" and that "a large proportion of the balance were about to commence laying?" Tell us, Messrs. Hoover and Priebe, who are these phenomenal prognosticators of the ability of these cull hens from farm flocks to produce eggs, after their owners had decided them to be no longer profitable? If Uncle Sam does not need these Argus-eyed gentlemen in his secret service, they might make a fortune Hooverizing the farm flocks of the country.

That statement concerning 5,000,000 eggs is just weak camouflage. Up to the time those hens arrived in the market it may be assumed that the eggs were saved. Rule 15, erroneously labeled 14, was not announced until the evening of February 11—it did not become effective on contracted for stocks until February 23—and it expires April 30. Taking the maximum limit of the rule, it is effective only 78 days. Does Mr. Hoover expect us to believe that 40,000 hens—cull hens from Southern farms—could be expected to produce 125 eggs each in 78 days? Has he, among other things, discovered the two-eggs-a-day hen, and in carload lots? Even if each and every one of those 160,000 hens should have been unusually productive, are we to believe that in the brief period up to May 1, 78 days at time edict was put into effect, that they would average in that time to produce 31.25 eggs each, or a total of 5,000,000 eggs? Just remember that the average farm hen does not average to produce more than 7 dozen eggs in twelve months, or 365 days. This egg talk and explanation is just camouflage and a very poor quality at that. Any man who could hypnotize the American farm hen into such wonderful productivity as the Food Administration pretends to expect of her, could befoozle "Kaiser Bill" into an immediate and unconditional surrender. We should send him "over there."

Advices from England show that eggs there were selling for 6d.—12 cents—each the first week in March and the poultry industry is taking a new lease of life. In New England the poultry edict and arbitrary interference with the poultrymen's business succeeded in smashing the price of eggs until on March 15 eggs were selling on the farm at 30 to 35 cents per dozen and the prices of grain and feeds were advancing. Fresh-killed and live fowls were practically eliminated from our markets, removing all competition of the Western-killed poultry sent in by big packers and shippers. Prices of this Western-packed poultry climbed very high and a movement to induce the public to "eat more poultry" was started.

It is pretty well known that big business in the West has for a long time been trying to kill competition by the large independent Eastern egg farms and market poultry plants. Plants which ship to big Eastern markets from a few cases to 30,000 and 40,000 dozen eggs annually and from a few hundred pounds to from 3 to 5 tons of dressed poultry weekly at this season. These figures representing

COCKEREL-BRED PULLET
A National Barred Rock Club winner at Fair Oaks Farm. Note character of barring. Bird now being bred in yard 5. Owned and bred at Fair Oaks Farm.

Fair Oaks Barred Rocks

don't live in the past.

Their records of victories are *modern history*.

In our pens you will find the following winners at the National Barred Rock Club Meet at the Greater Chicago Show, where the cream of the nation's finest Barred Rocks were gathered—from the East, West, North, and South:

First pullet-bred pen, first and second cockerel-bred pens, first and grand champion exhibition male cockerel, first and second pullet-bred cockerels, first, second and fourth cockerel-bred hens, second cockerel-bred pullet, seventh exhibition hen, and seventh exhibition pullet, seventh cockerel-bred pullet, eighth pullet, third and seventh exhibition cockerels, third pullet-bred cock, sixth pullet-bred cockerel. This list includes all Mr. Rogers' individual winners, which are now at Fair Oaks Farm. Mr. Rogers' winnings at Centennial Show at Springfield, Ill., 1917-1918: Exhibition class, first and second cocks, second and fourth hens, first, third, fourth and fifth cockerels; cockerel-bred first hen, first pullet and first pen; pullet-bred, first cock, first cockerel, first pen. Besides grand champion male of whole show, shape and color specials, and all specials for best display.

22 Grand Matings for 1918

Twenty-two great pens have been mated for this season's egg trade, containing the above winners. A few settings of eggs from these matings will produce individuals that cannot but help improve any flock, or give you a start in Barred Rocks that will put years ahead of your competitors. Many a prize winner next fall is coming out of these eggs this spring. Remember, a good hatch is guaranteed. Mating list free on application. Eggs, \$10.00 and \$5.00 for 15.

A Number of Grand Cockerels For Sale

A lot of choice cockerels of the same breeding as the above winners are for sale. If you want to introduce new blood into your flock, or raise the standard of your birds, here are some great bargains for quick action. Prices \$7, \$10, \$15 and \$20.

Game and Ornamental Fowl

We raise game birds and ornamental land and water fowls in sufficient numbers to stock large estates and farms with quality and variety that will satisfy the most fastidious. There are many varieties at Fair Oaks to select from: In Pheasants, all varieties; in ornamental ducks, we have all popular varieties. We also have Canadian Wild Geese, Egyptian Geese, California Valley Quail, Bobwhite Quail and dozens of varieties of pigeons.

Send 25 cents for our instructive booklet, "Management and Care of Pheasants and Other Ornamental Fowl," richly illustrated with handsome engravings. Ornamental birds are a very profitable side line for the poultry keeper. Send 25 cents today to cover postage and mailing on the book.

WYCKOFF'S S. C. WHITE LEGHORNS

ACKNOWLEDGED EVERYWHERE THE WORLD'S GREATEST LAYING STRAIN—UNEQUALLED IN STANDARD QUALITIES
Remember that we are the originators and for 35 years specialty breeders of the justly celebrated WYCKOFF Strain of S. C. White Leghorns, the most profitable strain of poultry in America to-day. Place your orders at headquarters and make no mistake.

Eggs for Hatching

from the most carefully selected matings. Our breeding pens this season are made up with the finest lot of stock that we have ever owned. For size, strength, vigor and laying qualities, together with the true Leghorn type, they are unequalled. Place your order early and get in line with the most profitable era ever known in the poultry business. Send for free catalog, giving prices and complete description of the stock, together with testimonials from satisfied customers in all sections of the country.

C. H. WYCKOFF & SON, AURORA, Cayuga Co., N. Y.

the shipments of individual independent plants. The poultry edict is smashing these plants. The packer's agent now on Food Administration is alleged, by Atty. Heney of Federal Trade Commission, to have been an active worker in

smashing small independent concerns. We submit that this is no way to encourage production of poultry, no way to stimulate an increase in chickens hatched and reared during this the 1918 growing season. The ban on sale of

hens helps no one but the big packers and shippers, and later on the whole Nation will suffer from this monumental folly—or worse, this probable monopolistic control of poultry and eggs.

England has tried this sort of thing and failed. She put a price on butter and lost her supply. Now people in France buy butter, where it is fairly plentiful, at \$1 per pound and ship it by registered first-class mail to friends in England. England put a low maximum price on rabbits, and shortly there were no rabbits where there had been plenty before. No one supposes that English rabbits suddenly lost their marvelous fecundity. It simply did not pay at the fixed price to produce rabbits for sale and production ceased.

At its present gait our unwise Food Administration will kill the poultry industry and smash producers in the United States. To secure production it must be made profitable for producers and their business must be unhampered by unwise legislation. It would be better to pay high prices and have food enough for our needs, than to have fixed low prices, restrictions on producers, and food so scarce that most of us cannot get any.

Mr. Hoover talks a lot about "famine" and "food shortage" and he seems to be leading us to it by the quickest route.

"Gas" the Poultry Lice

Declare war upon these destructive, profit-killing vermin. Adopt a policy of "frightfulness." Kill them by wholesale with LICECIL vapor. Merely hang a bottle of LICECIL near the roosts as directed. The vermin-killing "gas" will be delivered constantly in sufficient quantities to exterminate the lice and mites, to keep birds and roosts free from these trouble-makers.

Effective—No Trouble—Little Cost

Not necessary to handle each bird separately to dust or grease. The LICECIL vapor works all the time. No injury to the birds—sure death to vermin. LICECIL evaporates slowly, so treatment is inexpensive.

"We received the two bottles of LICECIL and have tested it thoroughly in the nests and find it a most excellent remedy to eradicate lice and parasites that infest the hens." A. E. MARTZ, Arcadia, Ind., Pres. Great Coliseum Poultry Show, Chicago.

"I have been in the fancy poultry business for 12 years. Have tried all kinds of lice exterminators but have found nothing that will compare with LICECIL as a louse exterminator." D. S. NEWTON, Osawatimie, Kan., Sec. Treas. Miami County Poultry Assn.

LICECIL will do the same good work on your plant. Price—delivered—1 bottle, 75c; 3 bottles, \$2. Order now—adopt the better way. Circular free. Address nearest office.

Where the Battle Is Thickest, There You Find Parks' Bred-To-Lay Barred Rocks Victorious

Winning the Blue on Eggs, Utility Pens and Exhibition Stock at Johnstown, Pa., State Show, Harrisburg, National Show, Washington, D. C. and Rochester, N. Y.

Since 1889 they have been establishing their great reputation as high normal layers, and their laying qualities are bred in the bone. They are America's Oldest Laying Strain. They easily out-layed the 2600 birds in the five Missouri Laying Contests, officially making them America's Greatest Layers, as these contests were made up of the best layers from 37 states and eight foreign countries. Also winners of the Three Silver Cups for Heaviest Winter Laying—December, January and February. After all it's really the winter laying that counts. The sparrows lay in summer. You've read our advertisements longer than any other bred-to-lay breeders. That hundreds with broader laying claims than ours should come and go seems strange. Yes, Parks' Rocks are now being fed by the third generation of Joes. High normal laying is our stronghold. A flock of 128 averaged 208 eggs in a year. In phenomenal laying they have records up to 290 eggs and the greatest sworn continuous laying record of 148 eggs in 148 days was made by a Parks' Rock.

DEYOE'S Station 1 DODGEVILLE, WIS.

DON'T FEED MOLDY CORN TO HENS.

Warning by Frank L. Platt, Extension Poultry Husbandman, U. S. Department of Agriculture, Urbana, Ills.

"Aspergillus" is the name of a disease that is fatal to chickens, and is the result of feeding moldy grain.

The condition of the corn crop this year makes it especially important that the farmers and poultry keepers should protect their chickens by giving them as sound and sweet corn as possible.

There is no practical cure for this disease. As the disease develops there is fever, diarrhoea, dropping wings, great depression, suffocation and death. The symptoms are similar to those of tuberculosis, and aspergillus and tuberculosis are both cases of what practical poultrymen often term "going light."

The spores of aspergillus are usually introduced by moldy grain or feeding the grain in moldy litters of straw. The fungus most frequently develops in the respiratory system, mouth and lungs.

One way to safe-guard the flock against this serious disease is to start in the beginning to take the common means of prevention, which at the present time amounts merely to feeding sound, sweet grain. Moldy corn is of particular danger at this time.

Day-Old Chicks by Parcel Post.

On March 8, 1918, an order was issued by the Postmaster-General to the effect that on and after March 15, 1918, day-old chicks would be admitted to the mails. They must be properly packed, and will be accepted only to points where delivery can be made within seventy-two hours, without insurance or C. O. D. privileges.

This order will, without doubt, be of great benefit to the day-old chick industry, and will, we believe, cause the express companies to give more consideration to wants and desires of those

Blatchford's MILK MASH

The complete milk equal for baby chicks.

It's all in the start—start right!

Blatchford's Milk Mash should be every chick's first feed and kept before them constantly until they are three months old.

Save the baby chicks

Push the little chicks forward with a sturdy, natural growth and you will avoid all loss from bowel trouble, leg weakness or white diarrhea.

Blatchford's Milk Mash will do it.

It contains milk, milk substitutes, meat and grains prepared for easy digestion and is the best starting, growing and developing food obtainable.

engaged in this important branch of the poultry industry.

Mr. Herbert H. Knapp, President International Baby Chick Association, has been untiring in his efforts to get this order thru and is certainly to be congratulated upon the success obtained.

FACE THE TRUTH AND WIN.

In mapping out a campaign, the successful militarist or business man does not worry much over what he shall do in case success crowns his efforts, but he does spend a great deal of time figuring out just what he shall do in case of blockades or difficult situations. By being alert to the possibility of failure he is thus able to successfully combat defeat and win the day.

Napoleon, the most famous militarist of modern times because he was able to transform apparent defeat into success, lived by a rule which many poultrymen would do well to follow. In instructions to his secretary, he said, "Do not bother me when you have any good news to communicate; with that there is no hurry. But when you bring bad news, rouse me instantly, for then there is not a moment to be lost."

Here we have it in a nutshell. In a critical time, good news will keep but when there is anything in the nature of disaster to cope with, not a moment is to be lost. Here is a motto which the poultry press might advantageously take to heart.

Whitewashing conditions in the poultry world just at this time is unfortunate. Bitter pills are not more easily taken by being concealed in chocolate bonbons. They spoil the bonbon and

"A Chick in the Hand is Worth Three in the Shell"

You can buy Chicks this season from the ORIGINAL
SCRANTON S. C. REDS

In response to popular demand and in line with our desire to give our customers fullest measure of satisfaction, we shall offer for the season of 1918 day-old chicks, as well as eggs from twenty superb matings—a real line-bred flock—winners in America's leading shows—producing each year outstanding quality in type, color, size, vigor and laying ability.

CHICKS—\$12 to \$35 per twenty-five, \$20 to \$60 per fifty, \$35 to \$75 per hundred. Ready to start growing lustily and become richly colored exhibition and useful Reds.

EGGS—\$3, \$5 and \$10 per fifteen, \$6, \$8 and \$18 per thirty, \$10, \$15 and \$30 per fifty, \$18 and \$25 per hundred. Everyone guaranteed new-laid and fertile, clears replaced, and if you wish to do your own hatching the surest promise of your ultimate satisfaction.

Our "Red Quills," the original Scranton S. C. Reds, are generally conceded to be the strain that most nearly approaches the desired combination of type, color, size, quick growth and laying ability. A prominent eastern fancier and pioneer breeder of Reds said of them: "It is the one truly line-bred strain in America." Why not stamp these qualities and the ability to reproduce them on your flock? Get your winners the way the other fellow gets his. Take advantage of the world-wide fame of these original Scranton Reds to get your share of the best sales.

Send today for baby chick and egg circular. Better still, get your order booked now direct from this ad and insure prompt and early delivery.

Remember, only the best wins. There is but one best. Get the "Red Quills" original Scranton S. C. Reds and be convinced.

RUDY'S Perfection White WYANDOTTES

leave the pill in the mouth. No one is fooled but everyone feels duped.

Being alive to the difficulties which confront them is the only way in which poultrymen can weather the storm. Let us not be afraid to face the truth. The difficulties can be put to rout if we have the courage to face the facts. No battle was ever won by patting oneself on the back and refusing to recognize possible disaster, while turning over to take another nap. Every poultrykeeper should be on the alert and quick to note possibility of disaster, for only in this way is he master of the situation. Napoleon only lost when he refused to face the truth.

NEW LIBERTY BONDS.

Knowing that the readers of AMERICAN POULTRY JOURNAL are interested in the new issue of Liberty Bonds and are anxious to do their part towards winning the war, we publish herewith a letter recently received by Mr. Frank B. White, Managing Director of the Agricultural Publishers' Association, from President Wilson:

The White House
Washington, March 8, 1918.

My dear Mr. White:

I am very much gratified that you are putting yourself so wholeheartedly back of the new Liberty Loan, and I am glad to send you this word of congratulation. To my own mind, these Loans present themselves as the best possible opportunity to demonstrate the unity,

vigor, and power of the nation in a struggle into which it has entered to sustain its own liberties and the liberties of the world. I cannot imagine a cause more fundamental or more sacred, and I have every confidence that the people of the United States, of all ages and occupations, will give their utmost resources to the Government to support it in this time of supreme crisis. The right must once for all be made triumphant and permanent.

Sincerely yours,
Woodrow Wilson.

The Best Method of Raising Young Chicks.

An egg that is fit for human consumption, if it is fertile and is incubated, will develop in the short period of 21 days into an active, living thing—a baby chick. In order to do this, a wonderful and rapid transformation must take place. The mistakes that are made from the day the egg starts to develop until it is laid and hatched, and the chick is about two months old is the most vital period in its whole existence, even if it should live to be ten years old. This covers a period of only a little more than three months, but the things which are done by a poultryman during these few days, are the things which lay the foundation for his success or failure for the coming year and perhaps for many years to come. You can trace any failure to its ultimate beginning, and you will find that it started with the egg in the breeding stock, during incubation, or during the

Ready-Built Philo System POULTRY HOUSES

Save Time and Money

AS WELL as provide the best possible conditions for the fowls. A trial side by side with old style houses will prove that fowls in the Philo System Coops will mature more quickly, gain more pounds at less cost, lay more eggs, and are freer from disease. Coops come ready to set up; built in complete sections that are quickly screwed together. Cost less than to build old style houses. Sizes from six to 25 hens. Prices \$8.00 to \$35.00.

SIXTH PRIZE COCK

first few days of feeding and brooding the young chicks. Why poultry raisers will drift along and suffer loss of high priced eggs, death in the shell, death from white diarrhoea, loss from improper feeding, loss from wrong methods of brooding and similar mistakes, is more than we can understand, especially when it is just as easy and less expensive to do the right thing.

Some poultry raisers seldom ever lose an egg or a chick. They make money from their flock, while others right by the side of them fail. If anybody else can raise a fine flock of Standard bred chickens in 1918, you can do the same. The secret of success lies only in the use of the right methods.

One of America's greatest poultry experts was born on a Missouri farm. His father died when he was a small boy and he took up poultry raising. His relatives threatened to disinherit him if he did not give it up. His friends said he was wasting his time and money. He stuck to it in spite of every sort of discouragement. He studied, experimented, and applied his knowledge. He succeeded in raising more poultry and better poultry than anyone in his neighborhood or his state. Poultrymen recognized his ability and later on he became Director of the Missouri State Poultry Experiment Station. He has filled many positions of prominence in his own state and in national organizations. We believe that it can be safely said that "Tom" Quisenberry is today sending out helpful advice to more poultry raisers, in more states and in more countries than any other one poultry authority in the world.

He has just issued a bulletin on feeding the baby chicks, the layers and breeding stock, also a book on poultry raising which he offers to send free to every one of our readers. If you will write the

American School of Poultry Husbandry, Box 206, Leavenworth, Kan., and ask for a copy of Prof. Quisenberry's latest

book on poultry, they will be glad to send you a copy at no cost to you whatever.—Adv.

Two Dollars is a small amount to pay to insure your valuable settings

Thousands of eggs are lost daily thru various shocks to your incubator caused by rumbling auto trucks, road dragging, thunder storms, blasting, heavy shooting, gas engines, railroad trains, stamping of horses, etc. These are only a small percentage of the shocks and jars that prove disastrous and costly to many a poultry raiser and which are charged to faulty incubator construction. Our

Incubator Shock Absorbers

have solved the problem. After long and costly experimenting we have perfected a SHOCK ABSORBER for incubators which can be easily attached in a minute's time. They absolutely protect you against losses from shock and a set of these inexpensive appliances on each of your incubators may be the means of saving you much time and money. **YOUR HATCH IS IN DANGER OF BEING RUINED RIGHT NOW.** Don't delay—order today. *When ordering, specify capacity of your incubator.*

CHAS. WEEKS

PALO ALTO, CALIFORNIA

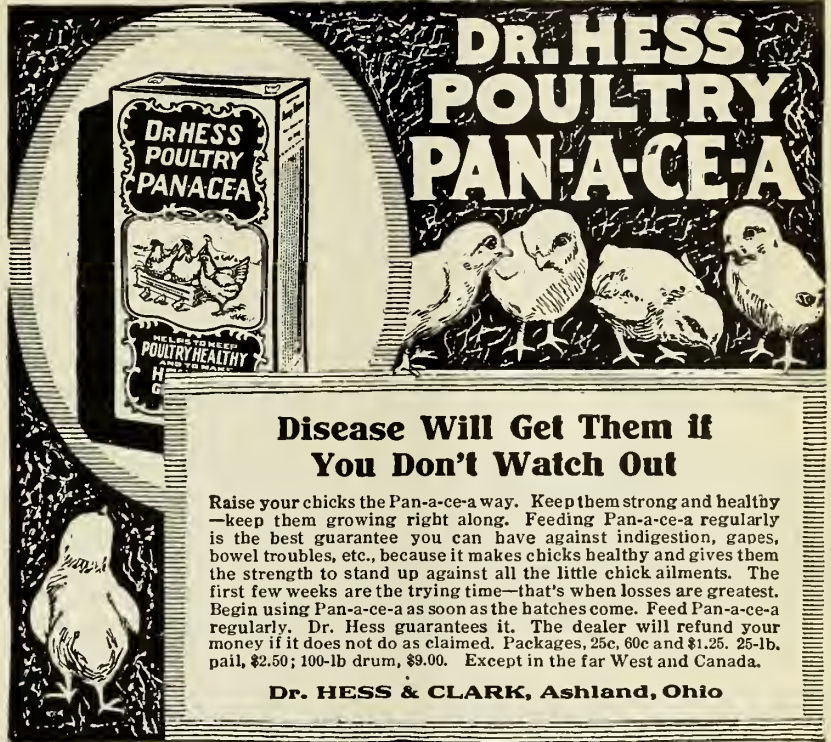

WHY I BREED BUTTERCUPS.

By CHAS. J. LIEBER.

BEING a reader of AMERICAN POULTRY JOURNAL and seeing a great many articles in its columns as to why this one and that one breed their particular kind of fowl and in all of those articles I have not seen anyone say why they breed the Buttercups, I thought I would, in my meager way, tell why I breed Buttercups and why I have stuck to them thru thick and thin.

Being brought up on a farm (a very small one) in a village where farming is the principal business, I spent a great deal of my time in working for different farmers and always took a great fancy to the poultry they had, especially if it was all of one kind and color, but, as most every one knows, farmers used to, more than now, keep all kinds and colors, and they did not appeal to me as much as they would if they had been alike; but one day I was invited to take a long ride thru the country and in making that trip I saw some thorobred birds, and made up my mind that if I ever kept any poultry they would be thorobreds. This idea never got out of my head, but steadily kept growing, until in the spring of 1913 I got the fever so bad that I made up my mind to start, but had not decided upon the breed I would keep, altho at that time the S. C. W. Leghorn was my preference.

After reading the poultry journals and seeing what different breeds were lauded to the skies by their champions, I made up my mind that I would take no one's word but would try out four breeds and satisfy myself, then if I got "stung" I would have no one to blame but myself and so begin to pick out the breeds I wanted to try out and it did not take me long to decide on the first three which were my favorites. I will give them in the order that they appealed to me: First, S. C. W. Leghorn; second, R. C. R. I. Red, and third, the W. F. B. Spanish, and now came the sticker, the fourth choice, but I was not long in deciding, as one evening I was reading a poultry journal and in its advertisements I noticed an ad. offering Buttercup eggs for sale and the name took my fancy, as I had never heard of them before, so I made my fourth choice, and which proved to be my best. I at once wrote the party that I saw their ad. in such a paper and would be glad to have them send their prices of eggs and any other interesting dope they might be able to furnish. In due course of time I received an answer in which they almost said that Buttercups would practically live and lay eggs without any feed or care. This kind of claim sort of put a damper on me, but still I could not give up the idea of wanting to try them out and so kept looking until one day I saw an ad. of a local man who advertised Buttercup eggs for sale and it being only 12 miles from me I made up my mind that I would see what they looked like. The next morning I started for his place and upon arriving and telling him what I was there for he took me out to his hen-house to show me the stock and I can candidly say that the first thought that entered my mind when the door was opened and I got my first look at Buttercups was that it was the prettiest bunch of fowls that I had ever seen in my life. I made up my mind then and there that I would have some of them, if

DR. HESS POULTRY PAN-A-CE-A

Disease Will Get Them if You Don't Watch Out

Raise your chicks the Pan-a-ce-a way. Keep them strong and healthy—keep them growing right along. Feeding Pan-a-ce-a regularly is the best guarantee you can have against indigestion, gapes, bowel troubles, etc., because it makes chicks healthy and gives them the strength to stand up against all the little chick ailments. The first few weeks are the trying time—that's when losses are greatest. Begin using Pan-a-ce-a as soon as the hatches come. Feed Pan-a-ce-a regularly. Dr. Hess guarantees it. The dealer will refund your money if it does not do as claimed. Packages, 25c, 60c and \$1.25. 25-lb. pail, \$2.50; 100-lb drum, \$9.00. Except in the far West and Canada.

IF WE ARE GOING TO BE PATRIOTIC Why Not Start Something?

I have 50 Buff Orpington females as good as the one in this ad. now in my breeding pens. They are on big runs with plenty of blue grass and fish worms. They are laying eggs that will hatch, and for 60 days I will make you a war time price on eggs for hatching. **30 Eggs, \$6; 100 Eggs, \$18.** If you want to start now with the best breed that ever wore feathers, here is your chance. This is just about 1/3 the value of eggs and remember, they are from the Indianapolis winners. Now is your chance, order from this ad. and do it today.

it was a possible thing to get them. Upon asking him what he would take for the bunch was told that they were not for sale, but that he would sell me some eggs if I wanted them and, believe me, I was not long in bargaining for three settings, but was disappointed when he told me that I would have to wait a few days, as he had three orders to fill, and then I would be next, but I told him to send them when he could.

Now to take you back to the other breeds. I sent to I. F. Rice, of Cortland, and got 30 Leghorn eggs and to another man, who claimed he had Tompkins' strain of Reds, and got 30 of them, and sent to Minnesota and got 30 Spanish eggs. I set them all under hens and when my Buttercup eggs came, the others were all hatched out and I had the following number of chicks: 23 Leghorns, 29 Reds, 12 Spanish.

Well, the man sent me one setting of Buttercups the 3rd day of June and I put them under a hen that night and the other settings (two) came the 13th and 20th of June, and they were likewise put under hens and started on their road to producing chicks. I was anxiously waiting to see what the Buttercup eggs would bring forth and on the morning of the 24th day of June I went to the barn (I had no hen-house at this time) and took the hen off and lo and behold what a beautiful sight met my eyes. There were 14 of the prettiest, plumpest and downiest little chicks that I had ever seen.

On the 4th and 11th of July, respectively, the other hens hatched, and while they did not do as well as the first one did, still they brought out twenty-two more of these little fellows. This made me 99 chicks in all and I succeeded in raising 93 out of the lot. At this time the Leghorns were nearly six weeks old, the Reds about four and the Spanish about three and all were healthy and growing fine, but in my daily care of them I noticed that the Buttercups were not eating as much at the same age as the others had and so thought I would keep a very close watch and see if I could find out the cause and in due course of time I found out the reason, which was this, while the Buttercups were out hunting for bugs and worms and filling themselves with these, the others were lying in the shade or else sunning themselves and the result was that the Buttercups had picked their dinner and the others waited until they were fed.

They all continued to grow and thrive and as soon as they were old enough to tell their sex I separated the cockerels and shut them up and in this way I found that I had as follows: Pullets, 12 Leghorns, 12 Reds, 4 Spanish and 21 Buttercups; cockerels, 9 Leghorns, 17 Reds, 5 Spanish and 14 Buttercups.

I let all the pullets run on free range until the middle of November, when I separated them and put them in their winter quarters, each breed by itself, and got ready for my testing, but was called away and so did not get a satisfactory test, but was getting a good egg yield from all, but I thought the Buttercups were doing a little the best, considering their age, and on April 4th, 1914, I got 18 eggs from the 21 Buttercup pullets that were hatched in June and July.

Well, I had the show fever, so in December I entered a young pen, 2 cockerels and 2 pullets, in the Syracuse show

STILES' COLORED
Leg Bands

Tells how to properly choose fowls, eggs, incubators, and secure cheap feed. This practical book worth dollars mailed for 10 cents.
Berry's Poultry Farm, Box 116, Clarinda, Iowa

and succeeded in winning 2nd pen and 2nd pullet, in keen competition with a good large class, and I made up my mind that Buttercups were show birds as well as layers.

As I was not thoroly satisfied yet that they were the best, I decided to test them still more, and give a thoro test this time, so in the fall of 1914 I built another house containing four pens, three of them being 6x20 ft. and one 8x20 ft.

I got them into the house the last of November and started in to test out proper. I picked out 12 of each breed and one cock for each pen and there were 6 hens and 6 pullets in each breed and under identically the same conditions, with the same feed and care. From December 1 to July 15 the Buttercups outlayed the Leghorns 10 percent and the Reds 12 percent. Therefore, I decided to discard the Reds, but I could not believe but what the Leghorns would equal the Buttercups, at least, so decided to try them out again, and did the next year. With the same kind of a test the next year the Buttercups came out victorious, so the Leghorns had to go.

Now, the reason why I breed Buttercups is because from actual tests I find that they are as good, if not better, layers than any of the egg laying breeds, are heavier, as the cock weighs 6½ pounds, hen 5 pounds; do not require as much feed to give the same results as other breeds; are hardy, rugged and vigorous; eggs are very high in fertility; the chicks mature very quickly and make the best of broilers; eggs will compare in size to any breed, unless it is the Minorca; they are easily confined, as a five-foot fence will keep them very nicely; they are an excellent show bird and are practically a non-sitting breed, in fact as near one as any, and last but not least, are very tame and will make great pets if given half a chance.

Now, dear reader, I am sure that if you will take the same pains in starting with poultry as I did and will give the Buttercup a fair trial that they will prove to your satisfaction that what I have said is true and you will be for them just as strong as any of the breeders who have bred them for years.

Let me say in closing that I do not believe there is a breed of fowls on earth today that will fill the wants of man, be he farmer, poultryman or fancier, in every respect equal to the Buttercup, and to every person who has a back lot in the city let me say, try out a few of these fowls and see if you cannot help out production for your Uncle Samuel who is helping out "over there" for the sake of justice and humanity.

If you are thinking of taking up poultry do not fail to give Buttercups, the coming breed, a trial.

Smith Standard BABY CHICKS

America must grow more poultry this year. We will help by producing nearly

GEORGE B. FERRIS
 605 Shirley St., Grand Rapids, Mich.

The year's at the Spring
 And day's at the morn;
 Morning's at seven,
 The hillside's dew-pearled;
 The lark's on the wing,
 The snail's on the thorn—
 God's in His Heaven
 All's right with the world!

—Robert Browning.

* * *

WITH the long cold winter at an end, each day finds us with a few minutes of spring sunshine to the good. A great many things have happened during the season just passed. As heard said the other day, "We have lived thru

The individual, as well as the community and the nation, daily discover valuable resources upon which they have not hitherto drawn.

We must all admit that notwithstanding present conditions thruout the world, the universe itself remains sound and healthy, the atmosphere pure and unpolluted, the sunshine warm, the wind sweet, the sky vast and unmoved by the tragedy enacted beneath it.

It is the custom of the peoples of the earth to place such reliance upon the value of the dollar that most of us have

Laying house and S. C. White Leghorns on Sunlight Poultry Farm, Lynchburg, Ohio.

such trials as not soon to be forgotten."

In living thru any trying experience, the value thereof is always to be determined by what we get out of it, what headway we have made, what progress has marked our journey. If we find the trial has not "tempered our steel," we are losers, not gainers by the experience.

Among any people there always exist vast material and moral resources untouched. A crisis helps to develop them.

altogether lost sight of more valuable assets. We are only beginning to learn how paltry the accumulation of wealth and what a house of cards it has builded. The history of the world is one of selfish greed, of crimes committed under the protection of wealth, of dishonesty and secret pilfering under the name of big business and diplomacy, but we need not be discouraged at its black record. There is hope that a day is

Sunlight Poultry Farm Box 200 Lynchburg, Ohio

dawning when every child born into the world will have a chance for his daily bread and every man an opportunity to be honest and wholesome, even tho' nowhere may we boast of this condition today.

We have but to read snatches of the illuminating literature as conceived in master minds and given to the world in past and present ages to awaken wonder that we have benefitted so little from the words of wisdom freely given us. Great thoughts and ideas proclaimed to the world sometimes lie fallow for centuries before springing up and bringing forth the inevitable good fruit. Unless we work for their fulfillment good thoughts are as futile as good dreams.

There is nothing more pregnant with hope for the betterment of the world than the discontent among its people. The greater the discontent with the old order of things, the more will coming generations be benefitted. That sincere persons in every corner of the earth are giving time, money and effort toward the establishment of a better social state betokens some great world wide awakening which nations and selfish individuals may attempt to obstruct but which will eventually find outlet.

* * *

If there are men and women among us today with a talent for righting wrong, there is work to do a plenty, and the time ripe for its doing. To sit idly by and complain of unjust conditions is futile. The very poverty of justice in the world is a challenge to you and to me to work for better things—to put our shoulders firmly to the wheel to do all in our power to give humanity the right of way above every other consideration.

The world is weakened for the lack of honor in its public mind. Most of the virtue of which we prate is vice-like—a conventional virtue which relates only to our material welfare. On every hand we find gross injustice and licensed privilege for the few. The food we eat, the very clothing that covers us is not free from the stain of unjust dealing. How can we hope to lift the gigantic wrong which has burdened humanity for centuries, with naught but our two hands and the will to leave the world better than we found it?

Every step of progress since the beginning of time has been the result of a thought in one man's mind, and the determination to work it out into practice. By what right do we eat bread and clutter up the earth with our presence if we contribute naught to the common benefit? The call of every citizen should be toward adding his daily bit in righting the flagrant wrongs of society which confront us on every side.

Nature is engaged in a constant state of repair. Every sunrise sees a new day. Every night casts off the old and furrowed face of yesterday. Thus Nature is ever refreshing, inspirational and good to look upon. Can we not learn a little of living from Nature or must we forever wear the same age-stained cloak and time-marked countenance, which aims to block every step of progress and prevents the dawning of a new and more beautiful day?

* * *

In coming years men looking back upon this age will sigh that they did not live in a time so rich in opportunity for human betterment: "Could I have lived then I might have saved the human race

Stop Hatching Weak Chicks

With Cheap Incubators

Remember it is not how many you hatch that counts, but how many you raise. Chicks that hatch out weak and wobbly, and live but a few days, mean nothing to you except trouble and loss. They make one sick of the poultry business. Most of the chicks you lose in the first two weeks die because they did not hatch out with enough vitality or strength for a good start.

Queen Incubators

Hatch Chicks That Live and Grow

The Queen is accurately regulated—taking care of a temperature variation of 70 degrees without danger. It is built of genuine California Redwood—very scarce in these days of imitation and cheap substitution. Redwood does not absorb the odor from the hatching eggs. Cheaper woods, and pasteboard lining in iron and tin machines, retain the odors, to weaken and kill the hatching chicks.

Start your chicks with a Queen constitution and they will make money for you. The Queen is not a cheap incubator, compared with many of the cheaply constructed machines on the market, but it is cheap in the long run. It will be turning out high percentage hatches years after the cheap machines have been junked. Sold by dealers. Catalog sent free on request.

Simplex Midget \$ 1 25 Feather Brooder 1 25 Postpaid

This Midget Brooder is made to fill a gap between the old "cluck" and the large artificial brooders.

We guarantee that this brooder will raise as many chicks as a "cluck" if placed in a living room or warm basement. It is made to accommodate one setting of 15 chicks, but will take care of 25 chicks for the first week.

Uses for this Brooder

Thousands of people buy baby chicks in dozen lots and have no place to properly brood them until they can take care of themselves. This Midget Brooder will take the place of the hen and raise them.

Many times a poor hatch comes out of an incubator or a few weak chicks de-

The feather hover inside can be raised and lowered to suit the size of the chicks.

mand special attention. It is a good deal of trouble to raise a few chicks in a big brooder. Why try, when you can get this Midget Feather Brooder to raise them without trouble?

When the old hen deserts her chicks, that's another time the Midget Feather Brooder is worth its weight in gold.

Construction

The body of this brooder is made of germ proof fibre board; the top and bottom are made of best grade of corrugated board and the feathers are genuine down feathers, the same as used in our larger Simplex Perfection Feather Brooders; and this brooder is guaranteed to raise every chick worth raising.

Send \$1.25 today and let us send you one by parcel post, prepaid. Money will be refunded if you are not satisfied. Also ask for our catalog of larger brooders and other poultry supplies.

Note the thickness of the downy feathers which warm the chicks.

SIMPLEX SUPPLY HOUSE, Pontiac Bldg. Chicago, Ill.

this or that set back—not a century but ten centuries at stake and whole races of people blind to the opportunity it was theirs to grasp." But at this most vital period of history, some of us with inattentive eyes and ears are going about discussing trifles. It is astonishing to observe the lack of interest displayed in matters of the gravest importance. With conditions such on every hand as to fire the heart of every man, woman and child, yet everywhere we find those who are not sufficiently aroused to inform themselves of the meaning of the revolution in Russia or, to come nearer home, the present condition of agriculture in our own country. In the very midst of world wide confusion, they sit contented, interested only in their next month's dividends or the selection of wall paper for the attic chamber. There is no lack of opportunity to learn somewhat of the world's present status and its crying needs, for with the will to know and understand, we can sift the chaff from the wheat in the literature with which we are surfeited.

The test of human worth lies in the breadth of character and extent of honest dealing. There can be no permanent advance of mankind which is built upon the miseries of those less fortunate. Mending the world is only possible by creating a better world, and each has it within his power to do somewhat of this, and no one need be at a loss to know just where to lend his hand. There remains a wide and varied field for those of noble aims. We are living in a world which is about to begin its real work. It is at the starting point rather than at the end of things. Our hopes rise before us, outlining but dimly what we are to be. What is not allowable today shall tomorrow be within our reach, and that which today seems scarcely attainable will tomorrow become a realized fact.

Let us then be bearers of hope. Let us reinforce all mankind with a vision which no temporary blackness can overcast; for the morning of a new day, rich in possibilities is even now illuminating the night surrounding us, and it is time to be awake to its possibilities.

* * *

CORN POPOVERS.

Scald two cups of sweet milk, add a scant tablespoon of chicken fat and stir in a cup of sifted corn meal. Allow to cool and add three well beaten eggs. Have gem pans greased and hot, pour in the mixture and bake in quick oven. These are delicious and a pleasant change from the usual corn muffin.

* * *

SOFT JOHNNY CAKE.

Boil one pint of water to which a teaspoon of salt has been added. Stir in one-half cup of rolled oats and one cup of corn meal and cook ten or fifteen minutes. Pour out in a flat bread pan, cover and bake for twenty minutes. Chopped raisins, currants or dates may be added to the mixture before baking and if a little molasses or sugar is added it will improve the flavor. If a crusty cake is preferred, bake in a thin sheet.

* * *

CORN DODGERS.

Place one cup of corn meal in the upper part of a double boiler, add a half teaspoon salt and gradually one cup of boiling hot milk. Beat smoothly and cook one hour. After frying sausage or bacon for breakfast drop the cornmeal

mixture by spoonfuls into the fat in frying pan and fry a nice brown. Serve hot.

BAKED EGGS.

Into one pint of hot milk add two table-spoons flour and two of butter which have been rubbed together. Add a teaspoon of salt and a little pepper. When the mixture is smooth, pour half of it into a baking dish, and break into this six eggs. Pour the rest of the sauce over the top of eggs. If desired, add a bit of cheese should be grated over the top. Place the baking dish in a pan of hot water and bake in a medium oven about twenty minutes.

MOLASSES DOUGHNUTS.

Beat two eggs and add one-half cup sugar and one-half cup molasses. Add a teaspoon soda to a cup of sour milk, and pour into the mixture, together with one-half teaspoon each of ginger and cinnamon. Sift in enough flour to make a dough that can be handled, adding a teaspoon of cream of tartar to it. Cut in rounds with hole in center or in strips and twist. Fry in smoking hot deep fat. Drain on brown paper.

BARLEY CAKE.

By K. A. B.

Mix one-half cup sugar with one tablespoon chicken fat and add one egg, one teaspoon cinnamon and one-half teaspoon each cloves and nutmeg. Stir in a cup of rich sweet milk and one and one-half cups barley flour, one-half cup rye flour and one and one-half teaspoons baking powder. Bake in a moderate oven.

OYSTER FRITTERS.

By K. A. B.

Make a thin batter, using the liquor from the oysters and an equal quantity of sweet milk, one well beaten egg, one-fourth teaspoon salt and about three tablespoons flour. Chop the oysters, mix with the batter and fry by dropping spoonfuls of the mixture in hot fat. Or the whole oysters may be dipped in the batter singly and fried whole, one oyster and enough batter to make a large spoonful. Fry each side a nice brown and serve at once. They require only a few moments to cook.

ORANGE CHARLOTTE.

By K. A. B.

Soak two level table-spoons granulated gelatine in one-fourth cup cold water until soft, then fill the cup with boiling water. Empty into a bowl and add juice of one lemon, one cup of orange juice and one cup of sugar. Stir well and place in a pan of cold water. When beginning to harden, fold in a cup of whipped cream. Beat with an egg beater and put into sherbet cups ready to serve.

JELLIED PRUNE PUDDING.

By K. A. B.

Wash one pound of prunes and put on to cook in one pint of cold water. When tender remove the seeds and add one cup of sugar. Cut each prune in several pieces. Dissolve one envelope of minute gelatine in two table-spoons of cold water, adding an equal amount of boiling water after the gelatine begins to dissolve. When thoroughly dissolved add to the prunes, together with the juice of one orange. Pour into molds and set aside to harden. Serve with whipped or plain cream.

POTATO CAKES.

By K. A. B.

Peel and grate raw potatoes, placing the pulp on a sieve to drain off the liquid or watery part of potato. Add to the grated potato one beaten egg and sufficient flour to make a thick batter and salt to taste. Form into little cakes and fry nice brown in hot fat. Serve hot. These are fine.

PARSNIP CAKES.

By K. A. B.

Parsnips which have been allowed to remain in the ground out of doors all winter are now very delicious plain boiled, fried and in many other ways. We are very fond of parsnip cakes which are made as follows: Boil the parsnips until very tender, drain off the water and mash them thru a colander. Beat two eggs and add them with a cup of rich milk or cream to the mashed parsnip. Salt to taste and sift in enough flour to thicken to form into cakes. Fry golden brown in hot fat, either in fry pan or in deep fat. Sprinkle with chopped parsley and serve hot.

FROM THE PACIFIC COAST

IRRIGATION ON THE POULTRY RANCH.

By CHAS. WEEKS, Palo Alto, Cal.

IN LOOKING back over the fourteen years' experience in the poultry business in California, I see so many mistakes, so much useless labor, so much grinding over useless details, that my heart goes out in sympathy to the new beginner, and I feel like saying just what any old poultryman would say to those just starting. The old adage, "Learn to do by doing," holds good in the raising of poultry as in all other things, but the successful men in the world are keen to make use of the accumulated knowledge on their line and thus save years of toil and experimenting.

The man that has the ability to start

in where the other man leaves off is the man that is able to progress. "Learn to do by doing" is the only practical way to become an expert poultryman, but by using the accumulated experience of others we are able to start doing the right thing instead of groping blindly for a right system. There is a way to do the right thing in the right place, and at the right time, and if we can make this "doing" count while we are getting experience, then we save time.

If I were to start over again I would

board. If I could not earn my board, I would pay for the privilege of getting to work with hens until I found out the secret of how to make them pay.

This is the surest way of becoming proficient in the art of making poultry pay. Another way is to start in on a very small scale and accumulate experience in off hours. Perhaps our most successful poultrymen have started in this way. Another way, and a very good way, is to locate in the neighborhood of a group of successful poultrymen and from observation and mingling and enthusiasm engendered at their poultry meetings be carried on to a degree of success otherwise impossible to one alone. A community of poultrymen located on the right soil with plenty of

go to the most successful poultryman I could find, put on my overalls, roll up my sleeves and go to work. If he could not pay me wages I would work for my

cheap water for irrigation and a home market makes ideal conditions for the amateur. The very air is permeated with poultry enthusiasm which carries a man on to a far greater success than he is ever able to accomplish in an isolated district. A community located on poor soil with no cheap water and far away from market will never succeed and only tends to leave an impression of poverty. You must have these three essentials: rich soil and plenty of water to grow green feed and a good home market. Any community of poultry keepers that has not these three essentials must tolerate a large number of failures. There are so many locations with these three essentials that it seems folly to locate in the poultry business without them.

In making my start fourteen years ago I looked long and faithfully for that much talk of "light, gravelly, loamy soil," so necessary for healthy fowls, and finally chose what I thought to be an ideal "soil" for poultry, little dreaming that it is only what the soil produces in the way of green feed for poultry that makes it a good poultry soil. Goodness, gracious! What a mistake I made! The soil was too poor to grow anything, and

EGGS McCartney Farms R. F. D. No. 1 Gardena, California

as the hens could not eat the soil and lay eggs, it was absolutely worthless as a poultry proposition. Then I had to lift my water fifty feet for irrigation, and only a little stream at that and any practical man knows that it is impossible to lift water over thirty feet and make it pay in producing vegetation. Five long, hard years I labored on this unproductive soil with little water, and barely earned a subsistence. The trials and tribulations and worries and heartaches of these five years are only a repetition of the experiences of hundreds of others who are so unfortunate as to locate on an unproductive soil with no water for irrigation.

I had set out to make poultry raising my life work. I had dreams. To be balked in the line I loved and had chosen this early in the game was more than I could bear and I was determined to solve the problem of how to make hens pay. I thought at first that my equipment was wrong. I built new houses, only to tear them down and build over again the next year, and so on for several years. I finally discovered that it was only at those brief seasons of the year when I could have succulent green feed that my hens paid. Then common sense began to assert itself and I began to reason that it is impossible to have the hen lay eggs without she has what nature intended she should have to form eggs. And as spring-time conditions always brought eggs, it behooved us to give the hens spring-time conditions all the year around.

These spring-time conditions can be had the year around here in California if you have the fertile soil and cheap water for irrigation.

When I made this important discovery that hens must have all the fresh, succulent green feed they can eat every day in the year, I saw very plainly that my location was absolutely worthless as a poultry ranch.

In these five years of endeavor I learned that a rich soil, well watered and near a good market are the necessary attributes to any feasible location for poultry raising. I saw that it was absolutely imperative to choose a new location, and this I did at once, and seven years on this rich soil with abundant water and home market have been as prosperous as the first five were a failure. If you have not these three essentials, sell out at once. You cannot afford to waste a single day without these necessary conditions, and the sooner the change is made the better. All the successful poultrymen that I know have these essentials, and the more quality these essentials have the better the success.

Green beets, green kale, green chard, green barley, green rape, green alfalfa, green every day in the year, cries the hen, and without this fresh, succulent green feed it is absolutely impossible to produce eggs at a profit. To grow these succulent green feeds you must have a large flow of cheap water. A windmill will not do. You must have at least 300 or 400 gallons per minute to be able to irrigate without loss of too much time. I have a centrifugal pump that throws 600 gallons per minute, 36,000 gallons per hour, 360,000 gallons in ten hours, at a cost of twenty cents per hour. My water lift from water level is only ten feet. With my rich soil and this river of water from my sixty-foot well I can raise tons and tons of beets and kale and

alfalfa at a minimum cost. I have raised 300 tons of green kale to the acre and 150 tons of mangel wurzel beets. This is the whole secret of my success in poultry farming. Any one can duplicate my success with my environments. A pumping plant for one or two acres need not cost more than \$500 for the well, centrifugal pump, motor and all.

With your own pumping plant and motor you are independent for water and have the motor for your hired men to cut green feed, grind grain, mix feed, do washing, run the emery wheel, and all such work.

The very first essential on a successful poultry ranch then is the pumping plant. You cannot succeed in California without it. Be sure you locate where plenty of water is available at small cost.

I feel like shouting these truths from the house tops after my ordeal of five years' useless labor in the wrong place, and if I can save my fellow poultrymen from making the same mistake I will be glad.

There are three distinct profits derived from feeding a succulent variety of green feed to hens. First, tender, succulent greens keep hens toned up into a healthy condition so that a great saving is made in loss of hens, which adds materially to the profit in large flocks. Second, with a good variety of tender, succulent green feed the hen will not consume so much grain and mill feed and thus a great saving in cash outlay for these expensive feeds. The saving in grain feeds is most surprising and hardly believable. Third, the hen produces far more eggs—in fact, all the profitable eggs produced are made from green feed. We are working for eggs produced over and above the maintenance of the hen, and it is absolutely impossible for the hen to lay enough eggs without green feed to more than pay for her feed. This is a settled fact. With these three profits to the credit of green feed, you can see how essential it is and that success cannot be attained without it.

On that new dream ranch of yours, then, you must first have a pumping plant; then it is only a matter of good soil and application of water in a scientific way that produces this fresh, tender, succulent green feed. Be sure you have plenty of water, fresh greens before you have a single hen on the place—do not get hens first. Get your pumping plant, green feed started, and houses built, and then you start in making a profit from the first day. I am laying down the very laws of success in the poultry business and common sense and reason tells you that this is the sanest procedure.

After you have your pumping plant, green feed growing luxuriantly and houses built, then, and not until then, are you ready for hens. Enthusiasts come to my ranch and are pleased with the system and apparent ease of poultry raising and go away dreaming, make a start and fall down. They start wrong. They order a thousand chicks, put in a brooder and are off. They have started backwards. They should first learn how to raise kale, beets and alfalfa.

I have taken the long road. There is a shorter road and I advise you to be sure you have the right location before embarking in this pleasant healthful vocation.

CHARCOAL FOR POULTRY

Extra fine, fine, medium and coarse \$2.00 per hundred at Ironton. Cash with order.

DELAWARE HATCHERY DELAWARE, OHIO

Poultry Raising in City Limits.

Don't for a moment let limited space dampen your aspirations for raising poultry. Eggs went soaring because so many fanciers quit the business. However, let's get back into line, overcome all difficulties, and raise more than ever this season. Be sure you select pure bred stock, they are quite as easy to raise as the mixed breed, and so much more profitable.

My first experience in the business was on a 50x150 ft. lot. I raised 300 Barred Plymouth Rocks that year, for which I received from \$2.50 to \$10 each, and from \$3 to \$5 a setting for eggs.

Of course, we all know the one great hindrance in this business is vermin. The battle must be royal from beginning to end, or they conquer. However, with new material, that is, new houses, nests, etc., they don't bother much the first year; hence my wonderful success, and by thoroly house cleaning in the late fall, after setting season, then again in spring just before the season begins, they can be materially subdued.

Some have the croneous idea that filth breeds lice. I've had baby chicks hatched in incubators to have them. A friend who was very sensitive about such things, described the symptoms of some chicks and asked what could be the trouble. I hesitatingly replied, "lice, dear;" she flew into a rage and informed me that she didn't have any vermin on her place. Just note the dense ignorance of some people.

The first thing I did was to divide my back yard into four pens, with 8 ft. wire fencing, with 24-inch base boards to prevent cock fighting. In each I built small houses, just large enough to accommodate 10 hens and 1 cock. I arranged the nests on the ground (which is best in warm weather) with planks 3 ft. wide, 3 ft. above for roosts (poles are tiresome to them), 8 inches under these was the solid droppings board, which should be raked off each morning, thereby lessening work. In one corner of each pen fork up deeply 6x6 ft. and enclose with 10-inch plank for scratching pen, which is very important for penned birds. About three or four times a month place 6 or 8 inches of chopped hay or straw into the scratching pen. They delight to scratch in it. All loose feed should be thrown in there. Keep plenty of oyster shell and grit (which is so essential to form egg shells) inside, in small receptacles wired to the fence to prevent upsetting. Vary the daily feeding for eggs, by hot mash in the morning, consisting of one pint of bran and hot water, one-half teaspoonful salt and one tablespoonful of some good poultry tonic. At noon one pint mixed feed (outside birds don't need the noon feed); night one quart of whole corn.

I kept green stuff, such as cabbage, turnip tops, carrots, etc., suspended on wires just high enough up for them to peck, which also gave them exercise. On either sides of two pens were vacant lots, so I arranged slide doors and turned them out in good weather. These days two feeds were sufficient. Bear in mind that penned chicks can't get any of their requirements, therefore you must furnish them. I used one gallon self-feeding galvanized water cans; however they can be improvised at home by using tomato cans. One inch from opening put one 8 penny nail hole on two opposite sides, fill with water and invert in

**Why Keep Hens
Why Not Let Hens Keep You**

The average hen loafs two-thirds of the time. This lack of egg producing efficiency takes all your profit.

Bred to fill the egg basket in Winter and Summer, and they do it!

Hatching Eggs from 200 to 267 egg record trapnested

S. C. White Leghorns

Our years of trap-nesting and experimenting has produced layers that can't be beat. Our layers have records from 200 to 267 big white eggs in one year. These egg machines are mated to vigorous males bred from 267-egg record hens. A visitor to our farm always means a buyer. They are always singing, scratching and laying big white eggs. It's not the way we feed, it's the way we breed. We will furnish you with hatching eggs at these low prices: Eggs from 200 to 220-egg stock, \$2 per 15, \$10 per 100; from 220 to 267-egg stock, \$3 per 15, \$15 per 100. You need hatching eggs from our stock if you want winter layers. Order now and get your eggs when you want them. Safe arrival guaranteed.

soup plates it will furnish water all day for 12.

The secret of good setting, in my experience, was in having a separate house for setting purposes, away from the laying hens. You know it doesn't matter how much the setting hen tries to tend her own business, there is always one that will upset her, by laying in the nest with her, that is the reason I conceived

the idea of separating them. Someone says how did you move her if she went to setting? That is easy enough; wait until she has finally concluded to set and has thoroly taken the nest. Then arrange her eggs in the nest, in which she is to set, after dark lift her carefully from one to the other, stroke her gently a few times to show her you meant no harm and right there she will stay.

Around each hen that I set I placed a screen (you can have them made of heavy wire), inside of which leave plenty of room for feed and water; of course, have them high enough to prevent them flying over. Mark your baby chicks in the web of the foot to prevent others claiming them. I prevented serious trouble once by having mine marked. I saw one of my neighbors chasing a good

ANDREWS

New Egg Carrier & Poultry Supplies

Shipping the Nation's Eggs

THE task before the Nation is to save—save coal, save wheat, save sugar, save eggs. Statistics prove that one egg in every four is lost between nest and table and that much of this waste is due to poor shipping facilities. Every poultryman in America knows what that means—more cost in marketing—less profits in return. It's up to you to stop the leak. Here's how I've helped countless others to make more money by losing less eggs.

My new Egg Carrier solves the shipping problem. Each egg is protected and packed in individual boxes that fit tight, preventing jolts and jars. It can be used many times over, always with the same infallible protection of its first trip. To many it has become almost indispensable and the following prices tell why.

Commercial—per doz.	
1 doz. size \$.80	4 doz. size \$1.55
2 doz. size .95	5 doz. size 1.85
3 doz. size 1.25	10 doz. size 3.60
Hatching—per doz.	
15 egg size \$1.10	50 egg size \$2.60
30 egg size 1.95	100 egg size 4.90

HERE are several articles of the famous Dollar making line. Each is a standard of its kind.

Andrews' Egg Trays—absolutely the most convenient and safest way in the world to collect eggs.

Andrews' Irrigated Apparatus—Guaranteed mite and lice proof. Every poultryman who cares for the life of his birds ought to have this apparatus. You can't beat it.

Andrews' Poultry Remedies—Andrews' Disinfectant and Dip, Andrews' Death Louse, Andrews' Poultry Medicine and Andrews' Obaco. These reliable remedies have saved the lives of many of my finest birds.

We prepay freight on orders of \$10 or over. On smaller orders enclose parcel post charges, otherwise goods will be sent express collect. Address

THE O. B. ANDREWS COMPANY
 Dept. A Chattanooga, Tenn.
 The World's Largest Poultry Specialty Manufacturers

looking Plymouth Rock rooster around and around, finally the chick ducked into my yard. I said, "Mr., that's my rooster." "O no, madam," he replied (just as he caught him), "I bought him at the market house." I said, "How is he marked?" there I had him. After showing my mark, was sure he was trying to steal the chicken.

No doubt many hesitate on account of the price of poultry feed. However, it is a comparatively small matter when you command fancy prices for your stock. Let people know about them by advertising thru the press. Fancy birds are so scarce they will flock to you.

MRS. MATTIE F. SETTLE,

Wants Milk Producers' Association to Help.

Editor AMERICAN POULTRY JOURNAL:
 Educate the farmer as to the cost of egg production. I am not a farmer, but live out on the farm and am in touch with farmers every day. We have very few poultry farms in the neighborhood, but every farmer keeps from 100 to 400 hens, and these furnish the bulk of cold storage eggs.

In the little town in which I trade, the three grocers receive and ship some 150 cases of eggs every week during the heavy laying season. This condition prevails throught this whole territory.

But these farmers have no idea what it costs to produce a dozen eggs, since they raise their own feed and never stop to consider cost of production. Even if I argue with them that egg farming under present feed prices is a losing game, they will admit this to be true because I must buy feed, but it never seems to occur to them that their feed is worth just as much as I pay.

They go on taking the price the grocer offers and seldom complain. Over against the great number of these farmers, the real poultry farms are a small minority and as such powerless to do anything. Therefore I say get next to the farmer and wake him up. Once let him understand that he is losing money on eggs and the egg price will take care of itself.

What makes me believe this? The milk situation. Two or three years ago and before that, the farmer was getting 90 cents to \$1.25 per hundred for his milk and seemed satisfied, never dreaming that that milk price was below cost of production. Then some Experiment Station experts on milk cost and the Milk Producers' Association woke him up. Result: the farmer is receiving \$3.10 for his milk and is asking for more.

If the Milk Producers' Association could be induced to include eggs in their program, the fight for a fair and just price on eggs would be won.

I do not wish to be considered as thinking a union between the milk and egg forces the only solution, if a better way can be found, but do not forget that the majority of milk producers are, in the aggregate, also heavy egg producers. By joining forces with the Milk Producers' Association we egg producers would be able to help kill two flies at one swat. In any event, wake up the farmer. Get in touch with the Milk Producers' Association.

The feed situation is bad here, it's fierce. Right here in the heart of the corn belt no corn. Corn shipped in "don't feed," as the farmers say. It doesn't. Try as I may I cannot get the eggs out of my hens as in other years. Scratch feed is \$4.25 and eggs are 30 cents.

I want to encourage your stand against high record layers. I trapnest and also have hens with records above 200. What of it? In most cases they are freaks and very often their eggs don't hatch. I haven't a chick yet from my highest record hen. The number of 200-eggers is very, very small. Give me the high normal producer—as Parks had it in a recent article—and I don't want a hen with a 265 record. By the way, why so many claims of a record of 265 eggs? There must be some charm in that number, or is the number intended to con-

Help Uncle Sam By Producing More Poultry

Do not waste valuable food by feeding inferior birds at this critical time. If your flock is not producing satisfactory returns you need more vigorous stock. **CUT OUT THE SLACKERS AND GET A FRESH START.** You can depend on Wilburtha Farms to properly supply your needs. We have this season already hatched thousands of sturdy chicks like those illustrated in this advertisement. We know our birds are right as to health, strength and vigor, as well as to their ability to produce blue ribbon winners at the world's great poultry shows and heavy layers in the egg-laying contest. Our 1918 mating list tells the whole story, or you can order from this ad. Right now is the most favorable time of the year to hatch superior birds.

White Leghorn eggs, \$10.00 per hundred eggs.

Rhode Island Red eggs, \$12.50 per one hundred.

White Plymouth Rocks, \$12.50 per one hundred.

Eggs from our best exhibition matings headed by winning birds at New York or Chicago, \$10.00 per fifteen eggs.

SIMPLEX FAULTLESS Baby Chick and Growing Stock Feeder

(Also Recommended for Full Grown Birds Being Raised in Low Coops.)
CAPACITY 5 QUARTS—EXCEPTIONALLY USEFUL

Raising Baby Chicks and instilling vigor into the growing stock depends greatly upon the feeding methods employed by the breeder. Young stock should be fed little but often—you know it's a big job to take care of them properly—then again, the feed they don't eat at once lies on the ground—gets soiled—unfit to eat. The **SIMPLEX FAULTLESS GROWING STOCK FEEDER** will keep the feed sweet and clean. It's always on the job—feeds the chicks when they are hungry—never too little; never too much. It's a pleasure to watch the little fellows work around the feeder and to know that they are being fed just right, that every kernel of feed they consume increases their weight and vitality, thereby producing larger birds with less work on your part.

NOT ONLY FOR BABY CHICKS

This feeder will work equally well if used for feeding full grown birds and is recommended for use in low coops. It holds five quarts, will feed any kind of feed either mixed or separate—it is built on the principle of our larger "FAULTLESS" Feeder and is furnished complete with bracket, which can be attached to the wall or side of a coop at proper height. This feeder is beautifully painted (dark brown) and with ordinary care it will last forever. It is guaranteed to feed your stock perfectly from the time the chicks are able to eat until ready for the axe.

No.	Capacity	Diameter	Hopper Height	Height Over All	Shipping Weight	Price

vey the subconscious thought of 365, or an egg a day the year around?

I hope you will think favorably of suggestion to join forces with the Milk Producers' Association and push it along with might and main.

Evansville, Wis. F. W. WENZEL.

(Note—Mr. Wenzel's suggestion to ask help of the Milk Producers' Association in securing a price for eggs based upon cost of production, is a very good one. We hope our readers will take it up with their local Milk Producers' Association representatives and also push it

with their Experiment Stations. Egg prices need adjustment on a basis of production costs so as to net a "fair and just profit" to producers. Grain and feed grown on the farm, if fed to poultry, should be figured at whatever price it would bring if sold for cash. It is the rankest folly to assume that because a man grows the grain it costs him nothing. If anyone asked him for the grain in these days we do not believe he would figure its cost that way.—Ed.)

Eggs are most necessary for children and invalids. Particularly are they

necessary for nourishing and strengthening our wounded boys in the hospitals "over there" and here at home. Our soldiers and sailors need eggs, more eggs, and yet more eggs, to help to win them back to health and strength. The busy, patriotic American hen will "do her bit" and a very big "bit" it is. All she asks is that Mr. Hoover and the people give her and her owners a square deal and a fair chance to make good.

EGGS FREE — Hall's famous Barred Plymouth Rocks. In order to induce more poultry, I am going to reduce the price of eggs from my famous winning line of cockerel-bred Barred Rocks, including World's Fair and champion Chicago winners, to \$5 per 15 eggs. With every order of \$5 I will give free five eggs from the daughters of "Liberty," egg record 294 eggs in one year. Several of those yards are headed by 12-lb. cocks, sons of champion female, Chicago Coliseum. I have formerly sold at \$10 to \$20 per 15. Everything goes this spring after March 1st, \$5 per 15, with five free eggs, giving you 20 eggs in all. 19 years line-breeding on my farm for size, eggs, production and exhibition quality has produced a line unexcelled by any breeder in America. We are prepared to take care of thousands of orders promptly. You may order any amount you wish; price is the same; with every \$5 sent for eggs I will send free five eggs. Catalog free. Luther J. Hall, Box 7, Kenney, Ill. 3-5

The Little Giant Brooder above is built round like an incubator, and is made entirely of metal, with the exception of the flannel cover. It is rust, fire and weatherproof, and is fitted with a lamp pattern warm air heating system.

Lot No. 8GL-297 Little Giant 60-Egg Brooder. Shipping wt. **\$3.25**
 15 lbs. Price, each..... **\$3.25**

This little grinder reduces the cost of bone meal to mere labor. Teeth are strong and coarse, and will not grind corn for family use. Fresh bones should be allowed to become dry before grinding. It will grind oyster shells, gravel, cracked corn and other coarse feed. Can be adjusted to grind fine or coarse. The crusher is cone-shaped, which crushes the product first, then it passes into the coarse grinding plates. This is a much better way than many other mills made with stationary burrs. 8-6L-8021, wt. 35 lbs. **\$2.95**

HARRIS BROTHERS CO. CHICAGO, ILL.

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

win at the Imperial Show of all the world, Madison Sq. Garden, N. Y., January, 1918, a new record unequalled in all history, as follows :

One of the Great Imperial "Ringlet" Males. Observe the Wonderful Shape, Color and Barring.

EVERY FIRST PRIZE OFFERED

Cocks	- - - -	1st, 2d, 3d, 4th, 5th.
Cockerels	- - - -	1st, 2d, 3d, 4th, 5th.
Pullets	- - - -	1st, 2d, 3d, 4th, 5th.
Hens	- - - -	1st, 2d, 3d, 5th.
Exhibition Pens	-	1st, 2d, 3d, 4th, 5th.

Sweepstakes Champion Male and Female; Color and Shape Specials Male and Female; Best Five Males; Best Five Females; Best Display, and every other Special Prize. This is the capstone to their unexampled record at New York for 30 victorious years. At the last four shows—1915, 1916, 1917, 1918, they have won 19 First Prizes out of 20 offered. Every bird bred on my farm. Supreme at Madison Square Garden is Supreme Everywhere.

IMPERIAL "Ringlet" EGGS

You want eggs to produce the Silver Cup and Blue Ribbon winners for next season's shows. No other Barred Rock eggs have ever produced the supreme high quality birds as my imperial "Ringlets." Hundreds of old customers order eggs every year—these eggs have brought them rich rewards in Silver Cups and First Prizes, and proved the foundation for many a money-making business. My Imperial "Ringlet" eggs will put you in position to win at next season's shows, you may raise a single chick worth hundreds of dollars, hundreds of my customers have done this—**my matings are unequalled in all America.** No such magnificent color and barring can be found on any living birds.

My Eggs are the best that money can buy—they produce first prize birds.

Mr. E. B. Thompson:

Dear Sir:—I showed the E. B. Thompson strain at Charles City, December 18th to 21st, won 1st and 2d Cocks; 1st, 3d and 4th Cockerels; 1st, 2d, 3d, 4th Hens; 1st, 2d, 3d Pullets; 1st, 2d Pen. At Hampton, Iowa, January 7th to 12th—1st, 2d Cocks; 2d, 3d, 4th Cockerels; 1st, 2d, 3d, 4th Hens; 1st, 2d, 3d, 4th Pullets; 1st Old Pen; 1st Young Pen. I think that shows that E. B. Thompson has the stuff.

Clarksville, Iowa, January 14, 1918.

Yours truly, J. E. WEISS.

Capons Make Big Profits On High Feed

The Experts Secret of Raising Big Healthy Sturdy Chicks

**Growing Mash –
Not Grain Feeds is
What Makes
Chicks
GROW
BIG**

Do You Know the Secret

of the big poultry raisers' success in raising big, sturdy, healthy chicks and why they have fewer losses?

They Feed Oatmeal Extensively

Thompson, Fishel, Felch, Dann, Kempster, Lambert and other experts all use it. While making exhaustive tests with different feeds for growing chicks, our feed experts discovered this same secret—AND MORE. By using oatmeal as the base and adding beef scraps, bone meal, green food and other protein ingredients to give variety and supply more bone, muscle and flesh building materials, they completed a growing feed that is SIMPLY IDEAL. We call it

FUL-O-PEP GROWING MASH

and say, how it does make young chicks GROW and THRIVE! It is so far ahead of any feed you ever tried for young chicks you will be astonished at the way they grow.

Scratch feeds won't make chicks grow big and thrifty, because it does not supply the bone, muscle, flesh, nerve and frame building nutrition required by growing chicks. Just put your chicks on FUL-O-PEP GROWING MASH and see the difference this year. They will grow bigger and faster. Your pullets will develop earlier and be better layers.

You see our experts determined to find just what young chicks and growing fowls needed to make bone, muscle and big, fast growth. They studied and experimented until they produced a feed which "does the work" as nothing else will. Chicks "go for it" like a feast on June bugs and how they do grow! Your chick raising troubles will vanish and your poultry profits pile up fast with this wonderful feed. We guarantee it. Ask your dealer about FUL-O-PEP POULTRY FEEDS; if he can't supply you, write us.

Valuable Poultry Book Free

DO YOU KNOW HOW to make hens lay larger eggs?—how to make pullets lay earlier?—how to make hens lay winter and summer?—how to select layers to make a productive flock?—how to insure fertile eggs for hatching?—how to break up a setting hen quickest and best?

These and many more valuable hints and helps are in our new FUL-O-PEP POULTRY CALENDAR we have just published. Contains a yearly egg-record, chapters on poultry raising—how to start—backlot poultry keeping—poultry secrets, etc. In short, it is said to be the most instructive poultry book put out recently. Fill out the coupon and we will gladly mail you a copy, postpaid.

A PAIR OF OAK DALE FARMS WINNERS

**Type — Vigor
Laying Ability — *these three***

One without the other is of little use. A bird without all three is a waste. Get them all! Buy Oak Dale Farms

S. C. White Leghorns

—birds that have the type because they win at the shows—the vigor because they are hardy Northern bred birds, raised under ideal conditions—and laying ability because it is bred in them.

May Is Nature's Month For Raising Chicks

Serve your country and yourself by producing all you can this year. Start more chicks this month — all you can keep — but start a **profitable** flock. Raise birds that will win for you at your show and pay dividends on the nest. Raise birds that will bring you good prices when you sell them. Order your eggs or stock **TODAY** from this price list:

15 Eggs	\$ 1.50	\$ 2.00	\$ 2.75	\$ 5.00	\$10.00	\$15.00
30 Eggs	2.50	3.50	5.00	9.00	19.00	29.00
50 Eggs	4.00	5.00	8.00	13.00	30.00	40.00
100 Eggs	7.50	9.50	15.00	25.00		
500 Eggs	35.00	45.00	60.00	110.00		
1000 Eggs	70.00	90.00	125.00	200.00		

STOCK

Following is a price list of our stock. If you do not want to wait to send for our catalog, you are safe in ordering from this ad, as our method of doing business amply protects you. Read about it below.

Cock	\$ 5.00	\$ 6.00	\$10.00	\$10.00	\$15.00	\$ 25.00	\$50.00
Cockerel	5.00	6.00	10.00	10.00	15.00	\$20.00	25.00
Hen	2.00	3.00	5.00	7.50	10.00	15.00	20.00
Pullet	2.00	3.00	5.00	7.50	10.00	15.00	20.00
Trio	8.00	10.00	15.00	20.00	25.00	50.00	75.00
Pen	12.00	15.00	25.00	35.00	50.00	75.00	100.00

Remember, if you do not want a bird bought of us after you have inspected it, if you think you have paid more than you could afford or more than the bird or fowl was worth, or it does not suit your fancy, if you will prepay the express and start it on its return journey within 48 hours after you receive it, the purchase price will be promptly refunded.

TO PREVENT BABY CHICK LOSSES

Lee's Germozone
For Colds, Roup, Cholera, Sore-Head, Bowel Complaint, et-

Lee's Lice Killer
Best Destroyer of Lice and Mites

If you have used Egg-o-Hatch you have already saved the loss generally caused by "chicks too weak to break through the shell," and now the right thing for you to do is to keep the healthy, well-hatched little things from being sick. Go to your dealer and ask him for that wonderful little booklet, "Care of Baby Chicks." It contains facts and pointers that will save you from loss and discouragement in your chick raising work right through the season. No theoretical "bunk" in this booklet, but "straight from the shoulder" proven facts.

If your dealer is out of Lee Booklets or if there happens to be no Lee Dealer in your town, write to us direct, telling us your dealer's name, and we will mail you this valuable "Baby Chick Book" by return mail—free.

ALDRICH WHITE ORPINGTONS

Eggs and Stock At Reduced Prices

We have now finished hatching for this season and will offer eggs to our customers from our all-star pens for the balance of the season at

\$5.00 Per Setting

We will also offer a limited number of our this season's breeders at one-half our regular price, to be delivered any time after June 15th. These birds will be reserved upon a small deposit in advance and it will pay you to place your order early. For catalogue and mating list, address

ALDRICH POULTRY FARM, 5084 N. High St., Columbus, O.

Note how each egg is carried in its own compartment, protected by air cushions at top and bottom.

It's too late to experiment! -

You need the best carrier out and you need it **quick.**

Arminger's Safety Hatching-Egg Carrier

fills the bill. It is **Heat Proof, Chill Proof, Shock Proof, Fool Proof**

Don't run the risk of losing valuable hatching eggs by shipping them in old fashioned, inferior carriers. Arminger's Carrier is the best thing ever invented for the purpose. All eggs are protected by air cushions and suspended in individual compartments, thus preventing all of the eggs getting soiled in case one is broken; however, accidents of this kind seldom occur. These carriers are made of material which is a non-conductor of heat or cold, and therefore there is little danger of eggs becoming overheated when placed near steam pipes or of becoming chilled when exposed to cold. They cost no more than others, but are years ahead in safety.

FERRIS HIGHEST QUALITY SUPPLIES
 EVERYTHING FOR THE POULTRY FARMER

EGG CARTONS
 3 row cartons, \$1.00 per 100, \$6.50 per 1,000, \$82.00 per 10,000.
 2 row cartons, \$1.40 per 100, \$9.00 per 1,000, \$79.00 per 10,000.
 Printed with your name and address at slight additional cost. Catalog gives full particulars.

PARCEL POST EGG BOXES
 1 dozen size, 25 for \$1.85, 100 for \$8.50. 2 dozen size, 25 for \$2.75, 100 for \$10.50.

CHICK SHIPPING BOXES
 25 chick size, \$1.90 each, \$12.50 per 100. Special prices in 1000 lots or more.
 100 chick size, \$3.35 each, \$24.00 per 100.

HATCHING EGG BOXES
 15 egg size, \$1.50 doz., \$10.00 per 100. 30 egg size, \$2.15 doz., \$14.00 per 100. 90 egg size, \$3.35 doz., \$24.00 per 100. 100 egg size, \$4.25 doz., \$30.00 per 100. Special prices on larger lots.

MARKET CRATES
 Standard size 2 feet by 3 feet. Twelve inches high. 45c each, \$48.00 per 100. See catalog for other sizes and kinds.

FOLDING EGG CRATES
 8, 9, 12, 16 and 30 doz. sizes. Also a complete line of market egg cases, filters and Dais at lowest prices. See catalog for prices.

BROOD COOPS
 Size 17x22 in. Made of heavy galvanized iron. \$2.50 each. 1 doz. \$18.00, 1 doz. \$125.00. Catalog describes Setting Coops, Chick Runways, Colony Coops and all the equipment you need to raise chicks successfully.

BROODERS
 ALL KINDS
 Fireless, Coal Burning, Oil Burning and Electric. Capacities from 50 to 1000 chicks. Prices \$2.75 up.

EGG CANDLERS
 We carry a complete line at all prices from 25c to \$75.00. Our Delight Candler, and Dais at lowest prices. Be sure to send for catalog describing them.

LEG BANDS
 For chicks, 10c doz., 50c per 100. For hens, 15c doz., 75c per 100. Celluloid, Superior, Double Clench, Challenge, Set Locking and several other kinds at above prices.

EGG PRESERVATIVE
 \$1.25 per gallon—enough for 60 dozen eggs. Will keep eggs 10 months.

FEED HOPPERS
 We have so many kinds of hoppers, grid and shell boxes, and feeding troughs that there isn't space in list them here.

THERMOS FOUNTAINS
 Keep water cool in summer and warm in winter. Three sizes. Catalog gives particulars.
 2 gallon crockery fountains, 60c each, \$6.00 per dozen.

CHICK FEEDER
 This is a great feed saver as the chicks cannot get into it and waste the feed. Large size each, \$4.00 per dozen. Small size, 20c each, \$2.00 per dozen.

AUTOMATIC FEEDERS
 If you do not have time to feed your birds regularly, you need these feeders. Several sizes and kinds from \$1.65 up.

TRAP NEST (front)
 Fastens to orange crate or other box. Price 50c each, \$5.00 doz. Wood and metal nests, all kinds.

ROOSTING OUTFITS
 Equip your poultry house with these outfits. Several styles. Also lice proof roosts.

GRINDING MILLS
 Grind your oyster shell, grain, etc., in one of these mills. Price only \$2.75.

FEED MIXERS
 Several styles—both hand and power. Properly mixed mash gives best results.

FEED COOKERS
 Several different kinds, from the cauldron cooker as illustrated, at \$15.00 to steam cookers at \$135.

BONE CUTTERS
 Fresh cut bone is better and cheaper than meal scrap. One of these cutters will soon pay for itself.

POULTRY BOOKS
 We carry a complete line of Poultry Books. Over 600 books listed in catalog. Also Egg Record Cards and Trapped Record Blankets.

POULTRY REMEDIES
 We handle only the best remedies and guarantee them to give good results or your money back.

DISINFECTANTS and Lice Destroyers
 Get our prices before you buy. We have several kinds. Our Carbolium Lice Killer at \$1.35 a gallon will keep miles away an entire year with one application. Lice killing nest eggs, 75c per dozen.

Get Your Copy of this Free Catalog
 No matter what you may need in the line of poultry supplies we have it. The items listed above are only a few of the several hundred articles described in catalog. Our prices are low and we guarantee everything to give complete satisfaction. If you order anything that is not just what you want you can return it at our expense and get your money back. We ship C. O. D. if desired. Send for the catalog now—you are sure to need some of the articles described.

ROBADEL POULTRY FARM

COS COB, CONN.

Where poultry is bred to perfection for pleasure
QUALITY, NOT QUANTITY, IS OUR AIM

We have purchased
Owen Farms' White Orpingtons

—the entire flock—which in addition to our already strong pens gives us undoubtedly the greatest flock of this breed in the world. There is no questioning the fact that Owen Farms has sold more and better birds and many more dollars worth of eggs for hatching the past few years than any other breeder of this variety has done. There is not a good flock of White Orpingtons in the country today that is not wholly or partly Owen Farms blood and it has been already demonstrated that the best flock of White Orpingtons in existence is on Owen Farms. The birds now in the breeding pens will not be moved until after June 1st, so that egg orders from Owen Farms list will be filled by them.

Charles Hubbard Formerly of Foxhurst Farm

LIME ROCK, CONN.

is general manager and superintendent of my plant, and his well known skill and ability as a breeder guarantees that anything you buy from **Robadel Farm** will be right. All this year's breeding pens were mated up by him after a great deal of thought, and they will produce chicks that will be eligible in any show room this fall and winter.

We are in position to care for all your wants in

HATCHING EGGS AND BREEDERS

from the finest birds in the country, bar none, in

PEERLESS STRAIN

S. C. Buff Orpingtons
S. C. Black Minorcas

S. C. White Orpingtons
S. C. White Leghorns

All hatching eggs and stock are sold on an absolute guarantee basis, and if you are interested in having the best of any of the above mentioned breeds, write us.

Send \$1.25 for a copy of Mr. Hubbard's *Poultry Secrets*, which contains more *horse sense* regarding the mating, growing and caring for poultry than any book I ever read. I guarantee that after the book has been read, if it is not satisfactory I will return your money.

Send for 1918 Mating List

I like a chicken, but it must be a **good** one, and when the time comes that I can't have **good** ones, I will get out of the business.

ROBADEL POULTRY FARM, A. C. Robertson, Owner, COS COB, CONN.

AMERICAN POULTRY JOURNAL

Entered as Second-Class Matter August 9, 1886, at the Postoffice at Chicago, Ill., under Act of March 3, 1879.

Volume 49

Chicago, Ill., May, 1918

No. 5

PRESENT-DAY POULTRY FARMS

IT WAS my privilege and pleasure a few days ago to spend parts of two days on what is destined to be one of the completest and best poultry farms of rather small acreage in all America. I saw so many really good things here and worthy of emulation just at this time by hundreds of business men all over our broad land, that I believe a short description of what I actually saw, and a brief outline of the possibilities of the adoption and development of this plan on hundreds of locations all over America, will not only interest you, but, prove instructive as well.

For some years A. C. Robertson, Cos Cob, Conn., has been a real fancier of poultry. He has kept in a small way several varieties that have given him much pleasure, and real relaxation from his regular occupation. Last Summer he decided that he wanted a real poultry farm, and he would start it at once and do his bit in raising as much poultry as he could during the present time when our Country needs every bird and egg that can be produced. After a search for the proper location, he bought an ideally located place of seven acres. The land is not level, but, has just enough slope to give splendid drainage, and its frontage of seven hundred feet on the Boston post road will make it a real show place and readily accessible to scores of men who would do well to follow Mr. Robertson's example.

Mr. Robertson is a New York business man. He spends working hours in busy down-town New York in the wholesale chemical business. He loves the country, and goes back to his fine country home in Cos Cob to relax, and get ready for the next day's business. He actually loves fine poultry, and he is putting himself in the position to get the maximum of enjoyment out of his chickens. If his poultry venture proves a money maker, he will be pleased, and perhaps surprised, as this is not his real object in starting "Robadel Farm." He told the writer that if the day came when he broke even on his poultry proposition he would be absolutely satisfied, as the actual fun he would get out of it would be worth considerable to him each year, and, if it did not quite break even, he would still be content. Not many men have been in the position to approach the poultry business in this spirit, and, if they have been able to handle it on this basis, they have not followed Mr. Robertson's train of reasoning to its logical conclusion. Many men who read this article are well able to follow this example, and, if they do so, will get immense personal satisfaction and real pleasure in so doing.

As a business man, Mr. Robertson realized he needed a really experienced poultry man to help him carry out his plan, and, in securing Charles Hubbard, he has made a ten-strike. Mr. Hubbard has been a successful breeder for more than a score of years. A finer, cleaner fellow never lived, and his phenomenal success in producing the Foxhurst Farms Black Orpingtons that proved unbeatable for many years, and in breeding his own fine Buff Orpingtons have stamped him as one of the ablest Orpington breeders in the World. At "Robadel," they will specialize on Buff and White Orpingtons, Black Minorcas, and White Leghorns. In Buffs, they have Mr. Hubbard's entire flock. In White Orpingtons, they have the entire flock and good will for two years of Owen Farms; in Minorcas and Leghorns, they have really fine foundation birds.

With this brief summary of the men, and of the birds, I am now down to the interesting details regarding the development of the plant. Mr. Hubbard will personally care for the birds, and raise the chicks. When necessary, he will be able to call in the splendid all-round man who has been in Mr. Robert-

son's employ for several years, and who takes care of the place in general, the three fine cows, and the garden. This will mean that Mr. Hubbard will have every essential under his watchful eye, and he will personally do the most important things. The idea is to make this a successful one man farm, with a little extra help at times. Their buildings are models of convenience, and comfort for the fowls. The breeding houses have a roomy scratching room in front, with the front open from the plate down to 30 inches above the sill. Muslin curtains are available for use in stormy weather, or extreme cold. The roosting and laying quarters are at the back, and are in a room by themselves, with ample ventilation through a full sized door. This can be closed by a muslin frame if necessary in extreme cold weather. The doors from pen to pen are between the scratching room and the roosting room. The partitions are boarded up 30 inches to prevent drafts and fighting, with 1/2-inch square mesh netting to the ceiling. The yards are roomy, and designed to give ample green supply in the form of rape, or oats sprouting in a trench. The brooder house is very similar and will be a successful building with ample ventilation. Two long buildings containing about ten pens each are devoted to breeding pens, and another to brooding quarters.

All buildings are 15 feet in depth, and with an A roof. The southern pitch being longer than the northern, so the peak comes above the passage way. A splendid building for pullets was nearly completed at the time of my visit. It was 60 feet in length, and divided into two large pens. In the fall pullets will be brought into this fine building, and kept there for the trade. A very fine building containing pens 3 ft. x 4 ft. for male birds will be built during the Summer, and out-door runs will be furnished for these males. The pens in this building will be double tiered, and the males have access to the runs on alternate days. Another fine building that will be built will be on the Boston Post Road. It will contain an office and a show-room, so that visitors can quickly see sales birds, and have their choice. This road runs by the rear of the place, as Mr. Robertson's dwelling faces the salt water on a street that runs parallel to the Post Road. The incubator cellar is a dugout, and backs up to a solid granite ledge that outcrops on a knoll at this point. It is an ideal cellar. The other buildings consist of ample barns for the horses and cows, and sheds for wagons and utensils. All in all, "Robadel Farms" will be the most complete small poultry farm the writer ever saw.

Mr. Robertson has gone on with his building and development in the face of the present high prices for everything, because he feels that it is a duty as well as a pleasure to help all he can at this time. Many of you who are reading this article are in a position to follow his example. Why not add your power to the production in this crisis, and start developing similar poultry projects in your locality? The cost will not be excessive, and like Mr. Robertson, you will be repaid many times over in the sanest kind of enjoyment. The enjoyment of nature, and real country life.

The latchstring of "Robadel Farm" is always out, and you will find a visit to this easily accessible plant a pleasure, and you will take away with you practical ideas that will prove very beneficial. I believe that a few hours spent there will make you so enthusiastic that you will not rest until you are following Mr. Robertson's example and developing your own place along similar lines. Try it, and see for yourself.

MAURICE F. DELANO.

Capons Make Big Profits On High Feed

The Way to Do It. *By George Beuog, Cedar Vale, Kansas.*

IN FEEDING high priced grain to capons you must remember that a capon will make two pounds of meat on the same or less feed than it takes to make one pound on a hen. That is, you can grow a ten-pound capon on the same feed that it would take to produce a five-pound hen or pullet of the same breed, in any of the American or English varieties. At the same time you can expect to get at least twice as much per pound for the capons as the average yearly price of hens. You see the capon is ready to sell along in February or March, a time when all poultry is very scarce and high. No hens comparatively are being sold at this time as they are then producing the most profitable and necessary part of the egg crop. A fact just recognized by the National Food Controller, and a ruling has been made that it is unlawful to sell hens at that time. This is, however, the most profitable and desirable time to sell capons, as they have made a very profitable growth all winter and have just about reached maturity during March and April. Coming onto the market

oats as my *main grain feed* in addition to the green and growing grains. You see one bushel of dry oats, properly sprouted, will make at least *four bushels* of the best nourishing grain feed obtainable.

I am paying at this time 80c a bushel for oats. One bushel dry makes four bushels sprouted, so you see my feed is actually costing me *only 20c* a bushel. In connection with the sprouted oats I am feeding good sound corn once a day. All the birds will eat. But they do not eat a great deal of corn where they have all the sprouted oats they want. The corn is the last feed late of an evening and thrown on the ground until the birds have all they want and go to roost leaving some uneaten.

Plenty of milk is kept before the birds whenever possible and whenever milk is not obtainable a meat scrap is used in its place. Capons and all of our other poultry is fed in this way. The young birds make big quick growth, the females lay well and the capons thrive, making a big profitable growth all the time. As a farmer all my life, I am glad to see the price of grains high—they are none too high, cost to produce considered. Properly handled, there is still a good profit to be made from poultry, feeding them at the high prices.

When we are about ready to market capons, or other poultry, we confine them to a small yard two weeks before we expect to market them and feed corn chop soaked in milk. All that we can induce them to eat up clean. We get best results by feeding at this time at least four times each day. This method plumps out the carcass and gives that rich milk fed flavor so much desired. Fed in that way you can be sure of the highest possible prices for your products and the greatest possible profit. Under the present war conditions and high priced feed, capons have made the biggest profits for those who had them of any time since I have been in the capon business, covering a period of more than fifteen consecutive years. Capons are now (March 5, 1918) bringing the poultry raiser 40c a pound on any of the good markets and as much as 30c a pound on the very poorest local markets in isolated sections. These prices mean that a ten-pound capon will bring from \$3 to \$4 each, depending on the location and market conditions. Remember this ten-pound capon only cost the same to produce as a five or six-pound hen worth less than half as much as the capon.

I want to give you an actual comparative cost of producing capons under war conditions. I live way out in Kansas, 225 miles from the nearest reliable market, near a little country town, where market conditions are about the poorest you can imagine. Eggs at this writing, March 6, 1918, for instance, are being bought on our local market for only 25 cents a dozen. Hens were being bought at only 15 cents a pound when they were really selling. Under these poor conditions I have sold 100 capons at an average of \$5 each or \$500 for the 100 capons. I bought every pound of feed that was fed to these capons. The oats cost an average price of 75 cents a bushel, the corn cost an average price of \$1.80 per bushel, and the corn chop to finish them cost \$3.15 per hundred pounds. The total cost of feed for the hundred capons was only \$75, on the local market the young cockerels could be bought for less than 25 cents each at caponizing time. The total cost of producing the 100 capons was therefore only \$100, leaving a profit of \$400.

I was able to get the high price of \$5 each on account of having raised capons many years, during which time I have developed a private trade that takes more than I can produce at a lump price of so much per capon. On that account my experience might not be a fair one to cite a beginner to. The beginner would likely want to sell his first lot of capons right on the market. A friend of mine in Indiana made his start in capons last season, under war conditions, feeding high priced grain. I just have a letter from this party. He is just an average small chicken raiser and only raised 50 capons to sell. These capons he has just sold on the market for 40c a pound and they averaged eight pounds, each bringing him a

FIRST PRIZE SILVER CAMPINE COCKEREL AT
MADISON SQUARE GARDEN NEW YORK JAN 1918
BRED AND OWNED BY
HOMESTEAD CAMPINE FARM WAYLAND MASS.

at just the proper moment, to sell as fresh poultry, and to compete with the packers' high priced cold storage market.

Feed at 20c a bushel—the best ever.

In feeding capons for profit under the present high priced feed conditions, they should be fed the same as any other poultry. Every breeder that understands the raising of poultry has his own methods and local conditions with which they are familiar. If these methods of feeding produce poultry at a profit, then the same methods applied to capons will yield twice as large profits and at no added cost.

In feeding my own capons and other poultry so as to make a profit under present "war conditions," I have made *sprouted oats* my *main feed*. Now, I do not mean that I used the sprouted oats as a green feed only. I have alfalfa growing in my yards, also both sowed oats and wheat that my capons and other poultry range on at all times. But I use sprouted

Ag. Photo

FIRST AND SECOND PRIZE PENS, WHITE PLYMOUTH ROCKS, AT MADISON SQUARE GARDEN N.Y. 1918 Bred & Owned By, WILBURTHA POULTRY FARMS TRENTON N.J.

gross price of \$3.20 each. Under just average conditions. He writes that they did not keep exact cost of raising them, but feels sure it is less than a dollar each, which leaves him a profit of \$2.20, or \$110 for the fifty capons.

I have before me the 1917 report of a prominent agricultural school where 500 capons were raised and marketed as a comparative test under war conditions against just fat chickens. Exact and complete records being kept. Five hundred capons weighed 3,772 pounds (dressed), sold at 30c per pound, \$1,131.60; cost to produce, \$375. Net profit, \$756.60. The college sums the situation up like this: If the same birds had been sold at the age of four or five months as fat chickens they would have weighed 2,000 pounds, at 25c per pound, worth \$500; cost up to that time, \$200. Profit on chickens, \$300. The difference in profit therefore in favor of the capons is \$456.60; besides this handsome profit the country was sup-

plied with almost a ton of badly needed additional meat at a critical moment.

The National Food Controller found such a shortage of marketable poultry this spring that it was deemed necessary as a war measure to prohibit the sale of hens. This distressing shortage in a time of national calamity was, no doubt, caused by the *short-sighted* policy of selling the young male birds as two-pound broilers instead of caponizing them and making ten-pound capons of them. More than that, the two-pound broilers did not produce any great profit to any one and furnished the minimum of food; had they been made into capons they would have produced the utmost in food and been ready in a time when the entire nation was in need of them so badly. See that these conditions do not apply in your case the coming season. Be patriotic, help win the war, make at least a few capons this year.

National Poultry Conference at Chicago

Important Get-Together Meeting, Over-Late, But "Better Late Than Never."
By Prince T. Woods, M. D.

GOOD should come of the National Poultry Conference, the "get-together" meeting of poultry interests held at Hotel Sherman, Chicago, March 29 and 30. This meeting was successful as an eye-opener, but it was held over-late. Had the repeated warnings published in AMERICAN POULTRY JOURNAL been heeded, we should have had this meeting and similar sentiment *two years ago*, a time when much good could have been accomplished by recognizing prevailing conditions and taking action to prevent just what has occurred. However, hindsight comes easier to most people than foresight. Instead of holding a post-mortem to learn that "the operation was successful, but the patient died," we might, if right action had been taken even 18 months ago, not now be called upon for such strenuous efforts to "save the poultry industry" which we are told will require "from 15 to 25 years of hard work to put it back upon its feet."

Still, "better late than never," this meeting will help. If it does nothing else it will wake up our Agricultural Colleges and Department of Agriculture to the need of practical and efficient work in behalf of the producers of poultry and eggs. We are likely to get something besides talk about alleged "profits" figured by subtracting wholesale feed costs from retail prices of all eggs produced, and hereafter all expenses, overhead charges and selling costs are likely to enter into poultry accounting, as they should.

There were comparatively few real producers present, but there were some. The majority of delegates were poultry instructors from the Agricultural Colleges. Editors, publishers, distributors, manufacturers of poultry equipment and feeds, were well and liberally represented. W. F. Priebe, of the Federal Food Administration, was present and consumed a great deal of time with explanations which were most indefinite, and altho asked for definite "Yes or No" answers, did not give any. Dr. M. E. Pennington, of the Food Research Laboratory, U. S. Bureau of Chemistry, ably assisted by Messrs. Greenlea and McAleer of same department, was also present and very much in evidence at every opportunity. At times it seemed as if this trio claimed the right of ownership and operation of the whole conference. The aforesaid federal representatives, not being producers or delegates, were not limited as to time of addresses or discussion, which was somewhat unfortunate.

Harry M. Lamon and Robert Slocum, poultry husbandmen of Poultry Investigations, Division of Animal Husbandry, U. S. Department of Agriculture, were also present and won the high regard of all producers by their quiet and unobtrusive manner and the definite way in which they obligingly answered all questions put to them. Delegates were impressed with the sincerity and earnest desire to help producers, and the poultry industry as a whole, exhibited by these representatives of Uncle Sam's poultry husbandry department.

There was a large attendance at the conference and the official count stated that 26 of the 48 states were represented; our count gives 30 states represented, as we know positively that one delegate from the East carried credentials authorizing him to represent no less than five important poultry producing states. Both Atlantic and Pacific coast states were well represented, as was the South and Southwest.

Reports from various sections of the country indicated that the flocks of breeders and layers now held are about 50 to 60 percent below normal and that hatching this spring is not much above 25 percent of normal production. High cost of grains and feeds, difficulty in securing adequate supplies, transportation difficulties, interference with and discrimination against producers, were among the causes mentioned as bringing about the poultry shortage. It would appear that those who have continued to carry on, in spite of difficulties, must soon come into better times as a result of the shortage and an increasing demand for both poultry and eggs.

Prof. James E. Rice, who was was of the chief promoters of this national conference, gave an interesting review of the poultry conditions, which was followed by general discussion. Prof. Rice is very active in the work to help, and to secure recognition for poultry producers and the importance of their work as a source of national food supply.

Rule 15 (marked in error 14), banning sale of hens and pullets, was freely discussed and a special committee appointed to bring in a report and resolution on this rule. Men from

Second pen cockerel, Greater Chicago Show, 1918. Owned by E. J. Road, Webster City, Iowa.

various districts expressed their firm conviction that the ruling had been more harmful than beneficial. The committee reported that a large mass of evidence, including over 200 letters from all parts of the country, chiefly the East, but also including Texas, Pacific Coast and Middle West states had been submitted, and in substance, over 90 percent of the evidence pointed "to the fact that Rule 15 is class legislation, unjust and unfair discrimination against the producers of poultry and eggs. That it has tended to destroy the confidence of producers at a critical period. That it is important that some action be taken immediately to restore the confidence of producers generally. That the time is very short in which action may be taken to do this in time to save and stimulate production in this 1918 season. A letter was introduced in the report in which a prominent Rhode Island egg farmer stated in part as follows:

"We yield to no class or section in our patriotism, but do not believe it calls us to produce poultry and eggs at an actual loss. * * * * We are all ready and willing to do our bit, but there is neither reason, justice, patriotism, nor business sense in producing poultry and eggs for those who are not willing to pay a living price for it. * * * * Why should one class of people be compelled to carry on business at an actual loss for the benefit of other classes?"

The following resolution was adopted as a part of this committee's report, with instructions to present same to the Food Administration and to the U. S. Secretary of Agriculture:

"Whereas, Rule 15 (marked in error 14) is class legislation and discrimination against poultry producers, having had the effect in commercial poultry and egg farming sections of this country of discouraging production and destroying confidence of producers; and,

"Whereas, the Food Administration has already announced in the Agricultural press (notably New England Homestead) that it is estimated that less than 5 percent of the poultry shipped thru usual market channels comes from the territory north and east of the Ohio and states north of the Carolinas and Tennessee, and rule has no particular economic effect' in this section, so that it is apparent that this Eastern territory should have been exempted from this rule; and,

"Whereas, California has already been exempted under the rule because of conditions similar to those affecting the East; and

"Whereas, immediate removal of the ban on sale of unproductive hens and pullets would have a good moral effect in restoring confidence and stimulating production and prevent further considerable financial loss to producers.

"BE IT RESOLVED, That this conference petition the Food Administration and U. S. Department of Agriculture, to immediately rescind Rule 15 (marked in error 14) or to so substantially modify same as to exempt from conditions of the rule, the Eastern poultry and egg farming section including the New England States, New York, Pennsylvania, Delaware, New Jersey and Maryland."

The committee on Government regulation of factors affecting costs and profits for the production of poultry products presented and secured adoption of following resolution:

"Whereas, We are all of the one mind that to win this war we must have food.

"Whereas, We believe that if this food is to be produced in sufficient amounts it will be only because the American farmer, together with his family, keep faithfully at work toiling to do their bit, which result will only be accomplished when he feels that his interests are being safeguarded and when his mental attitude is that of encouragement rather than discouragement and fear.

"Whereas, The profits in any business are hazardous in these war times, in spite of which, we feel that the poultryman is more willing to take a chance regarding his profits than to suffer the disturbances of regulation.

"Whereas, The policy and practice of price-fixing, either directly or indirectly, has a decided tendency to frighten the producer and to restrict production by creating a mental condition of fear as to what the future may hold in store.

"Whereas, The poultryman feels that any effort to fix prices which he receives for his product works an injustice, for it is universally agreed that it is physically impossible to compensate this by any legitimate restriction or limitation on the prices he must pay for the numerous products which he is compelled to buy to operate his business.

"THEREFORE, BE IT RESOLVED, That this convention go on record as not favoring a policy of price-fixing as applied to poultry products, but we do approve of regulating the machinery of transportation and distribution, which, we believe, affords relief in supplying his necessary needs and the outlet for his product."

The committee on feeds recommended and secured the prompt adoption of the following:

"We, your Committee on Feeds, recommend: (1) That the Food Administration be asked to request the Director General of Railroads to issue a permanent order placing animal and poultry feeds on a priority list with human foods; both having the same right of shipment when roads are open. (2) That in view of the high price of cotton and scarcity of jute, ultimate consumers be urged to conserve bags in first-class condition and return same to dealers. (3) That the Feeding Stuff

Division of the Food Administration be requested to present to the Grain Corporation the necessity of using off grade wheat, unfit for milling, to the extent of 30 percent instead

S. C. White Leghorn hen, bred and owned by Hillview Farm, Box 27, Lincoln, Mo.

of 10 percent in poultry feeds, as the rule now stands. It is understood that Section 3 above shall apply only in the Northwest section of the United States where such wheat is more available than corn, and includes the states of Idaho, Oregon and Washington."

We do not think that delegates generally understood that this Section 3 provided only for an increased use of feeding grade wheat in the Northwest, as it was the general sentiment expressed that reports indicate considerable quantities of feeding grade wheat, unfit for milling and human use, and that poultrymen wherever such low grade wheat is available should be permitted to use fully 20 percent of it in their poultry rations. The available corn is so poor in quality, has such limited feeding value—only about half that of sound corn—and is so high in price that poultrymen are in great need of a reasonable supply of feed wheat.

The committee on cost of egg production presented a lengthy report in which improved methods of cost accounting were recommended: keeping accurate account of all expenses, overhead charges, etc., including mortality, depreciation of stock, buildings, fences, equipment (or charge for rental), many kinds of labor, increase in amount of taxes, insurance, interest on investment, as well as a higher rate on account of war, the cost of marketing products, careful inventory of all losses, by fire, bad debts, thefts, etc., increased cost to rear stock to renew flock, etc., and other other legitimate expenses of operation. In short, it was recommended that poultrymen keep accurate account of all expense and all income, just as would be done in any other line of business, and it was recommended that instructors seek to bring about more approved methods of modern cost accounting in the various branches of the poultry industry and that a survey be taken to determine production cost so far as practicable. A special committee was appointed to make a careful survey of the different states to secure statistics showing the poultry situation all over the United States. An important committee was appointed to "educate the public as to the food value of poultry and eggs" and to secure desirable publicity thru the newspapers, magazines and other channels. This committee will

co-operate with the Poultry Husbandry division of the U. S. Department of Agriculture.

A special Advisory Board was appointed to organize the "War Emergency Federated Poultry Industry," including the following members, more to be added as needed:

James E. Rice, Ithaca, N. Y.; A. G. Philips, Lafayette, Ind.; G. M. Curtis, Quincy, Ill.; H. R. Lewis, New Brunswick, N. J.; Geo. Cugley, Springfield, O.; W. F. Kirkpatrick, Storrs, Conn.; A. A. Christian; E. E. Richards, Cedar Rapids, Iowa; S. T. Edwards, Chicago, Ill.; H. H. Knapp, Tiro, O.; W. T. Siebels, Chicago, Ill.; Frank B. White, Chicago, Ill.; James Dryden, Corvallis, Ore.; F. W. Kasmeier, College Sta., Texas; A. F. Rolfe, Baton Rouge, La.; B. F. Kaupp, Raleigh, N. C.; Reese V. Hicks, Browns Mills, N. J.; R. C. Lawry, Pacific, Mo.; M. K. Turner, West Nyack, N. Y.; E. B. Thompson, Amenia, N. Y.

The Board decided to maintain a fixed office at Washington, D. C., during the war. Prof. J. E. Rice and E. E. Richards were elected an Executive Committee for the Board and these two are to name a third person, presumably a producer and unincumbered by official position, to be in charge of the Washington office. This third member of the executive had not been named at time of going to press with this report.

Just how this "War Emergency Federated Poultry Industry" is to be financed and the very considerable expense of maintaining a "fixed office" in Washington is to be provided for, we have not yet been informed. It will be noted that actual producers of poultry and eggs are not conspicuously represented on this Advisory Board. The incubator, equipment, and feed manufacturers are well represented, as also are the colleges and publishing interests and the distributors, while breeders and poultry producers are in the minority. This may be accounted for in part, perhaps, by the fact that few producers were present; that the producer, at this time, is scarcely in a position to help finance such an undertaking—he is too busy with his flocks and endeavoring to scrape together sufficient funds to meet his feed bills, now that the spring broods are beginning to "feel their oats" and get down to making a business of eating and growing.

We hope and believe that good will come of this National Poultry Conference: but it will take more than talk and resolutions, it will require much self-sacrificing hard work and some strenuous "going over the top" to get the real results needed to save and strengthen the poultry industry.

How to Produce Capons, and Advantages

The Breed to Cross. Care and Management from Start to Finish. *By Henry D. Smith, Rockland, Mass.*

IN THE raising of capons there are several important things to be observed and thoroly understood, such as the object to be attained, the breeds to be used, the vigor and vitality of the breed, when the chicks should be hatched, how raised, when to perform the operation, how to perform it, and when to market the birds.

The object in caponizing is to produce a larger bird than would have been the case had it not been caponized, a bird especially fed and grown to be sold as a "soft roaster." I am confident that these birds do grow from one to two pounds heavier by being caponized, but there are those who contend that such is not the case. At any rate, these birds are certainly not any lighter for having been caponized and for the sake of argument, or rather to avoid argument, let us allow that they do not grow any larger and on this ground consider whether it is profitable to caponize or not. The prices which I am about to quote may or may not obtain in the different sections of the country, but they are relatively correct.

Let us take a male bird which would weigh as an old cock ten pounds and he is worth, we will say, 12c per pound or \$1.20, but had this bird been caponized and reached the same weight he would sell as a soft roaster for 30c per pound or \$3 per bird. Or, if the same bird was not caponized and sold as a soft roaster, he would have to be sold when weighing from five to six pounds, for after that period he begins to crow and develop other male characteristics, and the older and larger he gets the harder his flesh becomes and consequently lower in price.

Let us take the breed. The Boston market wants a large, full breasted, yellow bird for a soft roaster, and I would say in passing that the grower should raise what his market calls for. The Light Brahma makes the best breed for the Boston market, but at the present time, and for some time past, it has been very difficult to get enough good Brahmas to amount to anything, so we have been raising the next best, which is the Plymouth Rock, either Barred or White. The cross of Light Brahma on the Plymouth Rock hen makes an excellent capon, but this cross does not help the pullets much, if any. Where the market calls for a white meated bird I would suggest that the Orpington or Dorking would either of them fill the bill.

There are several reasons why the Plymouth Rocks are preferred to Brahmas for capon growing. As a rule they lay better, the eggs are more apt to be fertile, they hatch full as well if not better, and they thrive and do well all along the line, so that in the end there are more pounds of meat for the same amount of labor and expense. Altho each bird may not be quite as heavy, you get more birds from a given number in the flock of breeders.

As to the vigor and quality of the stock, it would seem that enough has been written along these lines so that every one interested in growing poultry would be fully aware of the importance of sound healthy breeding stock. Taking all that has been said in regard to the stamina and vitality of breeding stock, it applies equally as well to the raising of capons as to other branches of the poultry industry. It is essential that poultry producers breed only from good strong healthy stock.

It is important to know the best time to hatch chicks which are to be grown for soft roasters. When capons first began to be used in any numbers in this country, the chicks were hatched in the spring with the main object of getting the pullets for layers the following winter. The surplus cockerels would then be caponized and kept over until about a year old, that is the following spring when the prices were up. However, when people began to launch into the soft roaster business extensively, it was found that by hatching from September 1 to January 1, the capons would be just right the following May and June, and that is the time when the price is the highest. The most efficient soft roaster plants hatch some chicks a little earlier than September 1, and some

later than January 1, usually beginning the hatching August 1 and continuing until April 1. By this plan the first ones ready for market, along in March and April, are a little too early for the very highest prices, yet the prices are very near the top, and the same conditions obtain in the case of the late hatched ones, those after January 1. As most plants are

Sire of first cockerel and grand champion at Illinois Centennial Show, Springfield, Ill., January, 1918. Also third cock at Greater Chicago Show, January, 1918. Owned by Fair Oaks Farm, Waukegan, Illinois.

obliged to hatch during February and March for the next season's pullets, they can make the best of the surplus cockerels by caponizing them. Some of these will be ready to sell before the prices have dropped to any great extent, say along in July. There are those who begin to hatch as early as June instead of August 1, claiming that they can raise a larger percentage of the chicks at that season, but by following this plan they are obliged to sell practically all of the birds before the highest prices prevail.

Raising capons is not any different from raising good chickens for any purpose up to the time of the operation. In fact it varies but little thru the whole process, unless it be in giving them all the cracked corn and beef scraps they can possibly eat, with enough other grains or mash for the sake of variety, and during the last month or two give whole corn instead of cracked. Of course every one knows that the best chickens are those which have been kept coming right along all the time with no setback of any kind. Every poultryman knows there are plenty of chances for setbacks in growing chicks in any quantity. There are numerous ways in which setbacks to chicks may get the best of the poultryman, but if he attends strictly to business and keeps his eyes open he should be able to avoid them all. It may be well to consider a few of the most frequent causes of trouble along this line.

Eggs for incubation should not be kept over ten days and

must not be allowed to become chilled or be kept in too warm a temperature—from 40 to 50 degrees is all right. The fresher the eggs are the better and they should always be

UNRETOUCHED

from perfectly healthy stock. The next step is to see that they are properly incubated, for much damage can be done thru faulty incubation. With the center of the thermometer two inches from the bottom of the egg tray of the incubator, aim to keep the temperature at 103 degrees, not over that for the first week. During the second week if the eggs are reasonably fertile, the temperature will go up to the 103 mark without changing the regulator, but do not allow it to go much above that until the eggs are about to hatch, and then if it goes of its own accord, let it go but little if any above 104 degrees. If there are a large number of live chicks in the shell and it looks like a large hatch, be very careful that the temperature does not get too high, also that there is enough fresh air for the chicks. It may be necessary to set the door open, just a little crack, and yet it will not do to chill the chicks. In the machines which have nursery drawers, when the hatch is well along and chicks begin to work toward the glass door, the door should be opened and the chicks near the front, especially the dried ones, dropped down, leaving the hole open for the rest to drop in as they come that way. This should be accomplished as speedily as possible and the door closed and not opened again until the hatch is over, which should not be later than the morning of the twenty-second day. Unhatched eggs and shells should then be removed and all the chicks put into the lower drawers. If it has been a good hatch the regulator need not be changed, for under these new conditions the temperature will fall a little and the chicks having been placed in the drawers where the temperature will be about 95 or 96 degrees the conditions are about right for them.

The chicks should remain in the incubator until the morning of the twenty-third day when they should be well dried off, strong and hungry and ready for the brooder. The cooling and airing of eggs is not necessary in any of the hot air machines, providing they do not get too hot and the air in the incubator room is good fresh air. Having gone so far, we now come to the brooding. The temperature under the hover, right where you are going to put the chicks, should be 90 degrees. After the chicks have been placed in the brooder, the best plan is to judge the proper temperature by the action

of the chicks themselves. They will make it known by their looks and actions when they are either too hot or too cold. When nestled down for the night they should be just touching each other, forming a regular carpet or rug and not touching into a corner or spread all over or panting. Be very careful about drafts, even tho the weather may be getting warm.

There are about as many methods of feeding and kinds of feed to give chicks as there are people feeding them, but I am of the firm belief that almost any feed within reason and with considerable variety in the mixture will do, but—and right here is a good point—feed them in such a manner that the chicks will get good and hungry once every day while they are housed in the brooder. A good plan is to feed them liberally at night so there is a little left to pick up in the morning before the attendant gets there to do the feeding. Use good judgment in the morning and feed so the chicks will have it well cleaned up by noon, but if at this time they still have something left over from the morning feed, do not give them anything more then, for they are full with just so much left over. If, however, they are all cleaned up and acting as tho hungry, give them just a little, but not enough to prevent them working about and calling with some zest for their supper when that time arrives.

When the chicks are well feathered out, they should be removed to the colony houses and supplied with a self feeder filled with cracked corn and good beef scraps kept before them at all times. They should also be fed wheat and oats for the sake of variety.

The time for the caponizing operation on a Plymouth Rock is when the chick weighs from 1½ to 2½ pounds, but a Brahma can be successfully caponized up to the time it reaches 4 pounds. In any case, do not wait until they begin to crow or the combs grow large and red, or they show other characteristics of male birds.

FIRST PRIZE S C-BUFF ORPINGTON COCKEREL
NEW YORK STATE FAIR SEPTEMBER 1917
BRED AND OWNED BY
OWEN FARMS VINEYARD HAVEN MASS.

In performing the operation, first, fast the birds for some 36 hours. That is, after they have had their supper, take all their feed away from them when shutting them up for the night. They may be allowed water. Keep the birds in this

way all thru the next day and until the following morning, when they are ready for the operation.

The operation of caponizing is very simple if one has the proper tools, table, etc. After caponizing a few dozen birds, one can caponize a bird per minute and keep it up, and it can be done in thirty seconds, which shows that it is not a difficult operation. Some use a barrel for an operating table, but this is not as good as a board about ten inches wide by twenty inches long. Fasten the board at the center on a piece of 2x3 inch joist cut off slanting, so that with one end of the board toward the operator, the left hand side will be about five inches higher than the right hand side. With a wire and a hook to hold the wings, which are held together up over the back, and a weight about like one-half of a brick fastened to a cord two feet long with a small hook on the other end so as to take a turn around both legs, you will then have the bird lying on his left side, with the head from you, the wings fastened by the hook and the legs drawn out straight by means of the weight. The tools are a knife, a wire 5 inches long with a sharp hook on one end, a spreader and the forceps, a set known as the "Farmer Miles." There is also a set on the market with a few small improvements.

To begin to operate: With the fore finger of the left hand, press and pull the skin back until the finger nail slips over the last rib just forward of the leg. At the same time be pulling off a few feathers with right hand just over the last two ribs, so they will not be in the way for a good clean cut. Now, holding the skin tight as described above take the knife in the right hand and cut, preferably all in one cut or stroke of the knife, the whole length between the two last ribs, from where they are joined together at the top down to where they are joined at the bottom, but do not cut any bone off. This incision should be from one-fourth to three-eighth of an inch deep. Then with the handles of the spreader to the left insert them in the cut, catching the hooks on to each rib so as to spread them apart just a little but not enough to break the ribs. If the incision has been properly made a very thin membrane, called the peritoneum, will be in sight, and with the wire hook begin at the top of the incision and tear a hole the full length, being careful not to rupture the intestines which are just on the inside of the peritoneum. To remove the testicles take the forceps in the right hand with the thumb and finger inserted in the rings the same as in using a pair of scissors, and with the solid flat plate down, force the intestines down when the upper testicle will be in plain sight. But be sure and take the lower testicle first, which is not in sight as a usual thing, but can readily be found as it lies just the other side of the back bone and directly opposite to the top one. Push the forceps in beyond the lower testicle, which is not over one-half inch from the top one, open the forceps enough to take in the testicle and with an upward pressure sort of scrape the back bone in such a way as to drag the testicle out in sight. When it slips off of the wire part of the forceps, catch it on the lower solid side and then shut the forceps together taking in the testicle. Now pull back a little so as to be sure that you have caught no other organ, and with a twisting motion to bring the thin membrane that encloses the testicle into a string instead of a bag, and at the same time pulling it out, keeping a sufficient pressure on the forceps to maintain the hold on the testicle. Now go back after the top one, which can easily be gotten hold of, twist it as before and pull it out. In taking hold of the testicles be very careful not to get hold of a main artery which lies right between the two testicles, for if the artery is ruptured there is no hope for the chick. Pick it at once and treat yourself to a broiler.

If the first incision should not be high enough and turning the knife you cut up toward the back bone, be careful not to hold the knife in such a way that the point cuts away up ahead, for in this way you may cut another organ that will cause a lot of blood to flow and bother you, tho it may not prove fatal to the bird. Hold the edge of the knife straight up and down. After removing the spreaders and releasing the

bird, the object in pulling the skin away back before making the incision will be seen, for when the bird takes his natural position, the hole thru the skin will go forward so that the hole thru the flesh will be covered. Birds which have been caponized will remain rather inactive for a few days and some of them may puff up with wind under the skin, but this will pass off as a rule in a day or so. If, however, any seem greatly

Light Brahma and Barred Rock capons, alive and dressed.

distressed, make a little slit low down on the leg, so that if there is any pus in it, it will run out and the wind may all be pressed out very easily.

Last but not least, comes the marketing, but it is by far the pleasantest part of the whole undertaking, especially when the money comes in. The time to sell a soft roaster, either a capon or a pullet, is when it is "ripe," just the same as it is with a strawberry or a tomato. There are several ways to determine just when a roaster is ripe. As they approach this stage the spurs will begin to swell and grow larger, but for a time will remain soft and yellow. When the spurs begin to get white, horny and hard, the capon is about ripe and until one gets used to handling these birds, the best way is to weigh the bird and make a record of it and in just a week weigh him again and see what he is doing. A good thrifty capon will gain from one-half to three-fourths of a pound per week at this stage. Continue to do this every week as long as the bird gains, but the time will come when it will be found that he does not weigh any more than at the last weighing and perhaps not quite as much. You will then have an example of an over-ripe capon. If the price is going up, nothing has been lost during that week, but if it is going down and he has lost a little weight too, while not a great deal may be lost on one bird, yet, if one has hundreds of them in the same condition, it means considerable unnecessary loss. Some judge a ripe capon by the shedding of the feathers around the neck and some by the appearance of the flesh, which may be learned by examining the bird each time he is weighed.

Ralph Waldo Emerson said: "The basis of political economy is non-interference. The only safe rule is found in the self-adjusting meter of demand and supply. Do not legislate. Meddle, and you snap the sinews with your sumptuary laws. Give no bounties; make equal laws; secure life and property, and you need not give alms. * * * * The level of the sea is not more surely kept, than is the equilibrium of value in society, by the demand and supply; and artifice or legislation punishes itself, by reactions, gluts, and bankruptcies. * * * * Whoever knows what happens in the getting and spending of a loaf of bread and a pint of beer; that no wishing will change the rigorous limits of pints and penny loaves; that, for all that is consumed, so much less remains in the basket and pot; but what is gone out of these is not wasted, but well spent, if it nourish his body, and enable him to finish his task;—knows all of political economy that the budgets of empires can teach him."

Everybody Must Serve

One good thing which may come out of this war, which seems almost certain to come, is universal service in its broadest sense—not necessarily the military sense—a development of community co-operation and national co-operation, which hitherto has been missing in a world where it was "everybody for himself and devil take the hindmost." The Chicago Conference was a beginning in the poultry world. New England is now working earnestly to build up a co-operative poultry federation which seems likely to succeed where other efforts in the past have met with little support. Co-operation seems to be the watchword of the times. Everywhere we are urged to join in team work for the good of all. Community co-operation is urged in the production of foods, in all community interests after the manner of old times, when the country was young and each community group of families was like one big household, where each and every member co-operated to serve the best interests of all.

We are all dependent each upon the other. The sooner we find it out and work "all for one and one for all" the better it will be for all of us. Every business, every interest is interwoven and depends upon the other. Damage one link and you weaken the whole chain. As we pointed out in our January editorial "Everybody Must Work," there is no longer any room for the idlers and parasites. Everybody must work and everybody must serve. The quicker we wake up to this fact, the quicker will we win the war, and the quicker we will bring about better business and better living for each and all of us.

In the January editorial we said: "When everybody is put to work at whatever task he or she

proves most useful, when the good of the community becomes greater than the benefit of the individual, when we learn to know the value of justice, peace, and fellowship among all peoples, when creative and productive labor is compensated at its true value, then we shall enter upon an era of peace and good will that will be as near freedom and democracy as we are likely to get in this world."

Hearst's Magazine in its leading editorial for April says: "Neither human being nor animal which ceases to serve lasts. The world has been ignoring this eternal truth. Not only rulers, but gigantic corporations, wealthy individuals and influential politicians had come to be solely concerned in serving their own ends, in having people serve them, in using the people instead of striving to be useful to the people.

"With a jolt they have been taught the folly of their course. The principle of serving is again being enthroned.

"Kings and corporations and railroads and multi-millionaires and politicians are learning that their very existence depends upon fulfilling the eternal obligation to Serve.

"If a man will not work, neither shall he eat. That decree expresses a truth as fundamental as the universe itself.

"To work means to serve, to perform some useful service, to contribute some effort to turning the wheels of the world."

Union and service—in one word: Co-operation—will bring success and prosperity to all of us. Without it we may easily be divided into two groups, the excessively rich and the very poor. The Good Book and history teach us that a people with one language, united thru universal co-operation, are one people and may not be restrained from whatever they have undertaken to do.

We need co-operation—universal team work—and we need it NOW.

Lifting the Hen Embargo

Evidently those in authority are a little worried over what may happen when the embargo on sell-

ing hens and pullets is lifted May 1. Here are two of the more recently press bulletins issued by the Office of information, U. S. Dept. of Agriculture:

"SELL CHICKENS GRADUALLY."

"Don't glut the market with chickens, live or dressed, soon after May first when the Federal "closed season" on hens ends. This advice to farmers is given by the United States Department of Agriculture.

"Too many fowls on the market may result in food losses. Poultry stock should be sold gradually. Farmers will have better markets if they avoid glutting them."

"HENS SHOULD NOT BE HURRIED TO MARKET."

"A rush of too many fowls to market as soon as the restriction against selling laying hens is removed may result in food losses. Think twice before selling a hen that is still laying. Green food is becoming more plentiful and the demand for eggs continues. Universal marketing of fowls may react on prices as well as cause spoilage of dressed poultry."

All of which, above information, is doubtless true and good advice; tho a good deal like "locking the stable door after the horse is stolen." It is practically an acknowledgment that the embargo on sale of hens was a mistake.

We do not anticipate that farmers or poultry keepers will rush to unload any good laying hens or profitable breeding stock. There will in all probability be heavy selling of unprofitable flocks and of drones which have been held and carried at a loss. However most of the mischief done by Rule 15 was already done some time before these bulletins were issued. The harm that has been done cannot be undone this season.

So far as the rush of fowls to market is concerned, we suspect that that is already out of the producers' control and that country buyers had contracted for flocks of fowls some weeks ago. If rushing shipments gluts the market and smashes prices, the small independent shippers are the ones most likely to be injured by the break in the market. The producer, who has not sold and who is in a hurry to sell, may lose, but the chances are that he will hold out and wait for the reaction certain to follow heavy selling and price cutting. After the flurry is over, poultry prices will have to go up again.

The greatest damage done by the poultry embargo has been the cutting down of hatching and rearing operations. Probably not over 25 percent of normal number of chicks have been hatched in some of our best poultry producing sections. This reduction of broods of early chicks hatched cannot be made up this year. Hatches after May 1 are only desirable and satisfactory in a very small part of the country.

Ice-Packed Poultry

A public hearing was held in the Bureau of Chemistry, Washington, D. C., on April 2, to determine whether the shipment of poultry packed with ice, which is alleged to absorb water and lose food value, constitutes a violation of the Federal Food and Drugs Act.

Altho the notice was issued but a short time prior to the hearing there was a good attendance of shippers and receivers of poultry, with counsel, and also representatives of producers.

The dry cooling and dry shipping of dressed poultry is one of the pet hobbies of Dr. M. E. Pennington, of the Bureau of Chemistry. This department also has plans or blue-prints of desirable chilling

rooms for the purpose of dry chilling. While we agree that it would be a very nice thing if every farmer and poultryman could have a private chilling and refrigerating plant, we do not believe it is practical or good common sense to advocate such measures at this time.

From the plans we have seen such a chilling room might, in pre-war times, cost around \$1,600 to build, and the estimated cost of refrigeration is around 65 cents per day with ice figured at \$3 a ton. To build such a chilling room today, would probably cost close to \$3,000. To operate it, in our section of the country, would cost close to \$2 per day with ice at present prices right here at the lake. The use of ammonia refrigeration is out of the question in war time. We do not see how the poultryman or farmer could afford to invest in and maintain such a chilling plant in these times.

Also, as we have frequently pointed out in this magazine, we consider that the objections to ice-water chilled, ice-packed poultry are more imaginary than real, if the chilling and packing is properly done. Certainly we have been chilling dressed poultry in ice-water for a good many years, we have no fault to find with it when the work is properly done, and we have yet to learn of any harmful effects. Some of the finest quality poultry which goes to our most fastidious markets is ice-water chilled and ice packed, and it has always commanded a premium above top prices and been eagerly sought after. We do not believe that war time is a good time in which to introduce pet theories for reforming good and well established business methods.

Those in attendance at the hearing were unanimous in urging that no action be taken to prevent ice-packed shipments of poultry. F. S. Snyder, of Batchelder & Snyder Co., Boston, now a member of the food administration, was of the opinion that "legislation such as contemplated by the Bureau of Chemistry would without doubt reflect to the benefit of certain classes and at the same time would be detrimental in a large way to the average producer and the average consumer." Alton E. Briggs, of Boston Produce Exchange, explained that New England prefers poultry shipped under ice. The Chicago Poultry Board passed and presented very vigorous resolutions asking that there be no new rulings and regulations regarding the ice-cooling or ice-packing of poultry for interstate shipment until after the war. A special delegation from Philadelphia put up a very vigorous protest against any interference with the interstate shipment of ice-packed poultry.

C. E. Hatfield, chairman of ice-packed poultry committee, of National Poultry, Butter and Egg Association, in his report in *The National Bulletin* says:

"The many disadvantages resulting from a discontinuance of shipping ice-packed poultry in interstate commerce was very, very vigorously protested by every man who arose to the floor. I am pleased to note that there was not a single instance where any encouragement was offered to the Department that it should not be allowed to continue.

"The principal argument presented as to why we should be allowed to continue shipments of ice-packed poultry in interstate commerce was first of all, that it would disrupt and disorganize this particular branch of the entire industry; that it would necessarily mean that many shippers in the country and not only shippers, but dealers in the cities, wholesalers and jobbers would be forced to discontinue business, due to the fact that the shippers are not prepared for artificial refrigeration or pre-cooling plants; that it was not possible in many cases for even those who were financially able to equip, and

it was also presented that even tho it was possible, that right at this time the demand would be too great all at once; that it would be impossible to get materials for the construction of the most moderate plant. The materials most particularly mentioned that would be hard to obtain were ammonia and cork board.

"That dealers and jobbers in the cities presented the argument that even tho the stock was pre-cooled and reached them as pre-cooled, that it would mean heavier losses and a curtailment of trade, if they could not use ice in shipping to their out of town trade. They also advised that it would be almost impossible for the trade to whom they sold to take care of it, if at all, if they were not allowed to pack the poultry down in ice to hold during the period of distribution or use, as the case may be. ** *

"We feel as tho on returning from the conference that ice-packed poultry shippers are in no immediate danger of having this privilege taken away from them. We were assured that no definite action would be taken within the next year or two, and it is hoped by that time there will be much improvement and all prejudice removed, so that it will eventually be dropped and we will be allowed to continue shipments of ice-packed poultry."

That would seem to dispose of the wet-chilled, ice-packed poultry question for the present at least. We understand that most of the opposition to ice-packed poultry developed thru the work of one woman, who has very positive opinions on how the poultry business should be conducted, and who, it is understood, was also responsible for the hen embargo Rule 15. Let us hope that she will discontinue her activities in this direction, at least for the duration of the war. It would seem the part of wisdom to disturb as little as possible the established methods of food production and distribution.

Grow More to Feed Poultry.

EVERY poultryman will be wise to plant crops and grow more coarse grains and winter-keeping vegetables for his poultry. If you cannot grow what you need, make a careful estimate of what you will need and contract with some farmer to grow it for you.

While an abundance of grain is reported in Australia, India and South America, there are at present no ships to bring this grain to us. The indications are that all available ships will be needed to transport troops and munitions to the overseas battlefield. Grain has been rotting at the docks in various parts of the world south of the equator, so we are told, but there is at present no way to get it and may not be any way to secure it for a long time. It is probable that we in America will have to depend largely upon our own resources and help feed half the world besides.

Altho newspaper talk still continues about the "1917 bumper corn crop," the fact remains that this crop was very

much overestimated and a very large part of the corn was so soft that the spoilage has been very heavy.

Our statistical figures on crop estimates are not very reliable. No one knows just what the actual condition is throughout the country, and we very much need a carefully conducted farm census, to show how many cattle, milch cows, sheep, hogs, poultry, the quantity of grains on hand, and acreage in grain of various sorts, we really have to count on. Just now everybody is guessing. No one really knows, but the probability is that our available supply is less than we think it is. For example, the estimated acreage sown to winter wheat in New York state last fall, according to bureau statistics, was 512,000 acres. A carefully conducted state census recently completed shows only about 360,000 acres in winter wheat. If estimates for other states prove to be no more accurate than for New York, the actual shortage may prove to be considerable. Guesses may be all very well in times of peace, but in war we need something more tangible. We should immediately take an inventory of our resources by making a careful state by state census.

Meanwhile it is up to the poultryman to grow corn, oats, barley and buckwheat if he can. Also to produce a good supply of potatoes, cabbage, beets, mangels, carrots, squash and pumpkins, to make sure of a liberal supply for the family and the family flock next winter. A few rows of beans will furnish ample supply for summer use and an abundance for winter. Only a small plot of ground need be given to peas and summer "garden sass." It will be wise to concentrate on growing supplies needed for next winter. Grow crops that will keep.

Work for the Month.

MAY will be a busy month. The broods of chicks must be kept growing, must be well fed, and should have the advantage of a good grass run.

A sharp watch will have to be kept to prevent ill effects from lice and mites. These pests will develop rapidly from now on. Keep brooders and brood coops clean. Use good whitewash freely. Mother hens may be treated with a mixture of blue mercurial ointment one-third with petrolatum two-thirds, a piece about the size of a pea applied to the skin around the vent and bare places under wings. Apply lightly, do not rub in. A good lice and mite killing spray for use in coops, can be made by dissolving in kerosene all it will take up of crude naphthalene flakes—about one pound to the gallon.

Litter material should be changed frequently, whenever damp or soiled. Be careful not to feed any spoiled grain or sour food. Supply plenty of good clean drinking water in clean fountains. Provide shade and shelter for the chickens and fowls. If a grass run cannot be provided, supply an abundance of fresh greens—sprouted oats, fresh daily, will serve.

Do not neglect the garden. Planting will have to begin in earnest this month. Keep everlastingly at it. The more

wholesome food, like poultry, eggs, and vegetables, you grow at home the better it will be for your family and for all of us.

There should not be many idle hours in May. When you find them try fishing, where the law permits. Fresh caught fish, not available for family use, will be relished by the chicks and fowls. Simply scald, or plunge fish into boiling water until flesh and bones separate, for poultry feeding. Fish is one of the finest growing foods for chickens.

Make the most of May.

Hen Embargo Lifted April 20.

The daily newspapers of Saturday, April 13, carried the following news item. Comment seems superfluous:

Washington, April 12.—Hens are to enjoy immunity from the chopping block only a week longer, as the food administrator announced today that restrictions against their sale would be lifted on April 20.

It is estimated that at least 3,250,000 hens capable of producing eggs have been saved in New York, Chicago and Boston markets alone since the regulation was put in force on Feb. 23. Weather conditions brought about an earlier hatching and laying period than anticipated, enabling the ban to be raised 10 days earlier than the time set.

**FOR SALE
New Modern Poultry Farm**

2½ acres, one-half mile from live progressive town of 1,800, fifty miles west of Chicago on hard gravel road. All buildings built new last year. Residence has seven large pleasant rooms and bath room. Finished in oak, with oak floors, fire place, furnace heat, electric lights, etc., hard and soft water in house. Two large porches. Out-buildings consist of feed storage houses, laying houses with capacity of over 600 winter layers; also numerous brooder houses, colony houses, breeding houses and excellent range. Soil is rich black and level as a floor; very adaptable for fruit and garden produce, with ready market. Place fenced complete with six foot woven wire poultry fence. With this place goes an opportunity to raise thorough poultry for one of the foremost poultry breeders in the United States on large scale at much better than market price for both poultry and eggs. Reason for selling owner going to Arizona. Bargain price \$6,000 for quick sale. Part cash, balance may be assumed as mortgage. For particulars address owner,

Dr. Woods' Notes and Comment

THE UNITED STATES.

"That this nation, under God, shall have a new birth of freedom, and that government of the people, by the people, for the people, shall not perish from the earth."

—Abraham Lincoln.

* * *

It is a particularly good time now to remember the words of the immortal Lincoln. The creed deep seated in the heart and mind of every real American is: "I believe in the United States of America as a government of the people, by the people, for the people; whose just powers are derived from the consent of the governed."

In times of stress like these it behooves every citizen to jealously watch and guard "the government of the people, by the people, for the people" and we are bound to feel concern when some "inspired" legislator slips a rider on to bill pending in Congress which, among other things, punishes with a \$10,000 fine or twenty years in jail, criticism of Federal or State authorities. As a writer in April article said: "If ever elective and appointive office holders come to be regarded as not open to criticism, God help the Republic!" We

do not know what was done with this proposed "lese-majesty" rider, but cannot believe that it would be allowed to pass.

* * *

At this writing, April 12, we have word from Prof. J. E. Rice and Prof. F. H. Stoneburn that both are confident that Rule 15, the ban on selling hens, will be lifted before it expires May 1, through self-limitation. We hope that it will be rescinded for the sake of the good moral effect; but we are not over-sanguine that it will be done, because rescinding the rule would be a tacit admission that a mistake had been made, and few people are fond of acknowledging mistakes.

* * *

May hatched chickens are good chickens—particularly in the Mediterranean varieties. Do not hatch more than you can properly feed and rear. Grain and feed is likely to be scarce in many sections before a new supply is harvested. Use it to the best advantage and do not neglect the early hatched birds, keep them well fed and growing steadily without any set backs. A few chickens

JOHN S. MARTIN, Box 51, Port Dover, Canada

well fed are worth more than many ill fed ones. Give the early pullets the best of care. Every good laying pullet will be needed next fall, and every pullet laying next October and November means more food for everybody, and particularly necessary food for our boys in the hospitals. There are no food like new-laid eggs and fresh milk for helping wounded or sick soldiers and sailors to regain health and strength.

* * *

The person who speaks disparagingly about the American hen, does not know any better. He does not appreciate the wonderful food value of the new-laid egg, perhaps has always had plenty at too low a price to know the meaning of going without. Madam Hen is "doing her bit" and doing it well under difficult conditions. Only recently the investigators at Johns Hopkins University pronounced artificial foods a failure and stated that the oil in the yolk of an egg contains an unanalyzable substance which is essential to the maintenance of human life, and particularly necessary to children and invalids. The new-laid egg is one of the most important and least appreciated foods. Only the poultry specialist produces, with his flocks, eggs of highest food value and quality. If the consuming public really appreciated these specialty egg-farm eggs, it would find them cheap at even ten cents each.

* * *

Do not fail to hold on to your family flock of egg producers. Every ounce of food produced at home will be needed and eggs are the best of food. You will not miss the feed, or the cost of the feed, for your flock; but you will sadly miss the eggs if you fail to produce them.

* * *

Write to your Senator and Representative in Congress and ask them to give their support and encouragement to the Poultry Husbandry Division of the U. S. Dept. of Agriculture, in charge of Harry M. Lamon. If you have a good idea for the betterment of the poultry industry write to Mr. Lamon about it. He is working for the interests of poultrymen and he should have your support and encouragement. Your interests and his interests are the producers' interests. There are other powerful influences at work which are not for the good of the producers. Get behind Harry Lamon and the Poultry Husbandry division and boost the cause of more and better poultry.

* * *

Dr. M. E. Pennington, of the Bureau of Chemistry, is also interested in poultry, but she does not seem to be in sympathetic understanding with the producers' problems, her work has been chiefly with the big packing and distributing agencies. At the recent Chicago conference she spoke of instructing the country buyers to keep prices down and "to pay only enough to keep them (the fowls) coming" and to advance prices only a sufficient amount to keep the fowls coming from the farms, but not to pay enough to encourage heavy selling. That should have a good deal of significance for producers of poultry. It may explain why poultry prices did not respond readily to the increased cost of production. Poultry raisers only want a fair price and a liv-

Fort Madison, Ia., Apr. 5, '18
Dear Sir—I will just write you a line or two to let you know that the 50 Barred Rock chicks arrived O. K. and in due time. All are in fine condition and strong looking chicks. Many thanks to you for prompt delivery.
Yours truly,
R. C. S.

Scranton, Pa., April 12, '18
Dear Sir—Just a line to let you know the baby chicks arrived O. K., Thursday, April 11th, all alive and seemingly a peppery bunch. To say that we were pleased with the lot is stating it very mildly. Thanking you for your attention and assuring you of our future trade, we remain,
Yours truly,
A. H. G., W. B., G. J. C.

My 18 Years

of practical poultry experience has been incorporated into my bred-to-lay strains in such a manner that brings forth unsolicited hundreds of repeat orders from customers of many years standing. My catalog contains descriptions of my plant by representatives of the leading poultry publications, reports from many of my customers, and also my methods of breeding, care, and management. It is fully illustrated, and very instructive, and will prove to you that my prices on eggs at 15c and 30c each, baby chicks at 25c and 50c each, and breeding and laying stock at \$2.50 and up, are very reasonable.

*Start right, by writing for my instructive catalog today.
It has helped others and it will undoubtedly help you.*

JOHN G. POORMAN, BOX 100, TINLEY PARK, ILLINOIS, U. S. A.

Stop Hatching Weak Chicks

With Cheap Incubators

Remember it is not how many you hatch that counts, but how many you raise. Chicks that hatch out weak and wobbly, and live but a few days, mean nothing to you except trouble and loss. They make one sick of the poultry business. Most of the chicks you lose in the first two weeks die because they did not hatch out with enough vitality or strength for a good start.

Queen Incubators

Hatch Chicks That Live and Grow

The Queen is accurately regulated—taking care of a temperature variation of 70 degrees without danger. It is built of genuine California Redwood—very scarce in these days of imitation and cheap substitution. Redwood does not absorb the odor from the hatching eggs. Cheaper woods, and pasteboard lining in iron and tin machines, retain the odors, to weaken and kill the hatching chicks.

Start your chicks with a Queen constitution and they will make money for you. The Queen is not a cheap incubator, compared with many of the cheaply constructed machines on the market, but it is cheap in the long run. It will be turning out high percentage hatches years after the cheap machines have been junked.

Sold by dealers. Catalog sent free on request.

ing profit. None of them are likely to rush profitable laying fowls into market simply because attractive prices may be obtained, neither do they like to feel that prices are going to be held arbitrarily at a point just sufficient "to keep them coming." * * *

Just as we were planning to disc a fall-ploughed field and get it ready for peas and early potatoes, along came the April blizzard with sleet, ice, and heavy snow fall. As we write these notes, the farm looks like mid-winter instead of gentle spring and the robins and other birds must be fed to prevent their suffering. The poor birds are having a hard time seeking shelter from the chilling wind in the branches of the ice-and-snow-clad pines. The broods of early chicks are all well sheltered, but are protesting vigorously against the lingering winter. The prophets who predicted an early spring have once again dug their furs out of the moth balls and cedar chests, and are beginning to talk wisely about the "movement of the polar ice cap." We don't know about that, but we have met many similar springtimes in rugged old New England. * * *

Potter "Redybilt" Poultry Houses

Don't Build - It's Cheaper to Buy

An old reliable Potter ready-made henhouse can be purchased for less than it would cost you to build one. They have been used and recommended for over 16 years by thousands of poultry keepers, all over America. A clean sanitary house, nests and roosts mean healthy hens and lots of eggs. Do your part and the hens will do their part.

Roosts,
Nests, etc.,
Ready to Use

A \$39.50 Potter House Portable, open front, fresh air, scratch shed house, equipped with 6-ft. 3-perch Potted Henery Outfit for 30 hens.

For Less Than Cost of Making

Sanitary, portable, inexpensive. You start right when you install Potter outfits—roosts, nests, drop-boards coops, hoppers, etc. Get rid of makeshift, unsanitary disease-breeding fixtures and make a bigger success of your flock.

Get the Potter Book—it shows over 100 pictures of portable houses, coops, henery outfits, etc. Mailed free for two red stamps to cover postage.

POTTER & Co. 56 FOREST AVENUE DOWNERS GROVE, ILL.

A \$6.60 Potter Outfit

6-ft. 3-perch, 10-nest Henery Outfit for 36 hens. Same style made in 12 sizes.

While in Chicago, we had the pleasure of attending a Friday lunch of the Chicago Association of Commerce, at the New Morrison Hotel, where food regulations were very strictly observed but a good meal was served at 60 cents a plate. Julian B. Arnold, member of the British War Mission, gave a most interesting talk on "What is a Non-Essential Industry in War Time?" at this lunch to an assembly of several hundred "business executives." Mr. Arnold finds that the only real non-essential in war time is the pacifist, and thinks that "they should all be put in cold storage and no one would ever take them out." One "executive" ventured the remark that here in America we have our pacifists making submarine chasers, serving as Secretary of War, and doing little unimportant things like that. Probably they have a different brand of pacifist overseas, but ours seem to have left off the first four letters and kept only the "fst."

We were told that all Britain is busy on work for the war and for the "war after the war." They are "in the war over there." He does not think we are really awake yet. In England plans are already prepared for the new mills and factories to be built in Belgium. The machinery is already built and stored in English warehouses, each piece numbered and marked for its proper place in the manufacturing plants to be built as soon as the Germans are driven back far enough to permit it. England is wide awake, very wide awake, with "preparedness for the war after the war." It would seem that we Americans might learn a lesson here.

He told of the wonderful work of English women at men's work, of their efficiency in factories and war munition plants. The British workingman and working woman are getting much better pay than ever before, are "comparatively well off." More pianos were sold in England last year than ever before, but they were secondhand pianos from the homes of the rich and they have gone into the homes of the working classes.

\$450 FORD AUTO

FIRST GRAND PRIZE

IN the picture are hidden a number of faces. How many can you find? Some are looking right at you, others show only the side of the face—you'll find them upside down and every way. Mark each face you find with a pencil, clip out picture, send to us with name and address NOW. We will give away a \$450.00, 1918 Model, Ford Touring Car as First Grand Prize and Thousands of Dollars in Cash Rewards, Prizes and Special Premiums. Each worker will be rewarded. Solve the puzzle. If you can find as many as FIVE FACES, we will send you at once 1,000 Free Votes toward the \$450 Ford Auto and other Grand Prizes. We will also give away several \$40 Bicycles. These will be given free and extra, regardless of who gets the Auto. Someone will get the Ford Auto—WHY NOT YOU?

SUCRENE POULTRY MASH

*Makes War Time
Poultry Pay*

Get into the big drive for a hundred million pounds more poultry meat this year. Uncle Sam calls for it to meet the country's food needs. A few more back lot poultry flocks, a few more chicks per farm,

a little better care in feeding to prevent the 30% to 40% loss of young chicks every year, will produce the desired results.

Sucrene Growing Mash, Poultry Mash and Scratch Feed

solve the feeding problem for you in an easy and economical manner. They are scientifically prepared under the direction of high poultry feeding authorities. Can be absolutely relied upon for profitable returns.

For healthy chick growth and quick, full development of fryers and layers, Sucrene Growing Mash has no superior. Its 18% protein, 53½% fat and carbohydrates, with a proper percentage of ash, supply all the needs for flesh, feather, bone and vigorous vitality. Sucrene Growing Mash promotes health—saves the young chicks—makes the plump fryers or hardy layers in fall. That's when they bring in the money

Make Your Hens "Rapid-Fire" Layers

Sucrene Poultry Mash does it by keeping hens in prime condition and supplying the egg-making nutrients in proper proportion every day in the year.

In feeding for eggs keep in mind that ordinary grain rations are one-sided—do not afford nutrients necessary for complete egg formation. 100 lbs. of corn, for instance, would produce 255 yolks and only 134 whites. Other grains are similarly disproportionate in nutrient quality. Hens can't lay half-made eggs.

Sucrene Poultry Mash is composed of corn feed meal, alfalfa meal, meat scraps, corn distillers' dried grains, wheat bran, linseed meal, palm kernel meal and small percentages of calcium carbonate and salt. Guaranteed analysis: 18% protein, 3½% fat, 50% carbohydrates, 12% fibre.

In *Sucrene Poultry Mash and Scratch Feed* your hens have a complete, scientifically balanced body-maintaining and egg-building nourishment. Keeps them up to maximum laying capacity all year 'round—hurries them through the moulting period in good shape because they are strong in feather building material.

Sucrene Poultry Feeds Have a Record of Doubling the Egg Yield of Hens in Three Weeks

Order a 100-pound trial sack from your dealer, of Sucrene Growing Mash, Poultry Mash and Scratch Feed. It will place you on the road to poultry profits this year. If your dealer does not handle these feeds write us his name and we will see that you are supplied. Fill out and mail us the coupon or write us a postal for free illustrated literature on care and feeding of poultry.

Business-Bred Poultry Will Win!

\$20,000,000 is the estimated annual loss to the poultry producers of America because of the low average egg production of the American Hen! Are you contributing to the loss or do you keep poultry which is bred for business? You can

Make More Money

than before the War if your hens are of high average egg production. It requires about two doz. more eggs per hen to pay the feed bill now than three years ago. Are you getting the extra eggs? Keep better hens of the right quality and start now by buying

SHOREWOOD

Buff Leghorns AND R. I. Whites

Their quality has been repeatedly demonstrated under official test. We own the birds which have made the Highest Official Records in their respective varieties to date. And, too, our birds have been biggest winners at Chicago Coliseum and other prominent shows. They have made good with others—they will make good for you. Just one male raised from Shorewood eggs or baby chicks will be worth every cent of your purchase price and more too in "egg-breeding," and the females will keep you bountifully supplied with fine fresh eggs the year 'round.

Shorewood poultry is your best investment—farmer, fancier, commercial poultryman or back-yard poultry keeper. Get our illustrated mating list and ask for our new Spring Bulletin on

Eggs, Baby Chicks and Mated Breeding Stock

We have a special prepaid offer which will interest you. Write today.

SHOREWOOD FARMS CO.
842 Shorewood Road - Saugatuck, Mich.

The piano manufacturers have put their skilled men to work on aeroplanes and other war work where skill in joining the wirework is necessary; the jewelers are making caps for the shells, work which requires delicate fingers and fine workmanship. And so it goes, "everybody is in the war." Mr. Arnold's address was intensely interesting from many points of view,—but most of all it made us feel that here at home we have been "almost asleep at the switch." But America is waking up, there can be no doubt about that.

* * *

With an embargo on shipments East of Syracuse on grain and feeds from the West; and no bran, middlings or mixed feed obtainable at any price; oats scarce and corn poorer in quality, more chaffy and full of cob, the lot of the New England poultryman and dairyman is not one joyous round of pleasure. We are trying to do our bit in food production, but it looks as if grain and feed shortage may compel us to finish off the chicks as broilers and fryers, and can them. From present indications the one best bet of the New England farmer and poultryman is to put a large part of his effort this season into producing grain for his stock and a supply of food for the family. Freight seems to be moving, but foodstuffs and grains and feeds are not coming into this part of the country fast enough to help us much—and next fall and winter we expect that transportation difficulties may be increased instead of improved.

* * *

The following from Wallace's Farm-er is both interesting and very much to the point:

"WHY NOT PRACTICAL HELP."

"We have been enjoying the reports of some of the egg-laying contests and descriptions of some of the government poultry plants and buildings. We confess after reading of one with electric lighted buildings, electric heated water vessels, floors which cost \$500 and unlimited help (not only with the practical work of cleaning, whitewashing, etc., but also with the clerical end, and expert help in balancing a war-time ration), we felt a twinge of jealousy, because we, too, could not command for our flock the modern conveniences which fall to the lot of the government-minded hen.

"Probably few farmers' wives have time to care for their chickens as well as they know how to care for them. We would all white-wash every month if we had the time, but there are many interfering calls from other branches of home, house and farm work which must be cared for, and the poultry branch is one of the smallest.

"The head of a large concern is not expected to run the errands of the place. His time is conserved for the big things by letting the less valuable workers do the chore work. Why can't the government be of service to the farm women by providing a portable whitewashing machine with a crew of two and an automobile, to cover each county to see that the chicken houses of the country are cleaned, disinfected and whitewashed by men or boys who are not needed in half a dozen places at once, as is the farmer's wife? The cost of the outfit would probably not be greater than the cost of the bulletins telling us how to do it, and why it should be done, and women would gladly pay a fair wage for the labor.

"Important as is increased poultry production to the country, the need of the individual farm home for the mother's care is greater, to say nothing of the farm work which women will likely do this summer.

"Practical demonstrations carried out on farm homes might well come within the scope of the extension work, but if we put help from the government out of the question, is there any good reason why a neighborhood should not have routine cleaning done by one equipment, as well as threshing, shredding fodder, etc.? It isn't hard to do things right when one has everything to do with."

This Economy Brooder Hover Is Guaranteed To Satisfy You

You'll like this Oakes Brooder Hover

It's made of light, strong, durable steel and will stand anywhere you want it; no special platform or false floor necessary. It is complete in itself and takes but a small flame to give plenty of heat for the good of your chicks.

Made in two sizes \$6.00 and \$9.00; wire cage \$2.50 extra.

Send for Complete Catalogue of Poultry Necessities.

Here is one of the best spring poems we have yet seen, and it is particularly apt this spring:

"EVERYBODY'S DOIN' IT."

In our little town—oh, sad to tell!
There's a merchant who doesn't know how 'to sell,
A lawyer who doesn't know much of law,
A sawyer who doesn't know how to saw,
A teacher who doesn't know how to teach,
A preacher who doesn't know how to preach,
An odd-jobs man with never a job,
A cobbler who doesn't know how to cob,
A miller who doesn't know how to mill,
A butcher who doesn't know how to kill,
And a doctor who doesn't know how to doc.;
And since none of them are busy men,
You'll find them over and over again
Around the stove in the general store,
Each talking freely—and thru his hat—
Doing the one thing they're all good at—
Giving advice to the farmer!

—Exchange.

* * *

Several dozen people, already, this spring, have been telling us what we ought to do on our farm. We know well enough what ought to be done, we know what we would like to do, and we also know just about how much we will be able to do. With four in the family, all busy from sun-to-sun and much later for the elders, and a hired man who will only work 9 hours, or from 7 a. m. until 5 p. m.—with an hour off for dinner—we find we have to do whatever task happens to most need doing. There are many things which should be done and have to be left undone, either from lack of time or lack of funds. But city friends, with easy hours, seem to think they confer a favor when they drive out to the farm, for an automobile ride, and advise us what we ought to do in our spare time. Just as if there ever was such a thing as "spare time" on a farm. We wouldn't mind it if they would take off their coats and pitch in to help, or if they wouldn't expect us to quit work to entertain them, for we really do enjoy a reasonable amount of company—but we do balk at so much advice on how to run our business, from people who do not know what real work and long hours are like. Also it gets our goats to be asked for chickens, eggs, and other produce, as if it cost us nothing and we ought to be glad to give it away. We enjoy giving as a voluntary offering, but we do not like to have people try to use us. We wonder how a city merchant would feel if we walked into his store, tried to tell him how to run his business, and then asked for a gift of some of his choicest goods to take home. We'd expect to get kicked out and asked to stay out. However, there are a lot of people who seem to think that food ought not to cost anything and that they should be fed for nothing.

SOME OF
THE GREATEST LIVING BARRED ROCKS

were produced by my customers from Aristocrat eggs last season.

This statement means that my customers produced some of the very greatest Barred Rocks in all America—in all the world—from Aristocrat eggs. Hundreds of prize-winners—prize-winners in the biggest, largest shows of the entire continent—were hatched and raised and exhibited—by my customers—from regular Aristocrat eggs purchased last spring. (Note: The same identical hens and cock birds which produced those great winners this past season are again mated up right now.)

While you are breeding and raising chickens, why not breed, feed and raise THE BEST ?

Why not? It costs no more to feed and raise the very richest Aristocrats than to raise scrubs. **THINK!**

Send today for big, beautiful new catalogue and special booklet (FREE) and read THE CONVINCING PROOFS, under such headings as these: "Purchases Aristocrat eggs and wins out at the biggest show in America"; "A simply phenomenal record in Texas"; "First and second cockerel in New Jersey from Aristocrat eggs"; "Figure out this phenomenal record in Canada"; "Thirty-six ribbons, three championships"; "A great victory in Pennsylvania"; "Four first prizes at State Show"; etc., etc. Regular prices: 15 eggs for \$10; 30 for \$17.50; 50 for \$25; 100 for \$50; 500 for \$200.

Home and the Table

Good Things for Everybody

No sadder proof can be given by a man of his own littleness than disbelief in great men. —Carlyle.

IN THESE days of world strife and disrupted communication between the various races and peoples of the earth, it is a rare privilege to have the opportunity to talk with one who has but lately returned from Russia, after having taught in the schools of that country for a number of years.

Early in March I had the privilege of hearing Miss Alice Lowe, a citizen of this country but late of Petrograd, Russia, speak on the present status of the Russian people and the outlook for their future. After her lecture I had a personal interview with Miss Lowe, discussing with her the various phases of her most interesting subject.

Miss Lowe's admiration and enthusiasm for the great Russian people is unbounded. Having lived in Russian families in various parts of the country, taught their children, enjoyed their hospitality, studied their manners and customs, she returns to her native land with no word other than that of highest praise for, and confidence in a great true-hearted, noble people.

Miss Lowe expressed the hope that the American people would not lose faith in the Russians because of the dearth of encouraging news which reaches this country from Russia. We should consider the present state of difficult communication between widely separated countries, the sinister motives everywhere at work to discredit justice and right. But going deeper into the matter we must recognize the fact that in going among a people, the newspaper correspondent, or the college sociologist cannot find more than he carries with him—frequently less, but never more than he himself is capable of appreciating. It has been said that a word or an act means to a man just what that man is, and using what language he will, he can never say anything but just what he is. We cannot therefore expect any great depth of vision from some of the narrow minded, superficial observers who are going about the world at the present time in an endeavor to depict conditions.

When we wish to acquaint ourselves with the conditions of a people or with the spirit of the age, let us go to the source, and discover what is being done and suffered in the homes; let us know the temperament and personal history of the people, for here we find fact and not fiction. The superficial observer has neither time nor inclination to thus go to the root of the matter. But to divine the true character of a people, to read the hope which they nurture, let us go into the dwelling houses rather than the state house or the police station. For this work, men of ability are required and there is a shortage of capable men in the world. Sugar, ships and flour are not the only articles of which we are short. The correspondent finds it easy enough to count the number of men in the various divisions of the army, the number of square miles gained in an advance, or to criticize the views of the Soviets with which he is not in sympathy, but to study and learn of the conditions of a people, to note their characteristics, to expand his intellect sufficiently to appreciate their motives and hope for the future, is a much more difficult task.

The great intellectual revolution which assailed the old order of things in Russia, and upon which the revolution was based, preceded the actual revolution by no man knows how many years. But it is certain that the minds of the peasants, as well as those of the upper classes, have long been at work upon the problem. The widely circulated statements in regard to the dense ignorance of the masses in Russia will bear careful investigation. A large proportion of the people cannot read or write. But the Russian peasant is not lacking in real education. His education has not been gained in schools or found in books, for it consists in self-discipline, in self-reliance and in the ability to provide for and govern himself wisely. These people have grappled with the difficulties of life for generations, their minds and faculties have developed thru the constant necessity of providing for present and future contingencies such as a more protected or privileged people could have no conception of, and their minds are alert and open. Scaled-brain egotism and self-sufficient vanity are lacking in the Russian people. While there exists an inferiority of mere book learning, they possess a superiority of thought to many classes of people who have enjoyed the

privilege of free education but who have not been trained to think for themselves. In fact, the best word that comes from the Russians is that they are thinkers, and when a people possess this faculty the world must soon be aware of it. Emerson says that "when a thinker is let loose upon this earth it is as if a conflagration has broken out in a great city and no man knows what is safe or where it will end. There is not a piece of science but its flank may be turned tomorrow, no so-called eternal names of fame that may not be revised and condemned. The very hopes of man, the thought of his heart, the manners and morals of mankind are all at the mercy of a new generalization. The state of the world at any time is directly dependent upon the state of the existing intellect of mankind. That which is dear to man at this hour is so on account of the ideas he has fostered. A new degree of culture would instantly revolutionize the entire system of human pursuits."

A great sense of human justice characterizes the Russian people in all their undertakings. Honor and courtesy are a part of them. They are passionately fond of their children. They are both affectionate and demonstrative. There is marked absence of pretense among them. In their daily speech men and women everywhere and among all classes call each other by their given names. Prefixes are not used even among the royalty. Educational advantages among the upper classes are superior to those enjoyed in many of the most advanced countries. Four to eight languages in addition to the native language are spoken by the average educated Russian and these almost perfectly spoken without the slightest accent.

The Russian Bolshevik embraces the idea that labor is necessary and honorable and should be shared by all, that this is the only honest solution of the world's troubles and that nothing less is safe. They aim to establish a state wherein every individual shall accomplish his particular line of work and receive just consideration for it, and they have courageously set their hands to this great task, believing that a world in the hand is worth two in the bush.

Let us not forget that during the dark days of England's Great Rebellion, those men who rallied to her aid and rescued her from oblivion were not from the so-called educated classes, but men, many of whom could neither read nor write and all of them from the lower classes of society—tailors, tinkers, brewers, stable-

THE GARDEN GUIDE

Third big edition in less than 12 months tells the story of its application by garden owners. Compact, complete, unrivaled. Professionals solve every problem of the soil, thereby making of GARDEN GUIDE that reliable instructor amateur gardeners have been looking for all these years. Contains exhaustive chapters on the Home Vegetable and Fruit Gardens, with many original garden plans. Pruning, Propagation, Fertilizers, Insect Pests, Planning the Home Grounds, Favorite Flowers, Bulbs, Trees, Shrubs, Rustic Furniture, Tools, Birds, Canning and 1001 other garden factors all covered. Handsome cover. Over 275 teaching illus., 356 pp., Paper, 75c; cloth, \$1.00; postpaid. (Endorsed by all seedsmen.) A. T. DeLamar Co. 4427 W. 37th St. N. Y.

men, draymen, servants, coopers, carpenters and stokers. Cromwell himself had been employed in a brewery and according to England's best historian, "the tailor and the drayman were in that age strong enough to direct the course of public affairs and to win for themselves high position in the state." Then let us not fear for Russia or the great Russian people but accord them our whole hearted confidence as President Wilson is ably doing.

There is no want of sincerity in the Russian leaders or the great mass of the people and while their progress may be temporarily retarded by the powerful obstacles arrayed against them, yet in the end their cause must triumph. Coming generations will not be greatly interested in the recitals of strategy and intrigue of the German war machine, but they will read intelligently and with thankful hearts of the great Russian movement which aims to rescue her civilization at a hard pinch. The worthy efforts and high aims of this great people will long survive the puerile attacks made upon them in the current press.

The following receipts were contributed by Mrs. Susie Fisher Kline of Louisiana, who has kindly sent us ninety-five receipts in which rice is used and which are gotten out by the Southern Rice Growers Association:

OKRA GUMBO.

Place one quart of tomatoes and one quart of okra cut in rings in three quarts of water, and boil. Cut up a chicken as for fricassee. Fry the chicken and when brown drop it into the vegetable mixture. Add onions chopped fine, salt and pepper to taste and let simmer for two hours. Serve with minced sweet pepper and rice. A little canned corn may also be added, with bay leaf, parsley and celery for seasoning.

CREOLE JAMBALAYA.

Jambalaya is a stew of meat and rice, shell fish and rice, fish and rice, or fowl and rice, highly seasoned. It is a palatable and nutritious dish that is popular in the rice growing regions of Louisiana and Texas. Fry out some pork and add two minced onions, cooking until brown. And about a half of a pound of minced chicken left from a roast, and season with bay leaf, thyme, parsley and garlic. Brown and add two quarts of hot water and boil for about ten minutes. Add a cup of rice and boil until tender. Season with salt and pepper and tabasco.

RICE AND PEAS.

Boil two cups of black-eyed peas with half a pound of salt pork. Boil a cupful of rice in a separate pot. When the peas are tender add the rice to them. The peas must be moist enough to mix thoroughly with the rice. Now add half a cupful of minced ham, a teaspoonful of grated onion and a tablespoonful of butter. Simmer for a few minutes and serve. A can of tomato purce may be added and if this dish is then served with corn bread sticks, you will have a real meal. Red beans and rice cooked the same way, form another palatable and nutritious dish.

BAKED RICE AND HAMBURGER.

Boil one cup of rice and drain. Add half a can tomatoes, two onions cut fine, one pound or less of hamburger steak, salt and pepper to taste. The flavor is improved by frying the onion in a bit of fat for a few moments before adding to the mixture. Put all into a dish and bake about an hour. Serve hot.

GUMBO.

Cut up a chicken as for fricassee. Fry it in a large stew pan or kettle. When brown, sprinkle over it a tablespoonful of rice flour and let the flour brown. Add hot water enough to a little more than cover the chicken. Add two sliced onions, a seeded pepper pod, and salt and pepper to taste. When the chicken is thoroughly cooked and about fifteen minutes before the gumbo is to be served, add fifty oysters and their liquor. When the oysters wrinkle at the edges move the gumbo to the back of the range. Sprinkle into it a tablespoonful of file. Serve immediately with warm boiled rice. File is a powder obtained by pounding and sifting dried tender sassafras leaves. It is used for thickening and seasoning soups.

RICED CHILI CON CARNE.

Cut a small round steak into small pieces and put into a kettle with one tablespoonful of drippings, one cup of boiling water and two tablespoonfuls of rice. Cover and cook until tender. Seed two large, dried red chili peppers and let them stand ten minutes in a cupful of boiling water, then pour them into a sieve and press thru until the water is red and thick. Season with salt and onion juice. When the meat is done, pour this sauce over it and serve very hot.

Efficiency Chicks

are just what their name signifies. They are hatched from stock bred to produce **efficiently**—that is, to lay consistently an average number of eggs that will make their keeping profitable. And now Uncle Sam has stepped in with *his* efficiency. He says:

We can send Baby Chicks by Parcel Post

delivered to your door in the city or to your postoffice on rural routes. May is the best month for baby chicks. And don't delay. Baby chicks are getting scarce. You must do all you can toward raising enough food to feed yourself and others. Letters from our old patrons tell us how well our stock is doing for them. And our prices are surprisingly low. Send today for our catalog, which tells you all about the nine varieties we supply.

FROM THE PACIFIC COAST

THE MOST INTENSIVE EGG FARM IN THE WORLD.

By CHAS. WEEKS, Palo Alto, Cal.

SOME years ago a man by the name of Philo, Elmira, N. Y., startled the world by a new and unheard of system of keeping poultry in small pens with no outside runs. He wrote a little pamphlet telling of this new and wonderful system of poultry raising whereby one could earn \$4,500 from a town lot in one year. The whole world went to raising poultry in the back yard. Philo, it is said, made \$100,000 from this little pamphlet in one year. Old poultrymen smiled and said that it could never be done. Nevertheless, Philo coops sprang up in the back yards the world over and sometimes on the roofs of tall buildings in large cities.

The old poultrymen began to sit up and take notice when the tales of wonderful egg production came pouring in from all directions. They began to wonder what there was in this system of keeping six hens in a pen 4 by 6 feet that causes such an amazing increase in the eggs. They began to experiment with this new plan. They tested it along side their large flock, free range systems and found out that Philo had only emphasized a natural and primary truth and that this truth or law holds good in the production of all kinds of live stock.

Segregation is the whole secret of Philo's success.

Small flocks, well fed and kept in close quarters in a sanitary way, brought unbelievable results. Philo was the pioneer of this new movement toward smaller flocks in close quarters. But his system partially failed. Soon the back yards of the whole world were piled full of empty Philo coops, big piles of junk marked with memories of long days of routine in carrying heavy pails of water from coop to coop, lugging pails of feed down long rows of

tiny houses, lifting roofs and scraping dropping boards from coop to coop, reaching into a hundred pens to gather eggs. True, you got the eggs, but oh, the detail! Yes, this was the way to produce eggs, but could any mortal stand the strain of this terrific detail and attain the degree of happiness to which he aspired? Philo was on the right track; he found out the secret of producing the maximum number of eggs from a given feed.

Philo's system was weak in one point. It was cumbersome in detail. The detail was so great that the day's routine was slavery for one who performed his own work, and unprofitable for one who hired it done.

Soon after the Philo system there came another known as the Corning System. This filled all the poultry journals of the land with printed matter and illustrations of wonderful long houses whereby one thousand hens were kept in one long house without outside runs, thus eliminating with one stroke the awful detail in the Philo System.

The whole poultry world erected long houses. Small houses were sledged to the corners of the yards and fields or split up into kindling. Miles and miles of long houses, with their flat shed roofs, stretched out on every horizon. What a terrific waste of energy, lumber and capital! The Corning book is a thing of the past. The Corning System failed.

It was against all reason to put one thousand hens in one long house, compelling them to breathe the dust kicked up from the straw-covered floor and to roost at night fifteen or twenty feet back from the fresh air, crowded up against the low roof, with the stench from fresh droppings arising from the dropping board just below, filling their nostrils till morning, I say this is against all human reason and the Corning System is a failure. True, there are some yet today that will not admit it, but they are only young in the game and time will correct the error.

One thousand hens packed in between dropping boards and low roof at night with the awful stench from below and the foul air from one thousand pairs of lungs to breathe and rebreathe thru the long uncomfortable night, is it any wonder that the hens come down from their clammy quarters in the morning with watery eyes, and running noses, and swelled head, and roup, and canker, and chicken pox? It is no wonder that the hens get the tubercular germs and waste away and drop off, day after day. It is a mystery how they can exist so long as they do and be able to even pay their feed in eggs.

It is producing eggs at a tremendous loss of hen flesh. One by one the hens drop off, and at the end of the year when the final reckoning is made the balance is not what we expected.

The pendulum had swung from the detail extreme to the other extreme.

The Philo System and the Corning System are the two widely exploited systems that have cost the world a mint of money. They have added to the progress of the poultry industry in that they have provoked thought and experimentation along new lines. Both the colony system, with the small houses on runners, and the yarding system, with its foul runs, have been used for years and each has its deficiencies.

The colony plan, with its small houses on runners which are dragged from place to place, necessitates a large acreage and is prohibitive to the man of modest means. It is essential in this system to change the houses to new ground at least once a year. This system, perhaps, necessitates the greatest amount of heavy labor because of the distance to be traversed each day in hauling feed and water.

It is sloppy and muddy in the winter season and all the eggs require washing. Besides the fowls are most uncomfortable. This system may make a profit of 25, 50, 75 cents or in

MORRIS FARM, R. 4, BRIDGEPORT, CONN.

rare instances one dollar per hen. It is a cumbersome system with heaviest drudgery and far from the best.

The double yarding system with medium sized flocks is, perhaps, the most universal system in use and if yards are kept pure by growing crops, it gives results. But this system requires a lot of labor in keeping the yards free from disease germs. It is also expensive in ground, wire fencing and posts. Besides it presents an unkempt appearance that always looks ragged. It entails an endless amount of detail in opening and closing gates and much retracing of steps. Canker and pox usually come from filthy yards and it is a hard task to keep them pure. The routine of this system, like the Philo, becomes irksome and wearing, and, altho better than the other systems just mentioned, it has not given the results compared with the one about which I am to tell you.

After twelve years of handling in large numbers and many varieties, making this my exclusive business and working out every detail with my own two hands, spending my whole thought upon this line and continuous carrying on experiments, I have at last evolved a system of intensified poultry keeping that gets the results of the Philo System with the detail eliminated.

I have proven beyond the shadow of a doubt that the diseases of poultry come from filthy yards and the dust-laden foul air inside. The foul yards I have eliminated at one stroke by dispensing with them after years of careful experimenting.

Yards are absolutely unnecessary in getting the greatest profit from fowls, and in fact are a detriment, even if they could be kept free from harmful germs. All poultrymen mean to keep their yard pure, but they never do it. Yards are in the way of maximum results and only a nuisance. The yard has no place in my system of poultry keeping, the ground being worth far more for producing greens.

The less space a fowl can be kept on and yet insure health, the less space there will be to disinfect and keep free from disease germs.

It has been proven beyond argument that egg production increases as the size of the flock decreases. That happy point, where egg production reached its maximum with a given number of fowls, has taken years of experimenting with all sizes of flocks and all systems of housing and yarding to discover. After many years of detailed results the best percentage of eggs from a practical number of hens was had, in flocks of twenty in open front 8 by 8 pens, with three feet projection over open front to keep out rain. Less than twenty hens in one open pen requires more detail and too much cost in housing. More than twenty hens curtails egg production.

Twenty hens, therefore, is the unit for best results. To house these twenty hens so that they would be free from dust-laden air, so that they would have air as pure as outside air, so that they would still be protected from rains, and winds and cold drafts, in short, so that their bodily comfort would be the best possible at all times, to house these hens so that all these points would be taken care of is the problem. After trying all the designs of houses ever seen or read of, and after trying many patterns of my own, I at last evolved a house that gives all this bodily comfort and entails the least lost motion in care of fowls.

These pens are eight feet square, five feet high behind, and seven and one-half feet high at the comb, open front to the east over which is a three-foot projection to keep out rain and under which the attendant walks to care for fowls. These pens are built side by side into long houses, there being no limit to the length. Between each two pens is the feed hopper built into the partition and feeding both sides, holding one sack of dry mash and one of mixed grains in its respective compartments. Full length along the outside is the green feed trough from which the hens eat thru the opening. The water buckets are also on the outside. Thus all the hens are fed greens and watered without opening a single gate or door. The hoppers inside are filled once in about two weeks. The dropping boards and ground floor are cleaned once per week by simply raking the filth from the top of the sand which covers the floors. Sand is the only material to use on the floors of poultry houses.

Twenty hens, well bred, well fed, and quarters kept sanitary in this little pen are good for at least two dollars per year net profit

Don't let your poultry be worried by lice. Instant Louse Killer will kill the lice. Put it in the nests and in the dust bath. Raise better poultry—get more eggs.

above all expense. These twenty hens have nice sharp sand upon the ground floor and roosting boards, which are raked clean regularly; they have dry mash and mixed grain by them continually; they can stick their heads thru to the green trough outside and eat green feed every hour during the day; they drink water from clean galvanized buckets on the outside; they dust in the sand; they jump up to the feed hopper; they jump down again to the green feed trough; they run to the water; they hop up to the egg boxes (which, by the way, is the most important move of the day) and after depositing their board bill and rent plus the extra profit, they jump down and up again to the perches for an afternoon rest, or stretch out in the afternoon sunshine, which comes in thru the western window. Their

WOOLERY FARM

WOOLERY FARM, Box A, Bloomington, Indiana

whole day is given up to their individual care, and with all the necessities before them, all the time is available for making eggs, and with their morning sun bath, and noon sun bath, and afternoon sun bath, and free from draft or foul dusty air, they either have to "lay or bust."

One acre of good fertile soil with plenty of cheap water is all that one family can handle without hiring help. This is one of the most intensive poultry systems in the world and makes it possible for people with small means to make a luxurious living on a little land, with health and independence.

With this system it is possible to keep one thousand hens on one acre and produce all the green feed which is absolutely necessary for any profit in poultry. With the rich soil and cheap water, fresh, crisp, succulent, green feed in the way of beets, kale, alfalfa and chard, cabbage or rape can be grown luxuriantly, and the tonnage produced on one intensified acre is almost beyond belief. One thousand well bred hens on one acre, han-

dled on this intensified plan, can be made to net above all expenses two dollars each or two thousand dollars per year. If more income is wanted, develop a second acre and double it.

Fresh, crisp, succulent green feed is the secret of success in egg production and if your acre is not fertile, and if there is no water for irrigation, success can never be attained. Any ambitious industrious person need have no fears if located on fertile soil with plenty of cheap water and home market, for these are the essentials of success.

It remains to add that my system is by no means experimental. It has passed that stage and stands today as a matter of absolute demonstration, and as such freely acknowledged by thousands.

I have tried it out for ten years, side by side with other systems and am satisfied that it has been my good fortune to attain the desired result—the largest and steadiest egg production from the smallest acre consistent with sanitary conditions and healthy fowls.

D. W. YOUNG

Box E-12

MONROE, NEW YORK

Horticulture for Poultry Keepers
 Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

I AM writing today in my hotel in Washington, D. C. Here one keenly realizes that we are engaged in a great war. The city is crowded with people from every state in the Union and from foreign countries. The very air is charged with war and preparation for war. War dominates all talk in hotel lobby and street, in the home and elsewhere. It is evident that official Washington is preparing for a long time war. It is also evident that the production of grains and other eatables is one of the chief concerns of the powers that be, and that every effort will be made to induce land owners to plant increased acreage. The whole city is loyal to the administration, and here the food conserving laws are being obeyed to the letter.

* * *

Am getting anxious to be at home and take up the work in the garden and the orchard. Will have that pleasure April first and I know I will enjoy it as much as I have my trip this winter.

* * *

I have read your advice in American Poultry Journal to many readers and I now think of you as a personal friend, because of the interest you show in your replies. I would like to add my request for some information. I have recently purchased a farm in Hamp-

den County, Massachusetts, and as the place is devoid of fruit, would like to have you advise on what to plant. If possible, I intend to grow a little of most everything in the fruit line grown on the ordinary farm, with the idea of keeping our home supplied first and the surplus, if any, for market.

My wife and I wish to start with about the following number of trees, berry bushes and vines: 50 apple, 12 pear, 6 cherry, 12 plum, 50 raspberry, 25 currant, 300 strawberry, 6 grape, 50 rhubarb, 100 asparagus, 12 horse radish. Will you kindly inform me if you think we have enough of each variety? The farm has about thirty acres of cleared land, including pasture, some of which is hilly. Also what are the best varieties of the fruits named?

Massachusetts.

H. C. Hall.

In apple you will want one or two Duchesse for your own use. This is an early apple and dependable. Would also plant one or two Yellow Transparent. For the main planting of apples, for a commercial orchard, would plant McIntosh Red and Wealthy—two-thirds McIntosh Red, the remainder Wealthy. These varieties are hardy, high quality in fruit and always command a big price on your markets. One of the most noted apple authorities in America, a man connected with the Massachusetts Agricultural College, last season planted a large orchard to these varieties. *He knows.*

In pears would advise Lincoln and Seckle. These two varieties are of the best quality. Lincoln is, in my opinion,

the best all around pear in existence. Out in Iowa where we could not raise pears on account of the blight, the Lincoln is fruiting every year. It has never blighted on my place in twenty years, has withstood thirty-seven degrees below zero. It is an early fall pear, is large and simply delicious.

Plant Montmorency cherry. It is the best of all sour cherries. I do not feel able to advise you as to what variety of plums to plant. The plum is a fickle fruit and very subject to disease. Also some varieties will not stand dampness when in bloom. I advise you to consult your state authorities in this matter.

The Cuthbert is the best red raspberry. Many new kinds have been offered and boomed, but the Cuthbert still remains the best. Cumberland is decidedly the best black. I think the Royal Purple will make you more money than any other raspberry. It is an enormous cropper. Berries are large and very fine in quality.

Diploma and Red Cross are far and away the best currants.

You would do better to consult growers of strawberries in your immediate locality. Of all small fruits, the strawberry is the most fastidious as to soil.

In my estimation six grape vines are not enough. For home use, if you plant six vines make it one Moore's Early, one Campbell's Early, two Warden and two Concord.

In Rhubarb, the common sort, obtainable in the market is as good as any.

I have tried all varieties of asparagus and find the Palmeto to be the best.

It seems to me that you are making a mistake in not planting more heavily of small fruits. Of course I am going on the presumption that there is a good market for small fruits near you. If this is true you certainly should plant small fruits quite extensively. You will find if you have a market for strawberries, raspberries, currants, etc., that these fruits will be very profitable. They will give you a quick income. Investigate this branch of the business carefully.

* * *

Will you please tell me what to spray my grapes with and when to do it?

For a few years past they have been so wormy as to be almost worthless. I keep bees. Will the spray on grapes poison them? Where is a good place to buy prepared sprays? In the American Poultry Journal you often speak of using "Black Leaf 40." I have been unable to find this spray for sale in my town. Illinois, Harvey P. Hunter.

Spray the grapevines with sulfocide just before buds start. Again during the period that the grapes are making a growth the size of a pea, giving about two sprayings about this period. It may be necessary to repeat this spray during the season if the season is favorable to fungus growth and rot.

To keep the vines from the worms to which you refer, spray with arsenate of lead, powdered form, one and one-half pounds to fifty gallons of water. Use this first when vines come into full leaf and again when grapes are nearly full size. This material so used will not injure the poultry, if any, which may feed in the yard, nor will it injure your bees.

You can secure all spray material from any seed store, or they will send for it for you. Black Leaf 40 is a most valuable spray material. You can get it of any of the well known seed houses in Chicago. Try Vaughan's Seed store in that city.

Your local seed house or druggist

YOU WILL

-they don't
"lay down"
-they just LAY!

You Don't Enjoy a Losing Game

"Slacker" hens take most of the pleasure out of poultry raising and are an expense rather than a paying proposition.

What makes a "slacker" hen? It's not her fault—don't blame her.

You've got to have skillful, patient breeding behind the bird—breeding for systematic seeking of the nest, for the "laying habit"—breeding for sufficient vitality so that the small body may be drained daily, if well fed, without great depreciation.

Look at the hen as an "egg machine"—and thousands would be on the "scrap heap" today.

There is something Efficient

about the Ancona—about her trim appearance—her thorough bearing—that appeals to the eye—and, much more, appeals to the pocket-book, after her merits have been proven.

Anconas do not "lay down"—they JUST LAY. Not "gold bricks" either, but big white eggs. You can bank on the Ancona as the bird to help solve your food problem. You can afford to EAT EGGS when Anconas lay them. My book tells the story.

Nevada.

Chas. H. Keas.

You can secure these cuttings from any nursery in the midwest. Write to Lake Nursery Co., Shenandoah, Iowa.

* * *

In February issue of American Poultry Journal I read your reply to R. H. Milliman, in which you advise the investigation of the lands in Piedmont Valley, Virginia. May I trouble you for detailed information concerning this valley?

Your reply to Mr. Milliman seemed so honest and trustworthy that I was led to communicate with you. What is the climatic condition? Rainfall? Heat and cold? Elevation? What crops successfully grown? Is it a good dairy, hog and poultry place? What kind of markets?

Any and all information will be appreciated—both good and bad conditions. The Garden of Eden had a snake.

Colorado. L. E. Greene.

1. The annual rainfall is 55 inches, falling the heaviest during the spring and summer months, when most needed by crops. The temperature rarely plays the pranks it does in the north. Zero weather is rare. In summer there are few days when it is oppressively hot. In the higher elevations the weather is not so warm as in the lower levels and the nights are delightfully cool. The Piedmont section extends from the mountains down to where it reaches the so-called middle section. The elevation runs from 300 to 1,200 ft. above sea level, with higher elevations in the mountains.

2. All the main agricultural crops are grown here, corn, wheat, oats, hay, etc. It is one of the finest grass and grazing sections in all America. As a dairy section it is not surpassed. Hogs and poultry do well. The markets are good.

3. As a fruit section it cannot be beaten. I believe it to be the coming fruit section of this country. In all, it is a much favored section.

* * *

I am a business man, have made some money at it and can continue to do so, but I am utterly sick of the whole thing. We moved out on a small country place a year ago and we like it so well, that we sometimes think we would like to get a larger place where I could put in all my time at it.

Now suppose I should buy forty acres and put in apples. Could I by planting between the rows, gardening, keeping chickens, and working hard all the time make a living off the place and provide I properly cultivated, fertilized and sprayed the trees, in the course of five or ten years, would I have a fair chance to make some money from the venture?

This is a rolling country underlaid with limestone. Would I have as much of a chance here as I would in Arkansas, Tennessee or North Carolina? If so, what varieties of apples would you suggest for a commercial orchard? Can I get the advantage of a short course in the planting and care of fruit trees at our State Agricultural School?

Indiana. P. M. S.

I am glad you put your question as you did—"would I have a fair chance to make some money from the place?"

I think any man who will properly handle a 40-acre orchard proposition is assured of a very handsome income after the orchard begins bearing. Your land is evidently well adapted to the growing of apples. I advise you to remain where you are. Indiana is growing apples as profitably as any state in the Union. Would advise the planting of Delicious and Stayman. An orchard of these varieties will be very profitable. You can inter crop the orchard and make a good living therefrom until the orchard comes into bearing.

You can certainly take a short course in horticulture in your State College.

The call this year to cultivate is the most imperative in history

Answer it by using Planet Jr garden tools to grow your own vegetables. Planet Jrs are so designed and constructed that they do thorough, rapid cultivation.

You save time, labor, money, cut down living expenses, and increase the food-supply.

Planet Jr Garden Tools

No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator and Plow sows all garden seeds (in drills or hills), plows, opens furrows and covers them, hoes and cultivates all through the season. A hand machine that does the work so easily, quickly and thoroughly that it pays for itself in a single season.

No. 12 Planet Jr Double and Single Wheel-Hoe is the greatest combination hand-cultivating tool in the world. The plows open furrows, cover them, and hill growing crops. The hoes are wonderful weed-killers. The cultivator teeth work deep or shallow. Crops are straddled till 20 inches high; then the tool works between rows with one or two wheels. We make 24 styles—various prices.

72-Page Catalog, Free!

Illustrates Planet Jrs doing actual farm and garden work, and describes over 55 different tools, including Seeders, Wheel-Hoes, Horse-Hoes, Harrows, Orchard-, Beet- and Pivot-Wheel Riding Cultivators. *Write postal for it today!*

We would very much like your advice on which of the following trees will suit our locality. Also when best to plant. Two apple, two plum, two peach, one pear, one cherry. We only have one acre of land and would like to plant the above trees for home use. Michigan. Walter Dunmore.

Plant one Duchess and one Wealthy. Can't you plant two or more winter apples? If so, set out the Delicious and Senator, at least one of each. In plums would advise Endicott and Surprise. Early Elberta and J. H. Hale would be my choice of peaches. You ought to have a tree or two of Krummel October, a very late peach. Plant Lincoln and Seckel pears. The Montmorency is the best of all cherries.

My January American Poultry Journal went astray, in fact it did the second time and so only reached me yesterday with your reply to my question concerning berries.

I wonder if it would be asking too much to ask for further particulars about 'rooting Columbian berry canes? We have eight bushes that we have quite strong hopes are different from the rest and sufficiently hardy to stand our winters.

If this should prove to be the case, we will want to get as many bushes started from them as possible. Altho we shall try the Royal Purple, I think the late ripening will prove an objection with us, as it will bring them in the blackberry season.

1. What time in the fall do you lay the canes down, about the usual time for covering the tips, say September first or not until the leaves fall?

2. You say "break half way thru the cane just below each fruit bud." I find the buds from one to two inches apart from the tip to about half way down the cane, then further apart. Would you break the cane as close as this?

3. Would this method be successful if one covered the canes early in spring?

4. Will it work with Royal Purple as well as with Columbian?

5. Do you know anything of the Cardinal Purple berry? E. B. Cass.

1. I lay down the canes in September. By so doing they make for themselves a fine hold upon the ground, or rather properly settle and adjust themselves to the required condition.

2. I gently break the cane just below the buds. I put under ground the buds which are to take root. Would not break cane nearer than six inches to one foot from tip end.

3. Yes.

4. Yes.

5. Have seen the Cardinal growing in Missouri. It is not conceded by growers to be the equal of Columbian or Royal Purple.

I have an orchard near Spokane, Washington, which I planted and which is now past ten years old. I have four commercial varieties in this orchard, namely: Wagener, 84 trees; Jonathan, 70 trees; Rome Beauty, 56 trees, and R. I. and Northwestern Greening, 56 trees.

Now in common with most beginners, I planted my trees too close—25 ft. each way. Consequently the Greening and Jonathan now have the tips of branches meeting. Where this orchard is located we do not practice irrigation and since we only have from 12 to 15 inches rainfall annually, these large trees are now showing the effects of lack of moisture.

I would like your advice on this matter. The proposition is this: The Greenings, while they are a fine apple and give a good crop, are not the most desirable commercial variety in this section, so that if possible I would like to replace this variety with something else more desirable—probably Delicious. Could this be done by pulling out every alternate Greening and planting the new variety at the proper distance—say 35 ft.? In this way I would continue to get some benefit from the Greenings until the new variety would come into bearing. I also thought of top-working the Greenings, but this would not remedy the close planting and to take out every alternate tree would make the distance too great. This will also be true of the Jonathan, altho they are not affected so much yet as the Greenings. Washington. E. H. Hull.

I know of no better plan for the treat-

ment of this orchard than the one you suggest. Think you will not miss it in planting Delicious. Senator is another variety especially adapted to your section.

Do not think of top-working Greening trees. The tree is a bad grower and subject to body disease.

* * *

The hotels in Washington are charging fifty cents each for grapefruit. This seems a very big price, after having been in Florida all winter where the growers are getting a price which does not admit of a big profit. I was down to the market this morning and found that apples are selling at a higher price by far than they were a year ago. As usual, the good to extra good sorts are scarce. Our old friend Ben Davis is in evidence and is selling at a good price. The South takes thousands of barrels of this variety each season. This is because they keep so well here, where most other kinds go bad quickly.

* * *

I wish to obtain some first hand information regarding Florida in general and Dade County in particular. It is the climate which I wish to ask about most particularly. I remember reading in some of your writings that Florida possesses the finest climate in the world for the production of citrus fruits and Avacadas. These are the fruits in which I am interested, particularly the latter.

In what essentials is the Florida climate superior to Southern California? I have heard that the Florida climate is very humid and that the rainfall is very heavy. Citrus growers in California claim that for best results the atmosphere should be dry with the ground moist. Altho I have observed that the weather can be too hot for citrus. Two years ago the crop was very seriously damaged by extreme heat in the month of June. What has been your observation in this respect?

Now what are the real facts in regard to humidity, absence of frost, etc., in Dade County? Is the whole county adapted or does the climate just lie in spots? In California the citrus belt is in patches, some of them lying at widely different latitudes, and none of them to my knowledge are frostless.

Is the soil of Dade County all adapted or is it spotted as in other sections?

Is the soil and climate fully adapted to the Avacada, that is, is the crop sure? In California I know of no locality where it is a certainty. There is always the frost danger. Can olives be grown in Dade County successfully?

I am located in the foothills of the Sierra Nevada mountains. The weather is too hot and dry in the summer for apples and too cold in the winter for citrus and olives. I have no water for irrigation. I have been here five years and am not very well pleased with the location. And in Southern California prices of land and water are so high and the stability of the climate so uncertain that it is pretty much of a gamble to invest there. I have had the Florida bee in my bonnet for some time and when I read that you were in Miami and would enlighten folks, I jumped at the chance to write you.

You might be able to get some printed matter from the Chamber of Commerce or other sources which would fill the bill.

California. J. D. Reeder.

I am not going to make the attempt to decide the question which will never be settled—which has the better climate, Florida or California. That is and must remain a personal opinion. Florida, like

BABY CHICKS
DROPPED
AT YOUR DOOR

BY UNCLE SAM OR THE EXPRESSMAN

Baby Chicks for May and June

We ship Chicks by Parcel Post

This service has been recently granted us by the Post Office Department. Deliveries will be made to your door in the city and to our post office on rural routes. The postage will be much less than express charges and chicks will reach you in better order. We have shipped successfully over a million and a half of chicks. We have a capacity this season of a half million. One hundred and fifty flocks of pure bred stock all on free range. That means health, vigor and vitality. We ship two grades of chicks—"Exhibition" and "Select." The "Exhibition" quality is as good as any sent out by specialty breeders at much higher prices; they are not bred for "fuss and feathers" alone, but for high laying qualities, in addition to Standard requirements. Our old customers state that our "Select" quality is away above the average and continue to order each year in increased numbers.

It will be to your advantage to send for our handsome descriptive catalog and prices before ordering. It's free.

Warning! Chicks are scarce—don't wait.

"World's Champion Layers"

Our Certified Contest Records are PROOF

Our Leghorns lead at Leavenworth, 1918, defeating 500 competitors, from every state. Our champion pullet 1104 lays 28 eggs in 31 days, in the coldest January in 98 years—beating all birds of all breeds.

Our pen No. 110, 5 Leghorn pullets, lays 105 eggs this January; an average of 21 eggs per pullet—putting our pen 30 eggs ahead in the contest to date.

Our entry of five Wyandotte hens in the North American Egg Laying Competition, just ended, won First Prize and Three Silver Cups. These hens laid 1165 eggs, having these high individual records: 294-267-221-220 eggs. Contest under government supervision.

Our Champion Wyandotte hen "Liberty Belle" laid 294 eggs, winning first prize and cup, and establishing World's Highest Official Wyandotte Record. Her sister laid 267 eggs, winning third prize and cup against 500 competitors.

Merely another proof of our success in breeding 200 egg layers. Other competition winnings:

Leghorns—Highest award North American Egg Laying Competition, 109 pens competing, five hens laying 251-250-224-222 and 192 eggs.

Reds—Highest award, in their class, N. A. Contest, five hens laying 1043 eggs, an average of over 200 eggs per hen. Highest Official Red Record known.

White Wyandottes—Missouri International Contest, ten birds laid 206 eggs, over 200 egg average. One layer made a record of 265 eggs.

California, possesses a wide range of climate, so far as temperature is concerned. On the coast the climate is delightful the year thru. As to the moisture, can say that in my opinion California is on the whole dryer than Florida in that there is less humidity in the Golden State on the Pacific.

The climate of Dade County in Florida is not as congenial as it is on the coast. The summers are warm, the winters delightful. The soil there is a sandy loam, underlaid with clay. I should say that the humidity would not be oppressive in that county.

I cannot give you any figures on the annual rainfall in Florida at this time, as I have no report with me. The land in Dade County is generally good, but is spotted, as are all the lands in all the counties of the state. Not all the land is suitable to the profitable production of the Avacada pear.

You must bear in mind that the commercial production of the Avacada pear is in its infancy, that as yet no variety wholly suited to the climate of Florida has as yet been developed. It came from a seed brought from Cuba, and grew on the farm of Howard Trapp, south of Miami. I photographed the original tree this winter. I was informed by Prof. Simmons, who is in charge of the U. S. Experimental Station at Miami, that the freeze this winter killed or seriously injured Avacada pear trees as far south as Homestead, Florida. Homestead is in the extreme southern part of the state, so you see there is no frost line in Florida, notwithstanding the claims of the land agents.

The Collins grove of 60 acres of Avacadas, on the ocean beach, near Miami, were not injured by the freeze, and will this year bring the owner a large fortune. They stand in ocean bank sand, pure sand, and are annually bearing a big crop. A few miles from there I have seen Avacada trees planted in the Miami rock soil doing nicely and bearing big crops. The truth is we really know but little as to the requirements of the Avacada pear tree. Prof. Simmons showed me 34 varieties of trees which were gathered in Guatemala by United States collectors. Out of these he hopes to secure some suited to the Florida climate and which bears good fruit at the proper time.

The development in the Avacada pear has been largely confined to the country near Miami, and to the south of there. It remains to be seen whether the central part of the state and the west coast are agreeable to this tree.

I think that beyond all question the best citrus belt in all Florida is that part of the state beginning at Fort Myers and running north about 70 miles.

There are a number of your questions which I cannot answer, for the reason that they are unanswerable.

I am in receipt of a letter from John Olesman, Minnesota, in which he says he has sent me a few potatoes for seed. Of this potato he says:

"Last spring I planted 3 1/4 bushels of these potatoes. Out of the 3 1/4 bushels planted I sold potatoes for \$102.50. Also stored 8 1/2 bushels for seed. Prices were high, from \$1.75 to \$3 per bushel, but it was the one time the early bird got the worm."

I thank Mr. Olesman for this seed, shall plant it all and will report results.

STILES' COLORED Leg Bands

BEST IN QUALITY

Identify birds as far as you can distinguish colors. Made in Red, white, blue, green, black and yellow.

Mention variety when ordering.

SPECIAL BRAND—Single coil. Made of lighter material and have less lap than Economy brand. 25 for 25c; 50-45c; 100-75c; 250-\$1.70; 500-\$2.75, postpaid.

ECONOMY BRAND—Single coil of highest grade. 12 for 15c; 25-30c; 50-50c; 100-85c; 250-\$2.00; 500-\$3.85, postpaid.

ROYAL BRAND—Double coil. Best of all. 12 for 20c; 25-35c; 50-65c; 100-\$1.10. 250-\$2.50; 500-\$4.75, Postpaid.

Bands for Growing Birds—(two sizes, state age) 12 for 15c; 25-25c; 50-40c; 100-75c; 250-\$1.75; 500-\$3.25, postpaid.

Baby Chick Bands—25-20c; 50-35c; 100-50c; 250-\$1.25; 500-\$2.25, postpaid.

Hatch by Electricity

The Lo-Glo Electric Incubators and Hovers are the final expression of the art of incubation. Absolute control of Heat, Moisture and Ventilation insures big hatches and strong chicks. All metal, fire-proof sanitary, indestructible and odorless. Write for booklet "J."

Lo-Glo Electric Incubator Co., Inc., 76 Greenwich St., N.Y. City

I am very much interested in the betterment of our varieties of potatoes and ask the assistance and co-operation of all readers of AMERICAN POULTRY JOURNAL to that end. If you have a potato that is earlier or better or a heavy yielder than other potatoes in your section, I will be pleased to have you send me one or two tubers for trial in my grounds.

* * *

I had intended to say something in reply to the article by Dr. Sanborn in *Poultry Herald*, but Dr. Woods so well touches upon the ridiculous statements of Dr. Sanborn that there remains nothing for me to say. Every winter I see so many men suffering from what Dr. Woods terms Floriditis that I can well understand what ails the good Dr. Sanborn. The only dangerous thing about this disease is that while the fever is at its height, the patient may induce some innocent friend to believe there is truth and fact in the wild assertions so vehemently made by the sufferer.

* * *

In answer to F. K. O'Conner, New Mexico: You will make no mistake in planting the Senator apple. There are some fine orchards of this variety in your state. These orchards are very profitable. You ask about the new apple—Golden Delicious. I would advise that you try out a few of these trees. I certainly should not plant heavily of any new variety until I had tested it out were I in your place. I do not think it would be wise for you to plant heavily of early summer apples.

Make War on Lice and Mites!

Protect your young chickens from lice and mites that sap their vitality and prevent them from growing into big, fine, healthy layers. A little care now will increase your profits later on. Paint the inside of your chicken-houses with Carbola—dust your chickens occasionally with Carbola—and your flock, like the flocks of thousands of others who use Carbola, will be free of lice, mites and other vermin.

CARBOLA
The Disinfecting White Paint

is a finely powdered, snow-white mineral pigment combined with a germicide many times stronger than pure carbolic acid, but not poisonous or caustic. Carbola paints and disinfects at the one operation—dries a pure white, thus increasing the attractiveness and light in poultry houses, dairies, stables, creameries, cellars, factories, garages, etc. Carbola is ready to use as soon as mixed with water. No waiting; no straining. Does not spoil by standing. Can be used with brush or sprayer, and never clogs the sprayer. Carbola is not an experiment. It is used and endorsed by the largest and best known poultry, dairy and breeding farms and experiment stations to prevent the contagious diseases that affect poultry and livestock.
10 lbs. (10 gals.) \$1 and postage; 20 lbs. (20 gals.) \$2 delivered;
50 lbs. (50 gals.) \$4 delivered.
Trial package to cover 250 square feet and interesting booklet for 25c postpaid. If your hardware, seed, paint or drug dealer does not carry Carbola, order direct.

Licene

Exterminates all Chicken Lice as if by Magic

When such breeders as Mrs. Helen Dow Whitaker, E. B. Thompson, Dr. N. L. Smith, A. C. Hawkins, O. F. Mittendorf, Prof. T. E. Quisenberry, Len Rawnsley, U. R. Fishel, A. A. Carver and thousands of other big breeders that have had years of experience in raising poultry, endorse and use a preparation as the best, it must have exceptional merit, and will do all that is claimed for it.

LICENE Makes Hens More Profitable

No hen can lay her best when tormented by lice. Kill the lice and watch the increase in your egg production. E. B. Thompson, breeder of Barred Rocks, writes:

I have tried LICENE with the very best of results; it is a most excellent preventive of lice and a quick exterminator. LICENE should have a great sale to poultrymen who must appreciate its value after being tried.

LICENE Cheapest Lice Killer Known

Price, 60c a Tube, Postpaid Sufficient for 150 to 200 Fowls

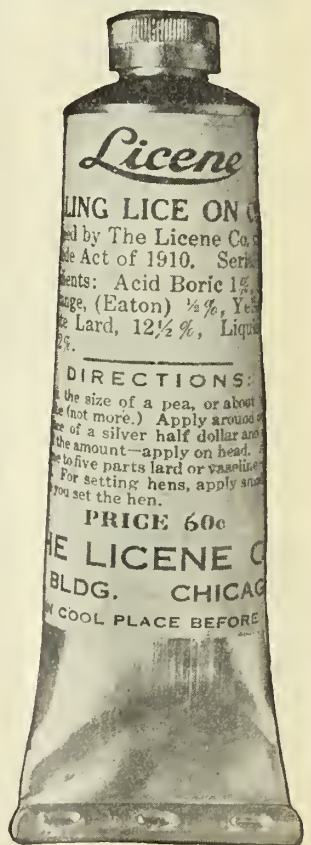

LICENE is applied twice a year, but many report that they have found one application a year sufficient. When you stop and consider that one tube is sufficient for 150 to 200 birds, you must realize that LICENE is cheaper than lice powder and liquid lice killers. It is also more conveniently handled and more easily applied, saving time, labor and money, making LICENE not only the best but cheapest lice exterminator the world has ever known. Put up in collapsible tubes, which prevents waste. Remember LICENE will not injure the birds in any way or destroy fertility of eggs, so with our positive guarantee you take absolutely no risk in giving LICENE a trial.

Positive Satisfaction Guaranteed or Money Back

If Licene does not destroy every louse and "nit" (egg of a louse) or does not clean scaly legs on your chickens, or if applied on sitting hens, and does not prevent head lice on chicks—you are the judge—we will refund your money if you notify us (or our agent) within one month after receiving Licene and no questions will be asked.

The Poultry Doctor FREE This little book is worth its weight in gold to any one raising poultry. Thousands of poultry breeders are following its suggestions with success and profit. It contains 16 different tested and proven formulas of remedies for diseases common among fowls. It is invaluable to the beginner and experienced breeder alike. Remember it is absolutely FREE, so just send your name and address for it.

THE LICENE CO., 1500 Pontiac Bldg., CHICAGO, ILL.

No More Red Mites

A ring of **BUGBEAR** around the end of each hen roost will keep your hens free from Red Mites all summer. It prevents mites from crawling onto the roosts from the walls. It kills every insect and disease germ that it touches. Harmless to hens. **BUGBEAR** is not sticky and will not evaporate or grow hard. It lasts for months and months.

Send for Sample

BUGBEAR keeps crawling bugs out of trees. A ring of **BUGBEAR** around your garden will keep out bugs and worms that can't fly.

Sold by poultry and garden supply dealers everywhere. If no dealer near you, send 25c for large sample can—enough to protect three hen roosts all summer. Our free book tells how to rid hen houses, trees and gardeus of crawling bugs and worms.

25c

American Poultry Journal Publishing Co.
523 Plymouth Court Chicago, Illinois

Your articles are always read with great interest and pleasure because I know you always tell the real conditions. At least I know this to be true of your articles on Florida, having spent four years there. In your answer to a correspondent in March issue you speak again of Southwestern Virginia as being very desirable farming land.

I have looked over the farming land in this section and find available land very poor and high and very high in price, and from some very little experience with the soil I find it very unproductive compared to the north, which is the native country of both myself and wife. Now our means are very limited, not over \$1,500 and \$1,700, but my health is not very good and I want to get on a small farm of say 40 or 50 acres where I could raise grains, etc., and keep cattle, hogs, sheep and poultry. I know you are a busy man, but if you could find time to fill out the answers to the list of enclosed questions, I would deem it a great favor.

1. What county, counties and towns would you advise me to visit?
2. Can you tell me about the relative values of lands there?
3. Are there roads thru there available for auto travel?
4. We have no children, so schools do not enter into the proposition.

W. L. Dunton.

1. Southeastern Virginia is more a cattle and grazing locality where the man raising and feeding cattle on a large scale has exceptional advantages. For the man who wants to operate 40 to 80 acres, as a home farm, the Piedmont or valley of Virginia is more suited to his purpose. I would advise my correspondent to make a careful investigation of Clark County, Virginia. It is one of the most favored sections in all of the United States in the way of production of grasses, clovers, etc. It is, too, a splendid farming section. Here cattle and hogs and poultry can be raised profitably. It is near splendid markets.

2. Lands there are somewhat higher than in less productive regions of the state. Still fine farm land in Clark County can be bought at from \$50 to \$75 per acre.

3. Roads are good. Yes.

4. Be careful to locate in a community where the social conditions are right. Land in a community without schools and churches would not cost much and would be worth less than it cost.

Hens Should Not be Hurried to Market.

"A rush of too many fowls to market as soon as the restriction against selling laying hens is removed, may result in food losses," says the United States Department of Agriculture. "Think twice before selling a hen that is still laying. Green food is becoming more plentiful and the demand for eggs continues. Universal marketing of fowls may react on prices as well as cause spoilage of dressed poultry."

Questions and Answers
 Conducted by
 Prince T. Woods, M. D.

Questions about poultry are answered in this department free for all readers of American Poultry Journal. Where answers are desired by mail, a stamp for reply is requested. Address all query letters to the managing editor, Dr. Prince T. Woods, Lock Box 4, Silver Lake, Mass.

Off-Colored Wyandotte Chick.

Q. Last spring I had four good White Wyandotte pullets mated to a fine cock. I raised some splendid pullets and two fine cockerels. One of these cockerels was mated to the four hens from last year's pen. Some of the chicks hatched from eggs from this pen are black. Would like to know if there is such a thing as breeding back to cause this and if the way they were bred made any difference? The cock I bred last year was from a breeder who is supposed to have fine stock. Last year's chickens came all white. They were not on free range, so could not get with any other chickens. Can you tell which side was to blame, the cock or the hen? Would you keep these breeders or would you get rid of them and start with a different flock? Or would you advise another cock bird?

Lima, Ohio.

C. A. H.

A. It is not unusual to get some dark chicks from some matings of White Wyandottes. Some of the best strains of Whites were started with sports from the Silvers. We would not worry about it nor would we get rid of the breeding birds. Save the best white chickens of this year's flock to breed from. Try mating some of the pullets with cockerels and mate others with their sire. Also mate best cockerels with the four two-year-old hens and about six of the best yearlings. Use the off-colored chicks for table purposes when they are big enough.

Prolapsus of Oviduct.

Q. Am having trouble with three of my Ancona pullets. The egg bag comes out and

is swollen so it will not go back, and they are badly swollen about the vent. They have been laying heavy since the first part of December. Is there a cure for this or had I better kill them?

Marion, Ohio.

E. I. P.

A. Prolapsus of oviduct, with severe inflammation and swelling, is difficult to cure, and it may be wiser for you to put the birds out of their misery instead of attempting to treat them. The trouble is not uncommon among heavy layers of good sized eggs. Poor grain, or smut-grain is often a contributing cause of this trouble. It is best prevented by feeding an abundance of greens and only sound, sweet, wholesome food.

If parts are picked and torn, deep purplish and show much hardness and inflammation. We would not attempt treatment. It would be better to kill the bird. If treatment is to be attempted, examination should be made to determine if there is obstruction of duct by an overlarge egg or broken egg. This can be done by exploring with a well-oiled little finger. Remove obstruction if found. Prepare a basin of warm water—not too hot to be easily borne on the wrist—to this add a very little borax. Hold bird's abdomen and vent in this warm bath for about 20 minutes. Then oil the parts well with warm sweet oil and endeavor to force them gently back into place. Keep bird quiet for a few days and feed soft food only.

Crop Inflammation.

Q. I had a hen that was stretching and twisting her neck all the time. Took her and worked her crop up a little and squeezed it all out clean. There was a very bad odor. When I put her down she fell right over and

Chicks and Eggs

At Reduced Prices

After May 1 we sell eggs and day-old chicks at reduced prices. May hatched chicks will lay in October or November, the June hatched in December, and will make just as good winter layers as earlier hatched chicks.

We can furnish chicks from 200 to 230-egg stock early in May—25 chicks \$7, 50 for \$13, 100 for \$25, 1,000 for \$200. From 230 to 264-egg strain, 25 chicks \$9.50, 50 for \$18, 100 for \$35, 1,000 for \$275. Utility chicks, 25 for \$5, 50 for \$9.50, 100 for \$18, 1,000 for \$160. Safe arrival guaranteed.

We can fill all egg orders promptly, and we guarantee fertility and safe arrival. 230 to 264-egg stock, 15 eggs, \$3.50; 100 eggs, \$16; 1,000 eggs, \$135. 200 to 230-egg stock, 15 eggs, \$2.50; 100 eggs, \$12; 1,000 eggs, \$110. Utility matings, 15 eggs, \$2; 100 eggs, \$9; 1,000 eggs, \$80.

Eight-Week-Old Pullets

One of the most satisfactory ways to start with Ferris Leghorns is to buy a pen of 8-week-old chicks. At this age the pullets weigh about $\frac{3}{4}$ lb. and the cockerels about 1 lb. The pullets can easily be distinguished from the cockerels and the trouble and loss that sometimes occurs in hatching and raising chicks is avoided, for at this age the birds are ready to go on the roosts, no longer require such close attention and are practically out of danger if given proper feed, a good coop and reasonably good care. We guarantee safe arrival anywhere. We can ship any time you want them after June first.

From 230 to 264-egg stock, 10 pullets and 1 cockerel \$33, 100 pullets \$225. From 200 to 230-egg stock, 10 pullets and 1 cockerel \$23, 100 pullets \$175. From good stock without records, 10 pullets and 1 cockerel \$18.50, 100 pullets \$125.

Exhibition Stock

We have purchased Frank E. Hering's entire flock of White Leghorns, including all of his Chicago winners. Eggs from these Chicago winners \$10 per setting. We can furnish winners for any show in the United States. Write for special circular describing our exhibition matings and quoting prices on stock.

THIS FREE CATALOG

tells all about Ferris White Leghorns and how we breed them for egg production; describes the eggs, chicks and 8-week-old stock priced above; and the liberal guarantee under which we sell them. Write for it—a post card will do—and let us show you why you should breed Ferris trapped nesting laying stock.

GEORGE B. FERRIS

905 Union Ave. Grand Rapids, Mich.

her neck kept trembling all the time. Put her in a place by herself and she lived three days. She seemed very thirsty. When she died I started to open the crop, but it was full of yellowish matter and the odor was so bad I could not stand it. My hens have been laying well all winter and have been letting them out of doors for the past two weeks (April 7). Today I have another hen that is acting the same way. What do you think is the matter?

Gardner, Me. R. F. C.
A. Hens have been feeding on some spoiled or moldy food causing crop inflammation. Make a search of premises to discover source of trouble. Keep the hens confined and feed only sound wholesome grain and greens. Be careful to avoid feeding spoiled soft corn.

Farm Journal's View of Egg Cost.

Editor A. P. J.—Enclosed find clipping from Farm Journal concerning cost of producing a dozen eggs. Comment is unnecessary for me.

Three Oaks, Mich. E. J. A.
Here is the item clipped:
"The poultry department of the Pennsylvania Agricultural College estimates that with grain at present prices it will cost from 12 to 22 cents to produce a dozen eggs. Unless the hens are actually sick or diseased, it is good business now to hold on."

We wish Farm Journal would demonstrate how it is done. One of the best managed and best equipped poultry farms of the East—handling flocks of close to 20,000 Leghorns—gives figures to prove that their average egg cost for 1917 was 45 cents per dozen for all eggs laid.

Difficulty in Getting Fertile Eggs.

Q. Can you inform me of any way that will enable me to get fertile eggs? My fowl are confined to a 20 ft. run, fed on commercial scratch and mash. The latter always before them. In the last four years I have not had a 15 per cent hatch. I have tried new cockerels and fed soaked oats. This year I lost the first 40 eggs incubated. One contained a chick in the 18th day of development, nearly all the others were clear.

East Providence, R. I. A. E. M.
A. Try cutting out the mash by leaving hopper open only two hours each day. Feed the scratch grain in deep litter. Feed plenty of green food. If birds are healthy and active you should get fertile eggs. If they loaf about and are overfat you cannot expect much of them. You do not name breed, but if birds are Asiatics, it may be necessary to pluck the heavy fluff.

Increasing Production.

Q. Our patriotism is appealed to to produce more and more poultry, but how in the world are we to do so when we have to produce it at an actual and substantial loss?

Little Compton, R. I. F. C. A.
A. Our personal opinion does not matter. Here is what the Hon. Henry Cabot Lodge, of Massachusetts, had to say, on the subject of increasing production, before the United States Senate, February 27, 1918:

"The one duty of any man, high or low, charged with the conduct of this war or any portion of it, no matter how slight, is to win the war and not to promote other measures, whether good or bad, which are purely social or political. That is the error which has been made both in the Fuel and Food Administrations. They started out with a proposition that they were going to lower prices and at the same time stimulate production. They were going to lower prices, not merely prices to the Government, but prices generally, whether for export or for domestic consumption, and at the same time they were going to stimulate production. There is only one thing, as human nature is now constituted, which will really and surely stimulate production, and that is the hope of making, first, a living, and, second, a profit. The experiment was an interesting one. Prices were reduced with a blare of trumpets in the newspapers; but, with a reduction of prices, we have had a famine in sugar and coal. * * *

"Criticism may be false, malevolent, and harmful, just as the falsehood which drips from the lips of interested flattery may be pernicious, but honest criticism may well be helpful. The man who tells the truth as he believes it in a proper way to those charged with responsibility must not be regarded as an enemy by the men to whom he offers the truth or the facts as he understands them. He is laboring for the same end. He had much rather give unstinted praise, but he would be false to his highest duty if in order to give praise he concealed the truth."

In the sound common sense to be found in Senator Lodge's remarks, will be found also

LOOK at the description of pen 1 from my mating list.

S. C. W. "Lay"ghorns

Pedigreed trapped stock.
PEN 1. This mating is a winner. Eleven yearling hens, daughters of No. 64, all sired by male No. 2, dam 278 eggs. These hens have records from 272 to 195 eggs. I have mated them to Ginger VIII, dam 288 eggs, sire's dam 278 eggs. This male is a high grade exhibition bird, as well as from a long line of heavy layers. Eggs from this pen, \$10 per 15 eggs; three settings, \$25.

After May 15th \$5 per setting, \$5 Eggs \$3 per setting. High record breeding hens and cockerels for sale. Our males are used at the Massachusetts Agricultural College, whose authorities highly commend them. My stock has paid me a handsome profit. With proper care it will do the same for you. Send for my mating list, but if you do not want to wait order direct from this ad. You will never regret it.

Natural Hen Incubator Co., Sta. H, Dept. 4, Los Angeles, Cal.

the solution of the poultryman's problem. The only way production can be increased is for the poultry keeper to be able to make, first a living, and, second, a fair and just profit.

Packing Eggs in Salt.

Q. I have heard that eggs can be packed in salt and kept the same as in water-glass solution. Do you recommend it?

A. Edmon, Pa. L. C. B. The salt pack (dry) has been used for a good many years. Also a lime water brine solution has been used for preserving eggs. We do not recommend these methods. We much prefer to use water-glass.

Diarrhoea.

Q. Have a cockerel that has been sick a week. He has diarrhoea, almost fluid with whitish lumps in it at times, empty crop in spite of a fair appetite, bluish black comb in parts, and he is very weak and wobbly. I have fed oats, barley, and buttermilk and have given him tonic, germozone in water and Venetian red in bran, but without results. Please advise what to do for him.

A. Emmons, Minn. R. M. T. Trouble was probably started by feeding poor or spoiled grain, either whole or ground and mixed. Better let the bird fast a day or two, giving only a few spoonfuls of scalded milk thickened with well-boiled white flour. Then get him gradually on to a moist mash of meal and middlings mixed with scalded skim milk. From this work slowly back to a hard grain ration.

International Poultry Federation.

Q. In April number you print an interesting and timely editorial on "How 'The Trade' Does It" and in it you mention the International Poultry Federation. While I am only a small producer I am interested in the work of an organization which will help a poultryman in buying and selling. Where can I get more information.

A. Altoona, Pa. J. E. Walton. Write International Poultry Federation, Topeka, Kansas.

Moldy Corn Causes Sickness.

Q. Practically all the scratch feed we can buy contains moldy corn of last year's crop, and the result is that the birds eating it are getting sick.

A. They lose color of their combs, get a crop that feels like a mushy sponge, the walls of crop seem to be two or three times thicker than natural. They lose appetite and also get diarrhoea. As soon as birds find out what causes the trouble, they stop eating the corn, and eat the other grain only, particularly those that are still well. The sick birds have a fever, crop and contents seem sour and they drink lots of water. I have tried using a little soda in their drinking water. Have not lost any birds yet, but it is checking the egg yield.

A. Highland Park, Mich. The only solution of this trouble is to get the birds on a diet of sound grain. Where this is to come from under present conditions, we do not know. We have had dozens of these complaints from Middle-West, South and East. The only thing to do is to eliminate the spoiled, moldy, soft corn from the ration, and feed whatever good sound feeding grain you can secure. A moist mash of boiled small potatoes mixed with middlings will help, but in our part of the country one cannot buy middlings in any quantity at any price. Try washing the grain with scalding water, then toast it dry in oven, without scorching, and see if ill results still continue. Possibly boiling the grain will help, but we do not know of any way to make spoiled grain wholesome.

Columbian Wyandottes and R. I. Reds.

Q. I am developing a 1000 acre stock farm at Aberdeen, Miss., and have not decided upon which breed of poultry to keep. We have always been farmers but have never paid much attention to poultry, keeping just "chickens."

A handful of money

doesn't go very far in most places these days, but it will buy more at Sunnyside Farm than any place we know.

Large production, big volume of sales and simplified methods which we have learned during our 28 years of breeding, pedigreeing and trapnesting for heavy egg production, enable us to sell at much lower prices than others ask for the same quality.

You can't afford to keep poor stock when you can buy at the prices we ask.

REV. J. G. TAYLOR 302 Park St. Chatham, Ont., Canada

Kindly give me the good and bad points of the Columbian Wyandottes and the R. C. Rhode Island Reds.

Will the Columbian Wyandottes breed true if raised with care?

Which breed will mature the earliest, lay the earliest? Eggs are cheap in Mississippi, so we want a breed that will supply a good meaty fowl and still give a good number of eggs.
D. W. H.

Minneapolis, Minn.
A. We do not know any bad points about either breed. Both are very excellent general purpose fowl. They are about equal as layers and as meat producers. Mature about the same age. In stocking a farm, we would choose whichever suits you best.

Columbian Wyandottes should breed true to type and color if you get good stock. They will make a little blockier, chunkier broiler and fryer than the Reds.

Wheatless Chick Food.

O. Please give formula for a wheatless chick food. We cannot get any good mixed grains and cannot buy mixed feed, bran or middlings.
J. C. M.

Portland, Me.
A. If you can secure sound old corn, oats and barley, you can get along very well. Have oats and barley ground into a coarse meal and sift out the hulls. With this mix an equal quantity of sound old corn ground into "grits." If you can grind the grain at home, as you need it, so much the better. Use the fine germ meal of the corn with an equal amount of fine oat meal or oat middlings, for a chick mash. Give milk curd, or scalded fresh fish to supply animal food. Feed plenty of greens.

Eggs Not Fertile.

O. I have a breeding pen of Barred Rocks in a house 10x12 ft. Perfectly dry, open-front. Feed scratch feed twice a day in deep litter, have dry mash before them all the time. Let them out on lawn nearly every afternoon. They get plenty of greens. All birds are vigorous and free from lice. I get 3 or 4 eggs every day from four females. On testing out 39 that had been under hens for 8 days, there were only 2 that were fertile, the rest were clear. These 2 had very weak germs. I have this same trouble every season. Last year I set over 100 eggs and never a chick until August. Then I got only

7 out in one sitting. If there is anything you can advise me to do, or not to do, will greatly appreciate it. These birds are all fine exhibition birds and I want to raise some chicks this season.
C. L. R.

Chicago, Ill.
A. Your birds have been living too well and laying too heavily to breed well. Take away the mash and allow only a very small amount each day. Cut down the scratch grain ration, but see that they get more hard grain than mash. Keep them hungry enough to always have kept appetites. Make them work on the lawn a good part of each day. Two meals a day should be ample and they should work all day in the deep litter. Birds intended for breeding purposes should not be forced for egg production all fall and winter.

Wants To Start With Two Breeds.

O. I am a young man, 22 years old, and am starting in the poultry business. I expect to handle two breeds. Please give me advice on what two breeds, I desire one breed that is a little smaller than the average bird, attractive and good layers, and I want one that is large, good table fowl, good layers and good sellers.
R. P. S.

Pueblo, Col.
A. Why not try White Leghorns and White Plymouth Rocks? They will fill your requirements.

Buckwheat for Poultry.

O. Do you recommend buckwheat for poultry feeding? We can generally get a very good crop here.
A. K.

Elkton, Md.
A. It is an excellent feeding grain and well relished by the fowls after they become accustomed to it. By all means grow a good crop.

Sell Chickens Gradually.

Don't glut the market with chickens, live or dressed, soon after May first when the Federal "closed season" on hens ends. This advice to farmers is given by the United States Department of Agriculture.

"Too many fowls on the market may result in food losses," says the department. Poultry stock should be sold gradually. Farmers will have better markets if they avoid glutting them.

FEEDING CAPONS AND ROASTERS.

By S. K. BURDIN.

FROM every direction comes the commanding, imploring and entreating injunction—grow more; do more, and give more—and on top of it all we are compelled to pay more. It is a simple matter to sit at a desk in the various capitals and repeat thru the press "More yet, more yet," but it seems quite another matter when some intrepid individual has the temerity to ask these officials to either lower cost of feed, control the packing and cold storage concerns or guarantee prices of products. "No-sir-ee, that is quite another question; we can't do that, but you just be good, shut your eyes to the future, go ahead, raise the chicks and next fall some philanthropic concern with plenty of space in their cold storage vaults perhaps will reward your loyalty with ??? per pound."

Economic evolution is slow, but government control of packers, cold storage, milling and elevators must come.

However, we all wish to do our bit and raise as many chicks as possible for home consumption to take the place of beef, pork and mutton, so we will not split hairs about prices and cost of production. We hope to show herein how you may produce, prepare, and use or sell the males at a handsome profit.

To many, especially beginners, where the bulk of increased production will come from, the cost of feed will be a heavy burden if old time methods are followed. The question of feed for young stock has received scant attention from our colleges and experimental stations, and it is to pass on a feeding plan to others that has been found cheap, simple and efficient here in Canada, that has induced me to discuss the matter here.

ERRORS IN FEEDING.

Just why and how grain has come to be regarded by so many as the only feed for poultry is hard indeed to fathom. Especially is this true of the inexperienced or beginner. One of the hardest things in the world is to get them to regard other things as essential and to give them a regular place in the feeding schedule.

Poultry (Aves) may be said to belong to the "Herbivorous," "Carnivorous" and "Grainivorous" class or species. True, they will live nearly or quite upon grain alone for a considerable time, but for best results they must have a wide variety of food in which grain is only a part. This is true of mature fowl and doubly so in feeding the young.

In feeding poultry, as in feeding domestic animals, one must know what he wishes to do and how to do it. He must be guided by requirements and feed accordingly to accomplish or produce the desired end. There is a vast difference between a laying, growing and fattening ration; however, we will consider only the latter two.

A WHITE ELEPHANT.

In raising chicks, about half will be cockerels. Here and there the rule fails, but on the whole it is a safe basis to work upon. To many these cockerels are a White Elephant.

Among the early hatches, say up to and including the first week of May, a good price may be realized on all cockerels as soon as they can be made to weigh two to two and a half pounds each, as broilers or fryers. It is customary and, in fact, excusable to handle the Mediterranean breeds in this way, but among the English, Asiatic and American breeds there is a better and more profitable method.

Barring accidents, when a chick weighs a pound they are out of danger. The great bulk of deaths occur during the first three weeks. Therefore, at four or five weeks of age the chick has passed the danger line, except for hawks, skunks and cats. Each live chick has to carry, or represents the cost of hatching and loss from infertile eggs, as well as early deaths from all other sources.

The RELIABLE Blue Flame, Wickless, Oil Heated Colony Brooder

- Burns Coal Oil. safety.
- Comfortable. Easy to Operate.
- Self Regulating. Convenient.
- No Wicks to Trim.
- No Coal Smoke or Gas.
- Economy of Operation.
- Steady Blue Flame.
- Gives Abundance of Heat.
- Positively Has No Fumes.

The Reliable Blue Flame, Wickless, Oil Heated Colony Brooder, is the latest, best and most efficient Brooder ever offered for sale.

After a year of experience in testing out and operating this Brooder we are offering to the trade, knowing that such a Brooder is needed by the poultry raisers in general.

We will furnish this Brooder, equipped with our Blue Flame, Wickless, Coal Oil Heater, which has positively no fumes, as it consumes all the smoke, soot and gas and it feeds itself automatically. You can gauge your heat by the flow of oil by our safety valve.

This Colony Brooder is far more efficient than the Coal Burning Brooder. There is no danger of fire going out and chilling the chicks. We guarantee that you get any amount of heat needed at all times, and our regulator will take care of all surplus heat and will do equally as good as a Coal Burning Brooder and more, with less trouble, less risk of fire going out and with equal success of comfort of chickens entrusted to its care and with less cost.

Guaranteed as Represented or Money Refunded

These Brooders are shipped direct from factory and will be furnished with everything complete, and ready for operation. Now is the time to purchase. We are offering special inducements in order to introduce this Brooder.

Baby Dux and Chix for Meat and Eggs

Meat and eggs are the crying need of the world. Are you going to do your share? Are you helping raise what you eat yourself? Our baby chix and dux have the necessary vim, vigor, vitality and "livability" to assure you of the greatest degree of success possible, whether you handle them for "green dux," broilers, roasters, or egg production.

They have 32 years of expert breeding along practical lines back of them. As our plant is right across the road from the express office, our chicks do not suffer the usual handicap of being held in boxes for hours waiting for train time.

HAROLD TOMPKINS

Box A

CONCORD, MASSACHUSETTS

If properly fed and managed, the cockerels are much more profitable to grow to six to ten pounds weight than to sell or use at two or three. In other words, it is less expense and trouble to develop what you have than to kill and replace them with later hatches.

CAPONS AND ROASTERS.

In the present increased production campaign we are doing our bit just as much when we plan and work for our own table requirements as when we raise poultry to sell.

Thousands upon thousands will keep poultry this season for the first time. They want eggs and meat for their own use and to turn to account every ounce of food that might otherwise be wasted. Farmers will set a few extra hens also, so that they may have more red meat and fats to send to our Allies. It is important, therefore, that every step be made to count and every effort put forth to increase our poultry production at the smallest possible cost for food, care and labor.

If you have from one dozen to one thousand or more cockerels intended for killing and eating, no matter how or what you feed them, they will eat less, fight less, run less, grow less, grow faster, fatten better, taste better and bring more if castrated (caponized) when they weigh about a pound and a half to two pounds each.

When castrated they are known as capons; if not, they are usually called roasters. Capons often grow to ten to fourteen pounds weight; are the finest eating, and bring the highest price of any of our table birds, turkeys not excepted.

FEEDING HINTS.

In feeding, as in anything else, haphazard methods only invite failure. One must have a definite plan and object in view. In this instance we are considering but one plan for one purpose—developing and growing young stock and producing soft, sweet meat capons and roasters in the fastest, cheapest, and therefore best possible way.

It must be remembered that birds must have a good large frame if they would take on flesh and fatten satisfactorily. Many imagine they can fatten a chicken profitably any time. It cannot be done. If attempted before they have nearly or quite attained their growth they simply use a majority of what is intended as a "fattening ration" and convert it into a "growing ration" and proceed to grow like weeds. Therefore it is best to feed first for frame, and then for fat, and the one should be so blended or shaded into the other that the birds will never know where one stops and the other begins.

Sudden changes in feeding methods are bad in every way. It takes the system too long to adjust itself to new conditions—loss is inevitable. Keep the birds keen when meal time comes. If they seem indifferent, skip that feed altogether and lessen the amount of feed slightly in future. They must not be overfed. Be particular also about fountains and water. Keep fountains clean and in the shade. Give fresh water two or three times daily.

FLOCK MANAGEMENT.

Where possible, cockerels and pullets should be separated soon as sex can be distinguished. This helps the pullets to do better, as the cockerels start their bullying and fighting tactics very early. If separation is impossible, caponize the cockerels as fast as ready or old enough. They can then all run together, as capons are as gentle and docile as pullets; in fact, pullets frequently boss them about.

For feeding reasons, however, where at all possible, the capons and roasters should be kept separate and fed differently. Cockerels intended for breeders and pullets should be given plenty of hard grains to develop the muscles of the gizzard, which gives them greater grinding and assimilating capacity; while those intended for killing may be fed soft and ground feeds, giving faster growth and softer flesh.

GREENS—CUT FINE.

Anything green and succulent, such as rape, alfalfa, clovers, cow peas, chard, cabbage, sorghum, young rye, oats, wheat, Jerusalem artichokes or grasses, should be cut fine (1/16 to 1/8 inch) in cutting box daily, as required.

GROUND GRAINS.

Mix finely ground grains and the following articles in these proportions:

- 10 lbs. Middlings
- 10 lbs. Ground Oats
- 10 lbs. Corn Meal
- 10 lbs. Ground Barley
- 1 lb. Fine Charcoal
- 8 ozs. Fine Salt

Note—If the ground barley or corn meal is hard to secure, double the amount of corn meal or vice versa. Either will do, but both are preferable. Also, if sour or buttermilk is not to be had, add 10 lbs. of fine beef scrap or beef meal to above grain mixture, and use water for moistening the greens.

DIRECTIONS FOR MIXING.

To ten pounds of greens (cut fresh daily) add three pints of sour milk, buttermilk or water and mix well in tight tub, pail or box. To this add five pounds of the ground grains, mixing all together thoroly.

Note—If water is used, be sure fine beef scrap or beef meal is added to ground grains as previously directed. Keep tubs and pails scraped clean and covered when not in use, on account of flies. Mix the day's requirements fresh each morning. All leavings and excess should be given older birds. Let none of this food stand before birds, old or young. After a little experimenting, mixing may be done by measuring instead of weighing.

HOW TO FEED THE MIXTURE.

When chicks are six weeks old give them at noon in a trough what they will clean up in ten minutes. For balance of the day feed as before. Clean or scrape out trough and turn upside down, unless same is under cover.

When chicks are eight weeks old give two feeds daily. What they will clean up in ten minutes in morning and in fifteen minutes at noon. Balance of day feed as before. Clean out and turn over all troughs, unless sheltered.

If sexes have not been separated, twice a day is as far as safe to go, being particular to give whole grain for afternoon or evening feed for reasons previously stated.

If cockerels and capons are kept by themselves, at ten weeks of age increase to three feeds daily. Give what they will eat in fifteen minutes, morning and noon, and all they can eat at night. From now on till ready for final fattening, give nothing but this mixture, with grit and oyster shell always before them.

By this method of feeding the capons are always suitable for killing after they weigh three to four pounds each, but for marketing and best results they should be kept till they weigh eight pounds or better after a month's feeding of a fattening ration, preferably in crates, using the customary methods and rations for 'crate feeding.' (The foregoing ground grains, without greens, are excellent.)

All leavings and cleanings from troughs and tubs, together with enough to provide one ten to fifteen-minute feed for the hens (layers) should also be provided each day.

When greens are scarce or unobtainable, fine cut clover or alfalfa (cured) may be substituted if steamed or cooked before using, but better and cheaper results will be secured if greens are used. This method is intended for summer and fall when green stuff is easily grown or procured. It will develop capons and roasters rapidly, producing the highly prized and much sought after soft, sweet, juicy, tender flesh that always brings top prices on any market.

Pullets and breeding cockerels grow rapidly and breeders and layers will also do better. The plan can be made to reduce your feeding bills from one-third to one-half and at the same time give much better and more satisfactory results.

CRATE FEEDING.

When capons or roasters are ready for final fattening they should be gradually changed over from the foregoing method to the following:

Confine them in feeding crates (slat bottom and front) and starve them for twenty-four hours. Use the foregoing ground grain mixture and make into rather soft batter, using sour milk or buttermilk if possible. Give what they can eat in ten minutes morning and evening for first week, gradually increasing till getting three feeds daily of fifteen minutes each, by the middle of second week. Remove feeding troughs or clean them out after each feed. Leave no feed before birds between meals. Feed in this way for four to six weeks before killing. Dress them to suit your immediate market requirements. These methods insure handsome profits from your surplus and cull cockerels.

Baby Chicks

50,000 of them are hatched every week at

UHL'S HATCHERY

SEE those bright little fellows—as lively as crickets. Blood will tell. They will go out into the world and make their owners happy by shelling out the eggs next winter. Maybe there are a few cockerels there that are going to furnish some savory fries. Um-m-m—I can smell 'em now! We receive hundreds of testimonials from our customers stating how well pleased they are with the fine quality and laying ability of the birds they raised from our chicks.

And Uncle Sam Will Deliver them by Parcel Post

right to your door if you live in town, or to your postoffice if you are on a R. F. D. Route. They are from the breeds that long experience has proven best—18 varieties of

- Rocks, Leghorns, Anconas, Minorcas,
- Reds, Wyandottes, Orpingtons,
- Spanish, Brahmas

There is a bred for every need and taste—they are all good. They combine "fine feathers" and laying ability, and you will make no mistake in choosing any of them.

Poultry Conditions in Florida.

AS A reader of American Poultry Journal, I cannot resist the temptation of writing my appreciation of the stand the Journal is taking relative to the existing conditions in the poultry industry today. I feel that this is a time when plain truths should be told and every effort made to better conditions. It is hard work not to lose faith in those who are so loudly demanding increased poultry production while at the same time they are disposing of their entire flocks, as is the case in some quarters.

Corn is selling here for \$4.25 per hundred pounds, oats at \$4, while bran and shorts are out of the question. Eggs are selling for 35 cents per dozen. Looks like a get-rich-quick scheme.

To me there seems to be a somewhat glaring inconsistency in the advice given poultrymen to weed out the drones if they wish to make their flocks profitable, while at the same time we are forbidden to sell these very drones. I breed a few White and Columbian Wyandottes and have managed to break even, or a little better, but under existing conditions I do not feel justified in breeding poultry in any

CAPON

CAPON
13 LBS.

EAT A CAPON, SAVE A PIG—HELP WIN THE WAR.

Why not make a ten-pound capon, like the illustrations, from your surplus cockerels? A simple little operation is all that is required and you can do it just as well as any one. This paper advised that last season, and those who followed the advice are now cashing in on their capons and not worrying about the price of feed. Capons are now bringing on the market from 35 to 45 cents a pound, live weight, depending on location. Which means from \$3.50 to above \$4.50 each for good capons, and in large or small lots, on the market. Beside the big profit those who make capons are rendering the country a "Patriotic Service," as they make five pounds of meat where there would be but one if handled in the usual way. Those raising just a few chickens are in the best shape to make capons at a profit, as no elaborate expense or equipment is necessary.

great numbers. The long promised reduction in feed prices has so far failed to materialize. Instead of reduced prices on grain, prices on feeding grains have reached high water mark.

This state has many advantages and, of course, some disadvantages, as a poultry raising country. So far as climatic conditions are concerned, it is nearly ideal. The principal drawback being the distance from markets and feed producing centers. Florida does not produce enough poultry and poultry products for her own needs, but our local poultry producers are in competition with Tennessee eggs, which are retailed here at a price less than the production cost in this state.

There are a few who can figure paper profits, and believe they can produce eggs at seven-cent cents per dozen, but I am not one of those fortunate individuals; am "from Missouri," and will have to be shown.

The American Poultry Journal is the only poultry paper that I know of which has the courage of its convictions.

Keep it up. The poultrymen are with you. Florida. E. J. Jennings.

Less Poultry in Iowa.

After reading my April American Poultry Journal would like to be where I could put you on the back for the way you have handled the order forbidding the sale of hens. This order has put a ban upon the poultry raisers of Iowa, at least in our locality, and there is not going to be the amount of poultry raised this year that there generally is here.

We got 52 cents per dozen for eggs until the first of March, then they dropped within a week to 23 cents per dozen. They are paying 31 cents now (April 6). Corn is \$1.65 per bushel; oats, 95 cents per bushel; mixed poultry feed and scratch, \$4 per hundred pounds.

The corn is very soft and its takes just as much again as usual. It cost me just twice as much for feed this past winter as it did before, and I have ten less hens and pullets. The corn is so poor that it takes so much more of it to keep up the strength and make the needed heat for cold days and nights of which we had plenty this year. If you need any reinforcements in the fight for a square deal to the poultry producer, call on me. I want to see things straightened out before another winter. Iowa. B. F. Morrow.

Texas Producers Hard Hit.

I thought I would write what we are up against here in drought-stricken Southwest Texas. We are carrying a flock of 200 pure bred hens, feeding them \$5 per hundred grain, \$4 per hundred mash, buttermilk and green stuff. This went on for three months while we were not getting any eggs, as pullets were late in starting to lay. Eggs were 50 cents per dozen at that time and every one said: "Hold on to your fowls, eggs will go to a dollar a dozen before the winter is over." We did not have any such pipe dream, but we thought the price would not drop and in the end we would probably break even, and thus be able to hold on to our flock of birds which we hate to sacrifice. We were finally forced to sell a part of those which we had intended to keep for breeders in order to pay for the feed for the rest of the flock.

Our hens began to lay the very week the order was put on forbidding the sale of hens until May 1. Egg prices tumbled 15 cents a dozen within the week. Fine for the consumer, no doubt, but what about the producer? We had fed our birds \$150 worth of feed, during which time we got no eggs. They are shelling the eggs out now, but at present prices of eggs they are not feeding themselves. While egg prices continue to go down, feed prices remain high and grain almost impossible to obtain at any price.

You are exactly correct when in the American Poultry Journal you say that the consumer must decide to pay the producer a price for his stuff which will insure him a living. The consumer must decide this matter poco pronto or he will have to become a producer himself, or experience a very severe "belly pinch."

Unless feed prices drop about 50 percent, as promised some months ago, it will be impossible to continue to feed the birds we are "forced to keep" by this new ruling, much less think of trying to produce more. We will have to turn our birds out and let them rustle for themselves, and thus lose what flesh we have put on them, as well as what we have put into them. We have to live first, and our whole family can live on what it costs us to feed our poultry, and we are feeding the most economical ration to be had.

The Food Administration will have to come to our relief soon by either lessening feed prices or, if this is not possible, fixing a price on eggs in accordance with their cost of production. We cannot produce eggs here for less than 60 cents per dozen at any time during the year under present conditions. Texas. C. E. Anderson.

"Gas" the Poultry Lice

Declare war upon these destructive, profit-killing vermin. Adopt a policy of "frightfulness." Kill them by wholesale with LICECIL vapor. Merely hang a bottle of LICECIL near the roosts as directed. The vermin-killing "gas" will be delivered constantly in sufficient quantities to exterminate the lice and mites, to keep birds and roosts free from these trouble-makers.

Effective—No Trouble—Little Cost

Not necessary to handle each bird separately to dust or grease. The LICECIL vapor works all the time. No injury to the birds—sure death to vermin. LICECIL evaporates slowly, so bottle lasts for many weeks.

Tested for years—highly endorsed by leading authorities. Price—delivered—1 bottle, 75c; 3 bottles, \$2. Order now—adopt the better way. Circular free. Address nearest office.

SIMPLEX FAULTLESS Baby Chick and Growing Stock Feeder

(Also Recommended for Full Grown Birds Being Raised in Low Coops.)
CAPACITY 5 QUARTS — EXCEPTIONALLY USEFUL

Raising Baby Chicks and instilling vigor into the growing stock depends greatly upon the feeding methods employed by the breeder. Young stock should be fed little but often—you know it's a big job to take care of them properly—then again, the feed they don't eat at once lies on the ground—gets soiled—unfit to eat. The SIMPLEX FAULTLESS GROWING STOCK FEEDER will keep the feed sweet and clean. It's always on the job—feeds the chicks when they are hungry—never too little; never too much. It's a pleasure to watch the little fellows work around the feeder and to know that they are being fed just right, that every kernel of feed they consume increases their weight and vitality, thereby producing larger birds with less work on your part.

NOT ONLY FOR BABY CHICKS

This feeder will work equally well if used for feeding full grown birds and is recommended for use in low coops. It holds five quarts, will feed any kind of feed either mixed or separate—it is built on the principle of our larger "FAULTLESS" Feeder and is furnished complete with bracket, which can be attached to the wall or side of a coop at proper height. This feeder is beautifully painted (dark brown) and with ordinary care it will last forever. It is guaranteed to feed your stock perfectly from the time the chicks are able to eat until ready for the axe.

No.	Capacity	Diameter	Hopper Height	Height Over All	Shipping Weight	Price

Found That Poultry Paid Well.

Last year my parents started me in with a flock of thoroughbred poultry. They agreed to pay all the bills providing I kept an accurate account of receipts and expenditures and give the birds the right care. I attend school in a distant town, so the work had to be done before leaving home in the morning at 7:30 A. M. and after returning in the evening, some times as late as 5:15 and never earlier than 4:30.

When I started, I thought I should probably make a fortune, for it was in the fall and eggs were going up in price every day, and there was a good supply of grain on hand. When I had to buy the next supply of grain I did not have enough money from the sale of eggs to pay for it, tho I had the supply of grain on hand without paying for it when I took over the poultry. I kept on and began hatching chicks in March. I have one poultry house all cleaned out and just used for broody hens. I white-washed it, sprayed it and put it in first-class shape first, and whenever a hen came broody I would move her to a dark nest there and if she continued to be broody I would get another one to go with her and put from 24 to 30 eggs under the two, according to the size of the hen and the lateness of the season. I have hatched out this way nearly one hundred chickens this spring. When two hens come off together, and there are not too many chicks for one hen, I give them all to the better mother of the two, and if I can get another broody I set her with the other hen over again. I think I shall have as many chicks hatched by the first of May as I can afford to feed, but as my parents are backing me I wanted as many as I could properly care for. We expect to can the cockerels just as soon as they are big enough to eat, and keep the pullets for layers. In this way we shall have our winter's supply of meat and will only have to feed the chickens for eight or ten weeks. Of course, the pullets eat just as much, but as they are early hatched they ought to begin to lay fairly early and even if they do cost a good big price to grow we do not know of any better food than good fresh eggs at our house.

Now about the profits. My accounts are accurate and I have not charged anything against the birds but money actually paid out. We had the equipment and the fowls, so the grain and other stuff they ate is the only charge made against them. They have laid well, but there is still a few dollars due me for grain. However, my parents declare that the flock has paid well because of the experience which it has afforded me in keeping books and in the care of the poultry, and we also know that the eggs and poultry on our home table are good and fresh and wholesome. We are also helping to feed ourselves, which everybody ought to do these days.

Kansas.

Malcolm Ford.

Keep the Chicks Coming.

For a number of years I have been very successful feeding young chicks and rarely lose any from sickness. I consider it quite an art to be able to keep large flocks of chicks growing from the day they hatch right thru till they are fully developed, and to have few, if any, runts in the flock. Of course, a great deal depends on the quality of the food given them, because no one can grow chicks on bad grain or feeds. Even a very little sour or moldy grain will upset an entire flock and mean a loss of hundreds of dollars to the owner. Now, even in the good old days before the war, the percentage of profit was so small in raising chickens that no one could hope to get by unless he kept up the good work every day and thus prevented any possibility of a setback. But today this matter of keeping the chicks growing, and steadily developing, is even more important and no one can possibly raise chickens unless he makes this an unchanging rule—constant daily growth and no setbacks from shell to maturity.

My success in growing chicks has been the result of giving my time unreservedly to the work and by the observance of a few simple rules which I will enumerate for the good of those who are this season taking up chick raising for the first time.

Do not allow the chicks to be in crowded quarters. Wherever chicks are too closely crowded or huddled, with a consequent lessened supply of good air, the result will show stunted chicks. Give clean, roomy quarters, with as much sunshine and fresh air as is obtainable. Prevent all crowding and overheating at night. Open coops early in the morning.

Give only clean wholesome grain. If you cannot get good grain to feed chicks, do not attempt to raise poultry. Feed often at first, but not too much at a feeding. Do not allow grain or mash to stay about the coops and sour. Clean up any that is left after feeding and do not feed so much the next time. Plan to have one meal every day for the chicks that

will be especially relished. If a chick food is given in the early morning, try giving a relish feed at ten or eleven o'clock. For the little chicks boil infertile eggs and mix the mashed egg with oatmeal, bread crumbs from the family table, scraps or gristle, etc., all carefully shredded and mixed into a crumbly mass. Or boil broken rice, cool and dry out and mix with oatmeal or any good dry mash mixture. Feed also cut up raw potato, which is greatly relished. As the chicks eat the green shoots of grass, move the coop and yard to a fresh spot. Give them all the waste greens from the garden, and while the chicks are small this should be shredded. Save all skin and gristle from meats, grind them up and feed in the crumbly mash which is to form the relish meal of the day to the flock. Now if this is made a rule and no day goes by that the chicks do not get some kind of a relish meal, not necessarily always the same kind of a relish, the other meals can be just plain chick feed, cracked grain and dry mashes. Supply them with all the fresh water, grit and charcoal they will consume, and as they begin to develop, beef or fish scrap or fresh fish if obtainable. I admit it is a costly operation to grow chickens and it requires the patience of Job, but if any one wants to grow chickens there is but the one road to follow. Don't attempt it unless you are willing to give the chickens a fair chance.

Missouri. James Nichols.

THE INTERNATIONAL PLYMOUTH ROCK CLUB.

By THEO. HEWES.

AT THE last Coliseum show there was perfected an organization that should have much to do with shaping the future of specialty clubs. This new organization is known as the International Plymouth Rock Club. Its aim and object is to bring all varieties of this breed under one head, with every breeder of this old time favorite working for the betterment of the breed, regardless of variety. It was proven at the first meeting that a lot of money was annually wasted in maintaining a lot of variety clubs with no results, whereas if the same energy was expended all in one direction that great good might be accomplished. Under the plan as outlined at the first meeting, all varieties of the Plymouth Rocks will have recognition on the board of managers, while the officers elected must give to all varieties that same careful attention.

Instead of paying dues in a half dozen clubs you will be paying dues into only one club and getting greater benefits. Instead of having a half dozen clubs, with practically no membership, you will under this plan have a big membership and have the real live wires of all varieties working together. This breed, without question the most popular one in America today, should have at the least calculation a membership of 5,000. You should and can have a secretary that you can afford to pay a fair salary for his services. You can issue a catalog annually that will do this breed a world of good and this catalog can be issued at no great expense to any member. No breed book yet issued has ever contained half the good copy that could be secured for such a book and it could be mailed to every prospective member and be kept as real reference for the one breed. It was clearly proven at the first meeting that there is no rivalry between varieties of this breed. In fact, the breeders of White and Buff Rocks stated openly that every man, woman and child that bred Barred Rocks or talked Barred Rocks indirectly benefited them. This same condition prevails in many other breeds. In these war times when every one is trying to conserve food and energy, let us all do our bit and conserve our breeds as well. What the Plymouth Rock breeders have done should be followed out by other breeds with numerous varieties.

Let others take up this important matter and hold annual breed meetings instead of variety meetings. Get acquainted with all the men and women that are interested in the same breed you are, try to help them and the breed you are interested in and you will not only feel better, but you will be doing a real service for every one. Edward Joynson, of Briceys, Mo., was elected secretary of the International Plymouth Rock Club, send him \$2 today and join the club. The next meeting of the club will be held in connection with the Coliseum Show, Chicago, December 3 to 8. There will be a lot of specials offered on all varieties of this breed for club members to compete for, in addition there will be a \$50 trophy offered for the best ten entries in Plymouth Rocks, all varieties competing. This last named prize should prove the most coveted special prize ever offered on this breed. Now is the time to get right. Do it now!

CONSERVATION SCRATCH

The Thrift Feed for Chickens

IT has answered the nation's call for a scratch feed that conserves the wheat and is rich in egg and meat producing qualities. Experienced poultry raisers all over the country are using it, praising it, and getting splendid results with it. Your hens will thrive on Conservation Scratch, lay regularly, keep in fine condition.

Conservation Scratch fills the wide demand for a high quality scratch feed that is economical and reliable. It has made good because it is a scientifically selected combination of clean grains which analyze high in food value and supply the correct proportions of protein, fat, fibre, etc., essential to a perfectly balanced ration.

Krause Feeds for Hens or Chicks

Put your fowls on Conservation Scratch. Save money, keep up maximum egg production and insure the health of your stock. Order from your dealer now. If he cannot supply you immediately, write us. Send for free sample at once.

Use Conservation Chick and Developer Feeds, also Krause Mash. Krause Mash never varies in quality—is most effective and gives big returns. Krause Mash and Conservation Scratch Feeds are money makers for every poultry raiser.

HOW TO RAISE THE CHICKS.

By SUSAN SWAYSGOOD, Pomona, Cal.

IN THESE strenuous times everybody who has a back lot can raise a few chicks that will help out, both their own and the nation's needs. If people living east of the Rockies could only understand that the day of big ranges are gone by, leaving a great scarcity of cattle and sheep, that will take years to replace, if indeed they ever are, they would then realize the necessity for raising more poultry.

The first requisite for raising a healthy brood of chicks is that the parent stock be healthy. This we cannot always know unless we raised them; but the average hatchery looks out for that, because unless the eggs are from healthy stock the hatch is never a profitable one. So when we hear people condemning chicks bought from a hatchery, it is safe to conclude that they have missed some one of the essential things that must be present in order to have healthy, growing chicks.

The first essential is to know how old the chicks are when they arrive, if they have been purchased; if hatched at home, then keep them in an even temperature for at least forty-eight hours without food or drink, but with plenty of ventilation. Hens that hatch a brood rarely allow their chicks to eat any of the feed thrown to them. Why? Because instinct tells them that the chicks have not fully absorbed the yolk of egg which is taken up by the system during the last stages of incubation, and is sufficient to last a chick for several days. The forty-eight hour wait, is not really a fast, because the chick is busy digesting this yolk and when this natural act of digestion is interfered with, by feeding, trouble starts immediately. Usually this is a form of diarrhoea, and the greatest aid in getting rid of it is to feed very lightly and to feed easily digested food, such as boiled rice with a little nutmeg grated in it and bread baked brown in the oven then ground up in the food chopper. Keep finely ground oyster shell and charcoal where the chicks can help themselves and boil all water they drink, allowing same to cool before serving. Chicks should never be served with hot food, no matter what age, always allow time for it to cool.

Chicks drink great quantities of water, and this should be served fresh, in clean vessels several times a day for good results. Poultry of all ages are the most active, maintain the highest bodily temperature and perform the most digestion of food of all our domestic animals. It follows that all their functional activities, that is, their bodily processes, must be rapid. So that if a mistake in feeding or in the watering be made the result is very quickly shown and often proves disastrous. The feed and water vessels should be scalded at least once a week in a solution of Sal-soda or something equally as effective in killing germ life. The reason for this is that if one chick should take a cold or have the least disorder that is communicative, it will be passed along thru the drinking vessel. Water serves to soften the food in the crop, to dilute concentrated food, to carry nourishment thru the body, to aid digestion and assimilation, to carry waste out of the system, to regulate the temperature of the body. So it will be seen that water is most essential toward raising healthy chicks. Indeed, a chick will suffer less and be less stunted when deprived or neglected in feeding than when the fresh clean water is held back.

A good ration for the first three weeks of a chick's life can be made in a bread from infertile eggs, a little sour milk or buttermilk and equal parts of fine steel cut oats, middlings, cornmeal and one-third the bulk in bran; add a little salt and bake well in oven slowly; when cold, grind in food chopper.

To this ration give all the tender green food that the chicks will eat, plenty of exercise and an even temperature under the hover at night and your chicks will thrive.

After three weeks a little grain, either cracked corn, or cracked wheat, or both, should be served at night and the bread kept up as long as the feeder likes to take the trouble. It makes for rapid growth and good bone, especially if mixed with sour milk, and this is the cleanest method of feeding milk. Three years ago I baked and fed this bread to 15,000 White Leghorn chicks, and had them weighing 1 1/2 pounds at eleven weeks old, when they brought fifty cents a pound as broilers. It may be added that all the chicks were supplied with food hoppers containing small granulated bone, which the chicks ate rather greedily. Granulated bone of good quality carries about 2 percent protein and 50 percent lime, two of the most essentials in rapid growth of chicks and besides this it contains phosphoric acid, which plays an important part in the digestion, and hence nutrition.

Milk, either sweet or sour, fills the same

OWEN FARMS

Annual Sale At Half Price

Former advertisements and my printed matter have told you all about Owen Farms unequalled quality. Each year hundreds of customers take advantage of this sale to secure maximum quality at a minimum price. This year each one of us must make every dollar buy its full equivalent. Order eggs for hatching from the finest matings in existence or adult birds to carry over for breeders next year and you are sure of superb quality at a real bargain price.

Frank H. Davey
Superintendent

need, but if served carelessly and spilled on the ground, milk is a promotor of trouble; it sometimes gets smeared on chicks' heads, causing inflammation of the eyes, and if mixed by feeding one day sour and another day sweet, it is an endless source of trouble, so it is preferable to use the milk in bread and serve bone in hoppers.

If it is not convenient to make bread, then a dry mash should be fed after the chicks are a week old. Five pounds of bran, 3 pounds of cornmeal, 2 pounds middlings, 2 pounds ground oats, 1 pound granulated bone, 2 pounds beef scrap and 1 ounce dry fine salt all mixed well together makes a fine mash.

Chicks that are fed dry mash need plenty of water, all the grit, shell and charcoal they will eat. And the more green feed is served the less of other feeds will be needed by the chicks. There is no particular kind, but what is served should be tender and succulent, so that it will easily digest. Lettuce, young cabbage, chicory, rape, lawn grass or even barley, rye or oats, soaked and raked in the soil, soon furnish abundant greens for a flock of chickens.

If the green feed must be bought, then sprouted oats or barley will fill the bill, tho they will be more of a chore.

Get a box and bore holes in the bottom large enough to allow water to run thru. Soak a bucketful of oats or barley overnight, then pour into the box, which should be set in a protected corner or in a building, cover the oats over, leaving them in a pile, just as they left the bucket, until they commence to mat together, then with the hand spread them over the floor of the box about four inches thick. Sprinkle with warm water in cold weather and cold water in summer, once a day, then cover again until the little sprout gets an inch high, then set out in sunshine uncovered, for it to grow green, cut a square about twelve inches big for 100 chicks and watch them enjoy it. More boxes should be prepared in advance to take the place of the one being used up.

Save the Chicks.

The first two weeks is the most important period in the chick's life. The first requirement of the baby chick is warmth. If the chicks are hatched in an incubator, have the brooder ready warmed, and regulated. One day after chicks are hatched, anoint the head of each hen-hatched chick with olive oil. It will kill the head lice. Many of the hen-hatched chicks are lost by the mother hen. Safeguard the chicks and prevent this tremendous chick mortality. Never allow the mother hen to range with the chicks until they are at least two weeks old. In the spring, chicks are quickly wet and chilled by the dew on the grass if they are allowed to forage with the hen. Brood coops should be constructed for confining the broody hen while her chicks are young. These coops should be built about two feet square with board floors. Secure the coops safely at night to keep out the rats, weasels, and other enemies. Hawks and crows may carry off chicks, so keep the broods near the farm house. This arrangement will also save steps in caring for the chicks.

FEEDING THE CHICKS.

Do not feed the chicks for the first 36 hours. Give them a chance to digest the yolk which they have absorbed into their intestines before hatching. Then feed the chicks 5 times a day the first two weeks. Feed a little at a time—just what the chicks will eat up clean. Always feed the grain on a clean spot of ground. Feed the soft feeds on clean grass or on a clean board. Give the mother hen a handful of corn each morning so that she will be contented. For the first chick feed use pinhead or steel-cut oats or oatmeal. Finely cracked corn is the next choice. One or two daily meals of dry bread softened with sweet or sour milk is a fine developing food. Johnnycake can be made from the following recipe: 1 quart corn meal, 1 or 2 infertile eggs that have been tested out, 1 teaspoon baking soda, milk to make a stiff batter. Keep the drinking water clean. Much bowel trouble comes from the drinking water having been contaminated by the chicks wading in it or from the food having come into contact with the droppings.

Texas County on Honor Roll.

The citizens of Grimes County, Texas, are on the wheatless honor roll. According to a telegram received by the U. S. Food Administration March 30, they will use no more wheat flour until after next harvest. These patriots have already turned over to the Government at cost, one car of wheat flour and will deliver others now in transit. These cars have been directed to an Atlantic port by the Wheat Export Company and the Food Administration for immediate shipment to the Allies.

Y.

Recent Inventions for Poultrymen

By Lester L. Sargent, Patent Attorney, Washington, D.C.

A FEED or water trough, invented by Albert L. Terstegge, and acquired by the Kentucky Stamping Company, of Louis-

ville, Ky., designed to prevent the fowls from stepping in the trough or crowding each other. It has an attachment in the form of a wire grid, the wires being bent in inverted V form and mounted in longitudinal spaced side members that engage over the outturned edge flanges of the trough. The patent number is 1,252,861.

A new sanitary non-freezing watering fountain, having a compartment for a lamp in its lower portion, has been invented by Elmer Hicks, of Des Moines, Iowa. The water reservoir is removably supported in the outer casing of the fountain, and has a water leg extending downwardly from the bottom of the reservoir and laterally displaced with relation to the trough, the reservoir being provided in its top with an opening, and a filling pipe leading from the opening downwardly thru the reservoir with its discharge and extending into the water leg, this construction serving to maintain an even predetermined level of water in the trough below the main reservoir of the fountain. The reservoir is spaced from the main casing of the fountain, thus providing insulation from the outside atmosphere to retard freezing of the water. The trough is readily removable at any time. Patent No. 1,258,620.

Gertrude A. Smart, of Madison, Nebraska, has invented a new fastener consisting of a flat metal strip with prongs at either end adapted to engage in the breast of a fowl after it is dressed for the purpose of cooking more readily. Patent No. 1,255,477.

An incubator having a novel moisture supply device has been invented by Marinus J. Nelson, of West Minneapolis, Minn. It has a valve controlled drip pipe opening into the egg chamber above a funnel which discharges the water into a drip pipe below. Patent No. 1,258,037.

Feed or Water Trough, invented by Albert L. Terstegge, patent rights acquired by Kentucky Stamping Company, Louisville, Ky. Patent No. 1,252,861.

A poultry insecticide applicator to automatically apply a quantity of insecticide to the heads of poultry to cause the extermination of

First prize Buff Minorca cockerel at Chicago Coliseum Show, 1916. Owned by Walthalla Poultry Farm, R. 1, Oscoda, Mich.

mites, has been invented by Alphonse La Breche, of Jefferson, So. Dakota. The apparatus consists of a flexible cylindrical wick fastened to a wire ring which is attached to

Poultry Insecticide Applicator, patented by Alphonse La Breche, Jefferson, So. Dakota. Patent No. 1,259,416.

the tank of a water trough, and spaced above the tank portion of the fountain so that when the fowls drink they will brush their heads against the wick. The device may be applied to any cylindrical fountain, and is readily adjusted or removed for the purpose of replenishing the supply of insecticide. The patent number is 1,259,416.

A sanitary nest—or, rather, a group of them—made entirely of metal, with the enclosed portion of the nest constructed of wire screening, has been invented by John F. Brooks, of

Sanitary Nest, patented by J. F. Brooks, Bluffdale, Texas. Patent No. 1,257,796.

Bluffdale, Texas. When the doors are closed it is a complete coop and effectively protects the hens and eggs from robbing animals. The bottoms of the several nests are removable. The structure is easily cleaned. Patent No. 1,257,796.

Two new brooders of the feather type have recently been patented; one, which includes a lamp casing in its central portion for artificially heating the brooder, is the invention of John F. Plach, of Maza, North Dakota (Patent No. 1,257,023). This brooder is ring shaped, thus preventing crowding, as it has no corners to crowd into. The feathers are suspended from a fabric inner cover. A second cylindrical brooder, without the lamp feature, is the invention of Charlotte E. Allspach, of Ubec, Ind. It has a single large tuft of feathers suspended centrally from a rod attached to the apex of the conical roof of the brooder. (Patent No. 1,257,063.)

A new device for breaking hens from setting has been invented by Albert E. Johnson, of Sanborn, N. Y. It is a cage having spaced bars rotatably mounted in the rim portions of revoluble discs which form the ends of the cage. Two pan-like containers having an opening in their central portions are secured to either end of the cage and provide suitable feed and water troughs, the contents of which will not be spilled by its rotation. An attempt

The Strains of Quality

Summer Sale

You Can Save Money By Spending It

in buying Breeding Stock and Eggs for Hatching at reduced prices. You will appreciate it next winter, when prices will be double. A breeding pen bought now will pay for itself many times before the season is over. Eggs will produce chicks that will win the highest honors for you next winter and will develop into great exhibition, breeding birds and great layers. Remember our adv. from last month. Read it again.

Can you imagine what it means to produce best colored and best shaped male, also best colored and best shaped female, for such a show as Chicago Colliseum? Our strains certainly have the blood lines behind them to do it. The reproducing power in our careful line-bred birds is very strong and if you have difficulty in producing such wonderful birds, also in winning the desired prizes, give our strains a trial, they have done it for us and others and also will do it for you; they also will be a profitable investment for you.

Now is your opportunity of the year to purchase part of our high class Exhibition and Breeding birds at reduced prices. Many of these birds could not have been bought early in the season at any price. Of this offering it can conservatively be stated that no more valuable offering, from the viewpoint of foundation material, both in males and females, ever went thru this sale. Order or book your order immediately to secure high class birds.

This month is just the time to raise these outstanding champions for your show next season, and you can do it in buying Eggs or Baby Chicks from such a strain. Everyone should make an effort to produce all the poultry that he possibly can during 1918 to help the country in producing food. Therefore we have started our Summer Sale very early to help everyone to secure the best possible quality in stock and eggs within their reach. It costs no more to produce good poultry than it does mongrels. When you start, start right.

Prices on Hatching Eggs Now:

	Special Matings	Exhibition Matings	Quality Matings	Farm Flock
15 Eggs.....	\$ 7.50	5.00	\$ 3.00

2 for 35c

Here is the Feeder and the Fountain

for which every poultryman has been looking.

It combines all the good qualities of the ordinary Mason jar fountain and feeder with the good qualities of the best baby chick feeders on the market. The bottom of the feed pan slopes from the center to the edges, thereby insuring a free flow of feed from the jar to the edge of the pan, where the chicks can reach it thru the openings. The small openings prevent dirt from getting into the pan—prevent the chicks from getting into the feed or water and prevent them from crowding too close around the feeder, thereby giving the weaker chicks an equal chance with the stronger ones. This overcomes every objection to the ordinary open pan Mason jar feeder and fountain. It fits any Mason jar.

3 for 50c

The top of the pan can be removed in a second to clean or fill. It is the most inexpensive, most practical and most sanitary feeding and watering device on the market and is fully covered by U.S. letters of patent. If ordered from this ad we will send them postpaid to any address in the United States. **SIMPLEX SUPPLY HOUSE** 1300 Pontiac Bldg. CHICAGO, ILLINOIS
Send for our complete Catalog of Poultry Supplies and find out about our marvelous Feather Brooders; also Automatic Grain Feeders and Non-Freezing Water Fountains.

Save the Babies

Don't hatch eggs or buy baby chicks until you are properly prepared to raise them

SUCCESSFUL HATCHES are of less value than total failures if the chicks do not live to maturity, as a failure in the hatch is far cheaper than a gradual diminishing of the brood thru leg-weakness, bowel trouble, diarrhoea, smothering, chilling or of any other affliction.

It is safe to say that 90% of these troubles are due to improper brooding.

Not only artificially hatched but also hen hatched chicks require proper care. Nature gave the hen feathers to protect her chicks but neglected to give the sense necessary to keep her from leading her brood into damp grass or sometimes deserting them.

Simplex Feather Brooders & Hovers

Combine Nature's Gift with Common Sense

They embody the use of natural feathers which have been thoroly cleansed, renovated and fumigated. The brooders are made in both artificially heated and fireless construction. The hovers are suitable to be placed in any old brooder and are just the thing for breeders having heated brooder houses. They are inexpensive, light, sanitary, easy to handle and easy to clean.

You will not only raise more chicks, but your chicks will be stronger and larger than chicks raised in the average heated brooder if you use Simplex Perfection Feather Brooders or Hovers.

Chicks cannot crowd in these feather brooders. They cannot chill or smother. They just seem as contented between the feathers as a cat behind a kitchen stove.

Don't take our word for it, but ask the folks who use them.

Simplex Feather Hovers are being used on some of the most successful poultry farms in the country since 1910.

SEND FOR OUR CATALOG. It will tell you all about these wonderful chick raisers, as well as our automatic baby chick feeder and other poultry appliances. Send today—it's free.

POULTRY BREEDERS IT'S UP TO YOU.

By THEO. HEWES.

IF THERE was ever a time when the poultry breeders of this country needed to sit tight and not rock the boat, we are on that date and it is not necessary to wait for another change in the moon. The producing end of our business has been stung in more places than the misguided pup that trotted into a swarm of bees. We may get some help from these one dollar per year men in Washington, but I am willing to gamble a nine dollar bill, eighteen inches long, that we do not. My guess is, and I am guessing with about as much information as the average man is possessed of at this time, that we had better forget Washington and spend a little time, putting our experience into print and mailing the copy to the American Poultry Journal and other journals of a like character that have sufficient circulation to warrant an audience. If this poultry business is going to run, it is up to just such people as you and I to keep the old cart greased. We have been hit in the head with a meat ax and now they are trying to break the handle off somewhere. The producer has been sacrificed on the altar of the packer and just so long as that class of men control we had better play a little game of solitary of our own. We do not have to sell our poultry on a glutted market May 1st. We can keep them for sixty days longer with no greater loss than the sixty days prior to that date, and by so doing we can prevent the packers from making a fortune out of our losses and it is up to every mother's son of us to do it. Unless the packers of this country are willing to pay a price for live poultry on May 1st that will at least equal the price of the feed and labor it has required to produce them, then positively refuse to let them go. We can at least feed the hired man and make him happy.

What we can do—and it is the right thing to do: Is to continue in the business, raise every bird that we have proper yard and house room to accommodate and hold this stuff for local consumption, giving to our immediate local trade the best we have at a fair price. There never was a better time to buy stock in any legitimate enterprise than on a falling market.

Things will adjust themselves in time, men with brains are going to see that proper adjustments are made. We may be the loser right now, but it will come back as sure as day follows night and it is up to us to see to it that we are prepared for the rebound. There never was such a scarcity of birds of quality as there is today. There was never a better demand than there has been in the past two months. But the price of thorobred fowls will now as they always have been, largely governed by the price of market poultry. So looking at it from a good sensible standpoint we cannot afford to lay down on the job. The price of feed can not reduce to any great extent until another crop is raised and even then we have no real assurance of any marked reduction, for the whole thing will hinge on transportation and God knows we are up against it proper at that end of the line. But we can help ourselves by using by-products that will take a part of the strain off of corn, wheat and oats. You can not raise poultry without grain; you must have some of it, and you must use some of it every day. But there are other substitutes that will help and they are substitutes that can be raised by nearly every one.

Just now I am feeding one meal every other day of boiled potatoes and bran. Potatoes are selling in the Indianapolis market in 20 bushel lots as low as 80 cents per bushel, or in bushel lots at 90 cents per bushel. I use about one bushel for 125 fowls. They are boiled in a large iron kettle, using plenty of water, and this water is salted in about the same proportion as we would for our own use. The potatoes are then mashed in their own juice and sufficient bran added to dry them down to a crumbly mash. This feed can be used every other day for one feed without reducing the egg yield, but if fed oftener than this you will soon see a marked difference in the egg yield, and you will find the fowls are still looking for something else, as they appear hungry even with a full crop. Onions, carrots and even cabbage makes a fair substitute, but they have not proved as good in my own yard as potatoes. Another feed, and one that can be raised on almost any soil is stock beets. Last year I produced more than one ton of this feed in two rows less than 75 feet in length. Regardless of the instructions usually given by the seed men to plant them late, my own experience is to plant them early. They will grow to an immense size, quite often reach-

A MORPAINÉ QUALITY PULLET FROM FIRST YOUNG PEN SUSSEX CLUB SHOW CLEVELAND OHIO JAN. 1918.

FIRST COCHEREEL SUSSEX CLUB SHOW CLEVELAND O. 1918. BRED AND OWNED BY MORAINÉ FARMS DAYTON OHIO.

ing a weight of 6 to 8 pounds. They can be fed raw or cooked the same as I have described in feeding potatoes. Then again the leaves of these beets can be fed all summer. In removing the leaves take only the side leaves, always leavin^g the two crowns and it does not seem to injure the growth of the beets, and new leaves immediately form where the old ones have been removed.

If we will all use the best judgment we have, try to do all we can do right, and not overdo it, we will come out of this crisis with a whole skin.

But if we overdo it we will be the loser. You can not raise 100 chicks in one coop and get good results. One of the wisest provisions we can make is to figure the size of our yards by the capacity of grown fowls and then hatch only as many chicks as will fill this capacity at maturity. It is a fact, proven times without number, that 25 hens in a back yard of ordinary capacity will produce more eggs in 12 months than 50 hens in the same yard.

Again I say, GO TO IT. This poultry business is worth all the time we can give it. It has survived a lot of knockouts and it will survive this one, but we must put real horse sense with our enthusiasm and not let ourselves be led away by wild stories of fabulous fortunes to be made on a back lot poultry farm.

HAVE BOTH CHICKENS AND A GARDEN.

How Best to Help Out on the Food Problem by Using the Back Lot.— A Garden Helps, and a Family Flock of Pullets Pays All the Year.

By A. F. HUNTER.

"NO. I think I won't start a garden this summer. The wife and children are planning to go away to her father's for two months, July and August, and I'll be away for two weeks myself, so I'm thinking I'll build a small chicken house this summer and buy a flock of pullets next fall; the eggs will look pretty good to us next winter, I'm thinking."

Thus talked a youngish man to me a few days ago, and I at once replied that he could just as well have the advantages of both the family flock and a garden, if he planned it right. He went on to tell that his efforts at a garden hadn't resulted as they had hoped last summer, in fact they hadn't got garden truck sufficient to pay for the seed planted, and that they had felt that a flock of good pullets would

be a better investment, from what he told me it is evident that he gave practically all of his space to summer green stuff, such as peas, string beans, lettuce, etc., and, excepting tomatos, they hadn't tried to grow fall and winter foodstuffs.

Undoubtedly a flock of pullets would yield better returns, if the birds were right and were handled right, but good pullets are going to be hard to find and high in price next fall, unless all signs fail. Would the wife's father grow a dozen or fifteen pullets for them? This is already arranged for, and as there were about a dozen families of chickens already out April first, with more to follow, there was good ground for believing there would be no difficulty about getting the pullets. That certainly listens good, evidently the man and his wife had been considering the step for some time, and the wife had taken up the matter of having pullets grown for them with her father and mother back in the country.

"But, why not have both the laying flock and a garden?" I asked him. "If you plan and plant the garden right you can have good foodstuffs from it next fall and winter, and then have the double benefit of eggs from the family flock and foods from the garden. Plant the garden space to such crops as potatoes, tomatoes, cabbages, beets, etc., these wouldn't be available until the family was back from the country in September, and these 'perma-

ment value' crops would provide quite some green food for the pullets. The outside leaves from the cabbages, potato and beet skins, etc., are all good for green food for the layers."

Our friend has a lot having sixty feet front, and there is a space about thirty feet by sixty available in rear of the clothes yard and garage. A space eight feet square, or 8x10 feet, is all that is essential for the flock of pullets. A house eight feet square, or 8x10 feet in size, is ample for fifteen birds of one of the American varieties (Plymouth Rocks, Wyandottes or R. I. Reds), or for eighteen to twenty Leghorns, and there need not be one foot of ground given over to a yard for them. Where they are kept for eggs for the family table only they will do just as good laying if kept confined to the house, will keep in just as good health, and the only essential is to promote exercise by having good scratching litter over the house floor into which to throw the grain food, so that the birds have to scratch and search for every kernel of grain they eat. This "scratch food," as it is called, together with a good dry-mash mixture at hand in a food hopper hanging against the side of the house, solves the problem of feeding the flock.

The waste from the family table helps out with the food, but there is less food value in this table and kitchen waste than there used to be; we are all learning to not waste good food, even tho it goes to the flock of layers. Some tiny bits of meat or gristle the birds may glean from discarded meat bones, and there is green food in the apple and potato parings, but it certainly is true that there is much closer saving of foodstuffs than ever was known before, and our flocks of layers need a regular supply of food if they are to make eggs for us.

And see that the birds have fresh, clean water to drink always at hand. The water fountain should be well rinsed out and refilled at least twice a day, and in cold, freezing weather the fountain should be filled with fresh lukewarm water three times each day, the last supply being given a little before sundown, so that the birds can drink their fill before going on the roost for the night. After the birds have gone to roost remove the fountain, rinse and empty it and put in a convenient place for refilling the first thing in the morning—at time of first grain feeding. The water fountain should hang against the wall of the house, about six or seven inches up from the floor, and preferably near the door, where it will be convenient to reach in to get it; "convenience" is most important for all hen house furnishings, since having things convenient facilitates doing the essential chores.

Have the nests in which the expected eggs are to be deposited set up from the floor; having them set close up to the under side of the droppings platform is the best location, because this gives the birds the entire floor space for exercise room for the flock. And the entire floor should be covered with some good scratching material, so that the birds will have to scratch and search for their grain. Several things are good for scratching material—straw, leaves, coarse hay, planer shavings, etc.—and this scratching material should be raked off and a fresh supply put in about once a month, or more frequently if it becomes damp and fouled. The most successful family flock of which I have knowledge has a bale of planer shavings put in the house about once a month, and the shavings are left in a solid block, just as the holding wire forms it; the birds go at it with vigor, digging it down and scattering it over the floor, and in four or five days the "bale" has disappeared and there is about three inches in depth of clean shavings all over the floor.

The best benefits from the family flock come from considering both eggs and meat; having the eggs thru the fall, winter and spring, and eating the birds before the family goes away for the summer. The original supply of a family flock, so far as I am aware, came about thru a friend of a Mr. Baldwin, of Toronto, Canada, complaining of the difficulty experienced in getting fresh-laid eggs for his family. "Why don't you keep a little flock of ten or a dozen birds yourself?" asked Mr. Baldwin. "You've got some room to spare in your back yard. Fix up a small house for them and I'll sell you ten pullets and bring them in to you, and next spring, before the wife and children go off to the country for the summer, kill and eat the birds as the family can handle them, then get another flock of pullets next fall."

The result of this family flock was so satisfactory the word was passed along, and within three years Mr. Baldwin was supplying eight or ten families with laying pullets each fall. Of course they were not his best pullets—no one ever sells his best! These family flocks were what would be called "seconds," and they were sold at a price accordingly; they were quite as good layers, and were exactly as good for eating, as tho they were the best birds and sold at top prices.

Mr. Baldwin is a breeder of White Wyan-

Profit or Loss?

All a chick needs to grow healthy and strong—to be a profit instead of a loss—is a proper, balanced ration—enough and just enough protein, fat, carbohydrate, etc.

—and a clean, sweet, fresh feed.

Why not begin this year and feed your brood a ration *guaranteed* to be balanced, fresh, sweet and clean—and guaranteed to make chick breeding a profitable business?

Common Sense Baby Chick Feed Guarantees Profits—

In every sack of Common Sense Baby Chick Feed you will find a written statement guaranteeing you healthier chicks—chicks with good digestion, strong, rapidly growing, free from sickness.

A trial will convince you. Ask for prices and let us send you, in addition, samples of our Developing Feed and the famous Common Sense Scratch Feed and Egg Mash.

dotter, and they are a very good all-around variety, as are the Barred and White Plymouth Rocks and the R. I. Reds; all of these are excellent winter layers, and all are excellent table poultry when dressed to eat. It is in this combination of eggs and poultry meat that we get the best results, get the best returns for the money and labor invested; this combination works out the best if we begin eating the birds about April first, eating two or three birds a month until the flock is disposed of. In some instances that have come to my knowledge there were three or four birds left when the family went away, and these were sold to the butcher.

And it should be kept in mind that the birds are worth just about as much to eat, as poultry meat, as they cost in the first place; this is a point lost sight of by too many small-flock poultry keepers, who are prone to imagine that there is a dead loss in cash when a bird is killed to eat! This is not at all the case, as anyone can figure out if he will recall what he paid the butcher for a fowl the last time one was bought for the table. Taking it by and large it will be found to work out that the last year's flock will be worth as much, as poultry meat, as the new flock will cost.

With such an arrangement as here suggested the family will be well fixed for eggs thru the fall, winter and spring, and for poultry meat thru the spring months, provided the right kind of pullets are purchased; and “the right kind of pullets” are those that were hatched

MATING AND BREEDING COLUMBIAN PLY. ROCKS.

By T. J. ENSLIN, Hackettstown, N. J.

The question of mating any breed having the Light Brahma color markings is no easy task. I hope, therefore, the reader will not think I am assuming too much in treating on this important subject, in view of the fact that my experience does not cover as long a period of time as that of many Light Brahma breeders. It is a well known fact that for fifty years some of the best poultrymen in the country have “jarred their brains,” so to speak, in endeavoring to produce A-1 specimens. As regards color markings, the same principles apply for Columbian Plymouth Rocks, as they are identical.

However discouraging the above statement may seem, I can assure the beginner that many Columbian Rock breeders have obtained marvelous results within

First prize and champion Barred Rock pullet at Dayton, O., 1916. Owned by Leigh Bickett, R. R. 9, Xenia, Ohio.

early in the spring and have been kept steadily growing so they come to laying maturity in October, or early in November at the latest. Pullets which are brought to laying maturity before cold weather overtakes them are easily kept laying by good food and good care. Those are the pullets which pay well for their keep, those are the pullets which it is a satisfaction to have on one's place!

Carrier Pigeons Wanted for the Army.

The 365th Infantry, a crack colored regiment of Camp Grant, Rockford, Ill., is in crying need of carrier pigeons for over-sea duties. The boys are patiently waiting the call to serve “over there,” and the strain that the birds will be under carrying messages to and from the firing line, makes it a rigid necessity that they be of the purest breed. A recent article on pigeons and their war use says: “A trench attacking party is cut off by barrage fire; wires are shattered by shells, semaphoring is impossible. Pigeons are released and at a speed of nearly a mile a minute they fly back to headquarters. This has happened time and again on the western front.”

Persons interested who may wish to lend assistance to this worthy cause in helping the men of the 365th get the doves may communicate with 1st Lieutenant Frank W. Haverstick, 365th Infantry, Camp Grant, and after this war is over and the boys come home victorious, the pigeons if loaned or donated will be returned to the owners.

It is a worthy cause and will be of great help to the men of this regiment.

a very short period, principally due to the injection of well established Light Brahma blood, which required a White Rock cross to give it a good foundation.

Unlike some breeds, it is not necessary to resort to double mating to obtain best results. Single matings will answer every requirement.

TYPE.

Unless a specimen has good Rock type, viz., long body, broad breast, with legs, neck and tail to conform, it is useless to breed the same. Most breeders understand so thoroly what is required as regards type that I will not take up your time in connection with this feature, but will devote myself almost entirely to color markings.

I might say, however, that the type of the female has a greater influence on the offspring than male does, consequently the female end of the mating should receive careful attention in this respect.

HACKLE.

To my mind there is nothing so beautiful in the makeup of a Columbian Rock as a well defined, distinctly marked

hackle, with feathers having broad black centers, edged off with the narrow white stripe. The hackle seems to outshine all parts of the body and naturally should have the most consideration. I do not know of any other section of the body which implies or has so much meaning, consequently every effort should be made to produce good hackles. The black markings should be carried well up to the head and should meet in front. I have heard many judges say that unless the hackle is at least fairly good they would not go to the trouble to take the bird out of the exhibition coop for closer examination. A smutty or smoky hackle is one of the hardest, if not the hardest, defect to outbreed, but it can be done by line-breeding two or three generations on A-1 hackled specimens. A tendency today is to have the white stripe in female hackle feather too wide. The narrow stripe, in my judgment, is the ideal.

TAIL AND SADDLE OF MALE.

The main tail feathers in both male and female should be solid black, also sickle feather of male. The tail coverts of both male and female constitute one of the most important, as well as most beautiful, sections of the color markings. The male tail coverts should have the greenish-black center in web, edged off with narrow white stripe, giving it the appearance of a highly polished feather. Female tail coverts should have solid black centers, edged off with narrow white stripe.

SADDLE IN MALE.

The question of saddle striping in male has been a bone of contention for many years. The present 1915 Standard of Perfection for male says: "Saddle, white, except feathers covering root and sides of tail, which should be white with a narrow V shaped black stripe at end of each feather, tapering to a point near its lower extremity." I do not wish to criticise, but I do think the description of saddle should be more explicit, both as to color of feather and amount of striping. My experience has been that if a saddle feather does not show a distinct black and white or clear white between fluff of feather and the V shaped black stripe, there will exist in its place a smutty or smoky color in that portion of feather. This off-coloring always accompanies foreign color in surface of feathers in the back, and as a rule reproduces itself in the offspring. Some breeders have an idea that saddle striping produces foreign surface color in back of female. This is not true, altho I have known of many cases where a superfluous amount of saddle striping will produce this effect in the offspring.

The amount of saddle striping is another point on which many judges disagree. It is a mistake to have all saddle feathers striped. About one-half or at the most two-thirds of feathers adjoining tail coverts is sufficient. When all saddle feathers are striped, it always accompanies an undesirable surface color in fluff, and outcroppings of black in breast either some distance below or immediately adjoining front of hackle. The Standard fails to make a distinction between different parts of undercolor of saddle feathers. Altho the main part of

need Nature's food—the perfectly balanced ration that Mother Nature and science say is perfect—

MILKOLINE

We all know how the small flock of chicks kept by the farmer's wife thrive and grow—no sickness—no trouble. Why? She feeds them skim milk—buttermilk—sour milk, and you can see them grow. It is impossible for everyone to have a home supply of milk products for their chicks. Milkoline solves the problem. It is made from pure, fresh buttermilk, modified and condensed for cheap shipping and easy handling. Just mix

1 Gallon Milkoline and 50 Gallons of Water

and you have the most healthful and cheapest feed possible. **White Diarrhoea is unknown where Milkoline is fed.** It is the ideal feed from the shell to the killing block. The backyard poultry keeper and the big packer both use it. **Young pigs and hogs thrive on Milkoline.**

undercolor should be bluish-slate, it is no detriment to the bird if white undercolor exists for a distance of about one inch from base or quill of feather.

WING FEATHERS.
Primaries should be black, except a narrow white stripe on the narrow side of shaft of web. Secondaries should

have a much wider white stripe in same portion of feather. Too much stress is laid on wing points. Good wings will not control hackle, saddle or tail feathers.

GENERAL UNDERCOLOR.

The Standard calls for "bluish-slate" for all parts of body, except breast, where "bluish-white" is called for. In mating up, discrimination should be used and surface coloring favored over both undercolor and hidden parts, notwithstanding the fact that good undercolor is very essential.

GENERAL COLOR MARKINGS.

To produce the ideal Columbian Rock, all parts of the specimen must harmonize. A very dark bird generally runs dark in all sections, including undercolor. The inclination today is to have them too dark, especially the male, in order to bring out the distinct black and white. This is overdone by some breeders, much to the detriment of our breed. It is a mistake to breed the so-called "dark bird" having slate surface color in fluff and a superfluous outcropping of black in surface of breast near hackle and in surface of back near hackle, in order to have a perfect bird in other respects. Such a condition produces anything but a beautiful bird. I do not agree with some breeders, viz., that the birds in the breeding pens should have stronger color markings than that which you may desire to produce in the offspring. The Standard calls for white surface color in breast, back and fluff, and to my idea it is this beautiful white, contrasted with black in hackle, tail and saddle in male and hackle and tail in female, which gave the Light Brahma unparalleled popularity in the past fifty years. "Breed as you exhibit and exhibit as you breed" is the best method. Many breeders claim the breeding male bird should be strong in color, viz., stronger than the Standard calls for, claiming he has predominating influence in color of offspring. Experience has taught me that this is true, providing the females are light in color, in which event, however, the offspring will not be a uniform lot of birds. Uniformity cannot be obtained by a union of two extremes. If the females mated to such a specimen are strong in color, the offspring will be more uniform, but will run too dark, and it is from this source that we obtain the so-called undesirable "dark bird." Better results are obtained by mating a male that is nearest the Standard to females light in color (if you have no Standard colored females) and then mate offspring back to male bird; in other words, line-breed on the male end.

Brassiness in males is generally the result of lack of strong color markings in the parent male and can easily be outbred.

One of the hardest defects to overcome is the appearance of gray in sickle feathers. However, since saddle striping has reached a high state of development in the past few years, this defect has not been so prevalent.

SIDE SPRIGS AND STUBS.

Both of the above have caused considerable annoyance in past years, on account of the Columbian Rock originating from a Light Brahma cross which have pea combs and feathered legs. These defects are now easily outbred by judicious selection of clean single combs and smooth legged birds for breeders.

HELP SPEED UP POULTRY PRODUCTION.

Work for Prices On Poultry and Eggs That Will Assure a Living Profit to the Producer.—First Prize Article American Poultry Journal Monthly Contest.

By H. L. WILSON.

ONE of the biggest problems confronting us at the present time is an adequate food supply for our own and our Allies needs. Without this, we cannot hope to accomplish that which we have set out to do. Reports are coming in from every section of the country, telling us of lessened planting areas and of the production of fewer meat animals. This is not a condition prevailing in east and west alone, but the great mid-west which annually produces more foodstuffs than all the rest of the country put together is just as hard hit in their inability to plant increased acreage as any other part of the country. The draft has taken heavily of their skilled labor, the shipyards and munition plants have further robbed them of hands. In the State of Kansas alone, the Secretary of Agriculture is responsible for the statement that his state needs 90,000 more farm hands than are in sight.

We do not know where this labor is to come from, or how the situation will be met, but we do know that every one of us is going to need food two or three times a day as long as we inhabit this little earth. It seems to me that it is the part of wisdom for every one to produce as much as he can during the coming season. I do not see how a shortage in poultry products can be averted this year. I have read reports from every section of the United States on this subject, and everywhere it is the same story—smaller flocks or no flocks at all.

The price of grain is, of course, responsible. It is perfectly natural when a man finds he can buy eggs for less than it costs him to produce them, to decide to sell out his poultry and "let George do it." I have felt that way a great many times during the past year. But we have reached the time when "George" himself, like the worm, is beginning to turn. And I believe the one thing which drove him to it was the fact that we still have those among us who claim a big profit in poultry keeping; men who are using a sort of absent treatment instead of putting common sense to the fore and stabbing at the real ulcer—that of helping the producer to get a fair play. During the past year I looked in vain for real help from the authorities, but I am now convinced that the producer must help himself or fall by the wayside. The following true story will explain my attitude:

A man who is the proprietor of one of the largest poultry farms in the entire country and who is thoroly practical and business-like in his management of the business, finding that he could not possibly eke out a cent of profit under present conditions, decided to attend a conference called by experts, and see what they could offer in the way of relief. He did not expect any real help, but was somewhat curious to know what sort of a front they were putting up. I will not go into detail as to what the speaker had to say. You and I know, for we have heard it a good many times. But my friend, the

VIEWS
ON THE FARM
J. W. PARKS
ALTOONA, PA.

(1) Part of our battery of trapnests. (2) New modern brooder house. (3) Head of vigorous heavy laying bred male. (4) Class in Poultry Husbandry State College inspecting Parks plant. (5) Leading business men and farmers of Central Pennsylvania. (6) A regular after-supper job; giving mail careful personal attention. (7) Pet; record of 206 eggs. (8) The Queen's Taste (utility and beauty combined). (9) Laora; record 277 eggs. (10) J. W. Parks (at wheel) and three local poultrymen upon their return from a 16-day auto trip among New England and Canadian poultry farms. (11) Busy; record 290 eggs.

proprietor of a great poultry farm, listened with some awe, and when the meeting was over, and the audience dispersing, he approached the speaker for the purpose of asking him a few questions. He was not incredulous, neither was he sarcastic, but he merely wanted to be shown how the balance could be placed on the right side of the ledger. The speaker suggested that he make a personal visit to one of the best paying farms in the country, where he could see the actual conditions, free from all theory, and thus be satisfied that a goodly profit is possible. My friend was delighted. It was just what he most wished to do, and upon inquiry, was directed to go to the town of B_____ in his home state. "The name of the proprietor is B_____," said the speaker, "and I am sure he will be glad to see you."

My friend acknowledged that he believed he would be glad to get home, as that was his own name and he was himself proprietor of the farm in question!

I take the stand that this is not a time to take up space, telling the oft-repeated story of big profits in poultry raising. We have suffered heavy losses because of this line of talk. Every man who raises poultry should consider himself a committee of one to abolish this senseless talk, and set to work to make the business what it ought to be, but isn't—profitable. It can be done, and must be done, and when poultry keeping really becomes a profitable business, we want to see our poultry papers and our experimentors in better work than shouting about profits. A business that is not profitable has no right to the name of business, because it is not business, but downright foolishness. When a business is profitable, there is no necessity to keep assuring ourselves and others that we are engaged in a money-making proposition. People can see for themselves and there will be plenty of people eager to engage in poultry culture, and ready to buy stock and eggs from us.

During the coming season I propose raising all the poultry I can afford to feed, because it is going to be wanted for food, and I ask the cooperation of every one who raises poultry to work

for prices on poultry and eggs that will assure a living profit to the producer. The laborer is worthy of his hire, and I believe if we put up the right kind of a fight for fair play, and stand shoulder to shoulder on the proposition, we will be able to make some impression upon the Food Administration. But, if we are to accomplish anything, it must be done thru the producer, for he is the only man capable of looking after his own interests. The nation is looking to the producer to feed the world. I believe every producer stands ready to do his utmost to do so. Now, let the producers look to the nation to pay the bill. There is an old saying, that we cannot get blood out of a turnip. Neither can we get food unless we are willing to pay what it costs to produce.

Let us, therefore, gather our resources together, and altho we have no profits assured us as have woolen manufacturers, munition makers, ship builders and countless others, let us bend our best energies to help feed the world and speed the spread of Democracy. But let us do it with a firm resolve that we ask justice in the handling of the food we produce, and in the payment which we receive for same. If the packing interests are to be assured nine percent profit, that profit must not come out of the producer. The producer comes first. Let him take his profit first, and from my experience with producers, I am sure there is no danger of it being excessive.

BACK-LOTTERS SHOULD SHOW THEIR COLORS.

Reorganize the Business On a War Time Basis.—Not Many Foods Can Be Produced On a Back Lot, But Eggs Are One of Them.—Second Prize Article American Poultry Journal Monthly Contest.

By JOHN C. BLAISDELL, Eastport, Md.

THE U. S. Government and the poultry press thruout the country are rightly advocating the raising of more poultry as a war winning proposition. The back-lotters are especially appealed to in this matter.

As I am a back-lotter, I can only speak from the back-lotter's standpoint. I notice that about all my neighbors have sold their poultry since the price of grain soared to its present heights. Well, I cut down the size of my flock on that account and I suppose the same thing happened all over the country. Everyone seems to have taken it for granted that such is the case. Letters from all sections of the country to that effect have been printed in different periodicals.

Considering this condition it seems to me that now is the time for the back-lotters to reorganize on a war time basis. All lines of business have had to reorganize since the beginning of the war. No business can afford to support a lot of dead heads. We have a branch of a chain of stores in this town. These stores are operated over a large part of the country. Before the war the local store, one of the chain, undersold the other stores in this town. A short time ago the store was closed and a sign stuck up—"Open in two weeks, undergoing repairs."

At the end of that time this store opened up on a war time basis. The building had been remodeled. The store was all on one floor, the counters and

When writing to advertisers, mention the American Poultry Journal.

shelves cut in half, a partition put in and the store only half as large as it was formerly. Where four clerks and a cashier had been employed formerly, there was now only the manager himself and an assistant to wait on customers. The delivery service was entirely discontinued. The horses and wagons were sold. Even the telephone was taken out. They are selling more goods today than they did before and underselling by a considerable margin the other stores.

We back-lotters must make a fresh start on a war time basis. If you have sold out and have not the money to buy another flock and cannot do better, why buy a couple of hens to eat up your table scraps. If they are not inclined to lay, pen them up and fatten them. You will be surprised to find how much flesh a hen will take on in ten days' time. Take the money you are spending at the butchers, buy chickens or hens, and fatten them for your table.

There is no quicker way of raising meat than raising poultry. You will find it cheaper to buy mill feeds and fatten poultry than to buy other meats. If you own a small-sized flock, cull them closely. Don't have a drone about the place consuming high priced grain. At present, I am getting table scraps from my neighbors for they are too valuable to throw away. In place of a grain ration of corn, wheat and oats I substitute oats and barley. I use the usual mash and get fish scraps from the fish markets for the asking, where I used to buy meat scrap at four cents a pound.

The back-lotter must plan to have a bigger garden than ever before. I have also added the growing of Belgian Hares to my back-lot activities. The

PARTRIDGE ROCKS

BIRD BROTHERS

hares and the poultry consume every scrap of the garden refuse. With a smaller flock and a larger garden, the Belgians fit in fine, as there are usually more greens than the poultry can eat.

Kill off all the useless sparrows and feed them to the chickens. They supply excellent meat food. It is a good plan now to keep hatching all summer if you have sufficient room to care for the chicks. In fact, it is science. In the summer there is more animal and plant life to feed the chicks, and if there is an opportunity for them to range, they will thrive if given half a chance. I propose to have hundreds of chicks where before I had dozens, keeping up the hatching and eating them, and selling them, as soon as large enough for market or the table. By following this plan, the flock can be carefully culled in the fall when everything they eat has to be bought. But in the summer there is a chance to have a larger flock, because of a greater variety of food stuff to be had for the picking, and very little housing being necessary until cold weather comes.

The back-lotters who have quit should stop to consider that grain is not the only thing that is high. Meat is high and practically everything we eat is advanced in price. We shall all have to keep on eating just the same, no matter what the price. While poultry products are still low in price, considering their cost, the back-lotter will find it pays to grow his own poultry and to have eggs from his own flock. The labor can be performed out of working hours and gives pleasant relaxation. There is no better meat grown at any price and it is always on hand. Eggs are one of the best foods for man, woman or child. We can't all keep a cow on a back-lot, but most of us can keep a flock of poultry and grow a good part of our meat supply at home.

The equipment need not cost much. Most every place has some kind of poultry house in a country town. Sometimes there is a shed or barn that can be used, or a small poultry house can be erected out of waste lumber, or packing cases. There are plenty of portable poultry houses for sale at reasonable prices, cost of lumber considered.

Anyone who has been accustomed to having a flock of poultry in the back lot and who has been scared out by the high cost of grain will soon realize what his flock of poultry meant to him. There is nothing like having good fresh-laid eggs from your own fowls, and an occasional roast or fry when culling out non-productive birds. It will only be necessary to count up the money paid out for eggs and meat to take the place of those produced at home to convince the average back-lotter that it is wiser to stay in the game, even tho paying the grain bill hurts.

To all back-lotters, I would say this is a bad time to fall out. We will each

Second prize White Plymouth Rock cock at Milwaukee, Wis. Owned by A. F. Poldt, Hartford, Wis.

First prize S. C. White Orpington hen at Indiana State Fair, 1917. Owned by Frank W. Jacobs, 2027 W. Nichol Ave., Anderson, Ind.

and every one have to do our share at this time, and especially should be willing to help feed ourselves. There are few foods which a back-lotter can raise, but eggs are one of them.

Paying Investment for Poultrymen.

If there are any readers of this paper who would like to invest a little money in a poultry proposition that will pay them a good dividend, I would be glad to put them in touch with same. Dividends will be guaranteed to anyone who will invest a reasonable amount and also includes a good position for the right party. The work would include outdoor work with poultry and office work. Good opportunity for some one. Write to T. E. Quisenberry, Leavenworth, Kansas.—Adv.

EGGS FREE—Hall's famous Barred Plymouth Rocks. In order to induce more poultry, I am going to reduce the price of eggs from my famous winning line of cockerel-bred Barred Rocks, including World's Fair and Champion Chicago winners, to \$5 per 15 eggs. With every order of \$5 I will give free five eggs from the daughters of "Liberty," egg record 294 eggs in one year. Several of those yards are headed by 12-lb. cocks, sons of champion female, Chicago Coliseum. I have formerly sold at \$10 to \$20 per 15. Everything goes this spring after March 1st, \$5 per 15, with five free eggs, giving you 20 eggs in all. 19 years line-breeding on my farm for size, eggs, production and exhibition quality has produced a line unexcelled by any breeder in America. We are prepared to take care of thousands of orders promptly. You may order any amount you wish; price is the same; with every \$5 sent for eggs I will send free five eggs. Catalog free. Luther J. Hall, Box 7, Kenney, Ill. 3-5

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

OF AMERICAN POULTRY JOURNAL PUBL. CO., published monthly, at Chicago, Illinois, for April 1, 1918.

State of Illinois, County of Cook, ss.
Before me, a Notary Public, in and for the State and county aforesaid, personally appeared James W. Bell, who, having been duly sworn according to law, deposes and says that he is the Editor of the AMERICAN POULTRY JOURNAL, and that the following is, to the best of his knowledge and belief, true statement of the ownership, management (and in a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher—AMERICAN POULTRY JOURNAL PUBL. CO., 542 So. Dearborn St., Chicago, Ill.

Editor—James W. Bell, 542 So. Dearborn St., Chicago, Ill.

Managing Editor—Dr. Prince T. Woods, Silver Lake, Plymouth Co., Mass.

Business Manager—James W. Bell, 542 So. Dearborn St., Chicago, Ill.

2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.)

James W. Bell, 542 So. Dearborn St., Chicago, Ill.
Henry G. Eisert, 542 So. Dearborn St., Chicago, Ill.

H. M. Bell, Congress Park, Ill.
B. M. Eisert, 1455 Balmoral Ave., Chicago, Ill.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.)—None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is — (This information is required from daily publications only.)

JAS. W. BELL,
Business Manager.
Sworn to and subscribed before me this Twenty-second day of March, 1918.
(SEAL) ALICE A. SHEHAN,
Notary Public.
(My commission expires June 20, 1920.)

Save Eggs and Help Your Neighbor Save

THE PLAN

Farmers and Poultry Keepers in the United States each to preserve one case—thirty dozen—of eggs when eggs are cheap, and sell one case to a nearby consumer to preserve.

THE PROCESS

Water Glass Method

For 30 Dozen Eggs — Use two 5-gallon crocks (capacity, 15 dozen eggs each). Take 18 quarts of water that has been boiled and cooled. Mix with it two quarts of sodium silicate. Place eggs as collected, fresh and clean, in crocks, keeping covered to a depth of at least two inches with water glass solution. Keep in cool, dry place. Eggs preserved in this way remain perfectly wholesome, maintain full food value and are perfectly edible for from six to nine months.

Lime Water Method

Place three pounds of unslaked lime in five gallons of water and let it stand until the lime settles and the liquid is clear. Use same as water glass.

This method is recommended when water glass cannot be obtained; it is good, though not quite as reliable as the other.

Infertile Eggs Keep Better Than Fertile

THE RESULTS

Eggs Stored Without Waste by Consumers When Eggs Are Cheap to Use in the Season of Scarcity. Less Eggs to Go to Terminal Markets in Hot Weather When Unavoidable Losses in Handling are Heaviest.

More Fresh Eggs Available for Consumers in Fall and Winter.

Producers and Consumers, Co-operating for the Common Good, Conserve Supplies, Equalize Distribution, Stabilize Prices

For Full Detailed Information About the Production, Preservation and Marketing of Eggs

“Superior Strain” Columbian Wyandottes

First Prize Winners, Madison Sq. Garden, '18, Chicago Coliseum, '17-'18

My recent winnings at these largest shows in America are conclusive proof that my strain has everything desired in this beautiful breed. I have also improved the egg production and have individual records well over the 200 mark. As my strains have been bred that way for years, it stands to reason that this quality is inherited by the progeny. My pens are mated and contain the best birds in the United States.

STOCK AND EGGS FOR HATCHING

from the finest matings in the country are now offered to those desiring fowls that are “profit producers.” I have just added the entire flock of Columbian Wyandottes of the Wilburtha Farms, Trenton Junction, N. J. All their winners are in my yards. This magnificent strain added to my own gives me the largest and best flock of Columbian Wyandottes in the country.

The Quality is Exceptionally Good. The Prices I Ask Extremely Reasonable.

Send for my free catalog and mating list giving full information.

THAYER, ILLINOIS

E. B. Thompson's Imperial "Ringlet" Barred Plymouth Rocks

win at the Imperial Show of all the world, Madison Sq. Garden, N. Y., January, 1918, a new record unequalled in all history, as follows:

EVERY FIRST PRIZE OFFERED

Cocks	- - - -	1st, 2d, 3d, 4th, 5th.
Cockerels	- - - -	1st, 2d, 3d, 4th, 5th.
Pullets	- - - -	1st, 2d, 3d, 4th, 5th.
Hens	- - - -	1st, 2d, 3d, 5th.
Exhibition Pens	-	1st, 2d, 3d, 4th, 5th.

One of the Great Imperial "Ringlet" Males.
Observe the Wonderful Shape, Color and Barring.

Sweepstakes Champion Male and Female; Color and Shape Specials Male and Female; Best Five Males; Best Five Females; Best Display, and every other Special Prize. This is the capstone to their unexampled record at New York for 30 victorious years. At the last four shows—1915, 1916, 1917, 1918, they have won 19 First Prizes out of 20 offered. Every bird bred on my farm. Supreme at Madison Square Garden is Supreme Everywhere.

IMPERIAL "Ringlet" EGGS

May and June are the Banner Months to Hatch Silver Cup and First Prize Winners

Scores of my First Prize Winners and those of my customers have been hatched in May and June. At the 1918 Garden Show my 1st, 2d and 3d Prize Cocks; 1st, 2d, 3d, 4th and 5th Prize Pullets; 1st Prize Hen; 1st Pen Cockerel, and several pullets in my five winning pens were all hatched in June.

My Eggs are the best that money can buy—they produce first prize birds.

Mr. E. B. Thompson:

Dear Sir:—I showed the E. B. Thompson strain at Charles City, December 18th to 21st, won 1st and 2d Cocks; 1st, 3d and 4th Cockerels; 1st, 2d, 3d, 4th Hens; 1st, 2d, 3d Pullets; 1st, 2d Pen. At Hampton, Iowa, January 7th to 12th—1st, 2d Cocks; 2d, 3d, 4th Cockerels; 1st, 2d, 3d, 4th Hens; 1st, 2d, 3d, 4th Pullets; 1st Old Pen; 1st Young Pen. I think that shows that E. B. Thompson has the stuff.

Clarksville, Iowa, January 14, 1918.

Yours truly, J. E. WEISS.

Mash Makes Eggs—Mash Makes Chicks Grow

If you would be successful as a poultry raiser, take for your feeding motto—M-A-S-H—whether for egg production or growing chicks.

Remember that Mash, not Scratch Grains, is the proper feed to make hens lay, and that a good growing mash is the ideal feed for young growing chicks.

To get MORE eggs from your hens, feed FUL-O-PEP DRY MASH—the famous egg-making feed.

It is a soft feed, finely ground and correctly balanced—a feed composed of animal food, green food, grain protein food and other egg-making elements—a feed as near like the hen picks up herself in the spring as it is possible for expert science to produce.

It is the raw material from which eggs are made. Keep it before your hens all the time and you will get eggs in abundance.

FUL-O-PEP

GROWING MASH

is without a doubt the finest quality growing mash for chicks ever placed on the market. It has for its base OATMEAL, ground fine and we have nicely balanced it with other bone and muscle forming ingredients which promote rapid, healthy growth.

When the chicks are 10 days old place FUL-O-PEP GROWING MASH where they can help themselves at will—keep it before them

day in and day out—the more they get away with the better and faster they will develop and grow. To the chick it is just like getting out on free range and feasting on bugs, worms, green stuff, etc., only in FUL-O-PEP GROWING MASH we have gone the free range one better and given him many good things that he could not possibly pick up shifting for himself.

The Big Poultrymen's Secret

The secret of FUL-O-PEP GROWING MASH is the same secret such experts as Thompson, Fishel, Felch, Dann, Kempster and Lambert have used in feeding chicks. They all agree that OATMEAL is one of the finest known ingredients for growing chicks. Our feed experts after making exhaustive tests discovered that by using OATMEAL for the base and adding beef scraps, bone meal, green food, etc., in the correct proportion, that they could produce a feed that was far ahead of any known feed for chicks—the result is FUL-O-PEP GROWING MASH. Get it at your dealer's and you will be astonished how your chicks will thrive and grow.

Free Poultry Calendar Book

Fill out and mail coupon and we will send you free, postpaid, our FUL-O-PEP POULTRY CALENDAR BOOK, which tells you the simple methods by which poultry raising can be made profitable. Contains a daily egg record calendar—gives successful feeding methods—tells how to get more eggs—proper care of young chicks—how to best break hens from setting—in fact, it answers practically all of your poultry problems—a book you will value and keep. Send for it today.

Ten Cardinal Points in Table Egg Conservation

- 1** — Standardize the Flock
Like Hens Lay Like Eggs.
- 2** — Produce Infertile Eggs
Germless Eggs are "Spot"less and "Rot"proof.
- 3** — Keep House and Nests Clean
Clean Premises Make Clean Eggs.
- 4** — Supply Oyster Shell Constantly
Strong Shells are Egg Savers.
- 5** — Gather Eggs Several Times a Day.
Summer Heat Stales Eggs Quickly.
- 6** — Keep in Cool, Odorless Place
Preserve the Fresh Egg Flavor.
- 7** — Use Cull Eggs at Home
They are Good to Eat—Not to Sell.
- 8** — Preserve in Spring for Winter Use
Economy Begins at Home.
- 9** — Sell Fresh Eggs Twice a Week
Age Never Improved an Egg.
- 10** — Ship in Clean Containers
Nice Goods Want Neat Parcels.

For detailed information about the production, preservation and marketing of choice table eggs, write your State Agricultural College, or

The United States Department of Agriculture
Washington, D. C.

YOUNG'S PORTABLE Poultry and Pigeon Houses

Cheaper than you can build. Write now for our free booklet showing 30 different cuts. We tell you how to raise your own meat and eggs. Write today. E. C. YOUNG CO., 6 Dept St., Randolph, Mass.

Ready-Built Philo System POULTRY HOUSES

Save Time and Money

AS WELL as provide the best possible conditions for the fowls. A trial side by side with old style houses will prove that fowls in the Philo System Coops will mature more quickly, gain more pounds at less cost, lay more eggs, and are freer from disease. Coops come ready to set up; built in complete sections that are quickly screwed together. Cost less than to build old style houses. Sizes from six to 25 hens. Prices \$8.00 to \$35.00.

Send for Free Illustrated Catalog

CYCLE HATCHER COMPANY
1800 Lake Street Elmira, New York
Also manufacturers of the "CYCLE" HATCHER, the best 50-egg all metal, fire-proof incubator, Price \$7.00.

First pullet Chicago Coliseum. First pullet at Greater Chicago Show. Also best shape, color and champion female. Catalogue free. O. B. Disenroth - Lawrence, Michigan

BROODER

For \$2.96, including heater, you can build the simplest, most efficient, and most satisfactory brooder ever made. Wind-proof; fire-proof; rat-proof; fool-proof. Can be built by anyone in an hour, with saw and hammer. Plans 10c.

I PUTNAM, Route 605 ELMIRA, N. Y.

PERRY'S Rose Comb WHITE LEGHORNS Bred for eggs, beauty and hardy birds; winners 16 large state fairs. Eggs reduced to \$1.25 and \$2.00 per 15. Day-olds, \$2.00 per 10; also fancy cocks and hens. Free circular. LOUIS H. PERRY, Route 8, Clay, N.Y.

Secrets of Expert Exhibitors and Easy Lessons in Judging

By FRANK HECK

A BOOK that is new in character and the most valuable and interesting production ever published for breeders of exhibition fowls. No other book or similar publication comes within gunshot of it. It is in a class by itself. The time has gone by when a breeder can pick up birds right out of the yards and win with them without special preparation. This is true even in the smaller shows. There are always at least a few hustling, enterprising breeders in nearly every locality who are keenly alive to the financial profit and the honors accruing from winning over all competitors. These breeders use all legitimate methods for putting their birds in show condition.

Faking and Legitimate Preparation Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Consider also the immense advantage you would have in being able to detect such forms of faking as can be discovered in cases where there may possibly be a dishonest exhibitor in the class.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained

You need the book to protect yourself against the dishonest fakir and you need it to put yourself on an equal footing with your honest competitors. It will save you dollars in useless entry fees, and it will show you how to win the coveted prizes and honors which your rivals would otherwise receive. The price of the book is..... **\$2.00** and it is worth the price. Have you ever bought a poultry book on general topics or disclosing some system or so-called secrets, and upon receipt of it had your expectations drop with a dull thud of disappointment? Well! This is not that kind of a book. **Don't put off sending your order. You need the book now. Address**

AMERICAN POULTRY JOURNAL PUB. CO., 542 South Dearborn Street, CHICAGO, ILLINOIS

ORPINGTONS BUFF : WHITE : BLACK

\$3 each for Cockerels and Pullets 2 to 3 months old, bred from finest possible Exhibition matings—Winners for Fall Fairs and early Shows.

Regular \$25, \$50 and \$100 pens of four yearling females and male at half price this month. Also \$10, \$25 and \$50 yearling males at half price. These are genuine reductions and you absolutely save as much as you spend, based on next Fall prices. \$10 eggs now \$5 per 15, \$15 per 50. 56 First Prize State Fair Winners sold customers last Fall, and 262 Winners sold past Winter (including both Chicago shows), is my record. Satisfaction guaranteed always.

keep your powder dry!

In other words, be prepared for the Fall rush of business.

Get your share!

Don't let the buyers forget you during the dull Summer months. Don't think because you have nothing to sell now, that you can afford to get out of the "limelight." The advertisers that are carrying good sized space now are the ones who will, in the Fall, reap the benefit of the prestige thus established.

The ranks of the buyers are constantly changing—the new are coming, the old are going.

In time of Peace prepare for War.

SUCRENE

POULTRY MASH

Something to Crow Over

*For Growing Chicks
And Laying Hens*

Because of the high prices of grains and the difficulty of mixing them properly for health, growth and egg production, the feeding problem stands in the way of success with many poultry raisers.

**Your Feeding Problem Is Solved
By SUCRENE Poultry Feeds**

Sucrene Poultry Mash, Growing Mash and Scratch Feeds are prepared by experts, with a thorough knowledge of poultry needs, and meet every requirement of the chick from hatching time to laying or market time. They are not cheaply mixed feeds—only materials of highest nutritive quality are used in their composition.

Sucrene Growing Mash for chick development and Sucrene Poultry Mash for egg making

Are Rich in Meat Scraps

and other materials high in protein, fat and carbohydrates—including palm kernel meal, alfalfa meal, corn meal, corn distillers' dried grains, wheat bran, linseed meal and small percentages of calcium carbonate and salt.

**GUARANTEED ANALYSIS: 18% Protein,
3½% Fat, 50% Carbohydrates, 12% Fibre.**

These mash feeds, combined with Sucrene Chick Feed and Sucrene Scratch Feed scattered in litter for exercise, constitute a complete, scientifically balanced ration for growth and egg production.

Prevent heavy chick losses through improper feeding. Have sturdy fryers in two months and layers in five months. Enable your hens to make daily contributions to the egg basket and come quickly through the moult with their egg laying power in full vigor for winter laying.

Try Sucrene Poultry Feeds for economy and big results. They re put up in 100 pound sacks. Order a sack from your dealer. If he does not handle it, write us his name and we'll see that you are supplied.

The coupon on a post card brings you illustrated literature on care and feeding of poultry. Write us also for information about Sucrene Dairy Feed, Sucrene Calf Meal, Sucrene Hog Meal, Amco Fat Maker for Steers.

Sale of Breeders

from Owen Farms White Orpingtons

Having recently purchased the Owen Farms flock of White Orpingtons, without doubt the best in this country, and added it to my already strong string of birds, I am in position to dispose of a number of the highest quality breeders. I am in a position to give every buyer more than their money's worth, and no temptation for pecuniary gain influences me to give a purchaser less than they are entitled to. If you are looking for the best, at a reasonable price, write me.

CHARLES HUBBARD FORMERLY OF FOXHURST FARM

Lime Rock, Conn., where he made an enviable reputation as a breeder and showman, will personally select all birds sold, and his well known judgment guarantees you honest value. We also have

HATCHING EGGS AND BREEDERS FROM OUR PEERLESS STRAIN

S. C. Buff Orpingtons : S. C. Black Minorcas : S. C. White Leghorns

and can fill your wants. Many prize winners are hatched late. On three occasions Mr. Hubbard won 1st cockerel at Madison Square Garden with birds hatched in June. If you possibly can, you should hatch a few more settings this month. All hatching eggs and stock are sold on an absolute guarantee basis.

I am willing to take Liberty Bonds and War Savings Stamps in payment

PARTRIDGE PLYMOUTH ROCK COLOR

The Defects in Plumage and How to Value Them. An Article On Scoring,
and Description of Defects to Be Avoided in Mating. *By Theo. Hewes*

THERE is something fascinating about the judging of poultry. This is not alone true of the amateur or beginner, but it is just as true of the old time fancier or those who are familiar with the show room and study the work of the experts almost every week during the winter months. And while the judging of all fowls is of more or less interest, the judging of parti-colored breeds is especially so, and since there is such a wide variation of color found in our leading exhibitions and judges themselves have a tendency to let hobby lead them astray, we are illustrating here some of the common defects that are found in Partridge Rocks, or in fact all Partridge colored fowls, that may in the right way lead them to a better understanding of the ideal and give to the breeder and the judges as well the correct idea of how to punish the defects.

In the color description of the Partridge Rocks in the Standard we find the same general description of the female in all sections, except neck. The Standard reads, "Mahogany brown, distinctly pencilled with black, the outline of the pencilling conforming to the shape of the feather." And as a footnote to the color description, "In all Partridge colored females we find the following: Each feather in back, breast, body, wing bows and thighs to have three or more distinct pencillings." And another description of color and one we wish to pay particular attention to before going further with this article is, "under-color of all sections, slate."

Having served on the Revision Committee that framed the above word description, I want to explain my position in changing of the sentences from "dark slate" to "slate." And for the information of the novice or new breeder of Partridge Colors, I wish to emphasize this one point—do not be afraid of "light slate," or, in fact, of pure white under-color in your male line if you wish to breed exceptionally strong colored females. In fact, as Partridge Rocks are bred today and as the awards are made at the average show, we question if it would not be more advisable for the breeder to mate separate pens, one for the production of cockerels, the other for the production of pullets. Because the light male, the one I refer to here, and the one that makes the best breeder for exhibition females is too light for exhibition and would be set back by the majority of judges regardless of shape and general surface color. A male bird for pullet breeding should have bright even color on top surface, with quite a lot of pencilling in body and fluff. Under the head of "Disqualifications" the Standard says in describing males: "positive white in main tail feathers, sickles or secondaries." Under this disqualification, a bird can show white in primaries or flight feathers without being disqualified, but should this white run into the secondaries or the main tail or sickle feathers, the specimen is thrown out. And it is quite often that from just such birds as are disqualified that you would get your best females. I wonder sometimes if the English breeders were not right when they said it was not necessary to remove a bird from the cage to award the color special. That surface

should govern in all cases and under-colors should be a secondary consideration. It is actually amusing to see the way a man will grab a bird out of the cage and turn it wrong side out to show you what a handsome under-color it has when the chances are the surface is so rotten that it would not have a second look by the judge in making his awards. Get your top color right first, then look after under color.

Before going into detail in pointing out the defects in the several feathers as shown in the chart, I wish to call attention to the words descriptive of the neck of the female. The Standard says, "reddish bay, center portion of feather black, slightly pencilled with mahogany brown; feathers in front of neck, same as breast." With this description it is not necessary that we have a perfectly black center in the neck of the female, but it is vastly important that the lacing continue around the entire lower end of the feather. But we should have gone farther in this color description and have said that the pencilling in the neck should conform to the pencilling in the other sections of the bird. In other words, if we are going to have a nicely pencilled back, breast and wing bow, then the same general formation of pencilling should appear in the neck; not so strong as in the other sections on the surface, but of sufficient strength to show distinctly in the outline of the feather when viewed separately. I remember a few years ago that the question of the double mating of this color was taken up by members of the American Poultry Association, and especially by breeders that were interested in the Partridge color. And they stated that to avoid the double mating it was necessary to allow the male to have some tinge of red in the body or fluff sections, and the present Standard allows for this. In the description of color in this section of males, it says, "body, black; fluff, black, slightly tinged with red." It may be possible that this allowance of tinged color in fluff would bring the desired result, but my own opinion is that it would be far better to depend more on lighter under-color for producing the perfect color in females, rather than the tinge or mussed up color as described by the Standard. For a number of years there has been a difference of opinion as to the number of lacings or stripes that the perfect feather should possess. And in arguing this question out with several prominent Partridge color breeders we decided to select the best feathers from the specimens that were then on exhibition and from this selection try to agree upon what would be best for all. And you will be surprised to know that the number of stripings or lacings had absolutely nothing to do with the general surface color. Birds with a double lacing had just as good mahogany surface as others that had four or five lacings, and among the feathers that were selected from these specimens we found not one, but several that had five distinct pencillings outlined in the feathers, not alone on wing bow, but on body and breast as well. Some even carried this color well up under the throat. But believing that we would set a stake too far ahead, even for the experts to maintain by calling for five lacings, we finally compromised on three, so that

PERFECT AND DEFECTIVE FEATHERS OF THE PARTRIDGE PLYMOUTH ROCK.

the Standard as it reads now calls for three or more distinct pencillings, but should the specimens have practically the same value from an exhibition standpoint, be tied for a prize, then the one that had more than three pencillings should be given the preference in the award.

In the chart of feathers as shown here, we have illustrated only the defects in the female. Feather No. 1 is a perfect hackle feather as described by the Standard. And this feather would also be perfect should it have the pencilling referred

to above and this pencilling run even around the entire feather. No. 2 shows a tracing of pencilling, but it is broken up and does not run the entire length of the feather. Then there is another serious defect in No. 2 in that the black runs to the point instead of being laced around the end and would give a specimen a dark or smudgy appearance in the neck. A feather like No. 2 should be discounted 2 points. In No. 3 we find a decidedly better feather. Not alone from an exhibition standpoint but from a breeding standpoint as well.

In fact, it is a feather that many breeders would give considerable preference in mating up their pens. Here you have an outline of pencilling, and while it runs more or less uneven, it conforms reasonably close to the ideas of a perfect feather, but unfortunately for this one the black and red intermingle, not alone in the center of the feather but in the edge of the feather as well, and carry a little of it around the lower edge so that a neck like figure 3 should be discounted 1 point. In No. 4, we find a feather that is badly defective, being nearly red on one side of the shaft and only partially pencilled on the other side and some of the black running to the edge of the feather on the side. Feathers like this showing prominently in the neck of the female should be discounted 2½ points. In feather No. 5 we have entirely too much black. If all of the feathers in the neck section should be as dark as this, the neck would be smutty black at the base and show but a trifle red around the upper part near the comb. There are no markings that would indicate a pencilled feather, but more after the style of a spangle. Both colors, red and black, are defective in this case and a section showing feathers like this should be discounted 3 points.

In feather No. 6, we have what the Standard describes as an ideal feather, three distinct pencillings properly divided between red and black. The overlapping of feathers of this character gives to the specimen that rich mahogany top color that is so much desired by Partridge breeders and is without question the reason of the popularity of this color today. Feather No. 7 does not show bad on the surface, but it is uneven in the outlining of the pencilling and breaks up bad at one side near the point and should be discounted 1½ points. Feather No. 8 is too dark in the center, only showing one outline of pencilling, almost black in the center, but still carrying a very good interlacing on the surface and should be discounted 2 points. Feather No. 9 is badly shot, the black and red intermingling. There is no distinct color, the black runs to the surface on one side and shows too much red on the other side. A feather like this should be discounted 3 points. In feather No. 10, we find a defect that is common. And you will find just such feathers as this in almost every one of your very best specimens, unless the exhibitor was wise to the fact and removed them before the judge had an opportunity of passing on the bird. The general formation of this feather is not bad, but instead of the pencillings running around the feather as it should it stops short where it joins

on to the shaft and in addition shows quite a little black at the outer edge or tip. A section showing many feathers of this color would be a sort of dingy mahogany, lacking the lustre that is necessary to bring out all of the good features, while the under-color when closely examined would be objectionable from a breeder's standpoint, and should be discounted 2 points. In feather No. 11, we have another ideal. In feathers taken from wing bow and sometimes found up close under the throat of our best colored specimens. It is one of the short feathers and one of the very hardest to get perfect, both in pencilling and in mahogany surface, and should be passed without discount. Feather No. 12 is broken up in the pencilling, running more or less zigzag, but still showing not a bad surface until examined closely, and many specimens of this kind are found in the shows of this country today. But it is not an ideal feather as compared to 6 or 11 and should be discounted 1½ points. In feather No. 13, we find a color defect not so common in the present day Partridge color, but it is a defect that will soon make an appearance if you are careless in your mating. The pencilling runs in scallops or half spangles and runs to the edge of the feather instead of running the length of the feather. Still the outer surface of this feather is not bad and even with the defect underneath does not make a bad mahogany finish, but should be discounted 2 points, as it will most surely reproduce and would be dangerous to breed from, no matter how good the line of males you might have to mate with. In feather No. 14, we have indistinct pencilling. A specimen showing feathers like this has a sort of grayish-brown effect on the surface. It is neither mahogany or steel gray, but a color between the two. But it is a color that is quite often found on the backs of our Silver Pencilled Rocks and Dark Brahmas. In these breeds it would not be such a severe handicap, but in the Partridge color it is a serious one, as the red and black intermingle thruout. It lacks in color underneath, is decidedly defective on surface and should be discounted 2½ points. In feather No. 15, we have a decidedly better outlining so far as the pencilling is concerned, but we have the same trouble of black and red intermingling. But the tracing of the lines on this feather are so near correct that a proper mating would bring it back to standard. I would recommend that breeders be very careful in discarding this color, especially so if you have a good light under-colored male showing quite a little red in body and fluff, and especially if this red in the fluff

THIRD PRIZE S.C.R.I. RED COCKEREL IN CLASS OF 51. MADISON SQUARE GARDEN NEW YORK JANUARY 1918. Bred And Owned By OWEN FARMS VINEYARD HAVEN MASS

SECOND PRIZE S.C.R.I. RED COCKEREL IN CLASS OF 51. MADISON SQUARE GARDEN NEW YORK JANUARY 1918. Bred And Owned By OWEN FARMS VINEYARD HAVEN MASS

and body is inclined to lace similar to the females. In feather No. 16, we show an ideal hackle feather of the male. A black feather laced with red, the red running entirely around the lower edge of the feather, while in figure No. 17 we show the same feather with black extending to the point, making one of the most serious defects that we find in Partridge males, a smutty dark ring around the base of the neck.

The general surface of the males as we have studied them for the past five years would lead me to believe that the breed-

ers are going too strong. You should have a brilliant red, free from orange or buff, at the same time a sufficient contrast between red and black to give the surface that brilliancy of reflection so much desired and so much admired by fanciers of this variety. Quite often we see males where there is practically no difference between red and black. They have bred them to a point where the red is such a dark red that it makes no contrast and it shows a smudgy lusterless surface that, to my eye at least, is far from Standard.

Common Sense Method of Raising Chicks

I Can Care for 500 Chicks with a Colony Brooder in the Same Time Required to Care for 75 Chicks with Five Hens. First Prize Article in American Poultry Journal Monthly Contest. *By J. R. Handyside*

COMMON sense is the forerunner of success in poultry keeping as well as in any other business. The practical use of common sense was the making of Lincoln, in fact most every man of talent in early history was a man who made common sense his motto and daily companion. How many have read of some great labor-saving device or remedy to overcome the big obstacles that present themselves in the poultry business, only to have it fail on trial and probably cause considerable loss? About that time it is customary to stop and think and the usual decision is that if we had thought in the first place and used a little common sense reasoning, we would have known better and could have prevented the loss.

As an illustration, several years ago I had 100 chicks ready to place in a brooder. It was about dark and every minute

I consider the method a good one.

I use the colony brooders entirely. If you can obtain hard coal, any of the coal burning stoves will usually give entire satisfaction. Why do I specify hard coal? Two years ago one of our neighbors ran out of hard coal. He tried using soft coal, for the manufacturers claimed that it would burn satisfactorily. The result was that he lost nearly fifty percent of his chicks and the poultryman was in bed for four days on account of being gassed. This year we are using oil burning colony brooders on account of the shortage of hard coal and they have been entirely satisfactory to us so far.

I use and recommend a room about ten by fifteen feet, with the brooder in the darker half. The entire floor is kept covered with hay chaff from the barn floor or mow. On the south or opposite end from the brooder we have windows for light and about one-fifth of the end is muslin. I have been in brooder houses where the air was so hot and close it would almost take one's breath away, but I do not believe in that method of brooding. The air should be kept fresh and warm and it will be that way if you have the right kind of a stove and a method of ventilating which gives no draft in the building, and this can be planned out to fit any style of building.

We use one and two-gallon size fountains set on shallow boxes which raises them about two inches off the floor. This keeps the water from getting contaminated by the litter being scratched into it by the chicks. We give sour milk as a part of the drink when we have it, or can get it, for as we ship whole milk it is rather a scarce article. If feeding sour milk at all, feed it all sour or it is liable to cause trouble when a change is made from sour to sweet.

We feed five times a day until the chicks are twelve weeks old, unless we feed the mash in hoppers after they are three weeks old. The scratch food is fed at six o'clock, twelve and six, and the mash is fed dry at nine and three. And the chicks always get their food on time. It pays. Coarse oatmeal is one of the best chick foods there is. We like to have it form one-half of the scratch grain for the chicks, the other half being composed of cracked corn and wheat or prepared chick food. At the two mash feedings they get equal parts cornmeal, bran, middlings and beef scrap, which is sifted, and one pound of salt added to each one hundred pounds. Chick grit and charcoal are kept before the chicks at all times. When the chicks are small we feed the mash on galvanized iron trays three feet square. These are easily cleaned after each feeding. Common sense tells us that we should keep things as clean as practical, for cleanliness is a forerunner of success in chick rearing. We clean the brooder houses out every week, and twice a week when chicks are small—oftener if they need it.

We usually brood about five hundred chicks in one flock and if things are kept reasonably clean there is no more danger of disease than where there are fifteen or twenty chicks under a hen where lice are sure to find the little fellows. One idea we carry in mind is to keep the chicks in control when they are small. We keep a strip of wire mesh netting around the brooder until they learn where to go to get warm, and then gradually make the pen larger, until in four or five days we take it away entirely.

Care should be taken that the rim of the water fountain is

UNRETOUCHED FROM LIFE 1916,
BRED AND OWNED BY C. N. MYERS, HANOVER, PA.

had to count in order to get the chicks in a warm place and settled down for the night. At the last moment it was discovered that the oil bowl of the brooder lamp was leaking and, being in a hurry, a glass bowled low lamp from the house was substituted for use in the brooder. About half an hour after retiring, we awoke to find the brooder in flames with a total loss of the chicks. If we had used common sense we would have distributed the chicks among the hens with chicks, since we had a large number of those at the time.

My method of raising chicks may not meet with the approval of all poultrymen, but after raising 90 percent or more of chicks hatched to maturity, as I usually do year after year,

not large enough so that the chicks may get in and drown. It is advisable to have no corners in the room where the chicks can huddle if the fire should happen to go out or an unexpected shower come up and the chicks become wet and chilled. We place one incl mesh netting across the corners, and believe that it has saved quite a number of chicks for us.

Only good wholesome food should be given chicks. We do not allow them quite enough to satisfy their appetites. A healthy chick should either be asleep or on the hustle. Many people seem to think that chicks must be fussed with, petted and cuddled all the time, but if heat, food and water are supplied them in a common sense way, the house and yards kept clean, and proper equipment used to keep them under control, the result will be successful.

A dairyman would not expect to accomplish much keeping cows in an old leaky shed which was about ready to fall in. Some people try to raise poultry under similar conditions and do not understand why they are not successful with poultry.

We have experimented in regard to the labor of raising chicks by the colony brooder system and also with hens. I find that I can take care of 500 chicks with a colony brooder in the same time required to care for 75 chicks with 5 hens and I believe that this will apply in most every case. All things considered, I believe that every farm woman who raises 100 chicks or more each season with hens could brood a flock of 500 with a colony brooder with the same amount of labor and the result would more than pay her for the equipment the first year. Of course a hen will perhaps raise three or four chicks without any attention on the part of the owner, but where the object is to produce chicks in any quantity with a minimum of labor the colony brooder is indispensable.

I believe that the colony brooder system is as far ahead of the hen in raising a large number of strong chicks, as the barrel churn run by gasoline engine is ahead of the old fashioned churn that is big at the bottom and little at the top, with a thing in the middle which goes flippy-flop.

Raise Chicks On the City Back Lot

Describing House and Runway Which May Be Made Any Size Desired. Second Prize Article American Poultry Journal Contest. *By Bernard H. Kirchbaum*

EVERY loyal and patriotic citizen should now be doing something for his country, or, putting it in a better way, should be doing all he can. There are those who think they can be patriotic by just waving a flag or singing the national anthem, but the call today is to do something that will actually help our country and our Allies to be victorious in this great war.

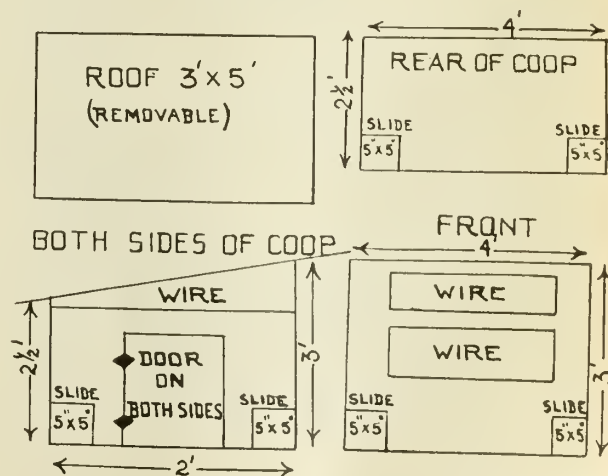

One way in which we can show patriotism is to raise chicks on the city back lot. Many city people, however, appear to have considerable prejudice against raising poultry, or, for that matter, allowing others to raise poultry in their neighborhood. This is a sentiment which should not exist today with the necessity for greatly increased food production and the present shortage of help. There are those also who consider work with poultry too dirty to soil their dainty hands. I have been raising poultry for the past seven years on a back lot and I consider it an interesting and pleasant work for man, woman or child. The work is not arduous and it gives one who is employed all day at other work a pleasant change, which takes his mind from his daily labors. It also affords him some outside exercise and fresh air. Work with poultry is not disagreeable, even to the most fastidious, for the poultry house and yard may be kept in a neat and inviting condition by devoting a very short time to the work each day.

The novice who attempts to raise chicks, for the first time this season, will do well to begin with day-old chicks. These may be purchased of reliable breeders and hatcheries in all parts of the country. It is advisable to purchase reasonably near to your own home, at least so the chicks will not have too long a journey, tho as a rule a day or two en route will not hurt them. But in buying, be sure you place your order with a dependable firm.

The back-lotter will not want to raise more than one variety of chicks, at least it is not advisable for him to do so. A uniform flock can be reared and cared for to better advantage than if one or more varieties of chicks are attempted, and when the culling is done later on, there is a better chance to have a nice little pen of your favorite variety to be kept for winter layers. The predictions are that poultry and eggs are going to be very scarce this coming fall and winter and it behooves every man who has a back yard to attempt to have a flock of poultry to help supply his own table with eggs. Some people object to late hatched chicks, but I have had better results with late hatched chicks than the earlier hatched ones. It does not begin to get reasonably warm here until May and the back-lotter, who cannot be with his chicks except before and after his day's work, can do better in chick rearing after the weather becomes settled and the sudden changes of early spring are over. Of course the chicks must be fed at frequent intervals while small, but those who are away all day can have other members of the family attend to feeding the chicks two or three times during the day. Later on when the chicks

are larger, they may be fed by means of hoppers and feeders during the day. Water should be supplied them at all times and during the summer it is best to change the water two or three times during the day. There should also be shade provided during the hottest weather. If there are no trees in the back lot, a few blackberry bushes will help out and there are many kinds of quickly grown shade. If provision has not been made along this line, stretch a piece of canvas or burlap across the end of the yard where the chicks may find relief from the hot summer sun. Try to grow a little green stuff if you have room and always save all outside leaves from any vegetables bought for the family, for the outside leaves of lettuce, cabbage, spinach and many other greens are greatly relished by the chicks. Keep a supply of charcoal and grit before them at all times and beef or fish scrap unless there are table scraps containing bits of meat, etc.

The house that I have been using has proved most satisfactory. I cannot let the little chicks run free because of cats, and because it spoils the lawn, and often gets you in wrong with the neighbors. I have, therefore, built a small house, which will house any number of chicks up to a hundred; while it will house twenty-five at three months of age, when they can be removed to the large house, and still keep them confined to a given space. In order that the young chicks can secure as much grass and insects as possible, I make use of a movable runway which can be moved eight times before moving the house. The house and run-way may be made to any size desired. The diagram explains the coop and run-way better than words.

A house and runway for use on city lot. The runway may be moved eight times before it becomes necessary to move the house, each moving secures a fresh grass run for the chicks.

From these diagrams it can be seen that there are eight slides. The run-way can thereby be placed in front of any one of these slides, each moving securing a new piece of ground for the chicks to run over, while allowing the former piece to become covered again with grass. By this method, I did not have one chick die last season and I credit this to the fact that their feeding was correct; that their run-way did not become dirty; that their coop was light, well ventilated, easily cleaned, and dry; that they always had a good piece of grass to feed on; and lastly, that conditions made them satisfied in rather close confinement. This coop also housed twenty-five chicks till they were nearly four months of age when I removed them to the hen house. By putting in a second floor, there was plenty of room for the twenty-five chicks. Because of the splendid success which I have had from the use of this coop and movable run-way, I would recommend anyone in the city, with a back lot, and with con-

ditions like mine to use it, or at least to try it.

After the coop question is settled, the rest is to a great extent governed by experience or can be gained from reading first-class poultry books and papers. The question of what to feed baby chicks is not at all difficult if you do not try some complicated and unnecessary method of feeding. I have had most success when I would feed at frequent intervals (about four times a day to baby chicks) commercial chick feed and rolled oats. I leave a dry mash before them all the time. When they get a little older, say about two or three weeks, carefully selected table scraps are very good. With the grass and insects and worms that they secure, this ration has proven entirely satisfactory.

Back-lot poultry raising, if it is undertaken in a simple and sensible manner, is profitable and interesting, while it is a splendid way to exhibit one's patriotism and loyalty to his country.

How Would You Answer This Letter?

Interesting Questions—With Replies by the Managing Editor.

Readers, who have had practical experience in poultry keeping as a means of earning a living, are invited to take part in the discussion and send their replies to these questions to Dr. Prince T. Woods, Managing Editor AMERICAN POULTRY JOURNAL, Silver Lake, Mass.

THE accompanying letter from a subscriber is unusual in its list of questions and also that the correspondent desires that a number of readers express their opinions on the subject in order that the answers may give various points of view. We have answered the questions herein, giving our frank opinion, based on many years practical experience and unusual opportunities for observation. Whether the reader differs or agrees with our viewpoint, we shall be glad to have him express his views on this interesting subject: Here is the letter:

Editor AMERICAN POULTRY JOURNAL:

A married couple in middle life—the man a city product; the woman brought up in the country, but now more or less of an invalid, may by force of circumstances be compelled to turn their energies into another channel in order to gain a livelihood.

Their thoughts have turned to the country and they are anxious to engage in something which would not entail a great outlay of money and where careful work and management would bring in an income sufficient to insure a modest living.

The man is not adapted physically nor by experience to take up the strenuous work of general farming, but the business of raising poultry and eggs has been suggested as offering the best solution of the problem, and in any matter affecting poultry we are told that we could not go to a better source for expert information and reliable guidance than the AMERICAN POULTRY JOURNAL.

Here are some of the questions which have occurred to us thus far:

1. What would you say as to the minimum amount of capital which it would be necessary to have in order to embark on a proposition of this kind in order to reasonably assure success and a modest living for two people?

2. How much ground—2, 3, 4 or 5 acres, or what would be required? We have been informed that practically all the profits are taken out of the poultry business unless one raises their own grain.

3. Is it better to get located near a large city on account of the larger market than it is to be 100 miles or more out in the country? The advantage in one way might offset the difference in cost of ground, etc.

4. What experience is necessary for the successful operation of such a business? Should not anyone with ordinary intelligence, some study, and hard work, be able to make a "go" of it?

CHICAGO READER.

Before taking up the questions by number, it will be well to call attention to the fact that at the present time veterans in commercial egg farming and market poultry growing, men with from fifteen to thirty years successful experience, are having difficulties in making "both ends meet" and to stay in business even with considerably reduced flocks. Many have

been obliged to quit altogether, or to seek other paying employment in order to carry their poultry business thru these strenuous war times and at the same time get a living. The government is advising against extensive poultry operations and is not, under present conditions, recommending that anyone take up commercial poultry farming as an exclusive business. When successful poultrymen with long experience find it difficult or impossible to get a fair and just living profit out of the business—where poultry must pay the living income for the producer and his family—what opportunity is there for a novice to embark in the business in hope of earning a living?

Commercial poultry farming for a livelihood is hard work and no business for an invalid or one who is physically broken down to engage in. Keeping a good sized family flock of fowls to supply eggs and poultry for the home table, or for fancy's sake, is a very different matter from earning a living with poultry. Work with a small family flock of fowls will prove interesting, entertaining and helpful for the invalid or for the physically unfit, but it takes a good, strong, husky individual to run a commercial egg farm or market poultry plant.

In normal times before the war, a good, strong, able-bodied man, with a hired helper part of the time in the busy season of chick rearing and crop growing, could take care of 2,000 head of laying hens, raise three or four thousand chickens and make a good living at it. He had to have a fair sized farm, grow fair crops for home use, keep a couple of cows, a pig or two, and a pair of good work horses. His working hours were always from sun-to-sunset and frequently longer—strenuous working days averaging 12 to 16 hours each. Men who have done such work and made a success of it, have, some of them, started on very small capital—quite a few we know had only the farm with a good sized mortgage on same and worked out by the day to get funds to live on and to get the farm started. They won out, but it took time, infinite patience and hard work. That was before the war. Today, in some of our best egg farming and market poultry growing districts, favorably located near the best of markets, many of these poultry farms have been forced out of business, others are "carrying on" at about 25 percent of normal capacity and hoping that more favorable conditions and the scarcity of poultry and eggs may enable them to make good a part of their losses. Some capable and worthy young men with a number of years of successful poultry experience, hard workers and thrifty, have been forced out of business or have had to mortgage their farms in order to pay their expense bills. So much for the introduction; now for the answers to the questions.

1. The minimum amount of capital required depends

wholly upon the man and his earning capacity—this, of course, in normal times and under normal conditions. Under favorable conditions poultry keeping is not a "get-rich-quick business" and one cannot expect any greater return for

For example, we know of a "one-man poultry farm" which keeps 2,000 head of fowls and grows 4,000 chickens annually. It takes 218 tons of grain and feed, or approximately 8,720 bushels per year to feed his flocks, and this would call for a good many acres in grain crops. The specialty poultry farmer has to be a pretty good general farmer as well, but we doubt the practicability of attempting to combine poultry farming and grain farming on so large a scale. It would undoubtedly be wiser and better to sell the grain and take the profit on it, rather than feed it out to poultry and other animals. The grain would be more valuable for human food. A very large percentage of the grain fed to poultry is of a quality unfit for human food, while the feeds are mill by-products.

3. As a rule a location convenient to a large city is preferable. Marketing the product is a sizeable job and one should be within convenient shipping distance by both express and parcel post. Each locality, even nearby large cities, presents a problem of its own in matter of shipping and marketing facilities. Two locations, each 30 miles from a big city and not over a dozen miles apart, may be wholly different as regards cost and convenience of getting produce to market. Cost of marketing the farm produce is seldom given sufficient consideration, it is a considerable item of expense.

4. The same amount of experience and executive ability which would be required to make a "go" of any business in which a like amount of capital and effort is invested. The amateur with push, pluck and ordinary intelligence, who will put study and work into his poultry keeping can make a "go" of poultry on a small scale. Operating a commercial poultry plant to earn a living at the business is a full-grown man's job and calls for executive ability and common sense of a high order. Do not run away with the notion that "making a living with poultry" is "easy money." It is not. Any man or woman who earns a living producing food works hard for every cent of income and earns a good deal more than is ever received.

UNRETOUCHED FROM LIFE 1916,
BRED AND OWNED BY C. N. MYERS, HANOVER, PA.

capital invested, and labor and other expenses incurred, than he would receive for like investment and operating expenses in other lines of productive work. For a family such as this married couple, one more or less an invalid and the other not adapted physically nor by experience to take up the strenuous work of general farming, the capital should be sufficient to own and stock the farm free and clear and pay living and operating expenses for a few years, the man and wife doing the work of the plant. It would depend largely on what is meant by a "modest living" and the size of the farm and scope of operations. If they could make the farm pay actual expenses plus a living for the first three to five years, we would consider it doing uncommonly well. The average city couple who attempt such poultry farming operations do not last over three years, when circumstances force them to again seek work paying a regular wage. Any farm worth having will cost around \$5,000. Fowls for laying and breeding stock, utility quality, are now worth from \$2.50 to \$5 each. Besides green food, vegetables, grit, shell, litter material, insecticides, disinfectants, housing, fencing, and miscellaneous equipment, the feed and grain supply per bird per year, will call for approximately 45 pounds of dry mash mixture and 45 pounds of grain, average.

2. For a man and wife having an independent income to live on and who simply wish to enjoy healthful country life, a few acres will be ample. For a commercial poultry plant we would not want less than 30 acres, and 70 to 100 acres would be better. Four hundred hens can be housed and yarded on one acre, but for practical poultry farming it is better to figure on not over 100 fowls to the acre of land devoted to poultry and to "rotate crops," keeping the land under cultivation and moving the fowls along to "new" ground every season or two.

The 70 to 100-acre farm will permit a "one-man poultry plant" of from 1,500 to 2,000 layers and breeders and the rearing of a few thousand chickens each season, combined with the growing of a part of the grain and all of the greens and vegetables fed. But one man is not "big enough" to run a poultry farm and grow all his feed at the same time, unless he has a very large farm and employs a good deal of help.

"DO YOUR BIT"

It has been said that free and compulsory education has been the chief factor in advancing the interests of this nation, and that only so far as a whole people grow in knowledge can they occupy a place of importance among the nations of the earth. If, as all intelligent people will admit, education of the people is the best investment for future values, what would be the answer if our statesmen should now propose a tax upon every child in the public schools of this land to be paid to the government for the duration of the war? So far as the public schools are concerned, they are a heavy expense to every community, an expense somewhere in the neighborhood of \$150 or more per child, every year he attends public school. However, even in war times, we have not heard anyone make the suggestion that this expense be met by taxing the school children so much per head, because everyone knows that the future of a people depends upon this education of its youth. But now comes a tax on newspapers and magazines in the form of increased second-class postage and the application of the zone system which adds to the postage cost from fifty to nine hundred percent, which will put a large number of worthy and eminently educational periodicals out of business, and which will so greatly increase the cost of others that those who most need these publications will be denied them.

The claim has been made that the Post Office Department loses money handling second-class mail matter at the present rates, but no one has yet been able to show figures which prove this statement. While there may be branches of the Post Office Department which are not self-supporting, yet as a

whole the department, which, of course, is operated for the benefit of the people is more than paying its way at present rates. Last October, the Post Office Department turned over to the U. S. Treasury \$9,000,000, being the largest profit ever made in one year of its history.

We believe the proposed increase in second-class postage and the application of the zone system to newspapers and magazines would be as detrimental to our people, and the future of the country, as it would to tax children for attending the public schools, for taxing the press is penalizing self-education.

The newspaper and the magazine are the poor man's high school and college course — frequently both, and sometimes thru these mediums, he not only competes favorably with the college graduate but often eclipses him completely.

Who can say what the one cent newspaper has done to educate and inspire the youth of this land? The ten, fifteen and twenty-five cent magazines have meant more to countless worthy youths than the four-year college course in some of our best universities, to those who had the means to go to college but not the eagerness for learning of their more handicapped brethren. A few years ago a learned professor stated that we must not expect too much from college graduates because those who could afford to go to college seldom had a thirst for knowledge. Because of low cost and widely circulated publications, these boys and girls who yearn for knowledge in every branch of learning, have had the opportunity to add daily to their store of knowledge and thus greatly increase their usefulness. Many of them from simple and inexpensive newspaper and magazine reading have gained the inspiration which has led to research in the higher branches of

learning. What knowledge has the average person today above that which he acquires thru his newspaper and magazine reading? Most of the so-called knowledge which was instilled into us twenty or more years ago has now become a back number in the light of modern science and present world conditions. The newspaper and magazine are the only means at our command for continuing and correcting the preliminary education which is considered of priceless value to youth, and which is in reality only a foundation upon which the real education is to be built. The practical work of the individual, together with his after reading must do the rest.

Shall we then permit a vicious tax upon publications which will curtail the scope of one of the greatest and most far-reaching means of education in the nation today?

Write to your Senator and Congressman and protest against the increase in second-class postage rates and the application of the zone system to newspapers and magazines, which unless repealed goes into effect the first of next month.

Need of Reorganization

Our national poultry organization, the American Poultry Association, is certainly in a bad way. It has not kept up with the times and is greatly in need of reorganization along modern lines, as has been frequently pointed out.

The fact is, we are wrongly organized for an international association in so large a field. The life membership fee is too low and will not take care of the financial needs of the organization. A common sense system of an initiation fee combined with annual dues is needed. There should be reorganization from the outside of the circle toward the center; i. e., geographical sections, districts, or states should be organized on a co-operative basis, with an effort made to include all poultry keepers, the state or district organizations should elect representatives to form the central or national executive body controlling all organizations or federations of poultrymen. In other words, put the A. P. A. as an organization on the same business plan as other successful national or international organizations. It could be done if enough members are willing to work for it. If it is not done, our boasted great international poultry organization may go into the discard.

One member, a man who has for many years been a real worker in A. P. A. affairs, wrote us recently: "The A. P. A. has been dead for some time, but only a few know it. No one seems to have the heart to bury it. It is in the coffin and every once in a while Dick Richards says: 'Anyone wishing to view the remains may do so.'"

Things certainly do look that way, have looked that way most of the time the past two years. We would very much dislike to see the old American Poultry Association pass into innocuous desuetude. It was once a very useful association, but it did not keep up with the times, it fell into the hands of men who were neither fanciers nor poultry producers, it became the plaything and political machine of those who live off of poultrymen, rather than the representative and guardian of the interests of real poultry breeders. Now and then a real fancier and breeder has tried to "save the A. P. A.," but such efforts have not met with whole-hearted support.

Yet, with all its faults, the A. P. A. is our only really international poultry organization, or the remains of it. It owns and publishes the only authorized standard for all recognized (by the A. P. A.) varieties of fowls. Of course breed clubs have standards for "non-standard" varieties, but that is outside the question. If the A. P. A. stays dead, it is going to hurt the poultry business, it is going to injure the business of every breeder and fancier, it is going to be a very bad thing to give the opportunity to the opponents of Standardbred poultry to say: "I told you so." It will take years to put the Standardbred poultry business into the running again, unless the international organization is brought to life and made truly representative of the poultry industry; or unless some better organized association is substituted. It ought not to be very difficult to reorganize the A. P. A. and make a start in the right direction. Who will be the Moses to lead the way?

Eggs and Poultry Prices

The prices of poultry and eggs have not at any time during the past two years responded proportionately to the increasing cost of production, altho in our Central states the percentage of increase in selling price of eggs and fowls was much greater than in the commercial poultry growing sections of the Pacific coast and North Atlantic coast states.

With prevailing conditions, higher cost of grains, feeds, and labor—as well as everything the poultryman buys—eggs should be selling at 75 cents per dozen in flush season and \$1 per dozen in season of scarcity. Eggs in England climbed to 12 cents each and their use has been restricted to children, invalids and wounded. In America the demand for eggs fell off considerably when prices advanced sharply. We have never realized any general acceptance of the "dollar a dozen" eggs which were so freely predicted last year and the year before. The consumer seems to prefer to go without eggs rather than pay what they are really worth—a price which would give the grower a fair and just profit above production costs.

With the present tendency toward price fixing, whether direct by the Food Administration, or indirectly thru trade boards and the "gentlemen's agreement" method, it is not possible to say what may happen to eggs and poultry prices. We can be reasonably certain, however, that every effort will be made to maintain a fairly low price to the ultimate consumer.

There does not appear to be any effort to make it easier for the commercial poultryman and egg farmer to get a living. He is "up against it" and likely to remain there for the present, unless he can effect a powerful co-operative organization to protect his business interests. Apparently even the Poultry Division of the U. S. Bureau of Animal Industry has little sympathetic understanding or regard for the commercial poultryman's difficulties, since it has employed Edward Brown, British poultry expert, to go about the country proclaiming:

"I would rather have one hundred men keeping ten hens each, than one man keeping one thousand hens."

The fundamental principle involved seems to be that the consumer wants cheap eggs and "must have 'em." The commercial poultryman must get

a profit in order to stay in business, so cannot sell cheap eggs, but it is hoped that many small flock poultry keepers will not count the cost, will not reckon with labor and overhead charges, and may be expected to market their surplus eggs—if they have any—for whatever old price the eggs will bring, just to get rid of them. It is a nice principle, one that grows on you as you ponder on it—the same ages-old scheme of trying to get something for nothing. Our ancestors shortly after being driven out of Eden used to get their food for next to nothing; simply plucking it where it grew, stealing eggs from nests or killing game where they found it. Evidently we have inherited the fixed idea that we must get our food without cost, or as nearly without cost as possible, even if we have to reinstate serfdom and slavery to bring it about.

It is exceedingly difficult to determine the extent of the poultry shortage.

TO OUR READERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every advertisement in this issue is signed by trustworthy people, and to prove our faith we will make good to our subscribers any loss sustained by virtue of their having purchased fowls or goods from one of our display advertisers.

All we ask is, that in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. In all cases in writing to advertisers say, "I saw your ad in American Poultry Journal."

Remember, we hold the champion record at National egg laying contest, and can supply you with trap-nested high record layers. R. M. Seward, R. 1, Lewistown, Ill.

While reports coming to us indicate that hatching and rearing this year thru-out the country does not exceed 25 to 30 percent of normal, this is a large country and no accurate statistics are available. Information secured before and during the Chicago conference, as well as visits and correspondence with poultrymen indicated a shortage of breeding and laying stock the past spring amounting to about 50 percent below normal. Unusually heavy selling of farm flocks was reported from all over the country. Rule 15, forbidding sale of fowls and pullets, was clapped on to prevent a feared wholesale slaughter of layers. This ban on selling hens worked more harm than anything else and was finally lifted ten days before time set for expiration of the "embargo"—was

actually lifted on the Pacific coast soon after it went into effect. Since then there have been published many requests to poultrymen not to sell their flocks. Apparently there has not yet been any heavy selling, for the market reports a

receipts are 30 percent more than for the same period last year. This was partly due to the early laying in the Northern sections. "I have advice that thru Missouri and Arkansas, and that country West, that the amount of eggs placed in incubators and under hens is nearly twice as large as last year. I feel quite sure, however, that east of Pitts-

Partial view of the hatchery buildings on the farm of the Co-operative Breeding and Hatching Co., Box 16, Tiro, Ohio.

scarcity of live fowls, "but in compliance with the request of the local Food Board *not to strain prices*, sales have generally been at 36 cents by the regular receivers, tho it has been rumored that some of the express receivers have obtained more money by making and charging up sales at 36 cents, but compelling the buyers to pay 3 to 5 cents per pound bonus to secure the goods," as a trade paper puts it. Hucksters hereabout have been paying 32 to as high as 40 cents a pound for prime quality live fowl and report difficulty in finding a supply.

A prominent Food Administration official is quoted as viewing the poultry situation in this wise as late as the middle of April, 1918:

"All of last fall and winter I heard nothing from the members of the American Poultry Association, but that the industry was doomed unless the government stepped in and either reduced the price of feed or increased the price of eggs, and all reported that we would see a great shortage of eggs this season. I have never agreed, for from my analysis, while the poultry specialist was selling his flock, I could see that farmers all over the Central West were increasing their flocks, and made the statement in January, that the receipts of eggs this year, in the four leading markets during March and April, would be as heavy, if not heavier, than for the corresponding period last year. It is a fact now that the

burgh and Buffalo there will be a reduction, but this reduction will be more than overcome by the great Central West."

This view does not coincide with our information, but we do not know of any person or any group of persons who have the actual facts, such as could only be secured thru a carefully-taken poultry census. Eastern storage warehouses are full of eggs. Altho a decrease in receipts of eggs in Eastern markets was looked for, the actual receipts have been heavier than during the same weeks last year. The demand for eggs has been fair, considerable quantities have been sold for home preserving and a good many have gone into storage on owner's account.

Prevailing wholesale prices for eggs the first of May in our large Eastern markets were *only about one cent per dozen higher than in 1917*. When one considers the higher cost of production, that fact does not carry much comfort for the producer nor much encouragement for increasing production. There

First Prize Cocker at Madison Square Garden, December, 1916

conditions and prices may be expected, would be a most remarkable prophet.

Apparently the Food Administration believes that the farms of the Central West and Southwest can be depended upon to supply all demands for storage packed eggs, and that it does not matter much what happens to the commercial poultryman and egg farmer.

The independent egg farmer and market poultryman, with the large productive plant shipping thousands of dozens of eggs and tons of prime poultry to market, has always been a thorn in the flesh of the storage and packing interests. It would seem to be a very convenient time to eliminate that sort of competition from the field. Of course the big packing interests only claim to

handle a very small percentage of the total foodstuffs consumed in the United States, but that does not mean that they would not like to control all of it.

There are no statistics to show how many eggs or how much poultry meat is annually produced and sold direct to retailers or consumers by independent poultry plants, nor have we any figures to show the production of small flocks which supply the home table of the owner and perhaps a surplus to neighbors. There can be no doubt about the very great quantity of poultry and eggs so produced. A shortage here would be greatly missed. It is here too—among the independent poultry producers—that price fixing hits hardest and unjust restraint of trade combined with increasing production costs tends to reduce production or drive the poultryman out of business altogether.

If there should not be any official interference with poultry and egg prices—direct or indirect—we would expect to see a reaction in the poultryman's favor by next fall. Under the existing conditions "the unexpected usually happens" and we can only wait and see.

June Chickens.

THE decision whether or not to hatch and grow June chickens this season will depend wholly upon individual and local circumstances and conditions.

No one should attempt to rear more chickens than he can feed and care for properly. A small flock of well grown chicks is far better than a large flock of chickens poorly fed and cared for. Good feeding grain is not plentiful and the indications are that it will, in some sections at least, be difficult to make the supply hold out until the new crop comes in. Conservation of grain and feeds is necessary, if our federal officials have informed us correctly. It is also necessary to grow an abundance of food as economically as possible.

Chickens are good food and can be quickly grown. If one has a good sized flock of early chickens, it may be well and wise to devote the feed and labor chiefly to the best development of that flock rather than to attempt hatching and rearing summer chicks. If the early flocks have proved a disappointment, or for any reason one did not get a supply of early chicks, it will be a good plan to either purchase a sufficient number of June chicks day old, or to hatch as many as may be required.

Summer chicks will do well if given good care. They need good range, clean sleeping quarters, freedom from vermin, shelter from sun and storm, wholesome food, and should not be too heavily fed. It takes a little more care and attention to make good with summer chickens, but in our Northern states they can be made to grow rapidly and to produce meat in record time. June hatched pullets of American varieties, if properly grown, should be ready to lay in December.

In the matter of June chicks, be

Regal White Wyandottes have stood the test. Whether you wish to go in for exhibition or for utility, the Regals will fill every requirement. This is the secret of their wonderful popularity. They are persistent layers, make rapid growth and are invincible in the show-room. Of all months in the year, May is the best month to hatch out the winners. The weather is warm, vegetation springing up, fertility running high and the chicks make the rapid growth so necessary to produce champions.

I Guarantee a Good Hatch

Mrs. Eli Fowler, of Rochelle, Ill., writes as follows: "From the setting of eggs purchased from you last season I raised the First Prize and Color Special Cockerel at the Greater Chicago Show, 1918. He is a beautiful bird and the judge did not hesitate long in giving him the blue ribbon."

Eggs from Exhibition Matings, \$5 per 15; \$15 per 50; \$27 per 100.

Special Exhibition Matings, \$10 per 15; \$18 per 30; \$25 per 45; \$50 per 100.

Dorcas Trapedsted Matings, \$5 per 15; \$15 per 50; \$27 per 100.

Utility Flock Matings, \$12 per 100.

If you have not already received my mating list drop me a card and it will be immediately mailed to you. Very attractive matings. Will have some high grade breeding stock for sale after June 25th and will be pleased to quote on them if you will tell me just what you want. Address:

HAROLD TOMPKINS - **Box A** - **CONCORD, MASSACHUSETTS**

guided by your needs. Grow as many chicks as you can make produce best results and enough to supply the home table and take care of any local demand you may have. Keep the chicks growing, keep them comfortable, well fed and contented. Do not throw away grain feeding it to a flock of ill-kept wasters. If you cannot grow the chicks as they should be grown, better not attempt growing any.

So far as exhibition stock goes, June chicks often develop into prize winners. The June and July pullet or cockerel, if well cared for, often is in the very best condition for winter showing. Where shade and shelter is abundant, the care and management good, food wholesome and sufficient, hot weather need not retard the growth of young chicks.

The Coming Shows.

It is time now to consider the coming poultry shows of next fall and winter. The poultry exhibition has been called the "life of the poultry breeder's business." So it is to a very considerable extent.

Last show season a good many poultry exhibitions lost money and many dates were cancelled. If we really intend to "save the Standardbred poultry business" we cannot afford to have the poultry shows go into the discard as "non-essential."

Preparation of the exhibition bird continues thruout the growing season. We know that there are many good fanciers who are doing their utmost to produce some uncommonly good specimens for the coming exhibitions. The poultry show gives a very necessary stimulus to the breeding and growing of poultry, it creates and keeps alive the interest in well-bred fowl. For the good of the poultry industry and to help stimulate increased production of poultry and eggs for food purposes, as well as the maintenance and continuance of our best strains of Standardbred varieties, effort should be made to make the coming shows more successful than ever before. Fanciers and breeders cannot afford to slow down—they need the shows and the shows need their support.

President E. E. Richards of the American Poultry Association has suggested that we advocate that the shows held during the coming 1918-1919 season do not pay any cash for prizes except such cash as may be donated for the purpose. Let the shows offer good ribbon awards and, of course, such special prizes as they can secure. Use the entry fee money to pay expenses. Make the entry fee as low as consistent with the success of the show. A lower entry fee for many shows would greatly increase the number of entries and thereby increase the revenue. With no cash prizes to be paid out, the entry fees and gate receipts should insure ample funds to meet all expenses, eliminate the chance of the show losing money and avoid the necessity of members of the association having to go down into their pockets to make up a deficit.

We are pleased to be able to indorse this suggestion of President Richards; we recommend it to the attention of all poultry show managers. With no cash prizes to pay—and the cash prizes are not as great a drawing card as many believe—an entry fee of, say, one-third to one-half the usual charge when cash prizes are given, should result in greatly

What are You doing?

Did you buy a Liberty Bond and figure that would be about all for this year, or

Are You a Real Patriot?

If you are, you didn't stop there. You are listening to the appeal of your Government. You are raising all the poultry you can produce. No other meat is so quickly grown, and every pound you produce means more meat available for our fighting men. Every chicken you raise is a shot at the Kaiser. A dozen fresh eggs is equal to two pounds of meat. How the boys in the hospitals will relish those fresh eggs next fall and winter, if you start now! But they won't be able to get them unless we all pull together. You must start now, and the best way is to buy

increased entries and exhibits from many beginners and amateur fanciers. The more entries the greater the interest—and interest in Standardbred poultry should be encouraged by every legitimate means. Think this over, Mr. Show Manager. It may win success and renewed interest for your local show.

Keep the poultry shows alive; they are needed.

Baby Chicks by Parcel Post.

WHEN the International Baby Chick Association succeeded in prevailing upon the Post Office Department to give the shipment of baby chicks by parcel post a trial, there were many who expressed doubts concerning the outcome.

The parcel post shipment of baby chicks has been on trial now during the heaviest shipping months and it has made good. Express shipments, owing to congestion and breaking down of transportation systems, have not been as satisfactory as in times before the war. Express matter has been very slow in going thru, delays and holding up of shipments have been frequent and the handling of shipments has been even more careless than common, which seems wholly unnecessary.

We were talking recently with the owner of a big hatchery and he was

thoroughly disgusted with his express shipment experience, but enthusiastic in his praise of the parcel post as a carrier of baby chicks. He had had very few delays and almost no losses. The chicks had gone thru by mail safely and promptly. Several long distance shipments, one from Massachusetts to Michigan, had made the trip by parcel post in splendid condition without the loss of a chick.

The whole secret in successful parcel post shipment appears to be found in selection of strong chicks from the incubators, proper packing in suitable carrying boxes, delivery to the post office in time to make the earliest mail out that will make thru connections.

Several baby chick men have expressed themselves as highly pleased with parcel post shipments. Next season should see a greatly increased business of live chicks by post, direct from hatchery to the grower.

Parcel post has also proved a very desirable way to ship hatching eggs. Basket packed shipments make the journey in the best condition, with almost no breakage if properly packed. We have shipped a considerable number of eggs by parcel post this season, some quite long distances, and in each case safe arrival and a good hatch has been reported.

Dr. Woods' Notes and Comment

The man who by his labor gets
His bread, in independent state,
Who never begs, and seldom eats,
Himself can fix or change his fate.
—Matthew Prior.

Those who would eat next winter will do well to grow at least a part of the required food during the present growing season. Grow chickens, produce eggs, and raise vegetables that will keep thru the winter.

Keep the chickens growing. Allow as much range as is readily available. Provide shelters from sun and storm. Keep the growing chicks well fed, but do not feed so heavily that they lack keen appetites. Do not waste good grain. All good grain will be needed before another harvest. Keep fresh drinking water in clean fountains always before the chicks.

Watch your purchases of corn and corn meal. Do not stock up heavily at this season. 1917 corn was very soft and full of moisture, even kiln drying left a considerable amount of moisture in the grain. Corn will heat and spoil quickly at this season. The whole corn needs frequent turning over to prevent heating. It is best to buy or grind the corn meal in small quantities to be used up quickly. Do not buy or use lumpy and discolored corn meal.

Good green range is best for chicks. If they are confined in small bare runs, see that they are supplied with an abundance of green food. Sprouted oats are excellent food for growing chickens.

Hawks were never more numerous and troublesome than this season. The goshawks are the most pestiferous and are so clever that it is almost impossible to kill one of them. Foxes are also over-plentiful and in half a dozen years we have not had as much trouble with stray dogs. One dog broke thru the poultry yard fence and killed seven valuable breeding hens before he was discovered. We regret to say that he escaped, because no weapon was at hand to shoot him. We like dogs, but believe that dog owners should not be allowed to let them run at large to kill poultry and sheep, as well as do other serious damage.

Evidently Edward Brown, late of England and now of the U. S. Department of Agriculture, is going strong on the recommendation of back-yard poultry keeping in units of ten

hen flocks for every family. It is urged to let these birds range—presumably on the neighbors' property, and to "let the birds pick up the riches of the earth and also to thrive on the 'scraps' supplied by the 'most thrifty housekeepers.'" This is following the plan advocated overseas. We shall be interested to see how it works out over here. We heartily approve of back-lot flocks and more of them. But we doubt if the thrifty American housewife has many scraps to feed to poultry in these war times. We know that the scraps from our home kitchen would not keep three hens alive. As for letting back-lot flocks range to pick up a large part of their living, that may work among the cottagers of old England, but it would soon start a neighborhood riot in many sections of this country. On town or city lots, freedom given to foraging hens would be a great nuisance and cause much damage. In the country it is well enough to give the hens abundant range on the home farm, but to permit them to trespass on the neighbors' property—unless given permission—is liable to start a war between old friends and result in damage suits in the civil

Stop Hatching Weak Chicks

With Cheap Incubators

Remember, it is not how many you hatch that counts, but how many you raise. A Queen costs but little more, and the extra chicks that live and grow soon pay the difference.

Queen Incubators

Hatch Chicks That Live and Grow

Built of genuine California Redwood. Redwood does not absorb the odor from the hatching eggs. Cheaper woods, and pasteboard lining in iron and tin machines, retain the odors to weaken and kill the hatching chicks. The Queen is accurately regulated—taking care of temperature variation of 70 degrees without danger. Not cheap, but cheap in the long run. Catalog free. Queen Incubator Co. Lincoln, Nebr.

MORE EGGS—MORE MONEY

Need no oyster shells or other grit, better results, less cost. Fine for little chicks. Highest endorsements. Write for booklet.
W. A. NEUNITS & CO., St. Louis, Mo.

courts. Hens, which are perfectly well behaved at home, are liable to become the worst sort of nuisances when they trespass in the neighbor's garden. Altho we live on a 70-acre farm we have more or less trouble from such source. Our hens when on range take to the woods and seldom trouble the planted crops, altho they are encouraged to follow the plow and harrow when the land is being prepared for planting, but the neighbors' hens seem to take special delight in coming a long distance from home just to scratch up our seed, or gobble up the young sprouts. By all means keep hens and have a fair sized family flock to supply the home table with eggs and poultry—but keep the hens and chickens at home on your own land. * * *

We thought we were fairly well fixed and safe on the farm labor question, but the call of high wages was too much for our helper who has been with us four years. He struck for a raise in pay for a dollar more per day, and when we could not meet it he left for a more attractive field than farm labor. So we are now our own chore boy, farm hand, and pretty much the whole thing so far as farm labor goes. We're glad that there are only two cows to milk and that the size of the flocks has been cut down to meet war conditions, as we do not expect to hire any regular farm helper while war prices for labor prevail and farm produce does not sell for enough to yield production costs. We can appreciate the Boston Herald editor when he says:

"Our New England farms may yet develop the man who can pitch, load and rake after the cart single handed, and milk two cows at once. Are we to learn by experience how caw dwellers got along before domesticating cows?"

We expect to keep the farm going to the best of our ability, but will confine our operations to producing food for the family, and none for sale unless there happens to be a surplus. * * *

Feeding the chicks this season is quite a problem. Good grain and feeds are scarce and the supply is irregular. We have been grinding a little old corn, feed wheat and oats into a coarse meal—about equal parts of each—and mixing this with an equal bulk of corn grits and cut oats. Chick size charcoal is added in proportion of about a pint to 14 quarts of the mixed chick food. Have also been using a commercial laying mash from the start. This contains both fish meal and fine ground beef scrap. The chicks are all with brood hens and are doing very well on three feeds a day, one of mash and two of the grain mixture. Now that it is possible to give them a good grass run they should come along rapidly. * * *

Unless market conditions change very materially by the time this season's cockerels reach 3 to 4 pounds weight, we do not expect to mature any more males than we need for breeding. The cockerels will be eaten as they reach good table size or will be boned, cooked and canned for winter use. The best pullets will, of course, be matured for egg production next fall and winter. * * *

try, there is almost nothing doing in this line this season. Capons brought prices of from 35 cents to 45 cents per pound alive at the growers door, but some of the most successful growers report that this price did not yield cost of production and a balance sufficient to pay the grower's board. It takes about 64 pounds of grain and feed to produce an 8-pound capon. These highly finished, specially fattened birds have always been in great demand, and in normal times have usually brought about 50 cents per pound dressed at retail. Such soft roasters and capons were sold to wealthy families, clubs, fashionable hotels and like trade. This sort of trade is today practicing economy and thrift as if their very lives depended on it, although most of them are making big profits, greater than ever before, out of war conditions. The real economy in shutting down on the consumption of fancy new-laid eggs, high quality dressed poultry and other highly finished meat animals, does not appear when viewed thru the producer's eyes. It would seem that success in war is dependent upon success in the business of food production and that it would be wise to stimulate increased consumption of quality foods by those who can afford them. Certainly business must be kept going if we are to have funds to pay war time living expenses, meet our obligations, pay war taxes, buy bonds, and contribute our bit to the Red Cross and other necessary war funds. Crushing and smashing many lines of production, particularly the production of valuable foods, does not appear like real economy in a world that is crying for food. Of course it may be argued that the specialty farm product is a "luxury," but certainly it is a very useful and wholesome luxury and those whose earnings are large could well afford to buy this specially grown food, help the producers to get a living, and leave more of the cheaper foodstuffs for those who cannot afford to buy the higher priced "luxuries." However, it is the man in the limousine who makes the loud complaints about 14-cent milk and eggs at 70 cents per dozen—the man in overalls buys the best he can afford and seldom kicks about prices. The man who really works for a living is usually willing that other workers should get fair pay.

There is much talk about making each community self-supporting. Particularly in New England we are urged to do our utmost to produce more food and to endeavor to make ourselves independent of supplies from outside sources. In spite of this very little has been done in a practical way to encourage New England farmers and poultrymen. The poultrymen have been particularly hard hit. From his attitude at Chicago conference and more recent statements, it would seem that Mr. Priebe of the Food Administration believes that the Central West can supply all the eggs and poultry needed in the East, as well as supply the balance of the country's needs, and that it will not matter if the Eastern commercial poultryman is forced out of business. Transportation conditions considered and the heavy losses during distance shipments, we fail to see the economy of letting Eastern egg farms and market poultry plants go to smash. It looks like needless waste and very unwise policy to us. These specialty plants in New England, New York, New Jersey, Pennsylvania, Delaware, and Maryland, have furnished millions of dozens of eggs and thousands of tons of poultry meat. One carload of meat or eggs grown in the East ought to be worth to the consuming public as much as two carloads produced in the Central West and which must be shipped here when every car is needed for other purposes.

Of course the Central West and the great Southwest may be able to supply us with sufficient eggs and poultry. It may be true that less car space will be required to ship the finished product East than to supply grain and feeds, but the finished product is perishable and requires special cars and refrigeration. The loss from breakage, spoilage and delays in shipments of eggs and meat are considerable. In normal times the loss of eggs from breakage and spoilage during transportation amounts to over \$45,000,000 per year. This would be increased under war transportation conditions. Already much spoiled and stale meat is coming into Eastern markets and the summer has not begun.

The smashing and elimination of the independent Eastern poultryman would, of course, do away with a great deal of competition now experienced by the big packing interests and would give a free field to the storage packed product. Even so, we expect Easterners to wake up to what such control of the eggs and poultry market may mean to them. Western grown poultry and eggs may be cheaper as long as there is sufficient competition from Eastern grown, nearby, poultry produce, but what will happen if the independent poultryman in the East is crowded out of business? We believe that every effort should be made to

Make your chicks grow rapidly; keep them healthy and strong by feeding

"Cornell Brand" Buttermilk Growing Feed

The wonderful health and growth promoting properties of BUTTERMILK can now be had in the proper proportions by feeding "Cornell Brand" Buttermilk Growing Feed. It lessens mortality, prevents white diarrhoea and other diseases and makes chicks grow and increase in weight rapidly.

encourage the egg farms and market poultry plants of the North Atlantic states. More food should be grown in the East and the public should give its support to the nearby product by paying a higher price for it.

In normal times New England does not produce more than 25 percent of the food consumed by her population. With the greatly increased population, more soldiers, more sailors, ship builders, and workers of all kinds, much more food will be needed, and, even if Eastern farms do their utmost this season, we are not likely to produce much more than the 25 percent of food required. Every branch of food production here should receive encouragement and support. More grain will be grown here this season, more sheep, more hogs, and more cattle probably, but poultry production is very far below normal. High cost of feeds, scarcity and high cost of labor, and comparatively low selling price of the produce all contribute to limit Eastern production. Even under the most favorable conditions it would be difficult to bring about greatly increased production—since old farms cannot be made over in one season. Here in the East we are going to be obliged to import from the West, or somewhere else, fully 75 percent of what we need to eat during the coming twelve months. We are going to have exceedingly congested transportation owing to greatly increased shipments of food and supplies into this section to be loaded on ships and sent overseas. The sooner we wake up to the situation the better. No one looks for famine conditions thruout the United States, there will be an abundance of food in parts of the great food producing section of the country, but the East may easily feel the "belly pinch" by next winter unless we do our utmost now to prevent it. Plenty of food 500 to 1,000 miles away will not help the man who cannot get it and who is confronted with a local shortage. Everybody with a bit of land should do what he can to produce food to supply the family. A family flock of hens will help. Those who cannot keep hens should contract with nearby commercial poultrymen for a regular supply.

Potatoes are so cheap and plentiful this spring that they are being freely fed to poultry. The grower cannot get a price for his potatoes that will cover cost of production. This is quite a difference from last season when potatoes were selling at from \$3.75 to \$4 per bushel and hard to get at the price.

New Southern potatoes are coming on the market. The city commission man will not pay enough for old potatoes to pay for hauling and shipping them, yet the city consumer is paying at the rate of about \$1.50 per bushel. Also the small country stores are getting their supplies of potatoes for their retail trade from city commission dealers, having them shipped back into the country rather than buy of local producers who have their cellars full. "Coals to Newcastle" seems to be the regular way of doing business in food distribution.

Potatoes are good food for poultry young and old. We boil them and then mash them up in the water they were boiled in. This is thickened into a stiff mash with either middlings or a good mash mixture. The layers will stand four or five good feeds a week of this potato mash and it helps to cut down the feed bills. Potatoes are also fed to the cows several times a week. In some sections potato evaporating plants have been established and we need more of them. The United States probably wastes more good food than it consumes, chiefly because of poor distribution and the fact that the grower does not get a square deal and a fair price.

With us this season fertility has been excellent and we have had fine hatches. We have sold some hens with broods of chicks and for ourselves are rearing fair sized broods with less than a dozen mother hens. It is the first season in many years that the incubators and brooders have been idle on our farm. We find many of our friends doing the same thing—rearing a few broods to supply the home and to keep up the breeding stock. Labor and feed conditions are such with us that it is not good judgment to undertake much work. We cannot hire labor at a price we can afford to pay. If one does get a man, he is likely to leave suddenly on the first opportunity to get more pay and shorter hours. Grain and feed continues high and may go higher. Shortages are frequent and supplies uncertain. There have been periods of what amount to feed famine, and may be others before the new crop. The selling price of the produce is altogether too low in proportion to the cost of production. Under such conditions, unless a man has abundant capital and can stand heavy losses, it is most unwise to go into production heavily this season.

It is not "a patriotic duty" to go broke or bankrupt. Financial loss to the individual producer is an economic loss to the nation, and it is the patriotic duty of every citizen, as well

as good business sense, to so conduct his business that he does not become financially embarrassed. There have been the same old promises of good markets and profitable prices and "consideration for the producer" at the beginning of this growing season as we had last year. Under normal conditions we would look for reasonably profitable prices next fall, but conditions are far from normal. Supply and demand no longer govern the market. Those who put whole-hearted effort into increasing production last season, were, most of them, badly stung in a market where prices were against the producer and below production costs. "The burnt child dreads the fire." "A man may be stung once and not be to blame, but if he is stung twice by the same game, it is his own fault." These quotations are heard very frequently and on all sides. Food is needed. Efficient food producers are needed. But the promised "fair and just profits" are also needed to encourage production. Every man who goes broke or who loses heavily in any branch of food production, hurts the business of producing food and makes our food just that much more difficult to secure. We believe that better times are coming, that conditions will mend, but we fear that the consuming public has a bitter lesson to learn first.

A number of poultry keepers have reported chicks blind from gummy eyelids. We do not believe that this is anything very serious. Such cases as we have seen seem to be due to irritation from dust or a mild contagious form of conjunctivitis. Most of them yield to simply opening the gummy lids. Some few cases may call for washing the eyes with a solution of boric acid, half a teaspoonful, in eight ounces of water. Water should be boiled first and then used luke warm.

Lice and mites are breeding rapidly now. Small chicks with hens should be treated by using a drop of oil on head, under throat, under wings and about the vent. The mother hen may be treated by dusting with lice powder or flowers of sulphur. Mercurial ointment (blue butter) one part with two parts of petrolatum, thoroly mixed, may be used to grease the hen about the head, under the wings and about the vent. Use only a very little and do not rub it in. A bit of ointment about the size of an ordinary garden pea is sufficient for the application to one hen.

To get rid of mites about the roosts and in cracks and crevices of coops and nest boxes, there is nothing better than a pound of naphthalene (crude flakes) dissolved in kerosene. Apply it with a sprayer or paint brush. Let roosts and coops dry before the birds use them, kerosene will blister the bird's skin if plumage becomes wet with it.

Keep a careful cost account with your poultry this season. Count all costs. Keep a record of cost of all feed and supplies, the value of your labor (whether paid or not), losses from mortality or from any cause, depreciation on buildings and fences, cost of repairs, cost of water supply, interest on total investment and capital used in business, cost of marketing the produce, taxes or rental in its due proportion. In short, keep track of all expenses and learn just what your poultry and eggs cost to produce. Keep an account of all eggs and poultry sold at actual prices received, credit for home supplies at wholesale prices for marketable produce, for unmarketable produce make a proportionately lower figure. Do not estimate receipts and do not figure anything you produce as worth more than you could sell it for in the open market. We would like to have a report of how your accounts balance at the end of the year.

We have had three consecutive wet seasons in this part of the country, and everything now points to a dry season following the severe winter. We seldom go more than three growing seasons without experiencing a severe drouth. When we get a drouth here it burns everything up. At present writing there is every indication of drouth, the grass is coming on very slowly, we had heavy rains in April before the frost was all out of the ground, but only threatening clouds and very light showers since. Unless we get rain soon there will be a very light June hay crop and perhaps none at all in many sections. We would feel a lot more comfortable if we could get our barn filled with hay, but hay and fodder here is now scarce and high, altho overplentiful last summer. Transportation has been in such bad shape that the usual shipments of hay have not come to us and the local supplies have been pretty well used up.

Everlay Brown Leghorns
Eggs half price. Special bargains in stock. America's greatest winning-laying strain.
H. V. TORMOHLN Box 2 PORTLAND, IND.

THE winter of 1917-18 was a test one in this section of the country. The full extent of the damage done to trees, vines and bushes is now plain. All our Gravenstein apple trees were killed. Winter Banana were severely injured. The Royal Purple raspberry bushes were killed to the ground. The Cumberland raspberry bushes were injured a trifle. The Gold, Endicott and America plums were nearly ruined. The Niagara grape vines which were not covered were injured considerably. The Lincoln pear trees came thru without one bit of injury. I now believe it is safe to plant the Lincoln commercially in this section. Surely every home yard should have two or more of these trees. It is not affected by the blight which attacks other pear trees.

* * *

The season has been a backward one, but everything in the garden and orchard is in good condition. At this writing, April 28, our potatoes are showing above ground, while the peas, onions, and other early, hardy garden plants are all up. I look for a very dry season, and have made some preparations and will further prepare for a very severe drouth.

* * *

R. H. Hoffman, Wisconsin, kindly writes:

We enjoy your articles in the American Poultry Journal very much. They have helped us greatly in our work and we hope you will continue to contribute.

* * *

I would like your opinion of Harford County, Maryland, as a location for growing apples and other fruits. Land seems to be very cheap thru that part of the country. Is there anything wrong with it?

C. C. Jones.

Land which has proper air drainage is suitable for the production of apples and other fruits. The soil is not very heavy, but is easily worked and under proper management produces big crops of all farm grains, grasses, etc.

* * *

A few years ago we planted 100 black currant bushes. At the time we had some doubt as to the advisability of so doing. To our surprise the demand has been greater than the supply. We have a foreign population here and they take these currants at a big price.

* * *

Having read in American Poultry Journal that you wanted one potato of each variety for planting in your trial grounds, I am sending you one medium size potato of an extra early variety. It is a new kind, but the name is unknown. It has proved a very heavy yielder for me, so I hope you will give this sample a trial. I am sorry to have no larger potato here to send you, as my seed potatoes are stored in a winter cellar. Of four varieties planted last year, this kind made two and one-half times as many as the Early Rose, three times as many as a white potato I had, and five times as many as the Rapid Transit on the same amount of ground. I enjoy your department and am glad to send you this potato.

Illinois.
Ben H. Rowland.
I have planted this potato and it will have the best of care. Have also received seed potatoes from Mrs. E. T. Harris, Michigan; W. H. Simonson,

Long Island, New York; A. C. Redd, Minnesota; Paul Winters, Pennsylvania, and Mrs. P. H. McGregor, New Hampshire. These have all been planted in my test grounds. I shall report as to yield, etc., of these different varieties in the fall.

* * *

I take the liberty to ask you to help me solve the question of location for poultry and beekeeping, for which I have been preparing myself for some time. Am a draftsman, 52 years old, my wife has poor health. On account of nervous stomach trouble, I have to change my occupation from indoor to outdoor work and am thinking of going where there is a milder climate, but not too warm. I have been collecting and filing your various recommendations of the American Poultry Journal and have to go back to October, 1917, page 995, where you mention Albermarle and Bedford Counties and Richmond, Va., as good locations for poultry and small fruit. Which places would you recommend for my undertaking, keeping the market possibilities in

 No matter what you may need in the line of poultry
 supplies we have it. The items listed above are only
 a few of the several hundred articles described in
 our catalog. Our prices are low and we guarantee every-
 thing to give complete satisfaction. If you order any-
 thing that is not just what you want you can return
 it at our expense and get your money back. We ship
 C. O. D. if desired. Send for the catalog now—you
 are sure to need some of the articles described.

GEORGE B. FERRIS
 605 Shirley St., Grand Rapids, Mich.

view, and I will go down there and look the ground over. People from the southern part of Alabama, Baldwin County, have been after me, but I do not know how that would be for poultry. Do you know anything about that section of the country? I have saved enough so that with just a little income or a reduction in the cost of living, I could manage to get along nicely. I am thinking of first renting an improved 4 or 5-acre place with option of buying. Any information you can give me, or any suggestion of any other location, will be highly appreciated. We can go anywhere and are willing to work in order to make it go. Ohio. Chas. Quast.

I think you will find it not at all difficult to pick out a spot in Virginia where bee keeping and poultry raising can be made profitable and where the climate is mild and very healthful and pleasant. Bedford County is more of a farming and fruit section than anything else. Albermarle County would, it seems to me, be better for your purpose. But why do you not figure on buying either an orchard or orchard land? Fruit growing and honey production go hand in hand. When you have an orchard and bees, the bees are doing double duty—producing honey and polonizing the fruit tree blooms. I advise you to write to F. H. La Baume, of the N. & W. R. R., Roanoke, Va., and to Chas. S. Chase, of the Southern Railroad, Washington, D. C. These railroad companies have no land for sale. They maintain a department for the express purpose of aiding people who wish to locate, as you do. You can depend upon them to give you valuable assistance. You can rely upon them wholly. I know nothing of Baldwin County, Alabama, personally. It is being boomed by land men—and I don't like that.

I sent you by parcel post three potatoes, one each of Burpee's Extra Early, Vermont Gold Coin and Farmer, each of which is the best in its class of any we have raised. All are very excellent table quality. Farmer keeps growing for a long time, is always solid, with never any hollow in the largest tubers. Last season we raised 50 bushels in an old garden, with hen manure for fertilizer, and many of them weighed 1 1/2 pounds each. All were fine grained, dry, and mealy and I am sure we never enjoyed our potatoes so much as we have this past winter. I started with them about six years ago, purchasing one tuber from John Lewis Childs, Floral Park, N. Y. By the time we were ready to plant, there were several stocky sprouts on the potato. I took eight of them and set in the ground with the top just out of the dirt. Seven of them grew, from which I raised 11 pounds of potatoes. I cut the potato with one eye on a piece after removing the sprouts, but did not weigh the potatoes raised from them. I am glad to pass these on to some one who is interested in good potatoes, and while I am writing I wish to express my appreciation for your good articles in American Poultry Journal. I am raising S. L. Wyandottes. Michigan. Mrs. Elmer T. Harris.

I was so interested in Mrs. Harris' yield of potatoes from the planted sprouts that I asked her to tell our readers all about it, how she planted these sprouts, etc. Her reply will, I am sure, be of much interest to many of our people who are fortunate enough to have a garden. Mrs. Harris writes:

Five or six years ago, I sent each a piece of potato of a new variety for trial, and at planting time there were on this potato several sprouts which we commonly throw away. I broke them off as usual, and laid them down while I cut up the potato, with one eye on a piece and planted them. As I broke off the sprouts, I noticed that some of them had tiny roots starting close to the potato and as I worked I thought why would not those sprouts grow? So I picked them up, selected eight healthy looking ones, some with roots, and some without, and set them in the dirt, the same as one would set out any kind of a plant, root end down, with the top just above the ground. Seven of the eight grew, and in the fall I had just as nice potatoes from them as from the pieces of potato. I weighed them and had

But he gathered 188 eggs!

LISTEN!
 —6 snow storms.
 —15 days below zero.
 —0 days above freezing.
 —only a few days of sunshine.

IN JANUARY!

Here is the letter in full from a friend of mine—who became such AFTER his experience with my Anconas. Can you blame him? What he did YOU may do—perhaps this winter.

"From the Ancona Chicks I purchased from you last July 17 (note that these were late summer chicks), I got 15 pullets and have never raised a snapper bunch. These pullets laid their first egg on December 2 at 4 1/2 months old. During last month (January) I got 188 eggs. This is remarkable considering that during January we had six heavy snow storms, fifteen days of below zero, not one day above freezing, with only about ten or twelve days of sunshine."

Friend reader—

eleven pounds of potatoes raised from the seven sprouts.

This made a nice addition to the amount of seed of this variety for the next year, and having found the experiment to work so satisfactorily, I have continued with other varieties the same way.

You may think this is queer work for a woman to do. I want to tell you it is more interesting than picking out new patterns of crochet, and better recreation than going to a picnic at a lake, altho I enjoy all these things. For three years past we have had our first new potatoes for the table from sprouts of early varieties. They mature about ten days ahead of the potatoes raised from the potato pieces which were cut and planted at the same time. The reason for this, as I understand it, is that the sprout grows to be the potato top, which has already a good start, little roots start immediately (some being already started at planting time) and little potatoes soon begin to "set" on them, while the piece of potato placed in the ground must lie there some time before a new sprout will grow to the size the original sprout was at planting time.

There are several questions that interested persons might ask, which I will try to answer. The soil must be moist or the sprouts will wither and die. Length of sprouts? Anything from an inch to a foot long will grow. Last year we had a lot of sturdy sprouts on our early potatoes at the time we cut them for seed. The men made furrows the same as for dropping potatoes, and laid the sprouts at one side of the trench (same depth as for potatoes) allowing top to lean against the side of trench and stick up any height it might be, then after dropping them all, they filled in the trench with a hoe, pulling the dirt from the opposite side from where the sprouts were placed.

We had four rows across our garden, which furnished a family of seven all the potatoes we used for two weeks previous to those raised from potatoes. When seed potatoes are scarce and high in price, as they were last year, it is quite a saving, as well as having them ready earlier.

Can sprouts be kept after taking them from the potatoes? They may be placed in a box of earth in a cellar if kept cool and moist, or can be "healed in" in the garden for a week.

The planting of them in large quantities would be quite tedious, but it pays when you have a choice variety which you have purchased at a high price and wish to get all you can from them.

Michigan. Mrs. Elmer T. Harris.

* * *

Last fall I planted some onion sets. Planted them very late, covered them with straw. This spring the straw was in part removed. We will have young onions in a few days—a long way ahead of the sets, which were spring planted.

* * *

I have bought a 20-acre farm, 7 acres set to fruit, apples, peaches, pears, plums and cherries. The trees came from Stark Bros. nurseries and seem to have been pretty well cared for. They are now about ten to twelve years old. The orchard is set to blue grass and I cannot decide if this is proper. Should the ground be plowed up and the soil kept mulched? The trees are planted 20 ft. apart each way. I was told by a stranger the other day, who said he had worked twelve years in the orchards of Michigan, that we Hoosiers do not know how to trim our trees, that we could grow fine wood, but we do not know how to trim for fruit. His words set me to thinking. What about this trimming for fruit? Can you tell me anything about it? If plowing the orchard would be a benefit, would you advise sowing crops of green food for my poultry in the soil or would you continue to cultivate thruout the summer? I would like to run my poultry in the orchard to give them the benefit of its shade. I expect to plant five acres in young trees. What varieties would you recommend for this locality? Would you suggest all apples or would you set other kinds of fruit trees as fillers? Would you plant strawberries and other small fruits between the rows of young trees? Would it keep the soil too loose for the young trees if I should cultivate the small fruit frequently thruout the summer?

What varieties of blackberries, raspberries, currants and gooseberries would you advise me to plant here? Is there any way to make plums stay on the trees until ripe? I am told the plums in this orchard dry off before they are ripe. These trees have always been given the lime-sulphur dormant spray in the month of March and arsenate of lead in May and again in June.

Is strong salt water good to spray pear trees with, to prevent blight? When would you use it? I am getting behind this proposi-

TO PREVENT BABY CHICK LOSSES

Lee's Germozone
For Colds, Roup, Cholera, Sore-Head, Bowel Complaint, etc.)

Lee's Lice Killer
Best Destroyer of Lice and Mites

If you have used Egg-o-Hatch you have already saved the loss generally caused by "chicks too weak to break through the shell," and now the right thing for you to do is to keep the healthy, well-hatched little things from being sick. Go to your dealer and ask him for that wonderful little booklet, "Care of Baby Chicks." It contains facts and pointers that will save you from loss and discouragement in your chick raising work right through the season. No theoretical "bunk" in this booklet, but "straight from the shoulder" proven facts.

If your dealer is out of Lee Booklets or if there happens to be no Lee Dealer in your town, write to us direct, telling us your dealer's name, and we will mail you this valuable "Baby Chick Book" by return mail—free.

tion with all I am worth and looking forward to the time when I can say good-by to the old railroad and get out where people live and enjoy life.
 Indiana. Omer Imes.

If the whole orchard is planted as one block it is evident from what you say that the proper management has not been followed. For instance, peach trees should never be allowed to stand in sod. The peach orchard should be given thoro cultivation each season, until about the middle of July, when a cover crop should be sown, this to be plowed under each spring. If the apple trees have made good growth they will now stand too close together and every other tree should be cut out. The apple will stand a sod if the grass is cut each season and piled about the base of each tree. Never remove the grass from an apple orchard in sod. You will get far better returns financially from the grass by piling it around the trees than you will to sell it as hay or feed it. This is true of a pear orchard too. Pear trees can stand 20 ft. apart, but it is a little too close.

The plums and cherries will stand sod if an open space well mulched is given each tree. In regard to pruning fruit trees, I cannot tell you on paper how to do this. Each tree is a problem in itself. As a general rule, shape the tree when set, and each season trim the tree, removing any unnecessary wood. It's all told in those few words, but it really conveys little idea to the reader. If I could be with you in your orchard a little while I could make it all clear to you.

Now as to plowing this orchard which has been set 12 years. You must be careful not to plow too deep. If you do you will injure the trees' roots, which will be near the surface. I would plow the part set to apples and peaches and treat it as above. Would leave the part set to cherries and pears unplowed and use the grass cut as a mulch for the trees.

I advise you to have one of the experts from your state college come and inspect your orchard and advise you. Do not fail to do this.

I would not intercrop the apple and peach orchard. If the trees have made the growth they should have made there will be no benefit to the trees in intercropping. Then, too, the ground will be so shaded as to be of little worth in growing any crop.

As to the new five-acre orchard you will set out, I advise you to plant all to apples. Plant Delicious and Stayman or Delicious and Jonathan, making two rows of Delicious and one row of the other variety. Set trees 30 ft. apart in straight rows.

You can intercrop this five-acre orchard. One way to handle it would be to plant strawberries, currants and gooseberries in the center of the rows, leaving open space of several feet on each side of the trees. Cultivate the whole thoro. Sow a cover crop in the open space between the trees and the small fruit about July 15. This cultivation will cause the young trees to make good growth. Another way, and one I like better, would be to raise corn in the young orchard, seeding down at the time specified in the other plan. However, either of these plans are all right, if you will bear in mind all the time that the growth of the apple trees is of the first and most importance.

999 QUESTIONS AND ANSWERS

124 pages. No matter what question arises, this book gives the answer in a few words. Questions for the fancier about feeding, correct rearing of chicks, what and how to build, diseases, incubation, breeding turkeys, ducks, geese, etc. Paper, 50c; cloth, 75c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

As to the varieties of small fruits. Plant Snyder and Mersereau blackberries, Royal Purple and Cumberland raspberries, Red Cross and Diploma currants and Oregon Champion gooseberries.

I have never had any trouble with plums falling from the trees. Cannot understand your trees thus dropping the fruit. It may be the bloom is not properly fertilized.

Do not spray pear trees (or any others) with salt water. Salt water has no effect on the blight. Pear blight is a hard thing to combat. The best way is to cut out all blighted parts below the damaged wood and to paint the wound with crude kerosene oil. I have found that spraying with sulfocide is a help in fighting blight. I have cut out all pear trees but Lincoln and Seckle. Lincoln has not blighted on my place in 20 years. Seckle is very free from blight and what little does show up can be controlled by pruning.

* * *

I have been a reader of your writings for a number of years and greatly enjoyed them. I used to live in Iowa, near Sioux City, but since our baby's and my wife's health is not as it should be, I brought them to Colorado and have been here over three years.

Now I am not a rich man, but a poor one, and would like to buy some land in Virginia. I want to raise fruit, poultry and cattle. I am now engaged as a herdsman on a large ranch, but it is impossible for me to buy land around here, as it runs from \$150 to \$250 per acre.

As you have helped so many others, perhaps you can help me, as I do not want to lose what little money I have saved by scratching and pinching wherever and whenever we could.

Where could I buy about 100 acres of land reasonably? I want to buy as cheap as possible and to steer clear of land sharks. I want to locate where the water is pure and think you know this country as well as any one does.

Colorado. Thos. E. Hiesley.

I advise you to look over Arkansas, Virginia and North Carolina. In those sections you can find good farm land, good grazing land and good fruit land. You can have there a supply of pure, soft water. The climate is mild and healthful and land is comparatively cheap.

* * *

Up until 1910 I worked as telegraph operator for about twelve years, when I came in here on a farm with my mother and have been farming since that time. My mother and I both are sufferers from catarrh and I want to move to a climate more favorable than this for those afflicted with this loathsome disease. My idea is to try Florida, and knowing you are familiar with conditions there I would like to have your opinion of land, climate, etc., around Fruitland; also around Lakeland.

I would not want over 15 or 20 acres of land and thought of having a poultry and fruit farm combined. Will not have over \$5,000 in cash, but thought I would get a place near some good town and secure a position with the railroad people, or maybe with one of the commercial companies — Western Union or Postal — and hold this until I could get the farm developed to where we could expect a living from it. I worked for the Western Union for two winters in their main office in Jacksonville, Fla., but I didn't have any op-

CONSERVATION SCRATCH

Keeps Chickens Fit to Do Their Bit

CONSERVATION Scratch is solving the wartime problem of maximum production at minimum feeding cost for thousands of successful poultry raisers.

It conserves the wheat, stimulates egg production and keeps fowls fine and fit. It is economical, reliable, profitable. Conservation Scratch has made good. Made good in a big way because it fills the demand for a high quality scratch feed that saves the wheat and does the work. It is a scientifically selected combination of clean grains which analyze high in food value and supply the essential proportions of protein, fat and fibre that a perfectly balanced poultry ration requires.

Krause Feeds for Poultry Needs

There's a Krause feed for every need of your flock. Profit by the experience of thousands of successful poultry raisers by putting your pens on Krause Feeds. You will get big returns and insure the health of your stock. Order Conservation Scratch — Conservation Chick and Developer Feeds — Krause Mash from your dealer now. If he cannot supply you immediately, write us. Send at once for free sample of Conservation Scratch and other Krause feeds.

portunity to see any of the country except from car windows.

I have always loved poultry and kept a few of my favorites—the Barred Rocks. My desire is to sell breeding stock, eggs for hatching and day-old chicks. What do you think of this branch of the business in Florida? What about the labor proposition in Central Florida?

The real estate people at the places I have named and with whom I've been corresponding boost the grape fruit. What do you think of this? I shall greatly appreciate any information which you can give me.

Mississippi. C. K. Stewart.

I know a man who was so badly affected with catarrh that he could not live here. He removed to Hammond, La., in the pine woods and was cured. That is, the disease did not trouble him at all there. He engaged in the small fruit and poultry business and prospered. You might investigate that part of the state.

I will try to answer your questions in order of asking.

I advise you not to go into the poultry business in Florida.

You can secure all needed labor at fair rates in Florida. The negroes do most of the work down there.

The soil around Fruitland and Lakeland is suited to citrus fruit production. Of course you must not expect to be free from frost, but you will be reasonably secure in this respect. I think a grape fruit grove in Florida, properly managed, a good thing to own. Florida produces the best grape fruit in the United States. The experienced growers there are making money. The climate is good in the section you mention.

You will be doing the right thing if you go down there and quietly look over the situation. Keep away from the land agents. Do not let it be known that you want to buy land, until you learn all all about conditions. And for the sake of your family and yourself do not let it be known to the land agents that you have \$5,000.

* * *

I have letters for Mr. Gust Soder, Kentucky, and Mrs. Miles Call, Arkansas. Have lost addresses of these people. Will forward letters if they will send me their addresses.

* * *

I have read with pleasure your answer to my letter in the March issue and believe I can read between the lines that you advise anyone making a change to look over S. W. Virginia. I would like to have you suggest some county in that section that I may go and look it over. Where you know they have blue grass pastures and the health conditions are good. I want to go and look that part of the state over in a few weeks. If you know any section that you think has a future in the way of increased farm values, would like to have you suggest it.

Maryland. J. E. Moore.

Advise you to look over the Piedmont and Valley of Virginia sections of the state. You will surely find conditions to your liking. All that section is increasing in value rapidly.

* * *

I have a long and interesting letter from Thos. E. Winslow, Australia, in which he says he will comply with my request and give me a letter for this department, on fruit growing and gardening in his country. I am sure our readers will enjoy this letter.

* * *

This month, spray the currant and gooseberry bushes with arsenate of lead to kill the currant worms.

plum trees planted many years ago that were quite good in their day. They have had no care at all and are now quite small. I have also some poultry. The poultry house is built right on the sloping bank and I would like to plant some other plum trees in the yards. What varieties would you recommend? Would such apples as the Delicious, Golden Delicious, Stayman's Winesap, Jonathan and Grimes' Golden do well in this soil and locality? I have not seen a cherry tree about here and I do so like cherries. Do you think they would grow and what varieties would do best?

My idea is to have some well paying White Wyandottes, some good fruit trees, berry bushes and a garden. I have some few bushes of currants, gooseberries, raspberries, both kinds, blackberries and grapes, but want to get more of all these. What kinds are best for growth in this sand? The sand in the ground where I plan to put the berries is black, has had some cultivation. But where I want to plant the trees it is yellow sand. Of course I can get a lot of barnyard manure for fertilizer.

Wisconsin. Reo Henry Hartwig.

I would not hesitate to plant apple, cherry and plum trees in the sandy soil of which you write. Of course, would not plant a large commercial orchard of apples, but for home use would not hesitate. The soil ought to be extra good for small fruit, especially raspberries, grapes, etc. The varieties of apples you name are all good and I would plant them were I in your place. Add to your list the Wealthy. Would plant Montmorency cherry, with a few early Richmond. I recommend the following varieties of small fruits:

Grapes: Concord, Worden, Niagara, Moore's Early.

Raspberry: Royal Purple, Plum Farmer, Cumberland.

Currant: Red Cross, Diploma.

Gooseberry: Oregon Champion.

Plums: Surprise, Wyant, Stoddard and Omaha.

Of course you will have to use barnyard manure liberally on this light soil.

My Opportunity to Help Win.

"As long as men go to the front at the risk of being shot," writes Lloyd H. Nelson, a New Jersey farmer, in a letter to the U. S. Food Administration, "it is clearly my duty to risk all I possess. It is my duty to take a full risk in planting as many extra acres as my means will permit. This I am doing in 1918.

"Having leased two extra farms, I propose making this year the supreme effort of my life. If I make a good profit, it will be fully earned. If I but make expenses and produce four times as much food as last year, it will be my opportunity to give strength—to give courage to help win. I am planning to farm to the extreme limit.

"One city man last year spent his half holidays helping a farmer—taking his pay in supplies, such as potatoes, vegetables and fruits. This plan combines recreation with production and should prove a popular form of war work."

We Make

- Runways
- Trap Nests
- Brood Coops
- Colony Coops
- Setting Coops
- Portable Henneries
- Fireless Brooders
- Exhibition Coops
- Fattening Crates
- Portable Fences

Here is the Feeder and the Fountain

for which every poultryman has been looking. It combines all the good qualities of the ordinary Mason jar fountain and feeder with the good qualities of the best baby chick feeders on the market. The bottom of the feed pan slopes from the center to the edges, thereby insuring a free flow of feed from the jar to the edge of the pan, where the chicks can reach it thru the openings. The small openings prevent dirt from getting into the pan—prevent the chicks from getting into the feed or water and prevent them from crowding too close around the feeder, thereby giving the weaker chicks an equal chance with the stronger ones. This overcomes every objection to the ordinary open pan Mason jar feeder and fountain. It fits any Mason jar.

3 for 50c

The top of the pan can be removed in a second to clean or fill. It is the most inexpensive, most practical and most sanitary feeding and watering device on the market and is fully covered by U. S. Letters of patent. If ordered from this ad we will send them postpaid to any address in the United States. **SIMPLEX SUPPLY HOUSE** 1300 Pontiac Bldg. CHICAGO, ILLINOIS. Send for our complete Catalog of Poultry Supplies and find out about our marvelous Feather Brooders; also Automatic Grain Feeders and Non-Freezing Water Fountains.

Makes 'Em Turn up Their Toes Mighty Quick

There isn't a ghost of a show for lice and mites on hens, chicks or nests after a dust with the old reliable Lambert's Death to Lice. It knocks 'em stiff in a jiff. As one of the big successful poultrymen wrote us, "It is impossible to get along without your louse killer," so it is with every user. There's nothing so efficient.

Don't Experiment

Follow the example of the leaders—ask any successful poultryman which lice killer has been the standard for 30 years—which is acknowledged BEST. He will tell you to

Get **Lambert's**
OLD RELIABLE
DEATH TO LICE

because he has found it **always** the **BEST**.

Don't expect to make your hens pay and permit lice to worry and annoy them. The lice will get the profit and often the hens and chicks, too. A few cents invested in Death to Lice will bring dollars in profit. Just the thing for layers, sitters, and exhibition stock. Will not injure eggs, chicks or hens or soil plumage. Get a 5 oz., 10c box at dealers to try (or send to us direct if he can't supply you). Other sizes 25c, 50c and \$1.00. Lambert's Latest copy of "POCKET BOOK OF POINTERS," a valuable book for poultry raisers. Mailed for 2c stamp.

KLEIN-LAMBERT CO.
601 TRADERS BLDG. CHICAGO

Selecting a Variety.

THE first requirement in choosing a variety of poultry, according to my way of thinking, is that they are profit winners. I wished to cast my lot with a breed that would bring in the most dollars in return for what was spent on them, while at the same time proving a source of pride and pleasure in their ownership. I decided that a white bird of good size and well proportioned could not be excelled for beauty. The contrast produced by the snow-like whiteness of the plumage with the green background of the lawn and range was one to attract the attention of all passers-by.

From the standpoint of the fancy, the White Wyandottes are everywhere greatly admired. Their massive, blocky, well set-up form finds favor in the show room wherever shown. Their pure white plumage with yellow legs, blood red wattles, lobes and comb form a very pleasing contrast. There are no sharp angles to be found in this variety. It is strictly a bird of curves. Picture to yourself the graceful curve of the back, the broad saddle, full hackle, and deep well-rounded breast. Then form your own conclusions.

We all like to get lots of eggs and get them during the winter months when prices are up. That at least is my desire. The Wyandotte, owing to their abundant feathering and neat,

the chicks from these eggs. No record was kept of these pullets, but they laid so well that we again procured eggs for hatching of the same variety. The following fall we kept ten pullets and a cockerel. This flock from December 1, 1916, to December 1, 1917, laid 1,538 eggs, which eggs sold or eaten at the market price amounted to \$50.05. The chickens amounted in cash to \$17.60 or a total of \$67.65. The feed cost of these birds amounted to \$66, which only left us a gain of \$1.65 for the year, which seems a small amount above feed cost, but buying grain in small lots in these days of high priced grain is expensive. We are paying \$4.50 per 100 lbs. for corn; \$4.75 for wheat; \$3.50 for oats; bran and mash, \$2.50 to \$3.50; straw, 50c a bale and beef scrap 5c per pound.

In 1917, we purchased several sittings of eggs from first-class breeders and raised 41 chicks and culled them down to 10 pullets and a cockerel. Six of these pullets were hatched May 20 and four of them were hatched June 20, 1917. We received the first pullet's egg December 18.

We find the Reds practical utility fowls, quiet in disposition, yet active about the coop and yard. They are perfectly at home in confinement and contented with their quarters. They do not seem to get overfat and are easily broken up when broody. We place them in a small coop for two or three days and feed

A view of one of the colony fields on the farm of the Co-Operative Breeding and Hatching Co., Box 16, Tiro, Ohio.

low, rose combs are well adapted to withstand severe winter weather. The temperature hovering around zero seemingly has no ill effect on them, for they keep right on doing business at the old stand. They stand confinement well, are not nervous or easily frightened. A four-foot fence is sufficient to keep them confined and in many cases three-foot fences have served the purpose.

White Wyandottes are not heavy eaters, altho of a heavy variety. As layers, the Wyandottes hold their own with any breed and in many cases come out on top. As a market fowl they are especially valuable. They are ready to be dressed for the table at any stage of growth, being always well filled out and the flesh tender and delicious. The yellow skin and legs are appreciated by careful buyers and there are no dark unsightly pin feathers to show thru the skin. When only a few weeks old they make fine broilers, but for real tooth-someness, the White Wyandotte broiler at eight weeks has no equal. At this age they easily attain the weight of one and three-quarters pounds, the flesh being especially tender and juicy.

Indiana. Otto E. Hackman.

Poultry on a City Lot.

We live in the city on a lot 50x120 ft., with the house on the front of the lot. Across the rear, running north and south, is a poultry yard. The poultry house is 10x20 ft. open front, facing south, and divided into two pens, each 10x10 ft. The yards are 10x30 ft. and at the south end of each yard is a small yard 10x10 ft. In each small yard is a coop for a hen and brood.

In 1914 we bought a sitting of eggs from a neighbor for 25c. From these eggs we saved 5 of the best pullets which gained our attention by keeping a family of two supplied with eggs that year. In the spring of 1915 a friend gave us 2 sittings of R. C. Rhode Island Red eggs and in the fall ten pullets were kept from

heavily, then put them back in the flock. Have never failed to break up a broody following this treatment. As mothers, they are unexcelled, steady, light and careful on the eggs, and faithful to their hatching duties and to the little chicks.

The Reds make fine table fowl. Last Thanks—

A Natural Food Product

Made from the choicest of buttermilk to which has been added vegetable oil to form a proper balance of carbohydrates and protein, and is further acidified to give it germ-destroying properties.

For Your Breeding Birds

Gives them extraordinary vitality to lay maximum number fertile eggs.

For Baby Chicks

Produces big, husky, lively chicks, free from white diarrhoea and other diseases.

For Fattening Broilers

Puts them in a plump condition and a finish that tops the market. The cost is slight—results are big—satisfaction guaranteed. Trial order \$2. Five gallons \$7.50.

60 VARIETIES—THOROUGHbred POULTRY

Ducks, Geese, Guineas, Turkeys, Pheasants, Yokohamas. Games and Peafowls. 2000 vigorous, profitable fowls for sale. Bred-To-Lay Strains. Stock and eggs. Any quantity, satisfaction guaranteed. Wanted—Peafowl Circular, 2c. F. C. WILBERT & CO. Grand Rapids, Mich.

giving we killed a cock that was nineteen months old. When dressed ready for cooking, he weighed just seven pounds. We put him in a covered roasting pan, which we use for roasting turkey, and kept him in the oven for a good length of time and he came out extra fine eating, with a rich juicy flavor and very tender. Later we killed one of the hens, which dressed seven pounds, and she was a great success with a table full of company.

In the confined quarters, which is all we can give the chickens, the Red color is especially good. Notwithstanding the alkali soil, the plumage looks well and even though they may be considerably soiled they do not show it. As a back-lotter's fowl we believe they are hard to beat. The R. C. Rhode Island Reds will put eggs with the bacon, and meat on the table of the city man who will give them a trial.

Colorado.

E. L. Stratton.

Likes Article by Mr. Henry.

The article in the April number of American Poultry Journal entitled, "Mr. Hoover and the American Hen," by J. P. Henry, is worth the price of the Journal for the year. It is the best article I have read on the subject. Unless some adjustment is made between the price of poultry and eggs and the price of feeds, the man producing the poultry will have to shut down and go out of the business. I have been in the business for some years and the price of feeds for some years past with low prices on eggs and poultry products is not conducive to increasing poultry production. The day of cheap feed for poultry is a thing of the past and poultry and eggs must go up in price and stay up. I would like to hear from others like Mr. Henry.

J. L. Boyd.

Care of Little Chicks.

When little chicks are first hatched, if placed with the hen mother, keep a close watch for head lice. I have found this trouble kills a great many young chicks. As soon as the chicks are hatched I rub a little lard on each head and under the head on the throat. When the chicks are about 48 hours old, I give them their first feed of hard boiled eggs and bread crumbs. Also supply them with fresh water and sand, but do not allow them out in the damp or cold for a few days should the weather be unfavorable. I have runs 5 ft. by 6 ft. and about a foot high and covered with fine wire, where I feed the little youngsters by raising one corner just high enough so the smallest chicks can get under. They can then eat to

First prize Buff Minorca pullet at Chicago Coliseum Show, 1916. Owned by Walhalla Poultry Farm, R. 1, Oscoda, Mich.

their heart's content without being annoyed by the bigger chicks. Every brood should be fed separate. When more than one sized chicks are in the same coop, the small one are always crowded and do not get their full share. I move the runs often. Charcoal should be kept in hoppers at all times. If any of the chicks become crop bound, give a teaspoon of melted lard. See that the hens and chicks have free access to cool fresh water at all times. This is a cheap tonic which is often overlooked. I use a large lard pail without handle, fill it with

A GREAT EGG PRODUCER

is "OCULUM," the liquid germicide so scientifically compounded that 10 drops to the pound of feed destroys worms and germs without injury to the fowls.

The merit of "OCULUM" is that it quickly routs diseases like White Diarrhoea, Roup and Cholera, keeps the flock healthy, saves feed and cuts down labor. The joy of using "OCULUM" is that you get plenty of EGGS winter and summer and even during moult.

U. R. Fishel, Hope, Indiana, says: "I would not think of doing without 'OCULUM' if it cost five times what it does." A. C. Hawkins, Lancaster, Mass., says: "You surely should have a large sale for 'OCULUM' when its qualities become known."

290 EGGS IN ONE YEAR

water and invert it in a shallow pan, considerably larger in circumference than the lard pail. For young chicks a good sized cup and saucer may be used in the same manner.

See that the nests are clean and the nesting material changed frequently. Whitewash the interior of the poultry house, adding a few drops of carbolic acid to the whitewash. Mix a few tobacco stems with the new nesting material. Keep down lice and mites about the poultry houses. I am a farmer's daughter, but a great lover of poultry. We have W. F. Black Spanish, Anconas, Buff Orpingtons, S. C. White and Brown Leghorns, Barred Plymouth Rocks and Silver Campines. We think the Leghorns and the Spanish surpass all the others for eggs.

Tennessee. Nellie Leake.

Raise More Grain.

The chaotic condition prevailing thruout the poultry industry today is the natural and inevitable consequence of one great mistake—the building of the industry, like our whole social order, upon sand. No foundation worthy the name having been provided, the structure could not weather a brisk storm. What would we think of a government sending an army into the field without necessary supplies to keep it in fighting trim but left the provisioning to greedy profiteers or whoever happened along? No one would call that a practical policy to adopt and all would agree that it would be doomed to failure at the start. But such is the precise condition under which the average poultryman labors. He starts out by buying or renting a small farm, usually from five to twenty acres and expects to keep from 500 to 3,000 fowls, several cows and hogs, besides raising large quantities of vegetables, fruits, etc. Usually he only has land enough to give his birds the required amount of range and supply them with the necessary green stuffs. It is rare that any provision is made for growing any part of the food for poultry. Moreover, the soil on the average poultry farm is of such inferior quality that it would not grow grains.

Now a man raising poultry cannot devote himself to general farming and he should not keep more cows or hogs than he needs to supply his own family table. He will have no time to raise vegetables, or fruit except for home use, but if he is to make a success of poultry keeping he will have to raise a part of the grain or be left to the mercy of soaring prices.

New York. Anthony Decker.

Wheat Conservation a Military Measure.

The conservation of wheat is now a military necessity and wheatless meals and days will be rigidly enforced in public eating places, the Food Administration announces. While private homes will not be required to observe special days as wheatless, they are urged to go farther and make every day wheatless where circumstances permit.

The housekeeper who cannot take wheat wholly from the menu is requested to cut each member of her family to at least one and one-half pounds per week. How she shall do this and how much greater reduction she can make is left entirely to the individual. The Food Administration believes that the imperative necessity for this measure will be well understood and that its request will receive ready response from the intelligent class.

Ferris White Leghorns

Chicks from 200 to 230 egg stock—25 chicks \$7.00, 50 for \$13.00, 100 for \$25.00, 1000 for \$200.00. From 230 to 264 egg stock, 25 chicks \$9.50, 50 for \$18.00, 100 for \$35.00, 1000 for \$275.00. Utility chicks, 25 for \$5.00, 50 for \$9.50, 100

CHARLES G. PAPE, Box 874, FORT WAYNE, IND.

Earth gets its price for what Earth gives us.
The beggar is taxed for a corner to die in.
The priest hath his fee who comes and shrives us,
We bargain for the graves we lie in;
At the devil's booth are all things sold;
Each ounce of dross costs it ounce of gold;
For a cap and bells our lives we pay,
Bubbles we buy with a whole soul's tasking—
'Tis heaven alone that is given away,
'Tis only God may be had for the asking;
No price is set on the lavish Summer,
And June may be had by the poorest comer!
—Lowell.

the office in town, and you reach the stretch of soft green grass of your home grounds, don't hesitate to yield to that call of the old days of childhood sweets, to "take 'em off," and thus once again know the joy of going barefoot!

Last season many people for the first time tried the plan of doing up their own fruits and vegetables. Of course, as is the case with beginners, many attempts were unsuccessful, but those who enjoyed the home-made jellies and canned fruits and vegetables last winter will want to repeat the experience.

At our house, we have always put up all of the canned fruits used by the family and most of the vegetables, but last season we added a few extra varieties and this season we shall add more. In these days of double duty, every housekeeper, with children and outside duties, is limited as to time. To devote a whole day or even a half of a day to canning is an impossibility except on rare occasions at our house. Last season we had our shelves well filled, and the work was done wholly at odd moments, while getting dinner or luncheon or in the early hours of the morning while the range was doing duty in baking or otherwise. I find it is much easier for me to can two or three pints or quarts of vegetables, or fruits, in this way, than to go at it in a wholesale fashion. Already (May 5) a shelf is being filled with canned asparagus. When preparing the "grass" for dinner, if there happens to be more than required for the family, I cut off the stalky part, leaving only the tender green shoots, wash thoroughly and put over the fire in a kettle, pouring boiling water over same. Salt slightly. When the water has boiled briskly for fifteen minutes, pour off all water. Have jars sterile and placed on a rack in boiling water. Put the partly cooked asparagus tips in the jars, packing carefully so as not to mash the tips, sprinkle slightly with salt and fill with boiling water. Place rubbers and caps on jars, but do not push down clamp to seal tightly. Cover the boiler in which the jars are placed and let boil for one hour. Be sure the water is boiling all the time. When ready to remove, push down clamps and invert jars until cold. Store in a cool dark place. Beans, peas and corn may be put down in the same manner, beans and corn requiring longer boiling.

In making jams and jellies, to save time, boil the fruit while getting tea, pour into a strainer and allow to strain over night. In the morning heat the sugar while getting breakfast and boil altogether twenty, thirty minutes or longer as required, pour into glasses and cool.

Of all canned vegetables we enjoy none more than the tender young beets, and we are still enjoying those which were pulled from our garden last July. The beets were planted thickly and thinned by pulling all those as large or a little larger than a thimble. The little beets were then boiled until tender, the water drained off and the beets plunged into cold water to remove the skins. The beets were then packed into glass jars and placed on a rack in boiling water. In a stew pan an equal quantity of cider vinegar and boiling water, with a tablespoonful of sugar to a pint

A WARM wind from the south, the hot rays of a scorching sun, a dry, dusty roadway, a little girl returning from school carrying a heavy coat and lunch basket, a flushed face and disheveled hair, a fretful tone of voice: "Mother, I'm so tired—and I want to go barefoot!"

The little girl after taking a cool sponge bath and changing her hot dusty clothing, wandered down across the field skipping over the soft green grass and incidentally dipping her pudgy toes into the cool brook as she hummed a joyous tune of summer days and delights. The transformation of taking off shoes and stockings and once again allowing the feet to come in contact with the soft dust of the road and the warm grass of the meadow had in one moment obliterated the trials and weariness of the sudden extreme heat of a day spent in a stuffy school room. Forgotten the wearisome fractions, dropped into oblivion the dry-as-dust history, for suddenly the world was transformed, the shackles cast off, for Freedom has cast her glory over the earth, since it is barefoot time!

I have sometimes looked into the faces of the tired, worn creatures met on city streets—business men, and society matrons, and overworked little children, and wondered if there was anything in the world which they so much need as to get out into real country and run around barefoot on the dew wet grass of early morning or summer evening. Going barefoot, occasionally, would probably tend to straighten the human foot out into something like its natural shape, and we might experience greater difficulty and discomfort in wearing the shoes which are manufactured for foot covering, but I think it would take somewhat of the tired look from the eyes, and perhaps might tend to make us a more capable and useful people. On a hot day in the city hundreds of people are seen walking, whose feet seem to be either too tired or uncomfortable, to carry them around. This is especially true of women and girls, but now that it is necessary for them to take men's places in all branches of industry, let us hope they will forever discard the extreme type of high heeled shoe, wedge shaped toe, and other monstrosities in foot gear. A few barefoot dances on the dew wet lawn or dabbings in the meadow brook will tend toward the adoption of more sensible foot wear, and incidentally help to brush the cobwebs from our brains and the weariness from our souls, at no cost. When with aching feet and weariness of spirit you wend your way up from the railroad station after a particularly trying day at

SAVE FEED MONEY

Conserve now by using IDEAL Economy Dry Feed Hopper—stops waste, keeps out rain, rats and birds. Weight of fowl on step opens door inward when feeding; automatically closes upon leaving. Roll bottom prevents fowl from hooking out wasting feed. Constructed of galvanized iron, designed for feeding whole or cracked grain, dry mash, grit, oyster shells, etc. It saves work, can't clog or get out of order. See your dealer today; write for information and literature.

BOX 100, TIV. 4 CORNS., RHODE ISLAND

of beets, was boiled and then poured over the beets to fill the jars. Rubber rings and glass tops were put on the jars and the water surrounding them allowed to boil continually for two hours when the clamps were pushed down and thus sealed. The beets keep their beautiful color and fresh flavor and are as delicious today as when just pulled from the garden.

BARLEY MUFFINS.

Sift together 2 cups barley flour, 3 teaspoons baking powder, 1 teaspoon salt and add 1 beaten egg, 1 cup sweet milk, 1 tablespoon chicken fat and 2 tablespoons syrup or sugar. Put into hot greased muffin rings and bake in a moderate oven.

QUICK BUCKWHEAT CAKES.

1 cup buckwheat flour, 1 heaping teaspoon baking powder, 1/4 teaspoon salt, 1 teaspoon sugar sifted together. Add a tablespoon molasses, 1/4 cup milk and 1 cup cold water. Bake at once on a hot greased griddle.

CORNMEAL POPOVERS.

Mix 1/2 cup cornmeal with two cups sweet milk and cook one-half an hour in a double cooker and remove from stove. Add 1/2 teaspoon salt and 4 tablespoons molasses. When cool add four eggs, white and yolks beaten separately. Bake at once in greased cups or muffin rings in a hot oven. Serve immediately when removed from oven.

CORN AND POTATO MUFFINS.

To 1 cup of hot mashed potato add 1 cup sweet milk, 2 eggs, 1 tablespoon chick fat, add 1 cup sifted cornmeal and 3 teaspoons baking powder. Bake one-half hour in a moderate oven.

OATMEAL WAR BREAD.

Pour 2 1/2 cups boiling water over 2 cups rolled oats. When cool add 1 cup rye flour, 1/2 cup white flour, 1/2 cup molasses, 2 teaspoons chicken fat and 1 yeast cake dissolved in 1/2 cup luke warm water. Put in a warm place and allow to rise for 2 hours. Then add enough whole wheat flour so as to handle the dough. It will take about 1 quart. Knead thoroly and let rise again. Mold into loaves and when light bake in a hot oven for the first ten minutes, and then allow the oven to cool slightly until bread is baked.

BARLEY BREAD.

Scald 1 1/2 cups sweet milk, add one scant tablespoon chicken fat, remove from the stove and allow to become luke warm; then dissolve one yeast cake in the liquid. Sift into it, 1 quart barley flour, 1 teaspoon salt, 1 tablespoon sugar. Mix with a spoon and add 1 tablespoon molasses. Let it rise over night and in the morning mix it up again and allow to rise again. Mold into loaves and when light, bake in moderately hot oven, the same as white bread.

CHOCOLATE BARLEY COOKIES.

Beat two eggs until light, add one and one-quarter cups of sugar, one tablespoon chicken fat, one-half teaspoon salt, one cup sour cream in which one scant teaspoon soda has been dissolved, sufficient sifted barley flour to make a stiff dough. Add a teaspoon vanilla, two tablespoons cocoa, and a sprinkle of ground cloves. Drop by spoonfuls on to a greased and floured baking sheet and bake in a moderately hot oven. These are very delicious and equally as nice as white flour cookies.

SHORTCAKE.

Even tho there is little white flour being used in the average American home today, those who are fond of strawberry and other fruit shortcakes need not deny themselves this luxury. The combination of barley and rice flour makes a very good shortcake, by sifting one cup of barley and one-half cup rice flour with one teaspoon salt and three of baking powder. Mix to a soft dough with sweet cream or if milk is used add one heaping tablespoon chicken fat. Spread into a greased and floured shallow baking pan with a spoon, and bake in a hot oven until crisp and brown. Serve as the usual shortcake with crushed fruits and whipped cream.

A WORD FOR THE OLD BREEDS

Some of Our Obsolete Varieties Worthy of Special Attention.

By THEO. HEWES.

IN OUR crazy, mad rush to all get in the same bandwagon, thousands of breeders in this country are overlooking some of the best breeds of fowls that have ever been recognized by the American Standard of Perfection.

Take the leading exhibitions of today and eliminate five breeds and you would have an exhibition that could be placed in one very small room, and it would not be necessary to double deck at that.

Like all other fanciers, I have been led away and have followed in the wake of what is termed the popular breeds. But thru accident, more than anything else, within the past few years I have tried out some of the old time breeds and am thoroly convinced that they should be re-established in the hearts of the fanciers and that big classes of these breeds should be on display at the leading exhibitions.

Take one breed in particular, the old White-faced Black Spanish, which is practically obsolete today. Of the hundreds of exhibitions held thruout the United States, I doubt if five percent of them have even a single entry in this old time breed. About one year ago my son decided to try the Spanish and purchased some baby chicks. They developed into strong, healthy, robust fellows, reached maturity in about six months, the males coming to a weight of about 5½ to 6 pounds and the pullets reaching a weight of 5 pounds. They began laying in December and up to this writing, April 20, have made better than an average of 60 percent for all the females in the yard. And in making this average, they are producing an egg almost as large as the Minorca. And regardless of the fact that the few strains of this breed that are in this country today must be strongly inbred, they are giving a greater percent of fertility than either the Orpingtons, Reds or Plymouth Rocks in my immediate neighborhood. A few of these birds were placed on exhibition in Indianapolis in February and it was really surprising to see the number of people among the old time fanciers that stood by the hour admiring them. It was like finding a long lost friend. And the calls for stock and the inquiries as to price of eggs would convince me that they would not only prove one of the most profitable from a commercial standpoint of any breed that could be taken up today, but there would be an immense demand for them from a fancier's standpoint as well.

It is possible that the effort made by the fanciers to increase the length of the wattles and ear lobes and produce the exceptional enamel white in these sections has caused some breeders who were at one time interested to go out of them. And I imagine that our judges have gone too far in making these special features of greater value in awarding prizes than they are really entitled to, with the result that some superior birds in shape and general character have been left out of the money in favor of the smaller diminutive bird with the well developed white in face and lobes.

But be that as it may, with these chicks incubator hatched, shipped some three hundred miles and given only ordinary attention, I do not believe that we have ever put feed into any one fowl that has given us better results from a commercial standpoint. And if flocks of fowls are to be kept for eggs only and this feature to be made the source of livelihood for the poultryman, then if other strains of Spanish will give as good account of themselves as the one we have in our yard, it would certainly be to the interest of the market egg producer to go strongly for this old time breed. You will not only get more eggs than you do from the average Leghorn, but you get a larger egg and at the close of the season you have a hen that will dress from four to five pounds and you have one of the strikingly handsome fowls at all times for the public to admire.

Another bird, and one that is considered ornamental only, is the Polish. We have bred the White Crested Blacks and the White Crested Whites for eight years. The Blacks have been bred to Crest until they have become delicate, or, in other words, we have overdone a good thing and placed a handicap on the breed. The immense crest that has been produced on both males and females handicaps the breed as a hustler for his own feed and makes him an object for every prowling animal to pick up without effort. But in the White Crested Whites we have a more compact crest and this bird can forage as well as the average of our American birds and is every bit as hardy. Eggs hatch just as well and chicks are just as easily raised as any variety we have on the farm and as winter

21 Jewels. Adjusted to the second

Adjusted to temperature positions and isochronism.

The Burlington Smashes All Watch Competition Look!

21 Ruby and Sapphire Jewels— Adjusted to positions— Adjusted to temperature— Adjusted to isochronism— 25-year gold strata case— Genuine Montgomery Railroad Dial— New Ideas in Thin Cases.

Only \$2.50 And all of this for \$2.50— only \$2.50 a month for the masterpiece of watch manufacture—direct to you—positively the exact price that the wholesale dealer would have to pay. Think of the high-grade, guaranteed watch we offer here at such a remarkable price. And, if you wish, you may pay this price at the rate of \$2.50 a month. Indeed, the days of exorbitant watch prices have passed. Write today—now.

The Newest Cases

In our new watch book, that we will send to you free and prepaid, you will see illustrated the newest ideas in watch cases. The latest triumphs of the master goldsmiths. Notice especially the Inlay Enamel Monograms, Block and Ribbon Monograms, Lodge Emblems and Diamond Set Cases. All offered direct to you on this startling offer. Send the coupon today.

See It First!

You don't pay a cent to anybody until you see the watch. You don't buy a Burlington watch without seeing it. Hold it in your hand and admire it. Notice the design, handsomely shaped—aristocratic in every line. Then look at the works! There you will see the masterpiece of the watch makers' skill. A perfect timepiece adjusted to positions, temperature and isochronism.

Free Watch Book

Get the Burlington Watch Book by sending this coupon now. You will know a lot more about watch buying when you read it. You will be able to "steer clear" of the over-priced watches which are no better. Send the coupon to-day for book and our offer.

"World's Champion Layers"

Our Certified Contest Records are PROOF

Our Leghorns lead at Leavenworth, 1918, defeating 500 competitors, from every state.

Our champion pullet 1104 lays 28 eggs in 31 days, in the coldest January in 98 years—beating all birds of all breeds.

Our pen No. 110, 5 Leghorn pullets, lays 105 eggs this January; an average of 21 eggs per pullet—putting our pen 30 eggs ahead in the contest to date.

Our entry of five Wyandotte hens in the North American Egg Laying Competition, just ended, won First Prize and Three Silver Cups. These hens laid 1165 eggs, having these high individual records: 294-267-221-220 eggs. Contest under government supervision.

Our Champion Wyandotte hen "Liberty Belle" laid 294 eggs, winning first prize and cup, and establishing World's Highest Official Wyandotte Record. Her sister laid 267 eggs, winning third prize and cup against 500 competitors.

Merely another proof of our success in breeding 200 egg layers. Other competition winnings:

Leghorns—Highest award North American Egg Laying Competition, 100 pens competing, five hens laying 251-250-224-222 and 192 eggs.

Rods—Highest award, in their class, N. A. Contest, five hens laying 1043 eggs, an average of over 200 eggs per hen. Highest Official Red Record known.

White Wyandottes—Missouri International Contest, ten birds laid 2006 eggs, over 200 egg average. One layer made a record of 265 eggs.

THE PENNA. POULTRY FARM

Box A, Lancaster, Pa.

layers they are next to the Orpingtons, and if given anything like comfortable quarters will pay for their feed during the coldest months, and did do it during the past winter, one of the most severe in this section of the country.

The White Crested Black Polish are domestic and want to be petted. The more you handle them the better they like you, but the White Crested Whites are just the reverse. I imagine that there has been at some time a pheasant cross in their make-up and while they will stand close confinement and allow you to go among them at any and all times, even coming close to them, the minute that you touch one of them they are off like a shot and no matter how much you handle them they will always set up a cry when you get them in your hands. I have had male birds in training cages for three months and every time I would put my hands on them they would cry like a whipped boy. It seems that you cannot get this trait out of them.

We have often heard people say that a strain has been inbred to the extent that it has not sufficient strength to reproduce. Our experience in breeding not only the Polish but several other varieties has convinced us that there is not any such thing as inbreeding to hurt poultry. As an illustration: Eight years ago I purchased two plain White Polish hens of really high class exhibition quality and the only male bird that I could find of that variety was the poorest scrub that one would find in a day's walk in the average yard. The feathers on his head could hardly have been called a crest. It was simply a little topknot and showed a trifle better than the average smooth headed males, but, of course, had other Polish characteristics and was in no way related to the females. That was the foundation of the strain of Polish that we have on the farm today and there has never been a drop of any blood added. Cockerels bred back to their own mothers, cocks bred to their own daughters and again to the daughters from the second and third crosses, until the average blood line is 31/32 of the original stock. And today the birds are larger, stronger, better crested, better Polish shaped and more hardy than they were at the beginning. So that we have this object lesson to convince us that instead of our birds degenerating thru inbreeding, in 99 cases out of 100 they would be decidedly better off and we would produce stronger and healthier birds if we followed it just as far as we can, for the average lifetime of a male is not to exceed four years.

WHY I BREED DOMINIQUE LEGHORNS.

By A. KURTZ, Kansas City, Mo.

FROM personal experience for the past thirty-five years I have found that there is no breed of fowls that outclass the Leghorns as prolific layers, and since boyhood it has been my ambition to originate a strain of bred-to-lay fowls and I undertook to originate a strain of Leghorns with the color and markings of the American Dominique, the oldest pure bred American fowl, and thought that any breed of fowls to hold their own popularity thru a long term of years as the American Dominique must have some special qualities to commend them.

Before the American Revolution, New England sailors brought some breed of fowls from San Domingo and thus Dominique became the name of the oldest thoroughbred American breed of fowls. In 1907 the National American Dominique Club was organized, since that time the Dominiques became very popular and have made rapid progress to the front ranks and having transmitted some of the best qualities to many of our most popular breeds of today, namely the Barred Plymouth Rocks, the first cross to produce this most popular variety of Plymouth Rocks was an American Dominique male on a Black Java female, in the year 1870, five years later the first edition of the Standard was published when the Plymouth Rocks were first bred as a Standard breed of fowls, that is, before the other varieties of Plymouth Rocks came into existence they were not called Barred Rocks but simply Plymouth Rocks. Since my boyhood days I have devoted the greatest part of my life to breeding and raising thoroughbred poultry, it would take too long to go into detail and give my experience of the "ins and outs" and the different matings I used, but I found it no easy matter to establish a breed of fowls that will breed true to feather and type, and what I am offering you now in the Dominique Leghorn is what my work has produced and it is a fact that I have learned by being almost daily with my birds and studying them that I have accomplished what I did in originating the Dominique Leghorns. I have also found by experience that it depends a great deal on the environments and good care to raise purebred poultry up to the Standard requirements.

The Dominique Leghorns mature early, are good foragers and do well in confinement; they cannot be excelled as winter layers. They were awarded the first prize at the fourth Missouri Laying Contest and they have the typical shape and symmetrical form and carriage of the Leghorn family and their Standard weight being the same; in color and barring they are like the American Dominiques and in judging, the Standard for Dominiques should be applied on color and plumage and the Leghorn Standard for weight, shape and form, etc. I have found from experience the Dominique Leghorns consume less food than many other varieties I have handled. Get a bred-to-lay Leghorn to help pay the grain bill and do your bit to help win the war.

Will You Do This?

Now that it has been decided to hold the next annual meeting of the American Poultry Association in Chicago, I wonder if you will act on the following suggestions: Cut out all sorts of entertainments, make it a strictly business meeting, and boil the work down to not exceed three days. Take the meeting out to the Lexington Hotel, 22nd St. and Michigan Blvd., where they will give you a very reasonable rate and a free hall large enough to hold all the meetings. This hotel is out of the loop district, is well and favorably known to thousands of poultrymen, the rooms are large and comfortable, while their grill is one of the cheapest in the city. For years we have been stuck up by high hotel rates in order to pay for our own entertainments, many of which we do not have the time to enjoy. If we want a banquet we can arrange it after we are in Chicago and find out how many will be there to take it in, and there is no better place to hold it than in the Lexington. For years I have advocated economy in conducting the annual meetings, and now is the time of all times to put over a real meeting without frills or fuss. To the committee in charge of arrangements this request is made, and my word for it, you will please every member who attends if you will act on these suggestions.—Theo. Hewes.

Questions and Answers

Conducted by
Prince T. Woods, M. D.

Questions about poultry are answered in this department free for all readers of American Poultry Journal. Where answers are desired by mail, a stamp for reply is requested. Address all query letters to the managing editor, Dr. Prince T. Woods, Lock Box 4, Silver Lake, Mass.

Chicks Dead in Shell.

Q. A hatch in my incubator gave only 50 per cent chicks, the balance were dead in the shell. This has happened several times. The incubator has been in use for about ten years. My hens are S. C. White Leghorns. All healthy. Good layers, about 80 to 90 per cent at times. Are carefully fed. Two males to 18 hens. Live chickens are doing well. What would you suggest to remedy conditions?

Floresville, Texas.

B. F. B.

A. The percentage of chicks dead in the shell is much too high. A few chicks dead in shell may be expected even under normal conditions. Evidently you are feeding your breeding birds to secure heavy laying. High egg production is likely to be accompanied by weak germs, which result in chicks dead in shell. Breeding stock should not be forced for eggs. You will probably get much better hatches if you will select a pen or two for breeding purposes, feed them mainly on hard grain and greens, give very little concentrated mash, and see that the birds get plenty of exercise.

Spots on Liver.

Q. Would like a cure for my chicks, they have white and yellowish spots on the liver. They go lame and die. Have been bothered for a long time.

Pavilion, N. Y.

T. A. S.

A. You undoubtedly have disease of serious nature in your flocks. Laboratory examination is necessary for diagnosis. Write to Poultry Department, State College of Agriculture, Ithaca, N. Y., and ask them to examine a few of your hens and advise you what to do.

Intestinal Irritation—Pasted Up Behind.

Q. (1) What is trouble with chicks 4 to 7 weeks old that suddenly become unable to stand on legs and at same time throw head right up in a twisted position toward side affected with lameness? Can it be prevented? Is there any cure?

A. (1) Trouble is due to intestinal irritation. May be caused by worms, indigestion, spoiled food, soft and acid corn, etc. Prevent by careful feeding, use of reasonably sound feeding grains, and avoiding sour or spoiled foodstuffs. Do not overfeed. Keep quarters reasonably clean. For worms give chopped garlic bulb or raw onions freely in mash. Three drops of turpentine may be given in a little warm sweet milk. If due to indigestion cut down the food allowance and feed mostly on chick food and greens for a few days, feeding very little at a time. Keep charcoal, grit, fine shell and water always before the chicks.

Q. (2) What causes clogging of vent in baby chicks? Is it wrong feeding?

Greenwood, Miss.

F. W. F.

A. (2) Chicks "paste up behind" because of diarrhoea, which may be due to careless feeding, spoiled food, or to infectious intestinal disease. Trouble is frequent this year because of the considerable amount of spoiled corn which has been worked into feeds and mashes. Where food is known to be all right trouble will occur among chicks running on old ground which has been recently occupied by other broods or by adult fowls. Grow the chicks on new ground, see that they have wholesome food and are carefully fed. Give granulated charcoal mixed with the feed. Chop up dandelion leaves and feed same fresh cut daily, all the chicks will clean up. If they do not eat these greens readily mix with mash.

"Parasitic Disease of Comb and Wattles.

Q. I bought a dozen Minorca hens and a cockerel in February. On the wattle of one hen I noticed a white spot, but paid no attention to it. It has spread around the eye and the wattle seems smaller than the other. The cock has the same kind of a white spot

on his comb, starting at back part of comb. Please advise me what to do.

Columbus, Ga.

K. O. D.

A. Disease is due to parasites. Wash affected parts with warm soapy water—use good old fashioned yellow soap. Then dry thoroughly and rub in compound sulphur ointment—"Hebra's itch ointment"—you can obtain same of your druggist. A few treatments three or four days apart should be sufficient to effect a cure. Add about five per

cent flowers of sulphur to the mash for ten days or two weeks.

Growing Mash for Chicks.

Q. Would like the formula for a good growing mash for chicks from two weeks on. Want one containing some meat scraps.

Uncasville, Conn.

R. E. P.

A. We are using a commercial "laying mash" which contains both fine beef scrap and fish meal, as we find it difficult to buy supplies of feeds for mash mixing. Equal parts wheat middlings, rolled oats (with hulls sifted out), sound corn meal, and barley meal, with ten per cent fine beef scrap or fish meal makes a good mash. Parts by weight. We are adding about five per cent ground pea meal to our mash, as we had a quantity of dry garden peas which had been damaged by weevils.

Layers Have Diarrhoea.

Q. Would like to know what to do for my laying hens, some do not eat at all, have diarrhoea, stools very thin and greenish yellow.

Dirt Breeds Disease

It is the healthy, vigorous chickens—those that are free from lice, mites, etc.—that thrive and lay eggs. You cannot have healthy chickens if their living quarters are dirty, dark and gloomy.

is a paint in powder form, that is combined with a disinfectant many times stronger than pure carbolic acid. It is not poisonous—harmless to the smallest chick—but it kills lice, mites, etc., and prevents the germs of contagious diseases from getting a start and spreading through your flocks and herds. It is ready to use as soon as mixed with cold water and can be applied with a brush or sprayer. It has no disagreeable odor and will not blister, flake or peel off.

Use it Instead of Whitewash

in your poultry houses, stables, dairies, cellars, outbuildings, etc., and save yourself time, labor and money, and get better results. Carbola is used and endorsed by thousands of poultry, dairy and stock farms, and by many experiment stations and agricultural colleges. One gallon covers about 250 square feet of wood, brick, stone or cement surface. Satisfaction guaranteed.

10 lbs. (10 gals.) \$1.00 and postage 20 lbs. (20 gals.) \$2.00 delivered
50 lbs. (50 gals.) \$4.00 delivered

Trial package and interesting booklet sent postpaid for 25c.

Your hardware, seed, paint or drug dealer has Carbola or can get it. If not, send direct—shipment by parcel post or express the day order is received.

CARBOLA CHEMICAL COMPANY, Inc.

7 EAST 42nd STREET Dept. I NEW YORK CITY

SAVE WHEAT!

Feed your baby chicks nature's food and see how they thrive and grow on it. You know how well the chicks thrive when they run at large with the mother hen—they do it on wild seeds.

MACMORE Brand Wild Seed Squab Feed

is nature's food—made up of wild grains—the seeds of weeds and native plants, the same as the chicks pick up on range, and is highly relished by penned fowl.

Send \$1.00 for sample bag of 25 pounds and circular telling of results obtained from it in years of experience.

MACMORE FARM SEEDS CO.

Dept. A, Harris Trust Building CHICAGO, ILL.

low. These hens seem very weak. Am feeding a lot of corn, but have been careful to get sound corn. Is this diarrhoea infectious to other hens through the droppings?

Catonsville, Md. J. F. B.
A. Would feed less corn and would be very sure that the corn is not sour or moldy. Stop all grain feeding for a few days. Give a mash of middlings mixed with scalded skim-milk and also feed chopped raw onions, either plain or in the mash. Return to grain ration of clipped oats, barley and a little feed wheat. Any diarrhoea is liable to become infectious, even if it starts as simple indigestion. Would look that corn over very carefully and have your State Experiment Station test a sample for acidity.

Blood in Eggs—Capon.

Q. (1) I keep poultry as a side line, don't have much time to look after them. Had 50 layers, several breeds. They have been averaging 20 eggs per day since January 1. Have had a good many broody hens since April. I feed a ready-mixed mash in open hoppers. Scratch feed before them all the time in feeders. Sometimes I find an egg with more or less blood on yolk and I found one which when broken into a saucer the white was full of blood. I dispose of all eggs, excepting what I use, to families living close to me, who come to my door for them as fast as I can get the eggs to sell. My objection to the blood in the eggs is that if my customers should get such eggs it might hurt my trade some. Would you advise me to feed less mash or to eliminate it for a while?

A. (1) Would not cut out the mash unless the hens are getting too fat. Blood spots will occasionally occur in eggs and we know of no way to prevent it. Hens which habitually lay bloody eggs can be detected by use of a trap nest, or by penning apart from flock, and such can be marketed. If you candle all eggs before a strong electric light, there will not be any danger of selling bloody eggs or eggs with large blood clots.

Q. (2) I expect to raise 160 chickens this summer, half Anconas and half White Wyandottes. I hatch and rear them with hens. Shall keep them in a yard 50x90, with plenty of grass and running spring water. Expect to keep all the pullets and the surplus cockerels will be sold when from two to four pounds. Do you think it would pay me to caponize these cockerels? The demand is greatest around Thanksgiving week and they would be very nearly all disposed of then or before that time. Will be through hatching by June 15.

Lilly, Pa. C. C.
A. (2) Unless you intend to hold the cockerels for sale until six months old or older, we do not believe it would pay you to caponize them.

For Eggs on a City Lot.

Q. What breed of fowls is best fitted for keeping on a city lot? I want them solely for egg production, not for eating or breeding. The outdoor runway is about 5x20 ft. I am considering Anconas. Please tell the objectionable points of this breed. Which are preferable, the single or the rose combs?

Is there a better breed with a high egg average.

Cleveland, O. J. G.
A. For your purpose early hatched pullets of any Mediterranean or American class breed or variety will fill the requirements. All are good layers if properly cared for. Select the variety which pleases you best. If you like Anconas, try them. You will not need to keep any male bird. Neither do you need to trouble about the objectionable points of any breed—good, healthy, utility quality, early pullets or yearling hens of any of the popular varieties will suit you if you manage them well.

Large or Small Flocks.

Q. I have read with interest "From the Pacific Coast" in May Journal which describes an intense method of poultry keeping.

We have been following the Corning system to a certain extent, but have never kept more than 150 hens in one house. As we are about to build more houses we should like to know whether or not you agree with Mr. Weeks, that hens will not do well in large flocks and if his is the best way of keeping poultry. We live in New York state where the winters are quite severe. Do you think this new method would prove the most successful in this climate? Could you suggest a more practical system?

Walton, N. Y. J. H. M.
A. The question of large or small flocks will probably always be a debatable one. There are strong advocates of both methods, and each thinks his own way is the best. As a rule, the man with only one or two small flocks will get better results per bird than the poultryman with many fowls, whether he keeps them in small or large flocks. In our opinion the chief reason for this is that it is possible and usual to give much more attention to the small flock. Fowls respond well to careful attention and feeding. It is much like the case of the family cow. One can buy a cow from a dairy herd, which is not keeping up to the herd average in yield and is unprofitable to the milkman. The same cow, as the family cow, will respond rapidly to the greater attention and soon be yielding much more milk.

On our farm we often have both large and small flocks. Personally we prefer a flock of 100 to 150 hens, with from 5 to 7 males running with flock in breeding season, housed in a 20x20 open-front house. Such flocks have averaged to give as good returns per bird, in both egg yield and fertility, as small flocks of 15 birds each, same sort of housing and care in each case. Of course if one is breeding for exhibition quality, and not keeping the fowls for market eggs, small select matings are essential. We always make a few small matings of choice specimens each year.

"Playing the Glad Game."

Q. About three years ago I read an editorial of yours in American Poultry Journal on "Playing the Glad Game" in which you mentioned a book. I would be glad if you would advise me where I could secure a copy of the book.

Sunny South, Ala. C. F. E. M.
A. The book is "Pollyanna" by Eleanor H. Porter, published by L. C. Page & Co., Boston, Mass. If you want to read another good book which also carries the same sentiment, "just be glad"—no matter what troubles seem to happen—get a copy of "The Secret Garden" by Frances Hodgson Burnett. We do not recall publisher's name, but any bookseller can supply you with these books and they will be found in most public libraries. Both are particularly fine books for present day reading and may be read with profit by anyone, young or old.

Heavy Laying Goose.

Editor A. P. J.—I wonder if any readers have any records of the number of eggs a Toulouse Goose will lay before she evinces

Buff Orpingtons

Buff Minorcas

The Strains of Quality

If You Want to Win Color Special Next Show Season June Is the Month to Produce Them.

Experts agree that JUNE hatched BUFFS will always develop into better colored birds. **Half Price Sale On All Adult Stock.**

Even some of our finest Exhibition and Breeding Birds go at HALF PRICE. Why waste money and time with the ordinary kind and put high priced feed into them, when you have an opportunity to get Standard bred fowls at half price. JUST THINK. Take advantage of this sale by ordering early.

We have Purchased Lindgren Brothers Buff Minorcas

—the entire flock—which in addition to our already strong flock gives us undoubtedly the greatest flock of BUFF MINORCAS in the world. Lindgren Brothers, Kingsburg, California, are the Originators of the BUFF MINORCAS. They have been breeding them in line for a number of years, also have made sensational winnings all over the western coast including Panama Exposition. Lindgren Strain as well as our own Strain have been the foundation blood for the other good flocks all over the world. Few really good flocks exist that are not wholly or partly Lindgren or Walhalla blood lines. Our matings for 1918 are the finest matings ever put together, they have no equal. Owing to the rapid growth and quick development of Buff Minorcas there is plenty of time to hatch prize winners. Pullets begin laying when very young. To help every one to get a start in this wonderful new variety we will sell EGGS FOR HATCHING at extra low prices. Here is your opportunity to secure the very best quality in Buff Minorcas either in Eggs or Stock. If you want the best there is in Buff Minorcas, write us.

EGGS! EGGS!! EGGS!!!

Eggs from our \$15 and \$10 matings as they run now for \$5 per 15 or \$8 per 30. From other fine quality matings \$2.50 per 15, \$4.50 per 30, \$6 per 50, \$10 per 100. We will ship eggs by parcel post, and pay the postage.

PRICES ON 8-WEEK OLD CHICKS:

	From Exhibition Matings	From Quality Matings	Utility Quality
1 Cockerel	\$25.00	\$15.00	\$10.00
4 Pullets			
1 Cockerel	40.00	25.00	16.00
8 Pullets			
2 Cockerels		45.00	30.00
16 Pullets			

Don't fail to write for our Summer Sale List, it's free.

NOTICE—Every Buff Minorca Breeder who joins the International Buff Minorca Club during June and July of this year, we will send with every setting of eggs ordered from us during that time several extra eggs gratis from our best pens. Mail the Secretary, Mr. Walter C. Young, Dayton, Ohio, R. D. 16, your application for membership today. One dollar pays up for one year.

BIRD BROTHERS

BOX C

MEYERSDALE, PA.

a disposition to sit, also how many she will lay during the entire season. The reason of this inquiry is that we have this year what we consider a remarkable goose who up to the time of this writing (May 8) has laid exactly 40 eggs and is still "going strong" with no indications as yet of becoming broody. This fowl began laying February 23rd and for a short time laid at the rate of an egg each day until about the middle of March when we began to wonder if this steady production would affect the fertility of the eggs and stopped the daily feed of wet mash she had been receiving. Since then she has laid every two days and all the eggs so far have hatched well. The first four laid were infertile and of the remaining 20 which have hatched so far all turned out a husky gosling except two. We set the eggs six or seven under our White Wyandotte hens. The nests were made in the corner of a building with a dirt floor which is always a little damp. To this we attribute the ease with which the goslings broke thru the shells, not one requiring any help at all. In fact we let the hens strictly alone until they emerged from the nest leading the goslings behind them. The nearest our goose has come to sitting occurred the last of April when she laid no egg for four days and being afraid she would begin sitting we shut her out of the small brood coop in which she had made her nest. Upon the fifth day we were surprised to see that she had made another nest upon the ground nearby and had begun laying again. Come on now all of you goose experts and tell us if this is an unusual record or but just an average one. Also what chances have we of establishing a strain of heavy layers from this bird and how would you go about it. I must confess that we are but novices in this business of breeding geese. Indiana. Maurice H. Decker.

(Note—This appears to be an unusual goose. Will some of our readers interested in geese come forward with their experience? —Ed. A. P. J.)

Hatching Eggs Will Stand Sea Voyage.

Q. (1) Are eggs still fertile after a sea voyage?
 A. (1) Yes, eggs will stand a sea voyage all right. Many eggs for hatching are successfully shipped across the ocean. Fertility is not affected. Chicks have been hatched under hens and in incubators on ships at sea.
 Q. (2) What is the Hogan method?
 A. (2) The Hogan system is a copyrighted method for selecting the laying hens and for estimating the probable laying capacity. The whole system is contained in a book on Hogan system which may be secured of American School of Poultry Husbandry, Box 206, Leavenworth, Kansas.
 Q. (3) I am in the tropics and have tried to raise Leghorns. With all care the mortality of chicks up to three months old was about 60%. Is this caused by climate or is the mortality as high in U. S. A?
 A. (3) The high mortality of chicks is unusual. Climate may have something to do with it, but we believe that spoiled feed and vermin are much more likely causes. It is difficult to rear chicks in excessively hot, humid weather, or in seasons when days are hot and nights cold. Comfortable coops, which can be kept dry, clean, vermin free, sufficiently cool and always well aired, are necessary. Feed must be sound, sweet and wholesome. Drinking water should be clean and cool and renewed often.
 Q. (4) Is it necessary in a brooder house with say 20 hovers with lamps, to have also a separate hot water pipe system or anything similar to heat the house as well? Or could a hot water system be utilized to heat also the brooders? In this case how could the heat be graded in different hovers?
 Military Camp, Trinidad. L. H.

A. (4) An auxiliary pipe system is not necessary where individual lamp brooders are used, except possibly in very cold climates. The pipe system can be used to heat individual hovers, each governed by a regulator. Several pipe systems are now built so that the pipes are used to heat the air which delivers fresh heated air to the hovers, the supply being regulated by a regulator on each hover and by ventilators. The coal burning colony brooder stove would be a good system to consider for your climate. The outfit and the house required are not expensive.

The Forced Molt.

Q. I have a lot of Black Minorca pullets and yearlings that have been laying satisfactorily since February. Eggs are hardest to get here in October, November and December. I want to force these hens to begin and finish their molt by the first of September. From June to September it is quite

BLUE HEN MAMMOTH

Automatic Turns 10,000 Eggs
Egg Turner in 10 Seconds

"Headquarters for Big Hatches"

Here's a Sample Report from Blue Hen Users:

"Hatches in our 6000 Egg Blue Hen Mammoth so far (May 6, 1918) beginning with Feb. 8 have averaged 71% of all eggs set, White Wyandottes and White Leghorns. Turning the eggs—3 times a day—with the Automatic Turner, takes about 2 minutes per day, saving us fully 4 hours daily. We consider this saving in time and work worth at least \$25 per month."— Dromana Farms, Corry, Pa.

Now is the Time to Investigate!
Ahead of the big freight congestion this Fall and Winter.

hot and dry here. Poultry never require shelter at any period of the year. How shall I proceed to compel these birds to begin and finish their molt by September 1. Any instruction which would lead to success in accomplishing what I suggest, would be likely to revolutionize poultry keeping in this section. This place is immediately across the Rio Grande from the Mexican State of Coahuila.

Eagle Pass, Texas.

D. E. H.

A. We do not approve of the "forced molt" as usually attempted. The following plan may prove successful. Much depends upon the season and on local conditions. About the middle of June turn your birds out to pasture on a fairly large range. There must be ample green food or forage, or you must plant a supply of quick growing greens for the birds to pasture on. Discontinue the regular ration and give the fowls only one light feeding of oats daily. If forage is abundant, cut this feed of oats down to about 3 quarts daily per 100 birds. Continue until about the fifteenth of July. Supply plenty of cool drinking water and watch the birds to note condition. If they are not keeping in fairly good order more grain may be fed; if they are getting plenty of forage and do not seem very keen on appetite, cut down the oats. About July 15 begin giving light feedings of boiled potatoes made into a crumbly mash with wheat middlings. From this work up gradually until in two weeks time you have them on regular daily ration of laying mash and hard grain. Feed plenty of greens. Cabbage is a very good vegetable food for use at this time, feed it raw.

We put a large flock on woodland range last summer and did not feed them for a few weeks, then gave scanty feedings of oats as they were cleaning up the forage. This was followed by mash, once a day, of boiled potatoes and middlings. From this we worked up gradually into full grain feedings and daily laying mash. Result was a good clean molt and an exceptionally good fall and winter egg yield. Shade is very important for a summer flock on pasture. In your climate sufficient shade will be doubly important.

Dark Fluid Droppings.

O. Part of my young chicks, from 3 to 8 days old, become sick. They have a diarrhoea of almost black fluid, with now and then a whitish streak. They are very weak and have an empty crop. This is my first experience of this kind. Would like to know how to prevent it.

Walker, Iowa.

C. A. H.

A. Trouble is probably due to spoiled or sour food. May be caused by spoiled corn or meal from soft corn. Prevent trouble by feeding only sound sweet grain to young chicks. Do not feed moldy, soured, heated, or otherwise spoiled grain to small chickens. Let the little chicks fast for 24 hours.

Then give scalded sweet milk thickened to creamy consistency with boiled white flour. When they show improvement feed good sound chick food, chopped dandelion greens, and mix granulated charcoal with their chick food.

Hoarded Flour Seized.

Flour hoarders will be severely dealt with during the world wheat shortage. Every pound of flour in the warehouses of the Copeland Grocery Co., Elberton, Ga., has been taken over by the United States Food Administration and distributed to dealers in Atlanta and nearby points.

It was found that this company had on hand 5,000 barrels of flour when only 200 barrels were needed to supply its normal needs for 30 days.

POULTRY KEEPING ON MID-WEST FARMS.

By J. E. MOORE, Princess Anne, Md.

SEVENTY-FIVE per cent of the poultry and eggs produced in this country are said to be produced on the farms, as a side line by the farmers' wives, and they have an up-hill pull of it to get enough feed for the poultry to eat, and a leaky roof to cover them at night. As a rule, all the farmer has to do with the chickens is to throw an ear of corn at them when he finds them in the barn, or in his way, and to pick their bones at the dinner table and grumble about the amount of grain they are eating. For five years I stopped on a fair average at fifteen farms a day in the central west, and saw at each farm the conditions under which the poultry was raised, and feel that I am well enough informed from actual investigation to state the conditions as they exist on the average farm in the middle west. Conditions equally as bad exist in the east. If you will make a house to house canvas of the farms for just one day through some rural section, I think you will find similar conditions. Of course you will occasionally find a farm with a modern poultry house, and a flock being kept and housed under sanitary conditions, but you will find them few and far between unless you happen to go thru some section that is specializing in poultry raising. The sections I refer to, are in the grain and general farming districts. Following are the conditions as I found them: Flocks of mixed birds crossed and recrossed until the flock looks like a crazy quilt. One could see breed characteristics of everything in the poultry line from Light Brahmas to Bantams, from Langshans to White Leghorns. Occasionally some enterprising wife would try to build up the flock by buying a standardbred cock bird of some variety, usually a Barred Rock, allowing it to run and cross at will with the motley bunch of hens. In size, they would range from a six pound hen to a Brown Leghorn Bantam cross that would hardly weigh two pounds.

They were allowed to roost where they pleased most of the year. Those that preferred the so-called hen house could roost there, and those that wanted to roost in the trees or on the manger in the barn, or the binder, or the buggy top, were allowed to do it until cold weather came. Then they were caught and put in the hen house and shut up tight at night, with no ventilation of any kind, and with not half enough roosting room; compelled to crowd, and to breathe foul air all night, and if there was snow on the ground, breathe it all day, and roost over a pile of droppings that had been accumulating for months.

The house allotted to the chickens was usually one not fit for anything else, and eight out of ten times had a leaky roof.

Once a year, usually in the early spring, this house got its annual cleaning, as by that time the droppings were almost to the roofs and the farmer needed them to top dress the pasture land. The dozen orange and soap boxes that answered for nests were taken out and the nests cleaned, and sometimes smoked, refilled, carried back, and placed on the floor in the house again ready to do another year's service, and in due time be alive with lice and red mites as were the roofs and most everything else about the hen house.

I have been in poultry houses in central Illinois, where land is worth three hundred dollars per acre, and where they pride themselves on modern farming methods, where chickens had died on the roofs, fell to the ground, and lay there rotting on the droppings and the poultry roosting over it.

DON'T LET MITES, LICE AND DISEASE DESTROY YOUR POULTRY PROFITS

Lee's Germozone
For Colds, Roup, Cholera, Sore-Head, Bowel Complaint, etc

Lee's Lice Killer
Easily the "World's Best"

Lice—Mites—White Diarrhea—Cholera—Leg Weakness—Chicken Pox—Cannibalism—Feather Eating—Bowel Trouble—Colds—Sore Head—Canker—and Roup are a few of the profit killing ailments which may affect your chicken raising efforts—and which in the majority of instances could have been avoided with a very small investment of time and money if—the ounce of prevention had been used instead of waiting until the pound of cure was needed.

If you are willing to profit by the experience of a man who in 30 years of practical poultry work has solved most of the "profit killing" faults of poultry raising, you are invited to go to your dealer and ask him for the Lee Booklet entitled "Secrets of Success." It's free and it is yours for the asking.

If your dealer is out of Lee Booklets—or if there happens to be no Lee Dealer in your town—write to us direct—telling us your dealer's name, and we will mail you this valuable booklet, "Secrets of Success," by return mail—free.

GEO. H. LEE COMPANY, 302 Lee Bldg., Omaha, Neb.

Day in and day out I found conditions the same, outside of cleaning out the house in the spring, the work done with poultry was by the farmers' wives. Only in cold weather when there was snow on the ground did the hens receive a regular feed and sometimes not then; they were compelled to shift for themselves and find feed the best they could, by stealing a few grains from the hogs at feeding time, by following the cattle, or perhaps by stealing into the corn crib, or scratching for it on the manure pile!

When a hen was lucky enough to get more food than to keep down hunger and supply the body wants and would lay an egg, she was just as likely to go to the straw stack or the fence corner or under the barn to lay it as she was to go to the poultry house. When the egg was found, it was stale and unfit for food, but many times found its way to the grocery store.

If every farmer would just set aside two rainy days each year, when he can't work in the fields, to improve the poultry house and conditions in general for the flock, what a change could be made. Fix the roof, build suitable nests, put in ample roosts and if the house is too small to accommodate the flock, there are odds and ends around every farm that could be used to make it larger. Buy a spray pump and spray the roosts and cracks with kerosene; keep it up until you have exterminated the lice and mites; make it a duty to clean the hen house just as regular as to clean the barn and the cow stables.

Plant a piece of rape or clover near the house for summer feed and some rye for winter greens, throw out grain to the fowls with a liberal hand and note the difference in the returns from them, and you will see what you have been losing by the slipshod, catch-as-catch-can method that has been used in caring for the farm poultry flock. With sanitary conditions in the roosting quarters you will eliminate loss by disease to a large extent. Give the wife a fair chance to show what she can do with poultry, give her what grain she needs, buy her a dozen or so standard-bred fowls to start with, so she can cull out the scrubs, and have a flock that will look all alike; or at least get her a few sittings of eggs from Standard-bred fowls. You will find they will be sturdier, look much better and lay more eggs.

A CAMPAIGN AGAINST POULTRY HAWKS.

A Prize is Offered for the One Killing the Largest Number of Hawks by March 1, 1919.

By D. A. RICHARDS, Wake Forest, N. C.

WHILE so much is being said in regard to conserving food I would like to add a few words. There are a great many ways in which we may conserve food. The housewives are saving food by adopting new methods of cooking, the mills by new methods of milling, but there is an important method of food conservation in which every farmer and every poultry keeper can lend a hand and yet I have not seen a word about it in the farm papers this season. I refer to saving young chicks from hawks. There is no doubt in my mind that thousands of dollars worth of young chicks are killed by hawks every year and still the farmers do not destroy the hawks as they should.

Now I want to get the American Poultry Journal to assist me in a campaign against the hawk. Let us get together and determine the amount of damage to poultry raisers by hawks each season and the best methods of exterminating them. I have a method which has worked well with me and I believe it will work as well for others and pay for itself in a short time in the number of chicks saved.

What is more annoying than to have hawks begin to carry off a nice brood of chicks after they are two or three weeks old, taking them one by one until they are all gone? I had one brood of forty last year and hawks carried off 27 of them in a week or so, before I could stop them. Since then I have been studying Mr. Hawk a bit and I will now relate the little stunt I am working on him this year.

I take a pole about fifteen feet long and about two and one-half or three inches in diameter at the little end. I saw it off smooth and fasten a hawk trap on the end of the pole and then put it up where I think the hawk is most likely to light. Usually a low place or by the side or corner of a woods is a very good place. I set three traps in this way three weeks ago and I have caught three hawks. Down by the pasture is a fine place to set the traps. That is where I caught my three hawks. The fence post is a good thing

to fasten the pole to. I want to ask every farmer or poultry keeper in the United States to purchase at least three good hawk traps and set them on a post as described above. They will not cost more than fifty cents and it is not possible to make a fifty-cent investment which will pay better. Let everybody in country districts set traps for hawks and if that will not work with the old and crafty hawks, get the shot gun out and sit around and wait for him about his usual calling time. They have a habit of coming a little earlier each day. Let each one try to interest his neighbor to set traps for hawks. I am endeavoring to get my neighbors interested for I have given traps to each of my neighbors and believe it will pay me. The man who raises a good many chickens will do well to buy a dozen or two traps and give them around among the neighbors who will take the trouble to set them for hawks.

To encourage the campaign against hawks I will give one \$5.00 sitting of S. C. Ancona eggs to the one who catches or kills the largest number of hawks between now and March 1, 1919, providing they send me their names and addresses by June 15, 1918, announcing their intention of entering the contest. Number of hawks killed must be reported by March 1, 1919. The eggs will be shipped to the winner March 15, 1919. The method used in capturing the hawks must be described and these will be published in American Poultry Journal for the benefit of all poultry raisers.

Combined Orpington Show.

The last meeting of this club was held at the Coliseum in Chicago, a day earlier than it had been scheduled, and as a result I was not present, as I had arranged to arrive at the show the day of the meeting.

Upon my arrival, I found that all of the members who had attended the meeting were full of enthusiasm of the proposed plan to consolidate all the Orpington clubs, and at the request of Secretary Gensch, I agreed to see what could be done at the Madison Square Show which followed. Mr. Rawnsley and the writer got several of the other officers together, with a result that an organization committee was formed for the purpose of holding a combined show of all varieties of Orpingtons at some winter exhibit next year. Since this organization, both the Single Comb and the Rose Comb White Orpington Clubs have approved of the arrangement of holding a joint show and both will undoubtedly send representatives to the meeting, which will be held in conjunction with this show to

effect the organization of an All Variety Orpington Club.

Mr. Andrews, of Miller, Neb., in reply to the invitation to join this movement, writes as follows:

"I am in receipt of your favor with the report of your meeting at the Garden and want to thank you for same, and will further state that the writer is very much in favor of an all Orpington show and am with you and more than willing to co-operate in any way I can. Have taken the matter up with Mr. Martz and Mr. Delafield and am sure that both parties will favor just such a plan.

"Will also go on record as being in favor of the consolidation of all Orpington clubs under one head, as the writer is satisfied it would do more to boost the breed regardless the variety, as we are all pulling for the breed, with some favoring one color and some the other.

"If at any time I can be of service to you, I am at your command."

There are many reasons, of course, why such a club will be more effective than the half a dozen small clubs now in existence. In the first place, a much larger and better year book could be published. The expense of one year book of a larger size, instead of half a dozen small ones, would, of course, be very much less. A paid secretary would, no doubt, be employed to look after the interests of all varieties. This man would undoubtedly be an unbiased man, non-breeder of any Orpington, but a man who could be relied upon in a way that would bring to the attention of the public the splendid qualities of the Orpington.

If you have any comments to make that you think would be of assistance to this club, you are invited to write them to the Secretary, so that the officers of the club may be guided by your wishes in reference to this consolidation.

—J. I. JILL.

FROM THE PACIFIC COAST

DEVELOPING PULLETS FOR HEAVY LAYERS.

By CHAS. WEEKS, Palo Alto, Cal.

TO MAKE each year's pullets better than the parent stock is a difficult task. To do so requires the most exact selection of the parent stock for vigor and prepotency with due regard to maturity and prime condition. Pullets must excel parent stock in order to make progress in developing a strain. This parent stock must be correctly mated with long years of breeding behind both male and female and the matings must not be closely related and should be of mature age. To make a correct mating excel itself in progeny requires a condition in this parent stock that is the very best possible. The parent stock must be at the zenith in condition, at the climax of the highest moment of their existence in order to stamp superiority in the young.

Sunshine, fresh air, plenty of exercise, clean quarters free from dust, and pure, wholesome food constitute the environment that will be conducive for best results from well mated birds. Do not feed wet mash or sloppy

feeds to breeding stock. Selection and conditioning of breeding stock is the first essential toward producing better pullets.

So much for the starting of this well bred pullet. The egg from which the well bred pullet comes must be very carefully and exactly incubated or the pullet will be handicapped for life. Here is where the very finest adjustment and care is necessary or that strong germ in the egg will meet obstacles in the way of its development that will hinder natural progress. The temperature should be kept as regular as a clock, between 102 and 103 degrees. The egg must not be chilled in cooling nor over-heated one single time during incubation. Too little moisture weakens the germ and too much makes the chick too large to get out of the egg. Incubation requires the closest attention and exactness. Any one can hatch chicks. It is very easy to hatch chicks. But to do it without injury to that tiny, tender, growing germ or embryo is a very difficult and careful piece of work.

No careless person can afford to attempt incubation. A well bred chick correctly hatched and you have a good foundation upon which to build a profitable layer.

Thus if this well bred chick is naturally brooded with plenty of sunshine and fresh air during the period it needs artificial heat, with clean quarters free from dust, then it has a good start in life and can be grown into a profitable hen.

At three or four weeks of age the chicks should be taken away from artificial heat and divided into smaller flocks, the cockerels and pullets being separated. Right here is where my small pen system proves its superiority. We move them from the heated pens into pens exactly the same in every detail except they are without heat. The chicks climb up, always up, for they have the climbing up habit from the start, to the roosting platform as usual, and being divided into smaller flocks are in no danger of piling and sweating, for we never place more than fifty together into one compartment. These have a clean bed of straw to snuggle in and if the weather is too cold we throw some sacks over the two perches above them and let them hang down over the chicks. Fifty chicks in a clean bed of straw up on this dropping board two feet from the ground floor will snuggle together with each little head out to the fresh air and will seldom if ever smother a single one.

The sooner the chicks can do without artificial heat the better, for artificial heat after a certain age tends to weaken and lessen the vigor.

One by one they take to the perches of their own accord, for the perches are right above them as they huddle in the clean straw, and it is surprising how quickly they line up. I have six thousand this year taking to the perches with no trouble at all. When I look over the worry and loss of previous years in trying to get chicks to the perches I draw a long sigh of relief to think that I have at last solved that hardest of problems for the poultryman, the getting of young stock to take to the perches. As soon as young stock takes the perches we usually think they are just as good as gold. Of all the inventions that have been tried to get young stock on the perches this scheme of teaching the baby chick right from the start, the going up habit beats all that I have ever tried.

We have followed this well bred pullet from the parent stock up to three or four weeks of age. If she has had every essential in each department passed through she now has clear sailing and it is only a matter of clean quarters, clean water and a wholesome variety of clean feed, with the emphasis on clean. It is the biggest mistake to take clean feed and throw it into filth for the pullet to eat.

This eight foot square pen is the little world of these fifty pullets until they are ten or twelve weeks old, when they fill the two perches and must again have more room and are divided into two pens, making twenty-five to the pen. On the outside of this pen is a feed trough under the projecting roof which extends over three feet and keeps out the

rain from blowing too much into the open front. The pullets eat from this trough by sticking their heads through an opening. Thus they can not get into the feed with their feet and must take it in the cleanest way possible. They also have a feed hopper upon the side of the wall that holds a sack full of dry mill feed in one compartment and a sack of mixed grains in the other. The platform to this hopper is eighteen inches from the floor, so they must jump up to feed. They must also jump up to the perches above the dropping board, and this continual jumping up and down gives them exercise as well as entertainment. The water bucket sets on the outside with the feed trough so that no doors need be opened in feeding and watering.

The dry mash is composed of four parts ground wheat, one part ground corn, one part ground oats with hull sifted out, (when not too high) one part beef cracklings, half part soy bean meal, half part linseed meal, half part charcoal. Many would say that this is too rich for young growing pullets, but where they have a mixture of grains in the compartment of the hopper adjoining they will eat only enough of this dry mash to balance their ration. The feed trough on the outside is filled twice daily with fresh, crisp green feed. This can be alfalfa, kale, green barley, beets, cabbage, chard or rape, and the greater the variety the better. Be sure they have this green feed 365 days in the year, including the fourth of a day. Don't under any circumstances attempt to keep hens without plenty of green feed. To have that in California means that you must irrigate. And you must have your poultry ranch located where water is cheap or you can never succeed. If you have no water for irrigation, and plenty of it, sell out and I will tell you where you can get as good land as lays out of doors with all the cheap water that is needed for irrigation. Too many fail for want of the right location. For goodness sake, do not attempt to raise poultry on a dry, poor, barren place, for it cannot be done. I know, for I tried it early. You must have plenty of water or the time using it will not pay for the results. There is plenty of good cheap water near good markets if you will find the right locality.

This little eight-foot square pen with open front forms the little world for these growing pullets and here they stay during their first laying year. They have everything before them to eat all the time and all the fresh air and sunshine and a deep sandy ground floor to roll and dust in, and are absolutely better off than any hen that ever roamed the wide world outside. They eat, drink and grow, and when they arrive at the laying age it is simply a sociological principle; their mind is on their business, eat, drink and lay; that's their daily routine. They have no other amusement and can specialize. They eat to digest, and digest to lay, and as their parents were heavy eaters before them and made eggs out of their food, they have that tendency and have it accelerated. Each year the tendency to digest and lay grows because habits make tendencies and tendencies in time become traits.

We must remove every obstacle that would hinder the development of this well bred pullet from the breeding stock to the day the first egg is laid. System, method, exactment and a fine adjustment pay in the breeding of heavy laying hens.

We have made wonderful progress in developing heavy layers in all parts of the world in the last ten years. The 200-egg hen is no longer a marvel. We are already to the 300 mark and still progressing. Will there be a limit? When we cease to wonder at the 300 hen will there be a 400-egg hen to create new sensations? I believe there is no bounds in development. Evolution is a wonderful process and with the plastic White Leghorn hen man can have an absorbing game in watching the advance from year to year.

Hotels Pledge Wheatless Days.

The first wheatless-till-harvest pledge was taken by 500 leading hotel men who gathered from all parts of the country for a conference in Washington, March 29. After the world food situation and the crying need for wheat in Europe had been presented to them, the hotel men pledged themselves with practically no exception to forego the use of wheat in their establishments until next harvest. Thus was started the wheatless roll of honor.

PROFIT IN SURPLUS COCKERELS—THE WAY TO DO IT.

By GEORGE BEUOY, Cedar Vale, Kans.

EACH year half the chickens raised are cockerels. It is impossible to use all these for breeders, or even to eat them all at the tender acceptable frying stage. On that account these extra cockerels are quite often sold at a loss, and in many instances this loss is sufficient to make the chicken business a failure.

The wife and I soon found that if we were to make the chickens pay on our farm we must make the male half of our flock profitable, and that is exactly what we have done and I know that any other poultry raiser can do equally as well, and much easier, at this time, than it was for us ten years ago.

The way to do it is to make capons of the male half of the flock just as soon as they are large enough. Or at least turn all the male birds into capons that are not needed for breeders and immediate table use.

Especially the late hatched cockerels should be caponized. By the time these late hatched males are ready to sell as fryers or broilers the prices are so low usually that they will not pay for the feed consumed. On our market it is very seldom that I can get as much as 30 cents each for them, often less than 25 cents each. Yet these same young roosters made into capons bring me from \$3 to \$5 each, along in March, sold as capons. Even if feed is high they make me good money, often \$1.50 clear on each capon, depending on market conditions, and I look for the market to

be higher this coming spring than ever before.

One big reason for the high prices is that capons reach the market at a season when all other fresh poultry is very scarce and high. That is in February and March, the time when the capons get mature and ready. At that time no live hens, comparatively, are going onto the market, for the simple reason that any poultry raiser who has gone to the expense of wintering a flock of hens is not going to sell them just at the time they are beginning to lay the best and when eggs are still quite high. Only cold storage poultry is really available at that time, as it is too early for spring hatched chicks. The capon has made a profitable growth up to that time and is just right to sell, and the grower cashes in to his own advantage at that time. In years passed we often got 40 to 50 cents a pound and no telling how high they will be in the future.

Surely it is patriotic to make a ten-pound capon from a two-pound rooster and that is easily done if the birds are caponized before they reach two pounds in weight. If of good stock they often get much larger. I have had many weigh up to 14 pounds each.

When they are like a quail in size and appearance is the best time to caponize. That should be (in the American breeds) when they are more than six weeks old and not over two months from hatching time. We have been making capons for twelve or fifteen years. When we commenced there were no good instruments to do the work. Now capon tools have been perfected so that they work "automatic" and a child can do it just as well, and often better, than a grown person.

I have one girl and three boys and any of them can make a capon just as quickly and just as perfect as their mother or myself and any of them could do it before they were ten years old and without any special instructions other than came with the instruments used in doing the work.

When I first commenced to make capons I had to condition the bird by seeing that they were off feed for 36 hours before operating. That is still necessary, but it is not necessary at this time to use heavy weights to hold the birds like I had to do at that time. A capon bow is now used for that purpose, and it is much better in every way. With a capon bow the bird is placed just as you desire it and can be turned over or moved to get the best light with perfect ease and without loosing weights or hurting the bird in any way. The trouble with a weight is that no two birds are of the same strength. If the weights were heavy enough to hold a strong bird they would just about tear a weaker one in two, and if light enough for the weak birds they would let the strong bird injure himself by flapping at the critical moment.

With the capon bow you have control of the bird in every way and stretch him just right and there is no possible way for it to flap loose or injure itself. Besides the capon bow, a testicle remover is required and the automatic type with two hollow and beveled loops is by far the best. These allow you to see the work and small chance to make a mistake. The kind I commenced with had a crooked handle and a solid lip underneath the grasping jaws and often caused trouble, besides being expensive, much

capons now and these parties may be consulted to good advantage, as the experience of others will always help a beginner. The important thing, however, is to have good reliable instruments, as the work cannot be done without them. Then have the birds in good condition and there is scarcely a chance for failure. Follow the directions that come with any of the reliable instruments and almost any one can make capons. Every one that has birds at all suitable should make capons at this time and render the country a real service and a profitable one to themselves.

THE BUFF MINORCA.

By W. R. MORTIMER, Los Gatos, Cal.

THE ability of a fowl to produce quantities of large sized eggs is of the greatest importance. The Buff Minorca is absolutely unsurpassed in this quality. They begin to lay as early as any Leghorn, and earlier than the majority of breeds. In their first year no fowl will give a better egg yield. A flock of good, well cared for Buff Minorca pullets, or yearlings, will lay a surprisingly large number of the finest layers for a greater length of time than practically any other breed, and do not have to be sold when about two years old, but most of them can be retained with profit for at least three or four years. They are excellent winter layers, beginning to lay promptly when thru with the molt, and continue laying right thru the winter, no matter how disagreeable the weather may be. The eggs are strictly pure white in color, are well shaped and of a good flavor. In size their eggs, like those of the Black Minorcas, are of the very largest, averaging larger than those of the Anconas, Brahmans, Houdans or any other breed noted for its large sized eggs. In short, a Buff Minorca hen will produce more pounds of eggs in one year, or in her life time, than any other kind of a hen.

The Buff Minorcas are true non-setters, which is, without doubt, a great virtue. Such occasional cases of broodiness as are found in Buff Minorcas are easily cured, and the broody hen is usually laying again as well as before, within a week. The egg yield from a flock of Buff Minorcas is not decreased in the summer by means of numerous, troublesome broody hens, and time is not wasted in shutting them up, or in other ways breaking up their spell of broodiness.

In size the Buff Minorcas are large, being about the size of a Rhode Island Red, or Wyandotte. The Standard weight for the cock is eight pounds, and for the hen six and one-half pounds. The Minorca is the only large breed that is a non-setter, and that lays white eggs, with the exception of two or three old breeds that are scarcely ever seen now. This point should not be overlooked.

Buff Minorcas make a very good market fowl. The chicks make excellent broilers at an early age. When allowed to develop they make the best of fryers and roasters. When old they can be fattened into a choice table or market fowl of good size. Their clean white legs and skin give them a very good appearance when dressed.

Like the Black Minorcas, the Buffs are very hardy and vigorous, standing heat, cold and adverse conditions remarkably

well. The chicks grow fast, work hard, and do very well if given any chance whatever. The large fowls, as well as the little chicks, are excellent foragers. They are always busy and don't sit around all day doing nothing but eat, sleep and take on fat. They can, with little effort, be made very tame, yet they are not at all stupid like the American and Asiatic breeds. They are alert and full of life, the cock always being ready to defend his flock. They eat just about two-thirds the amount of feed that a Black Minorca does, and eat but very little more than a Leghorn. Of course, this is of the utmost importance, especially at the present cost of grain. A flock of Buff Minorcas will give its owner in exchange for a given amount of feed more eggs and meat of the very highest class than any other breed or variety.

The Buff Minorca has about the best all around color a fowl could have. As far as beauty is concerned, a buff fowl has no superior. A flock of brilliant golden buff birds makes as pretty a sight as one would wish to see. In the sun the cock shines like gold and which, contrasted with his bright red comb, presents a fine appearance. Looking at the practical side, buff is nearer an ideal color than any other. The white fowl, when kept clean, looks very nice. But keeping them clean in a barn-yard, or when in confinement, is nearly impossible. When given free range there is great danger from hawks and animals of prey, on account of the white color being so conspicuous. The buffs on the other hand do not show the dirt and can often escape hawks and animals without being detected. The black fowl is always secondary at the markets on account of the dark legs and black pin feathers, while the buffs command the top prices. The blue fowls do not breed true to color, and even when properly mated, will still throw off twenty-five to fifty percent off color birds. Red fowls fade in color after their first year and lose their attractive color, while buff fowls stay brilliant and beautiful as long as they live. Parti-colored birds, such as mottled, barred and the various silvers and goldens are always hard to breed true to color. Many of them require double matings and experts to get good results in color. Buff fowls do not require any special matings, nor experts to get good color and very few off color specimens are gotten.

In shape the Buff Minorcas are the same as the Black and White Minorcas. The shape of the Minorca is a practical shape, many high scoring exhibition hens making wonderful layers of large sized eggs. The Buffs are bred quite true to color now and were admitted into the Standard in 1914.

The Buff Minorca presents a very striking appearance with its most beautiful golden buff color, bright red comb and clean white ear lobes. It has wide-awake, gay and lively actions, yet when treated with ordinary care they are not at all wild.

Anyone who gives the Buff Minorcas a fair trial cannot help liking them, whether he looks upon from a practical standpoint or as a fancier. From the practical side they are unequaled layers of white eggs, are an unsurpassed market fowl of good size, are non-setters, hardy and small eaters. As a fancier's fowl they are very beautiful, are tame and are attractive.

Something New in Egg Preservation.

At this season of the year everybody is, or should be, preserving eggs for next fall and winter use. The water-glass method has long been considered the most satisfactory and is recommended by both Federal and State Agricultural Departments. The home preservation of eggs is more than ever needed this spring.

The water-glass method, while effective and certain to keep eggs sweet, is more or less sloppy and calls for a wet sack in bulky containers. A safe and certain method of preserving eggs which would permit use of regulation egg cases and storing in pantry or cool room, if proved satisfactory, would certainly be welcomed by all producers and consumers alike.

As a matter of news it is interesting to know that the Colytic Corporation, with offices and demonstration plant at 351-353 East Ohio Street, Chicago, is making extraordinary claims for a new method for preserving eggs without cold storage.

It is claimed that by use of the Colytic process, the farmer or poultryman can so treat his eggs that they do not develop spots, rots, molds, taints, bacteria, etc., and the eggs may be stored, shipped, exposed for sale and handled just as fresh eggs are handled without deterioration.

The process consists of dipping the eggs in a liquid of presumably secret formula. While the company uses a machine for this purpose, it is claimed that no special equipment, other than a thermometer is required.

The extraordinary feature of the claims for this process are that fresh eggs will be kept sweet, sound and unchanged for a year or longer without cold storage, may be kept and handled just as any other staple food is kept and handled, that the eggs keep sweet and the process sterilizes the eggs and will actually remove the stale taint and unpleasant flavor from storage eggs, restoring them to almost their original sweetness.

The process has been offered to the U. S. Department of Agriculture for use during the war. The Swiss Minister at Washington is interested on behalf of his government and asks for exclusive rights for his country. Numerous tests have been made of the processed eggs and chemists have testified as to their apparent wholesomeness and freedom from bacteria. This new process would seem to be worthy of most careful investigation by our government experts. If it will do all that is claimed for it, it will certainly prove a boon to poultrymen and the consuming public.

New Food Control Rulings.

Step by step the commercial handling of food commodities is being freed from elements of chance and opportunities for waste. Among the new amendments and additions to existing food control regulations are several of unusual interest to farmers.

Specific new rules governing the acceptance and unloading of perishables will prevent undue accumulation of perishable shipments at terminal points and reduce the possibility of waste to a minimum.

In any sale of feed stuffs, licensees

must not take more than a reasonable profit over the average cost of stock of any commodity on hand or under control, nor at that time contracted to be sold.

Poultry feed must not contain any wheat fit for human consumption and in no event shall the amount of wheat exceed ten percent.

Profiteering thru unnecessary transactions is eliminated by the rule which forbids the resale of food commodities within the same trade, without reasonable justification. The complete rules and regulations have been published by the Food Administration in pamphlet form.

Why Lose Chicks and Waste Feed?

Right feeding and methods this summer will save money and keep chicks growing. With present high priced feeds you can't afford to feed chicks in a "hit and miss" fashion. Such methods waste feed, time and money. Proper methods enable you to avoid bowel trouble, lower feed bills and develop pullets into early layers. It's vital that you know how to keep your chicks growing and healthy, free from lice, and your houses free from mites. Stop wasting time, money and good eggs. Thousands say the suggestions of the widely known poultry expert, "Tom" Quisenberry, Box 206, Leavenworth, Kansas, President of the American Poultry School, have enabled them to hatch and raise more chicks with less work, less loss and at a lower cost than ever before. He shows you how to keep the chicks growing and de-

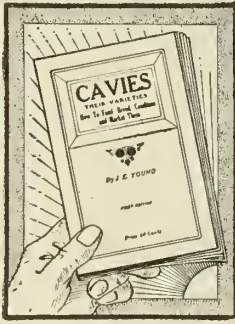

velop early layers. Mr. Quisenberry sends his bulletin on "Fighting Lice and Mites" and on "Feeding and Growing Chicks" without charge to any of our readers who are interested. His suggestions will save you money, feed and chicks. Write today before all bulletins are gone.—Adv.

NO COLD FEET AT KANSAS CITY.

The Heart of America Poultry Show Announces Its Dates and Judges for this Year.

THE Heart of America Show will again be held Thanksgiving week, November 25 to December 1, 1918, opening promptly on Monday morning and closing Saturday night. The following is a list of the judges and some of their assignments. Jas. A. Tucker, Royal Oak, Mich., all Rhode Island Reds, both Rose and Single Combs. E. C. Branch, Lees Summit, Mo., Plymouth Rocks, Barred, Partridge and Columbian; Wyandottes, Partridge, Silver Penciled and all waterfowls. J. H. Drevensstedt, Schenectady, N. Y., Plymouth Rocks, White, Buff; Wyandottes, White, Buff, Silver Laced and Golden. Walter Burton, Arlington, Texas, all Orpingtons, all Minorcas, all Langshans, Buttercups, Cornish, Anconas and turkeys. Harlo J. Fiske, Leavenworth, Kans., all Leghorns. All other classes to be assigned later. Edward McMurtry, 1310 Cleveland Ave., Kansas City, Mo., will again be on the job as general superintendent and Chas. Grunske, 1514 Elmwood Ave., Kansas City, Mo., will again be at the desk as secretary-treasurer.

We trust that all show associations will take notice of the above dates and try as far as possible to avoid conflicting dates. Address all communications until October 15, 1918, to Chas. Grunske, secretary, 1514 Elmwood Ave., Kansas City, Mo.; after that date, 418 Reliance Bldg., Kansas City, Mo.

CAVIES

THEIR VARIETIES — HOW TO FEED, BREED, CONDITION and MARKET THEM

By James E. Young, Licensed Judge, Pres. Chicago Breeders Assn.

Contains chapters on Cavy Breeds and Their Varieties, English Cavies, The Market for Cavies, Housing, Feeding, Breeding, Conditioning for the Show, How to Ship, Diseases and Their Treatment, and chapters of miscellaneous hints. Illustrated with halftones and line drawings of prize winners of different varieties and hutches for housing.

This interesting book covers this profitable and interesting pastime from A to Z. Send for it today.

VALUE OF ROSE COMB BLACK MINORCAS.

By O. M. ALLEN, Butlerville, Ind.

IN WRITING about Rose Comb Black Minorcas, enough cannot be said in regard to their good points. As far back as they can be traced it will be found they have fulfilled their mission under every condition.

In breeding the Minorcas, the most important factor with me is the type, or at least I try to let it be the most important. Neither do I lose sight of color or size. In fact, I try not to lose sight of anything. Endeavor to have in mind what your "ideal" of a Minorca is and strive to attain just such birds. The Standard weights for Rose Comb Minorcas are: Cock, 8 pounds; hen, 6½ pounds; pullet, 5½ pounds. Altho much larger birds are bred than these. Males often weigh as high as ten pounds, while I have a female now in my yards that weighs 8½ pounds.

The Minorca is a beautiful bird, being entirely black, with black legs and white ear lobes.

Having bred and given an impartial trial to five different breeds during the

Uncomfortable		Joram's Lice Rid
Hens Never Lay		Keeps Them Comfortable
One Size 3 Ounce 50 Cts	Hens Free From Lice LAY BETTER	Directions on every can

THIS STUFF WORKS!

What poultry keeper can say that his flock is free from lice? These abominable vermin take all the pleasure and profit out of poultry keeping—they make the hen uncomfortable and mopey—they kill the chicks—they even kill the grown hens. It has been said by an authority that lice are responsible for more dead birds than any other enemy of poultry.

JORAM'S LICE RID KILLS THE LICE

It is a remedy for lice that never fails to work. It kills lice, and it prevents lice from getting onto the birds afterward. JORAM'S LICE RID will kill HEAD LICE on CHICKS.

EASILY APPLIED

JORAM'S LICE RID is not like the other lice killers on the market—you KNOW they don't work—but JORAM'S goes after them in a "DIFFERENT" way. Vermin have a "base" of operations, just like submarines. You apply JORAM'S to the "base"—and the lice never move from there. That's where they die.

JORAM'S LICE RID IS ABSOLUTELY GUARANTEED to do the work, if directions are followed, or money refunded.

CHEAP It costs less than 1 cent per bird to apply JORAM'S LICE RID, and that's the end of it. You need this key to success in poultry raising. You need it now. One size, 3 ounces for 50 cents.

Laying Type		WALTER BENSON 712 W. 103rd St., Chicago

time I have bred poultry, during which period of time my object has always been to produce birds of egg laying, meat production and show qualities, all combined in one breed, I believe that I can truthfully say that of all the breeds I have tried and had experience with, the R. C. Black Minorca comes nearest to being that ideal fowl for which we are all striving and in which is embodied those most important qualities so much sought for in the all purpose fowl, namely, a breed that will lay, weigh, win and a breed that will pay.

I have often noticed during the cold winter months of November, December, January, February and March, when the so-called prominent breeds kept by some of our neighbors and fellow fanciers were huddled together in their respective poultry houses endeavoring to keep warm, with their heads under their wings to keep their combs from freezing, then it was that our good old R. C. Black Minorcas were doing their best and were demonstrating their hardiness and their ability to withstand the most severe cold weather, by shelling out their beautiful white shelled eggs and this at the very time when the price of market eggs was at its very highest. So our claim that they will surely pay must go without successful contradiction.

Take the average farmer and the Minorcas will fill the bill in almost every instance. From birth they are a desirable fowl for the breeder, because of their unusual strength as compared with many other breeds, their ability to pick up a living on range and the ease with which they are handled; this latter due to their docility. They feather quickly, so that their sturdiness favors their not huddling or crowding and smothering to death when raised in brooders or after their foster mothers have left them or been taken away. Then when moved from their first coops to larger quarters, such as colony houses on range, they soon accustom themselves to the new surroundings and it is seldom that even one of them gives any trouble in wandering to the old camping grounds when night falls.

The farm with its unlimited range for the growing birds offers ideal conditions for maturing Minorcas. On free range they are not inclined to take on flesh rapidly but will develop wonderful bone, frame and stamina, just the things that are most essential for the fowl that is intended for a breeder. It is a very simple matter to catch up a few cockerels and fatten them in a few days for the home table.

If a bunch of these birds are to be fattened for market they can be yarded and housed at some convenient place where it is easiest for the feeding and watering. When it comes to yarding them, use a four-foot fence. The scraps from the table, mixed with corn meal and sour milk, will put on fat at a surprising rate and give these favored fowls a flavor that is not to be beaten. On the farm there is always the possibility of company arriving unexpectedly and with a Minorca cockerel in the fattening pen the question of meat is solved. When you kill one of these fine large fellows you not only have enough to eat yourselves but plenty for the company.

Eggs are a problem on every farm and here the R. C. Black Minorcas shine during those winter months. This breed does not require pampering and apparently the less of it they have the more

eggs they lay. Their rose combs are impervious to the coldest weather and being well covered and cushioned with an abundance of feathers are ideally built for withstanding Jack Frost. To my way of thinking there is no better fowl for the farmer and judging by the sales of these birds that they boom more good under what are ordinarily con- each day.

In selecting and mating Minorcas, the Standard of Perfection is designed to furnish correct ideas for success to breeders, therefore the breeder of any variety ought to become thoroly familiar with the Standard requirements before he undertakes to select birds for breeding.

It is impossible to have breeding birds which are absolutely perfect in all sections. The object of breeding to a Standard is to have an ideal for each section of the bird so that by breeding as near as possible to this ideal the flock is kept more uniform than it otherwise could be. In mating Minorcas, when selecting females, care should be taken to select birds which are uniform in appearance, having similar faults and excelling in the same points so that they can all be well mated by the same male. The male should be especially strong in the points in which the females are weak, so his weak points will be balanced up with strong points in the females. Always select the best that can be obtained in all sections of both sexes.

Minorca chicks are not all black when hatched. At first they are black with creamy breasts and throat, often extending to the front of the wings. After they get feathered out there is nearly always some white feathers in the wings which will be carried until the first molt. Some occasionally have all black feathers from the start, but it is not common, and the white on the chicks is a true sign of good stock.

These birds will thrive where kept in confinement the same as on the farm if they are looked after in the right manner and lay extra well. I do not recommend these systems, but I believe that my hens or pullets would prove to be profitable under any sanitary conditions. Any one that is thinking of poultry could do no better than to try a few of these Rose Comb Black Minorcas and help solve the great food problem.

Next to milk, the egg is the most wonderful, most desirable, best, least appreciated and cheapest "meat" food available for human use. Yet a man who will squander 25 cents for a thimbleful of drink which injures him, or a woman who will eagerly pay over a dollar for a dime's worth of sugar in the form of candy, will both of them scream "robber," and yell their heads off, if asked to pay seven cents for a new-laid egg or 15 cents for a quart of good fresh milk. The consumers' policy seems to be: "Millions for greed and folly, but not one cent to the food producer if we can help it."

Increase Your Egg Production

Many have increased their egg production 100% by following the common-sense principles found in

A Revolution in Egg Production

Not theory, but proven facts. Cloth, illust., \$1.00. AMERICAN POULTRY JOURNAL PUBL. CO. 523 Plymouth Court Chicago, Illinois

RHODE ISLAND WHITES.

By F. W. BUBB, Newmanstown, Pa.

THIS is one of the new standard breeds which has gained prominence as a practical business fowl. Like the Reds, they originated in Rhode Island. They are the result of a careful crossing of several well-known breeds, the Cochin, Wyandotte and Leghorn.

Only a few years ago they made their appearance as a new breed. They were considered scrubs at first and met with severe opposition. They have withstood many knocks and jars. They have had a hard, up-hill fight to gain a place among the best breeds. But because they possess the necessary qualities they have become one of the most popular breeds. There are few, if any, breeds now being raised that possess as many desirable and useful qualities and at the same time have so few drawbacks. As a breed they meet every requirement for all classes of practical and fancy poultry raisers. They are like the Rhode Island Reds in size, shape and habits. They are white instead of red, but possess all of those and more good business qualities which have made the Reds so famous and popular.

Their unquestionable popularity is due to their all-around qualities. They are first to produce eggs in any climate, first to mature as broilers. Many will weigh two pounds at eight weeks, and bring a fancy price in the open market. As table fowls they are unexcelled. Their meat is well flavored, fine and juicy.

They are great layers, early beginners and winners in the egg-laying contests. In the National egg-laying contest, which closed November 1, 1915, with 79 pens and 26 varieties competing, there were only two pens of Rhode Island Whites. One of these pens won the December cup and held second place until June. Then during the summer months it fell back to fourth place, but during September and October it won back what it had lost, winning second place for the entire year. Beaten only by a pen of world-renowned English Leghorns that had been line-bred for years for eggs, thus winning over all the American birds in the contest. The other pen of Rhode Island Whites won sixth place. Seven of the ten best pens were Leghorns. Thus the Rhode Island Whites have proven all we have ever claimed for them in the way of eggs—that they lay as well as Leghorns and lay better when eggs are highest.

The sensational part of their performance in the laying contests is their wonderful fall and winter laying. They are also splendid year-round layers, but as winter egg producers they are proving themselves leaders in their line. They are the hens that lay during the winter months and are therefore the most profitable.

Meat and eggs are the people's need of poultry, and this is where the Whites are doubly productive. They are a medium, well-built bird for market purposes, and large enough and splendidly shaped for good egg producers. Having long, broad, deep bodies, they have ample capacity for food consumption, consequently a large egg capacity. Combining, as they do, more good qualities and fewer bad ones than any other breed yet offered to the public, they are bound

Poultry Books at a Cut Price

A complete list of poultry books that everybody interested in poultry should have. This list is made up to supply the wants of all poultrymen, and covers about every phase of the industry; in fact, it makes almost a complete poultry library, and by taking them all at a cut price, you will be well equipped to make a success of this business. The books tell you how to line-breed, feed for egg production, reduce your feed bill, mate to produce exhibition birds, prevent and cure diseases, mix a balanced ration, build poultry houses, poultry appliances, etc. Following illustrations show books.

to excel when it comes to profit. On the farm, the suburban home and back yard of the town-lot fancier, they are winning their way because of their ability to deliver the goods in eggs and meat. If I were to stock an egg farm I would have nothing but Rhode Island Whites. They do not go on a strike or vacation when the thermometer is hovering around zero, but keep busy, and the egg basket is well filled when the market is highest.

For the fancier I know no better bird. In beauty they rival the White Wyandotte, but are of a more business type. There is not a more beautiful bird known to the American Standard of Perfection than the Rhode Island Whites. The reason they have not been more extensively advertised is because the demand for them has been growing greater than the supply, and breeders find their surplus easily sold before the breeding season begins. Combining all these good qualities, we have the world's best and greatest general-purpose fowl. I have bred seven of the most popular American and Mediterranean breeds and if any had proved to be better I would breed them instead of the Rhode Island Whites.

Thus, the reader will readily see that this breed has all the good points to recommend them, both to the fancier and to the farmer. If you want one of the most profitable, most beautiful, excellent winter layers and a No. 1 market fowl, invest in Rhode Island Whites.

SALMON FAVEROLLES ARE BECOMING POPULAR.

By EUGENE T. PRESCOTT, Salem, Oregon.

AS SECTION SECRETARY for the American Salmon Faverolle Club, I am pleased to offer to the readers of the AMERICAN POULTRY JOURNAL some facts concerning this breed of poultry, which, I believe, will interest them. My belief is based on the fact that I am constantly receiving letters from all parts of the country asking for information concerning this, supposedly, new breed of poultry. In these columns I am able to explain to something over 200,000 people with as little effort as I would give to one letter.

Salmon Faverolles, while considered by many to be a new breed, are not of as recent origin as many suppose, for as far back as 1880 we find they were quite commonly raised in the northern part of France, in a district known as the "Faverolles," from whence comes their name. They were first introduced into England in 1892 and found their way across the water to this country in 1896. Since that time they have spread all over this country and have found their way from here across the water to Japan, where they are now becoming very popular.

In 1914 this breed was admitted to the Standard of Perfection by the American Poultry Association, which threw down the bars and opened wide their untrodden pathway which leads to a most promising future. As the Faverolles pass thru the portals, their sturdy physique, attired, as it were, in a most artistic gown, they must attract the attention of all poultry loving people, and as they scatter thruout the country will win a permanent abiding place wherever given shelter.

Faverolles are classed as a general purpose fowl. They bring the highest price on the market and are good egg producers. The cock weighs 8 lbs.; hen, 6½ lbs.; cockerel, 7 lbs.; pullet, 5½ lbs.

Faverolles are quite a unique breed in many respects, and most interesting as a study. They were produced by crossing the Houdans, Dorkings, Cochins or Brahmans. The crossings, whether accidental or intentional, produced a type of fowl that stands out in contrast to all other breeds of poultry. Possibly the most noticeable characteristic is the color scheme. The breast, body feathers and fluff of the male are black, while the same of the hen are cream. The back, neck, tail and wings of the hen are salmon brown, while the back of the male is a mixture of black and reddish-brown, and the neck, saddle and wing-bow are straw. The wing bar is black and the wing bay white. The male takes his color very strongly from the dorking.

The Houdans give to this breed a muffing on the sides of the head and under the beak. The crest of the Houdan was lost in the cross. Both the Houdan and Dorking furnished this breed with a fifth toe, while the Cochins or Brahma furnished them with a light feathering on the legs. This feathering is not so heavy as on the parent stock.

This breed is recognized as being the heaviest feathered fowl in existence. This extra protection makes them very much adapted to the colder climates and practically immune from the ill effects of changing weather conditions. Their excellent winter egg production is also attributed to this heavy feathering.

At the recent "All-Northwest Laying Contest" the Faverolles were found to be among the best layers there.

The front view of a Faverolle hen reminds one of the bulldog sturdiness. The keel bone is deep and extends well forward. There is great width between the legs and a slight tendency in some birds to squattiness.

Faverolles are great foragers; in fact, the muffing on the sides of the head limiting their vision to straight ahead compels them to spend more time and go farther in search of food than were it not for this peculiarity.

The wing of the Faverolle is quite small, which makes them easily confined when desired. They are tame and easily made pets.

The sex of the Faverolles can be determined at two weeks old, which makes it possible to sell pullets next to day-old.

Faverolles often weigh 4 lbs. at sixteen weeks old. The pullets are never without their natural protection. The cockerels feather out more slowly and as a result their development is much more rapid. Properly handled they are ready for the market at five weeks old.

The sexual nature of the cockerel is slow in development, which fact makes it possible to allow the two sexes to run together much longer.

Pullets hatched in April begin laying between 5½ and 6 months old. May-hatched pullets often do as well when fall weather conditions are favorable.

If you are a fancier of the ornamental, the Faverolles are that; and if it is a broiler you want, they cannot be beat, and if you are catering to the egg market they will not disappoint you.

Faverolles are advertised in England as "king of utility and the world's greatest winter layers." The eggs of the Faverolles are cream in color and of good size.

The harmonious blending in the Salmon Faverolles of the several meritorious characteristics of their ancestors has produced a breed of poultry that is destined to make France and her little Faverolle settlement famous the world over as the home of one of the grandest breeds of poultry ever produced.

If statistics are to be believed, the American hen in 1915 produced \$953,920,000 worth of poultry meat and eggs, estimating values at average wholesale prices of the entire country for the whole year. If it were possible to show the actual total value of all eggs and poultry produced and consumed in one year, the American hen could easily prove her claim of producing a "billion dollars" worth of food annually.

DISEASES OF POULTRY

STARKS' WHITE ROCKS

WHY BREED ROSE COMBS?

By S. B. WENGER, South English, Iowa.

WITH many people it is a matter of fancy. Some fancy rose combs while others fancy single combs. It is our privilege to breed our fancy. It is perfectly all right that we do so, but laying aside "fancy," there is an advantage in the low rose comb, as that of the Wyandottes, etc., in resisting frost. We sometimes hear it said that "a frosted rose comb is worse than a frosted single comb." This is true because of the thickness of the comb.

The advantage, however, is that the rose comb does not so readily freeze. It will stand more cold weather without freezing. I frequently quote the language of Mrs. W. J. Sparks, Blunt, S. D., because it so fittingly tells the true story between the rose and single combs. The advantage of the rose comb could not be expressed in plainer terms than the language of Mrs. Sparks which is as follows:

"Returning home after the blizzard I found my Barred Rocks all badly frozen except my five rose combs, which did not seem to know it had been cold." In making this statement in a private letter, Mrs. Sparks had no idea that her language would ever be used in print, or that she was any more than privately expressing her own experiences with rose combs.

There are a number of breeds of chickens of Standard varieties that can be had either in the rose or single comb. They are being bred all over the country as a matter of fancy. They are recognized by the American Poultry Association as Standard breeds and apparently have no opposition. There was a time, perhaps, in the formation of these breeds when it was an "up-hill pull" for those who were engaged in producing them. After they were approved by the American Poultry Association and became Standard varieties, the problem was solved and there were then plenty of fanciers of these particular breeds.

It is remarkably strange that many people do not fancy things until they become popular. They will as a rule oppose new measures until they see where public sentiment is going, then they fall into line and like to become leaders in the new movement.

People fail to see the advantage in new methods and measures until they see which way public sentiment is going. After things become popular you could not keep them out with a club. This holds good in many things, not only in the introduction of new breeds of poultry.

We are often asked the question, "Is the Rose Comb Barred Rock a standard breed?" The answer is, No; it has not yet been admitted to the Standard by the American Poultry Association. If it were, there are thousands who would fancy the rose comb who today will not look at it. Nevertheless, this breed is gaining friends every day and it is, some day, going to come to the front on its merits. When a breed has the foundation advantages as the Rose Comb Barred Rock, there is nothing but suspicion and prejudice retards its development. For its foundation it has the high standards of excellence of the Single Comb Barred Rock. One Rose Comb Barred Rock cockerel with a pen

of Single Comb hens or pullets in one season changes the comb from a sure freeze to a practically non-freeze comb in the flock.

Every person has a right to breed his fancy, but aside from "fancy" there are advantages that ought to appeal to our better judgment in the line of humane treatment as well as financial benefits. Breed your fancy, but allow your fancy to be guided by your own better judgment in any breed. I would suggest that we also shorten up the wattles to prevent them freezing.

To Whom It May Concern.

This is to certify that I have this day sold to Arthur H. Shaw, proprietor of Sabrina Farm, Wellesley, Mass., my entire flock of White Wyandottes without reserve, and my good-will for two years.

This sale includes all my 1918 matings, and the 1918 chicks. These matings were far and away the finest ever on Owen Farms, and the chicks are the most promising. This fine flock of Wyandottes, when combined with Mr. Shaw's already fine flock, will give him one of the largest and best flocks in all America.

Mr. Shaw bears the very highest reputation as a man, and as a poultryman. I can heartily recommend him to every Owen Farms customer, and it gives me great pleasure to turn over to him my

fine flock, as I know the line-breeding will be carefully continued, and the general excellence of the flock raised to an even higher plane.

Owen Farms White Wyandotte customers will receive the same careful attention from Mr. Shaw that they found here, and can go to him for birds to mate with their present flocks.

Fraternally yours,
MAURICE F. DELANO,
Proprietor of Owen Farms.

Paying Investment for Poultrymen.

If there are any readers of this paper who would like to invest a little money in a poultry proposition that will pay them a good dividend, I would be glad to put them in touch with same. Dividends will be guaranteed to anyone who will invest a reasonable amount and also includes a good position for the right party. The work would include outdoor work with poultry and office work. Good opportunity for some one. Write to T. E. Quisenberry, Leavenworth, Kansas. Position, for one each, good printer, bookkeeper, practical poultry and office man.—Adv.

White Wyandottes.

No doubt there are a good many people who are about to embark on the breeding of thorobred poultry, both from a commercial and fancy standpoint, and it is for the beginner that I am writing this article. It is highly possible that you have been pondering on what is the best breed. You may have written to some publisher asking his views on the subject or perhaps your friends have offered their service in the endeavor to help you to make a decision.

I am deeply interested in the man or woman who is inclined to follow the breeding of thorobred poultry and I want to see you succeed, no matter whether you breed my favorite or not.

I have bred White Wyandottes for a number of years, finally choosing this breed after trying White Leghorns, Barred Rocks and R. I. Reds. All of these varieties have their good qualities, but I much prefer the White Wyandottes. You may ask why. As for a market fowl they are of good size, have yellow skin, which is so much preferred by the commercial dealer, and their ability to lay a large number of eggs and especially in the winter when eggs are

bringing their best prices, is not denied by any one. These merits alone should be conclusive evidence that they are one of the best breeds. Perhaps you would take pleasure in entering your birds in competition with your fellow breeder in some of the large shows. As an exhibition bird what is more beautiful than a White Wyandotte? Their white plumage arranged in curves, together with their yellow legs and beak and red wattles and comb is a combination that is unequalled. If you are anticipating the breeding of poultry for show purposes, another point that is very much in their favor is that their plumage is a solid color and not so hard to breed. Some critics may say that you will have brassiness in your flock. As for this I am pleased to state that this breed is backed up by a lot of men who are enough interested in them that a stay-white bird is no longer a rare specimen, but instead their flock is of an A-1 dyed-in-the-wool, stay-white quality, and their offspring will be the same if not better. I had the pleasure of attending the last St. Louis show and the long rows of these beautiful birds was an attraction alone.

No matter whether you are breeding

for eggs and meat or for the fancy, let your foundation be the best. In this breed fancy and utility are combined in the same birds. There are several ways in which one may get a start in this fascinating, money-making pleasure. One is to start with a setting of eggs, another to invest in baby chicks and still another to buy breeding stock. If you are anxious to have your birds to care for then to buy stock is best and cheapest. Within the covers of this magazine may be found the advertisements of men who are making the poultry industry their life business and which ever way you choose to start your investment with any of these advertisers is backed by the AMERICAN POULTRY JOURNAL, which assures you a square deal.

Assuming that you have a proper start, you must have proper houses for your birds. I am an advocater of the open-front style.

With proper care of your birds you should have no trouble in obtaining success. Do not become discouraged with the first snag you strike, but say you will, then put forth a little more effort. There are many things to learn. Build as you go. Learn to feed properly, to mate in the right way and your outcome will prove a profitable investment.

O. G. BRYTE, JR.

Follansbee, W. Va.

Poultry Don'ts.

Don't allow your hens to eat decayed flesh of any kind, unless you want them to get down with limberneck and have many of them die from the effect of it.

Don't allow filth and dampness to abound in and around your poultry roosting house; it will cause roup and its various attending ills.

Don't let the mites and lice get the upperhand about your place and cause you untold trouble and loss of both old and young stock.

Don't be afraid to give your fowls an abundance of green stuff at all seasons and all times; it is their salvation, whether they are old or young.

Don't be afraid to invest a few dollars in good stock any more than you would in improved seeds and grain to insure success.

Don't keep any males with the females, unless you intend hatching the eggs. Eggs for market will keep much longer if they are not fertile.

Don't put all sizes, shapes and colors of eggs in one lot for market; learn to grade them so they will look as much like one hen laid them all as possible.

Don't allow a dirty stale egg to go into your market basket no matter how high they are or how badly you need the money.

Don't be afraid to work with your poultry the year round, as it is the only road to success and one must stick to the right track. Keep up interest in your poultry both winter and summer. No matter what other duties you have, they should not be neglected.

Don't expect every egg to hatch when you buy eggs for that purpose from some good breeder. Your own eggs, as a rule, will not do that well.

Don't attempt to raise more than one kind of good standard bred chickens to reap the most benefit from them. Learn to specialize.

COLISEUM ANNOUNCES ADDITIONAL JUDGES.

Chas. McClave, of New London, O., and W. W. Henderson, of St. Louis, Mo., Added to the List.

DEFINITE plans for the judging of the several classes at the Coliseum Show, Chicago, have been perfected. Geo. W. Hackett, of North Freedom, Wis., having accepted a permanent position with the Government, is not able to fill his date, and Chas. McClave, of New London, Ohio, has been appointed to fill this vacancy. W. W. Henderson, of St. Louis, Mo., one of the best known Barred Rock breeders of the Middle West, has been assigned to the exhibition females and the pullet-bred cocks, cockerels and pens. James A. Tucker will judge the Barred Rock exhibition males and the cockerel-bred hens, pullets and pens. The 10th annual exhibition of this great show will be held December 3, 4, 5, 6, 7 and 8. Premium list will be mailed earlier this year than ordinarily on account of congested condition of all second and third class mail. Readers of this journal who may be interested in this exhibition should register early for a copy of the list.

SIX \$50 TROPHIES OFFERED BY THE CHICAGO FEED MEN.

The Chicago feed manufacturers, appreciating the importance of this exhibition, are each offering a \$50 trophy. These trophies to be offered for the best ten entries in a breed regardless of the varieties. For illustration, there will be one trophy for best ten Plymouth Rocks, one trophy for best ten Rhode Island Reds, one trophy for best ten Leghorns, one trophy for best ten Orpingtons, one trophy for best ten Wyandottes. In order to win these trophies, exhibitor must have ten or more entries. The judges in all classes will consider the quality of all birds in these classes, giving due consideration to color of the particular birds, and award the prize to the birds coming the nearest to Standard perfection.

No one is barred from this competition, and no additional entry fee will be charged. This will, without question, be the most valuable prize ever offered at any poultry show in America, and will mean more from an advertising standpoint than any special ever awarded.

\$100 ON ROSE COMB REDS AND \$50 CASH ON BARRED ROCKS.

The old exhibitors at the Coliseum, realizing the condition of the times, are planning to take a part of the expense off the management, and are putting up big cash specials. The Rose Comb Red breeders have put up \$100 in cash to be offered for first, second and third displays. No one exhibitor can win more than one of these cash specials, and competition is open to the world.

The Barred Rock fanciers have put up \$50 for a like special. The Light Brahma Club which holds its annual meeting at the Coliseum, is putting up \$150 in cash for club members.

A NEW FEATURE TO BE ADDED TO THIS SHOW.

A new feature never before added to a National show will be added this year, something that every exhibitor is vitally interested in and something that will please all of you. This feature will be announced in a later issue of this journal. Look out for it.

It is a notable fact that the Coliseum Show under its present management has introduced more new and beneficial features than any other ten shows in this country. We will try anything first, then the other fellow takes it up, but the one referred to here is the best ever. If you did not exhibit at the Coliseum in 1917, be sure to send in your name for copy of the premium list. — Theo. Hewes, Secretary, 25 West Washington St., Indianapolis, Ind., until October 1. After October 1, Lexington Hotel, Chicago. The Lexington Hotel, 22nd St. and Michigan Boul., has been selected as headquarters for 1918.

Coliseum Gets Light Brahma Club Meeting.

The American Light Brahma Club, without question one of the foremost specialty clubs of this country today, will hold their annual meeting with the Coliseum Show, Chicago, December 3, 4, 5, 6, 7 and 8. There is already subscribed more than \$100 in cash, besides numerous cups and other specials. The Light Brahma Club, under its present management, has done more to popularize this grand old breed than anything that has been done for a quarter of a century. With that kind of

club secretaries, Harry C. Wood, of Bound Brook, N. J., and that hustling Western president, Frank P. Johnson, of Indianapolis, Ind., it is a foregone conclusion that there will be a larger entry and a greater interest in this meeting than any that has been held to date. The classes will be divided between Fred Shellabarger, the veteran Iowa judge, and Chas. I. Balch, of Manchester, Conn. Mr. Balch is recognized today as one of the greatest breeders of Brahmas in America, while Mr. Shellabarger will be equally at home with this breed, as it was one of his first loves, and many of the best Light Brahmas in the West were bred on his place several years ago. This will be Mr. Balch's first appearance at the Coliseum as a judge, but when his name was suggested to the Western breeders one and all were strong for him on a part of the class, as his strain in the hands of the Western breeders had invariably given the best of satisfaction. Remember, Brahma breeders, this show comes early and it will be up to you to push the young ones along. The dates are the same as the International Stock Show, which brings thousands of buyers from all parts of the country. Register at once for copy of premium list, also get in touch with your secretary, Mr. Wood, or your president, Mr. Johnson, for list of specials. For show premium list address the secretary of the Coliseum Show, Theo. Hewes, Indianapolis, Ind.

Important Happenings.

Walhalla Poultry Farms, Oscoda, Mich., recently purchased the entire flock of Buff Minorcas from Lindgren Brothers, Kingsburg, Cal. Mr. Lindgren was the originator of the Buff Minorca and without doubt had the best flock of Buff Minorcas in the world.

Single Comb Red Male Brings \$212 for the Red Cross.

At the Red Cross sale held at Mountain Grove, Mo., May 11, a S. C. Red male brought \$212. This bird's mother made an unusual laying record in the National Egg Laying Contest at the Missouri State Poultry Experiment Station, Mountain Grove, Mo., having laid 260 eggs in twelve months. His sire was a splendid specimen of the breed and from the best blood lines in the United States. This

bird will be shipped to other Red Cross sales and re-sold until he reaches New York City, from which place he is to be shipped to General Pershing in France. It is expected that several thousand dollars will be realized for the Red Cross by the time the bird reaches New York City.

International Plymouth Rock Club Will Meet at the Coliseum.

The first annual meeting of the International Plymouth Rock Club will be held in connection with the 10th annual exhibition of the Great Mid-West Poultry and Pet Stock Association, Coliseum Building, Chicago, December 3, 4, 5, 6, 7 and 8, 1918. This new club organized at the last show in the Coliseum takes in all varieties of the Plymouth Rocks under one head. The aim and object is to promote the interest in all varieties of this great American breed and to consolidate the interest under one head, thereby saving the expense of several clubs and getting better results for all. There is hardly a prominent breeder of any of the Plymouth Rocks in the Middle West that has not joined the new club, while new members are being added every week. There will be the greatest list of specials ever offered put up at this show and every variety of Plymouth Rocks will have their special list. In addition there will be one grand \$50 special offered for the best 10 entries in Plymouth Rocks, all varieties to compete. This grand sweepstakes prize will carry with it the greatest advertising value of any special ever offered. If you are not a member, don't fail to join at once, as this is one specialty club that every Plymouth Rock breeder, regardless of variety, should support. The judges so far selected for this class at the Coliseum are James A. Tucker, exhibition Barred Rocks; A. F. Kummer, White Rocks; Chas. V. Keeler, Buff Rocks; Harry Atkins, Partridge Rocks, and Leo A. Lee, Columbian Rocks. Two other judges will be added to the Barred Rock class, one for cockerel-bred, and one for pullet-bred. Their names will be announced later. If you are not a member, send \$2 to Edward Johnson, secretary, Bricks, Mo., and join at once. Don't fail to register for premium list of the show, as it is confidently expected that this meeting will bring out at least 1,000 Plymouth Rocks. For further information address the show secretary, Theo. Hewes, Indianapolis, Ind.

SABRINA FARM

We have been breeding for years to produce

White Wyandottes

that are strong, sturdy, utility birds, and combine

Heavy Laying with High Standard Quality. The present high quality of our flock has been secured by painstaking care in breeding and trapnesting and by grasping every possible opportunity to improve our strain. Our latest step in advance is the purchase of

THE ENTIRE FLOCK OF Owen Farms White Wyandottes

—over 200 selected cocks and hens and the cream of the 1918 chickens. These birds, which have been line bred by Mr. Delano for 20 years, combined with ours, gives **Sabrina Farm** one of the **FINEST FLOCKS OF WHITE WYANDOTTES in existence.** Early hatched cockerels, fit to win at any Fall Fair in the country, are developing in grand shape. Write us your requirements and let us quote you.

We Offer Now at Half Price

a limited number of splendid cocks and hens, which will give you an opportunity to secure tested birds for showing and breeding next year, for only a fraction of their real value. My entire time is devoted to Sabrina Farm and every inquiry or order has my personal attention.

ARTHUR H. SHAW, Proprietor

Office at 502 Grove Street

Wellesley, Massachusetts

Feeding Baby Chicks.

Many chicks are lost each year because of improper feeding, especially during the first two or three weeks of the chick's life. The common mistake among a large number of people is to feed the chicks too soon after they are hatched. Just before breaking out of the shell, the newly hatched chicks ingest all of the unused yolk for future food supply. For this reason they do not need food for from thirty-six to forty-eight hours after hatching.

The first feed should be a coarse sand or fine commercial chick grit. After the chicks are from forty-eight to seventy-two hours old, the first food can be given. This food should be of a light, flaky nature. Rolled oats has given us the best results. They are flaky and easily seen. They also seem to have a desired effect on the bowels. In place of rolled oats, finely ground bread crumbs, wheat bran or hard boiled eggs can be used as a starter. Where buttermilk or sour milk is at hand, it should be used instead of water, as the acid keeps down bowel trouble. Feed at least five times a day, but in limited quantities.

Rabbits Wanted

Breeding Does and Young Stock; all breeds. State lowest prices and full description first letter. Will buy Guinea Pigs.

Austin Rabbitry ⁵¹³⁶ W. Madison St., Chicago, Ill.

- ROSE COMB - WHITE LEGHORN EGGS

\$6.00 per 15—From My Star Pen.

S.S. Hamburgs and R. C. Brown Leghorns, winners at County Fair. Utility Stock, eggs \$1.50 per 15.

JÓYCE GLEIN - - - FERTILE, MINN.

After two or three days of feeding on these starter feeds, a grain mixture consisting of equal parts of cracked corn and cracked wheat can be fed along with the starter feed. Commercial chick feed can be used instead of the above, but we advise the use of the former, because only the best of feeds should be used for baby chicks, and often the commercial feed is found to be mouldy. Besides the grain ration, the chicks should have before them at all times equal parts of wheat bran and sifted beef scraps. This system of feeding can be continued until the chicks are two weeks old.

From the third week to the sixth, the following ration will give good results: For the grain mixture use two parts of cracked wheat, two parts pinhead oatmeal, one part millet, and one part cracked corn, or a good commercial chick feed, providing it is absolutely free from mold. Feed the above in the litter once a day. For the dry mash that should always be available in a hopper, feed equal parts of bran, wheat middlings and beef scraps. Until this time the chicks should have nothing to drink but buttermilk or sour milk, but now it is advisable to give both milk and water.

From the seventh week on to maturity, feed equal parts whole wheat, hulled oats for a short time and then use oats and cracked corn. Feed this in deep litter once a day or twice a day. Keep the following mixture in a hopper before them at all times: equal parts of bran, wheat middlings, cornmeal, and half-part of linseed meal. Beef scraps, grit, oyster shells and charcoal should always be available. Keep plenty of fresh water and sour milk in a shady place.

Green feed should be supplied from the time the chicks are a few days old. Sprouted oats is one of the best green

feeds. Lettuce is also relished by the chicks.

S. R. STOUT,
Assistant in Poultry Husbandry,
Fayetteville, Ark.

SICILIAN BUTTERCUPS.

By E. B. McPHERRIN, Des Moines, Ia.

DURING this era of very high priced feed, I wish to urge poultry people to consider these fowls from Sicily as producers of great numbers of eggs on a small amount of feed. And why should we not look to this sunny country over the sea to produce great layers? For that is the country where everything and everybody labors hard to gain a livelihood. Is it strange that these hard-working people should have trained their fowl into laying large numbers of eggs, to help them gain their livelihood? For they have made even the bees of the air work diligently, for no bees have ever been found that could compare with the Italian bee. Coupled with this ability to lay great numbers of eggs on a small amount of feed, they have other essentials to make them an ideal fowl, such as a yellow skin, more size than the Leghorns, a friendly and quiet disposition and great beauty.

They are not a breed made up thru mixing and crossing, but are peculiarly distinctive, one of their chief characteristics being their comb, which is cup-shaped, surmounted by numerous erect points, resembling the petals of a flower. The color of the female is a golden buff, with barred black markings on the body, with plain golden colored hackle. The male is a beautiful, brilliant orange-red colored bird, with black tail and lustrous greenish black sickle feathers. No more handsome, or aristocratic bird exists than a well bred male of this variety. The fowls are backed by a club containing many members thruout this country and Canada, who believe the fowls are worthy to become one of the leading breeds of the world.

COMING EVENTS CAST THEIR SHADOWS BEFORE.

Coliseum Show to be Recognized by the Big Feed Manufacturers.

ARRANGEMENTS have been completed whereby five big feed manufacturers of Chicago are to offer as special prizes a \$50 trophy for best display in five separate classes. These trophies will be different from anything ever before offered at any poultry show and they will be offered for the best 10 entries of a breed rather than a variety. As an illustration: One trophy will be offered on Plymouth Rocks, one on Rhode Island Reds, one on Leghorns, one on Orpingtons and one on Wyandottes, with perhaps two more classes to be taken care of later.

These trophies will be offered for the best 10 entries in a breed and all varieties of the breed can compete. In the Plymouth Rocks, it may be the Barred, White, Buff, Partridge or Columbian variety that wins the special, but it must, in the opinion of the judges that handle that breed, be the best 10 entries. In other words, it must, in the opinion of the judges, be the 10 entries that come nearest to perfection as described by the Standard. Never was there a special offered that carried with it such advertising value as this one and it should be competed for by every red blooded fancier in America. The same rule that governs in Plymouth Rocks will be followed in all breeds. Every variety of that breed has a chance for this trophy. This announcement is made at this time so that all fanciers may have ample time to prepare their birds for this great event. All of last year's exhibitors at the Coliseum will receive the premium list without request. Others should send their names to Theo. Hewes, 25 West Washington St., Indianapolis, Ind., and request that their names be placed on the mailing list.

Illustrate Your Printed Matter

ABOVE IS ONE OF THE MANY HANDSOME ILLUSTRATIONS SHOWN IN THE

American Poultry Journal Cut Catalog

which contains many hundreds of cuts suitable for advertisements, letterheads, envelopes, catalogs, mating lists, in fact any and all classes of printing. Come up and lend distinction to your printed matter by the use of one or more of these illustrations. Send today for a free copy. We do not do job printing. We sell electrotypes (reproductions) of these illustrations which can be used by your own printer.

American Poultry Journal Pub. Co., 523 Plymouth Court, Chicago, Ill.

A New Jersey Woman's Experience With a Small Flock.

Dear Mr. Editor:

Noticing in this month's journal that one of your readers reports unfavorable results with her poultry, I (a back lot beginner with poultry) send you my experience and results. If you deem them helpful, print them.

Yours truly, Mrs. M. Rutherford, N. J., March 8, 1918.

WINTER 1916-1917.

Oct. 30, 1916, paid for 5 hens and exp- ressage (2 B. Minorca hens, 3 grade Minorca pullets).....	\$ 6.02
Up to May 9, 1917, paid for feed, straw, cups, nest eggs, etc.....	6.55
	\$12.57
May 9, 1917, received cash for hens and what feed, etc., was left.....	\$ 6.50
	\$ 6.07
Received cash for eggs sold and also for what we used at from 60c to 75c per dozen (current prices).....	\$18.87
Net profit	\$12.80
One of the pullets was a persistent sitter and should have been eaten. I don't think she laid more than 20 eggs all winter.	
	Eggs laid
From Dec. 16 to Dec. 31, 1916.....	48
From Jan. 1 to Jan. 31, 1917.....	65
From Feb. 1 to Feb. 28, 1917.....	67
From March 1 to March 31, 1917.....	94
From April 1 to April 30, 1917.....	86
From May 1 to May 8, 1917.....	24
Total eggs laid.....	384

WINTER 1917-1918.

Oct. 30, 1917, paid for 6 hens and exp- ressage	\$ 8.66
March 7, 1918, paid for feed, straw, cups and nest eggs.....	11.38
March 7, 1918, total outlay to date....	\$20.04
	Eggs laid
From Nov. 6 to Nov. 30, 1917.....	34
From Dec. 1 to Dec. 31, 1917.....	73
From Jan. 1 to Jan. 31, 1918.....	88
From Feb. 1 to Feb. 28, 1918.....	69
From March 1 to March 8, 1918.....	24
Total eggs laid.....	288
The account stands—	
24 dozen eggs at 85c.....	\$20.40
Feed on hand.....	2.00
5 hens (laying).....	7.50
	\$29.90

Note — The above hens were 5 Plymouth Rock pullets and 1 grade Black Minorca, 2-year-old. During December one of the pullets was broody for ten days and during February two pullets were broody for a week. The Minorca got a frozen comb and did not lay for two weeks, and on February 14 a fine, big, laying pullet dropped dead off the perch—it was very cold during that time. We could have sold every egg at from 75c to \$1 a dozen, but consumed or gave away every egg laid—none being sold.

The method of feeding was as follows: Night and morning commercial scratch, thrown among the litter; at mid-day a crumbly mash and green feed, with each meal they were supplied with fresh warm water for drinking, kept on a shelf about a foot above the floor; three or four times a week sufficient permanganate of potash was put in the water to color it. The green feed was oats, sprouted, in eight little boxes made out of cigar box wood, each box measured 4½x2x1¼ inches; they were kept near the kitchen stove, as the temperature was variable it was found eight boxes gave better results than seven. The mash consisted of two pounds each of bran, middlings, corn meal and beef scrap; salt was added when the daily feed was prepared. The house was 6x10 feet, well lighted and ventilated by having the whole south side sash removed, the aperture being covered with a piece of wire netting. The house was kept clean and the perch had kerosene poured

on it once or twice a month. Table scraps were a negligible quantity (there being only two in the household). If your correspondent, "P. O. of S. Orange, N. J.," hasn't had luck with your good advice I suggest she post one of Hoover's bulletins in the hen house, alongside a clipping of market reports from the daily paper, showing the high price of hen feed and eggs.

KEEP DOWN DISEASES AMONG YOUNG CHICKS.

By HARLEY L. WILLIAMS.

TO HELP prevent diseases too commonly prevalent among young chicks at this season of the year, dust the mother hen once every eight days with a good lice powder. Clean all poultry houses once a week in warm weather and clear out and burn all nesting material once a month. Spray the nest boxes with kerosene oil or some good disinfectant and refill the nest boxes with good clean nesting material. It is much easier to keep houses, coops, and poultry yard in good, clean, sanitary condition than it is to fight diseases and parasites once they get a start.

One of the pests to be guarded against on Southern farms is head lice on growing chicks. To destroy this insect the following home-made, inexpensive head lice ointment is recommended: 1 tablespoonful of pure lard, 1 tablespoonful of sulphur, 10 drops of kerosene.

Mix this thoroly and grease the heads of the young chicks by rubbing it well into the feathers. A piece about the size of a small pea is sufficient for application on one chick. One application is usually all that is necessary, but if a second application is needed, wait eight days after giving the first.

White diarrhoea is quite prevalent in Mississippi during the early spring months. Medical treatment is impractical, as it is expensive. Buttermilk is a splendid preventive of this dread disease. A daily feed of well cooked rice is also good for infected chicks.

For information about methods of poultry keeping suited to your conditions see your County Agent or write to the Extension Division of the Mississippi Agricultural College.

Position Open at North Carolina Agricultural Experiment Station.

Following out the scheme as practiced by agricultural colleges in some foreign countries, the Poultry Department of the North Carolina Agricultural Experiment Station and College has created a position of Practical Assistant to the Plant Poultryman. In this posi-

tion the person accepting it will devote his entire time to routine plant work: having time for reading at night. He will have access to the Poultry Library and Reading Room. He will receive sufficient pay to cover his actual living expenses and at the end of the year will be a practical poultry plant man or poultryman. The idea is to give him just practical poultry plant experience. Anyone interested in this position should correspond with Dr. B. F. Kaupp, Poultry Investigator and Pathologist, N. C. Agricultural Experiment Station, West Raleigh, N. C.

\$106 for the Red Cross.

Mauerhan Bros., of Edon, Ohio, until recently were the proud owners of a very fine White Wyandotte cock, but Uncle Sam called one of the brothers and before leaving for Camp Sherman they gave this bird to the Red Cross. The Rev. J. Denver Driskill sold the bird at public auction for \$106, which swells the Red Cross fund that amount.

EGGS

are what you want—and lots of them. To secure the best results you need Bartlett's

S. C. W. "Lay"ghorns

My pen 1 contains 11 yearling hens, with records of 135 to 272 eggs, mated to Ginger VIII, dam 288 eggs, sire's dam 278 eggs—a high grade exhibition bird.

Eggs, \$5 per 15 from this pen. I also have lower and higher priced eggs and some good breeders for sale. Order direct from this ad or send for mating list.

EMORY H. BARTLETT, Box 19, Enfield, Mass.

FREE—"THE RABBIT; A Source of Meat."

Illustrated treatise for 3-cent stamp. Also my sale list of high-class rabbits: Quality Flemish and Checkered Giants, Belgians, and New Zealand Reds.

M. W. MEEK

5141 Washington Blvd., Chicago, Ill.

Successful Poultry Culture

Treats on all subjects appertaining to the poultry business. The chapter telling how to save three-fourths of your feed bills is alone worth many times the price of the book. 128 pages, profusely illustrated. Price 50 cents. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

How to Build Poultry Houses

of all kinds and descriptions. It gives complete plans. How to make feed troughs, nest boxes, water troughs, roosts, dropping boards, brood coops, brooder houses, fattening coops, colony houses, winter and summer houses, etc. Price 50c. AMERICAN POULTRY JOURNAL PUB. CO. 523 Plymouth Court Chicago, Illinois

Why Poultry Pays and How to Make It Pay

By Morgan Bates. A "straight from the shoulder" talk on raising poultry from the money-making point of view. It gives the beginner sound advice about starting in. Covers all subjects. Price 50c. AMERICAN POULTRY JOURNAL PUB. CO. 523 Plymouth Court Chicago, Illinois

IF there is one business on earth that a quitter should leave alone, it is advertising. To make a success of advertising, one must be prepared to stick to it like a barnacle to a boat's bottom. Advertising doesn't jerk—it pulls. It begins very gently at first, but the pull is steady. It is like a team of horses pulling a heavy load; but half the power is required to keep it going that is necessary to start it.—John Wanamaker

CLASSIFIED ADS.

UNDER this heading ads will be inserted for seven cents per word each month for less than three months, or *six cents per word each insertion for three months or longer*. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under *classified headings*. No ads accepted at less than an average of 60 cents per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from AMERICAN POULTRY JOURNAL than from any other poultry journal—none excepted. On writing any of these advertisers, mention AMERICAN POULTRY JOURNAL. *All copy for Classified Ads must reach us by the 17th of month preceding the date of issue.*

AMERICAN BREED

NEW AMERICAN BREED — Patriots; color, red, white and blue. Send for circular. Westboro Farms, Westboro, Mass 4-6

ANCONAS.

ANCONAS—SINGLE COMB. Cockerels, 8 weeks old, \$1.50 each. Cleve Fenerhaken, Ontarioville, Ill. 5-7
