Open Air Poultry Houses

For ALL CLIMATES

By DR. PRINCE T. WOODS

TELLS plainly and in detail just how to build Open Air Poultry Houses, and what to build of, so that anyone, with few tools, can readily construct the kind of houses used and recommended by the most successful breeders. The best and most practical work on the subject. Don't build or make alterations without this valuable book. 48 illustrations of poultry houses, plans and diagrams and photographs of construction work. Shows how to care for your houses and fowls to get better poultry, greater egg yield and fertility and freedom from disease. 88 pages, printed on best quality paper; handsomely bound in cloth.

Price, 75c Postpaid

American Poultry Journal Publishing Co. 523 PLYMOUTH COURT - CHICAGO, ILLINOIS

Federal Farm Loan Bonds Supply Funds To Finance Farmers

The First Year's Work

The bond of the Federal Loan System should command the attention of all investors.

The Federal Farm Loan System is the one agency of the United States Government which will bring to America month by month, year by year, and decade by decade through all the future a highgrade security, issued for the purpose of carrying out a great national agricultural policy.

The whole world looks for salvation to the American farmer.

The American farmer looks for financial help to the Federal Farm Loan System.

The Federal Farm Loan System seeks to enlist the wise investor in its movement to finance the farmer safely, soundly and conservatively, and thus save the world.

There are twelve regional Federal Land Banks, all operated under the inspection, examination and control of the Federal Farm Loan Board, a bureau of the Treasury Department at Washington.

The first of these banks to be organized received its charter March 1, 1917. Others were chartered immediately afterward. The farmers borrow through national farm loan associations. The first of these associations received its charter on March 27, 1917.

On March 31, 1918, associations had been formed to the number of 2808, or about four associations to every five counties in the United States.

About 56,000 farmers had joined these associations for the purpose of borrowing money on farm mortgages.

Loans amounting to over \$160,000,000 had been approved by the banks and on over 30,000 of these loans money had been paid to the farmers to the amount of about \$80,000,000.

And since March 31st the work has gone on—new associations have been organized; new applications have been made; new bond issues have been authorized.

And it will go on forever. So long

Springfield, Mass.

Louisville, Ky.
New Orleans, La.
St. Louis, Mo.

St. Paul, Minn.
Omaha, Neb.
Wichita, Kans.

Houston, Texas
Berkeley, Cal.
Spokane, Wash.

as investors will buy Federal Farm Loan Bonds, and so long as farmers need money and can give security this work will go on. It is a mighty movement to put farming on a better financial basis. You can enlist in it to your own profit and to the good of the Nation by buying Federal Farm Loan Bonds.

Federal Farm Loan Bonds bear 5 per cent interest, payable semiannually, May and November, and in the language of the Federal Farm Loan Act, "shall be deemed and held to be instrumentalities of the Government of the United States, and as such they and the income derived therefrom shall be exempt from Federal, State, Municipal and local taxation." It will be noted that this exemption is complete. Interest on these bonds need not be included in income tax returns.

Such exemption from taxation in a five per cent bond constitutes an advantage hitherto unknown in American investments. These bonds are issued in denominations of \$25, \$50, \$100, \$500 and \$1,000, and in either coupon or registered form. They are due in 20 years and redeemable after 5 years.

Federal Farm Loan Bonds are printed in the Bureau of Engraving and Printing in Washington, and have the same protection against counterfeiting that is enjoyed by the currency in your pocketbook.

In the language of the Farm Loan Act, Federal Farm Loan Bonds "shall be a lawful investment for all fiduciary and trust funds and may be accepted as security for all public deposits." You can offer your banker no better collateral. You can buy Federal Farm Loan Bonds at 101 and accrued interest. Order through any bank, trust company, broker or express agent, or write to any of the twelve Federal Land Banks:

Here is one of the most instructive and interesting poultry books ever published. It is written by a leading poultry expert. The secrets of the poultry expert's success in raising poultry are explained in a simple, "easy to understand" way.

would like to know how you can make a start, by all means send for this book. Nearly every problem that confronts the poultry raiser—amateur or expert—is explained. Tells *how* to get more eggs—*why* so many young chicks die and *how* to prevent it—*how* to develop sturdy, healthy, early-laying pullets. In short, this book

If you are interested in raising poultry or if you

Tells How You Can Make More Money From Poultry

and eliminate the many losses that are so discouraging to the poultry raiser.

This book also tells you all about the FUL-O-PEP OATMEAL POULTRY FEEDS—the feeds that are causing such a sensation among poultry raisers. These feeds are made to meet every requirement of poultry in all stages of growth and the results obtained by poultrymen testify to the superior merits of these feeds.

Improper feeding is the cause of more financial failures among poultry raisers than any other one thing. This book tells you the correct method. It tells you *why* FUL-O-PEP CHICK FEED is the ideal feed for young chicks and *why* FUL-O-PEP GROWING MASH makes young chicks grow faster and bigger and develop earlier, better laying pullets. Also *how* FUL-O-PEP DRY MASH makes hens lay, both Winter and Summer, as they never laid before.

These and many other questions of vital interest to poultry raisers are explained by the author—a recognized poultry expert. Here is a book you will value and keep, and if you follow the simple instructions it gives you, your success with poultry is assured. Send us your name and address and we will send you one of these books *free*—postpaid.

If there is one business on earth that a quitter should leave alone, it is advertising. To make a success of advertising, one must be prepared to stick to it like a barnacle to a boat's bottom. Advertising doesn't jerk — it pulls. It begins very gently at first, but the pull is steady. It is like a team of horses pulling a heavy load; but half the power is required to keep it going that is necessary to start it.—*John Wanamaker*

Successful Poultry Culture
 Treats on all subjects appertaining to the poultry business. The chapter telling how to save three-fourths of your feed bills is alone worth many times the price of the book. 123 pages, profusely illustrated. Price 50c. cents. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

Why Poultry Pays and How to Make It Pay
 By Morgan Bates. A "straight from the shoulder" talk on raising poultry from the money-making point of view. It gives the beginner sound advice about starting in. Covers all subjects. Price 50c. AMERICAN POULTRY JOURNAL PUB. CO. 523 Plymouth Court Chicago, Illinois

A SUCRENE FEED

For Every Poultry Need

Sound Health Quick Growth Heavy Laying

It takes only one-eighth as much feed to produce one pound of poultry as it does to produce one pound of pork. You can produce 100 pounds of chicken in ten weeks; but it takes seven months to produce 100 pounds of pork. In selling price as well as in producing cost, poultry products have a big advantage over the hog, which is generally considered the best money maker on the farm. But to get good results

You Must Feed Chicks and Hens Complete, Correctly Balanced Rations

A chicken can't grow or lay eggs on a one-sided ration, such as the ordinary grain feeds are, any more than a tree can grow to maturity and bear good fruit without carbon, hydrogen and sunlight.

The sooner poultry raisers realize and act upon this fact, the sooner the heavy annual chick losses, and complaints about "loafing hens," will stop—poultry raising will be on a sure profit making basis.

SUCRENE Growing Mash for Growth SUCRENE Poultry Mash for Eggs

are scientifically correct. They are prepared according to formulas carefully worked out by chemists of highest standing in America, as experts in mixed feeds. They are combinations of meals, meats and grains high in protein, fat and carbohydrate nutrients, with necessary minerals, to insure the full and rapid growth of your chicks and capacity egg yields from hens, winter and summer.

It Pays to Buy Feeds That You Know Will Bring Profitable Returns

Sucrene Growing Mash, Poultry Mash and Scratch Feeds make good all we claim for them. They solve the poultry feeding problem for beginners and for those who are out for the big money in poultry raising. We guarantee uniform high quality in every sack.

Put up in 100-pound sacks. Order a sack from your dealer. If he does not handle Sucrene Feeds, write us his name and we will see that you are supplied.

The coupon or post card brings you illustrated literature on Poultry Feeding, giving much valuable information which you will appreciate. Write also for facts about Sucrene Dairy Feed, Sucrene Calf Meal and Sucrene Hog Meal.

More Geese Should Be Raised On Farms

Our Geese Get the Principal Part of Their Living from a Swamp and a Grassy Meadow. We Do Not Feed Them Except in Winter, When Corn Is Their Main Food. First Prize Article in Monthly Contest. *By C. M. Brumfield, Van Bibber, Md.*

FARMERS as a rule do not favor raising geese on the farm because of the destruction they wage on crops. Before I learned more of the nature of this fowl, thru personal experience in raising them, I agreed with the farmer. I have seen geese mowing down young tender wheat, corn and other grains, nipping as they go, and later on in the season when the grain was maturing, they would reach up the stack and reap it of the grain.

A few years ago, when we moved back from the city to the farm, I had two geese and a gander presented me and started out a novice in the goose business, tho I had formerly had experience with other poultry. We soon discovered that the goose family is the easiest fowl to keep within the confines of a fenced range and accordingly put ours in a "medder lot," with only an old "worm fence" on one side, board and wire fence on the other sides, from which they never escape, tho pigs, calves and larger stock frequently make exit and roam on forbidden crops.

In the lot is a swamp, from which the geese get their living principally, aided, of course, by the good grass in the meadow. We never feed our flock of geese except in winter, when corn is their main food, fed on the ear—and they can shell it better than a corn sheller. In these days of high priced grain, the young goslings find a welcome on our plantation that we cannot extend to the other fowls, which have to be fed expensive grains.

The goose begins laying early in March, as a rule, and where one has a flock, it is a good plan to set all the eggs possible under one goose as soon as one becomes broody, allowing the others to go on laying a second time. If broken up from sitting they will lay the third time. Usually a goose lays from 16 to 20 eggs the first time, which is a good nestful for one to sit upon.

With my original flock of two geese and a gander, I soon found that one of the geese persisted in laying soft shelled eggs or rough shelled ones, which was quite a disappointment, but she proved so useful as a sitter that I felt she was not wasting her time as I might have felt had I set the other, having only the two geese. Where the number of geese is limited and the geese cannot be spared for sitting, it is a good plan to put the eggs under a hen, five or six eggs making a good nestful for an ordinary sized hen, tho, of course, goose eggs vary in size. I used the soft shelled eggs for cooking and found one of them equal to three hen eggs. I do not consider them good eating, as they are slightly strong in flavor if eaten alone, but they are fine for use in baking. We have a city friend, however, who prefers goose eggs to hen's eggs and I am sure would take our entire crop if we would dispose of them in that way. Each year at Easter he solicits us to send him any number we can spare. At that season of the year we are using all the eggs our geese lay for sitting, but this year we sent him three beautiful large goose eggs. He wrote us a very ardent appreciation of the

eggs and said they partially made up a very excellent breakfast Easter morning!

The second time, the goose usually lays from 9 to 12 eggs, and will lay from 6 to 9 the third time. The eggs require four weeks to hatch, and if under hens should be wet frequently (each day if possible) in warm water to help moisten and soften the extremely tough shells. Goose nature provides a way for doing this, since the sitting goose goes off her nest each day and into the water, coming back to the eggs with wet downy feathers.

It has been said that when hatched a gosling is practically raised, but I will add a little warning to the novice. First, the goslings require plenty of water to drink, but not to swim in while little, as they will surely die if "wet over the back." They must have plenty of sand and charcoal for a few days and they should not be turned out on damp ground while too young. The small gosling gets cold very easily and it is fatal to put them out before the third day, unless the weather is very warm. The goslings are also very easily injured. A slight fall, or any falling fruit, such as apples from trees, will make a quick end of a flock of goslings, as a friend of ours found to her dismay when she placed the gosling pen in the orchard.

Occasionally, the goslings are troubled with lice when hatched under hens. This trouble is not usually noticed until one sees them losing weight each day—as "light as a feather" as we say, in which case look for lice. I use kerosene on the hens and a kerosene cloth rubbed over the down of the gosling with good success, but keep a lookout, and repeat as often as necessary.

After the sand and charcoal stage, turn the goslings out. I make a pen with wide boards, moving it as often as necessary. When the goslings are big enough to climb over the boards, they are big enough to go at large, ranging about, nipping grass, catching bugs, worms, etc. After a few weeks one is disgusted to find the pretty fluffy yellow things changed into great rangy, ill-shaped beings; but when they feather up, they again become good to look at, grow very fast and by Thanksgiving or Christmas usually weigh from 12 to 16 pounds, and sometimes more than that.

The goose loses its hatchability more quickly than any other egg and should be set soon after being laid. In our locality, snappers in the swamps are the worst enemies of the goslings. Several of my half-grown ones last year made fine eating for snappers, but the flock that escaped made fine Christmas dinners for a number of families, and I will add there is no finer eating than young goose, well fattened with corn for a few weeks before killing. An old goose is not good to eat, the meat being strong, but the older the better for breeding stock if kept by themselves. A very old gander, however, is apt to be cross with other fowls where all are kept together. It is said that geese live to be 100 years old, but I am not giving this out as my own statement—not having had any

ONE OF OWEN FARMS' PRIZE WINNING PENS OF S. C. WHITE ORPINGTONS. NOW THE PROPERTY OF ROBADEL POULTRY FARM, A. C. ROBERTSON, OWNER, COS COB, CONN. MR. ROBERTSON HAS PURCHASED OWEN FARMS ENTIRE FLOCK OF WHITE ORPINGTONS.

handed down from great grandfolks as a family heirloom.

The mature stock should be picked every six weeks, beginning about April or May and continuing until cold weather. All the under down and feathers should be removed. This adds greatly to the comfort of the fowl as well as adding to the profit of the business. Geese are uncomfortably warm with a great coat of down on in summer and appear greatly relieved with some of their "clothing" removed. The picking of six geese or six pickings of one goose makes sufficient good-downy feathers for a large pillow. The picking of live geese is not inhumane as some people seem to think. From personal experience I know that the goose on being picked utters no "protest or plaint." All the cackling and racket comes from the remaining flock, yet to be, or previously picked. We pick them out of doors on a calm day, placing the feathers in large wash tubs or other receptacles until ready to bag them. A humorist in our neighborhood once said that the meanest people he had ever known were three women who, while picking geese, stopped to chase one escaping feather all around the yard. Our experience is that some feathers escape, even on a calm day, but we hang on to what we have and let them go.

The goose feathers her nest with down, and makes her nest upon the earth. If the eggs are to be placed under hens, I make the nest upon the ground, if possible; but if not, I put sods of earth in the nest. A goose's nest is not hard to find like those of the turkey and guinea fowl. If a barrel is placed conveniently, the goose immediately chooses it the first time, later she will go off to a wood or swamp, but Father Gander stands near by, giving her hiding place away with his cackle. This year we had an interesting experience with a goose who laid her first litter of eggs in the barrel we had left for her nest from which we took the egg she laid each day, but for the next lot Mrs. Goose went off to

the swamp and fixed her nest on a dry bunch of tussocks, surrounded by *real* swamp. My husband put on his rubber boots and secured five eggs of the second laying, which I immediately placed under a turkey hen that had stolen a nest to sit on 11 of her eggs, and the turkey hen brought out 5 goslings and 8 turkeys. Later my husband went wading out again to visit Mrs. Goose and she was then sitting on the 4 remaining eggs of her second litter. We allowed her to have these eggs in her swampy nest until within one day or so of hatching time, when my husband took another wade and transferred the eggs to a sitting hen that was just about to come off with a brood of guineas, and we now have three little goslings from the four eggs. It did seem heartless to thus rob Mrs. Goose, but she could not have brought her family to safety thru the swamp, and as a wise old aunt of mine used to say: "One has to practice cruelty somewhat in the poultry business."

Goslings do not need a hen to mother them nor to care for them, as they take care of themselves very well after a short time. I propose to keep mine away from the parents until of sufficient size that they can prove themselves too much for the snappers; then all the flock, young and old, can graze contentedly together in the meadow. When the old stock is allowed to range with the goslings, the gander takes his full share of responsibility in rearing the family.

Sometimes in hatching, the goslings need a little assistance in getting out of the shell, especially if the eggs are hatched under hens and not enough moisture has been supplied, but as a rule they hatch well and good strong young ones. A woman of my acquaintance who has been raising geese for some years had a goose hatch 9 goslings from 8 eggs, one egg being a double one. Two perfectly good goslings hatched from the double egg. I might add, however, that this friend is one of those sunny faced mortals who always and under all circumstances get the most out of life.

Cull the Flock Often and with Care

No One Can Afford to Be Feeding Deformed Birds or Those of Depleted Vitality. Only Vigorous, Quickly Grown Stock Should Be Retained. Second Prize Article American Poultry Journal Monthly Contest. *By Otto E. Hackman, Ft. Wayne, Ind.*

STRICT culling of the young stock is a necessity if progress in breeding is to result. Neglect in weeding out undesirable specimens will prevent progress in breeding and in profit making. We must keep culling out weak, undersized chicks thruout the growing season. All chicks which fail to grow and develop quickly will, by being forced while still young, often attain fairly good size and general appearance, but all such birds should be fed only long enough to put into marketable condition. Cull out all undersized chicks and place them in a flock by themselves, where they should be fed a special fattening ration until of marketable size.

There are various reasons for frequent culling of the flock. A bunch of culls running with good birds, invariably detracts from the good appearance of the rest of the flock. A few undersized, runty chicks can mar the beauty of an otherwise fine looking flock of birds. Nothing is gained by holding them over longer than just time enough to fit them for market. Poultry feeds are scarce and high and no one can afford in these days to be feeding deformed birds or those of depleted vitality. Only vigorous, quickly grown stock could be retained.

It may be well to state here a cause of weakness in the young stock as hot weather comes on—a cause which many amateurs are apt to overlook. Overcrowding is fatal to the proper development of growing chicks, and with it, should be classed overheating, which is a direct result of overcrowding chicks in small, filthy, poorly ventilated brood coops on sultry nights. Under such conditions the chicks "sweat" excessively which affects the vitality and weakens the chicks. When thus overheated, the chicks are also easily chilled when they rush out into the early morning air, and frequently colds result.

Experienced poultrymen can easily detect a weak or ailing chick, but the novice is not so apt at the culling process and is prone to overlook weakness or under-development in chicks, and keep on feeding birds which should either be marketed or sent to the family table early in the season. A good habit for the man raising poultry to acquire is to notice the actions of the chicks. A good healthy chicken is always busy. The weak, under-sized chick is seldom busy, usually displaying no ambition to run about and scratch. He spends the greater part of the day sitting around, or standing on one leg, while all the healthy chicks are constantly on the go, in quest of bugs and insects. The weak chick mopes about and seldom has a full crop.

Scanty feathering or "slow feathering" is another indication of weakness in chicks. When the chicks appear to have difficulty in feathering or the feathers are coarse and rough appearing, the chick's vitality is not of the best and it should be placed in the cull pen and fattened for market or the table. A small shrunken body that seems to take on no flesh, and a thin crow head, dull eyes, thin shanks, weak piping voice, and an inclination to "squat" instead of run about are all indications of a lack of vitality and chicks possessing these symptoms would be culled out at the earliest possible moment. Excessively long wings and small bodies are also noticeable in some chicks and are indications of bodily weakness.

The healthy vigorous chick is always noticeable by its show of life. The body is full size for the age, the feathers bright looking and smooth in appearance, the legs are sturdy and the eyes bright. Particularly should the legs be big and husky, of a size sufficient to support a well developed frame. Thin, puny legs are not apt to carry about healthy vigorous bodies. For this reason, grass range for growing chicks is particularly desirable, where they can exercise freely and range about in

the grass, getting their fill of bugs and worms. A healthy chick on range manages to pick up and scratch out a goodly amount of food which his body requires for its proper development and which is not always supplied to penned up flocks where range is impossible. A grassy field where the chicks may enjoy both sun and shade is ideal for growing chicks. If good wholesome feed is supplied them in quantity, as well as plenty of drinking water, the percentage of chicks to be culled out under these conditions will be very small, if indeed there are any weaklings in the flock.

There is the very great advantage in separating the culls from the well developed chicks, in that both flocks will respond in better growth and development because of the separation. There is little or no chance for the weakling as long as he is crowded about and pushed away from the feed hoppers by stronger, larger chicks. On the other hand, the healthy chick always looks better and grows faster if the flock is in good physical condition as a whole. Keeping the two flocks separate will thus aid in the development of both, and the quicker the weaklings are in condition and sent to

market, the better it will be for the poultryman's pocketbook.

Chickens are naturally ardent daylight savers and they go to bed very soon after the sun sinks below the western horizon. They are ready to begin their day's work as soon as it is light enough to see to scratch. Every minute they are kept shut up in a close coop after that time retards their best development, especially is this true during the hot summer weather. It is difficult to put flesh on a bird that is kept shut up for an hour or more when it is eager and restless to get out in the open. Just open the coop some morning when you oversleep and watch the rush to get out and stretch, to flap wings, and crane necks, in an effort to recover from staying overlong in too close quarters. Make every effort to have the roosting quarters of chicks airy and of sufficient size to allow plenty of room for the chicks moving about. Put them in open-front colony houses as soon as they are sufficiently developed to remove from brood coops. Supply plenty of roosting room and get them out on range as early as possible in the morning. There will be few weaklings in the flock if these simple precautions are taken.

Encourage Experienced Poultrymen

Let Us Not Allow Large Practical Plants to Go into the Discard. *By J. D. Simmers, Baltimore, Md.*

I HAVE lately read several reports of talks and lectures given in various parts of the country relative to the plans now on foot for the conduct of "the war after the war" in regard to the expansion of business when peace shall have been declared. As one who has already found it necessary to give up my business because of unfavorable conditions I have been greatly interested to find that in practically all the foreign countries and in some respects in our own country definite plans have already been formulated for the reorganization of business.

At the beginning of the war I was operating a market poultry plant, but, as has been the case with many others in this

line, I gave it up and went to the city to work for a salary. It would be difficult to estimate the number who within the past two years have found it necessary to give up poultry keeping. I understand that in the allied countries there are no market poultry plants in existence today, and that in nearly every case where poultry is being kept, it is on a back lot scale. It would thus appear from all the available information that there is actually a very grave shortage in poultry, notwithstanding the fact that both poultry and eggs are low in price in comparison with their food value and the prices on other foods.

There are so few foods comparable in value with eggs, that a shortage in poultry would prove a real calamity, and for this reason I watch with alarm the breaking up of established plants, and the advocacy of back yard flocks to take their places. It seems to me there is coming a time when we shall need poultry raised on a large scale on market plants, since there is really no better food to be had at less cost. Fowls consume a grade of grain and feedstuffs, which are not fit for human food and no one of intelligence can deny that they convert it into first-class human food. Why, therefore, should poultry keeping on a large scale be discouraged with nothing in sight but the occasional small flock to take the place of these big plants? All lines of "big business" are making their plans to meet after war conditions, but so far as one is able to see from the surface, poultrymen are permitting their business to become completely disorganized and put out of the running, and this at a time when every effort should be put forward to combat unfavorable conditions. There is an old adage to the effect that "Heaven helps those who help themselves," and I think it applies very well in this case. Certainly no one can save the poultry business unless the poultry keepers are ready and willing to save it for themselves.

Literature is being circulated thru the country to the effect that the big grain farms of the Middle West can raise enough poultry to supply our whole people and that these farms are today shipping such vast stocks of poultry and eggs into storage that we need have no alarm as to future supplies. The Middle West and great Southwest have been supplying the storage people with eggs for many years, and while we frequently read reports that there is greatly lessened production of poultry and eggs thru those sections at the present time, yet they may be able to supply all eggs required for storage. In Eastern cities, however, vast quantities of poultry and eggs are consumed which have never occupied space in storage and comprise a supply which if cut off by lessened production on market plants means a tremendous loss of an important food supply. There is no way to estimate the amount of poultry and eggs raised near and eaten by inhabit-

ants of the thickly populated communities of the East. Before the war there were all thru the eastern half of this country immense market poultry plants, some of which were selling for immediate consumption as high as one million and a half dozens of eggs annually and yet these plants were unable to supply the demand for eggs in the East, and thousands of storage eggs were imported from the Middle West to meet the deficiency. If the market plants of the East are put out of the running, who is going to supply the eggs for the Eastern cities and thickly populated communities? From reports that have come to us thru reliable agencies, poultry holdings have been cut down on Middle Western farms from thirty to sixty percent, so it does not appear that we can look for our poultry and egg supply from these sources by way of the cold storage route.

I notice that Edward Brown, of England, who is lecturing in this country, on the poultry situation, is discouraging market poultry keeping. In a statement widely quoted, he says: "I would rather have one hundred men keeping ten hens each, than one man keeping one thousand hens." I believe in encouraging every man, woman or child to keep back yard poultry, who can possibly do so, but I believe it a mistake to do so at the expense of the specialty producer. If every city man with a back lot were to keep a flock of ten hens, there would still be call for big market poultry plants and with the present plan of disorganizing poultry keeping on a large scale, it will take fifteen or twenty years to again place the business on its feet. In the meantime, people are going to want poultry and eggs and eventually they will have to pay the price which these products should everywhere command. Moreover, ten men with ten hens on ten city lots will not be able to produce eggs at less cost than a competent grower with one, two, or three thousand hens on a farm, nor will he be able to utilize an equal amount of waste food per bird. While in the poultry business on a farm, I was able to utilize quantities of waste food, stuff that could not well be fed except to poultry, but with my little flock on a city lot, all the waste we have for poultry are crushed egg shells, apple and potato skins (not peelings) and occasionally a little gristle from meat from which all the nourishment has been extracted. Human food is always much more expensive to feed to poultry than the inferior quality grains and feeds which the poultry keeper buys for his flock. With the present day condition of great scarcity of human foods, no one should advocate feeding table waste to poultry, for table waste is nothing more nor less than human food which has been allowed to waste. In some localities now they are keeping an eye on waste of human food. Wherever it is found that stale bread,

left over cereals, broken crackers, wormy meals, scraps of meat, etc., are thrown to dogs or chickens or put in swill receptacles, the householder is politely informed that waste of human food is no longer permissible in a world threatened with wide-spread food shortage.

The back lotter should be encouraged to keep poultry, but let us not make the serious mistake of asking him to keep poultry on table scraps. Let us tell him the truth of the matter, that poultry requires grain, but not the milling qualities of grain required for human food. In a country the size of ours there is always a vast quantity of grain and grain by-products which is good for feeding poultry and other animals but not for human beings, but which when converted into poultry, eggs, beef, milk, sheep and swine makes human food of the finest quality and highest nutriment.

I believe that at this time it a great mistake to allow the big market poultry plants to discontinue. Every effort should now be put forward to retain those which are still in operation. Further disorganization of market poultry and egg production means serious loss to our people generally. We cannot hope for cheap grains during present conditions, because grain cannot be produced cheaply while farmers are subject to the same heavy war time expenses that all other business men are. It is a waste of time to figure on feeding poultry cheaply, because it cannot be done, whether we have a back yard flock of ten, or a farm flock of ten thousand, but when the producer knows that it is costing him from sixty cents to one dollar a dozen to produce eggs he knows he cannot afford to sell them below, or at this figure. He also knows he is producing a first-class food which is needed, and therefore his business should receive every encouragement. We all know that the business cannot be conducted profitably at the present time, but let us work to the end that *it must be made profitable because it is a legitimate necessary industry* and let us not place too much confidence in the statement that ten hens in every back yard will supply our people with poultry and eggs. We need both poultry meat and eggs produced on the large plant, and the only way to get these products in sufficient quantity is to work for better prices on poultry and eggs. This must come eventually. The only question is, shall we in the meantime allow the efficient, economical and large scale production of poultry and eggs to become completely disorganized, and consequent greatly higher prices to consumers to pay for this calamity, or shall we stand solidly behind the men who are hanging on against fearful odds, and put our shoulders to the wheel to make poultry keeping what it ought to be, a profitable undertaking whether in ten hen or ten thousand hen flocks.

Were I to Start in the Poultry Business

By A Breeder

WERE I to start in the poultry business—I mean, were I to start over again—I can see how I could have avoided some disasters, and how I could have progressed faster than I did. But, after all, every beginner must matriculate from the School of Experience; and if he seeks the cause of failure, if he diligently hunts for the reason of the trouble and finds it, and then masters the difficulty, he may be rightly called an apt scholar; we may look for his success, with a very small tuition fee having been paid to Dame Experience.

Not so with the careless student, the student who does not apply himself to his task. It is he that has the heavy loss; it is he who pays so much bounty to experience and who finally becomes discouraged and quits the business.

The reader may have recently attended a poultry show. He sees visions of black, brown, red, and white hens in his dreams; he has made up his mind that he wants to start in the poultry business because he feels that he will derive a great deal of pleasure from a profitable investment.

He will choose his variety purely as a matter of fancy in many cases; he likes a certain color best, he thinks them very handsome fowls. Certainly he could not choose his breed from any other standpoint, for he knows none. But were

he to purchase a horse or a cow from a large stableful, he could hardly make his choice from the standpoint of color, unless all other things to be considered were equal. He would make his choice from the practical side, from the standpoint of downright usefulness. But this lesson of breeds and their special points, their varying types and strong and weak points, he has yet to learn. Some day, if he succeeds, he will be able to give some good reason why he chooses this or that variety.

I would never again start as I did, with scrubs. There is but one way in my mind to succeed, to make the greatest success, and that is with thorobred fowls. You ask, Why? There are several reasons. If you have a thorobred flock, they are uniform in size and color. Should you sell them, they are an even lot. If they hang in the market, their uniformity is at once conspicuous—an even size, shape, plumpness, and color of skin; it is bound to commend itself to the purchaser.

Again, the thorobred flock can all be fed alike—not so with a mixed flock. The grade Leghorn and the grade Orpington want different feed, a different quantity, and fed differently to them. One is much quicker than the other, nervous and active—to use the horseman's term, they don't hitch well

together. You cannot get the best out of both at the same time, and you are losing on one or the other—more correctly, on both of them. To succeed in these days of hustle, you must get the most out of everything.

Again, a flock of thorobred hens lays eggs of a uniform shape and color, which is an especially strong point with the fancy trade. But suppose we lay aside all these reasons, and ask why was this breed originated? What was the purpose in view? If Holstein, Durham and Jersey cattle each have some particular line in which they are especially strong, why not in the different breeds of fowls?

Certainly there was a reason. Breed "A" is a meat producing variety, it has great size and good flesh. Can you expect a scrub to equal it? Breed "B" is an egg producing, non-setting variety. If eggs are your chief aim, it will excel the common hen.

Wouldn't it be wiser to select a breed especially strong in the production of eggs, for instance, that has back of it a century, perhaps, of breeding, one that has a fixed shape, color and size, than to buy some large and some small speckled and polka dot pullets and mate them with a calico "rooster" and perchance raise some lavender chickens? A crazy quilt? No, a crazy poultryman! Common sense and good judgment tell you that if you have the opportunity to take advantage of the other man's brains and hard work by keeping the breed of fowls that he has perfected, you ought to do it.

You may not desire to enter the fancy business, and say that common chickens are good enough for you. They are not. When your hen hatches scrub eggs, you do not know what kind of fowls they mature into, and you are sure that they will not be alike. What you do know if you have thorobred fowls is this, that the chickens will be uniform in size and color. There is no uncertainty, and if you are familiar with the breed you will know also to a day how long it will take to make a broiler, and at what age the pullets will begin to lay. You are banking upon no uncertainty as you do with the common fowl.

Don't misunderstand me as saying that there are no breeders of thorobred fowls that do not make mistakes in breeding for feathers instead of utility, and that will advertise their breed as being the best layers, etc. You must use your own

judgment in selecting a breed and then purchase from a breeder who has the future of the fowl at heart, and don't breed toys for you to play with, but tools with which you can chisel out a fortune.

If you in your dreams have had a great future painted on the canvass of tomorrow, remember that nothing worth while grew in a minute, but started from a small and humble beginning. One of the great blessings of the poultry business is that it offers the opportunity of success to all alike, the rich or the poor.

I, personally, know of one of the leading judges of the country, who was an orphan, began without a dollar and now has one of the finest equipped poultry plants in the United States, all earned and paid for by the hen.

The boy with limited means can succeed if he is a careful, painstaking student. Two dollars and a half will build him a coop and park large enough for ten hens. A piano box of thirty square feet, with a window in what was the bottom, and a roost and nest, you have a little hen house that is plenty good enough to begin with. Make it tight and warm and dry, and you will be surprised what a convenient little coop you have.

I believe that the person with limited means who desires to start right will find it slightly more economical to purchase eggs for setting, but I wish to emphasize the fact that the greatest care must be taken of the hen that is intrusted with them or you may lose all. I am aware that there are many who think it better to purchase baby chicks, and they may be correct, but I prefer to put the extra money into the best quality of eggs and bank upon my ability to properly and successfully bring off a good hatch.

The greatest care should be taken to prevent lice. Dust the hen thoroly, at least twice while setting, and watch the chickens very carefully. Be quick to note any one that seems to be dull; train your eye so that at a glance you will detect the trouble; school yourself so that you become apt. Just as it requires practice to add a column of figures quickly and correctly, so does it require skill to tend any chickens and do it quickly and thoroly. It requires years of study to become a lawyer or doctor—can you become a poultryman in a day? Of course not. If you suffer loss, don't quit, but profit by the lesson and let it never occur again.

What a Woman Can Do If She Will

By Mrs. Chauncy Simmons, Route 3, Erie, Kansas

THERE are many women who don't know the value of a dollar. Never earned a penny in their lives, but spend dollars. A large percent of these women have the ambition to help their husbands, if they only knew what to do. I have found in my own experience that I can help my husband and children thru poultry. I was raised in town, taught school one year, and, at the age of 19 years, married a farmer's son, and moved to a farm at once. I became interested in poultry, and raised about 300 chickens each year, but

sold to local merchants. Thought I was helping wonderfully, and I did.

But in 1910 I became interested in thorobreds. I bought 100 R. I. Red eggs, and since that time have been building up my flock. For the past 4 years I have had a nice business of shipping stock and eggs. And as I had become so interested in better Reds each year, I decided to join the Kansas State Poultry Federation, and attend the State Poultry Show. So, in December, 1915, I started for Topeka, Kansas, to spend

FOUR FIRST PRIZE MALES, CHICAGO, 1917, OWNED BY U. R. FISHEL, BOX A, HOPE, INDIANA

four days in the show room. I attended all the lectures, and was benefited very much by them.

But the one that I derived the most good from was a demonstration and lecture on caponizing. I took quite an interest, but thought I can never do that, for I have poor eyes. I am obliged to wear glasses, and can't see very well with them. I rather doubted the lecturer's word, when he said, "They grow very large, their comb never grows, they never crow, and the meat is the finest flavor of any other meat." But, dear sister and brother, this is all true.

In May, 1916, I sent for a set of instruments. I was very nervous, expected to kill every one, and put it off, from day to day. Finally my husband told my mother, "If we ever have any capons, I'll have to make them; I can see that now." Mother told me, so I braved up and decided to surprise him. On July 13, 1916, I shut up four little fellows (just large enough to tell they were roosters) and on the morning of July 15, after my husband had gone to the field, I sent the children down in the orchard to hunt a supposed hen's nest, then began the much dreaded job. O, how I trembled and shook. My head ached and I felt as weak as a kitten. When I got thru with the first one, and he was ready to eat and drink, I began to brace up. I called the children to come and see. They were so happy, and screamed with joy, "O, mamma, we knew you could." I was successful in the next two, but killed the fourth one. July 21, I worked on 11 more, killing one. July 28, 20 more, killing none. August 1, 11 more, killing two. August 2, 18 more, killing two. August 4, 19 more, killing two. August 5, 4 more, killing none. August 9, 12 more, killing one. August 13, 13 more, killing none. August 16, 12 more, killing none. August 18, 17 more, killing none. August 21, 15 more, killing none. September 1, 8 more, killing none. September 8, 5 more, killing none. September 11, 26 more, killing none. September 28, 4 more, killing none. November 1, 10 more, killing none. Out of these 125 were for myself. The remainder for mother, sister and friends. I lost very few after operation, and that was by accidents. I kept them confined in lots a few days, so I could look after wounds, to keep wind puffs down. After a few days they were marked (split outside web of right foot) and turned loose on the free range. They are great rustlers, going as far as 80 rods from the house.

On December 10, 1916, I shut up 4 and fed extra. December 17, they weighed 7½, 8, 8½ and 9 pounds each. I sent these 4 to the Kansas State Poultry Federation Show, and won third on display of capons.

On January 10, 1917, I shut up 25 more and fed chop wet with milk or warm water. Sometimes I put in some bran. I fed this in troughs two or three times a day, keeping the troughs clean of filth or trash. I fed whole corn at night, as they tire of chop altogether. Kept fresh water and oyster shell before them all the time.

On January 23, we dressed 20 of the best ones, dressing according to directions. We weighed them on small kitchen scales. They weighed 138 pounds and 14 ounces same evening they were dressed. We shipped these to Brockman Commission Co., St. Louis, Mo. On January 31, we received our returns, which were as follows:

20 capons, 137 lbs., at 27 cents.....	\$36.99
Less express and commission.....	4.40
Net proceeds	\$32.59

We immediately shut up 25 more, and fed as before.

February 7, we dressed 25 more. Our weights were: 19 capons, 128 pounds 8 ounces; 6 slips, 40 pounds 12 ounces. Shipped these to P. M. Kieley, St. Louis, Mo. February 16, returns as follows:

18 capons, 122 lbs., at 28 cents.....	\$34.16
6 capons (rough), 38 lbs., at 25 cents.....	9.50
1 slip, 6½ lbs., at 20 cents.....	1.30
Less commission and express.....	5.51

Net proceeds

We kept 25 to 30 capons in the fattening rooms all the time now.

February 14, we dressed 20 more. Our weights were: 14

capons, 84 pounds 7 ounces; 6 slips, 36 pounds. February 19, returns as follows: From Brockman Commission Co., St. Louis.

11 capons, 67 lbs., at 26 cents.....	\$17.42
8 slips, 47 lbs., at 24 cents.....	11.28
1 stag, 6 lbs., at 15 cents.....	.90
Less commission and express.....	3.60

Net proceeds

February 27, we dressed 27 more. Our weights were as follows: 19 capons, 106 pounds 2 ounces; 7 slips, 40 pounds

Second Prize Buff Orpington Hen, Chicago Coliseum, 1917. Owned by Walhalla Poultry Farm, R. 1, Oscoda, Mich.

2 ounces; 1 stag, 5 lbs 13 ounces. March 5, returns as follows: From Brockman Commission Co., St. Louis.

25 capons, 142 lbs., at 24½ cents.....	\$34.79
2 slips, 10 lbs., at 21 cents.....	2.10
Less express and commission.....	4.74

Net proceeds

The remainder were kept for home use, some were sold here for roasts, some dressed and sent to relatives for presents. I have kept some for mother, and will see how they do for that.

Husband and I had never seen a capon dressed or undressed, but we dressed 92 in January and February, and realized above expense of express and commission \$130.19. They would have brought more per pound, but were young and didn't weigh heavy enough. This year I expect to begin earlier.

The ones I made capons for last year, said: "O, their meat! The finest I ever saw. How I do wish I had more made last year. I'll sure have some more made this year."

When I first began to caponize, I dreaded it so, but now I would rather caponize than eat, when I am hungry. I expect to teach the children this year.

I would not be without capons, if I made them for table use only. They are fine eating, much better than turkey or hen.

Notary Public.

"What Everybody Says"

We were talking the other day with a veteran farmer and commercial poultryman. He is now well past "70 years young," as he used to put it, and he has been very successful during his lifetime in the business, altho he says he has always earned the greater part of his income thru trading and real estate deals. We tried to get him to give us his opinion of the immediate future of the poultry business, but he would not definitely commit himself and was inclined to generalize. Following, in part, is the result of the interview, in the old man's words, as nearly as we can recall them:

"What everybody says, and what everybody 'pears to think, is most likely *not so*. Leastwise that's been my experience.

"Now, I've got a neighbor that I've known, man and boy, for nigh onto fifty years. He always had a reputation for bein' an onery cuss. 'Worst boy in the whole village' everybody said. The brothers and sisters down at the meetin' house used to pray for him to be 'snatched from the burnin'' pretty regular. He was always accused of being mean with animals, leastwise everybody thought and said he was. But most folks had to admit that even as a boy he was a hard worker and worth as much in the field as any two men.

"He was too tough to get along well at school and was bound out when he was about twelve years old. He didn't get along well with the teachers and didn't have much chance at book learnin'. Used to come to my place to work often and I never had any fault to find with him, but everybody said he was bad all thru. He got into cattle tradin' after a spell and did pretty well at it, but his reputation stuck. He got arrested a good many times for 'cruelty to animals,' but most times the judge let him off for 'lack of evidence.' One or two times he was fined, but the evidence was mostly circumstantial and even the judge said he fined him pretty much 'on account of his reputation.'

"Now I never saw him do anything bad except go on a 'toot' a few times when he was down on his luck and fight and cuss hard when he was mad—and mostly he didn't seem to be mad on his own account but just a hoppin' because

somebody else had been treated pretty mean. But everybody said he was 'a bad one and terrible bad with animals'—and he *did* used to have some pretty hard looking old plugs for hosses—so I got to feelin' that perhaps folks was right, until some things happened that set me to thinkin'.

"The Swede's baby, just a toddler, got hold of a bottle of gasoline and drank some and there was nobody home but a eleven-year-old sister. Neighbor was going by with a drove of cattle and heard the children scream. He piled right in, left his drove in the barnyard and went to work on the baby, then hitched his horse to the Swede's buggy and took the child to the nearest doctor and brought them both back with him. The doctor told me about it afterward and said Neighbor saved the baby's life, but Neighbor never had anything to say about it. It was like it was all in a day's work for him and when I tried to bring it up one time, he just acted huffy and wouldn't talk.

"Then I got sick when my best heifer came in and Neighbor came down and took charge of the place. Got mad and cussed a lot when I tried to pay him for it. I had rheumatiz and could putter about the place, but wan't much good for work. That heifer was valuable and, of course, she had to go get herself all busted up in the barb-wire fence. Neighbor took care of her as tender as a woman and I never saw him even lose his patience once, tho she kicked and thrashed somethin' wicked when he'd milk her and dress the cuts. Just talked to her 'sif she was a baby: 'So bossy, so bossy, I know it hurts, but I got to do it and I can't help it.' And when she'd step hard on his toes or kick him hard, he'd only say 'ouch, bossy, that hurts like blazes.'

"One day I says to him, 'Why don't you strap her up? No use gettin' all banged up.' Says he: 'I been handling cows for over forty years and I never strapped, or struck, or yelled at one yet, and I won't let nobody else do it neither. Guess you'd raise — if you got hurt like that.' I believe, he told the truth, too, for it come out earnest like and was the longest speech I ever heard him make about himself.

"So you see, Mister, what everybody says and everybody thinks is pretty likely to be wrong. Lots of folks know a lot of things that ain't so, and the more they tell 'em about, the less truth sticks to the story. Majorities is most often in the wrong and minorities right, leastwise that's my experience. And when a minority gets to be a majority, it gets wrong, too, and there's a new right-minded minority born. Just think it over, Mister.

"Now you was askin' about the poultry business, and all I

got to say is that it takes a lot of pluck to stick it out and may cost a lot of money. I'm an old man, but I'm goin' to stick in a small way, so's I can come back good anytime I think business is goin' to be good. That don't mean going in heavy when things are against you, but it is a long ways from quittin'. But, you just remember what I said about Neighbor and apply it to the poultry or any other business. Most likely you'll find that what everybody says and everybody thinks *just ain't so!*"

That covers our interview pretty well, and we present it here because we believe it is well worth pondering over. A real optimist, you know, can make lemonade out of the lemons that are handed him. And a man isn't a pessimist because he can see trouble coming or obstacles in the path; probably he is more truly an optimist—because he sees the difficulties and tries to overcome them—than the man who blunders blindly on and bumps himself hard on obstacles which he will not see and says do not exist.

There's a Difference

There is a vast difference between keeping poultry for amusement and pastime, or as a side-line chiefly for home supply, and egg farming or market poultry growing for a living. Some folks do not seem able to see the difference, but we believe, that among other things which the reconstruction period is due to bring, that vision will be granted in this particular also.

Poultry keeping will never be upon a solid and permanent foundation until work with poultry, as well as other work in food production, becomes a reasonably sure means of earning a livelihood.

Eggs and poultry are necessary foods, among the best foodstuffs we have, and they should command a price at all times which will insure a fair and just profit for the producer. It does not help matters to say that one "should not expect to make a living from hens," that they "seldom prove profitable on a large scale and can only be counted as a farm side-line or as a fancy." The production of any staple food ought to be a paying business, and just so long as it is not there is something decidedly and radically wrong—a wrong which must be remedied if we are to progress. It will take some folks a long time to realize this—for example, those who get an income cutting coupons on securities handed down instead of having to get out in the world and dig hard for a living. People, who were born with a golden spoon in their mouth and have been carried about on a cushion, are going to get a few eye-openers when everybody has to do real work or fight.

As in everything else, all branches of the poultry business and allied interests are each and every one dependent upon the others. Unless all "nick" and fit in so as to work harmoniously together, everybody suffers. It is well-enough gallery play to shout about "the fancy for fanciers exclusively" and to try to keep alive the old contention between differing factions in the poultry world, but it does not work well and it hurts everybody. Each and every one of us are dependent upon each other and we ought to be working together as a harmonious whole instead of bickering over pet theories or our special idea of exclusiveness.

The fancier-breeder is dependent upon the beginners and the utility poultrymen for a large part of his business. He needs the egg farmer, the market poultrymen, the poultry shows, the poultry publica-

tions, etc., and each and every one of them need the beginners. Then why not try to work together in harmony for the common good of all instead of eternally striving to stir up strife?

The person who goes about all the time with a chip on each shoulder is certain to get one or both chips knocked off sooner or later. Earnest, honest, dependable men are now working hard to bring about successful and efficient organization of the whole poultry industry. It is natural that some self-seekers should try to grab the control for personal gain. It ought not to be difficult to differentiate between the man who is saying three words for himself and one word for organization and the men who are putting their whole energy into effort to organize the industry for the benefit and greatest good of all, with no thought of personal reward. Of course, some of the critics, hired or merely prejudiced, will knock the dependable workers. That always happens, but we believe that all poultry keepers are competent to distinguish between self-seeking, greedy individuals and those who are unselfishly working for the common good. Even some of the "old guard" may have the scales drop from their eyes in time.

Help organization, don't hinder it.

Don't Waste Feed

Don't waste feed. Even tho the crop forecasts predict bumper crops this season, remember that "there is many a slip 'twixt cup and lip," and the growing season is only fairly started. It is a long time yet until harvest. All of the grain and feed we can produce will be needed.

In some sections of the country there is already serious shortage of feeding grains and mill feeds. It is not unlikely that, taking the country as a whole, we shall be obliged to use our supply with exceeding care in order to have enough to go around until the new crop is available.

Do not waste grain and feed. Make every ounce count in helping to produce poultry, eggs, milk, beef or pork.

It is wasteful to attempt growing more chicks than you can care for properly and secure the best growth. It is wasteful to carry more male birds than are needed beyond marketable size as small roasters. It is wasteful to feed runts and non-productive fowl. It is wasteful to overfeed and equally so to underfeed. Keep the flocks well fed, but not overfed.

Where one has a small flock it is easy to fix the feed allowance so that there is no waste. On the farm, with cows, pigs and other animals besides the poultry, there is no need of any feedstuff being wasted. A little system will adjust the feeding so that there is efficient conservation.

Rats are the worst grain and feed wasters. Keep up the fight against rodents. It easily costs \$3 per year to board a rat in these times, to say nothing of what he damages and destroys. Make war on rats with dog and cat, as well as with good traps, rat bane, and by shooting. Digging out the rats, with a good Airedale dog to assist, is the best way to rid the earth-floor poultry houses of this pest. Traps, and barrels partly filled with water and fitted with a tilt-board on top, work well; but any trapping device must be changed from time to time, as the rats become wary of it.

Don't waste grain, it will be needed.

Boost Standardbred Poultry.

THERE is no lack of interest in poultry keeping. The campaign of the poultry husbandmen, of the U. S. Department of Agriculture, for increased production of poultry, has brought many beginners into the field of poultry work.

Probably the primary interest of these recruits to poultry keeping is the production of food, meat and eggs for the home table. Many of them have bought market eggs for hatching purposes, or have secured a flock of adult fowls at the live-weight market price or at the lowest price for laying hens. Certainly many of the flocks we have seen show little preference for breed or even one variety. There has been a very good demand for low-priced hens for a family flock of layers and for baby chicks at "utility stock" prices. Of course we would like to see them all good quality Standardbred stock, believing that such stock would give far better results, but

TO OUR READERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every advertisement in this issue is signed by trustworthy people, and to prove our faith we will make good to our subscribers any loss sustained by virtue of their having purchased fowls or goods from one of our display advertisers.

All we ask is, that in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. In all cases in writing to advertisers say, "I saw your ad in American Poultry Journal."

the fact of chief importance is that a big army of beginners is becoming interested in a family flock of poultry—back yards that never before harbored chickens are now giving space to a

promising flock of growing chicks. This is a hopeful indication of better times coming in the poultry business.

Every beginner starting this season with a war-time flock, even tho he grows mongrels or mixed stock, is a good prospect. He is developing an interest in poultry and eventually will want to have better poultry. It is up to our breeders to develop these prospects, to demonstrate to these beginners the superior quality and value of Standardbreds. Boost Standardbred poultry. Advertise and circulate information concerning Standardbreds. Make the poultry shows more attractive and offer inducements for novices to exhibit their birds in competitive classes. If every friend of Standardbred fowls will "do his bit" now to stimulate and hold the interest of the beginners, next spring season can be made one of the most successful and satisfactory for the breeders of Standardbred poultry that we have experienced in a long time. Every beginner with a back-yard flock of mixed fowls or mongrels is a prospective fancier. Approached in the right way, he can be easily brought into the ranks of the producers of Standardbreds. Get him interested. Help him to get started right. See that he gets a square deal and good breeding stock to start with. Help him as you would like to be helped if in his place.

There never was a better opportunity to develop and greatly increase public interest in well-bred, well-kept flocks. Just forget that "the fancy poultry business has been all shot to pieces." That is a matter of ancient history now. A very considerable number of citizens in every locality all over this country have become interested in "keeping hens to help out the family food supply." Naturally they want the best and the most for their money. It was to be expected that the majority of them would make a beginning with low-priced eggs, chicks or stock. We cannot help that, but it will be the fault of our fancier-breeders if these beginners stop with cheap flocks of nondescripts. We know that the best is not often the cheapest at first cost, that it pays to start with the best stock one can afford. That breeding to a standard can and will develop both uniformity and productivity. That a well-bred flock of Standardbreds should produce more meat and more eggs than a flock of nondescripts. We know these things, but does the beginner know? The chances are that he does not know, that he thinks any kind of hen will lay and that "mixed flocks lay best." To him "eggs is eggs."

It is up to the fancier-breeder to get in touch with such beginners, to interest them in Standardbreds and to demonstrate to them in a practical and convincing manner that well-bred stock gives best returns for feed and labor, as well as proving more pleasing to the eyes. He can interest the beginner thru personal talks, thru correspondence, thru advertising and articles written for the press, and he can hold the beginner's interest by helping him to secure good stock at a fair price, by getting the "Golden Rule" into his business dealings, by making beginners welcome at the shows, and by putting a strong element of fraternalism and good fellowship into his relations with beginners. In the old days, before commercialism became as rampant as it has been during recent years, the old-time fancier-breeders used to extend a cordial wel-

Common Sense—

Common Sense Scratch Feed and Egg Mash carry a triple-assurance guarantee—right in the sack that the feed comes in:

1. The guarantee is written—making it official and binding.
2. Specifically guarantees *better results*—which means that this ration is guaranteed to be a better, less expensive and more productive feed than any you have used.
3. It protects you. It says without any qualifying phrases that if you do not get better results with Common Sense Feeds we buy back the feed you have left and pay all transportation charges on the original shipment to you and all charges on the return of the feed to us.

Could anything be more fair? Could anything be more assuring and iron-clad than that?

The same guarantee covers our famous Common Sense Baby Chick Feed. Write for samples and prices—today.

THE FAMABELLA COMPANY, INC.

Potter "Redybilt" Poultry Houses

Don't Build - It's Cheaper to Buy

An old reliable Potter ready-made henhouse can be purchased for less than it would cost you to build one. They have been used and recommended for over 16 years by thousands of poultry keepers, all over America. A clean sanitary house, nests and roosts mean healthy hens and lots of eggs. Do your part and the hens will do their part.

Roosts,
Nests, etc.,
Ready to Use

A \$39.50 Potter House Portable, open front, fresh air, scratch shed house, equipped with 6-ft. 3-Perch Potter Henhouse Outfit for 30 hens.

For Less Than Cost of Making

Sanitary, portable, inexpensive. You start right when you install Potter outfits—roosts, nests, drop-boards coops, hoppers, etc. Get rid of makeshift, unsanitary disease-breeding fixtures and make a bigger success of your flock.

Get the Potter Book—it shows over 100 pictures of portable houses, coops, henhouse outfits, etc. Mailed free for two red stamps to cover postage.

HILLVIEW FARM

Box 27

LINCOLN, MISSOURI

come to all beginners, give much time to helping them toward success and to developing the budding interest in breeding quality poultry. We need more of this same spirit of co-operation and fraternalism today, and less of the apparent loss of interest once a prospective buyer has become a customer and parted with his money.

This is not a time to lie down, curl up, and quit the business. There should be better times and better business close ahead of us in the coming season. It will be our own fault if we fail to get our share of it. The men who get the business will be those fancier-breeders who can and will deliver the goods; the men who keep their advertising everlastingly before the public, who give every customer a square deal, who will inconvenience themselves to satisfy the customer, even tho he seem unreasonable, and who treat every prospect and every customer as if they hope to make a friend of him and hold his trade for all time.

This is the time to boost Standardbred poultry. Our good Uncle Sam is pushing a vigorous campaign for more and better Standardbred poultry. This is your opportunity to benefit from the greatest publicity campaign Standardbred poultry has ever known. Business will be what you make it. Get into the game and play your hand for all it is worth.

Don't Throw It Away.

AN OLD friend of ours has a favorite saying: "Don't throw away money, it's valuable." This does not mean that he is penurious, for he is a "good spender," but that he does not like to see money wasted.

We do not like to see money wasted and therefore we will paraphrase our friend's saying in this wise: Don't throw away advertising, it's valuable.

Advertising is cumulative in its effects, it gathers strength and pulling power thru constant repetition. To advertise vigorously and then quit is a waste of money. Spasmodic bursts of advertising are wasteful. It is like trying to start your furrow with a jerk when a long steady pull is needed. Advertising needs to be continuous; the reader should find

your "bid for business" in every issue of the result-getting publication. If you drop out to start again later on, you waste a good deal of what has gone before. As John Wanamaker says: "Advertising doesn't jerk—it pulls. It begins very gently at first, but the pull is steady. It is like a team of horses pulling a heavy load; but half the power is required to keep it going that is necessary to start it."

This is a big country, we have all sorts and conditions of climate and seasons. The trade in poultry supplies, hatching eggs, baby chicks, breeding stock, etc., should be a year around business; *will be* if you go after the business right.

"Toot your horn, if you don't sell a fish!" is another way of saying that "It pays to advertise," but it pays best to advertise all the year thru and to keep everlastingly at it.

With Uncle Sam's agents boosting

Standardbred poultry thruout the entire country, with the incessant urge for everybody to keep a back-flock, better business must soon come to poultrymen. Advertise and get your share of this business. Do not throw away the accumulated pulling power of past advertising by slowing down or quitting now, add power and pull to your advertising by keeping up a good strong publicity campaign. "There's just as good fish in the sea as ever were caught," there are more poultry business prospects in sight now than there have been for some time, get good fresh bait on your hook and go fishing for customers. If you go about it right you will get and hold your share.

BETTER ACT QUICKLY. We never have had enough for our early demand. Take advantage of the normal conditions of express service. Just as soon as grain and winter coal starts moving railroads will again be jammed.

SURE, WE'RE GOING TO WIN THIS WAR. Uncle Sammy has too many resources up his sleeve that KAISER BILL underestimated.

YES SIR-EE. The hen, too, is going to play her patriotic part, and especially the LAYING HENS. What other country can boast of a strain like the Parks' Strain with careful selection, trap nesting and pedigreeing for eggs since 1889. **WOULD YOU WONDER** they so easily out-layed the 2500 birds in Missouri laying contest, from 37 states and 8 foreign countries, and made the remarkable winter month record of 194 eggs in Jan. (3 birds). **NO,** we don't make the broadest laying claims, but just remember in all these 28 years they have laid their way into universal popularity while hundreds with greater phenomenal laying claims have come and gone.

Catalog giving history of strain, and valuable information, a dime. Circular free.

ALTOONA, PA.

Dr. Woods' Notes and Comment

"It does us no good, but real harm, to believe only that which we would like to believe, to allow the wish to be the father of our thoughts. It is better to be guided by hard facts than false hopes. The best hope is the recognition of the truth and firm determination to overcome every difficulty."

—Boston Globe.

Henry C. Wallace says: "If we are to fight effectively we must know the truth. The quicker we get thru with the gush and boasting, the better it will be for us."

Boost for greater consumption of eggs and poultry meat. Too many people are knocking eggs and urging the use of egg substitutes. There are no substitutes for new-laid eggs from well-fed hens. Summer weather is slowing up egg production somewhat and egg prices

S. C. White Leghorns

Breeding, Laying and Exhibition Stock for sale. Meadow Lark Farm, Box 3, Route 3, Elgin, Illinois

should soon be more satisfactory. Eggs still continue to be one of our best and cheapest foods and the price has never yet climbed to a figure proportionate with feed costs and the prices of beef and pork. Eat eggs and urge others to eat more eggs. Greater consumption will encourage increased production.

Well-shaded, well-grassed range combined with liberal feeding will help summer egg production. Hens which have reared early broods of chicks should be in prime condition and can be kept shelling out eggs all summer.

Shade from the hot sun, shelter from sudden showers, cool drinking water in clean vessels, freedom from lice and mites, good green range, plenty of wholesome food but no food allowed to stand around and sour or mold, comfortable well-aired sleeping quarters, small flocks and no crowding are essen-

tials to successful chick growing—particularly so at this season.

Where small bare runs must be used, scrape and sweep them clean before heavy rains. Then spade up or plow and sow to oats, rye, or other quick growing stub to sweeten the soil and supply greens.

Poultry droppings will promote quick growth of all truck if used carefully in the garden. When weeding or thinning out the garden, do not forget the poultry. Confined fowls and chicks will relish garden waste and put it to good use.

The welcome June rains came too late to help much with the hay crop, but they worked wonders for the growing crops which the long dry spell threatened to kill before the young plants had a fair start in life. Potatoes are looking fine, corn is in fair shape but not up to last season and did not come up any too well, much of it having to be planted over. Strawberries, which were hard hit by the drought and badly dried out, have taken on a new lease of life since the rain and are coming on rapidly. Bugs and caterpillars are unusually plentiful here, where we usually have far too many of many kinds, and insecticides are difficult to obtain. The growing chicks and the birds are making war on the insect pests but cannot make any appreciable showing against such hordes. The gipsy and brown-tail caterpillars, rose bugs and cut worms are our worst pests, while the army worms and corn worms are exceedingly troublesome. New England seems to be more afflicted with dangerous insect pests than any other section. Where there is so much woodland, and large acreage of second-growth scrub, it is practically impossible for individuals to make headway against the gipsy moth caterpillars, which are killing off the hard wood and are now attacking trees of all sorts.

Judging from correspondence, some of our readers in the Central states do not understand conditions here in the

First Prize Cock at Madison Square Garden, December, 1916

ROBADEL POULTRY FARM

C. ROBERTSON
Owner

COS COB, CONN.

East. We have good markets, it is true, and have the advantage of being nearby cities where the top prices can be secured. We have low priced farm land, but it is pretty well robbed of its fertility and requires much manure and fertilizer to secure a crop. Early and late frosts are exceedingly troublesome. War conditions have practically denuded our farms of labor. Right in our little town most of our farmers are working nights in a munitions plant, five nights a week, for \$18 to \$20 per week, and working the farm all day Saturday and Sunday and afternoons the rest of the week. Even at that they are having difficulty to make both ends meet. Most of our supplies must be shipped in from the Middle-west and Southwest. Shipments are irregular and uncertain on account of railroad congestion. Very little grain is grown here and it will be some time before much can be grown; shipments from the West have been slow and uncertain; local shortages of grain and feeds have been frequent. Such conditions are not conducive to increased production. Our already congested population has been greatly increased because of war activities. Prices obtainable for farm produce have not kept pace with the steadily advancing cost of production.

* * *

We still have difficulty in securing mill feeds. Some bran is obtainable at \$2.60 per 100-lb. bag, but middlings are scarce and cannot be obtained in some localities. Altho the price was fixed on these products last Christmas, some dealers, who have a small supply of old middlings, are getting from \$2.80 to \$3.25 per bag for them. No supply is available in our town. Oats and corn are a little easier but still far above normal prices. A good stock feed, such as we used to buy for \$1.50 per bag, now costs us \$3.40.

* * *

This is a good time to thoroly clean and renovate the poultry houses. Burn all old nesting material. Bury old litter in the compost heap. Sweep dust and cobwebs from the walls of the house. Put on whitewash with a sprayer, or, if prejudiced against whitewash, paint walls and sprinkle floor with crude petroleum.

* * *

Keep nests clean. Collect eggs often. Keep eggs in a clean cool place where temperature does not rise above 50 degrees. Use an egg tester or a small electric light to candle all eggs sold to private trade. Candling is easily and quickly done and it pays.

* * *

Look over the jars of preserved eggs and make sure that the water glass solution is at least an inch deep over topmost layer of eggs. If there has been much evaporation, more water glass solution should be added. Mix it one quart of water glass syrup to nine quarts of boiled water and be sure it is cool when poured into the egg containers.

* * *

Charcoal kept before the birds is helpful in preventing summer diarrhoea. Barley meal and wheat middlings added to the mash are also helpful. Give clean, cool, fresh water and keep the fountains clean.

* * *

Ducks and goslings may be easily brooded in ordinary box coops without

heat at this season. If you have waste pasture land available, try a brood or so of goslings. After they are well started they require very little attention, except shelter, green range to graze on and plenty of drinking water. Ducklings require more grain than goslings, but are easily and quickly grown. Green ducks should be ready for the table or market when from ten to eleven weeks old.

* * *

Start hatches the last of this month for chicks intended for winter chickens or soft roasters.

* * *

Some hatcheries are offering baby goslings, ducklings, and guinea fowl. Look up your local hatchery for supplies if you do not find what you want advertised.

* * *

Open up the poultry houses, brood coops and brooders on warm sunny days. The powerful heat of direct rays of summer sun will soon make poultry quarters exceedingly uncomfortable unless due attention is given to running things wide open.

* * *

The University Farm, Minnesota, reports that grain rust threatens the crops all thru the wheat belt. As the old lady said: "If it isn't one thing it's another." Grain rust harbors on and spreads from barberry bushes and the work of eradication of barberries is being speeded up. Here in the East we have the pine blister rust, which uses the currant and gooseberry bushes as its intermediate host, and State authorities are compelling the digging up and burning of gooseberry and currant bushes. The pine blister rust seriously threatens the life of our growing white pine timber. We like currants and gooseberries, but the plants have had to go, as the pine timber is far more valuable and necessary. The gipsy moth caterpillar, when fall grown, has developed a taste for pines and other evergreens and is becoming very troublesome. These pests do not seem to be affected by poisonous sprays after they reach an inch and a half long, every high wind drives them before it from infested woodland and they attack any green growing thing on which they land. We have had millions of these ravenous and repulsive pests blown in on our place the past three seasons, and this year they are more numerous than ever.

* * *

The All-Northwest laying contest in its report makes the following statement:

"Under present prices of feed with a flock average of 12.5 dozen eggs per bird per year, eggs must net 40 cents per dozen to make a wage of 30 cents per hour for the poultryman. Four classes of poultrymen can survive under present conditions.

"1. The man who produces a part or all of his feed, in particular grains and milk.

"2. The man who operates on a scale over the average, so that a small income over feed per bird can be multiplied sufficiently to make the business pay. This means large investment, labor-saving equipment, high-grade stock, better than the average facilities for buying feed and marketing eggs.

"3. The man who sells day-old chicks, hatching eggs, exhibition and breeding stock.

"4. The man who has an adequate bank account back of him, with faith in the poultry outlook sufficient to warrant the setting of present loss over against future prospects."

Why should the poultryman be expected to be content with 30 cents an hour, assuming that he can get it? Skilled labor everywhere is bringing

Mention the American Poultry Journal when writing to advertisers.

from 75 cents to \$1 per hour. Ordinary unskilled labor is collecting from 40 to 50 cents per hour for a short day. The U. S. Dept. of Labor, in a recent press statement, said that farmers should pay 40 to 50 cents per hour with board for farm labor. Is it reasonable to expect the proprietor of a poultry farm, with capital invested, to take all risks and do the work of producing valuable food like poultry and eggs, for 30 cents per hour, or less than an unskilled laborer's wage? Here in Massachusetts last year eggs averaged to bring 45 cents per dozen, which did not break even with production costs in most cases.

* * *

Cull the flocks often and weed out the undesirable. If there are any weaklings or runts in the flock, cull them out and force feed them in a small run for food. Select promising specimens now for the fall fairs and give them special care in comfortable quarters and well-shaded runs. Small flocks are best when growing stock for show purposes.

* * *

Early pullets, intended for fall and winter layers, should have liberal range on grassland with abundant shade. Keep them well fed and growing steadily.

* * *

Adult stock, which is thru laying and which is not to be carried over another winter, should be marketed or canned for home use before the molt. Selected yearlings which are to be wintered should, if possible, be given orchard or woodland range and fed sparingly on hard grain. If range is ample and greens abundant they will need little grain and will pick up enough insects to supply animal food. If insect life is not plentiful, skim-milk, scalded-fresh fish, beef scrap or fish meal should be supplied. Made to hustle for the greater part of their living until the latter part of August and then worked on to regular laying ration, they will molt early, make a clean molt, and come into laying when eggs are at top prices. It is not wise to force stock intended for breeding purposes for fall and winter eggs.

* * *

Commenting on the self-appointed advisers of our farmers and constant appeals to the patriotism of our food producers, *New England Homestead* indulges in the following sarcasm:

"Mr. McAdoo granted the railroad employees an extra quarter of a billion of dollars; the farmers of New York the same day were cut 1 cent a quart on milk. The farmer should display his patriotism by producing cheap food, that the man who is in a munition plant working a few hours a day and receiving from \$4 up may be care free and happy. Why not treat farming as any other business? If munitions are needed, or any other material, money is forthcoming, factory is built, and the investment is expected to pay reasonable dividends. Land is plenty and on the market. Why do not some of these advisers form companies, buy the land, feed the world and grow rich; if they are satisfied there is money, health and wealth in it, and not be forever giving away a thing?"

Organizing.

POULTRY co-operative organizations are being formed in many different sections of the country and the poultry press is speaking a good word for these organizations which are to protect the future of the poultry industry.

I believe that co-operation is the keynote to success in any undertaking. Even the nations of the earth must eventually co-operate, one with the other, one for all and all for one, or fall. Co-operation in a family means that the family will prosper. Co-operation in the community means that its interests will enlarge and grow in usefulness. Co-operation wherever and whenever tried has helped, according to the real co-operative spirit displayed within the organization.

During the past spring I have attended several meetings called for the purpose of perfecting poultry co-operative organizations and, because of the existing unfavorable condition in poultry keeping, have been greatly surprised at the large numbers gathered together to effect an organization, many coming from long distances and at great personal sacrifice and expense. It appeared to me that conditions were never more favorable for the formation of a good live working organization. In one instance an organization has been formed, but with a much smaller membership than should have been enrolled. Certainly twice as many members should have been included at the start and several thousand more should now be a part of the organization. Why is this not the case?

From talks with various producers, I venture the following opinion: Organization, to be effective, must include the great majority of those engaged in the work of the industry to be organized. A small minority of the poultry producers of this country may organize and decide how best to save the industry, but without the great majority the organization may make rulings and regulations which they will be unable to carry into actual working. Co-operative poultry organizations should include all poultry keepers as members. How may this be brought about? By giving

every member of the organization the same privileges, regardless whether he keeps ten hens or ten thousand. It is of far greater interest to the man with ten thousand hens to have the man with ten to one hundred hens a member of the organization than it is to the ten-hen man himself, because the latter can afford to dispose of his few surplus eggs at any old price to his neighbor and thus curtail to a slight extent the demand for eggs from the big plant.

The thing which every co-operative poultry organization should bear in mind is that every poultryman needs such an organization and every poultryman is ready and willing to become a member if he is given a square deal, and that without every poultryman, big and little, the organization cannot bring about the result for which it is formed.

At one meeting which I attended when an organization for the protection of poultrymen was in process of formation, a somewhat lengthy discussion was participated in, relative to the rights of members, opinions varying considerably as to whether members should have equal voice in governing the organization or according to the number of fowls possessed by the member. Naturally the members of the organization were to be taxed according to the number of fowls kept, the funds to be used for the support of the organization and especially to bring about improved conditions in poultry keeping. Dissension arose over the proposition that a man keeping 100 hens should be accorded only one vote in the meetings of the organization, while a man who owned 1,000 hens should have ten votes and one with 10,000 hens could practically control the organization with his 100 votes, especially if he happened to have a friend or two in the organization with an equal number of votes. In this way, two or three men could out-vote the entire organization.

After the meeting I talked with a number of those present and overheard numerous groups discussing this feature of the organization and the verdict generally was, that this ruling, which was adopted by the organization, would keep

J. W. GARVEY Box A THAYER, ILL.

out the greater number of poultry keepers.

I am well aware that in all stock companies a man with one share of stock gets only one vote and a man with fifty-one percent of the stock controls fifty-one percent of the votes, but I am convinced that agricultural organizations will not accomplish their aims by the adoption of this procedure. Many years ago, men voted according to the amount of property they owned. A man owning no property had no vote, but this has long since been declared undemocratic and detrimental to the best development of the nation. It will eventually be found to be equally as detrimental to any company or organization.

A man or woman may engage in the poultry business on a small scale with little capital and he may do this while he is earning his living at some other employment. The big producer cannot, therefore, so easily squeeze the little fellow out of the poultry business as he can in other lines of trade and no matter how he may contrive to control prices on poultry and eggs, he must compete with numerous little producers in every locality. An effective organization of poultry keepers should include every man, woman and child who keeps ten hens or more, and every member of the organization, whether he owns ten hens or ten thousand, should have an equal voice in the organization. I believe this would bring about the much desired, much talked about poultry co-operative organization, with clubs or branches in every county and state in the Union, which could bring about the results all poultry keepers seek—an opportunity to make a fair and honest living. Within a year it would be possible to have practically every poultry keeper in the United States a member of such an organization. I would like to see the opinions of other poultrymen on this subject published in AMERICAN POULTRY JOURNAL. How many are ready to work for the success of such an organization? Massachusetts. J. H. Morse.

A Word from Australia.

I have been trying to get some good photographs of the birds in our egg laying competition, a report of which I have sent you, and expect to forward same to you soon. Will also send you the results of the State Government competition in a later mail.

The AMERICAN POULTRY JOURNAL is the "goods" and it is read by our household from cover to cover each month. Australia. E. J. Hardy.

Experience With Fruit and Poultry.

I regret that AMERICAN POULTRY JOURNAL is not read by the entire consuming public of this country, because of the conscientious and truthful stand which you have taken in regard to the unfairness shown food producers in this country at the present time.

I have particularly enjoyed reading Dr. Woods' Notes and Comment, and my experience agrees perfectly with what he has to say on the food situation, except that he speaks of easier conditions in the Middle West. I have always considered that I live on the northern edge of this section, and I can assure you that conditions here are just as trying as anywhere in the country. I believe the only poultry products that can get by under present conditions are those pro-

An Expert's Experience:—

"We have been using Carbola at the Vine-land Contest during the past year and a half with remarkable success. It is not only a disinfecting solution easily and thoroughly applied, but it is also an excellent germicide, and due to the fact that it leaves the interior of the buildings white, adds much to their attractiveness. We are using it extensively at our poultry plant at New Brunswick and contemplate going over all our houses this summer in preparation for fall and winter."

One of the best known and highly esteemed poultry experts in the United States wrote the letter from which the above is quoted. You will be equally pleased if you use

a paint in powder form combined with a disinfectant many times stronger than pure carbolic acid. It is non-poisonous—harmless to the smallest chick—but it kills lice, mites, etc., and helps keep the germs of contagious diseases, such as roup, white diarrhea, glanders, contagious abortion, etc., from getting a start and spreading thru your flocks and herds. Carbola is ready to use as soon as mixed with cold water and can be applied with brush or sprayer to wood, brick, stone or cement surfaces. No disagreeable odor; will not blister, flake or peel off. One gallon covers 250 sq. ft.

SAVES TIME LABOR AND MONEY

when used instead of whitewash in poultry houses, stables, dairies, cellars, piggeries, outbuilding etc. Endorsed by thousands of poultry, dairy and stock farms.

duced by the backwoods country woman who trades eggs for calico and who makes no account of what eggs cost to produce.

I have forty acres of fruit land (light soil) and the trees are all doing finely, but produce no income yet. Our small fruits are profitable, and with our poultry and cows and raising some early vegetables, we have always had something to bank on yearly, until this past season, which shows our business management is not at fault.

Presuming that the law of supply and demand was still in force, we began the winter with confidence and managed to hang on, without mortgaging, to pay feed bills until spring.

By exercising the strictest economy and by having enough cash to pay our board and throwing in our labor without charge, as well as having the advantage of the Chicago market, we managed to pull thru to grass. Beginning with January, I had a 50 percent lay from White Leghorn pullets housed in open front houses and they climbed to 80 percent. Just now they are back near 50 percent again. These birds easily cost me \$1.25 each before they laid an egg and they are not paid for yet.

This neighborhood has many commercial poultrymen, with flocks up to 2,000 birds, and practically every one of them has had similar experiences or worse. There were also heavy losses in this section on account of the restriction on sale of hens.

I want to be able to make a living here until my trees come into bearing, and moreover I should like to be able to buy a few small bonds to show my patriotism in a substantial way, but it is bad business to spend the money which such a business as mine should net—but does not.

Michigan. H. W. Haddock.

Guineas.

It is not too late to hatch out a few broods of Guineas in July. There is no finer eating than Guinea chicken, roast, fried or broiled. They are great foragers, mature quickly and every farm should have a flock of these lively little fowl. The eggs are as good as hen eggs and the Guinea hen lays every day during the laying season. The egg is slightly smaller than a hen's egg, the shell being speckled. On our farm we raise a good flock of these birds each year and they serve as gleaners in the grain and grass fields, roaming all over the farm and picking up the greater part of their living. They are given the freedom of the farm as soon as the grain and grass is cut and it is surprising the amount of good food they find as they glean the fields. If these birds had to be fed three meals a day, few of us could afford to raise them in these days of high priced grain, but as they go about themselves and gather up the waste seeds and grains left from harvesting and convert it into good juicy meat, we regard them as real conservers of foodstuffs. It would cost man a great deal to save this waste grain and it would not be worth the price, but the Guinea goes about the job, day after day, from the day he hops out of the shell, and keeps it up until he develops into a sweet, luscious broiler or roaster. Every farm should have its flock of Guineas.

Pennsylvania. S. R. Bryde.

SABRINA FARM

WHITE Wyandottes

are bred primarily for heavy egg production. We believe that our breeding stock should not only be vigorous, lay large hatchable eggs, and produce heavy laying offspring, but should also be real standard high quality birds that can hold their own in the show room. We have recently purchased the entire flock of

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

I HAVE bought, or, rather, am paying for fourteen and three-fourths acres of land at Alderwood Manor, twelve miles north of Seattle. I intend to raise poultry and Belgian hares. Have had considerable experience in both.

Could I raise fruit and poultry together? The land is logged-up land and gravelly. It is on top of a hill and well drained. Now, I don't know anything about trees or market conditions in Seattle, but my wife and I want to make a success of our undertaking. I am 35 years of age, "sound and a good worker." The Puget Mill Co. advises the planting of fibert nuts, but they cannot supply stock for

another year. I want to move out there early next spring and still keep working in the ship yards. We have good interurban service.

Please tell me what to plant and would it be all right to set out trees this fall? I have heard that there are several medical plants and herbs that could be grown here. Do you know about that?

Washington.

A. W. Anderson.

You certainly can profitably raise fruit and poultry together. It is an ideal combination. The character of your land as regards air drainage, water drainage and soil is extra good. You should have none, or little, damage by frost, as the cold air will seek the lower ground. Then the water drainage is all right. That is important. You do not say what kind of sub-soil you have. If it is of clay so much the better. A gravelly loam with clay sub-soil is ideal for fruit growing.

Now as to what kind of fruits you should plant. Your soil is ideal for the growth of small fruits, especially raspberries and blackberries. It seems to me Seattle ought to take all the fruits you could raise and at a good price. Set aside a number of acres for a commercial orchard. I cannot tell you just how many acres, for you must decide that yourself. It looks to me as tho you have exceptionally good soil for the production of cherries. From your description of the soil it is ideal for cherries. Consult your state authorities as to just what variety is best suited to your immediate locality. Set trees 20 to 25 ft. apart. Intercrop the young orchard with raspberries. Be careful to leave several feet of space between the rows of berry bushes and the young trees. Bear in mind that the cherry orchard is the main thing in this enterprise and that the berry bushes are temporary—put there to bring in a revenue while the cherry trees are maturing. Of course, you will want some apple trees. Also some pear, peaches, plums, grape vines, currant and gooseberry bushes. Owing to the fact that soil and climatic conditions are so varied in your state (as in all mountain states) I will not name varieties for you to plant, but advise you to consult your state authorities.

I advise you to be careful in the planting of medical plants. You might investigate this matter, but I do not think it worth your while to do so.

I am no longer a subscriber to American Poultry Journal, as I am compelled to give up the farm for a while, as my husband is going to enlist in the service soon and thinks it best not to leave us so far from town, as we are eight miles from the nearest town. I have been away for some time and just recently returned and find a host of letters from people inquiring about Arkansas. It would be impossible to enumerate all the letters I have received since I wrote that letter to you last December. I have tried to answer all I received, but some found they way to another Mrs. Call and some were addressed wrong, so I suppose there are some I will never get. For the good of all I am going to write a description in general of this part of Arkansas. I want to say this, that never before did Arkansas look so good to me as on my arrival from the dirty, dusty streets of the city.

Eureka Springs is in the northwestern part of the state. It has an elevation of 1,462 ft. and a population of 3,572. It has the finest mineral water that nature can produce and is a noted health resort. The country is mountainous and the soil is naturally adapted to fruit and berries of all descriptions, also grapes. Gardeners and truck farmers, dairymen and poultry keepers do well around Eureka Springs; in fact, anyone can raise anything

JULY CHICKS LAY

Sheppard's Famous Anconas WAR BABIES

July hatched make ideal winter layers. They quickly mature under warm summer skies, grow into hardy birds, and start laying in December. They just get nicely started in the Christmas month and then settle down to real business in January.

they want to almost. The land is mostly rough and gravelly, but produces well. We have mild winters usually. The past winter was the coldest ever known. The temperature dropped to eighteen degrees, which is something unusual. Our summers are pleasant, as there is seldom a day when we haven't a cool breeze blowing. There is fine farming land around Berryville and Hiresville, also along King's River and all other small streams. The upland will produce where it doesn't look like it would sprout peas. Good farms with modest improvements can be bought for \$15 to \$25 per acre. Unimproved land can be bought for as low as \$5 per acre. Of course location has something to do with it. Places close to town sell for more than those farther out. We have a good market the year around, almost on a par with the Kansas City and St. Louis markets.

Last year was a wonderful, bounteous year with us. We raised a wonderful crop of everything. Our sorghum was the finest I ever saw—as clear as honey—and we had all kinds of fruit. Our hills are now covered with huckleberries, which will begin to ripen the last of this month and will ripen on till August and September—free for the picking—and they are luscious good fruit too. Last year the woods were one great grape vineyard. I never saw so many grapes. This is not always so, for often they get stung and blight. Bees do well here. Most every family has a few hives of bees. There are lots of bee trees to be found in the summer. The bees are doing fine this spring.

We also have ticks and chiggers. It would not be right to mention all the good things and forget these harmless mean things. There was one lady who wrote me asking if we had snakes. Yes, we have them, all shades and colors, but one does not take much notice of them, as they are usually just as anxious to get away from us as we are from them.

I trust I shall be able to greet some of my American Poultry Journal friends in Eureka Springs some time and hope to be able to renew my acquaintance with American Poultry Journal folks as soon as this terrible war is over.

Arkansas. Mrs. Miles Call.
* * *

In answer to James K. Sweet, Ontario, Canada: I am sure you will make no mistake in planting Early Elberta and J. H. Hale peach trees. To fill out the season you should also have some Krummel October and late Elberta. McIntosh Red and Wealthy apples are ideal for your section and you will make no mistake in planting these varieties. Yes, Winter Banana is a good apple and a profitable variety in some localities, but I advise you not to plant largely to this sort.

* * *
You probably know that the state of Kentucky (the land of mystery) is very different from any other place on earth and I would like your opinion as to just what kind of fruits would thrive best in this part of the state.

I am located in the center of the new coal fields in the mountains of southeastern Kentucky, Perry County. The river valleys are about 800 to 900 feet above sea level. The valleys are usually sandy loam, the slopes of the mountains are sandy loam and clay subsoil and the tops of the mountains are clay-like. We have enough rainfall. The winters are sometimes severe and sometimes we scarcely have any winter at all. The most peculiar condition of the climate is the sudden changes of temperature, the thermometer dropping from fifty to sixty degrees one day to zero weather the next. The spring season is sometimes real warm in later part of February and March, causing the fruit trees to bloom, then a freeze coming in later part of April or May to kill all the fruit. I have seen eight inches of snow here on May 20, long after garden truck and corn were being cultivated. Fruit brings high prices here. Eggs run from 30c to 80c per dozen.

I am thinking of planting a commercial orchard and would like your opinion as to just what kind of apples, peaches, pears, plums and cherries would be best suited to this section. The different kinds of apples now growing here which were mostly brought here from Virginia and N. Carolina are the Melom, Queen, Horse, old striped Ben Davis and Yellow Sweet. They are almost sure bearers here. Peach trees only live about three to five years here.

I have a demonstration orchard of 100 trees from Stark Nurseries, containing about twenty varieties of their highest recommended apples. These trees have been growing about three years and are looking well.
Kentucky. S. M. Boggs.

The Thrift Feed for Chickens

You certainly have an exceedingly changeable climate, and one which it is hard for a fruit grower to reckon with. It seems to me that notwithstanding your fickle climate you ought to make a success of fruit growing, for your market is first-class. I feel confident that if you will locate your orchard on the mountain side you will experience no trouble from frosts. Down in the valley where the cold air lodges as it comes down from the higher ground, the conditions for orchard planting are all wrong. The orchard on the higher ground will find an ideal condition.

Now as to varieties which you say do well in your immediate locality. If you can get good crops of these apples annually, and they are apples which can be sold at a good profit, why not plant those varieties? You speak of Ben Davis as one of these sorts. I believe you can sell all the Ben Davis apples you can raise and at a big profit. If the old Ben Davis does well there the Black Ben, which is the same type of apple, but better in every way, will do equally well. They are great keepers, immense yielders, large and beautiful and the south will take all you can raise. The Early Melon is an apple of the Wealthy type, which is especially suited to your conditions and will make you big money. Be sure and plant this variety.

In cherries, plant mostly Montmorency, with a few Early Richmond. Pears—Lincoln and Keifer. Peaches—Early Elberta, J. H. Hale for main crop, Krummel October for late. Plums—Gold, Endicott, America and Omaha. Wish you would report as to the behavior of the trees in your demonstration orchard.

* * *

In answer to Mrs. R. P. Clarke, Maryland: You can easily destroy the big black ants that are building mounds on your lawn. Place about one ounce of carbon bisulphate in a dish and set same on top of hill. Cover with a tight box. The fumes of the bisulphate are heavier than air and will penetrate to the bottom of the holes made by the ants, killing ants and all eggs. Be careful in handling the bisulphate in that no flame reaches it.

* * *

Our Lincoln pear trees came thru the test winter unharmed and will give us a big crop of fruit as usual.

* * *

For a number of years I have been much interested in the Henry Clay apple. This is a native of Kentucky. It is the earliest good apple with us. I was afraid it would not be hardy enough for this climate, but it has gone thru two test winters without being damaged in the least. Last winter took a number of sorts that were supposed to be entirely hardy. I am not yet prepared to advise the planting of Henry Clay here in a commercial way, but I believe it is entirely hardy. It is a heavy bearer of extra good looking and high quality fruit. I am very enthusiastic about this apple. In a few more years we can tell for sure as to its value as an orchard tree here.

* * *

At this writing, farm crops are looking extra good. The corn is up and even with what we all supposed was very questionable seed, the stand is a good one. We are having more rain than we need, but our usual dry and

KEEP your fowls tuned up in health and production by feeding Conservation Scratch. Answer the wartime call for more eggs and more poultry.

Conservation Scratch does it at minimum feeding cost—keeps fowls lively and healthy, gives them energy and strength. This economical and effective feed is a perfectly balanced combination of corn, kafir corn, milo maize, barley, oats, buckwheat and sunflower seed. It is a top-notch scratch feed which analyzes high in food value and does the work.

Krause Feeds for Poultry Needs

Krause Poultry Feeds bring success to every poultry raiser. They are the result of careful analysis by poultry feed experts, and the product of one of the largest poultry feed manufacturers. Conservation Scratch and Krause Mash are the ideal feeds for egg production and body building. Conservation Chick and Developer feeds will give chicks the

right start—make them grow to strong, healthy, fine fowls.

Order Conservation Scratch, Krause Mash and other Krause Poultry feeds from your dealer today. Write us if he cannot supply you immediately. Send for free samples. Put your fowls on Krause feeds and profit as thousands of other successful poultry raisers are doing.

Joram's
Lice Rid
Keeps Them
Comfortable

One Size
3 Ounce 50 Cts.

THIS STUFF WORKS!

What poultry keeper can say that his flock is free from lice? These abominable vermin take all the pleasure and profit out of poultry keeping—they make the hen uncomfortable and mopey—they kill the chicks—they even kill the grown hens. It has been said by an authority that lice are responsible for more dead birds than any other enemy of poultry.

JORAM'S LICE RID KILLS THE LICE

It is a remedy for lice that never fails to work. It kills lice, and it prevents lice from getting onto the birds afterwards. JORAM'S LICE RID will kill HEAD LICE on CHICKS.

EASILY APPLIED

JORAM'S LICE RID is not like the other lice killers on the market—you KNOW they don't work—but JORAM'S goes after them in a "DIFFERENT" way. Vermin have a "base" of operations, just like submarines. You apply JORAM'S to the "base"—and the lice never move from there. That's where they die.

JORAM'S LICE RID IS ABSOLUTELY GUARANTEED to do the work, if directions are followed, or money refunded.

CHEAP It costs less than 1 cent per bird to apply JORAM'S LICE RID, and that's the end of it. You need this key to success in poultry raising. You need it now. One size, 3 ounces for 50 cents.

G. L. DU BOIS, Distributor, COBDEN, ILLINOIS.

growing weather will come in due time. It always does. So why worry? Our farmers have put in an increased acreage of all crops. They are doing all they can to co-operate with the government officials in the effort to produce more foodstuffs and thus win the war.

* * *

Dr. Sumner Gleason, of Kayesville, Utah, originated the Early Elberta peach. In a recent issue I credited the introduction of this great peach to Prof. Dean Sumner. I do not know how I came to make that mistake. I ask Dr. Gleason's pardon.

* * *

In answer to Clarence Thorp, of Minnesota: The Peter apple is very much like the Wealthy. In fact, it takes an expert to tell the difference between these two varieties. Both were originated by Peter Gideon of your state. I would plant the Wealthy were I in your place.

* * *

The following letter refers to Major Lloyd C. Stark, who some time ago resigned the presidency of the Stark Nursery Company and enlisted in the service of his country. I know Lloyd C. Stark and was not at all surprised when I learned of the personal sacrifice he made for the good of our cause:

Louisiana, Mo., May 18, 1918.

My Dear Mr. Rigg:
I just returned home from Richmond, Virginia, where I spent several days with Lloyd. Found him working hard, but looking fine. He is commanding the Second Battalion of the 315th Regiment, Field Artillery. Expects to sail soon—in fact, I rather think he is on the water now. His battalion is the crack battalion at Camp Lee and he personally hit 19 bull's eyes out of 20, which I understand is the best record made at that particular camp. His naval training and experience is helping him at this time. He is very enthusiastic about the work and is anxious to "go over."
I know, you will be glad to learn that our copy carried in the American Poultry Journal pulled very well indeed and we are planning to use considerably more space this next spring than we did the past. There is a great opportunity for boosting fruit growing along with chicken raising, as they both go together.

* * *

Keep a sharp lookout for aphids in the young fruit trees. They will be especially troublesome this month. Spray trees with Black Leaf 40, to which add a small quantity of soap. The soap causes the liquid to adhere to the leaves of the trees. Every two weeks give the plums a spray of sulfocide. This will prevent the fruit from becoming rotten. It's a sure preventive.

* * *

In answer to Leslie T. Ward, Pennsylvania: (1) I do not know how you can wholly control the cane borer. The use of arsenate of lead just as all leaves are formed will hold this pest in check. Altho I annually spray the bushes with this poison (for the currant worm) I cannot entirely rid the bushes of the cane borer. Just as soon as you notice a cane has become withered cut it off. Follow down as far as it is hollow. You will find the worm and you know what you should do then.

(2) Be careful how you use arsenate of lead as a dust on cucumber plants. There is danger of getting on too much and this burns the plants. Slug shot is by far the safer material to use. It cannot injure the plants, no matter how much of it is applied, and it will kill the beetles on the plants. Be sure to dust the underside of the leaves and the stems.

(3) Yes, wood ashes are good to

RAISE the best broilers and roasters in shortest possible time at least expense, for your table or the market. It is a simple matter to put one-third increased weight on birds in twelve days with the ordinary feed by mixing

use on cucumber plants, but not so effective as slug shot.

(4) The Yellow Transparent apple blights badly when the tree is planted in heavy, rich soil. It is one of the very best of the early apples, and is entirely hardy.

(5) Stayman Winesap is the best winter variety for your state.

* * *

In answer to S. T. Collins, North Dakota: The Northwestern Greening apple is a hardy tree and the fruit is of fair quality. It ought to give you good returns. The tree does not come into bearing until quite old. Plant a few Duchesne, but make your planting largely of Wealthy. Patton's Greening is also a good sort for you to plant. It is a very hardy sort, a big cropper, fruit of fair quality and a good keeper until in January. Think you will find the Minor and Wyant plums hardy in your section.

* * *

The cyclone which struck a portion of Iowa in May caused great damage to the fruit trees. Trees were uprooted and carried away. The Hilton orchard of 40 acres of bearing apple trees was completely ruined. It is hard luck. Mr. Hilton, by years of careful attention and an expenditure of much money, built up one of the best and most valuable orchards in this state and it is too bad that it should thus be destroyed.

* * *

I have 3 Champion and 2 Elberta peach trees, 4 Apricot and about 10 apple trees that are just coming into bearing. We are going to have some peaches and apricot and quite a number of apples. I have been unable financially to buy an outfit to spray with until the present time. I am writing to inquire if you think it advisable for me to spray these trees now the fruit is set. I am going to get the sprayer, anyway, as I have to spray my potatoes, since the Colorado beetles are thick on them now. If you think it advisable, what would you use as a spray? Some of the peaches and apples were stung last year and a number of the apples fell off. I have the orchard pruned up in good shape and in good cultivation and am in a position to irrigate it. I irrigated it last season with the best of results. We had Elberta peaches which measured ten inches in circumference.

Kansas. C. F. Matthews.

Of course these trees should have been sprayed early in the season. It is now too late to use the materials which should have been used earlier. Watch the trees for the appearance of any leaf eating insects and for fungus growth. If necessary, spray with a combination of arsenate of lead and bordeaux.

* * *

If the raspberry, dewberry and blackberry bushes were not sprayed early this spring while in a dormant state, better get busy this month and next, and give them a thoro spraying every two weeks with arsenate of lead-bordeaux mixture. Unless properly sprayed early, these bushes are usually attacked by the anthracnose. The infected parts are circular at first and later become oval in outline. The areas are sunken. Destroy all infected canes.

* * *

We are going to have a big crop of honey this season. The whole country is covered with white clover. It looked early in the season as tho the clover had been winter killed. The sweet clover is abundant too. If we do not get a rain during the linden bloom the bees will

Makes 'Em Turn up Their Toes Mighty Quick

There isn't a ghost of a show for lice and mites on hens, chicks or nests after a dust with the old reliable Lambert's Death to Lice. It knocks 'em stiff in a jiff. As one of the big successful poultrymen wrote us, "It is impossible to get along without your louse killer," so it is with every user. There's nothing so efficient.

Don't Experiment

Follow the example of the leaders—ask any successful poultryman which lice killer has been the standard for 30 years—which is acknowledged BEST. He will tell you to

Get Lambert's

OLD RELIABLE
DEATH
TO
LICE

because he has found it always the BEST.

Don't expect to make your hens pay and permit lice to worry and annoy them. The lice will get the profit and often the hens and chicks, too. A few cents invested in Death to Lice will bring dollars in profit. Just the thing for layers, sitters, and exhibition stock. Will not injure eggs, chicks or hens or soil plumage. Get a 5 oz., 10c box at dealers to try (or send to us direct if he can't supply you). Other sizes 25c, 50c and \$1.00. Lambert's Latest copy of "POCKET BOOK OF POINTERS," a valuable book for poultry raisers. Mailed for 2c stamp.

KLEIN-LAMBERT CO.
601 TRADERS BLDG. CHICAGO

have more honey making material this season than they can take care of properly.

* * *

In answer to G. W. Hallway, Missouri: (1) There are large peach orchards in the vicinity of Rogers, Arkansas. Land can be bought for from \$50 to \$100 per acre.

(2) The Black Ben is at home in Missouri and Arkansas. As a barrel filler it is a wonderful apple. It is a great seller in the South in the winter, as it is large, beautiful and a good keeper.

(3) You will have to plant every third row to dewberry bushes in setting out McDonald blackberry bushes. The McDonald will not set fruit unless pollenized by the bloom of the dewberry.

(4) Stick to Moore's Early, Concord and Worden grapes and you will succeed.

(5) I cannot decide the question of what agreement you should make with your son for his services on the farm. I can say this, however: *Pay him well.* Better still, take him in as a partner. Don't do as the majority of farmers do—give the boy only his board and clothing. That is what is driving so many boys away from the farm.

(6) Montmorency cherry is the best of all.

* * *

We have four pairs of Grosbeaks nesting in our trees. How they do take the green peas! But they are entitled to good measure. Even if they did not destroy countless insects, their presence would entitle them to big pay at my hands. One of the females—I call her "Lady Grey"—takes much satisfaction in what she believes is fooling me. When I go down in the orchard, bordering the woods, where she has her nest, she flutters around me, and, as she supposes, leads me away from her nest. I imagine how she laughs when she tells her husband how she fooled the old man. When she seeks to lead me from her nest, I never allow her to be disappointed. I told her the other day to bring the whole family up into the garden and help themselves to the peas. And do you know, I believe she understood, for in less than an hour, she, her husband and four young ones were busy eating Little Marvel peas.

* * *

Our S. Villosa lilacs are now a grand sight. This variety is especially valuable, as it comes in bloom two weeks after all other lilacs are gone. The flower is light purple in bud, but pure white when open.

* * *

The arbutus, that very breath of spring, once was in the Chicago vicinity. People who loved it would not let it live. The lady slippers once colored the later days of spring. They are gone. The trillium is going. Even the hardy phlox and the delicate wild geranium, even violets, are disappearing in the hands of their deadly friends who will not be content with seeing them where they belong but must tear them out to carry a basketful of sad, wilted flowers home to be hopeless and faded aliens in surroundings where they can be only forlorn.

It is not sentimentalism to lament the brutality which destroys the wild flowers. If they were not worth while in the lives of human beings they would be safe. No one would molest them. The fact that they are destroyed proves that they ought to be protected.

Jens Jensen's suggestion to the board of education that two vacation days be added to the school term to give the children a chance to see the woods and fields needs another suggestion:

That the children be taught to respect what they see. It is a prevailing notion that the way to demonstrate an interest in the outdoors is to destroy its beauties. If people were in-

different to wild flowers the flowers would not be at the very edge of extinction.

About Chicago where people go in the greatest numbers the wild flowers are dying out because of the interest taken in them. They are dragged up by the roots. They are prevented from seeding. They disappear from places which they decorated to the pleasure of the very folk who destroyed them. If the school children are to be given two days as a country vacation it ought to be upon the understanding that the things they are given a vacation to see would be just as interesting for children twenty years from now to see.

If wild flowers can be protected from people who think they are worth while they will be safe.—Chicago Tribune.

The annual spring raid upon our wild flowers, vines, bushes and trees by school children, under direction usually of school teachers, is something which should be stopped by law. I live near the Iowa River and a large tract of timber land borders my home. These woods used to be full of dogwood, May apples and all the wild flowers and vines common to this section. All these "hangers of spring" have been destroyed by school children, in the presence and by permission of the teachers, who ought to be punished for their wanton destruction and for their lack of common sense.

STILES' COLORED Leg Bands

Questions and Answers

Conducted by Prince T. Woods, M.D.

Questions about poultry are answered in this department free for all readers of American Poultry Journal. Where answers are desired by mail, a stamp for reply is requested. Address all query letters to the managing editor, Dr. Prince T. Woods, Lock Box 4, Silver Lake, Mass.

Buying Hard Coal for Incubators.

Q. I am unable to obtain hard coal to run my 3,000-egg incubator and have written to both my county and state fuel administrators telling them of my handicap, but they have given me no satisfaction in the matter.

I would very much like to know where large hatcheries are getting their coal for incubation purposes and how and where I can get hard coal for next season's hatches.

Adaza, Iowa.

S. B. E.

A. We would suggest that you write to Dr. Garfield, U. S. Fuel Administration, Washington, D. C. State that you desire the coal for incubator operation and the amount needed. In December, 1917, the Fuel Administration promised:

"That if it is notified of requirements of chestnut coal in connection where such fuel is needed for operation of incubators and brooders in connection with the hatching and rearing of chickens, we will arrange to have such coal promptly supplied to the dealer in the community where it is needed. Arrangements should be made, however, to notify the Administration as early as possible of needs which may actually exist."

So far as we know that promise has never been withdrawn. Both the Dept. of Agriculture and Food Administration urge the hatching of chickens that they may be grown for food purposes. Hard coal is necessary for both hatching and brooding. At this time the Government is actively urging that coal stocks be put in promptly this summer so that transportation will be hampered as little as possible. If you present your case properly to the authorities we believe they will aid you in securing the supply required.

If you will write Herbert H. Knapp, president of the International Baby Chick Asso-

ciation, Tiro, Ohio, he may be able to assist you.

One-Piece Work Suit.

Q. Where can I buy a one-piece work suit made of overall material? I have seen such but not in the stores. Think it would be a fine thing for the poultryman.

A. Same can be had of most department stores, mail-order houses, and automobile supply dealers. If unable to find what you want, write to The H. D. Lec Mercantile Co., Trenton, N. J. (or Kansas City, Mo.), and ask about their "Union-alls." Be sure to mention that you were so advised by American Poultry Journal. This sort of work suit is the most convenient outfit for work about the poultry plant or motor car that we have yet found.

Bald Spot at Back of Head.

Q. What is troubling my fowls? They show back of comb a bald spot. Some small and some larger. It is not on any other part of body, but just back of comb. I thought it might be depluming mites and have applied vaseline, but without results. Poultry house is clean and free from vermin.

Marinette, Wis.

H. C. W.

A. Do not believe it is anything serious. Frequently it is due to feathers pulled by an active male bird during service. Anoint bald spots with vaseline and feathers will grow in again in due time.

Whole Corn for Chickens.

Q. (1) Will whole corn hurt young chickens? At what age would you begin feeding it?

A. (1) It will not injure them when they are large enough to eat it. We usually feed cracked corn until they reach about 2 1/2 to 3 pounds weight and then feed whole corn.

Q. (2) Would you advise me to buy ready-mixed scratch grain or to mix it myself?

A. (2) With small flocks it is usually more economical to use ready-mixed feeds. Large plants generally mix their own rations.

Q. (3) How many two-months-old chickens should be kept in a house 8x10 ft.?

A. (3) Fifty. Half that number when full grown.

Q. (4) I keep my brood coops in a colony house and the mother hen is confined. Is this all right?

Lake City, Iowa.

L. B.

A. (4) I keep my brood coops for weaned chicks? The hens in brood coops would be better off if coops were out of doors.

Enteritis.

Q. Chicken has watery diarrhoea, sits with head tipped backward, wings droop, droppings stick to feathers. Comb does not change color. Keep Leghorns mostly. Feed commercial mixtures. Breeding stock is healthy.

Branford, Conn.

P. J. B.

A. Trouble is probably enteritis. Commonly follows an attack of indigestion, particularly where chicks are kept on infected soil or are fed on spoiled or moldy feed. Prevent by growing chicks on new ground, moving broods to fresh soil often, feeding only wholesome food. Sweeten used soil by disinfection with air-slaked lime, deep plowing or spading, and cropping with some quick rank growing stuff.

Breeding Related Stock.

Q. Not long since I was much prejudiced against keeping chickens in town. I was very fortunate in getting hold of one dozen very choice White Leghorn pullets. Since then I purchased an excellent cockerel. He is a fine individual and comes from a hen who was a great layer. Consequently I have a fine bunch of pullets coming on.

What is line breeding? How closely can your male be related to the females in his flock? Should I breed this male next year to his own pullets? I do not want to part with this bird for another year unless necessary.

Dighton, Kans.

D. G.

A. We have fowls on our farm which have been closely inbred for more than nine generations. We cannot see that there have been

anything but good results. The chief consideration is to have all breeders sound, vigorous and in best of health and to avoid mating birds having similar defects. Line breeding is simply carefully conducted inbreeding, mating the stock back to one particular sire or dam, so that its "blood" shall predominate in the progeny. We should continue the male with the best yearlings and a few of the best pullets of his get. We have mated a good male with his daughters, his granddaughters and his great-granddaughters, in direct line, with excellent results. Care must be taken to avoid mating similar physical defects. If birds are mature, well-conditioned, and possess sound constitutional vigor the relationship will only serve to intensify the strength of family type and quality. Such matings sometimes go wrong because of similar unseen defects in both male and female which are intensified in the progeny.

Swollen Hock Joints.

O. I have been a reader of your paper for four years and have always been interested in the Questions and Answers, which have been a great help. Have cured almost every curable disease in poultry, but now have a case which puzzles me. About a month ago my prize cock bird became lame, as if his feet were sore. He gradually got worse until he staggered around the yard as if dizzy, with wings extended. Gave him an injection of a remedy which did not help him. His vent is now inflamed as if he had vent gleet. Have been treating him for rheumatism, rubbing his joints with turpentine and sweet oil. He gets grain twice a day and a mash of table scraps. Can you suggest a remedy? I do not want to lose him. His joints have swollen and he seems to have a fever.

Ossing, N. Y. R. S.
A. Think the vent inflammation was caused by the irritating injection. Would put him on a scant ration of hard grain once a day and all the greens he will eat. Keep him out of doors where he can have fresh air and sunshine, a dry run and ample shade. Examine front of hock joints under feathers. You will probably find ulceration there. Wash well with soap and warm water, dry thoroughly and then rub in a little iodex. This can be had of your druggist. Dress joints again in two days. Do not handle the bird more than is absolutely necessary.

Danger in Spoiled Grain.

We have received a considerable number of letters from Central and Southern states reporting similar trouble affecting young chickens and sometimes adult fowls. Birds become droopy, comb is red; walks with staggering gait as if dizzy or unable to see well; head and neck sometimes drawn back on body; crop contents fluid and frothy, sometimes dark and sometimes yellowish; watery diarrhoea, either white or yellow streaked; discharge gums up fluffy or may paste up vent.

The complaints are so general and such a considerable percentage of the flocks are affected that we believe that the trouble is largely due to spoiled or musty grain. Feed wheat this season is uncommonly poor in quality. Much of the corn and corn meal is unfit for feeding. The unseasonable hot humid weather in May caused a good deal of grain spoilage and the slow and frequently checked transportation of freight has not helped matters any.

The best plan is to prevent digestive troubles by using care in selecting grain and feeds, avoiding spoiled, musty, moldy, heated, or acid grains and feeds. When first symptoms of indigestion, crop irritation, or looseness of bowels show in the flock, shut off the feed and make a careful investigation. Do not feed decidedly musty or moldy grain. Cook any doubtful grain or ground feed. Oats as a rule are in pretty good condition and should be fed liberally in warm weather. Greens should be supplied freely. Charcoal should be kept before the growing chicks and adult fowls. Barley meal and wheat middlings added to the mash will help correct simple diarrhoeas. Moving the flocks to new soil, which has not been used by poultry for several seasons, will often prevent serious intestinal troubles from occurring in the flock. As a rule we consider that it is a waste of time and money to attempt doctoring seriously sick chicks or fowls. If plenty of fresh air, clean quarters, new earth runs, and fasting for a few meals, followed by scant feeding on known-to-be wholesome food, will not bring them around all right, they are not likely to prove worth an attempt at saving.

This season has brought so many beginners into poultry keeping that reports of poultry ailments are more numerous than usual. The experienced poultryman, who breeds and feeds for health and knows how to keep his flocks comfortable, seldom has much trouble with diseases.

Toe-Picking Among Chicks.

Q. I have 10 White Leghorn chicks about eight weeks old. A few weeks ago I noticed the other chickens picking at the toe of the smallest one. Upon examining I found the toe half gone and bleeding. I dipped toe in pine tar and put chick in a separate coop. In a few days the toe was hardened over and I put her back with the others. She was all right for a week and yesterday they started picking the same toe again. Can you tell me anything I can do to prevent same? These are the first chickens I ever had.
Merrick, Mass.

W. P. H.

A. Toe-picking and other forms of cannibalism are common among chicks, particularly when closely confined; if one chick becomes bloody or injured the others are quite certain to pick at it and to keep it up if they get a taste of blood. Small chicks generally pick at one another's toes and if one bleeds the trouble starts. Feeding plenty of greens and mashies containing fish meal or fine beef scrap and wet up moist and crumbly with skim-milk, helps to prevent trouble. Give the chicks a box containing sprouted oats to scratch over. Use a very little salt in their mash food. Make them scratch for a part of their chick food in a litter of cut clover or hay-mow chaff. You put the chick back with the flock before the toe had entirely healed and they very naturally picked at the scab.

Enlarged Liver.

Q. Can you tell me what is wrong with my hens? They sit around and if I touch them they act just as if they had been turned loose in the dark. They eat and do not lose flesh, but the last two days before they die the comb and face turn pale. If I pick them up slimy water runs out of the mouth. I have opened some after they died and found the liver about 4 or 5 times larger than natural size, but otherwise they seem all right. I have lost quite a few, and in one of them the liver was enclosed in a sack which seemed to contain all the blood in the body. Eggs were all clotted together. I feed fresh scrap from a restaurant. Get the scraps every day. Give a dry bran mash and oats and spelts and plenty of grit and clean water.
Redfield, So. Dak.

E. R. B.

A. The restaurant scraps are very rich food and you are overfeeding your birds. The enlarged livers are caused by forced feeding and lack of exercise. Hens with blood about the liver died from rupture of blood vessel in same. Probably all of your fowls are now overfat internally and have large livers, and they should be killed and marketed as meat before you lose any more of them. When starting with another flock, if you want eggs and not fattened table poultry, do not feed the restaurant waste so freely make the birds work for a ration of hard grain by scratching in deep litter.

Record Egg-Laying.

All previous world's records for individual egg laying by White Leghorns have been eclipsed in the Bendigo (Australia) single test competition, where 530 birds of various breeds have been under test for twelve months. The winner and new record holder is H. B. James White Leghorn pullet Lady Constant, her total being 332 eggs for the 365 days. A feature was the size of the eggs, which varied from 25 to 26 oz. per dozen. In the winter test (April, May, June and July) 115 eggs were laid in 122 days, establishing a new world's record, while 172 eggs were recorded in the first six months. During the test Lady Constant laid over 43-lb. weight of eggs, nearly eleven times her own weight. The previous world's record in competition was 315 eggs for the year, established at Bendigo by a South Australian bred bird last year.

J. E. Bradley's Black Orpington won in the heavy breeds' class, also establishing wonderful figures. Her year's tally was 326 eggs, 14 better than the previous world's record, established in New South Wales last year.

These performances are the more remarkable inasmuch as it has been a particularly bad year for egg laying.

Shipping Eggs in Car Lots.

The total damage to eggs transported in carload lots was reduced to less than 1 percent in tests conducted by the United States Department of Agriculture covering a period of more than two years, and in which the eggs were shipped on an average of 1,000 miles. The amount of damage sustained in marketing eggs in carload shipments, according to various local authorities, averages from 3 to 9 percent. The following good commercial methods of packing, storing, and handling

ing, eggs can be transported in carload lots with a total damage, including "checks," "dents" and "leakers," of less than 2 percent, according to Bulletin No. 664 recently issued by the department, which discusses the experiments and best methods of transporting eggs from the producer to the consumer.

War Time Rations.

A circular by J. G. Halpin, issued by the Wisconsin College of Agriculture, gives the following list of war-time poultry feeds:

WAR TIME POULTRY FEEDS.

Grain (Scratch Feed)—Corn, oats, barley, buckwheat. Take at least two from this list.

Mash—(1) Bran, (2) middlings, (3) gluten feed, (4) malt sprouts, (5) brewers' grains, (6) ground corn, (7) ground oats, (8) oil meal. Take Nos. 3 and 6 and as many more as you can secure.

Animal Feed—Skim-milk or buttermilk, ground fresh meat and bones, meat scrap, tankage, insects (when the hens are on free range in summer). Some kind of animal feed is essential to economical egg production.

Green Feed—Cabbages, mangels, sugar beets, carrots, sprouted oats, silage, in winter time. Green grass, vegetables, trimmings, etc., in summer. Clover and alfalfa chaff. Table scraps—Use all the waste material that the hens will eat. Cooked carrot peelings and such feeds are good. Green feed cheapens the ration and keeps the digestive tract in good condition.

Mineral Feed—The hen will not lay eggs until she has enough mineral to manufacture the shell. Oyster shell, lime rock grit, broken egg shells. Just as important as any part of the ration.

Charcoal—Keep before flock at all times. **Water**—Fresh and in abundance, before the flock at all times.

GOOD LAYING RATIONS

No. 1. Feed in deep litter—4 lbs. of corn and 1 lb. each of oats and barley. Feed light in the morning and heavy at night.

Feed in hopper—(all the time). A mixture made at the rate of 100 lbs. each of bran, middlings, ground corn, and gluten feed, 50 lbs. of meat scraps, and 2 lbs. salt.

Feed in trough—(three times a week). Same mixture of ground feed moistened with milk.

Green feed—Sprouted oats and mangels.

Grit Oyster Shell Charcoal Water
No. 2. Feed in deep litter—4 lbs. of corn and 1 lb. of barley. Feed light in the morning and heavy at night.

Feed in hopper—(all the time). Mash of equal parts bran, middlings, and cornmeal. Salt slightly.

Feed in trough—(at noon). Boiled oats. Feed as much as the hens will eat in 20 minutes. Add table scraps, cooked vegetables, cooked small potatoes, cooked potato skins, and such feeds.

Milk—Sour milk or buttermilk to drink.

Grit Oyster Shell Charcoal Green Feed

FEEDS FOR THE CHICKS.

The little chick must not be fed any hard feed until 48 hours after hatching. (However, the mother hen, if one is used, should be fed whole corn.) Give free access to skim-milk (fresh, soured or clabbered) or buttermilk as soon as they leave the nest or incubator. When the chicks are 48 hours old feed them in chaff, chopped hay or straw, or shavings.

YOUNG'S STRAIN

Single Comb White Leghorns

Columbian Wyandottes

Some grand bargains in hens and cocks at sacrifice prices. H. A. D. LEGGETT & CO., 24 N. Nash Place, Burlington, Vermont.

Chick Feed—

Finely sifted cracked corn makes the best chick feed; add steelcut pin-head oats, cracked kafir, broken rice, and such feeds, if you can secure them, or use a good brand of commercial chick feed. (Feed morning, noon and night.)

Mashes—

Corn bread, corn and barley bread, or some other such feed should be fed as a mash.

Corn Bread:

Cornmeal 2 pounds
Eggs (infertile) 2

Mix with sour milk to make a stiff batter and add one teaspoonful of soda for each cup of milk used. Salt slightly. Bake in moderate oven for one hour.

Corn and Barley Bread:

Cornmeal 2 pounds
Barley middlings 1 pound
Eggs (infertile) 3

Mix according to the preceding directions.

One may also substitute wheat bran and middlings for the barley when they can be procured. The infertile eggs may be omitted and a little meat scrap or fish scrap added, or the eggs or meat may be omitted entirely if necessary. (Feed mid-forenoon and mid-afternoon.)

Or a mash may be substituted for corn bread.

Dry Mash—

If chicks have a good range dry mash may be left before them all of the time. If confined to a house or small yard, then allow them to have dry mash for only an hour or so toward night.

Mixture No. 1:

Ground corn 1 pound
Rolled oats 1 pound
Bran 1 pound
Middlings 1 pound
Gluten feed 1 pound

Mixture No. 2:

Ground corn 1 pound
Gluten feed 1 pound
Hominy feed 1 pound
Rolled oats 1 pound
Barley middlings ½ pound

For the first three weeks use a mash such as No. 1 or No. 2, or else use a good grade of commercial chick mash.

Animal Feed—

At the university we have raised good chicks on fine cracked corn, clover and buttermilk, and also on corn, clover, and meat or fish scrap, but more variety in the ration is desirable. The village poultry keeper may be able to furnish his chicks enough animal feed by frequently spading the yard and letting the chicks eat the worms, and by carefully feeding any meat or bones (broken in small pieces) from the table.

It is very important that animal feed form a part of the ration. When chicks have free range they can usually find bugs and insects so that they will make a fair growth, but buttermilk or freshly soured skimmilk may be fed to advantage even when chicks are on free range. Milk is best fed in earthenware fountains. Yarded chicks are frequently stunted because their ration lacks animal feed. If you cannot obtain fresh buttermilk or skimmilk and have more than a dozen chicks you will find that it will pay to secure condensed or dried milk, meat scrap or fish scrap. The buttermilk or fish scrap may be added to the meat dry mash so as to form about 8 to 10 per cent of the ration. Most of the chick mashes on the market have one of these forms of animal feed.

Green Feed—

The best chicks are grown when green stuff is the most tender. Encourage the chicks to eat large amounts of green stuff by supplying it in abundance. Keep the grass cut short or pastured down close so that it will be tender. If chicks are yarded, carry them all the weeds, waste lettuce leaves, lawn clippings, cut green clover, and other greens that you have.

Mineral Feeds—

Chicks make very rapid growth and must have plenty of mineral matter in order to make that growth economically. Give free access to fine or chick size lime rock grit, or to finely crushed oyster shells (if you have old hens screen out the fine part for the chicks and give the coarse to the hens.) Chick size dry bone is a very valuable addition when chicks are yarded. Give free access to charcoal at all times.

Water—

If chicks have free access to freshly soured skimmilk or buttermilk they do not need water for the first four to six weeks. After that, fresh, clean water should be before the chicks at all times.

Table Scraps—

Use all the kitchen and table waste possible. Chicks will relish many things that formerly went into the garbage can. Even the experimental war bread will not be entirely wasted if it is fed to a bunch of husky chicks!

Men of U. S. Department of Agriculture Hold Meetings.

A meeting of the poultrymen of the U. S. Department of Agriculture was held in Kansas City, June 1 to 4, 1918, under the leadership of Harry M. Lamon, in charge of the poultry work of the Animal Husbandry Division, Bureau of Animal Industry. At this meeting an urgent appeal was made to the American people to increase the production of poultry and eggs. The following plans of action were adopted and are urged upon the people in order to accomplish this purpose:

1. Keep better poultry. Standard-bred poultry improves quality and increases production.
2. Select healthy, vigorous breeders to produce strong chicks.
3. Hatch early to produce fall and winter layers.
4. Preserve eggs when cheap for home use.
5. Produce infertile eggs, except for hatching.
6. Cull the flocks and eliminate unprofitable producers.
7. Keep a small back yard flock to supply the family table.
8. Grow as much of your poultry feed as possible.
9. Eat more poultry and eggs and conserve the meat supply.

Those in attendance at the Kansas City meeting at which the above definite plans were outlined, were: Harry M. Lamon, Washington, D. C.; Robt. R. Slocum, Washington, D. C.; Jos. W. Kingborne, Washington, D. C.; R. H. Wilkins, Washington, D. C.; C. H. Cross, Washington, D. C.; Miss Minnie Harbaugh, Washington, D. C., and the following district men: Jno. D. Jaquins, in charge of District No. 2, headquarters Chicago, comprising the states of Illinois, Indiana, Wisconsin, Michigan and Ohio; Geo. W. Hackett, in charge of District No. 3, headquarters Kansas City, Mo., comprising the states of Kansas, Missouri, Nebraska, Iowa, South Dakota and Minnesota; R. C. Blake, in charge of District No. 4, headquarters Oklahoma City, Okla., comprising the states of Oklahoma, Arkansas, Texas, Louisiana, Mississippi, Alabama and Florida; A. A. Peters, in charge of District No. 5, headquarters Los Angeles, Cal., comprising the states of New Mexico, Arizona, California, Nevada, Oregon and Washington. At the close of the meetings in Kansas City, the above party proceeded to Omaha, Neb., where daily sessions were held on June 5 and 6, with the state men from District No. 3, the plans of action being set forth in further detail and plans of organization discussed in connection with the state work.

From Omaha the poultrymen visited Chicago, and daily sessions held at the Great Northern Hotel, June 7 and 8, in connection with the state men from District No. 2. The attendance at the Chicago meetings was large and in addition to the Government men a large representation was present from the various state agricultural colleges comprising the second district.

Additional meetings are to be held in New Orleans of state men of the fourth district, and at Los Angeles of state men from the fifth district.

These meetings have been of the utmost importance to the poultry industry of the United States, in view of the fact

that this is the first time that any definite plan of action has ever been presented to the poultry interest of this country to increase poultry production along definite lines, and thus stimulate interest in the emergency poultry campaign of the U. S. Department of Agriculture and enlist the services of the American hen in all parts of the United States to help win the war.

AUSTRALIA LEADS IN HIGH EGG RECORDS.

495 Birds in Competition Average 203 Eggs Per Bird.—The Bendigo Independent's "Single Test Competition" Sets a Lead to the World.—Record of 332 Eggs for White Leghorns and 312 Eggs for Buff Orpingtons.

By E. J. HARDY, Northcote, Victoria, Australia.

WHEN the Bendigo Independent newspaper initiated in Victoria the single testing of the hen, to prove her individual worth, they did so to help foster the industry. On Sunday, March 31, 1918, the second test was concluded, with the world record scores to the leaders, and an all round improvement in the scores of the other birds. Indiscriminate breeding did fairly well for the industry, but now that single testing has come to stay, breeding must be carried on on definite lines, which will certainly be for the betterment of the industry as a whole. The fight is for eggs, and these can only be secured in large numbers from carefully bred stock. To breed accurately, one must know the ancestors of each bird, and to arrive at that most necessary data the parents must be tested and then later they must be mated to the sons of tested stock—a pedigree all along the line is what is required. As the Babcock test improved the dairy herd, so must single testing place the important primary industry of poultry on a sound basis and lift it high as a genuine structure.

Last year's test concluded with new world's records at 315 and 313 for White Leghorns and 312 for Black Orpingtons. The test the Bendigo Independent just concluded gave the scores:

107	H. B. James, W. Leghorns.....	332
123	Gedye Bros., W. Leghorns.....	330
111	Marville P. F., B. Orpingtons.....	326
110	Marville P. F., B. Orpingtons.....	319
79	G. G. Dunn, B. Orpingtons.....	312
186	D. J. Robertson, B. Orpingtons.....	312
183	D. J. Robertson, W. Leghorns.....	304
171	K. Courtenay, Faverolle.....	295

When the breeding of each of these birds is traced, it can be seen that they are the result of single testing, and in

BOURNE LEG BANDS

Are Easy to Use. They are made with large numbers printed on colored celluloid held in an aluminum band.

They are easily read from a distance. Numbers up to 300 are printed on white, red, green, cerise, blue, yellow and pink celluloid. From 301 to 1000 on white only. Band will withstand weather and water. Sizes for all breeds; also for pigeons.

BOURNE MFG. CO.
231 Howard St. MELROSE, MASS.

view of that, it is wrong to suggest that they are fluke scores. Then, further, the birds looked layers. While some men sent birds to win, others sent them solely to have them single tested, and by the results, altho they did not win, they are well satisfied. Of them, one cannot write much, for the value of the bird can only be estimated by the owners; suffice it to say there are scores of breeders more than pleased with the work their birds have done in this test. To the general public the birds which did well have a special interest and for their benefit the monthly laying of each of the leaders is here detailed:

	107	123	111	110	79	186	185	171	
April	27	23	21	29	26	16	16	20

495
With such good scores, one's thoughts must turn to the feeding, and it is here that all the credit reflects to the workers at Kangaroo Flat. Bert Mitchell, the general superintendent, and his son, Roy, being those to whom all the credit is due. While the breeding and selection are done at the farms of the breeders, the feeding is done at Rosedale. At first the feeding was half pollard, half bran, and just a snack of oatmeal mixed with water to start with. Chopped lucerne and berseem clover were added most liberally. At evening the grain feeding was three parts wheat, half part of oats and half part of crushed maize thrown into a liter of creek sand and straw. This feeding was kept up for about three weeks, when the lucerne was gradually changed to rape, the water gave way to liver soup, and minced liver was sparingly introduced. The weather, at this time set in wintery, which necessitated more oats and maize, the proportions being three parts wheat, one part maize and one part oats. When the competition was about a month out, the severe weather checked many birds. These were specially fed, while the others that were doing well were left to themselves, or, in other words, "well was left alone." The special feeding consisted of more green stuff, more meat, little less bran and peameal, and minced onions raw. Gradually they came back, and at the beginning of July, all were on the same mash, which was made up of pollard 3 parts, bran 1 part, a good sprinkling of peameal, the oatmeal being continued, as were the onions. The green stuff (rape) was fed fully bulk for bulk and the minced liver increased to 1/2 oz. per bird, three times per week.

American Poultry Journal Publishing Co.
523 Plymouth Court Chicago, Illinois

This tasty mash was mixed with the warm liver soup and fed as soon after daybreak as possible, so that the birds after the long spell on the perch would not have to wait. At midday, to encourage the birds to keep moving while the day was cold, a little grain was thrown into the litter. The evening grain fed for the greater part of the winter was wheat 3 parts, maize 1½ parts, oats 1½ parts. As the lucerne was coming on early, it was inaugurated in August with the rape and bearseem. Until early spring this mash was hardly altered, excepting perhaps more attention was paid to onions and the meat was fed on 4 days each week. In October—spring time—the mash was pollard 4 parts, bran 1 part, the oatmeal increased and green stuff very extensive, freshly cut; succulent green feed being fed at the rate of 56 percent in the morning and a bit at noon. Then after the grain feeding, which was wheat 4 parts, maize 2 parts, oats 1 part, there was more green feed. Grain feeding was commenced at 4 p. m. and by 5 p. m. there was literally a dust storm at the farm, so vigorously were the birds working in the litter, which up to now had been renewed and the pens cleaned out 4 times. When the scratching seemed to have slackened down, more green feed was placed in the troughs and it was a unique sight to see the manner in which the birds ravenously ate it. As the birds now seemed to be in the heavy laying stride this mash was practically continued, slight alterations being made according to the weather, with at all times the main idea of getting eggs; consequently animal and vegetable proteins were never stinted, but the food was studied so that the general constitution of the bird would not be undermined. In fact, the desire was to get eggs and to keep the birds in good condition, that meant good dams immediately. That Manager Mitchell was decidedly successful in this has been borne out since the finish of the test, by the letters received, all the leading birds being immediately mated, as they showed no signs of molting and they were in that rosy meaty (not fatty) hard condition (as if well trained) that the careful breeder likes to see his breeders in. On an average about 3 ozs. of mash was fed each day, and grain 2 ozs., the cost scarcely being twopence or 4 cents per week per bird. While the quality of the mash from the middle of winter onward was fed alike to all, the quantity varied considerably. It was fed in a trough divided into three sections; the center one being for the charcoal and grit. The quantity of mash was governed by the birds' eagerness for it, being fed at each end of the trough and it was very noticeable that birds came to the same side each morning, consequently there was not a hint at a fight, and do not the results prove that the birds fed well? The charcoal kept always before the birds because of its medicinal properties, came from a kiln situated in the bush not far from the farm. The grit consisted of shells from Portarlington, oyster shell specially ground, and quartz grit from the local crushers.

One decided feature of the trial was the handling of the broodies. The heavy birds are naturally inclined to brood, but there were only three birds which brooded sufficiently to warrant them being called mothers. This does not mean that there were not many broodies, but it is mentioned to show that birds were

not seriously handicapped on account of broodiness. The method of combating close setting was that frequent tours of the pens were daily made, and every night another look was made for vacancies on the perches. The brooding bird was at once removed to a specially prepared grass run, where she had available every comfort, the old style of providing roughly-made, bottomless coops being discarded. Next morning the birds were given a big feed of pollard two parts, bran two parts, meat 1 oz. per bird, with a little oatmeal added. Chopped lucerne was also in the mash. This feeding formula reads altogether different from theory and the practice in other places. The results were also altogether different for the birds, instead of being off for weeks were only out days, in some cases hours. The reason for such liberal feeding was that the bird had to keep alive. The green stuff in the mash was supplemented by the lucerne growing thickly in the pens. Some people advocate that maize is fattening, but when fed with any quantity of green feed they become beneficial. Good results could have been obtained by feeding maize and no green stuff. It was noticed that the brooding birds craved the maize and the green stuff.

When the test started at the request of scores of leading breeders, with two birds in a pen—a heavy and a light breed—there were some critics who offered all kinds of obstacles. These were never in the way and even if they were they have been passed over (a glance at the scores will show this). It was thought there would be fights. Certainly there was some sparring for the first day, but when the mash was fed in the different troughs this concluded. Not one bird had to be removed on account of fighting, in fact there was only one—a mere chicken which might well have been kept at home to develop—that had a color of blood on its small un-grown comb. The color of the egg complaint has also been proved a bogey. This was really the only point that gave Mr. Mitchell any deep thought at the first and he, too, acted at times critically in this connection, but from April 1 to March 31 he did not have to challenge an egg. As often as possible visitors were taken round at collecting time, and not once did they (and they included competitors) suggest a reconsideration of any egg. Another "difficulty" mentioned was that the broodies in the heavies would be in the road of the lights, but the brooding feature as detailed certainly settled that. During the cold wet nights, which were very frequent, it was seen that the huddling together was a boon to the birds. When one was out broody it was noticed that the light breed, being on her own, was looking for her mate. It could have been argued that this close roosting would aid the spreading of lice. But the spreading of lice was not permitted. The floor of the pens were all inches deep in a nice clean sand, the sort that made the birds enjoy the dust bath. This litter was kept clean and deep, for if there is one thing that is not wanted at Rosedale it is the louse. All the roosts were tarred at first and then kept clean by the painting of a liquid disinfectant. The competition grounds being always open—from daylight to after dark to competitors and their friends—visitors were numerous, coming from all parts of the State, as well as from

South Australia, Queensland and New South Wales. That they were interested could be gathered from their expressions of appreciation, but what struck many of them most was that they had not to leave at feeding time. Several spoke well of this privilege. In this connection it can be mentioned that the main, in fact only, object of the running of the trial is to do things in the interests of the breeders, and this could not be done were details kept from them. The mixing of the mash and grains were watched and the quality of the feed in the bins was always easily seen. Then further, Mr. Mitchell did not refuse to answer questions, his attitude being that of an experienced man wishing to help others.

At 4 p. m. daily the work of collecting eggs was commenced. First, Roy Mitchell went round getting the eggs from the pens, then Bert Mitchell followed, entering the eggs in the day book. At night these were transferred to the egg ledger—a specially printed book with a space for every day's laying. This book was freely commented on by visitors in glowing terms. Messrs. Richardson, Robertson and Archer, experts of the Department of Agriculture, who were in Bendigo at the time of the Farmers' Convention, declaring in no uncertain terms of its cleanliness and easy manner of keeping accurately the daily work of each bird. Coming from such keen critics of the breeding of stock and the value of actually knowing the parents of animals and birds, this was an acceptable appreciation.

The test opened with mild autumn weather, which soon broke into wet, and all the winter there was much rain. This made things very miserable on the outside, but the birds, being under cover on the intensive system in pens 3x4 ft., built on well drained land, they did not feel the effect of the rain. When the rain came in flooding downpours, as it did at times, special care was taken to see that the water in the drains was kept on the move. The spring was very natural and it was then that the sequences were made. Summer broke fairly early, but except for three or four hot weeks, which fortunately were not consecutive, the summer was decidedly in favor of egg laying and only three birds died from heat.

The Fifth Contest.

The fifth Arkansas State Egg Laying Contest will commence November 1, 1918. The rules and regulations to govern this contest will be mailed out with the June report.

Before drawing up the rules and regulations for the fifth contest in final form, we wish to announce to the poultry breeders of the state that we welcome suggestions. We wish to make each succeeding contest better than the preceding one. We therefore ask your co-operation. Drop us a line if you have any new ideas which might make the contest mean more to Arkansas poultry raisers. Martin Nelson, Dean and Director Arkansas Agr'l Expr. Station, Fayetteville, Ark.

Breaks Record for Hauling Eggs.

The first commercial truck load of eggs from Vineland and Millville, N. J., into New York City—about 140 miles—arrived recently with not one egg broken. Delivery from the shipper to the wholesaler was made in 15 hours, which is faster time than that made by express shipments and establishes a record for motor haul of eggs, according to the Bureau of Markets of the U. S. Department of Agriculture which arranged for the demonstration. The 5-ton truck carried 150 crates of eggs weighing nearly 4 tons, the rest of the load being made up of crated glass. It left Vineland at about 11 a. m. and arrived in the wholesale district of New York City at 2 o'clock the next morning.

National War Emergency Poultry Association.

The writer has been delegated by the National War Emergency Poultry Federation to prepare and give out the statement below. We earnestly solicit your co-operation in giving this truly patriotic movement the widest possible publicity.—W. T. Seibels.

At a meeting of the Advisory Council of the National War Emergency Poultry Federation held in Chicago, June 10-11, by-laws to govern the federation were completed and adopted, thus assuring a nation-wide and complete poultry organization during the war, which has been created for the purpose indicated by its name. This federation movement grows out of the big conference of poultry interests held in Chicago, March 29-30, reports of which were widely circulated.

Officers of the federation have been chosen to serve until the July meeting of the Advisory Council, which will be

held in Chicago, beginning the third Wednesday, at which time there will be at least a two-day session, with an interesting program bearing on the work already in hand and to follow. Preparation of this program is under direction of Prof. Jas. E. Rice, Ithaca, N. Y., who expects to have his old friend, Dr. McCollum, the famous food research chemist, attend the meeting and deliver an address.

Temporary officers of the federation are: President, Reese V. Hicks, Brown's Mills, N. J.; vice-president, Prof. A. G. Philips, Lafayette, Ind.; secretary, Prof. H. N. Lewis, New Brunswick, N. J.; treasurer, S. E. Edwards, Chicago. Permanent officers will be elected and the organization will be completed and greatly extended at the July meeting.

The plan of the federation contemplates taking in all national and state organizations having to do with the production or distribution of poultry pro-

NEWTOWN Giant Incubator

Hatches the Most Chicks—
The Best Chicks—
With Least Labor—
And at Lowest Cost—

You cannot ask or get more; you should not be satisfied with less. Newtown efficiency and economy will insure your success.

The Newtown Mechanical Eggs-Turner

is a big labor-saver. Where other large incubators are used, much time must be spent in turning the eggs twice daily. The *Newtown Mechanical Eggs-Turner* has changed this. Take ten seconds to turn the crank and all eggs in the machine will be turned better than you can turn them by hand. No eggs are cracked or dropped and broken. No "bunching" on the trays.

Read this Report from Michigan Agr. College

"Relative to our hatches with the *Newtown Giant Incubator*. We have brought off three in all. The first gave us 92% of the fertile eggs, second 91%, and the third a little better than 92%."

"The incubator gives us chicks that can be shipped by parcel post as far as Texas, W. Colorado and Northern Minnesota. The greatest number found dead,—in shipments ranging from 200 to 400 chicks,—no more than four. We are very enthusiastic about the *Newtown Giant*."

(Signed) C. H. BURGESS, Assoc. Prof. of Poultry Husbandry.

If you demand highest efficiency plus economy and certainty, write for complete Newtown catalog today. Please state the size incubator in which you are interested. Remember, it is to your advantage to place your order early.

Jessie F. Gordon Box 535 Spring Valley, Minn.

ducts and supplies, and, as the name implies, the federation will be an organization of organizations—probably a hundred or more. But the by-laws are framed on such broad and liberal lines that any individual may become a member thru his local, state or national organization. A strong effort will be made to enlist the support of every person, firm and corporation having to do with poultry, poultry products and supplies. Already thousands of producers in all parts of the country are clamoring for a form of representation that will be truly national and which will be coupled up with the powerful backing of other organizations; together with what their own can give.

But it is distinctly understood that the federation is not intended to supplant any existing association, committee or other organization, but rather to co-operate with and to further the constructive and patriotic work being done individually and collectively in this enormous industry. The fact that the value of the commercial poultry and egg crop exceeds \$1,000,000,000 annually—one-twelfth the value of all agricultural products—and that government authorities now declare that the poultry industry is sure to contribute largely to the great cause of winning the war, make the need more apparent for all branches of the industry to get together and to pull together with Uncle Sam until *we do win the war!* It will be the chief purpose of the federation to cement our big industry into one common whole for this patriotic purpose. In short, the federation seeks to render a two-fold service: (1) to help our country and our Allies in every way possible, and (2) to promote and protect the poultry industry

during these trying war times and in the reconstruction period after the war, when it will be necessary to restock Europe and practically all the balance of the civilized world with poultry for commercial and breeding purposes.

The July meeting will be a rousing get-together affair—a grand rally of big-hearted and big-minded men and women. The program is bound to give a boost to the constructive work already planned and still more to be outlined later. Further information may be had by addressing Secretary Lewis.

Government Jobs Open for Qualified Men.

The United States Civil Service Commission announces that the Department of Agriculture is in urgent need of assistants in direct marketing, at entrance salaries ranging from \$1,200 to \$1,800 a year, and assistants in white-pine blister-rust eradication, at entrance salaries ranging from \$1,200 to \$1,440 a year. These positions are open to men only. The duties of assistants in direct marketing are to assist in securing information relative to quantity, quality, preparation, cost of marketing, and movement of farm products being marketed by parcel post or other medium of marketing direct from producer to consumer, and in disseminating information. The duties of assistants in white-pine blister-rust eradication are scouting for white-pine blister-rust, directing squads of men on blister-rust eradication, and in some cases conducting, under supervision, investigations of methods of eradication of this disease. For both positions certain specifications are made as to education and experience. Applicants will not be required to report at any place for scholastic tests, but will be rated upon their education, training, and experience, as shown by their applications and corroborative evidence and upon these submitted with the applications. Full information and application blanks may be obtained by addressing the United States Civil Service Commission, Washington, D. C., or the secretary of the board of U. S. civil service examiners at Boston, New York, Philadelphia, Atlanta, Cincinnati, Chicago, St. Paul, St. Louis, New Orleans, Seattle, or San Francisco.

A Poultry Venture on a Small Scale.

The desire for eggs fit to eat started my back-yard poultry plant, and now I am glad to say to anyone that it is a great help toward overcoming the present high cost of living.

We first embarked in the poultry business with 10 hens (Barred Rocks), pure bred, but not show birds. These hens started their laying career on January 15, 1917. In one year they furnished 1,800 eggs at nearly \$100 profit.

They were housed in a good, warm house, never given free range, always confined to a 20 by 30 ft. inclosure. Were not forced by feeding—just ordinary care, free from vermin, an abundance of clean, fresh drinking water and practical feeding. Result—eggs, and lots of them. We sold 1,200 of the eggs at 2c and 3c above the market price and incubated the other 600; from the 600 we hatched and raised 276 chicks. We sold 50 pullets and 100 cockerels at market price, receiving \$79.65 for them. One hundred hens later averaged \$1 each. The 1,200 eggs sold brought \$32.50. Total receipts, \$212.15. Total cost of all feed fed to hens and chickens amounted to \$119.20. Total profit from 10 hens, \$92.95, or over \$9 from each hen in one year. Besides, I still had 25 choicest cockerels, 5 of which were ordered for \$5 each.

Later I disposed of the remainder and my profit was well on toward the \$12 mark. My profit and business this year is larger, owing to number of chickens, and we hope on the 15th of next January to have our books make a better showing than before. I owe much of my success to publications of farming papers, as my sister is a country subscriber to several, which she sends me in exchange for different poultry magazines that I buy here in the city. Thus we keep well read on up-to-date methods, which means success in chicken raising.

Anyone with a back yard can raise chickens in the city as well as country; on a smaller scale, of course, but the profit makes up, for city people are willing, I find, to pay good prices for really fresh eggs or fowls and there is no expense of delivery, as they will call for them.

American Poultry Association Annual Convention.

The annual convention of the American Poultry Association will be held in Chicago during the second week of August, 1918. Headquarters will be at the Lexington Hotel, Michigan avenue and Twenty-second street. Every member of the association who is at all interested in poultry should plan to attend this meeting. It will be, without doubt, the most important meeting ever held by this old association. Matters of the most vital importance to Standardbred poultry will be up for discussion, and it is up to those interested to be on hand and take part in these discussions and assist the officers of the association in mapping out the proper steps to be taken in these troublous times.

FROM THE PACIFIC COAST

FEEDING HENS FOR EGG PRODUCTION.

By CHAS. WEEKS, Palo Alto, Cal.

THE very first essential in feeding for eggs is *heavy feeding*. Too many poultrymen feed only a maintenance ration instead of a producing ration. The laying hen should never become hungry, consequently she will never be overfed, for it is the hungry hen that overeats.

It takes a wonderful digestive machine to turn out an egg every two days in the year, for the egg is highly concentrated raw feeds and without an abundance of large variety of feeds the hen cannot produce.

An egg is a marvelous production of rich food content manufactured from the raw foods that the hen has before her. It behooves us to make sure the hen has every essential for making that egg and the hen knows much better than we what kind of food to select to produce that egg and only wants a chance to choose from a large enough variety to be able to supply all the constituents of the egg. If a single element is lacking in the feed, then egg production is not maximum. The hen may have everything before her with which to make an egg and lack only lime for the shell and is thus hindered. If there is one element lacking in the ration the hen will have to carry the egg over to another day in order to have that egg completed. If the egg is finished in due time the hen is compelled to eat more of one kind of food than is necessary in order to make up for the lacking parts, and thus part of the food is not wholly assimilated. When part of the food passes thru the hen unassimilated, as we sometimes see from the droppings, then the ration is not a balanced one and food is wasted. A wise feeder will keep as many varieties before the hen as possible, so that she may choose the constituents for the egg. The most successful egg farmers keep feed in hoppers before the hens all the time. That day is past when we measure feeds out to hens. If the grain is measured out at stated periods, the hen invariably eats more than is good for her to eat at one time.

Nature intended the crop of the hen to act as a receptacle into which the food for a day can be dumped as the hen in her wild state found it. Thus being slowly filled no ill effects resulted. Nature never intended that the crop of a hen should be filled in a few minutes, as is the case when hens are fed wet mash or grains at stated intervals.

A hungry hen will always fill the crop too full and if dry grains are eaten they swell and soon sour before they are taken into the gizzard and indigestion and bowel trouble result. Likewise, in feeding wet mash at stated periods, the hens will gorge and the crop will be packed, and before this bulk can get into the gizzard, fermentation sets in and sour crop is the result, with all its digestive troubles. The gizzard has not its normal work to do in the grinding of wet mash and consequently degenerates where wet mash are constantly fed. In many years experience in butchering hens we have discovered many truths in regard to feeding. The digestive organs of hens that have been fed wet mash are much more inclined to disease than those fed dry feeds. Small, wasted gizzards, ulcers, tumors and many inflammations arise from feeding wet mash. After wet mash have lain in the feed trough for a time it soon sours and trouble sets in. Bacterial conditions also arise in the feed troughs. Then the extra slavery of carting around wet mash each day is a burden to any poultryman.

DRY FEEDS MOST HEALTHFUL.

If the right kind of dry feeds are kept before poultry all the time, they will never overeat and digestive troubles will be lessened. With the right kind of feeds before them all the time they will never fill the crop too full and sour crops are eliminated and better assimilation takes place because the food is eaten as nature intended.

In preparing dry mash, it is well to cater to the tastes of the hen. Hens do not like finely ground mash, nor will they eat them until starved to it. They always pick out the coarser particles first and leave the finer. This is a suggestion that we should not overlook. Middlings, shorts, flour, bran, or other finely ground grains are too fine and are not relished in the dry mash. This fact is easily determined by placing hoppers of different grades of mash before the hens. It will be found that no fine mash will be eaten as long as the coarser can be had.

Did you ever stand and watch hens try to gulp down finely ground mash as tho they were so many children being forced to take medicine?

Give the hen a chance to select what she likes.

FRESHLY GROUND GRAINS THE BEST.

As soon as the grain is broken it begins to deteriorate in food value. The longer grains have been ground the less the food value and less palatable. New-

"Beating the Hen at Her Own Game"

"My Blue Hen hatches averaged well over 65%. My last try was with a section of pedigreed eggs. At the same time, I set a few settings under hens. The hens averaged 65%—the Blue Hen 85%, same eggs, same time. That is sufficient proof of the hatching ability of the Blue Hen. Beating the hen at her own game."

Recent Reports.

"My Blue Hen incubator is running tip top. Got nearly 2400 chicks from 3200 eggs set. (75% hatch). It takes practically no time to operate the Blue Hen. Lost my help the other day, but can get along alone now." H. L. Whittenberger, South Vineland, N. J., April 5, 1918.

"In our estimation, the Blue Hen cannot be beat as a hatcher. We are taking off hatches every Tuesday that are astonishing. For instance, our hatch today was 1300 chicks from 1600 eggs set. (80%). Wonderful, you will agree."—McArthur Brothers, Lockport, N. Y., April 23, 1918.

"It is gratifying to report my success with the 1600 Blue Hen this season. Have been hatching 75 to 80% of all eggs set with practically no weak chicks; proven by my raising 95 to 98% of my hatches. It is a marvel as to regulation, ventilation, minimum amount of labor required and cost of operation."—W. E. Miller, Cadiz, Ohio, May 20, 1918.

ly ground grain is much more palatable. For best results dry mashes should be made from freshly ground grains. Then these grains should be coarsely ground, for hens naturally like the larger particles and the finer it is ground the quicker it deteriorates. I would have no grains ground into a flour. I would not have wheat and corn broken any finer than we usually make it for chick feeds and then you can be sure it will be relished and eaten clean. Ready mixed dry mashes that are mixed months in advance are the most useless of poultry feeds. The food value deteriorates and the palatability is much lessened and, besides, that mixed with beef scrap becomes more or less rancid until ptomain poisoning oftentimes happens. I think there is more trouble from dry mashes that have been mixed for a long period than from any other cause, for the hens do not like them. They are the least savory. Grind some fresh feed and see how the hens go for it. I would prefer grains ground not more than three weeks. The dry feed hoppers can be filled once in three or four weeks from new grindings. The fresher the better. Nature placed a hull around the grain kernel to preserve it and as soon as that is broken oxidation sets in. The volatile parts escape and it is less savory and the appetite is a good indicator of food values.

Each poultryman can have his own grinder and thus be able to have newly ground feeds at any time. Better still, each community of poultrymen could have its own warehouse for poultry supplies and have its own grinder and mixer. It is obvious that the poor quality of grains go to make up the so-called poultry feeds that are ready mixed. By grinding your own grains, good quality is assured. A community of poultrymen organized in a way to buy grain in quantity and mix their own feed are in a position to get maximum results. In my neighborhood, we have organized a warehouse association and will build our own warehouse and install a grinder and mixer. Any person in the association can have freshly ground grains in the dry mash at all times.

This will insure a better quality of feed at a minimum cost.

COMPOSITION OF GOOD DRY MASH.

The dry mash that has given me best results, after fourteen years experimenting, is as follows:

Four parts medium cracked wheat.
One part medium cracked corn (Indian corn or maize.).

One part good quality dried beef scrap.
One part soy bean meal (coarse ground).

One-fourth part oil cake meal (linseed).

One-fourth part charcoal.

The hens relish this mixture and will eat it up clean and will eat almost the same proportion as of the mixed grains if kept before them. This mixture will feed down any good dry feed hopper, without clogging or caking. It is essential to have a good pattern hopper for dry feed, for it saves much labor and serves the hens.

I have little use for bran. The little food value that it contains is obtained at tremendous exertion of the digestive organs. The hull of any kernel is made for the protection of the inside contents and not for nourishment. In oats and barley the husk hull serves almost the

AMERICAN POULTRY JOURNAL PUB. CO., 523 Plymouth Court, CHICAGO, ILLINOIS

same purpose as the bran hull in wheat, for when that is removed the grain has scarcely any other covering. I have long ago learned that it is not wise to feed oats or barley with the hulls left on. The irritation caused by so much tough hull causes endless losses. Remove the hull from oats and barley and these grains make a very good feed in the grain mixture. Whole wheat ground gives as much bran as the organs can handle.

GRAIN MIXTURES.

A safe grain mixture is that composed of three parts whole wheat and one part Egyptian corn. If hulled oats and barley are added to this in same proportions as Egyptian corn it will add variety. I get better results to keep this grain than as the dry mash. My hopper has two compartments of equal size and one is filled with this grain mixture and the other with the above dry mash. I never, under any circumstances, throw the grain on the floor, for the hens will eat more or less filth and kick up a dust which is much worse than can be offset by any exercise.

GREEN FEEDS ABSOLUTELY NECESSARY.

I have written so much and so often on green feed for poultry that this may seem a repetition to my readers, but the truth is so important that I wish continual suggestion to convert all.

You may have every condition for hens and if you lack green feed you will not make them pay. It is an impossibility and the greater the variety of green feed the better the results. It takes fertile soil and plenty of water to grow good green feeds. Slow growing greens become bitter and tough and have not the food value and are not palatable. Greens need to be grown quickly and to grow them quickly requires a rich garden, loam soil, well watered. A poultry ranch without rich garden soil and plenty of cheap irrigating water is handicapped here in California.

The three best green feeds are kale, mangel wurzel beets and alfalfa. If your soil is rich and well watered you can pick a crop of kale leaves and beet tops every three weeks during the warm months. Alfalfa, to be best relished, should be also cut every three and not over four weeks, but to do this it must have plenty of poultry manure and water. If you have these three green feeds before the hens as many months in the year as possible, or from May to December, then you can rest that hens will pay. From December to May we use the root of the beet and whatever kale is left over at that time and manage to have a crop of green barley come on in the alfalfa patch for the winter. Barley sown in September or October and cultivated in with a fine alfalfa cultivator will make several crops during the winter. Cabbage is also a fine crop to grow in the fall for winter feed. It should be put in in August or September.

Rape is another good winter crop and can be mowed with the scythe several times. Barley, beets, cabbage and rape for winter, and kale, beet tops and alfalfa for summer. These green feeds save hens, save feeds, cause better assimilation and produce more eggs.

I am no book farmer and if you care to visit my ranch here at Palo Alto you will see this system of feeding carried out day after day.

Feed That Makes 'Em Lay Double the Food Value of Meat Scraps

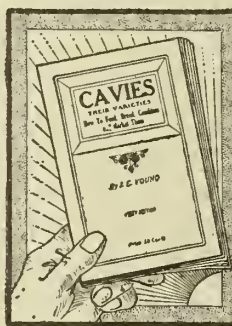

Realizing the importance of the right feed to keep up egg-production we experimented on this new product until we are convinced that it is right. We know that a valuable poultry food has hitherto been overlooked. Here, in the new

Chick Cheese

GEORGE B. FERRIS

905 Union Avenue Grand Rapids, Mich.

JULY WORK FOR WAR-TIME STANDARD PRODUCTION.

100 Hens on Every Farm—100 Eggs from Every Hen.—Culling Out the Poor Layers and Backward Pullets Saves Feed, Room, Time and Labor, Gives More Eggs from Fewer Hens at Less Cost, With Greater Profit.

(Prepared by the Animal Husbandry Division, United States Department of Agriculture.)

IT IS time now to count the layers for next winter and to begin to give them the preferential treatment which will make them ready for good work in the season of high prices. There are two classes of birds to be considered—hens and pullets. For the purpose of selection for winter laying, each class may be divided into two groups. Hens of the small breeds may be given a higher age limit than those of the medium and large breeds. Late pullets should be culled much more severely than early pullets.

The culling of the hens is the most important work of the month and should have first attention. The culling of the pullets may be put off until they go into winter quarters if the poultry keeper is pressed for time and they are not overcrowded.

SELECTING LAYERS ACCORDING TO AGE.

The ordinary laying flock is made up at this season of yearlings and older hens in about equal numbers. The older hens are mostly two-year-olds, tho often there are a few hens three, four, or more years old which have been kept because they are favorites with the owner or he was in error about their age. The usual reason for keeping a hen after her second year is that she is known or supposed to have been an extra good layer. In the case of hens of small breeds, which do not tend to fatten easily after they have passed their prime, those considered likely layers may be kept for trial in a third laying season. But in the medium and large breeds the end of the second laying season should be the limit of age in the selection for future egg production. While occasionally a hen of this class is a profitable layer for three, four, or in extreme cases five years, the proportion that are profitable layers after their second laying season is so small that it is not good policy to reserve any after that age unless they are known to be exceptionally good breeders and are kept for that purpose. So in selection for laying all Leghorns, Minorcas, Anconas, Campines, and hens of that class that are over three years old; and all Plymouth Rocks, Wyandottes, Rhode Island Reds, Orpingtons, and hens of their class, and all Brahmas, Langshans, and other large hens that are over two years old are discarded for age without considering any other factor.

SEPARATION OF GOOD AND POOR LAYERS.

All hens over the age limit having been discarded, the problem is to select from the remainder those that may reasonably be expected to produce well for the remainder of this year and thru quite a long period after molting. The

points to be considered in judging hens for this purpose are:

- (1) How well they have laid.
- (2) Whether they are laying.
- (3) Their general physical condition and its relation to future egg production.

The owner of a small flock who knows the hens individually and watches them closely will usually know from daily observation that certain hens are good layers. It is entirely possible to know all the good layers in a small flock in this way. But as hens are usually kept, only the few good layers that are conspicuous for some other character are known as good layers. To identify the rest, some principle of selection based upon appearance or structure must be used. There are several such principles, each of which independently is serviceable for the purpose, tho not infallible. If judgments of a hen by these different principles agree as to her probable performance as a layer their common verdict may be taken as in all probability correct. When they disagree, the case becomes doubtful and the relative values of the several conclusions on the different points must be weighed according to circumstances which might affect them.

A point to keep in mind when culling the laying stock is that it is a very different process from either the selection of extreme high producers for a laying contest, or from efforts to judge accurately of the laying capacity of individual hens. The purpose of culling in ordinary flocks is to identify and discard hens of such poor laying capacity that they will not contribute their due proportion of the number of eggs needed to make the very moderate flock average of 100 eggs per hen in the ordinary conditions in which farm flocks and large flocks are kept.

Strictly, culling is the removal of the culls, or as they are sometimes called—the wastars. When these have been eliminated, those which remain are presumably profitable producers. Where there has not been culling thruout the season to discard hens apparently not in good laying condition, carefully culling at this time will usually leave not more than half of the yearling hens to be reserved for another year.

IDENTIFYING THE POOR LAYERS BY APPEARANCE.

A hen that at this season has smooth, bright plumage, and shanks and beak of a deep yellow, or a rosy flesh color, or fresh looking black or slate—as the case may be—thereby certifies that she has not been a profitable layer. Good condition at all these points shows that she has not laid enough to drain her system of the elements that give high color to the skin and a fine surface to the feathers.

A good layer that has been kept on moist, grassy land, or that has recently done duty hatching and rearing chicks, may have the shanks fresh looking, but will have rough plumage. If she has not yet molted, her plumage will be very rough. If she has molted early, as some hens do when running with chicks, her feathers, tho new, will still be short and rough. Such a hen is likely to lay well thru the fall and molt at the beginning of winter. It will pay to keep her as

A Natural Food Product

Made from the choicest of buttermilk to which has been added vegetable oil to form a proper balance of carbohydrates and protein, and is further acidified to give it germ-destroying properties.

For Your Breeding Birds

Gives them extraordinary vitality to lay maximum number fertile eggs.

For Baby Chicks

Produces big, husky, lively chicks, free from white diarrhoea and other diseases.

For Fattening Broilers

Puts them in a plump condition and a finish that tops the market. The cost is slight—results are big—satisfaction guaranteed. Trial order \$2. Five gallons \$7.50.

long as she lays, but the tendency to premature molt is not a desirable character and she should not be kept longer.

In the farm flock having good range there is usually no difficulty about distinguishing the poor layers by their good looks at this season. When hens have been kept on very dry land or in bare yards the plumage may be rough and dull and the shanks bleached in the poor layers, as well as in the good ones—if not to the same extent, at least as much that judgment on these points is made more doubtful. The condition and appearance of the comb are of some assistance in that case.

The comb of a healthy laying hen is much larger when she is laying than when she is not. It is bright red in color, suffused with blood, yet soft and flexible. The poor layer that under favorable conditions has nice plumage and skin usually has comb and wattles of a rather darker red, looking more as if the blood were somewhat congested in them. This is not so characteristic or so marked that much importance should be attached to a judgment based on the appearance of the comb alone.

IDENTIFYING THE POOR LAYER BY HANDLING.

A hen that is very fat at this season is a poor layer without question. One that is very thin and poor now may have laid well thru the winter and spring, but unless the poultry keeper is conscious that shortage of feed is to blame for her poor condition, it is safe to conclude that her best laying days are over.

The best way to deal with such hens is to feed them heavily to fit for market. Many of them will begin to lay when they regain flesh and lay well for a few weeks or months. They should be kept as long as they lay, feeding well all the time; but sold or killed as soon as they stop laying again. They are not the kind to keep over.

JUDGING LAYERS BY THE PELVIC BONES.

The width between the pelvic bones—when considered in connection with other points of structure and condition—is a fairly reliable index of marked differences in the laying capacity of fowls. Good width in this region is generally associated with sufficient breadth and depth of body to give the "double wedge shape," which is often called "the laying type."

To be a good layer, a hen must have body capacity for vigorous vital and digestive organs and also for a considerable number of eggs in process of formation. A little careful observation will enable one to judge marked differences in laying capacity, as these affect or are affected by structure of the body quite as well by the form of the bird as apparent to the eye as by actual measurement of the width by the pelvis. The latter, however, is of greater service in determining whether a hen is laying at the time of handling; for in the same hen the width is greater when she is laying than when she is not. This is a natural difference, the body being more distended when carrying eggs and the bones of the pelvis separating more when a hen is in that condition to give easy passage when the eggs are extruded.

GENERAL APPEARANCE AND CONDITION OF GOOD LAYERS.

A poultry keeper, who, following the instructions and suggestions given, has culled the poor and unpromising layers from the flock, can get a much better idea of the characteristics of good layers and of their appearances at this season from the hens that remain than from any verbal description or pictorial illustration. Yet it may assist him to have a brief statement of their conspicuous points, treating the flock as a unit—for it is not individual layers but flocks of good layers that will make the big increase in egg production.

The flock now consists of about half the original number. The hens are all rather shabby in plumage, with bleached shanks. They have bright, healthy-look-

ing combs and wattles, and bright, clear eyes. They are alert and energetic—out early in the morning, foraging and resting in the shade by turns thru the long hot summer days, and making the most of the long evenings—rarely going to roost while they can see to eat.

CULLING THE GROWING PULLETS.

A flock of growing pullets nearly always contains a considerable proportion of birds that are very much under size or in other ways poorly developed. Most poultry keepers are inclined to keep these until the flock is culled at maturity. It is much better to cull them out as soon as they are marked as conspicuously backward. This is the best policy at any time. In war time, with feed scarce, press of other more important work is the only excuse for letting them remain. They will never make a profit and the sooner they are eaten the less will be the loss on their account. Even where foraging is good it does not pay to keep them. It is much better to let the good thrifty pullets have all the feed.

Why Breeders Should Join the National White Wyandotte Club.

To those of us who are breeders of White Wyandottes it is not necessary to be told of the outstanding quality of these great birds, but there are thousands who do not possess any knowledge of them other than their existence.

White Wyandottes have such exceptional good merits that but little argument is required to convince one that they are not to be ignored.

The National White Wyandotte Club, H. J. Riley, Sec'y-Treas., Byran, O., is an organization of breeders of White Wyandottes that represents the highest standard of excellence of producers of this variety.

There are many breeders of White Wyandottes who are not members of the club. If the principles of the club and the advantages obtained thru being a member were explained to them in a straight-forward manner, eliminating all red tape, they would be only too glad to become affiliated with this organization.

The reasons which may be given why a producer of thorobred poultry should belong to the specialty club representing his respective breed are in no small numbers. Why all breeders of White Wyandottes should belong to the National White Wyandotte Club is what I want to impress upon you.

In your advertisement in the poultry magazines to say "Member National White Wyandotte Club" shows that you mean business and altho you conduct your business on the square this is proof of it.

At many of the shows thruout the various states the club offers handsome ribbons to members of the club, and to win one of these ribbons is a boost for your birds.

The annual dues are only \$1 and \$10 paid at one time makes you a life member. Send in your dollar and become a member of the club. The club needs you and you need the club.

If your neighbor is breeding White Wyandottes explain to him that it is to his advantage to get in line with you. Write to your state secretary. Let him know where you are and help him to advance the breed.

You are watching with eager eye those fast growing youngsters and will put

Shoemaker's Poultry Book and Almanac for 1918

Send for it NOW!

The book has about 200 pages, with many colored plates of fowls true to life. Tells all about chickens, their care, and diseases and remedies.

It also tells all about incubators, their prices and operation. All about poultry houses and how to build them. It's an encyclopedia of chickdom. You need it. Only 15 cents. Your money back if not satisfied.

EGGS AT HALF PRICE NOW

Send for circular—it contains prices that will interest you and everyone else, and it's free for the asking. There are thousands of the best breeders for the coming season hatched during August and September. C. C. SHOEMAKER, Box 605, FREEPORT, ILL.

Free Bulletins on Lice, Mites and Feeding.

Is your poultry showing a profit? Is it being handled at a loss? Are your houses and birds infested with lice and mites? Are you feeding a balanced ration? Is feed costing too much money? Are your young chicks not growing rapidly? If so, write today to T. E. Quisenberry, Box 206, Leavenworth, Kansas, for free copies of his new bulletins and circulars covering all of these subjects.—Adv.

Breaking Up Broody Hens.

In the spring of the year, after the hens have laid their first clutch of eggs, they usually become broody. This tendency to become broody varies with the breed and also with birds that have been bred for heavy egg production. The egg breeds rarely ever develop this characteristic to any marked degree, while the heavier breeds become broody a good many times during one season. Hens at this station have been known to become broody seven times during their first laying year.

If these broody hens are allowed to set around for a few days or a week before an effort is made to break them up, it oftentimes becomes a problem. Each time a hen becomes broody, the egg production ceases and thereby a loss results. Some hens, if broken up as soon as signs of broodiness is noticed, will go to laying again within a week or ten days, while others will not lay again for two or three weeks. All this time the hen must be fed, and no returns are realized for the feed consumed. It is the busy hen that is returning a profit, not the one that is always broody.

There are a great many ways recommended for breaking up broody hens, some of which are: Placing the broody hens in a yard with a number of vigorous male birds; making the hen exercise for her feed; placing an alarm clock alongside the hen, having the alarm set for some hour during the night; standing the hen in a tub of water over night, the water being just deep enough to touch the hen's

body; placing a patent arrangement on the hen's leg in order to keep her from setting; tying a string or cloth to the hen's tail to attract her attention, and many others. Some of these will work on some hens, but will be of no use in breaking up others. I have known hens to have been placed in a pen with a number of vigorous male birds and remain broody a month. Standing hens in water over night will not always work.

The best and quickest method of breaking up broody hens is to build a cage entirely of laths without any solid floor to it, hang this cage up in a tree or somewhere out of doors so the air can pass thru. You can break them from setting in a very few days by this method, for a hen will not set where she cannot generate heat, and the lath bottom permits a free circulation of air and keeps the hen cool. A similar coop to the one just mentioned can be built and placed in one end of the house, but is not as satisfactory as having it out in the open. It is not necessary to deprive the hens of food and water. Feed the hens all they will eat. Heavy feeding starts them back to laying at an early date. Starving them delays egg production.—S. R. Stout, Assistant in Poultry Husbandry, Fayetteville, Arkansas.

AMERICAN EGG LAYING CONTEST.

Methods of Preserving Eggs for Winter Use.—Will Enable You to Double Your Money in a Few Months.—Hens in the American Egg Laying Contest Making a Good Record.—Entries Coming in for Next Year.

By R. F. PALMER, Assistant, American School of Poultry Husbandry, Leavenworth, Kansas.

IT IS becoming more and more necessary for both the producer and consumer to hold eggs over from the season of plenty to the season of scarcity, from the season of low prices to the season of high prices. One egg next winter will be worth as much as two and perhaps as much as three eggs at the present time. There is every indication that eggs will be even higher next winter than they were last. For that reason it will pay the producer and the consumer to find some method of preserving eggs at present prices. Next to cold storage, we have had best success by preserving our eggs in water glass (sodium silicate). We are also trying out two or

three commercial preservatives, and the indications are that they will prove equally as satisfactory.

You should first prepare your preservative, even before you get the eggs. The water glass solution is made as follows: Use twelve times as much water as you do of the water glass; in other words, to each twelve gallons of water stir in one gallon of the water glass. If you have only a few eggs to preserve, use a smaller quantity, but in this proportion. The water should be boiled and then allowed to cool. When it is just luke warm, you then begin to stir in the water glass. You stir until it is thoroly mixed. You are now ready for the eggs.

As a container, we use earthen jars, candy buckets, kegs or half barrels. If you use wood, see that it is thoroly cleaned and odorless. The eggs should be clean and fresh. One bad egg may spoil the lot. Place them in the container with the small end of egg down. Then pour in enough of your solution to cover the top eggs about two inches deep. The following day, or just as the eggs are gathered, more eggs can be placed in the same container and more of the solution poured over to cover them. You can continue this process until your container is filled. See that the top layer of eggs is well covered with the solution and if there is any evaporation the container must be refilled. Cover it over with a heavy cloth and tie it on. Lay a clean board or weight over it to protect same. Place them in a cool place, cellar or basement, and they will keep for several months. White eggs preserve as well as brown eggs.

The eggs are good for any purpose, but if you wish to boil them, a small hole should be punctured in the large end of the egg before placing it in the water. In all instances, wash the eggs in water before using.

THE CONTEST.

Broodiness affected the records of some individuals during May, which, of course, affected the pen records also. A pen of White Leghorns from Washington broke our monthly record by laying a total of 144 eggs. White Leghorns, Black Leghorns, Anconas and Rhode Island Reds were the leaders in the order named in the Breeders' Contest for May. The record being made by the yearling hens is really surprising. These birds all made good records last year, but in spite of that fact the five highest pens of yearling hens laid from 133 to 138 eggs per pen for May. A number of hens made a perfect score of 31 eggs in the 31 days, and a few of the hens which have been among the high layers went broody and their lead is being cut down because of that fact.

It will be seen from the following table, which gives the records of the exhibition birds in the Breeders' Contest, that the Buff Leghorn pullets have made the highest average per bird for the seven months.

The five highest layers to date are:

No. 385	Silver Wyandotte, South Dakota.....	157	eggs
No. 273	White Orpington, Ohio.....	155	eggs
No. 351	R. I. White, Illinois.....	154	eggs
No. 102	White Leghorn, Missouri.....	154	eggs
No. 73	Buff Leghorn, Michigan.....	151	eggs

The five highest pens of five pullets each to date are:

No. 43	White Wyandottes, Illinois.....	660	eggs
No. 1	Black Leghorns, Georgia.....	630	eggs
No. 48	Light Sussex, Ohio.....	647	eggs
No. 27	White Orpingtons, Ohio.....	643	eggs
No. 7	Buff Leghorns, Michigan.....	632	eggs

The following table gives a complete summary of what the exhibition pullets accomplished during the month of May. Each of the following varieties are represented by fifteen pullets:

	May Leader	Best Pen for May	Av. Pul. 7 Months	High Layer 7 Months—Pullets	High Pen 7 Months—Pen
Black Leghorns	28 eggs	128 eggs	106.4 eggs	No. 16—137 eggs	No. 1—650 eggs
Brown Leghorns	26 eggs	123 eggs	96.8 eggs	No. 61—130 eggs	No. 6—537 eggs
Buff Leghorns	30 eggs	121 eggs	117.3 eggs	No. 73—151 eggs	No. 7—632 eggs
White Leghorns	30 eggs	142 eggs	112.0 eggs	No. 102—154 eggs	No. 12—628 eggs
Anconas	28 eggs	128 eggs	77.7 eggs	No. 131—134 eggs	No. 13—576 eggs
White Rocks	31 eggs	119 eggs	97.6 eggs	No. 183—133 eggs	No. 18—537 eggs
Buff Rocks	21 eggs	94 eggs	65.1 eggs	No. 214—129 eggs	No. 21—458 eggs
Barred Rocks	31 eggs	120 eggs	104.5 eggs	No. 236—127 eggs	No. 24—615 eggs
White Orpingtons	22 eggs	95 eggs	108.7 eggs	No. 273—155 eggs	No. 27—643 eggs
S. C. Reds	31 eggs	125 eggs	104.0 eggs	No. 281—147 eggs	No. 30—559 eggs
R. C. Reds	31 eggs	123 eggs	99.0 eggs	No. 334—136 eggs	No. 33—590 eggs
R. I. Whites	26 eggs	110 eggs	101.0 eggs	No. 351—154 eggs	No. 35—629 eggs
Silver Wyandottes	31 eggs	112 eggs	97.0 eggs	No. 385—157 eggs	No. 37—508 eggs
Colored Wyandottes	31 eggs	88 eggs	63.0 eggs	No. 402—118 eggs	No. 40—397 eggs
White Wyandottes	31 eggs	109 eggs	113.3 eggs	No. 446—149 eggs	No. 43—660 eggs
R. L. Sussex	27 eggs	100 eggs	106.9 eggs	No. 463—139 eggs	No. 48—647 eggs
Speckled Sussex	31 eggs	87 eggs	75.4 eggs	No. 491—140 eggs	No. 49—418 eggs

OUR NEXT CONTEST.

Entries are coming in for the next contest, which is to begin this fall. Several classes are already filled and if you contemplate making an entry you should write at once for rules and regulations. A winning here will mean a great deal to any poultry breeder at this time, when people are looking for birds of quality that can lay well. Have your best layers officially trapped.

Open Air Poultry Houses

For ALL CLIMATES

By
DR. PRINCE T. WOODS

TELLS plainly and in detail just how to build Open Air Poultry Houses, and what to build of, so that anyone, with few tools, can readily construct the kind of houses used and recommended by the most successful breeders. The best and most practical work on the subject. Don't build or make alterations without this valuable book. 48 illustrations of poultry houses, plans and diagrams, and photographs of construction work. Shows how to care for your houses and fowls to get better poultry, greater egg yield and fertility and freedom from disease. 88 pages, printed on best quality paper; handsomely bound in cloth.

Illinois State Fair Poultry Show.

The big Illinois State Fair Centennial exhibition will be held this year at Springfield, Ill., on August 9 to 26, and it goes without any possible contradiction that nowhere in America will there be anything like it in 1918. The Illinois State Poultry Association, co-operating with the Illinois State Board of Agriculture, takes this means of telling the poultry breeders of Illinois and surrounding states of the grand opportunity before them. There will be no exhibitors' ticket charged the poultrymen, as formerly, and cash prizes will be larger than any fair in the world, and on all classes of poultry there will be silver centennial medals well worth winning. The U. S. Dept. of Agriculture will send a full and complete live poultry exhibit direct from the experimental farm at Beltsville, Md., and will establish a school for culling at the fair, commencing August 16 and lasting straight thru until the end. The culling of the non-producing hen from the flocks of Illinois is a wonderful thing and with capable demonstrators which the Government will have in charge of the school every breeder should take advantage

of this opportunity to attend this school, learn the culling system, enlist in the war emergency work the Government is asking you to and become your county leader and spread the good news and the system thruout your district. A utility class will be put on this year at the fair and a better opportunity for the utility breeders was never put before them. The American Poultry Association convention being held in Chicago on August 12 to 15, the results of the meeting will be brought straight from Chicago to the members at the summer meeting, and plans will be drawn there for a rousing drive for 1919. A junior department will be put on for the first time also and it is up to the breeders of poultry in Illinois to show the State Board of Agriculture that we are a bunch of hustlers and we will be able to get anything that will help the poultry industry from them. Fall down on this opportunity now before us and the cause of fancy poultry will get a setback that will take years to build up again. Let us all realize that the time to get into this thing is now. Enter at least a few of your birds at the fair. Come to the meeting, bring as many hustlers from your county as you can get, attend the culling school, enlist as local leader and become a

party to the greatest work ever attempted by any Government. Catalog will be ready soon. Write A. D. Smith, Quincy, or B. M. Davison, Springfield, Ill., for copy.

International Turkey Club to Meet at the Coliseum.

The new International Turkey Club, taking in all varieties of turkeys under one club head, has been organized and will hold their first meeting at the Coliseum Show, Chicago, December 3 to 8. This is one of the wisest moves that has ever been made, as under the new banner the work of conducting a club can be successfully handled by one secretary at a great deal less expense to the members and with better general satisfaction to all concerned. The membership for the first year is \$1, and this is to be taken as an invitation to all turkey breeders, no matter what variety you are interested in, to become a member of the new club. Mrs. Eli Fowler, Rochelle, Illinois, is the acting secretary, and will be pleased to get in touch with all interested turkey breeders. Would suggest that you send to Mrs. Fowler \$1 for membership and receive your card at once, and please understand that there will be \$50 in cash offerings this year at the Coliseum on Bronze turkeys alone. This will be for first, second and third display, so that no breeder can win more than one of the cash specials and these specials are offered in addition to the regular cash prizes paid by the association, and with H. A. Pickett, judge of turkeys, we should have the greatest entry at this show that has ever been caged at any exhibition. Remember, the Coliseum Show for 1918 is held on the same dates as the International Stock Show that brings thousands of stock men to the poultry exhibition and many of them are interested in turkeys and there will undoubtedly be more and better sales made than ever before. For premium list of the Coliseum Show write to Theodore Hewes, Secretary, 25½ West Washington Street, Indianapolis, Indiana.

International Buff Minorca Club.

The breeders of Buff Minorcas recently organized a club to be known as the International Buff Minorca Club, and elected the following officers: President, Dr. B. J. Hoverstadt, 57 Canal St., Boston, Mass.; vice-president, Mrs. Dr. S. M. Applewhite, 1502 South Press St., San Antonio, Texas; secretary-treasurer, Walter C. Young, R. R. 16, Dayton, Ohio. One of the main objects of this club is to increase and promote the interests of the Buff Minorca fowl thruout the world. Every breeder who is interested in this variety should become a member of this club.

Annual Outing.

The Wisconsin State Poultry Association will hold their annual outing some time the first part of August, 1918, at Watertown, Wis., which enterprising city boasts of the largest and most active poultry association in the Northwest. Its 150 members are making plans to entertain the State Association and hope to pull off a state meeting that will set a record to be proud of. Wisconsin poultry men will do well to plan to attend this meeting. Watch for particulars later.

Mention the American Poultry Journal when writing to advertisers.

Eggs Cannot Break!

The Sefton Eggsell

Ship eggs by express or parcel post with absolute SAFETY. Use the Sefton Eggsell, the new, economical and most practical way to ship eggs. No more breakage! Not one egg touches the outer wall. FUL-O-PEP

DRY MASH

Did you ever stop to ask yourself why your hens laid more eggs during the Spring and Summer than they do during the Fall and Winter months?

Many poultry raisers accept this as a matter-of-fact condition—they get the idea that is natural for the hen to lay during the summer months, but only occasionally in Fall and Winter.

No greater mistake could be made. The fact is, your hens will lay in Fall and Winter if you provide them with the same egg-making feed that they pick up themselves in the Spring and Summer when on FREE RANGE. It is the hen's chief mission in life to produce eggs and it does not matter whether it is Winter or Summer—if she gets the proper egg-producing feed, her machinery will produce the eggs—she can't help it. *You can't get eggs by feeding scratch grains*, because scratch grains do not supply the necessary egg-producing qualities.

Get Your Hens Ready Now For Big Egg Production This Fall and Winter

If you will begin now to feed your laying stock FUL-O-PEP DRY MASH you will get eggs in abundance right through the Fall and Winter months when you get the fancy prices. **We Guarantee It.**

Our poultry feed experts and scientists discovered by continued experiments and by watching the natural habits of the hen when on free range that there were certain food elements necessary for the hen if she was to produce eggs.

We learned that to get eggs in abundance it was necessary to supply the hen with the same kind

of feed she picked up herself in the Spring. This we have supplied in FULL-O-PEP DRY MASH. This wonderful egg-producing feed consists of Green Food, Animal Food, Grain Protein Food, finely ground and correctly balanced so that it makes hens shell out eggs in large numbers.

Remember, FUL-O-PEP DRY MASH is not an experiment—it is a tried and tested feed, manufactured and **guaranteed** by the largest feed manufacturers in the world. Tests with our own poultry and the poultry of our patrons have demonstrated that as an egg-producing feed FUL-O-PEP DRY MASH cannot be surpassed.

Get a supply from your dealer and see how it will make your hens lay—keep it before them all the time and you will get eggs as you never did before.

Free Poultry Calendar Book

Fill out coupon and we will send you free—our FUL-O-PEP POULTRY CALENDAR BOOK—it contains much information of value to poultry raisers, amateurs or experts. It tells you how to solve your poultry problems. Send for it today. Write to office nearest you.

SUCRENE

For Every Stage of Poultry Life

Quick Growth

Maximum Egg Yield

A Balanced Ration Strong in Protein Necessary for Growth and Egg Production

Because of the rapid growth and greater activity of poultry, and the 12.8% protein content of eggs, "rations for growing and laying poultry should contain a rather larger proportion of protein-rich feeds than for other farm animals"—Prof. Henry and Morrison, Wis. Experiment Station, in "Feeds and Feeding."

Every 100 pounds of Sucrene Poultry Mash is guaranteed to contain 18 pounds of protein—equal to the protein content of 1200 eggs or 144 pounds of live weight poultry. Also guaranteed to contain 53½ pounds of fat and carbohydrates for the yolks in eggs, and to supply the energy nutrient for the active body. In addition Sucrene Poultry Mash contains calcium carbonate and other lime and mineral matter, for bone building in growing poultry, and for egg shells in laying hens.

This high analysis is produced and uniformly maintained by

A Scientifically Correct Combination of Standard Quality Feeding Stuffs

Sucrene Poultry Mash is composed of Meat Scraps, Corn Feed Meal, Alfalfa Meal, Corn Distillers' Dried Grains, Wheat Bran, Linseed Meal, Palm Kernel Meal, Calcium Carbonate ½% and Salt ½%.

It should be kept before growing poultry and laying hens all the time, in self feeders to prevent waste; and should be supplemented daily with Sucrene Scratch Feed—composed of seven different grains and seeds—all clean and sound—no waste in feeding.

Let Sucrene Feeds save you trouble, worry and money this year and place your poultry on a more profitable basis. Order a 100-lb. sack of each of these feeds from your dealer. You will find it the best feed investment you ever made. If your dealer does not handle Sucrene, write us his name and we will see that you are supplied.

The coupon or a post card brings you free illustrated literature on the care and feeding of poultry. Write for it today.

PRESENT-DAY POULTRY FARMS

What a Visit to Sabrina Farm Taught An Old Poultryman

By Maurice F. Delano

WHEN one has devoted all his time for twenty-one years, and part of his time for the six years preceding, to the poultry business, he can be pardoned for feeling that he knows many things about the business and for having a skeptical feeling toward a brand new idea he has never seen worked out. I will freely confess that my visit to Sabrina Farms was made with my mind in its most critical state and really a tolerant attitude toward the new giant-house idea that Mr. Shaw was trying out on his farm. After a delightful day spent in studying the farm, the buildings, the carefully kept records, and the personality of the proprietors, Mr. and Mrs. Shaw, I came away with the feeling that this new idea in poultry architecture was a success, and well worthy of emulation throughout the country.

One beautiful day last May, Mrs. Delano and the writer passed up the train and took the trolley from Boston to Wellesley. A short auto ride from the center of this beautiful town brought us to "Sabrina," and we were welcomed by the proprietors. From the time we approached the farm I

found my spirit changing, and the more I studied its possibilities, the more I found to admire, the surer I became that here was a farm that was bound to become one of the most successful in all America. The location is not only beautiful, but absolutely ideal for poultry. The soil is excellent, a sandy loam that dries quickly and has splendid drainage. Originally developed as a pleasure park, with a large artificial lake, and several islands all walled in by granite to preserve them, the artificial features have been made part of the landscape by the softening processes of time, and Sabrina has one of the most beautiful settings I have ever seen anywhere.

More than forty acres are under cultivation this year, with corn the main crop. This acreage will be increased next year. Fine orchards have been started, and the older trees cleaned up and grafted. A fine flock of thorobred sheep is utilized to graze the extensive lawns and save mowing. The poultry, geese, ducks and pheasants are all kept under ideal conditions by following the laws of nature very closely. Mr. Shaw has built a roomy, homy bungalow on the largest of the islands

BUNGALOW OF ARTHUR H. SHAW, PROPRIETOR OF SABRINA FARM, WELLESLEY, MASS. THIS HOME IS LOCATED ON AN ISLAND, CONNECTED BY THREE BRIDGES WITH THE MAINLAND.

MAMMOTH LAYING HOUSE FOR 800 LAYERS ON SABRINA FARM.

in the lake. This island is roughly egg shape, and a white paling fence just back of the stone wall surrounding it helps bring out this appropriate outline for the home on this egg farm. It would be hard to imagine a prettier setting for a home. Splendid water vistas through the trees open up on every side. Ducks and geese were playing in the water everywhere, the paling fence keeping them from the home lawn and garden. I saw nest after nest full of goose eggs that were being hatched just where the parent geese chose to locate their nest, and a few early broods were already off. The home island is connected by three bridges with the mainland. Were Mr. Shaw to make them draw-bridges, he might well feel like a baron of old and sleep securely surrounded by a moat.

Naturally, my keenest interest lay in this new mammoth house for 800 layers that I had heard of, but never seen. We were soon following the winding driveway up the hill from the lake until we reached the higher level where the poultry buildings are located. The large 60-foot square building was studied from all sides before we entered it. The south front, and half way back on the east and west sides, were windows that could be opened at either top or bottom; one-piece 12-light regular storm sash. A very ingenious arrangement allowing this double method of opening. They can also be taken out and stored over head, and their places taken by muslin screens, at will. The main floor is all one room and 800 laying birds have a superb exercising space in this roomy interior, with plenty of sunlight and pure fresh air. The ventilation is perfect, as the fresh air comes in the window openings and the dead air passes up through ventilators and out above the roof. Enormous dry mash hoppers start about 15 feet from the front of the building and

run down the middle for about 20 feet. They have their bottom about 24 inches above the floor, so they do not interfere with the floor space. Foot boards give ample room for the birds to stand while eating their requirements from the hopper. The hard grain is fed from an ingenious invention of Mr. Shaw's. He places the grain in a large hopper which is mounted on wheels and has a snout or opening near the floor. Running this through the deep litter places every kernel of grain next to the floor, and the birds have to scratch hard for it. Running east and west across the building, about 40 feet from the front, are the banks of trap-nests. These, too, are well off the floor so birds can pass under them. In the rear of the building is the roosting room, with ample accommodations for the 800 dwellers in this mammoth apartment. A wire partition makes it possible to confine the birds to this room at will when cleaning the main building or handling the flock in a more constricted space.

Above the main room is a large feed room and plenty of space for grain storage. Mr. Shaw has taken advantage of a side hill to have the east side of the main floor just above the ground level, while the west side of the cellar floor is at the ground level, and the enormous cellar under the whole building gives him many things that all poultry farms need and very few have. Through the center is a roomy hall or corridor and the rooms all open from this hallway. It runs to within about 18 feet of the east side of the cellar. On the right as you enter is a roomy and well-lighted carpenter's or work room that is well equipped with machinery for doing all kinds of wood work. Next comes a fitting room for getting birds in condition, then an egg room, where there are ample accommodations for keeping eggs, then an incubator cellar well stocked with good lamp machines. This brings us

PORTABLE ROOSTING HOUSES USED FOR CHICKS ON SABRINA FARM.

to the corner. Next, along the east wall, is a cold storage room that is splendidly cooled by a large body of ice stored overhead in a large bin. Here are cooled and kept dressed poultry and market eggs. The next two rooms are root cellars, then a mushroom cellar, and this brings us to the corner, another root cellar. Along the north wall as an "L" to the main hallway is the heater and room for storing coal. Mushroom bins are cleverly placed around the heater, and a splendid income is derived from these bins and the other cellar. Next comes a large feed room, and chutes from the loft come down in the main hallway just outside the door to this room. Finally we come to a splendidly fitted room for fattening birds in crates, making all-in-all the best and most complete auxiliary plant I have ever seen on a poultry farm.

There are two large yards in connection with this building and the birds have access to them alternately, so that green stuff is kept coming all the time. Three hundred feet away the foundation was being built for another building just like the one described above, excepting the cellar will be used for housing the tractor and other farm machinery, and not as much money would be laid out in partitions as on the original building. Mr. Shaw believes that ample storage room for housing summer colonies, brood coops, as well as all machinery, will pay in the long run, and he is certainly right. Most of us have to take the wear and tear on our smaller houses, however.

You will be as keenly interested as I was to learn just how the birds wintered in their roomy quarters last winter. As you know, it was a supreme test, for it was the coldest winter on record. Also, there were only 600 females in the house last winter, so it was not filled to capacity. Notwithstanding these facts, it was an absolute success, and Mr. Shaw's carefully kept egg records are ample proof of it. The birds when I saw them were in splendid order and showed they had been in perfect health all winter. Mr. Shaw's opinion of the house is best demonstrated by the fact that he is building another. The saving of labor is sufficient to make the house attractive to every market egg man.

Between the two houses a long breeding house was being erected that will house the choice pens of White Wyandottes that will be Mr. Shaw's specialty. This house will have ten or more pens, each 8x15 feet, and the usual open-front curtains will be used. Yards will go from front and back of this house, so birds will alternate and have a green run all

the time. Several colony breeding houses and a male bird house will complete the present equipment for adult fowls. A good brooder house is now on the farm, and another will be erected this summer.

The many hundred sturdy youngsters coming on were very attractive. They had a large grass range, and as soon as the cornfields are well started the movable fences come down and the chicks roam at will through this ideal range. The roosting houses for these chicks differed from any I have seen elsewhere, and are well worth your study. They are all collapsible and are 10 feet square on the ground when erected. Sides, back, front and top are all frames, covered with wire netting and heavy roofing paper. The sides are covered with paper only for the rear 5 feet and the front has no paper. The roof and back are solid. This gives a fine roosting room at the rear and a covered loafing place at the front. The buildings are anchored to the ground so they will not collapse in a high wind; a splendid shelter for a goodly bunch of chicks and easily housed for the winter.

Mr. Shaw has been breeding carefully and well in a rather small way for some years and is now planning for the future. He is building what is bound to be one of the largest and best poultry farms in the country. Expansion will come as needed and only after the need for more house room has been demonstrated. Mr. and Mrs. Shaw love their White Wyandottes, and the fine quality in their flocks reflects this attitude. They also have a good flock of utility Reds and some of Uncle Isaac Felch's heavy laying Brahmas. Novel labor-saving devices are being freely introduced and automatic drinking devices convey water to every flock on the place. Mrs. Shaw is just as keen a fancier as her husband, and many splendid suggestions have come from her and helped to make the farm successful.

Every fancier will welcome the Shaws to our ranks with open arms, and the same careful work they have done with layers when applied to standard points will insure their success from the word go. It will be an inspiration for you to go to Sabrina, and you will come away with brand new ideas and full of enthusiasm from an hour or two spent with the Shaws. My regret at parting with the flock of White Wyandottes that I have worked on for over twenty years has been tempered greatly by the fact they have gone into such good hands, and I know that their further development as one of America's leading flocks of this grand variety is assured.

Advocate Standardbred Uniform Flocks

This Is Not a Time to Give Up Poultry Shows, to Stop Advertising or to Stop Breeding High Class Poultry. Fewer Birds, If Necessary, But Better Bred, Better Reared and Better Kept. Quality Counts. First Prize Article, A. P. J. Monthly Contest. By Edward R. Wright

THERE ARE THOSE who do not realize that the future of poultry keeping is dependent to a great extent upon the continuation of careful and scientific breeding, without which the painstaking work of years will become a dead loss. It is all well enough to say that "a hen is a hen" and that a hen lays eggs no matter what her color or shape may be, yet the fact remains that until the practice of careful and scientific breeding of poultry became a recognized undertaking, the female of the hen species laid her litter of eggs, hatched out a handful of chicks, taught them to scratch for a living, and then considered her life work done. Certainly no one who has made any study of the subject can fail to see that since man has begun the careful study and experimentation of poultry breeding, the value and desirability of the different breeds of poultry have increased enormously. And these things have not "just happened." If man had not spent his thought and energy upon the worthy problem of improving domestic poultry, we would be some billions of dollars poorer in wealth and not so well off so far as health and efficiency are concerned.

The future of poultry culture is just as dependent upon the

continuation of careful breeding as the present-day breeds of poultry have been upon former efforts in improvement. In all things a standard of excellence, with a gradual changing of ideals for betterment, is the only means of bringing about progress. When the standard is lowered, the work goes backward; or when the value of a high standard is disregarded or lost sight of, the result is invariably retrogression. Progress can only be maintained by the upholding of a high standard.

We are certainly justified in the belief that for many years man has chosen the best fowls of the various breeds as well as the most prolific layers for breeders and that thru this method of wise selection we have attained a high degree of beauty and efficiency in the accepted breeds of poultry. The work of a few painstaking breeders in each decade has carried the work forward. Is it a time now to allow this work to go for naught or shall we with grim determination accept the present crisis as the time to establish permanently the value and worth of Standardbred poultry? Man's time and money, his energy and brain power were never more valuable than they are today. There are a dozen demands made upon

him today where formerly there was one. Who can afford, then, to lend his energy or interest to any undertaking but that of highest worth?

It seems to me that this is the psychological time which all breeders of Standard poultry should grasp to spread the gospel of the importance of pure bred poultry and to aid in disseminating knowledge of their superior economic worth. All over the country, on city back lots and in country towns, beginners are taking up poultry keeping and many of them do not know one breed of poultry from another or whether a bird is a scrub or a pure-bred. True, a great many of these amateurs believe it is possible to buy a perfectly good pullet for \$1 or a setting of eggs for 50 cents, as was the case in purchasing mongrels not so many years ago. If, however, these beginners could be brought to understand the difference in actual value between an undersized, poorly fed, improperly grown mongrel or cross-bred and a perfectly well developed, well grown, Standardbred variety of poultry, and the really slight difference in purchase price, and the remarkable difference in value and income from such, every backyard, wherever poultry could be kept, would have a fine flock of pure-bred fowls.

The only way this can be brought about is for the breeders of Standard poultry and those interested in the advancement of well-bred poultry to work to that end. This is not a time to give up poultry shows. This is not a time to stop advertising. This is not a time to stop breeding good poultry. If your time is limited, if your means are limited, put what time and money and thought you can spare into the best—fewer birds if necessary, but better bred, better reared and better kept. Keep the quality plainly in evidence and let the public

know what you have by showing your best birds at the shows and by advertising them.

More and more, as time goes by, we are coming to realize that the breeds which maintain popularity are those which are capable of producing a good yield of standard quality eggs and meat, but this does not mean that so-called fancy poultry must go into the discard. It does mean that the fancy and the practical go hand in hand, and make up the all-around quality of the best breeds of poultry. Some of these breeds have held place in the front ranks for many years, and if their worth and breeding are rightly maintained will continue to do so. A letting down of the bars as to the quality breeding of poultry in a few years would result in a serious handicap to the poultry branch of animal industry, for all progress in whatever line depends upon the maintenance of a high standard of excellence. There is an unusual opportunity for everyone interested in poultry culture to do the industry lasting and unprecedented good in advocating that only the pure breeds of poultry be kept, whether the birds are kept for breeding purposes or for meat and eggs. In either case the results from pure-bred flocks will greatly outweigh those from scrub stock and the owner will in all probability become permanently interested in the breeding of high-class poultry.

A campaign along this line will greatly benefit the industry—all branches. But let us not go about it in a half-hearted sort of way. Whatever is worth doing at all is worth doing well and this is a matter that should claim the attention of every breeder and lover of thorobred poultry.

Let us strive as never before for high-quality breeding stock and the establishment of uniform flocks wherever poultry is kept.

The Sanitary Marketing of Eggs

The Producer Should Market Only Clean-Shelled, Whole-some, Full-Meated, Newly-Laid Eggs. Second Prize Article
A. P. J. Monthly Contest.
By Mrs. W. P. Henry

MUCH has been written about the tremendous loss thru breakage of eggs in shipment, as well as by loss thru spoilage, but this great waste of good food goes merrily on year after year. One has only to look over the poorer quality stocks of eggs on sale in the cities to realize that only about half the eggs for sale in the markets are really fit for human food. I have seen great hampers of filthy-shelled eggs, which must have been at least three weeks to two months old, placed on sale at perhaps 10 cents less a dozen than clean-shelled ones, and been amazed to watch the well-dressed women who came in and bought them for "cooking eggs." I have always been of the opinion that it is just as necessary for a cooking egg to be a good egg as if it were to be boiled, fried or poached for immediate consumption, and that if it had a tang of filth about it as flavor, it would stay with it even when concealed in a cake or muffin. Nevertheless, there seem to be a great many worthy people who make a business of using dirty, ill-flavored eggs for cooking purposes. Isn't the proposition up to the poultry grower to stop having dirty-shelled, ill-flavored eggs; and doing so, will he not at once increase the price of eggs?

I realize that frequently, even in the best regulated poultry houses, eggs do become soiled, and that sometimes the percentage of soiled eggs is quite large, but the marketing of soiled eggs in any quantity is a real handicap to the poultry business and one which poultry keepers everywhere would do well to strive to prevent. There are various ways in which this end may be attained.

No other than clean nests and nesting material should be tolerated in the poultry house. Broody hens should not be allowed to occupy nests where other hens are expected to lay. A sufficient number of nests should be provided in order that crowding on the nests may be prevented. Six nests will be sufficient for a flock of 50 hens. The nests should be so

arranged that there is no possibility of the birds roosting on the side of them and thus soiling the nesting material. If the young pullets start this bad habit, cover the nests in such a manner that they can find no footing on the top or edge of nests and they will soon seek other roosting quarters. Do not give up in a night or two, but keep up the practice for some weeks until the habit of roosting in a suitable place is fully established and there will be no further trouble. Roosting on nest boxes is a bad habit for young stock to acquire and it should be broken at the first opportunity.

Use nothing other than clean, sanitary nesting material. Hay, chaff, straw, excelsior and many other materials will suggest themselves, according to what is obtainable in the vicinity. Sawdust and clean, sweet-smelling shavings are used in many poultry houses. The main thing is that the material shall be clean and free from any disagreeable odor, as the egg readily absorbs any taint with which it may come in contact. If enough nests are provided there is little danger of the hens breaking the eggs in the nests. Plenty of oyster shell should be kept before the birds at all times and the hens will attend to having the shell of the egg of the proper composition that it will not break easily.

Carelessness in gathering eggs is responsible for a great many soiled shells. Breaking one egg on a pairful of others converts the whole lot into "dirties." In gathering eggs, the hands should be as clean as in milking a cow, the receptacle into which the eggs are put should be clean, the case clean in which they are packed, the fillers and cardboards all free from soil or broken egg.

In packing eggs for shipment, a certain amount of culling must be done. No rough-shelled eggs, brittle-shelled eggs, very small eggs or extra large eggs should be put into the case. The rough and brittle eggs are too easily broken, the small eggs rattle about in the filler and are broken, the extra

large eggs are too big to go into the filler without making too much pressure on the egg in the next compartment. Sometimes the large egg will carry in good condition but the ones next to it are found to be crushed. Plenty of packing should be used in the bottom of cases and on top. Corrugated paper is fine for this purpose. If the eggs are to be shipped any distance, sawdust should be used as packing in addition to the regulation fillers and corrugated paper packing. No eggs should ever be shipped unless they are known to be absolutely fresh and of good quality. If a reasonable price is obtained for the eggs they should be candled, and eggs containing bloodspots used for home consumption. Such eggs are perfectly good food when the blood spot is removed and the egg used while fresh, but when kept any length of time

and under unsanitary conditions the egg containing a blood-spot easily becomes a "bad egg."

While waiting shipment, keep the eggs in a cool, clean room. When shipping, mark the cases plainly as containing fresh eggs and thus see to it that the great waste in breakage and spoilage cannot be laid at the producer's door. If the expressman chooses to toss the case mercilessly into the car, and break 30 dozen at one stroke, the producer's conscience need not trouble him, since he has delivered into the carrier's hands 30 dozen clean, wholesome, full-meated, newly laid eggs and is entitled to collect a good price for one of the choicest foods man is heir to. Here's to the well-fed egg, here's to the new-laid egg, here's to the clean-shelled egg—a well balanced food, a satisfying food, fit for the gods!

Answers to Letter in June A. P. J.

Readers Reply to Interesting Questions Asked by "Chicago Reader"

IN JUNE A. P. J. we published a query letter from a "Chicago Reader" asking some very interesting questions about starting in the poultry business. Although we gave our frank opinion in reply to the queries, we asked readers, who had had practical experience in poultry keeping as a means of earning a living, to take part in the discussion and to give their views.

Four of the most interesting replies received are given herewith. One earnest fancier writes: "I think far too much stress is laid on so-called commercial poultry ventures anyway. It has always struck me that *poultry is and should be a side-line venture* with most of us anyway, a hobby as with myself and many others that I know of, but in my case a profitable one in that it shows a profit of satisfactory proportions, but at the same time I would dreadfully hate to rely

upon my hens for my bread and butter—oatmeal bread included.

"There is money—some—in commercial poultry, but why hasn't a fancier a better chance to weather storms than a market egg man? He has nearly as many eggs to sell, size of flocks considered, and whatever stock is sold generally brings in far more real money than the best market prices afford. I would like to see your premier journal put a little more accent on the fancy side and a damper on the 200-egg freaks."

ONE THOUSAND HENS IN FLORIDA.

The request in June issue of AMERICAN POULTRY JOURNAL, page 606, attracted my attention and the following reply is based entirely on thirty years' experience and results in the state of Florida.

THE THREE JOES — PAST, PRESENT AND FUTURE.

(1) One of the three Joes, J. R. Parks, Sr., past. (2) Another one of the three Joes, J. W. Parks, present. (3) The latest one of the three Joes, J. E. Parks, future. (4) Cockerel-bred male, from a 232-egg record dam. (5) Egg-type and narrow barring combined, as bred by J. W. Parks, Altoona, Pa., Box J.

If the man and woman referred to are fond of poultry and really enjoy work with fowls, will keep them entirely free from vermin and all such pests, and will supply their flocks with proper food and water, they can reap a comfortable living and 10 percent on their investment from 1,000 hens, pure-bred, from one of the Standard egg-producing breeds. I prefer S. C. White Leghorns because they stand our long summers better than the bigger breeds, lay as many eggs, and white eggs, on less feed—at least 50 cents per annum for each hen.

Based on the following prices for best feed obtainable (which is none too good for hens expected to lay eggs): corn, \$3.50 per hundred; oats, \$3.50; beef scrap, \$6; bean meal, \$2.25; wheat bran, \$2.25; wheat middlings, \$2.80; corn meal, \$3.50 (ground on place with hand mill); collards and sprouted oats for green feed, we are producing eggs at 20 cents per dozen, or we are feeding our hens for 20 cents each per month. The average price for eggs is 50 cents per dozen. We make no charge for labor. The man and the woman must of course do all the work. The roosts should be one foot above a light tray to catch all the droppings, which from 1,000 hens are worth \$40 per month here.

With all the necessary qualifications in the man and the woman, I would consider that a capital of \$4,500 would insure success, the investments to be made as follows:

Five acres of land near Jacksonville, Fla.....	\$ 250
Three-room cottage and sleeping-porch.....	750
Water plant (first-class).....	500
Hen house, 5x100 feet.....	250
Horse, wagon, tools and harness.....	250
One thousand April hatched pullets, October 1.....	1,250
Cash	1,250
Total	\$4,500

About two acres of land should be used for the poultry and buildings, the rest of the land used for cultivation, which in this latitude means every day in the year.

In normal times in Florida, an egg plant of less than 3,000 hens should be located near large markets; for more than 3,000 hens it makes very little difference, as the big producer can always contract his entire product to one of the big hotels.

No one writes about droppings, but on our light, sandy soil it is necessary to fertilize in order to grow crops that pay, and organic manures are better to enrich the soil than chemicals, tho' chemicals are a great stimulant to plant growth; but in order to enrich the soil organic manures must be used.

We expected to get \$1 a dozen for eggs in December, January, February and March, but 75 cents was the top. We are now getting 45 cents (June 10). Our egg year really begins in December, about the time the winter travel begins and the big hotels open. Now we have a great many soldiers to feed and men working in the shipbuilding plants, so the demand for eggs is very good and the price will not go below 45 cents, I am sure.

I buy day-old chicks in March or the first of April to keep up our stock, and if I were going to start here, I would buy chicks rather than hatch them. The 60-day broilers which have been pushed will bring now 75 cents each. Our loss this spring was hardly worth noticing, being less than 2 percent.

If I could not get ready for the hens before fall—say October 1—I would buy April or first of May pullets. We haven't a hen today over 13 months old. Our greatest trial here in this warm climate is caused by lice and mites. A virgin spot with brand new buildings is by far the best, and then never let a hen come on the place that isn't perfectly clean.

Anyone with average business ability, and who is adapted to the poultry business, who reads the poultry journals and is associated with successful men, who is willing to work hard, can live very comfortably on the proceeds of a 1,000-hen plant and have at least 10 percent on his investment to put in the bank. A garden will furnish something for his table every day in the year. Clothing and fuel will cost much less here in Florida than in cold climates, and the cost of buildings will be considerably less.

Jacksonville, Fla.

W. L. VAN DUZOR.

SHOULD BEGIN SMALL.

I read with interest the letter of "Chicago Reader" on page 606, AMERICAN POULTRY JOURNAL, the answer given his questions and the invitation extended for discussion. While leaving it for the poultry expert to specifically answer "Reader's" question, I think perhaps the experience and conclusions of a city man on a farm may help him somewhat.

By way of preface let me say, my wife and I moved to the farm in the fall of 1913. I was then on the shady side of forty. So have been in the business five years and would not think of crossing swords with experts. Having lived in the city more than forty years, I feel, however, that I know something of city men.

The first year on the farm I built a poultry house for 300 hens. In the fall I bought 25 pullets. For the 14 months ending December 31, 1914, I had \$25 over the keep of the birds. In 1915 I purchased a 140-egg incubator and two oil brooders. I sold the cockerels for a little more than the cost of feed and put 80 pullets in the laying house. In 1916 they returned about \$75 over their keep.

In 1916 I put up a brooder house, purchased a coal-burning brooder stove and a 340-egg incubator. That was a very bad year for poultry. Eggs were poor and hatches were bad. The spring was cold, with a great deal of rain, and I lost a large number of chicks. That fall I put 106 pullets in the laying house and sold the cockerels at a little above feed cost. The pullets laid earlier than the year before and by December 31, 1916, had given a profit of \$34, and in 1917 gave a return of about \$250 over their keep.

The last was another bad year and losses were heavy. I purchased another incubator, put up another brooder house, and in the fall put 265 pullets in the laying house. Those birds were late in laying, and when I come to sell them I stand to lose on them. In 1917 I sold the original birds and those hatched in 1915 for \$13 above cost, which sum includes the profit on sale of cockerels in 1915. In 1918, I sold the birds hatched in 1916 at a profit of \$70, which includes the profit on the cockerels sold in 1916, also some of the birds sold early in 1917 at \$2.50 each while laying.

There is nothing remarkable about that record and we came far from making a living, but as we have a little income "on the side," I did not set out to make a living—only to add to the income.

Now for conclusions and advice, and—by the way—advice is the cheapest thing on earth. When I came to the farm, I figured that a hen would lay 12 dozen eggs a year, that the eggs would sell at an average price of 25 cents per dozen, or \$3. I thought a hen would eat \$1.50 worth of food and that 50 cents per hen would cover all overhead charges. I still think that a fair estimate for conditions then existing. Today we must double the expenses, but I am not so sure about doubling the receipts!

If a man can care for 1,000 hens and hatch out and care for 3,000 chicks, he stands to make \$1,000 from eggs, plus something from the sale of the cockerels and the hens not kept for layers. Quite some job for a city man! I should advise "Reader" to start small and not expect to keep 1,000 birds for several years. But "Reader" should first decide whether he likes the country and country life. If he does not like it, he will find farm work the most monotonous drudgery he ever undertook. It is as great a care to raise chicks as it is to raise babies. If he thinks of getting into poultry raising as a man out of work might take any job that offered because it pays a living, he better keep out of it. I have been kept up until 1 o'clock in the morning nursing a refractory brooder stove, and again turned out in a driving snow storm at 2 a. m. to see that the lamps were burning and not snowed under. So have we all of us!

I would suggest that if "Reader" has the capital necessary to purchase, equip, stock and work a 100-acre farm, which I figure would be \$20,000 or \$25,000, he had better take, say, \$5,000 and buy a small place of about 10 acres and invest the balance in government bonds. That will give him some income while he is learning the business. Such a place would cost about \$2,000. He could fix it up for \$1,000 or less and have \$2,000 working capital. He should start small and

work up. After a few years he will know whether he wants a larger place.

Whether the poultryman should raise grain or not depends upon many factors. Here, it was cheaper to buy grain than to grow it, but now we can grow some grains cheaper than we can buy them. Yet I have bought all grain this past winter and made something above cost.

I see no reason why a man of ordinary intelligence, with work and study, should not make a "go" of the poultry business. But no man of intelligence should expect to start without experience and make a success of running a large farm or poultry plant. He would not expect to do it in any other business.

G. F. SHEPARD.

Stafford Springs, Conn.

POULTRY KEEPING WILL ADD TO INCOME.

I came to the country myself, an invalid thru nervous exhaustion, with the intention of making a living with poultry for eggs and meat. I gained my health but not a livelihood, for I soon saw that commercial poultry meant more than I cared to attempt. It looked easy and read easier, but there were several things I had no conception of. Fortunately for me, I thought I would start my poultry venture easy by not attempting too much the first season, so I contented myself with buying 200 baby chicks and a really good breeding pen. The breeding pen didn't bother me so much, but I was busy from morning till night with those fool chicks. Of course, I had it all to learn, with no equipment on hand whatever, and I certainly learned a plenty; and the best thing I learned was that if I had multiplied my chicks by ten, which was my original intention, I would not be here to write this story. So my poultry was successful after all.

Now, after ten years, I am still in the country, in good health, with a good bunch of chicks, and I am sure no one could induce me to live in the city again—no, not for a dollar a minute. Also, I have found my proper niche in the poultry business and am making progress every year, and have accumulated some reputation and am making money out of my poultry venture—but I have never considered it a livelihood. I look on it more as "velvet," for I have never gone in very strong, and neither have I any intention of doing so, for work, worry and responsibility are things I wish to avoid as much as possible.

But I feel that with my garden, which is generally a good one, and my eggs and my meat, I could weather any financial storm that might come along, but I want it a storm and not a catastrophe.

My remarks, you understand, are from the viewpoint of an invalid who has regained his health, but who has had a lesson in health conservation that will be long remembered. When first coming to the country I was amazed at what mere living in the country entailed. I had no idea that two people could use so much water that had to be pumped and carried and afterward emptied. I had no idea that one would have to cut and split so much wood to keep warm and cook with, nor had I any idea that grass and weeds grew quite so fast! I also noticed that whatever I attempted to do generally needed my utmost strength, from opening the barn door to stretching fencing. In fact, I was amazed at so many things that I had to change my ideas of life about.

In the city I generally lived in hotels, traveled with a good jolly crowd of men—men who were mostly comfortably fat—and when I came to the country I wondered at first where all the fat farmers kept themselves, but after I had been there myself a while and dropped from 210 pounds to 156 pounds, I ceased to wonder.

The point I wish to make is, that a country dweller can't be fat and do anything at all, for whatever there is to do requires considerable exertion and effort, so the country is no place for an invalid who cuts out a great deal for himself, whether it is keeping poultry or growing crops. So to Mr. and Mrs. Invalid of the June number I would say, go to the country by all means, but don't attempt anything much until you feel you surely can see it thru. Just try to live comfortably and easily, and make your garden, at least, half feed yourselves; the rest is not very expensive in most rural com-

munities, remembering that the farther off the main lines you get the cheaper it is to live.

I will now answer the questions from my viewpoint.

1st.—If one has enough money for two or three years' rent, groceries, and coal or wood, one can get along until health and opportunity point the way to a successful financial outcome. One can attempt it on nothing at all, but it means working out by the day when opportunity offers, and work and invalidism don't go together.

2d.—Never mind how much ground you have; make the most of what you can get. One acre will support a family if it goes at it right, but there's the rub—experience teaches better than words. Growing the poultryman's grain is a "false alarm." It can be done, but that means many acres, a lot of tools, teams and no end of work. A far better way is to grow a lot of what the land is adapted for, strawberries, or some fruit that runs to money fast, and use this money to buy grain with. With the profits of one, two or three acres of strawberries one can purchase all the grain a 50 to 100-acre farm will raise.

3d.—I bought mine away from a large city; that is, about 14 miles away, but on a road that isn't so much traveled, no trolley within 7 miles and no railroad, so I feel safe from tramps, poultry thieves and picnickers. If anyone wishes to see my hens he is quite welcome, but he has to make an effort to do so and I am not overrun with the merely curious and feel that I don't have to keep up a show place. I keep poultry for exhibition use only and have quite a few visitors, and anyone who makes the effort to come to see me I feel certain of selling to.

4th.—The experience of growing and feeding hens to keep them in perfect trim. The rudiments can be learned from books if one reads understandingly, but the actual experience is gained by watching your fowls from year to year. There are many branches to poultry keeping, all of them profitable if gone at right. I will name them in the order of desirability, from my viewpoint. Show stock, hatching eggs, breeders, baby chicks, broilers and roasters, table eggs. The first two branches are the only ones that appeal to me, for I can do a good bit of business with a relatively small flock. If I liked hatching I would sell baby chicks exclusively, but it means considerable time in the incubator cellar and I want to be outdoors mostly.

AN EX-INVALID.

The following "news" item went the rounds of the daily newspapers early in July:

"For each 100 pounds of feed given to hens, man gets back only 5.1 pounds of eggs.

"For each 100 pounds of feed given to cows, man gets eighteen pounds of milk.

"For each 100 pounds of feed fed to sheep, man gets but 2.6 pounds of mutton.

"These and other interesting facts are brought out by the Allied Food Commission, representing the United States, France, Great Britain, Italy and Belgium, in a study of the food requirements of human beings. The logical conclusion is that cereals should be conserved for human use, instead of being fed to live-stock, and that governments, in fixing prices, should place the restrictions on meat rather than on grains.

"An average man weighing 154 pounds, says the commission's report, doing average work for eight hours a day, needs food to the value of 3,300 calories daily. In case of need this can be reduced 10 percent without injury to health. Meat is not necessary to human life, rules the commission, and therefore a minimum meat ration was not specified. The minimum ration of fat per day per person is seventy-five grains, or about 2½ ounces."

We have not read the official report and so do not know how much of the above is quoted and how much was born in the fevered imagination of some enterprising "journalist." We doubt very much if experienced and practical men will accept either the "facts" or the "logical conclusion." To us it looks like a bad attack of *foodfaditis*, and the worst feature of it is that a very large part of the city-bred consuming public will accept it for truth.

Of course we know that man can exist without animal foods, but can he really *live* and be truly efficient? Even the peoples nationally subsisting very largely on cereals also consume great quantities of fish, poultry and eggs. We would not want to see

introduced into our country the malignant diseases which so commonly affect those whose national diet is largely cereals and fish. Probably much of the natural health, ability and efficiency of Americans is due to our well-mixed diet, as well as our environment and natural advantages. Much of our success in preventing infant mortality has been due to an abundant supply of pure milk and new-laid eggs. We certainly cannot afford to sacrifice our growing youngsters and coming generations upon the altar of the food faddists. Winning the war at the sacrifice of our future population would indeed be a barren victory, and such sacrifice certainly seems wholly unnecessary. With the food situation properly handled and with our great natural resources, there should be an abundance of wholesome foods for all.

Without going too much into details, which any practical poultryman or farmer can supply for himself, think what it would mean to materially cut down or go without our farm animals and their by-products. Wool, leather, feathers, etc., are very necessary and much needed. Some "agricultural experts" have told us that we do not need the dung of animals to manure our farms and that chemical fertilizers will fill all requirements, but are there many practical farmers who will accept that as fact? Certainly experience has demonstrated that nothing will build up run-out farm land like the manure from poultry, cattle and sheep. Chemical fertilizers are well enough and very useful in their place, but there are soils and seasons where they fail to give results and their cost is prohibitive.

Take the statement made in regard to the hen. It is not true that 100 pounds of feed are required to yield five and one-tenth pounds of eggs—"feed"

in this case meaning grain or by-products of grain. Selected eggs may easily weigh from 28 to 32 ounces to the dozen. With well selected hens, 45 pounds of mash mixture and 45 pounds of scratch grains will feed one hen for twelve months and in that year such hens should average ten dozen eggs per hen. The eggs will average 24 ounces to the dozen, which gives 15 pounds of eggs for 90 pounds of feed, and during the year the hen has, in all probability, added one pound to her own weight, assuming that she started the year as a five-pound pullet. This, we believe, is a conservative estimate and many of our readers will be able to produce records much better than this from flocks of well-fed hens.

It is not fair to assume that this 90 pounds of feed, fed to the laying hen, could be saved for human use as cereal food. The feed is very largely made up of inferior quality grains and the by-products from milling grains, as well as a percentage of vegetable and animal products which even "journalistic" imagination or the food faddist's theory could not stretch into usefulness for human food. Probably from 85 percent to 90 percent of the feed used for hens could not be utilized for human consumption and would be wasted if not fed to farm animals. Why put so much effort into endeavoring to show great loss entailed when feeding such feeds to hens, and why misrepresent the hen and her product? Next to milk, eggs are our most valuable food. Without considering the case of our babies, what would become of our wounded and invalidated soldier boys if such valuable foods as milk and eggs were eliminated at the source?

Surely no one will question that milk is our *one most valuable* and generally useful foodstuff, nor dispute the fact that butterfat is very desirable. Undoubtedly skilled use of grains in feeding dairy cows has contributed largely to increased milk production, next to careful selection and breeding. Without presenting the case of the dairy cow, we will confine our comment on the commission's statement to personal experience with a good family cow, a grade Guernsey. She has been in milk now for about 23 months and altho due to come in within five weeks, she is giving nine quarts of strained milk daily. We have cut off the grain feed to try to dry her up before calving, but she gives evidence of being likely to "milk all around." She has averaged only five pounds of grain feed daily. On this feed, in addition to her hay, grass, or fodder, she has averaged to yield 20 pounds of milk per day, which would be equivalent to 400 pounds of milk for each 100 pounds of grain feed fed, instead of the eighteen pounds mentioned in the newspaper item. The grain feed has been very largely wheat middlings, with some corn and gluten feed. Taking her entire food ration, feed and fodder, she has not failed to yield 40 pounds of milk for 100 pounds of rations. We have had milk, cream and butter for the whole family, and in addition she will soon give us a calf and has yielded a very considerable quantity of manure to add fertility to the soil of our farm. Her three-year-old daughter, now fresh, promises to yield better returns than her dam, and is yielding close to 18 quarts of strained milk daily with her first calf. She is getting approximately the same allowance of grain feed in proportion to her yield.

We wonder if even a food faddist could get as much nourishment and comfort out of say 5 pounds

of middlings, even with the addition of 45 pounds of fodder and vegetable waste, as he would from ten quarts of good rich milk? Would he prefer, or thrive better, on mill feeds, forage and fodder; or would he find milk, cream and butter—as well as prime quality new-laid eggs—better and more wholesome food for himself and family?

We haven't had much experience with sheep, but if the sheep figures are half as far-fetched—which seems more than likely—as are those for hens and cows, our newspapers would do well to print less "expert testimony" and give us more plain common sense and practical experience.

Still at It

The demand for new-laid eggs is far from being what it ought to be. Although production costs have soared almost out of sight, eggs are today one of our cheapest foods and big value for the money.

At present writing, July 6, the wholesale price of eggs at the farm is only 55 cents per dozen and the retail price 60 cents. In normal summers before the war, with production costs about 150 percent less than at present, eggs have regularly sold to shore and summer colony trade at from 60 to 75 cents per dozen and the supply about equal to the demand. Today they are slow sellers at 60 cents.

If our good Uncle Samuel wants to do something to really and permanently increase production of poultry and eggs, he should do his utmost to stimulate increased consumption. Get people to understand that eggs are cheap and wholesome food at present prices, really economical food at prices considerably in advance of present ones. Encourage people to eat eggs and more eggs. Increase the demand for eggs at a fair price and there will be an abundant supply to meet it.

One thing more, put a stop to all this "knocking" of eggs and their food value and prices. From time to time for many months we have urged a big nation-wide campaign for greater consumption of eggs and poultry products. Over a year ago we called special attention to the "knockers" who have been persistently knocking eggs and discouraging the consumption of eggs by the general public. We also on several occasions called attention to a big baking powder concern and some other big advertisers who were "knocking" eggs and urging the use of substitutes.

We believe that the American Poultry Association appointed a committee last year to confer with the baking powder concern and urge it to stop its objectionable advertising discouraging the use of eggs. We read later on that the baking powder concern had promised to be good, and one other big advertiser, who had been "using the hammer" on the value of eggs as food, promised never to do it again. Evidently the promises did not amount to a great deal, for they are still at it. One can scarcely pick up a paper or home magazine which does not contain some "knock" against eggs and some urge to use egg substitutes or to "get along without eggs." This may not make any difference with well-informed consumers, people who know that eggs and milk are the two best and most complete, as well as the cheapest foods—food value and digestibility considered—that can be obtained, but the persistent "knocking" leads a good many people

to "cut out eggs" and has seriously checked the demand for the new-laid product. People who ordinarily, in normal times, used quantities of eggs have greatly lessened their consumption; those who came by automobile and eagerly bought from 5 to 10 dozen at 75 cents per dozen, now buy seldom, buy not more than one or two dozen at a time and complain bitterly about the price—alho they are getting eggs at 15 cents less per dozen, at same season of the year, than they paid before the war boosted production costs.

We opened a newly purchased can of baking powder the day this editorial was written and found therein a tiny 12-page booklet entitled "A Few of the 55 Ways to Save Eggs," on the third page of which we read:

"In most recipes the number of eggs may be reduced one-half or more and often left out altogether with excellent results, by using a small additional quantity of _____ baking powder, about a teaspoonful in place of each egg omitted."

The reader of the booklet is urged to send for other eggless recipes — evidently, in spite of promises, they are still at it. We feel sorry for the many people who will not know any better than to try to substitute a teaspoonful of chemicals for two ounces or more of substantial, wholesome food contained in one egg.

A writer in the *Poultry World* (English) said over a year ago:

"Weight for weight there is no comparison between the nutritive value of eggs and any of the ordinary foods. An egg is a sealed packet of concentrated

TO OUR READERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every advertisement in this issue is signed by trustworthy people, and to prove our faith we will make good to our subscribers any loss sustained by virtue of their having purchased fowls or goods from one of our display advertisers.

All we ask is, that in ordering the fowls or goods, you mention to the advertiser that you saw the ad in *American Poultry Journal*; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. In all cases in writing to advertisers say, "I saw your ad in *American Poultry Journal*."

food out of all comparison more valuable, weight for weight, than fish, meat, pork, bread, etc. It is all assimilable, and contains no waste."

Something ought to be done to quiet and stop the "knockers" who are still "knocking" both the price and the food value of eggs. Something ought to be done to prevent mixtures of chemicals being offered as egg substitutes. Something should be done at once to educate the public concerning the great food value of eggs, their relatively low price when compared with other "meat" foods, and their great desirability as food for everybody and more particularly children, invalids and convalescents.

A big publicity campaign is needed to encourage greater consumption of eggs. Don't worry about a possible shortage in case of greatly increased consumption. The supply will take care of itself

if we stimulate demand. Let the public demand eggs and still more eggs—at prices which yield the producer a fair and just profit—and there will be plenty of eggs for everybody. There is no better way to secure increased production of food than to create a good demand for it at a fair price. Our resources are without equal—in a very short time America could increase egg production sufficiently to provide a liberal supply for the whole world.

Give us the demand, a chance to realize an honest profit, and, never fear, there will be eggs aplenty.

War Emergency Poultry Federation.

WE HAVE been reading the certificate of incorporation, by-laws and other literature of the National War Emergency Poultry Federation—that name in itself is a handicap which may have to be reckoned with—and a published interview given by the temporary president, Reese V. Hicks.

Now, we are for any practical measure which will result in an efficient organization of all the poultry interests of these United States for the betterment of the poultry industry. Not for any price would we "throw a monkey wrench into the gears" of any movement which seems destined to bring about desirable organization and co-operation of all poultry interests to save, protect, and promote progress of the poultry industry.

This "War Emergency Federation" is the direct outcome of the poultry convention at Chicago, March 29-31, and a later "star-chamber session," June 10

NOTICE!

This is to inform present and future customers that, beginning August 1, my entire stock of both old and young birds, S. C. WHITE LEGHORNS, formerly located at Lincoln, Mo., including all equipment, etc., will be transferred to Benld, Illinois.

[SIGNED] C. J. Labahn

Hillview Farm has incorporated with Belvedere Farm (formerly owned by Sciarra Bros.), an ideally located farm of 120 acres, within walking distance of Benld, Ill. The new location selected—the new Hillview Farm—is a natural range for poultry. It is naturally wooded, giving just enough shade; it is well drained—the entire farm being covered with hills and valleys, and a brook of clear, cool water fed by springs running almost thru the middle the entire length of the farm.

"Hillview" S. C. W. Leghorns are hardly in need of description, but we feel it our duty to inform our customers that in stocking Belvedere Farm several years ago, Sciarra Bros. did not spare money or trouble to secure the very best White Leghorns in the country for a foundation. The combination of these two strains (each of which will be bred separately) we honestly believe gives HILLVIEW FARM the best and largest flock of REAL QUALITY White Leghorns in America TODAY!

8,000 youngsters are now being raised on the new Hillview Farm, and the majority of these birds will be ready for the fall fairs and early shows. Hillview winnings at the National and largest shows and the National Egg-Laying Competitions are convincing evidence of the wonderful quality we have in both exhibition and utility Leghorns. MAKE US A VISIT—come and see for yourself! If you can't come personally, at least write for our big free catalog and get an introduction to AMERICA'S FINEST WHITE LEGHORNS. Write us your needs—we will cheerfully answer your letters. Get acquainted with HILLVIEW Quality, Service and Efficiency.

HILLVIEW FARM C. J. LABAHN **Box 753, BENLD, ILL.**
Sec'y-Treas. and Gen'l Mgr.

The equipment is the very best; new houses are being built, 21,000-egg incubator capacity, and brooding equipment sufficient to raise 10,000 chix is already installed, and all stock is kept under the most modern sanitary conditions, and under the personal expert supervision of Frank Gloeckl (former manager of Elm Poultry Yards). Mr. Gloeckl has had 15 years experience in handling large flocks of poultry and is thoroly familiar and considered one of the best poultrymen in the country today.

and 11, behind closed doors, of eleven gentlemen constituting an "Advisory Council," which session has been variously reported as a somewhat stormy one and alleged to have been "stampeded into doing what it did not want to do."

The purpose of the organization and the immediate work which it undertakes to do cover the same ground that is covered in the purpose of the American Poultry Association and the work which it has undertaken to do but has not done. Yet we are assured by Pres. Hicks that the federation is not to conflict in any way with the American Poultry Association. Thus we have two organizations in the field, both built of practically the same timber and devoted to the same work. Altho stated to be an organization for the "duration of the war," the certificate of incorporation and by-laws bear every indication of permanent organization. The whole structure seems rather unwieldy and cumbersome for a "war emergency" measure. The expense of development and maintenance, as well as the stated methods of business procedure, seem to be out of proportion to any probable benefits in the immediate future, and more in keeping with an organization which is intended to become permanent. Possibly we are mistaken in this. To us it seems that what is needed is prompt action and efficiency in safeguarding poultry interests.

Practically all that this federation can do, could and should be done thru immediate reorganization of the existing international organization, the American Poultry Association, placing it on a modern business basis with a sound system of finance thru annual dues and contributing memberships, always conceding that it be efficiently officered and the officers supported by a really active membership. The question naturally arises, Is this new federation merely a diversion which tends to divide the field and which may result in putting the fancy and the meat and egg branches of the business even wider apart than they are at present, or will it tend to close the breach which constant friction has kept always open? Will the new organization tend to eliminate the American Poultry Association or will the latter old organization ultimately gobble up the federation and render it inoperative?

This is a poor time to play politics and we have no desire to do so. There is need of immediate action to aid the Standardbred poultry industry. We are desirous of seeing co-operative organization of poultry interests which will truly represent all poultrymen, little or big, and render all concerned efficient service, with equal rights for all and special privileges for none. But this is not a time for duplication or wasting of either work or money.

This is written before the first open and general meeting of the National War Emergency Poultry Federation at Chicago, July 15 to 18 inclusive, the program of which is one might might well take two weeks rather than four days to cover in a satisfactory manner. We find comparatively small representation of fanciers, breeders, or plain practical poultrymen listed in the presentation of features for discussion. As was the case with the original Chicago conference the real producer seems to be decidedly in the minority. It would

seem that the poultrymen themselves—actual producers—rather than "instructors and investigators" ought to be specially prominent in any movement which proposes to: "Consider ways and means

Smith's White Leghorns

More first prizes at Chicago and St. Louis shows than any other strain! Birds that will win for you or birds that will improve utility qualities. Catalog sent free upon request. Eugene C. Smith, 317 Galena Blvd., Aurora, Illinois

Instead of Whitewash

You will save time and labor, find it much easier to mix and apply, get better results and in places that need disinfecting, too—poultryhouses, stables, dairies, creameries, cellars of homes and stores, outbuildings, etc.,—you can save one operation if, instead of whitewash, you will use the disinfecting paint that makes buildings lighter, better looking, sweet-smelling and sanitary and kills lice, mites, fly eggs, and the germs of contagious diseases.

CARBOLA

The Disinfecting White Paint

is a finely powdered pigment combined with a germicide many times stronger than pure carbolic acid, but not poisonous or caustic. It can be applied to wood, brick, stone or cement, or over whitewash, with a brush or spray pump as soon as it is mixed with water—no waiting or straining. It dries a clear snow white. One gallon covers about 200 square feet. Will not blister, flake or peel off. No disagreeable odor to taint milk or other food products. Does not spoil by standing, so can be kept ready to use when wanted, or for a rainy day job. Harmless to smallest chick or stock that licks it. Dry powder is an unexcelled lice powder.

to safeguard, promote and federate the poultry interests of the Nation."

We are hoping that the meeting will bring bright and welcome enlightenment concerning the federation and what results may be expected from it in the immediate future. While it is conceded that the war may last a long time, all of us are hoping for and, we trust, working for an early and decisive victory for America and her Allies. If this

new poultry federation is, as stated, "for the duration of the war only," it must at once get busy on a definite constructive policy and be prepared to show some immediate results—alho its lines do not indicate swift and decisive action, let us hope that it will surprise us all with its display of speed and efficiency.

Eggs by the Pound.

THIS is a good time for those who advocate selling eggs by the pound to get busy. Many fruits and vegetables which formerly sold by the basket,

bunch, or dozen, are now being sold by the pound as a result of the new food control rules. The plan seems to be working satisfactorily.

Bananas, which have so long sold by the dozen, are now sold by the pound. For the past two months the prevailing price of bananas has been 12 cents per pound, which sounds cheap but which means from 50 to 60 cents per dozen, or about the prices that prevailed forty years ago. It ought to be as easy to sell eggs by the pound as it is to sell bananas or other fruits and vegetables that way.

Selling eggs by the pound would be better for both producer and consumer and be conducive to a square deal for both. It is not necessary to go into all the details of the argument for eggs by the pound; the subject has been freely discussed on many occasions. In fact, wholesale prices today are governed by the weight of eggs per case, quality being equal. No one will question the fact that a dozen eggs weighing from 28 to 32 ounces to the dozen is worth more than a dozen weighing from 18 to 24 ounces.

With the "cheaper cuts of meat" selling—bone, trimmings and all—for 45 cents per pound and the better cuts bringing from 75 cents to \$1 per pound, as is the case today in our big Eastern markets, no one ought to complain when asked to pay 45 cents per pound for best new-laid eggs. Think what that would mean to the producer of large meaty eggs. The consumer would get first quality food, practically all digestible highly concentrated nutriment, packed in sanitary sealed packages—the shells—and no waste but the small amount of shell which is useful for settling the morning coffee.

Mr. Food Administrator, why not issue an order that hereafter eggs be sold by weight?

The Poultry Shows.

THE poultry shows should be given every encouragement and substantial support. Particularly should the small local show come in for its share of boosting.

Poultry shows create interest in poultry, stimulate the desire to own and breed Standardbreds, and encourage increased production. Give all the aid you can to make your local poultry show a success this coming season.

Show managers will do well to provide opportunity for beginners to exhibit and compare their poultry. It might be well to bring back the novice classes—even though some shows did drop them for apparently good and sufficient reasons. Beginners are necessary to the life of the industry. There are plenty of interested beginners this year who know very little about Standardbred poultry of exhibition quality and its worth. It certainly is worth while to endeavor to bring these beginners into the ranks of the fancy and to develop their budding interest in good poultry.

It has been suggested that a part of the proceeds of the shows be given to the Red Cross, also, where cash prizes are given, that 50 percent of the prize be awarded in Thrift Stamps or War Savings Stamps. These suggestions are worth considering.

"Letting George Do It."

RECENTLY we visited a village place where there were houses for accommodating several hundred fowl and every house empty. The proprietor was busy at work on one of the finest war gardens we have seen, the greater part of the area being devoted to crops that will keep thru the winter.

"Quit keeping chickens?" we asked.
 "No sir, and no notion of it," was the answer.

"But you are not raising any chickens and the poultry houses are empty," we ventured.

"Oh, that's different," he replied. "Raising chickens? I never raise any, can't spare the room nor the time. I always 'let George do it,' he always has and always will, I guess. I can buy all the pullets, ready to lay, in the fall for what it would cost me to raise them, or less. Always follow that plan. Buy pullets in the fall, fill up the houses, force feed to get the biggest possible yield of eggs and then 'scrap' the pullets when eggs get cheap and the price of fowl is high. For profitable egg farming on a small village place it is the surest way to get satisfactory results. I get eggs when the price is at the top. I only have to feed poultry when egg production is at top notch. Never have to feed any non-layers; that is, not for long. I get the best part of the eggs they would lay in their first year—no 'dead horse' to pay for—and I get all the manure they make and all there is in it for fertilizer value."

Noting that there were no yards in sight, we asked: "Do you keep the birds confined to the houses all the time?"

"No, when I begin to fill up the houses with pullets between the middle of September and the last of October, I use temporary yards of portable fencing and let the birds have green range until the heavy frosts kill the green food so it is not fit for feed. Then the layers are confined in the houses until plowing time in the spring, when I let them follow the plow and harrow to get rid of worms, grubs, and insects. The fence parts are kept painted and are stored under cover when not in use. In this way the portable fences ought to last me a lifetime."

"How long do you keep the pullets as a rule?"

"That depends on how they lay and market conditions. I keep most of them from six to eight months. They will average around nine or ten dozen eggs per pullet and there will be a gain in weight of about a pound or more per pullet."

"Don't you find difficulty in getting good laying pullets in the fall? What price do you really have to pay?"

"Never have had any trouble yet getting all I want. I buy only thoroughbred stock, because it is more uniform in quality. I pay from 30 to 35 cents per pound live weight for the pullets. This season I may have to pay more, but I think they will sell for more and egg prices ought to average better. I 'scrapped' my egg machines when they were thru laying last spring at an average of 40 cents per pound live weight."

Further conversation developed the fact that he prefers American class varieties and stocks up with only one variety when possible, as it is easier to

Feed For Profits

SHARE the success of thousands of other experienced poultry raisers who are turning puzzling problems of feeding into pleasing profits with Conservation Scratch, Krause Mash and Conservation Chick and Developer Feeds.

Conservation Scratch fills the demand for an economical, wholesome, clean grained scratch feed that gives your fowls energy and strength. Krause Mash supplies the necessary balance of egg-making elements, is rich in meat-producing nutrients and never varies in quality. Conservation Chick and Developer Feeds build downy chicks to sturdy plump broilers in record time.

Badger Feeds For Poultry Needs

You can be certain of profitable results with Badger Poultry Feeds. They are formulated by experts, tested and guaranteed by one of the largest feed manufacturers in the country. Profit by the experience of thousands of other successful poultry raisers and put your fowls on Badger Feeds.

White Ply. Rocks
& S. C. W. Leghorns**

are noted for unexcelled utility and show qualities. Each year the average quality of the flocks and the individual quality of the best specimens has been raised. Careful line-breeding has brought results that would have been impossible to produce in any other way.

The unequalled records of my birds at Madison Square Garden, New York; Boston, Chicago, New York Palace, Syracuse, Minneapolis, and other leading shows, are given in full in my printed matter—that is yours for the asking.

Hundreds of utility flocks all over the country are pure Owen Farms blood because their owners found by careful comparison that the perfect health and vitality possessed by Owen Farms line-bred birds made them "Live, grow, lay and pay" better than other strains they had tried.

Half Price Stock Sale

of quality has been unusually popular this year. A few more fine males at \$12.50, \$17.50 and \$25.00 each. Females at \$5.00, \$7.50 and \$10.00 each. Your chance to secure real breeders for next year at low prices.

A Special Snap!

100 Red hens at \$3.00 each.
100 Leghorn hens at \$2.00 each.

Early Chicks

As usual, I have them. Big, well-matured early cockerels and pullets for your Fall Shows. Birds that will win for you and make superb breeders. Cockerels \$10.00 each upwards and pullets \$7.50 each upwards. Exceptional quality at any price you wish to pay. Let me know your show and I will tell you the right price to pay to insure winning.

Owen Farms Service

It has always given me great pleasure to have prospective customers write me complete data regarding their requirements, and ask for my advice. Have gladly given them the results of my many years experience, and helped to make their investment profitable.

Every inquiry will have my personal attention, and every order will be selected for you by either Mr. Davey or the writer. Our long experience is at your service.

feed so as to control the results in eggs when one is feeding only one kind of pullets.

This small plant egg farming on the "let George do it" plan struck us as sufficiently interesting to pass along to our readers. Perhaps there are many who are not so situated as to be able to keep poultry the year around or to raise chickens, but would welcome this plan for winter egg production. No male birds are kept, so all eggs are "virgin" or non-fertile eggs and as such bring a few cents premium per dozen. Another interesting fact is that this poultryman regularly water-glasses a good many dozens of eggs in the early spring and so has a supply to carry him thru and a small surplus to sell to neighbors when the poultry houses are empty.

The plan is not new, many have practiced it successfully, and some have carried it out on a large scale. Half grown pullets are now being offered at attractive prices and from present indications there will be some bargain offerings of well-matured pullets during the coming fall months.

Everybody with a poultry house can winter a war flock of laying pullets, even if it is found more convenient to let "George" do the chicken raising.

DR. WOODS' NOTES AND COMMENT

Before green apples blush,
Before green nuts embrown,
Why, one day in the country
Is worth a month in town.
—Rossetti.

Senator Weeks, of Massachusetts, urges that all business men "get together and practice co-operation and co-ordination" and says: "I am not a pessimist, but I am uneasy about the conditions after this war. *We shall never return to the conditions that prevailed before the war.*"

It is too early yet for congratulations on the 1918 season crops. Crop estimates made long before harvest are a lot like "counting chickens before they are hatched." We have had a peculiar spring and summer thus far. May, in our section, was very dry, with a good deal of "dogday weather," a good deal of pasture, hay and new grassland was dried up. The latter part of June was cold and wet. Summer was ushered in, on June 21, by a downright freeze between 1 and 5 a. m., the mercury falling to 28 in some places and 32 degrees in many. Much corn and many gardens were ruined and early potatoes badly injured. We saved our plants by keeping bonfires burning all over the place all night. It was some job, but we did not have anything frozen and only a few stalks of corn touched at the tips a bit. Our potatoes, nearly three-fourths of an acre of them, were in full bloom at the time of the freeze and the tops have not shown any ill effects. Many of the neighbors had their potatoes frozen off right down to the ground. Of course, the full extent of the damage cannot be told until crops are harvested. Our Baldwin trees are full of apples, and, so

H. CECIL SHEPPARD
Box X2
BEREA - - - OHIO

far as we can see, the only effect the freeze had was to put a deep red blush on the small green apples. As the fruit is growing well and very few apples have dropped, we do not believe much damage was done. Weather has been too cold thus far for good growth of corn, but, all things considered, the growing stuff seems to be doing well, all except the grass. We shall have to buy our winter's supply of hay. Peas and beans are looking fine. We had our first Nott's Excelsior peas on June 17 and have been getting a fine supply for home use ever since, with promise of yield on successive plantings for some time yet. It certainly paid to stay up all night and keep the bonfires burning during the June freeze.

* * *

Chickens are growing fine. We have had excellent luck allowing Black Langshans and White Rocks to run together on same range. The little Langshans look so much like crows that they help to keep hawks away from the flock.

* * *

The grain and feed supply is still a big problem and probably will continue to be. Local shortages are frequent, freight is uncertain and the new rates are all against the producer. Also definite percentages of increase in freight rates were stated, the rule in practice seems to be "all the traffic will bear," and sometimes more. Where we had a rate of 7 cents per 100 pounds on grain and feeds in carlots, the rate has been jumped to 16½ cents per 100 pounds. Feed and grain prices in surrounding towns show wide variations, often a difference of from 30 cents to 60 cents a 100-pound bag. We have been assured that after July 1 the carlot price on mixed feeds (wheat mill feeds) at Boston points would be fixed at \$26.88 per ton, and that this price allowed for the new freight rates and a reasonable profit for the millers, but we are still required to pay from \$48 to \$60 per ton for such feeds. Somebody is making a "whale of a profit." One elevator has been requiring customers to buy an equal quantity of corn meal or stock feed mixtures with all wheat feeds.

* * *

If the flocks have not been culled, this work should be done at once. Weed out and sell, or can, all fat old hens and chickens which will not be needed for home use or for breeding and laying stock. We would not advise wintering anything older than yearlings except in case of valuable breeding birds. Very few two-year-olds or three-year-olds can be depended on to produce eggs enough to pay their keep thru fall and winter. Separate the cockerels from the pullets and give the latter good green range. Hens that are intended for wintering should have well-shaded green range from now on until after the molt, and will be better off if male birds are not permitted to run with them. All of our yearling hens have been put on good woodland range, where they can pick up a large part of their living.

* * *

Now is the time to clean up, disinfect and overhaul all poultry buildings. Start repairs on buildings and keep at the work until everything is "ship-shape" before time to house the flocks in the fall.

NEWTOWN Giant Incubator

Hatches the Most Chicks—
The Best Chicks—
With Least Labor—
And at Lowest Cost—

You cannot ask or get more; you should not be satisfied with less. Newtown efficiency and economy will insure your success.

The Newtown Mechanical Eggs-Turner

is a big labor-saver. Where other large incubators are used, much time must be spent in turning the eggs twice daily. The *Newtown Mechanical Eggs-Turner* has changed this. Take ten seconds to turn the crank and all eggs in the machine will be turned better than you can turn them by hand. No eggs are cracked or dropped and broken. No "bunching" on the trays.

Read this Report from Michigan Agr. College

"Relative to our hatches with the Newtown Giant Incubator. We have brought off three in all. The first gave us 92% of the fertile eggs, second 91%, and the third a little better than 92%.

"The incubator gives us chicks that can be shipped by parcel post as far as Texas, W. Colorado and Northern Minnesota. The greatest number found dead,—in shipments ranging from 200 to 400 chicks,—no more than four. We are very enthusiastic about the Newtown Giant."

(Signed) C. H. BURGESS, Assoc. Prof. of Poultry Husbandry.

If you demand highest efficiency plus economy and certainty, write for complete Newtown catalog today. Please state the size incubator in which you are interested. Remember, it is to your advantage to place your order early.

This month we haul out our cordwood, cut last winter, and have it sawed into stove lengths and store away a full supply for heating and cooking purposes for the coming year. Ordinarily the work is done a few weeks earlier, but the cold season and late rains set us back nearly a month. We aim to get out the wood before the gypsy moths deposit their eggs. We note that in some cities the fuel administration has forbidden the use of coal until after December 1 and are certainly glad that we do not have to depend on coal on the farm. Wood is high in price compared with prices before the war, but it is not bringing any more than it is worth; in fact, as compared with coal, good hardwood is really selling cheap.

* * *

This has been a busy summer on the farm; often we have not been off the place for weeks at a time except to put in an hour or so hauling grain, feed, or other supplies. City friends ask: "Don't you get lonesome? How do you stand it with no amusements?" Well, when one is busy from before sunup until after sunset, the need of "amusements" is not very great. We do not need "necessities" of the "tired business man" who seeks relaxation in the cabaret, the theater or the "movie" show. Nature furnishes us with a continuous performance of movies and variety thruout all our waking hours, something to please both eyes and ears while at work or at rest. It does make us weary when some bore tries to sympathize with us because we do not live in the city. The town has some advantages, it is true, but they are as nothing when compared with the advantages of country living and the freedom of the open air in the fields and woods. The only time we get really lonesome is when we have to put in a few days in the crowded city, cramped in by towering buildings and jostled by hurrying crowds, where most men are strangers and all are swarming like ants in a disturbed ant hill. We can enjoy a day, or at times a week, in town, but the greatest pleasure of the visit is that of getting back home to the farm. Sixteen hours may seem a long and wearisome workday on the farm, the work may be difficult and back-breaking, but it has advantages over eight hours of city work combined with eight hours of seeking to find an excuse for living, and eight hours of restless sleep in a stuffy room in a block of overheated brick and stone. We wouldn't swap our outdoor sleeping quarters down on the farm for the best suite of rooms in a city hotel, that is if we had to occupy the latter.

* * *

"Optimist" in the Poultry World (England) says: "Nature abhors a vacuum—especially in the stomach of a fowl. It is well to understand this fact once and for all. One cannot extract oil out of the east wind, altho it is possible to extract nitrogen out of the air. A hen that is half-fed does not produce half an egg; she produces none at all."

"When I cut down rations one-half I found that the laying hens cut down the egg supply more than one-half, and if I had not speedily restored the full amount of food I should not have got any eggs. What I actually did achieve by cutting down their rations for ten days was to throw some of the birds into an early molt and lose some three weeks' supply of eggs. It was five weeks or so before I got them into their stride again, and I made a vow that never again would I experiment in the direction of underfeeding the birds."

"I remember Tom Barron saying that a great deal of nonsense was written about over-

feeding, and his experience had been that a great deal more harm was done by under-feeding. I am perfectly sure he was right. So far as pullets are concerned, it is practically impossible to overfeed them during the laying season. Older hens may be overfed, but they very rarely are. Fowls, like humans and other sorts of live stock, vary in their liability to obesity. Some hens run to fat just as dogs, horses and men do. It is not the quantity that is eaten that fattens; it is entirely the nature of the animal. But when one is talking of heavy-laying pullets let us be assured that they must be fed, and well fed. Give them as much as they can eat while they are producing three, four, five or six eggs per week. And be sure that a fair proportion of it is animal food—either meat, fish, or blood. A laying hen is a wonderful bird, but she cannot perform miracles. Bricks without straw is an easy proposition compared with eggs without food. Out of nothing, nothing comes.” * * *

Several of our big factories engaged in making war supplies at a very substantial profit—in some cases, it would seem, more than substantial—have been introducing a lecture feature for employees. Lately this feature seems to be taking on the appearance of propaganda. One of the lecturers is telling the workmen about our boys in France, how they put in long hours in the mud and filth of the trenches and receive for their services only \$1 a day, and he urges that the workmen should not demand high wages for their eight hours' work in a comfortable factory where there is little or no risk, and that they ought to be willing to work for \$1 a day. No one has a higher appreciation of "our boys over there" than we have. Members of our family are "over there," and we do not believe that there is anything too good for our boys in France. However, we feel that they would be among the first to resent this sort of lecturing to our American workmen. It is the workingmen who are paying war taxes, buying Liberty Bonds, buying Thrift Stamps and War-Savings Stamps, subscribing to the funds for the Red Cross, the Y. M. C. A., the K. of C., etc. It is money found in this way which equips, feeds and pays our army and navy, supplies comforts, entertainment and necessities for the fighting men, and takes care of them when sick or wounded, and may provide funds for their aid after the war, as well as aid to the fighting man's family at the present time. It is a well-known fact that it takes many men working at home to keep one fighting man in the trenches or on our ships. The workingman may be getting war wages, but he is paying war prices for the maintenance of his family, he has to pay his own expenses and also find a surplus to help pay and provide for the men who are so bravely striving to win the war for democracy. Putting the workingman on a "dollar a day"—or even "a dollar a day and found"—basis, would not help matters any or benefit our brave boys who are giving their lives for the welfare of the world, but lower wages for the workingmen would materially swell the war profits of the profiteers. * * *

In the New Zealand two years' test, in which two pens of Leghorns received a whole wheat ration and the other two pens no wheat at all, the results appear to show that wheat is not essential to egg production. The wheat-fed hens produced 239 and 243 eggs per bird and the non-wheat hens produced 238 and 241 eggs per bird.

THIS STUFF WORKS!

What poultry keeper can say that his flock is free from lice? These abominable vermin take all the pleasure and profit out of poultry keeping—they make the hen uncomfortable and mopey—they kill the chicks—they even kill the grown hens. It has been said by an authority that lice are responsible for more dead birds than any other enemy of poultry.

JORAM'S LICE RID KILLS THE LICE

It is a remedy for lice that never fails to work. It kills lice, and it prevents lice from getting onto the birds afterwards. JORAM'S LICE RID will kill HEAD LICE on CHICKS.

EASILY APPLIED

JORAM'S LICE RID is not like the other lice killers on the market—you KNOW they don't work—but JORAM'S goes after them in a "DIFFERENT" way. Vermin have a "base" of operations, just like submarines. You apply JORAM'S to the "base"—and the lice never move from there. That's where they die.

JORAM'S LICE RID IS ABSOLUTELY GUARANTEED to do the work, if directions are followed; or money refunded.

CHEAP It costs less than 1 cent per bird to apply JORAM'S LICE RID, and that's the end of it. You need this key to success in poultry raising. You need it now. One size, 3 ounces for 50 cents.

Brookside White Wyandottes

American Laying Contest Winners.

Eggs half price; hens and pullets at bargain prices. Brookside Farm, G. W. Schottman, Prop., Montrose, Ill.

A low-studded poultry house is usually a pretty hot place in August. Keep the windows and doors open, using screens of one-inch mesh poultry wire. Cool, comfortable quarters are essential to the welfare of the birds.

* * *

"Poultry" (England) says: "That many fowls which are allowed to perch do develop crooked breastbones is perfectly true. Yet it is equally true that large numbers of fowls which are never permitted to perch are similarly affected! The cause is mainly a matter of constitution. And many crooked-breasted fowls would have had the deformity no matter whether they roosted on perches or on the ground. Nature teaches a fowl that when its wings are strong enough to lift its body off the ground it had better seek higher sleeping quarters."

True for you, *Poultry*. That has been our belief for a long time. We have a fine bunch of White Rock and Black Langshan chickens which have been taking to the roosts at night since before their hen mothers weaned them. Their keels are straight and true, with never a "crook" in them.

* * *

You know how the general run of visitors to the farm usually tell one what ought to be done and how it should be done—as if one did not know. Well, here's a case that is different. The last of June, Harry Lamon, senior poultryman of the U. S. Department of Agriculture, happened in on us for part of a day. He had never been here before, but assured us before he left that "I'm coming back to stay longer." He repeated that statement several times. Of course, he went all over the place, saw everything and asked a lot of question. Then he said: "It's great! I'm coming back soon. You are doing just what I would do in your place. You've got a real home here and you are going about it right. Stick to it." Now, Friend Lamon has been up and down this country a good deal, so that what he says carries more weight than the general run of comment.

* * *

Looks as if all the editors, writers, poultry judges, etc., were about to quit keeping poultry and go to work for Uncle Sam's poultry husbandry department. Dr. N. W. Sanborn has recently joined the forces and taken over the work of increasing poultry production in Florida. The latest advice is that that dusty miller, poultry judge, and all-around poultry fan, D. Lincoln Orr, has joined the ranks of Uncle Sam's poultry husbandmen. "Everybody's doin' it!" As "Link" says: "What's the use?"

* * *

Tom Barron has declared that eggs saved the situation in Lancashire, England, where undoubtedly there would have been food riots at one time if the poultry keepers had not been able to supply the workers with eggs. Mr. Barron says: "Tho a hen is a small thing, 25 hens will produce more value in money than a cow."

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

MY PREDICTION that we were going to have a dry, hot summer was anything but correct. We have had an exceedingly wet and cool season so far. Once 2½ inches of rain fell in 24 hours. A week later 4½ inches of rain fell in 24 hours. Farm crops have been greatly damaged. The corn crop will be cut at least one-fifth. We will not have any apples, plums or cherries. The trees were loaded, but the severe rains and cool weather caused all fruit to fall. The gooseberries and currants were a full crop. Gardens here have also suffered. Peas all went down, the continued wet weather rotting the vines even when they were brushed. Potato tops are immense and I think the crop will be heavy. So it goes. But we have an abundance of moisture stored up. The apple and other fruit trees never looked so green and robust at this time of year. We ought to have a big crop next year, for conditions for the setting of fruit buds are ideal.

The bees have been unable to work for days, and the nectar in the clovers and flowers has been destroyed by the rains.

* * *

What kind of a cross would an Ancona male make on a Houdan hen? Do you think the eggs would have white shells and what about the size and number of eggs? If I ever try this cross I would use the Mottled Houdan. What do you think of the White Houdan?

How large a limb of an apple or peach tree can you bud or graft? I am interested to know about this budding and grafting.

Is the McIntosh apple red and sweet?

Ohio. J. M. Leidigh.

Why cross the Ancona on the Houdan? You would not have a fowl superior to either of the breeds so used. You would not get a better layer than the Ancona and surely would get fowls inferior to the Houdan as a market fowl. Eggs from such a cross would be white shelled and no doubt larger than those produced by the Ancona. The White Houdan is a beautiful and useful fowl. I prefer the Mottled Houdan.

In bud working a tree, quite small limbs should be selected. You can insert scions into a large limb. Of course the limb which is to take the scions should not be exceedingly large. I like a limb about an inch in diameter to work upon. If the limb is much larger it will be best to put in two to four scions, cutting out all but two when growth starts. The McIntosh is a beautiful red apple. It is not a sweet apple.

* * *

A. M. Hart writes from Ohio that all White Peachblow potatoes in his vicinity blighted badly this season. The season here has been favorable for blight, but I have headed it off by the use of Sulfocide as a spray.

Dr. L. M. Herrington, Pennsylvania, writes:

I have long been interested in your columns in A. P. J. What has pleased me most is your absolute truthfulness. What a tragedy to let a bureau—hunting for railroad fares—induce many hundreds of people to exhaust their resources to reach a certain state and be unable to reach God's country again. In other words, to deceive people into their ruin!

* * *

What do you think of the eastern shore of Maryland, particularly around Berlin, Md., as a country place to live, in regard to climate, etc?

Would it be possible for a person to raise vegetables and fruit enough on say 10 or 20 acres for home use and gradually build up a little poultry business, providing it proved profitable? What do you think of that section as a market for poultry or nearness to same? What would you think a reasonable price for land in that section?

I would have about \$25 a month income, with more later on, and am country bred and have had experience with a garden and poultry and very fond of the work. I was thinking more of a modest living at first, at least, than any big profits.

Pennsylvania. J. A.

There is some good land on the eastern shore of Maryland. It is a pleasant place to live. Nearness to markets, to the seashore and the delightful climate are all valuable assets. It is a splendid section for truck farming and fruit growing. There are some very profitable farms, both general and trucking, around Berlin. Here is located the big and profitable Harrison peach and apple orchards. Good land can be bought in the vicinity of Berlin for \$50 to \$100 an acre. Yes, it is possible for a person to handle 20 acres of ground as you mention. Do not invest in land there or elsewhere until you have made a thoro investigation and personal inspection.

* * *

I would like your opinion as to what to do to save tomato plants from dying. They start withering at the bottom as soon as the tomatoes get to be a fair size. My plants have been doing this way for several years. I have watered them well. I have a large planting this year and if possible would like to save them.

Missouri. Wm. H. White.

Spray the tomato vines with Sulfocide. Keep the vines well up off the ground so that the air circulation beneath them will be good. Of course, after blight once hits a plant no spray material will save it. Do not plant the same ground to tomatoes year after year.

* * *

Our mulberry trees came thru the cold weather and rains all right, and are bearing a great crop of fruit. The birds are certainly enjoying the fruit.

* * *

I have always had a great desire to go to Florida and I see you speak well of some parts of that state. I notice you recommend the

This 45c Can of BUGBEAR will

- keep red mites off 12 hen roosts all summer.
- keep 100 hens free from lice all summer.
- prevent hen manure from soaking into and sticking to 6 roosting platforms.
- drive all lice and mites away from 24 setting hens.
- make a water-proof and decay-proof paint for the bottoms of 6 outdoor brooders.
- prevent rats and mice from gnawing through wood grain bins and floors.
- positively cure Scaly Leg.
- go farther than 2 gallons of the best liquid lice paint.
- never evaporate, harden or lose its strength.

Sold by poultry supply dealers everywhere.

This book tells where the breeds originated, how to mate to get best results, etc. Should be in every poultryman's library. A work of art. Price \$1.00.

AMERICAN POULTRY JOURNAL PUB. CO.
623 Plymouth Court Chicago, Illinois

More Haven district for vegetable growing. That is my hobby. I love to grow lettuce, beans, potatoes, strawberries, raspberries, blackberries, and gooseberries. Can you tell me what the land brings per acre and how much money it would take to start at More Haven? Where is it located? How far from Jacksonville? How would it be for poultry raising in More Haven? Would want to raise Light Brahmas.

Ohio.

D. Love.

The More Haven tract of land is situated about 350 miles southwest of Jacksonville. The land was once a lake bottom. It is new land, very light, and when properly fertilized produces great crops of potatoes and other vegetables. Last winter this land was selling at \$40 to \$100 per acre. Of course, you could not raise raspberries, blackberries or gooseberries in Florida. Conditions there are not favorable for the commercial raising of poultry.

It does not require much capital to get started in farming in that section. The land is very easily worked. You need not put up expensive buildings at the start as the climate is genial and such buildings are not needed. Labor is plentiful and cheap in Florida.

* * *

In answer to C. K. Moorran, Colorado: Wheat land in northern South Dakota is selling at \$25 to \$75 per acre. Unimproved wild land can be bought at first named price. The corn lands in Yankton County, of which you speak, are equal in producing power to the best lands in Iowa and Illinois and superior to much land in those states. This Yankton County, (S. D.) land is worth from \$150 to \$300 an acre. The hardy sorts of apples can be successfully raised in most parts of South Dakota.

* * *

I am in poor health and physicians advise me to go to Arizona or New Mexico to live. Which would be the better place to go to raise fruit and poultry and do general farming? Would I have to irrigate the land? What would be the prospect of being able to secure work, such as carpentering, during the fall and winter? Where could I get any other information on the subject?

New Hampshire. Ralph E. Kelley.

There are many large and profitable apple orchards in New Mexico. They are quite widely scattered, owing to the fact that the fruit lands are in comparatively small pockets or tracts. I advise you to look over New Mexico in preference to Arizona if you are to engage in fruit growing. Of course, you will have to irrigate in order to produce crops in either of these states. Write the State Auditor for full information.

* * *

I take great pleasure in reading your writings, especially your stand against the land sharks, as in my business as a painter and decorator I am thoroly acquainted with their tricks of fixing up to sell.

I am writing to ask if you can give me any information in regard to the land and markets at Wilmington, N. C. I am at present employed here at a weekly wage of \$30. My object is to get south, away from these severe winters. I can get employment there and at Jacksonville, Florida, in the shipyards, and at the same wage.

I would not want over ten to twenty acres, the same to be devoted to small fruits and poultry. Would want to work along until I got the place on a basis that it would pay me the same wages as I make now. The work would be nothing new to me, as I was raised on a truck and fruit farm and kept as high as 900 S. C. White Leghorns at one time. I am not looking for any snap or "get rich quick" game. All I want is a home out of the city once more, where I can average \$75 to \$100 a month over expenses and not be continually catering to some would-be boss. There are only my wife and self in the family and we are living in furnished rooms which cost \$7 per week, yet we have managed to save from

FRANK MYERS, Mfr. FREEPORT, ILL.

\$10 to \$15 a week from my wages and live comfortably.

Last year we lived in Clarksburg, W. Va., and had about one acre of ground, raised our own garden stuff and bought 100 pullets and hens from May 3 to July 15 and then sold out the first week in January with a profit of \$87.50 over cost of stock and feed, which cost \$4.25 per hundred pounds. My wife is very earnest in regard to poultry and is now taking a course in the American School of Poultry Husbandry, in order to better succeed.

Chas. J. Brodhead.
The land in the vicinity of Wilmington, N. C., is a sandy loam. Here trucking is carried on to a considerable extent. Growers there have a good home market. They cannot successfully compete with the growers in Maryland and Virginia, however. I know just how you feel about getting a home of your own, where you and your wife can be the managers. But I want to caution you to go slowly in this matter. To make an income—net income—equal to the wage you are receiving is a pretty difficult job on 10 to 20 acres of truck land. Why would it not be better to invest your savings in a 160 or 80-acre farm in Virginia, where the climate is mild and pleasant, and where you could raise poultry, fruit, milk and general crops at a profit and where life can be lived at its best? I simply offer this advice because of my interest in your welfare, and because I believe you and your wife are abundantly able to successfully handle such a proposition.

* * *

For years nothing has bothered our black currants. Worms or fungus have not touched them. This season the cat birds are taking the crop. A flock of these birds are feeding on them constantly.

* * *

Would like some advice as to the kind of fruit trees to plant in this climate. I want to put in some cherries, peaches and plums, as well as apples. Our latest frost comes usually between May 1st and 15th, and the earliest in September or October. The altitude is 4,200 feet and this part of New Mexico is very dry, without much irrigation. I would want trees that can stand a good deal of drought, and not bloom before the late killing frosts. New Mexico. C. M. Bueler.

I advise you to plant Delicious and Senator apples. Both of these varieties are late blooming. My Delicious trees bloom ten days later than other winter sorts. The Senator blooms just a few days before Delicious. Try a few Golden Delicious. It, too, is a late bloomer.

* * *

Further reports from the Council Bluffs, Iowa, fruit district are to the effect that all fruits were severely damaged by rain and hail. The apple crop is about ruined. Grapes will not be more than half a crop except in some few sections. The Nebraska apple crop will be exceedingly short. The strawberry crop was practically a failure in the midwest. I have a little less than half a crop and am getting 28 cents a quart box for them now.

* * *

I am in receipt of the following letter from T. M. Simpson, Sullivan, Maine: "I notice your advertisement (in an old AMERICAN POULTRY JOURNAL) of Houdans and White Wyandottes. If you get this letter, would like to know if you have Houdans for sale?"

This shows that an advertisement properly presented in the AMERICAN POULTRY JOURNAL bears results for many years. It is more than fifteen years

since I was an advertiser in this JOURNAL. I am still getting letters like the above.

If Mr. Simpson will consult the advertising pages of the JOURNAL today he will find the announcements of several reliable Houdan breeders. I have neither stock nor eggs for sale.

* * *

I have a few trees on my back lot at Duncellen, N. J. On one fall pippin apple tree, the ends of the small limbs die off, about six inches to a foot from the end of the limb. This year there seems to be more of them dying than usual. The tree is fifteen years old and bears fine apples. I cannot see anything on the limbs, though I have examined it under the microscope. Can you advise me on this matter thru the A. P. J. or suggest to whom I should apply for advice?
New Jersey. C. C. Dunham.

Looks to me as tho the terminal parts of the branches of this tree have been killed by aphid. The injury may have been done last season, the twigs being so weakened that they could not survive the winter, but did contain enough sap to start growth. Send a few of the twigs to your state horticultural authorities at once. This season we have had an excess of moisture here. Then out came the sun and the thermometer went up to 98 degrees in the shade. The ends of the twigs of my Wealthy apple trees were cooked—turned brown. I cut off the injured parts at once, so no great harm has been done the trees. Had more than 300 quarts of gooseberries thus cooked and new growth of bushes killed back from two to four inches.

EGG AND "EGG SUBSTITUTES."
A. F. ROLF, Poultry Specialist, Baton Rouge, La.

The egg is the most widely used food known to the human race. As produced by nature, the egg is a perfect source of nutrition, with no waste or harmful constituents, and is a food of very appetizing and delicate flavor.

With the rather recent increase in egg prices, there have been some so-called "egg substitutes" appearing on the market. Practically all of the materials sold under that guise consist of baking powder, mixed with a little starchy material or powdered milk, and some kind of a powerful yellow dye. These preparations do not contain substitutes for the nutritive elements of the egg, and are not entitled, therefore, to be called "egg substitutes." Their action is simply to give cakes and pastries the apparent texture and color given by eggs—that is, to make the foods appear to be what they are not, or, in present-day language, the action is pure camouflage.

Some of these imitation substitutes are advertised under misleading statements which hope to create a false impression of their value, such as, "Half the eggs in any recipe may be replaced by the use of one teaspoonful of 'substitute' for each egg omitted, without impairing the quality of the finished article." The use of the same amount of baking powder would give the same texture, and the use of grated carrots in proper amounts would give the same color, but in neither case would the nutritive value be as great as when the designated number of eggs is used. It can safely be said that up to date no real substitute for eggs has been found.

A fresh-laid egg with a good sound shell, including water, shows the following analysis: 13.2 percent protein, 11.4 percent shell and 0.8 percent other ash, 8.9 percent fat, and 65.7 percent water. Fresh eggs may be substituted for meat to good advantage. Eggs contain the flavor and value of animal protein without the toxic animal wastes found in meat. Chemical analysis shows that eggs and moderately lean meat, pound for pound, have nearly equal food values. On this basis alone, the value of one dozen eggs would be equal to that of one and a half pounds of meat, since one dozen average eggs weigh one and a half pounds. However, chemical analysis misses the facts that eggs are a more commendable food dietetically; that two eggs weighing four ounces will satisfy the average person who would require eight ounces of meat for the same portion of a meal, so that they will go

farther, pound for pound, in serving food; and that eggs are an article used in general cookery for which no substitute has been found. These facts, when fully considered, show the intelligent buyer that one dozen eggs have a value equal to at least two pounds of lean meat. Until the price exceeds that point, eggs may be very economically used in the diet.

The food value of the egg can be conserved, for long periods, with little or no deterioration. This requires, first, the production of good eggs, and second, their proper preservation. Infertile eggs are better for market purposes than fertile eggs for the reason that they will not spoil so quickly. Eggs should be produced from a flock in which no male bird is present. Clean nests should be provided, and the eggs gathered regularly at least once a day. They should be stored in a cool, dry place and marketed frequently. Cold storage provides the best method of preservation, although this method is available only for the larger packers. For home preservation of eggs, the waterglass method is very simple and efficient. By this method, eggs produced during the season of plenty may be preserved, in the home, until the season of scarcity. Eggs may be preserved by this method, for from six to eight months, at a cost of about two cents per dozen. Detailed directions for this method of egg preservation may be obtained, free of charge, by writing to the Live Stock Extension Service, Baton Rouge, La.

If you want to help the country to get better and cheaper eggs, get a flock of hens of your own. Almost any back-yard will support enough hens to utilize the vegetable and table wastes, converting them into the best food in the world—eggs.

Have You a Chicken in France?

Miss Lucy Hewitt of Chicago intends to "rechickenize" France. She sells chicken buttons for 10 cents apiece and on each button is the password, "I have a chicken in France." Every button is the price of an incubator egg and every incubator holds 1,000 eggs. Thru the persistent efforts of Miss Hewitt incubators, chickens and children have been assembled on a farm in the south of France and under the direction of experienced poultrymen the children, 600 in number, look out for the incubators and care for the chickens as they make their debut. Thirteen poultry farms have been established since Easter by Miss Hewitt. For \$400 four incubators can be obtained, the wooden barracks provided by the French government, and the salary is paid for a former soldier who oversees the installation of the machinery.—Chicago Daily News.

Arkansas Fifth Laying Contest.

The fifth contest will be open to Arkansas breeders only. The contest is a sort of registry of merit test for poultry and we wish to have Arkansas breeders to have the benefit of the work. The competitive feature of any contest should really be a secondary consideration. Cash prizes will be offered at the close of the contest to both individuals and pens; also certificate of production for all pens, and certificates of merit for all 200-egg hens. This

will make interest in the contest even more keen than at present.

The entry fee of \$5 per pen will be used to help pay the cash prizes offered.

We are also planning on making extensive improvements on the poultry plant so as to be able to give the birds the best possible conditions. The yards will be divided so that half of each yard can be kept in green crops to be used to supplement the sprouted oats used at present. The houses will also receive attention.

It is also our plans to be able to provide expert care for the birds during the contest, so that conditions will not be lacking in order that the birds may do their very best.

The contest pens in the fifth contest will not be mated, so that breeders can be assured that their stock will not be scattered over the state unbeknown to them. Any desire to mate pens must come thru the owner of such pen.

We are planning on making this fifth contest the best possible and respectfully ask the hearty co-operation of all Arkansas poultry breeders.—H. B. Dvorachek, Professor of Animal Husbandry, Fayetteville, Ark.

"In our estimation, The Blue Hen Mammoth cannot be beat as a hatcher. We are taking off hatches every Tuesday that are astonishing. For instance, our hatch today was 1300 chicks from 1600 eggs set (80%) Wonderful, you will agree. We would like to double deck for next season."
 Lockport, N. Y. McARTHUR BROTHERS

Turn 10,000 Eggs in 10 Seconds One Man Can Handle 50,000 Eggs

WHY UNCLE SAM USES BLUE HEN MAMMOTH

This letter from the Government Poultry Farm, Panama Canal Zone, will tell you why Uncle Sam uses Blue Hen Mammoths.

"The hatches in the Blue Hen continue to outclass those of the Candee, and we have received three 100% hatches. Ninety percent hatches and over are quite often made, and an average for the month of May of 76.6% of the eggs set in the Blue Hen against 44.2% for the Candee."

Blue Hen Mammoths more than pay for themselves the first season. Only one-tenth of usual time needed to operate. Turn all the eggs in a few seconds, test them in half usual time, and practically eliminate cooling. Secure 2½ times usual capacity in same space. Save Time—Save Work—Save Money.

Prepare now if you want to "cash in" big next Spring and Summer. Blue Hen Mammoths are a "sure thing." Hatch as high as 90% without taking up much of your time. Reap big profits when crying demand comes for Day-Old Chicks. Write today for fine new catalog.

Let us send you our new catalog telling all about the Blue Hen Mammoth. Read it over and learn about the finest incubator on the market—as hundreds of users call it. If you send a sketch of your present or proposed incubator cellar, our Special Service Department will send you some helpful suggestions. Write immediately for the Blue Hen Mammoth catalog.

Annual Surplus Stock Sale

Parks' Bred-to-Lay Barred Plymouth Rocks

Edward Brown, one of the world's greatest authorities on poultry subjects, says: "Breed from the high normal layers in your flock, and not the phenomenal layers." That's the kind Parks' Strain is—High normal layers. They prove it everywhere, in the hands of my customers and in the laying contests.

A Grand Selection of Pullets, Cockerels, Hens and Cocks

They are all listed and quoted at very attractive prices in our free surplus stock circular.

BETTER ACT QUICKLY. We never have had enough for our early demand. Take advantage of the normal conditions of express service. Just as soon as grain and winter coal starts moving railroads will again be jammed.

SURE, WE'RE GOING TO WIN THIS WAR. Uncle Sammy has too many resources up his sleeve that KAISER BILL underestimated.

YES SIR-EE. The hen, too, is going to play her patriotic part, and especially the LAYING HENS. What other country can boast of a strain like the Parks' Strain with careful selection, trapnesting and pedigreering for eggs since 1889. **WOULD YOU WONDER** they so easily out-layed the 2500 birds in Missouri laying contest, from 37 states and 8 foreign countries, and made the remarkable winter month record of 134 eggs in Jan. (6 birds). **NO,** we don't make the broadest laying claims, but just remember in all these 28 years they have layed their way into universal popularity while hundreds with greater phenomenal laying claims have come and gone.

Catalog giving history of strain, and valuable information, a dime. Circular free.

Potatoes and Chickens.

HAVE been greatly interested from time to time in experiences related in the American Poultry Journal in regard to truck growing in connection with poultry raising, especially am I interested in growing potatoes and chickens, since I have had most interesting experiences with this combination. A year ago last spring we planted two patches of potatoes, one of which was in the garden where the chicks could not get at them. As my time is limited, this patch was more or less eaten up by bugs and overrun with weeds and grass. The other patch of potatoes, one-third of an acre, was planted near one of the coops where I placed a small colony brooder with 350 chicks. At planting time the hens were shut out of the patch, but the chicks allowed out, and they certainly took care of the tender young weeds as they came up and the potato bugs, as I never saw a "hard shell" all summer.

I cultivated the potatoes in the one-third of an acre patch five times with horse and five-shovel cultivator, which took me two hours each time. I went over the patch twice, the first time with a hoe, and it took about three hours to get all the weeds out. When the vines about covered the ground I spent another hour pulling what weeds were left. The chickens had been shut out just before this, as they began scratching and wallowing under the vines and picking potatoes when they found them.

The ground for these potatoes had been well covered with poultry droppings brought direct from the dropping boards and all plowed in early. The potatoes were planted with a hand planter. We had an early freeze last September which froze the vines to the ground and I am sure this cut the crop about 20 bushels. I did not dig them for quite a while after the frost and then had a man to help me. We started in about the middle of the forenoon and dug them with potato forks, always digging backward, throwing the two rows together and four rows of vines together. We had them all dug and picked up by night, and had 86 heaping potato crates of potatoes. They were all absolutely smooth, large and white and well ripened, with very few small potatoes. They were Carmon's potatoes. The patch was right along the road and many said they were the finest looking vines they ever saw and when they were dug and lying in the clean rows, people said the sight was the finest they had ever seen in a field of potatoes.

I am planning each year to have a good flock of chicks to help handle the "hard shell" bugs and the weeds, and believe that it is possible in this way to have a good crop at a lessened cost of production. In planting my last year's crop I used small seed, many of the potatoes being too small to cut once in the center, and yet from these I gained the reputation of growing the finest quality potatoes in the country about here. We have a fine sand soil and the poultry has made it rich with droppings.

Michigan.

J. L. Spangler.

A Genuine Fancier's Fowl.

What constitutes a genuine fancier's fowl? Without a doubt the first point the fancier looks for is beauty, but beauty means more than the unthinking would have us believe,

since beauty is dependent upon health, on proper development and upon physical vigor, as well as many other qualities. In my mind, there is no more beautiful bird nor one giving greater satisfaction to the owner than a flock of well bred White Leghorns. I am always attracted by the breed even when seen in the distance because of the white plumage and stately appearance.

It has been said that the S. C. White Leghorn approaches the ideal in poultry more closely than any other variety, and this appears to be true since an ideal bird satisfies the buying public and rewards the owner. This ideal bird, the White Leghorn, has attracted more fanciers than any other one variety of poultry. How many like myself have wanted to own and breed the S. C. White Leghorn, and after engaging in this fascinating occupation, have become more and more interested in the work of breeding more and better Leghorns!

Ohio.

Elton Stauffer.

True Quality in R. I. Reds.

It is a very difficult task to state the reasons for one's satisfaction in such terms as to produce the same feeling of satisfaction in the one who reads. Were it possible to do so, each reader would immediately purchase a flock of R. C. R. I. Reds.

In any breed there are several qualifications necessary to make it a breed of real worth. It is because the R. C. Reds fulfill these qualifications that I keep them. For the sake of emphasis let me state these qualifications in the beginning. They are, eggs, meat, beauty, disposition, mentality, vitality and ability to reproduce themselves.

The average owner expects his fowls to give a good return in eggs. No matter what breed he has, he is disappointed if they do not lay eggs and plenty of them. With half a show the R. C. Reds will not disappoint their owner in this respect. Glance over the contest records of the past and see if they have not been holding their own with the best. You will also notice that they have been doing it on as little feed as any of them. We feed 2½ pounds of scratch and 2 pounds of mash per 15 hens per day. And they give a return in eggs. Last year 31 hens gave the following report: January, 540; February, 542; March, 604; April, 607; May, 601; June, 526; July, 476; August, 280; September, 210; October, 81; November, 24; December, 15. The reason for the small records in the latter months was that we kept killing them off to make room for the young ones. We bought them for layers and they have not disappointed us. With the best of attention they would have done better. They seem to know that their business is to lay eggs.

Meat is also no small item. A canary bird is not very desirable even tho it may produce a fair number of eggs. A Red cockerel will produce six to seven pounds of the finest flavored meat in so many months. In a flock of 32 cockerels on a town lot we averaged ¾ pound per month, on an average of 9 pounds of feed per month, not counting the lawn clippings. And where such meat? A beautiful bird, alive and a beautiful bird on the platter. With heavy drum sticks, a full breast, a well meated back within and without, and a neck far from poor picking, they make a feast fit for the most fastidious.

Some folks occasionally say that they do not care for the looks of their chickens, just so they produce eggs and meat. No one entirely disregards the appearances of his chickens. The R. C. Red can do his share of the work and look well while at it. Nothing is a more pleasing sight to the eyes of those who appreciate beauty than a flock of Reds. With their rich, strong liquid red that has a snap and life to its color, they add a brilliancy and beauty to any surroundings. The city back yard takes on new life and beauty with them present. To the green fields of the farm they add the needed color to make the place a perfect harmony, while at the same time their color is a great protection to them.

Their shape is also a thing to admire. Their long, lithe bodies move with a grace that denotes their royalty. They have a shape all their own. They do not have the leggy appearance of some breeds; sit well on their legs but are not a pinched up bunch of feathers as some others. An equal mingling of curves and straight lines which appeals to the eye of the artist. Good combs that are never spoiled with frost bite, an eye full of fiery vitality, a boldness of bearing that would do honor to a Caesar, a clean red face that adds materially to their beauty.

No one should consider purchasing a flock of chickens without first learning their disposition. This is a large contribution to your pleasure in working with them and to their success for you. Personally I have no patience with a fussy, nervous bird. We cannot agree. Study the disposition of the large and successful breeders and of the birds they breed, and see if they are not generally well mated. The R. C. Reds are wiry but not wild, docile but not lazy. Very peaceful and easily contented. If paid attention, they become the greatest of pets. Cool and cautious at all times.

Mentality is a quality of supreme importance, tho seldom considered. Low mentality is almost as bad a defect as low vitality. I have had birds vigorous and active but with low mentality, hence less productive. One who knows nothing of the mentality of his birds is not well acquainted with them. It is an attractive quality to those who appreciate its worth. The Reds have it in a marked degree.

Vitality is of the greatest consideration. It is very seldom you see a R. C. Red with his head under his wing warming the roost. They are tireless workers from dawn till dark. When foraging, they seem to be engaged in a life and death struggle. They possess a constitution and body that is capable of a large amount of work. They are not very susceptible to the changes of the weather. In this is perhaps their greatest advantage as egg producers. Zero does not stop their musical choruses. They do not lose one single moment with frozen combs as the single comb varieties sometimes do. Not every person is so situated as to have pens that are frost proof. The cold weather does not affect their laying in the least; besides, the warm summer months hold no terrors for them. A sick Red is the exception. Their strong vitality saves one from a thousand worries and cares, both as youngsters and older birds.

The back-lotter, farmer and general chicken man desires a chicken that can reproduce itself without the double mating of some breeds. Generally he does not have the time or room for it. Double mating can be practiced with good results, but it is not necessary to keep a uniform flock in type and color. Use a cock bird of good type, good luster to surface plumage, medium to medium dark with a strong under-color not showing much contrast, with as little contrast in hackle, saddle and shoulders as possible, free from smut in back and free from white or black in hackle and saddle; on females of as uniform color and shape as it is possible to use, and you should have young-

sters of uniform type and color. Never use females of all colors and shapes and expect to get uniform offspring. It can't be done.

A little smut in male does not bar him if used with caution. Never use one with white in hackle or saddle and with weak under-color. Off sizes and colors are more rare than in some of the other popular varieties. Begin with a strain that possesses good blood lines and stick to it, and you will soon learn what to expect from your birds. And you will have an added pleasure and profit in caring for them.

It is because the R. C. R. I. Reds fulfill the above qualifications so nobly and respond to every attention given them so readily that I keep them. Apply ordinary common sense and attention to the R. C. Reds and they will reward you richly for every act in giving you as fine a looking flock and as practical a business fowl as any other variety or breed. The R. C. Red is his own best argument. He needs no eulogy; he speaks for himself. Try him and be convinced.

West Virginia. Chas. Hickman.

Anconas for Large Eggs and Many of Them.

By H. M. Long.

EGGs that weigh 28 ounces to the dozen—4 more than the average—and handsome birds that always command attention explain why I am an Ancona enthusiast. I do not call myself a fancier; I realize there is much for me to learn. My birds are my recreation, but I make it my business to see that they work, stay on the job and do not

owe me anything when the account is balanced at the end of the year.

When a boy I kept chickens—just chickens. There were almost every kind in the yard. Sometimes they laid, but often it was the opposite.

Several years ago it became possible for me to start another flock. This time I was determined my stock would be full-blooded at least, even if I did not have birds I would feel justified in entering in a show.

The local show was held in early January. I attended, inspected the exhibits and subscribed for three magazines. These I began to study to decide what breed I wanted. It was not until April that I reached the conclusion I wanted Anconas. There were several factors in determining this:

1. The Anconas are strikingly handsome birds.

2. They belong to the Mediterranean class, which means usually a maximum of eggs for a minimum of food.

3. They do not require the floor or ground space heavier breeds do.

4. They mature early.

5. Eggs are white and it is my experience they are next in size to Minorcas', which make up in increased amount of food required to produce eggs of equal value.

In April I ordered chicks from one of the leading Ancona breeders, and late in May the little fellows arrived. The fifty were nursed very carefully. A few found existence too much of a struggle and passed out, but of those that lived 23 were pullets, and some of the cockerels appeared to me to have class.

Nearly all that year it was everything going out and nothing coming in.

The Anconas began early in the fall to pro-

EVIDENCE OF THE QUALITY OF BARRED ROCKS BRED BY J. W. PARKS, ALTOONA, PA., BOX J.

(11) Silver cups and ribbon winnings on eggs, utility pens, laying contests and exhibition classes. (12) Over 21 lbs. of favorable reports from customers over the world. (13) Getting on the outside of 274 eggs in 365 days. (14) First honors silver cup won by Parks Strain pen at Missouri Laying Contest.

duce white eggs. We had more than we could use and sales in the immediate vicinity began. I had three or four Reds to use as broodies later and when I reported 632 eggs for March there was a marked demand for Ancona eggs for hatching purposes. April was not quite so good, the 600-mark being just missed. But for the year, molt and all and minus several birds that answered the dinner bell early in the year, the flock made a total of more than 3,800 eggs. In the fall I was away for several weeks and a boy looked after the feeding for me, and not any too successfully.

We have had some odd experiences with our Anconas. Woman agents have come to the house to canvass, caught a glimpse of the birds, asked my wife to show them, and then the ones who came to sell changed things and carried away eggs we were sure would hatch strong chicks.

I had one dissatisfied customer—a woman.

She placed 20 eggs—all I had at the time—in an incubator without another egg of any description as a check. Three weeks later she brought the eggs back. They did not hatch. I broke the shells—a chick in every one. Something went wrong with that incubator. I gave the woman another 20 eggs. I had just broken up the pen and when a couple of days later she wanted more eggs I did not have them. She was not destined to have Anconas that year. She placed the basket on the cellar stairs and her father kicked it to the bottom. And with 40 eggs she did not get a chick. But it wasn't the fault of the Anconas.

I never tried to see what I could do in the course of a year, but in 1915 the first pullet egg was laid July 28. And the pullets did not molt.

There is a beauty about Anconas I cannot find in other breeds. I admire a good specimen regardless of breed, but the black coat

mottled with white appeals to me, and I find it as difficult to get near perfect specimens as it is for the Barred Rock men to secure the barring that is the mark of good strain.

I do not find Anconas wild. It is true they are as easily frightened as Leghorns and some other breeds. Little ones hop on my knee, get on my shoulders and even on my hat when I take green stuff to them.

Ancona eggs are a delight. I get the largest eggs in a block where there are a dozen flocks. Twenty-eight-ounce eggs are common with me.

Uniformity is a good point in eggs that go to the market. One spring when I was carrying a dozen to one of the men at the office our grocer became curious while I was waiting for a car. I displayed the eggs in the carton. They were weighed, and that grocer wanted to buy all the eggs I could furnish and pay current retail price.

"I can do it and sell them and make 5 cents a dozen," he said.

When we compared the stock in the store and even after we had picked out a dozen of the largest eggs in a good-sized box on the counter, the weight of the Ancona eggs could not be duplicated.

I have found Ancona chicks hardy, not difficult to raise to maturity. This last summer I lost a number—not from disease, but because a certain black cat managed to get in the house in spite of wire roof on the yard. I don't know yet how he did it. No; it wasn't rats. I got out of bred one bright moonlight night in time to see the cat trotting across the yard with a squawking chick in its mouth.

For several years I have had Anconas. It will be years, I hope, before I have my last one. I am satisfied, which is something not all poultry raisers can say. My birds have paid their way; they have done more—they have left many dollars as reminders of the busy little black hens mottled with white that produce the big white eggs that are eggs. And now that local merchants are threatening to sell eggs by the pound, I say:

"Go to it." The Anconas will get all the best of it."

Ohio State Fair.

Poultry representation at the Ohio State Fair the last week in August in the number of exhibits, variety and quality is expected to surpass that of any previous exposition here. Interest in poultry in Ohio has been developed rapidly and production the past year, it is declared, has been on an unusually large scale. This has been stimulated by the fancy prices which birds command and to the insistent and patriotic appeals for more poultry and eggs as substitutes for meat.

Because of the fact that the war has created a peculiar and enormous demand for poultry and eggs, the management of the Ohio State Fair this year has given extraordinary attention to the poultry department in an endeavor to make it more attractive and instructive than ever before. There is certain to be an extensive exhibit in view of the fact that each year has brought a larger display of birds at the fair. The entries last year were so numerous that it was necessary for officials of the fair to borrow pens from Ohio State University.

J. L. Carlisle, of Greenfield, is the member of the state board of agriculture in charge of the poultry department, and the superintendent of exhibits will be W. E. Limes, of Linden Heights. These judges have been announced: L. Rawnsley, Willoughby, O.; D. D. Whitaker, Cuyahoga Falls, O.; Walter C. Young, Dayton, O.; H. A. Pickett, Georgetown, Ky., and Charles V. Keeler, Winamac, Ind.

Prizes offered in the poultry department this year total \$2,900. E. V. Walborn, manager of the fair, states that entries will close at 6 p. m., August 12. Birds must be in position, ready for judging, not later than 8 a. m., Monday, August 26. Fowls will be judged by comparison and not with use of a score card.

No fowl shall be awarded first premium that is unworthy of a score of 90 points.

One of the poultry features of the fair that will attract wide attention this year comes under the caption of boys' and girls' club work contests, in which there is a special event for poultry clubs. Club members may exhibit a trio of birds, a cockerel and two pullets. The express charges incident to bringing the exhibits to the fair will be borne by the fair management, which also will pay the expenses of demonstration teams that will participate in a contest. These teams are each to be composed of three club members, representing a county or district. The demonstrations are to be given in feeding, killing and preparation for market, caponizing, judging of utility poultry, and the like.

Poultry is claiming the attention of thousands of boys and girls thruout Ohio, many of

whom are earning nice sums of money in the business. These contests are planned with the chief object of keeping present interest alive and encouraging other youths to get into the poultry game.

Wisconsin State Fair.

From present indications the poultry department of the Wisconsin State Fair will by far surpass any of the previous exhibits. Special efforts are being made to make this show a record-breaker and to this end they are offering over \$3,000 in cash premiums. The poultry exhibit will be held in the new building that was completed in 1917. Send for premium book and entry blanks to Oliver E. Remy, State Fair, West Allis, Wis.

Poultry premiums at the Oklahoma Free State Fair, Muskogee, to be held September 30-October 5, have been doubled over those of former years. This year's premium list in the poultry department equals those of the largest fairs of the United States, and classification has been provided for all breeds.

The premium list in the poultry department of the Erie Exposition, Erie, Pa., compares favorably with that of the larger state fairs and this department promises to be of unusual

COLISEUM

Poultry & Pet Stock Show, Chicago

TENTH ANNUAL EXHIBITION

December 3, 4, 5, 6, 7 and 8, 1918

THE one show west of New York that for nine consecutive years has met every obligation in full and in cash, without the sale of one dollar of its capital stock.

THE COLISEUM SHOW

has introduced more new features that work to the interest of the fanciers than all other shows in this country combined. It is the one exhibition that caters to all classes of breeders, and helps in the right way to promote the interest of all fanciers, large and small.

A WINNING AT THE COLISEUM

is without question the most important win that can be made in this country, no matter what part of this country you may be located. A winning at this great show will put you on the map and insure you good prices for your stock.

THE COLISEUM SHOW

has never sold concession space to a faker. Only legitimate concessions are allowed, and we pride ourself on the fact that we are the only national show in the world that absolutely guarantees its concessionaires to its patrons.

THE COLISEUM SHOW

is the greatest sale show in America, and the only show that we know of where a legitimate sale of \$5,000 was made by one exhibitor. Coming as we do on the same dates as the Great International Stock Show, we put our exhibitors in touch with the greatest buying public in the world, as more than 100,000 stockmen from all parts of the world come to Chicago on this date.

The Light Brahma Club, the International Plymouth Rock Club, the International Turkey Club, the National Bantam Club and the American Rouen Duck Club will hold their meetings with us this year, with other important clubs now voting and quite likely to decide in favor of the COLISEUM.

YES, THE COLISEUM SHOW

will pay cash prizes in 1918. And in addition to our regular cash list we will pay more cash specials than ever in the history of the show. This is no time to retrench on expense. The breeders need all the encouragement they can get, for God knows they have been hit hard enough. In addition to our cash prizes

THERE WILL BE SIX \$50 TROPHIES

for best display in six important breeds. These trophies are without question the most valuable prizes ever offered at any show and are offered for the best ten entries in a breed, instead of variety, as formerly.

THE COLISEUM PREMIUM LIST

will be mailed earlier this year than formerly. All exhibitors at the 1917 show will receive the list without request; others are requested to write the Secretary, so their names may be added to the mailing list.

The Lexington Hotel, Chicago, has been selected as headquarters. This hotel is located at 22nd St. and Michigan Blvd. Street cars stopping in front of the Coliseum stop in front of the Lexington; or exhibitors may walk, as the distance is only six squares.

A BIG NEW FEATURE

will be added this year—one that has been requested by the exhibitors and one that will be appreciated by every exhibitor, as it gives to the exhibition and the public something they have always needed. Don't fail to send for list, and please remember

ALL ENTRIES CLOSE NOVEMBER 15

Chicago and suburban residents may get information in regard to concessions from James W. Bell, care American Poultry Journal, 523 Plymouth Court; but for premium list address the Secretary, 25 West Washington St., Indianapolis, Ind., until October 15th; after October 15th, Lexington Hotel, Chicago, Ill.

THEO. HEWES, Secretary.

size and importance. This show takes place during the week of August 19 to 24, inclusive. For full particulars address the manager, C. R. Cummins, Erie, Pa.

The Kankakee Inter-State Fair will be held August 26-31, 1918. The premiums in all departments are most attractive and especially in the poultry department. For premium list address the secretary, Len Small, Kankakee, Ill.

KANKAKEE FAIR INCREASES PREMIUMS.

Week of August 26 to 31—War Work Important.

The Kankakee Inter-State Fair, which this year will be held in the week of August 26-31, has for a number of years put on a high-class livestock and horse show. Its Percheron exhibits have been large, and its cattle, sheep and swine shows excellent and complete, while the fancy horse show has been of the very highest quality.

This success has been due largely to the policy of that association in offering as large premiums as it could afford, and paying all premiums in cash to the winners. For this year it is at work to enlarge its premium offerings, and improve and revise its classification. Many important changes will be made in the premium list—changes that will be appreciated by exhibitors.

The management of the Kankakee Fair feels that in conducting its exposition it is rendering patriotic services of a high order. It has long done its utmost to encourage the raising of better crops, the breeding of pure-bred livestock, and the making of better foodstuffs. Now that the nation is at war, the importance of work such as this is doubly important, and naturally this fair proposes to do much valuable work along these lines. It is planned to make this a wartime fair.

Coliseum Gets National Pet Stock Meeting.

The Great National Pet Stock Club, representing every state in the Union, has voted to hold its annual meeting with the Coliseum show December 3 to 8. This meeting will bring out the very best there is in pet stock, and will undoubtedly be one of the greatest shows ever held by this progressive club. There will be many special features, including everything in the fur-bearing line, and now, that the secret of tanning these furs has been discovered, it is making of the domestic animal one of our most valuable assets. All pet-stock breeders that exhibited at the Coliseum in 1917 know that this is the greatest sales show in the world and prices ranged higher than at any other show ever held in this country. If you did not exhibit in 1917, do not fail to send in your name at once and secure a copy. Remember that classes will be made and cash prizes paid on every kind of fur-bearing pets.—Theo. Hewes, secretary, Indianapolis, Ind.

A FEW REMARKS BY THEO. HEWES.

NOW that it has been decided to hold the annual meeting of the American Poultry Association in Chicago, we are glad to report to the readers of the American Poultry Journal that President Richards has acted upon our suggestion and arranged for headquarters at the Lexington Hotel, 22nd St. and Michigan Blvd. Practically all of the second floor of this hotel has been assigned to the poultrymen for this week at a very reasonable rate, and we would suggest that members who are intending to visit Chicago at that time make their reservations or at least advise the hotel what day or days they expect to be in attendance.

As we understand it, this year all frills and foolish entertainments are to be eliminated, and it is to be a strictly business meeting where important matters pertaining to the association and some plan looking toward better conditions for the commercial breeder during the period of the war are to have full consideration. While this meeting has been wished on Chicago, the members there making no effort to secure it, it is without question the logical place, and especially at this particular time and we hope that every member residing in the Mid-West district will make it his or her business to attend.

There are many things of importance that should have attention at that time and there are quite a few of the auxiliary associations

that are affiliated with the American Poultry Association which will hold their conventions at the same time. A good attendance is desired in order that proper legislative work may be straightened out many of the kinks that get into these auxiliaries during the twelve months intervening from one meeting to another.

Last year at Milwaukee about all that was done in the way of progressive work was to appoint committees. About 150 people were named on these committees and it was clearly evident at the time that they would not accomplish much, as the best committee that was ever appointed was a committee of three, where one man died and another got sick and the third man did the business. If we imagine that we can sit down and offhand name large committees with the expectation that these people are going to give a lot of valuable time to the association without any compensation whatever, we are simply making fools of ourselves. For now is the one time in the history of this country when every man must do something in order to keep his own head above water, and he cannot do justice to himself and his family and give this valuable time to someone else, unless he receives some sort of compensation for his time and energy.

* * *

The frost that visited Indiana on June 22nd was one of the most severe that we have any record of in this state. Just one week prior to the heavy frost was the hottest day that we have had in Indiana for twelve months, in fact, the hottest day except one during the entire season of 1917. The change in the weather came without rain or without storms; in fact, during the entire week preceding the big frost each night seemed to grow colder, and while the sun shone brightly during most of the day, it seemed to be lacking in heat, until finally the mercury dropped on Saturday night below freezing and thousands of acres of valuable farm products were injured and in many cases practically destroyed.

The frost waves seemed to travel in pockets and while the low land suffered the most in some instances, it reversed and crops in the valleys were not affected as much as they were on the ridges. Then again, a field of corn standing 2½ to 3 feet high would be seared as tho a fire had passed over it, while adjoining this corn field we sometimes find acres of tomatoes only about one-third as high as the corn that escaped with practically no damage. Then you would find a field all ap-

parently on the same level, a streak perhaps 100 yards wide would be free from frost, all of the foliage green, while on the other side perhaps twice as wide would be practically frozen to the ground.

Within the past few days, I have been over the greater part of Marion county and some of the edges of the adjoining counties, and while the general report is that the frost did not do as much damage as was first reported, my opinion is that it has done a great deal more damage than we first thought.

While it is true that the corn crop, if weather conditions are favorable, will come out providing the heart is not frosted, it will give the entire crop a setback of several weeks and it will never mature into the same quality that it would have under normal conditions. Viewing the situation now, four days after the freeze, I am convinced that the wisest thing for the farmers to do is to straddle the rows with a corn planter and replant the entire field. Should the frost remain off until the first of October, there is yet time to grow a corn crop and, even though we have an early frost, this corn will reach the stage where it can be placed in the silos for winter feed.

* * *

We have tried to get a line on poultry conditions in the state of Indiana and at this writing I believe the fanciers are as well provided with young and early hatched chicks as they were in 1917. Some are short of last year's productions, while many have more than formerly. May was one of the best months that we have ever seen, not alone in Indiana, but in any state we have lived in, there being no frosts and not a great amount of rainfall and early hatched chicks made rapid growth during this weather. The gape worm has affected some sections and where this pest has entrenched itself, there does not seem to be any remedy to cure it or even take it out of the soil and it will be necessary for breeders to discontinue trying to raise chicks on this ground; but where they have been moved onto new ground not contaminated, they have made wonderful growth and it is a common thing to see cockerels and pullets all of standard variety feathered out and even to hear the young males crowing. The trade in baby chicks and eggs for hatching has been better than in 1917. This demand has come from all sections of the country and it is especially gratifying to know that much of it has come from Canada, proving conclusively that regardless of their four

years in the war the Canadian fanciers have not given up and are still interested in the best there is in thoroughbred poultry.

The State Fair and Exposition are offering extra inducements this year for large entries and the Indiana State Board is making special classification that should call out the largest entry that we have had here for a number of years. Classification has been made in young and old pens in nearly all varieties, while in Barred Rocks and Brown Leghorns classes have been arranged for the light and dark matings. Breeders who are interested in this exhibition should send to Charles Kennedy, Sec., Indianapolis, Indiana, for premium list. The premiums here are very liberal on all breeds, with only a 25-cent entry fee on single birds and \$1 entry fee on pens. W. W. Zike and W. P. Overman will look after the interests of the poultrymen and no better selection could have been made.

Questions and Answers

Conducted by
Prince T. Woods, M. D.

Questions about poultry are answered in this department free for all readers of American Poultry Journal. Where answers are desired by mail, a stamp for reply is requested. Address all query letters to the managing editor, Dr. Prince T. Woods, Lock Box 4, Silver Lake, Mass.

Lice.

Q. I am a beginner and have three lots of chicks with hens. They started fine but now they are almost all feathered out, they drag their wings on the ground and stand around all hunched up. A few have diarrhoea. They all eat plenty, but seem to have stopped growing. Can you help me?

Hartford, Conn.

A. The chicks are probably infested with lice. Clean out the brood coops and either whitewash them inside and out, or paint with crude petroleum both inside and out. Let coops dry well before chicks occupy them. Apply a little carbolated petrolatum to heads of chicks. Dust the old hen thoroly with a good lice powder, working it well into the feathers down to the skin. You ought to be able to take the hen away from the chicks now. Give chicks a good green run, plenty of cool, clean water to drink, granulated charcoal, grit and fine crushed oyster shells, and feed liberally on wholesome food. See that they have shady shelters to protect them from the sun and from storms. If they have been running some time on the same ground, move them to new soil. Spade up the old run and plant to oats or rye.

Wintering Old Hens.

Q. I have about 80 hens which I bought last fall at \$2 each. They were two years old last spring. I fed them well but they did not lay much until February. Now they are beginning to drop off in egg production and a few are losing feathers. Would you advise me to summer them on free range and keep them over another winter? We intend to can a few of them.

Plympton, Mass.

A. We certainly would not carry any three-year-old hens thru next winter, unless perhaps a few exceptionally fine breeding birds. Evidently you have none such. Better begin canning the non-producers. Use what you need for the home table. Any you do not need for home use or for canning it will be well to fatten on whole corn and mash for two weeks and then sell for market purposes. They will bring a good price at this

time. For what the hens will bring per pound, when properly fattened, you should be able to buy, at a similar price per pound, good early hatched pullets around the last of September or first of October. Fill your poultry houses up with early hatched pullets of some one good Standardbred variety. Give them good green runs and liberal feeding when you first house them. Keep them well fed and you should have a first-class egg yield all winter at lowest production costs. You can get results with the early pullets, but we do not believe that you can make the three-year-olds pay their board next winter. Watch the ads for bargains in early pullets; some good opportunities for purchase are, or soon will be, available. Do not buy several varieties. Get all of one variety; it will be easier to make them do their best in egg production.

Mites.

Q. I have been having bad luck with sitting hens used to hatch a few summer chickens. The hens either leave the nests and refuse to sit, or they grow thin, get diarrhoea and die on the nests. What is wrong?

Manchester, N. H.

M. A. B.

A. The nests for sitters are probably infested with red mites. Burn all old nesting material. Clean out the nests and give them a good coat of crude petroleum both inside and outside, working it well into the cracks. Dry the nests well in the hot sun. In making new nests, put a piece of grass sod in bottom of nest, earth side up. On this build nest of clean bright soft hay. Dust all hens well with a good lice powder before placing them on the nest.

Trap-Nesting 500 Layers.

Q. On a small egg farm, say 500 Leghorn hens, would it be practical to trap-nest every day to increase the efficiency of the flock? Does the constant daily handling of the hens, necessitated by the trap nest, have a tendency to retard the laying qualities?

Westwood, N. J.

G. A.

A. Trap-nesting will not increase the efficiency of the present flock. To trap-nest 500

layers requires considerable outlay for nests and a great deal of labor. The handling of the hens, if properly done—gentleness is necessary, for rough handling immediately after laying may injure the bird—will not have any effect upon egg production. Better select a reasonable number of best quality specimens for prospective breeders, and trap-nest them. Choose the best layers in this select flock to breed from next spring. The birds which are kept and forced for market eggs need not be trap-nested.

Best Breed.

Q. What is the best breed for a beginner to keep? I want to get plenty of eggs for home use; do not intend to breed and raise chickens, as there is not room enough on our back lot.

Columbus, O.

M. E. T.

A. There is no best breed. Any one of the popular breeds of fowl should answer your purpose. R. I. Reds, Plymouth Rocks, Wyandottes, Langshans, Leghorns, Anconas, and many others will fill all your requirements. You do not need any male bird. Buy good, early hatched pullets of any one variety which pleases you and take good care of them. You will get a good egg yield if you feed them well. Do not buy several different kinds. Buy pullets of one variety only, the one which suits you best.

Loss of Feathers From Back.

Q. Please give remedy in A. P. J. Right on the back, close to the tail, the feathers have come off and also some of them from top edge of their wings. There are no mites on these hens and I do not know of any lice or mites on the place. All the hens seem to be perfectly healthy and laying well.

Winston-Salem, N. C.

P. M. L.

A. There is nothing wrong with your flock. Simply take the male birds away from the hens and let the hens have a good, well-shaded green range for rest of summer and fall. Loss of feathers on backs and tops of wings is due to the attentiveness of the male birds. As you are no longer needing eggs for hatching purposes, remove males from flock.

Torn Backs.

Q. A number of hens have badly torn backs. What is the cause?

Lexington, Ky.

E. C. C.

A. Sharp edges and points on toe nails of male birds, and possibly sharp spurs. Examine males and with a pocketknife and flat file blunt the edges and points of toe nails, also if the spurs are long and sharp, blunt these also. For hens so injured, cleanse the wound thoroly with warm water, dry the parts and apply a good ointment like germicide or unguentine. If the tear is extensive, freshen

MEYERSDALE, PA.

the edges of the tear, trim off all ragged parts and draw the edges of cut together with a few stitches, using clean white silk. Remove the stitches in four or five days. Be sure that all dirt is removed from wound and that it is clean and healthy appearing before you attempt to close it up. Keep such hens in coops by themselves while wound is healing. It is better to bed them with straw than to permit them to roost on perches.

Slight Colds Among Young Chickens.

Q. Some of my half-grown chicks sneeze and seem to have slight colds. They are free from lice and kept in clean coops. Have about 50 chicks in a small colony coop. It is closed up well at night.

Lowell, Mass. H. D.
A. Rub a little camphorated petrolatum into nostrils and cleft in roof of mouth. You are crowding your small colony coop and closing it up too tightly at night. Divide the flock into two groups of 25 chicks each and house separately. See that a part of front of coop is kept open at night, using only fine mesh wire netting over opening.

Langshans as Layers and Mothers.

Q. I notice you keep Black Langshans. Do they make good layers and good mothers? Can you recommend this breed for a beginner in back-lot poultry keeping? I have a good-sized back lot, always have a good garden and have room to grow a few chickens and to keep a fair-sized home flock. I like the looks of the Langshans. Is it easy to confine them?

Des Moines, Ia. C. R. T.
A. The Black Langshans are admirably suited for back-lot poultry keeping. They can be easily confined with a four-foot wire fence, provided you keep them well fed, contented and do not permit them to get the habit of going outside the run. If they once get the habit of going over a fence they will either walk up it or fly over, and can only be kept in by wire over top of run. We find them exceptionally fine mothers, good sitters and especially good to raise broods. They are gentle and easily handled if the attendant makes friends with them. Tho a heavy fowl, they are as nervous and active as Leghorns, but are easily kept tame. Ours stay with their broods long after they begin to lay again as a rule, sometimes keep with the chicks until the whole brood is well feathered out and often will begin roosting together if opportunity is given. This year we used Langshans exclusively for hatching and rearing. The hen mothers are very good foragers and are absolutely fearless in protecting their brood, and will attack hawks or dogs which come prowling around. As layers we have found them about on a par with our heavy laying White Rocks.

Wants to Start With Reds.

Q. (1) I am interested in poultry and take A. P. J. at the news stand. Have a small place just out of the city on the car line. I want to make a start with good poultry, something I can get results with and have the fun of showing good chickens. The Rose Comb Rhode Island Reds look good to me. Would you advise starting with this breed?

A. (1) You will find the R. C. Reds well suited for your purpose. They are fine producers, make good table poultry, and breeding them for exhibition is sufficiently interesting to suit any fancier in the making.

Q. (2) How would you start? With eggs? Baby chicks? Or a dozen good breeders? I would like to get started this fall.

A. (2) If you start with eggs or chicks you will find it best to make an early beginning in the spring. For a start this fall, you will find bargain offerings of breeding stock now advertised. Better get the best small flock of mated stock that your money will buy. Say half early pullets and half good vigorous yearling hens and the best male bird you can get. Put it up to the breeder to mate the birds for you.

Q. (3) Would you advise me to wait until the fall shows before buying breeding stock?

Buffalo, N. Y. H. E.
A. (3) Better buy the stock now. Buy breeding stock, not exhibition stock, and ask to have the birds properly mated to give good results in producing exhibition quality. You will not be exhibiting this fall, but next year you will have the pleasure of being able to show stock of your own raising. Before you buy your birds, be sure to get ready a suitable house and run to keep them in. Consult the advertising columns for offerings of breeders of R. C. Rhode Island Reds.

Heavy Laying Leghorns.

Q. I am interested in Leghorns—the S. C. White variety—and would like to establish a strain of heavy layers. I want chickens that are good to look at and some of the pictures

of the record layers look like frights. Isn't it possible to have a hen good to look at and able to lay lots of eggs at the same time? What is the best way to go about starting a strain?

New Rochelle, N. Y. D. S.
A. It takes years of careful breeding to establish a strain. Standard beauty can readily be combined with heavy laying. Never could understand why the egg record faddists so generally find their freak layers among the unattractive specimens. We have seen some alleged record layers that look like no other fowl on earth and remind one of the ruin of a misspent life. If you start right you can combine eggs and beauty. Build the foundation of your flock with good Standardbred breeding stock selected from good average layers. Phenomenal layers seldom reproduce their like. Good average layers will usually beget good layers. Select a breeder known to produce good Standard quality stock and who can show records of excellent egg production. Get from him good average layers or pullets out of such. Insist on good Standard type and quality. Secure of the same breeder a related male of good Standard type and quality, preferably one from a heavy laying dam and grandam. Breed this stock in-and-in, always breeding from the best average layers that show excellence in Standard quality.

Heavy Laying Light Brahmas.

Q. I like the appearance of Light Brahmas but am told that they are heavy feeders and not very good layers. Is this true? I have not kept poultry for a long time, but a number of years ago used to read about a heavy laying strain of Light Brahmas. Do you know the record of any of the Brahmas kept in Massachusetts about 20 years ago or more? Would you advise me to try Light Brahmas on a town lot?

Albany, N. Y. B. H.
A. Reliable breeders are still advertising Light Brahmas that lay and pay. You will find them good layers and fine fowl for the town lot, if you buy stock from a good laying strain. Probably you refer to the Hartnest Farm Light Brahmas and their famous hen No. 61, with a record of 233 eggs. This farm lost heavily by fire and went out of business about 18 years ago. There are plenty of good laying Brahmas today. Some specimens are heavy feeders, but if one seeks heavy pro-

ducers in any breed he must look for them among the good feeders. Like dairy cows, the big producers are good eaters; it is not possible to get something from nothing. Brahmas of a good reliable productive strain can be depended upon to deliver as good value for the feed they consume as will any other heavy breed—in fact some of the heavy fowl will give the lightweights a good run for the money.

Curing Clover Rowen.

Q. I am going to have a good second crop of clover on land where I used to keep chickens. What is the best way to cut and cure it for winter use of poultry?

Worcester, Mass. C. L.
A. Choose a day that promises to be bright and fair, with a warm, gentle breeze. Cut early in the forenoon, before the dew is dry. Spread well and let lie until the middle of afternoon. Then when it has just wilted, rake into small heaps or cocks; let lie to "sweat" in cocks until next morning. When sun is well up, open the cocks and turn over a few times to dry it. Put under cover before the dew falls. If it shows any tendency to heat, dry by spreading and turning while under cover. Do not shake up sufficiently to break off the leaves. If dried too much the clover loses much of its quality as a winter feed. Before feeding cut into short lengths with a clover cutter. We do not know of any better winter feed than good, well-cured clover rowen. We prefer it to alfalfa.

SAVE FEED MONEY

Conserve now by using IDEAL Economy Dry Feed Hopper—stops waste, keeps out rain, rats and birds. Weight of fowl on step opens door inward when feeding; automatically closes on leaving. Roll bottom prevents fowl from hooking out or wasting feed. Constructed of galvanized iron, designed for feeding whole or cracked grain, dry mash, grit, oyster shells, etc. It saves work, can't clog or get out of order. See your dealer today; write for information and literature.

Recent Inventions for Poultrymen

By Lester B. Sargent, Patent Attorney, Washington, D.C.

AN INCUBATOR of large dimensions and adapted to contain thousands of eggs in separate trays arranged in tiers is the subject of patent 1,262,860, recently granted to Samuel B. Smith, of Cleveland, Ohio. The incubator is of a combined hot water and hot air type. Hot water pipes are provided at the upper end of the chamber and the heated air caused by these pipes is continuously circulated thru the chamber and above and below the various tiers of egg trays by fans arranged close to the heating pipes. The hot air is circulated in a column with such speed as to keep the temperature substantially uniform. The egg trays are provided with open mesh bottoms, upon which the smaller ends of the eggs rest in close and solid formation. Each tray of eggs occupies the

Mammoth Incubator, patented by Samuel B. Smith, Cleveland, Ohio, and assigned to the Buckeye Incubator Company, of Springfield, Ohio. Patent No. 1,262,860.

upper rack for the first three days and is then transferred to a place in the upper end of the tilting racks on a lower plane. During the next fifteen days the trays in the tilting rack are shifted from higher to lower planes and tilted at frequent intervals to stand in oppositely inclined positions. When the eggs in the lowermost trays in the tilting racks are about ready to hatch, each tray is transferred to a stationary rack at the bottom of the incubator chamber where the chicks may be removed as occasion requires. Each tilting rack comprises perpendicular corner bars pivotally united by a series of cross bars carrying connecting angle irons extending from front to rear at each side and upon which the trays are adapted to be slidably supported. The links are pivotally connected at the center of the uppermost cross bars of each tilting rack, thus permitting an entire series of trays to be placed in an inclined position by merely raising or lowering one side of the rack by hand. The fans are mounted on trap-doors forming the ceiling of the central corridor.

An antivermin poultry perch having adjustable plugs has been patented by George B. Allison, of Willis, Michigan. An elevated supply tank is provided,

Antivermin Poultry Perch having adjustable plugs, patented by George B. Allison, Michigan. Patent No. 1,263,015.

from which the insecticide is automatically fed to the various hollow poultry perches. The conduit leading into the channel of each perch is provided with an adjustable dripping plug by which the quantity of insecticide supplied to the perch can be regulated readily. This plug is of tapered form, threaded exteriorly, and provided with longitudinal grooves for the flow of a small quantity of the insecticide. It may be applied to ordinary perches by grooving them out and then covering with a strip of wood thru which the insecticide may seep. Or specially prepared perches may be used, already channeled from the flow of insecticide thruout their length, the insecticide being of a character suitable to exterminate any vermin the poultry may have acquired, and adapted to keep the poultry house in a wholesome state. Patent No. 1,263,015.

Egg Grader, invented by Oliver C. White, Gardena, California. Patent No. 1,259,181.

California Fresh Extras showing graded eggs and egg grader.

An egg grader, invented by Oliver C. White, of Gardena, California, grades eggs by weight. It comprises a balanced beam, formed of sheet metal, a pair of standards, means pivotally connecting the beam to the standards, a threaded rod mounted under the beam and extending both ways from the center, an adjusting weight on this rod, and an egg receptacle at one end of the beam, which is counterbalanced by a weight at the other end of the beam, sufficient to overbalance one egg. In short, the device grades the eggs by weight. The device weighs eggs of any and all grades, having a weight capacity of from 18 to 29 ounces to the dozen, graduating by the one-twelfth ounce. Patent No. 1,259,181.

An insecticide poultry perch devised by Warren E. Wallter, of Charles City, Iowa, has as its novel feature an absorbent covering moved on an apertured pipe thru which the insecticide flows. A trough-shaped metallic strip secured to the bottom of the covering, longitudinally of the perch, prevents the insecticide from dropping from the perch. Patent No. 1,262,880.

Incubator, patented by Howard L. Davis, Plumstead, N. J., and assigned to Harold L. Watson, Lancaster, Pa. Patent No. 1,259,726.

An incubator devised by Howard L. Davis, of Plumstead, N. J., and assigned

to Harold L. Watson, of Lancaster, Pa., has removable egg supporting trays in each compartment, which are connected by a series of gears with a shaft extending longitudinally thru the compartments. The operation of this shaft causes the trays to turn, simultaneously, or selectively, as desired, to shift the position of the eggs in the tray, thereby permitting the proper positioning and adjustment of the eggs during the period of incubation. Patent No. 1,259,726.

CLOVER FOR CHICKENS.

S. B. WENGER, South English, Iowa.

ONE of the greatest questions of today is economy. Not for the sake of accumulating finances, but from the standpoint of food production and conservation to keep the wolf from the door of the human family at large. That actual starvation is facing the world is without question. How to meet the food emergency and lessen the awful horrors of starvation of the nations of the earth which will follow the world's greatest war tragedies is the question that confronts every individual.

We have come to a time when it is not only our duty to obey the war emergency food regulations but to aid in every conceivable way to add to the food supply. One of the ways in which nearly every family can help is in using up the waste matter by raising poultry for food. There is nothing else that will produce as much for the table as to use up the scraps and waste matter in feeding chickens. They will come nearer thriving and producing from waste and from their own findings than anything else that furnishes food for the human family.

In order to aid in this matter it is highly important that we study the feed problem to carry them thru the winter months and have them producing eggs during that period economically. One of the best poultry feeds for the winter season is clover and alfalfa put up in the form of hay. A half ton or even a few bales of good clover hay packed away in the shed or poultry house will furnish feed and scratch litter. They will eat off all the leaves and heads and save much expensive grains and other feeds, and will produce more winter eggs than when fed altogether on grain. This summer, while the hay supply is abundant, is the time to prepare the winter's supply of clover. It may be common red clover, sweet clover, alsyke, white clover or alfalfa. Much of this could be gathered along the roadside right-of-ways or waste lands, which is going to waste. This would enable people in very limited circumstances, having only a limited number of chickens, to feed them with very little expense and greatly increase food production. One dozen eggs will weigh one and one-half pounds and is probably the equal of that much meat. You will not only be furnishing your own table, but you may be saving the life of some less fortunate person than yourself. Do not fail to put up some clover for your chickens. It should be cut while green and well dried, without having been rained on, and put into dry quarters. Regular feeding will be almost the equal of sprouted grain.

**Ferris Leghorns
LAY WINTER EGGS**

For eighteen years Ferris White Leghorns have been bred to lay more eggs at all seasons than ordinary hens, and to lay particularly well in winter when eggs are highest. We do not breed from hens that are not good winter layers. We can't afford to, for with one of the largest poultry farms in the country we must have winter eggs to make it pay.

Thousands of poultry keepers in all parts of the country are having unusual success with Ferris stock; hundreds of customers in Canada also, and we have made successful shipments to Scotland, Japan, Australia, Nicaragua, Alaska, Philippine Islands, Bermuda, Cuba and Mexico. We guarantee safe arrival anywhere.

ALL STOCK IS SHIPPED ON APPROVAL. You can return within three days any birds not satisfactory and money will be refunded. (We will ship C. O. D. if you want to see the birds before paying for them. Send only \$1.50 for a pen of five, and 20 cents each for larger numbers to guarantee express charges.) We insure all stock for 30 days. Any birds that die or get out of condition will be replaced free of charge. Their breeding value is also guaranteed. Any male that does not produce fertile eggs, any hen that does not lay hatchable, good-shaped eggs replaced free.

Special Aug. and Sept. Prices

We have three grades of laying stock. Stock from our heaviest laying strain with trapnest records of 230 to 264 eggs will cost as follows.

EARLY HATCHED COCKERELS
\$9.00 each, \$8.10 each for 10 or more. Yearling hens or early pullets \$4.50 each—1 male, 2 females, \$18.00; 1 male, 4 females, \$27.00; 1 male, 8 females, \$40.50; 1 male, 12 fem., \$54.00; 7 males, 100 fem., \$385.20.

STOCK FROM 200 TO 230-EGG STRAIN—the kind we recommend for breeding and laying where large flocks are required: Early hatched cockerels \$6.30 each, \$5.40 each for 10 or more. Early pullets or yearling hens \$3.15 each; 4 females, 1 male, \$18.90; 12 females, 1 male, \$42.30; 100 females, 7 males, \$294.30; 100 females without males, \$256.50.

UTILITY STOCK FOR LAYING AND BREEDING. Not bred from trapnested stock, but from stock that we can guarantee to be better than the average. Cockerels \$4.50 each, \$3.60 each for 10 or more. Hens \$2.25 each, \$180.00 per 100. Pullets \$2.70 each, \$225.00 per 100. Four hens, 1 ckl., \$13.50; 12 hens, 1 ckl., \$28.80.

WINNERS FOR ANY SHOW. We can furnish cocks and cockerels hatched directly from our Chicago Coliseum winners at \$30.00 to \$100.00. Hens and pullets at \$15.00 to \$50.00. These birds will win at any fair. They have splendid low tails, good heads, wonderful shape in every section, and pure white plumage. We have hundreds of early hatched cockerels and pullets to select from and will guarantee them to please you. Remember that for several years Ferris Leghorns have been leading winners at the Chicago show, winning in 1915, 3 firsts and numerous other prizes, including silver cup for best display and silver cup for best five cockerels. In 1916 we won all specials, all 1st and 2d prizes; last Dec. we won 3 first and 16 other prizes, so no matter where you wish to show, we have the birds that will win for you.

**This 1918 Catalog

Mention AMERICAN POULTRY JOURNAL when writing to advertisers.

United States Fuel Administration

Washington, D. C., June 27, 1918.

Mr. Herbert H. Knapp, President International Baby Chick Association, Tiro, Ohio.

My dear Mr. Knapp: I beg to acknowledge your letter of June 13, addressed to Mr. Meyers.

The situation for the coming winter and spring in connection with chestnut anthracite coal for use in brooders and incubators is as follows: Because of the domestic requirements of the northeastern section of this country, comprising the New England states, New York, eastern Pennsylvania, New Jersey, Maryland and Delaware, and the absolute necessity of taking care of the actual needs of that section of the country with anthracite coal, because on account of transportation conditions, it is only possible to give that section bituminous coal in sufficient quantities to enable the essential war industries to continue in full operation, it has been necessary to materially reduce the amount of anthracite coal normally shipped into the state of Ohio, Indiana, Michigan, Illinois, Wisconsin, Minnesota, and North and South Dakota, and to eliminate entirely the other states west of the Mississippi and south of the Ohio and Potomac rivers excepting Virginia. It is realized in connection with the poultry proposition that this to a certain extent is going to cause some hardship, but in a state like Tennessee screened coke can be secured if an earnest effort is made sufficiently early in the season to do so. In so far as Missouri is concerned, or even Nebraska, they can secure western anthracite coal either from Colorado or Arkansas, or use screened coke, and action should be taken to protect their requirements of next winter and spring just as soon as possible and to get in the modest amount usually required

by each of the individuals so that they may have it on hand when necessity requires. It is suggested that prompt advice be given to the poultry raisers of the middle states mentioned where the amount of anthracite coal normally moving to those states is going to be reduced that they should undertake during the summer months to get such anthracite coal as is required for incubator and brooder use and to put it away in order to protect their requirements next winter and spring.

The situation is going to be such next winter that the administration cannot undertake to do what we did last winter because of the fact that specific allotments of tonnage have been made not only to states, but within a very short time will be made to communities as well, and if a certain community next February or March has received what it should have received under the allotment given to it, it will not be possible to get an additional car or two even to take care of incubators and brooders. It is the belief of the administration that this information should be given as much publicity as possible and that the poultry journals should be advised to this effect, and that the Candee Incubator Company and others who circulate literature among their patrons should also give the advice indicated above.

If every poultry raiser will undertake during the summer and early fall to get the fuel which he requires for next winter and spring's use, and in cases where anthracite coal has been eliminated from the states mentioned to secure either one of the western anthracites or screen coke, we are certain that little or no difficulty will be experienced by the growers as a whole in being able to raise their full quota of chickens next spring.

Very truly yours,
U. S. FUEL ADMINISTRATION.
By A. S. Leary,
Director Anthracite Distribution.

American Laying Contest.

By T. E. Quisenberry, Leavenworth, Kansas.

If I had ever had any doubt about a good Standardbred hen, containing exhibition qualities, being able to lay a profitable number of eggs, that doubt would now be dispelled. In Orpingtons, Plymouth Rocks, Reds, Wyandottes, Leghorns, Sussex and practically every variety in this contest, there are females among the highest layers which are also high scoring birds. Most of the birds in our present contest come from Madison Square Garden, Boston, Chicago and Kansas City winners at other of America's best shows and best advertised exhibition strains. Many predicted that practically all of these birds would make a disgraceful showing because they were largely Standardbred exhibition birds. Their record has been a creditable one in practically every case. Nearly all of these varieties have individuals going well over 200 eggs, judging from present indications. Our best record has been 218 eggs in eight months, by a yearling White Rock hen.

Why should not a Standardbred bird lay? Or why should not both Standard qualities and egg-laying ability be combined in the same fowl? The body of both are about the same. The head and tail is where the main difference is between a Standardbred bird and what is ordinarily known as a utility bird. In a Standard bird there is a neatness and carriage to tail and head that is produced by careful selection and breeding. In the ordinary layer no attention is given to head and

tail points or to disqualifications in many cases, just so the bird will lay a large number of eggs. But the body in both cases is practically the same. So is it not reasonable to believe that these minor head and tail points can be bred into a good layer? It can be and is being done.

One yearling White Plymouth Rock hen has laid 218 eggs in eight months. This is our best record to date. Another White Leghorn pullet has a record of 204 eggs for the same time. These are our two best records. The forepart of June was said, by the weather man, to be the hottest weather known for many years. In spite of all we could do we lost eight hens one day from overheating and a like number on the following day. The egg yield was cut down some by the excessive heat and by having to feed a ration composed largely of corn because of government regulations.

The best pen record in the yearling hen contest is a pen of White Rocks from Illinois with a record of 655 eggs.

The five best pen records to date in the Leghorn contest are as follows:

Pen No. 110—Pennsylvania848 eggs
Pen No. 70—Washington799 eggs
Pen No. 132—Kansas774 eggs
Pen No. 90—Maryland770 eggs
Pen No. 104—Illinois761 eggs

The following table gives a complete summary of what the exhibition pullets accomplished during the month of June. Each of the following varieties is represented by 15 pullets:

Variety—	June Leader Eggs	Best Pen for June Eggs	Av. Pul. 8 Mos.	High Layer, 8 Mos. Eggs	High Pen, 8 Mos. Eggs
Black Leghorns	25	95	122.7	155	743
Brown Leghorns	28	83	111.0	152	617
Buff Leghorns	26	101	137.3	176	749
White Leghorns	26	115	133.9	179	721
Anconas	24	94	91.9	153	669

Successful Poultry Culture

Treats on all subjects appertaining to the poultry business. The chapter telling how to save three-fourths of your feed bills is alone worth many times the price of the book, 128 pages, profusely illustrated. Price 50 cents. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

DISEASES OF POULTRY

By D. V. Salmon. 252 pages; 72 illustrations. Every poultryman needs this book. The cause, symptoms, care and remedies for each disease fowls are subject to are given. Price 50c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

Seasonable Hints for Pacific Coast Breeders.

By Susan Swaysgood.

ALL accounts from both Coast and interior poultry centers tell a story of shortage. Not only did eggs hatch poorly, but the chicks did not live, nor thrive as usual. This may be partly due to a late, changeable spring, but it is more likely to be want of stamina in the parent birds, owing to change of feed and in many cases an unwise selection of feeds. But no matter what is the cause, the fact remains that the crop of laying pullets for fall and winter laying is very far below normal, and that at a time when we really need an abnormally large crop. Our boys will be coming home, in fact some are here now, but later they will be coming in large numbers; and what are we going to say to them or to the doctors who order the wounded convalescents eggs and chicken?

Nothing we can say will increase the production of either, but we need not be confined to saying, let's all buckle in and do some fall hatching. Fall hatched chicks are easy to raise, the broilers or fryers come ready at a time when prices are about the limit, and if the pullets are from good stock they will be ready to lay in January or February at latest, just when the hens that have laid all winter are needing a rest. But you need to set about it now—not wait until the time chicks should be out.

If the hens are in yards free from males, the only difference that need be made in their treatment is to furnish a little less forcing feed in the form of mash and beef scrap and to make them exercise for what grain feed they get. If there are males in the yards during July or August, until you put them in for breeding purposes, then you are not a good poultryman or woman; because you are not furnishing strictly fresh eggs to the market. All eggs that contain germs of fertility during these hot days commence to deteriorate almost as quick as they are laid. Every slight movement, every exposure to an increase of heat, such as carrying to town in a buggy or auto, starting the living germ into activity, the next cooling they get the germ dies and we have a deteriorated egg.

So I am judging that careful poultrymen are running their yards on the "no male plan," so that the hens are being rested and are free from annoyance. The males should be well dusted to keep them free from lice, and well fed to keep them up in good life. A little fresh meat of some kind once or twice a week is a great help to male birds; we must not forget that some males are so chivalrous that when with hens they almost starve themselves, so they need extra care when separated. Instead of throwing them into a dirty hen-house with a handful of feed and water that is left to stagnate, because the males are not needed just then, they should be well looked after, so that when they are put in the yards there will be no doubt about the fertility of the eggs.

The best time to mate up the yards for fall hatching is when both hens and males are in good condition, about the middle of August. If the weather is very hot the yards should be well sprinkled every day about mid-day and every evening, and the eggs should be gathered twice a day and stored in a cool place. It is not wise to keep them too long before starting to incubate, not over one week if it can be helped, and less time is better. I always like to get chicks out in a growing moon, especially fall hatched chicks, and this year the growing moon comes in on the fifth and lasts till the twentieth. So it will be seen there is quite a margin to choose from, allowing ten days for the eggs to get fertile after mating, if there are hens enough to supply an incubator or two full of eggs in four or five days there is time to get chicks out in the September growing moon. If fed right and cared for they keep on growing and are not near so much trouble as spring hatched chicks, because all the nice fall weather they can be outdoors enjoying the sunshine, and the green feed is not so watery as it is in the spring months. In fact, nearly everything is in favor of the fall hatched chicks. I have seen 1,600 Leghorn chicks wintered in a tent. They were hatched about the middle of September and brooded right in the tent in lamp brooders; when they were 8 weeks old the brooders

were removed and a load of straw dumped into the tent, covering one-half, then a set of perches was arranged over the remaining half, and in January the cockerels were sorted out and sold and the pullets left in, and by the middle of January 50 per cent of them were laying. The 1,600 were raised with a mortality of 7 per cent and without a sign of roup or cold of any kind.

That was before the day of open-front houses too, but it was conclusive proof to me that fresh air, administered rightly, was the best antidote for chickens of all ages.

Chicks raised in the open are more healthy than those raised in heated, closed houses, and in nearly all parts of our country, especially on the Western coast, September and October are ideal months for chicks to be in the open.

Now it is not at all probable, no matter how or at what angle we look at the poultry business from, that eggs will be cheap for a long time to come. I never predict very large prices for eggs, because there is a limit to what people will pay for what they call luxuries, and unfortunately for the poultry business the people are not educated to a proper value of eggs and poultry as necessary foods. As long as these articles of food are deemed luxuries, of course economical people fight shy of big prices; but even so, there is not a doubt in my mind but that eggs, even pullet eggs, will bring the producer 50 cents a dozen clear next January and along until eggs are plentiful in spring.

If this is so, and common sense tells us it is so, would it not pay to go to some trouble in getting out one or two fall hatches. Chicks hatched up to the middle of October would make good, but after the hens get into heavy molt it would not be profitable to use their eggs for hatching. The time to do anything is now, there is no other time; the eternal now is all the time we can be sure of, and that is the time to do things—tomorrow may be late. Crop reports are like everything else—unreliable in general—because they are judged without taking the freaks of the elements into consideration, but after the season's work is done in the poultry yards and returns are in, it is a fairly safe thing to accept reports as being accurate, or nearly so. Then the next safest plan is to act on the reports and try to gain some benefit from it. This can only be done by acting promptly; there is not a whole year to think about it. The best way to hatch fall chicks is to hatch them as quick as possible and think afterward.

The National War Emergency Poultry Federation.

The first annual meeting of the new organization known as The National War Emergency Poultry Federation was held in Chicago, July 15-18, 1918. The first day was given over entirely to the work of the advisory council. The second day and the forepart of the third day were devoted to lectures and discussions of problems that are vital to the poultry industry. The real business meeting of the federation began at 2 p. m., Wednesday the 18th, at which time permanent officers were elected and a resolutions committee appointed. This committee, consisting of James E. Rice, W. R. Graham, Grant M. Curtis, U. R. Fishel and W. T. Seibels, reported the following resolutions:

"Whereas, The National War Emergency Poultry Federation, made up of a number of national and state associations and other

allied organizations, being in annual meeting assembled, and

"Whereas, This federation has been formed for certain specific purposes—first and foremost to help win the war, to which we pledge our full support—and

"Whereas, Permanent organization being now completed and a general statement of policy having been announced,

"We Hereby Resolve, That we affirm and endorse the twenty general statements of aims and objects of this federation as are hereto attached, and that in furtherance of the same we particularize and specially recommend as follows:

"(a) That if, in the judgment of our executive committee which is duly authorized under our by-laws, it seemed wise to open an office in the city of Washington, D. C., and station a representative there, that this be done forthwith.

"(b) That in order to give aid and encouragement to all branches of our industry in all sections of the country under existing war conditions we recommend—

"1. That a nation-wide publicity or educational campaign be undertaken looking to an increased consumption of poultry and eggs, same to be conducted under the auspices of this federation working in close co-operation with federal and state authorities and departments, and with other associations, organizations, educational institutions, the press, other agencies and individuals which in the judgment of our officials and representatives may seem wise and proper.

"2. That at the earliest practicable date plans be formulated and executed for a comprehensive survey of our national and state poultry resources and liabilities, to include a cumulative study of cost of production and distribution, the same to be worked out in co-operation with federal and state governments, educational institutions and other organizations, agencies and individuals, thus to determine and promote the best methods of production, conservation and distribution of our products for the benefit of our members and the general public.

"3. That we heartily endorse the principle of co-operation in all branches of our industry, and hereby pledge ourselves to stimulate co-operative methods and to help co-ordinate and to support all worthy co-operative movements among the members of this federation.

"4. That it is a first duty of every person in our industry to strive for higher efficiency in the conduct of his business, both to stimulate a larger production and assure a freer general consumption of our products, and also to discover and eliminate all possible waste in production and distribution.

"5. That it is our conviction if any branch of our industry suffers all branches are adversely affected, and that if we are to prosper as a whole we must individually and severally pledge our united support to such a program as we conceive to be set forth herein for the common good of all.

"Resolved further, That we thank the representatives of our national and state governments who have attended this meeting and given us valuable counsel in helping to improve our industry.

"Resolved further, That our secretary be requested to transmit a copy of these resolutions to Hon. David S. Houston, of the Department of Agriculture at Washington, together with a written statement to assure him of our full co-operation with his department looking to the welfare of our industry and service to our common country.

"Resolved further, That a copy of these resolutions together with a written statement be likewise sent to Hon. Herbert C. Hoover, U. S. Food Administrator, and assure him of our full co-operation with his department looking to the welfare of our industry and service to our common country.

"Respectfully submitted,
James E. Rice,
W. R. Graham,
Grant M. Curtis,
U. R. Fishel,
W. T. Seibels.

"Chicago, Ill., July 18, 1918."

We do not feel that we are at this time in position to make any comment, except to state that we are convinced that the men behind this organization are making a sincere and earnest effort to bring together into one federation all the different branches of the poultry industry and make it what it should be, one of the largest and most influential industries in the country.

A. P. A. MEETING.

What we consider to be the most important meeting of the American Poultry Association ever held will be held in Chicago the 12th to 15th of this month. Every member of this grand old association should make an extra effort to attend this meeting.

Home and the Table
Good Things for Everybody

For right is right, since God is God,
 And right the day must win;
 To doubt would be disloyalty,
 To falter would be sin.
 —F. W. Faber.

* * *

A VERY great aid which mothers can render in helping to win the war is that of keeping the family in health. We cannot afford now to have sick or ailing members in the household.

The most frequent causes of illness in childhood are improper food and lack of sleep, fresh air and sunshine. Everywhere teachers complain of the many children who are unable to keep up with their classes on account of a lack of sufficient sleep and this is a condition for which parents are wholly to blame. Every growing child requires at least eight hours sleep in a well ventilated room or sleeping porch, while young children need more than this, according to their age. Nothing can take the place of good, sound, undisturbed slumber in childhood. Fresh air and sunshine are free to those who will seek them and the mother should see to it that her children have a few hours play and recreation in the sun and air.

When we come to the question of proper food for growing children, we should consider that no matter how great the cost for good wholesome food, it is cheaper in the end than would be the case were the children fed insufficient food or food of poor quality at less cost.

The future of any people depends upon the health and proper development of its children and in no way can we be of greater service to our country at this time than by looking to the welfare of the coming men and women.

The Children's Bureau of the U. S. Department of Labor, at Washington, has lately issued a number of bulletins on "How Mothers Can Help in Children's Year," which should prove of great value to the mothers of growing children. The following paragraphs are taken from one of these bulletins which treats on the question of the child's food.

* * *

The family must be fed, whatever foods cost, and the wise mother will study how to get the greatest return on her investment by the careful selection of foods. The cheapest foods are by no means necessarily the most economical. Half-decayed fruits and vegetables are sold very cheap from the wagons or markets, but may be very expensive to the family if illness results, and it is only too true that cheap milk may cost the life of a baby. It is plain that unless food is in good condition it is not cheap at any price. But even when the quality of food is above reproach, it must be selected wisely and adapted to the needs of the family. To do this it is a good plan to divide the money that may be spent for food in some such way as the following:

(a) "Spend from one-quarter to one-third of the total food money for bread, cereals, macaroni and rice." Bread and other cereal foods form the basis of the American family diet and should be freely used for children.

(b) "Buy at least from one-third to one-half a quart of milk a day for each member of the family." This amount of milk for the family will ordinarily permit each child to have one and one-half pints a day.

(c) "Spend as much for fruit and vegetables together as for milk."

Children should begin to have a little vegetable food in the first year, and after the second year well-cooked vegetables should form a usual part of their diet.

It has been found that many families spend an entirely undue amount of their food allowance for meat, which is the most expensive article of food on the market. Especially in summer the proportion of meat in the diet of young children may be reduced by using milk, and milk products, eggs and vegetables in its place. Fish and chicken are excellent food for children.

In order to keep track of these expenditures it is a good plan for the mother to keep an itemized account of her food costs for a while. In the country and villages where the family raises a great deal of its own food the problem of buying will not be so serious, but it is always necessary to see that the proper balance of the family meals is observed.

Having purchased the foodstuffs, still further economy can be effected by proper preparation and cooking. A fireless cooker will help greatly in the task of cooking in summer. Most cereals and many vegetables may be reheated so that at least enough for two days may safely be cooked at one time. Milk may be used in many kinds of good summer foods, such as vegetable soup and custards, or may be the basis of the children's suppers, either with bread or cereals.

Food should be kept as cold as possible and carefully screened against flies, mice and other marauders. When there is danger that foods will not keep until the meal for which they are needed, they should be cooked, scalded or sterilized, and then cooked as quickly as possible, even if they must again be warmed before being eaten.

* * *

CHERRY PUDDING.

Sift one cup barley flour and one cup wheat flour with two teaspoons baking powder, one-half teaspoon salt, one scant cup sugar. Add one egg and one cup of thin cream or milk. If the milk is used, add also one teaspoon chicken fat. Have two cups of pitted cherries in readiness and add just before pouring the batter into a mold to steam. This pudding will require about two and one-half hours to steam. Serve with juice from cherries, sweetened slightly, and boiled for five or ten minutes.

* * *

CHERRY VINEGAR.

By R. T. M.

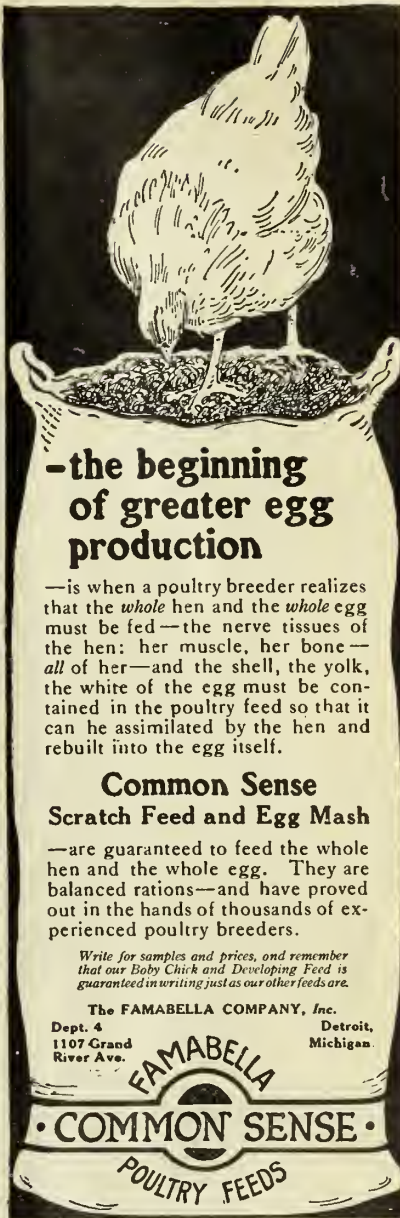

Stone and stem two pounds of cherries, add an equal quantity of sugar and of water, and a small bit of white ginger root, cut in small bits. Cook slowly until the cherries become soft and then strain, mashing the cherries thoroly.

* * *

FRUIT SYRUP FOR SUMMER DRINKS.

By R. T. M.

Practically all the fruits make delicious syrups for summer drinks. When canning fruit, there is often a small quantity of syrup left over from filling a jar which should be bottled for future use. For the smaller fruits such as raspberries, strawberries, blackberries and currants, add two pounds of sugar to two pounds of washed and prepared fruit. Mash the fruit thoroly and rub thru a fine sieve. Bring to the boiling point and allow to boil for five minutes. Put into air-tight jars or bottles and seal immediately. In using larger fruits such as peaches, pears and pineapples, the fruit should be peeled and mashed and the sugar added. Proceed as with smaller fruits.

-the beginning of greater egg production

—is when a poultry breeder realizes that the *whole* hen and the *whole* egg must be fed—the nerve tissues of the hen: her muscle, her bone—all of her—and the shell, the yolk, the white of the egg must be contained in the poultry feed so that it can be assimilated by the hen and rebuilt into the egg itself.

Common Sense Scratch Feed and Egg Mash

—are guaranteed to feed the whole hen and the whole egg. They are balanced rations—and have proved out in the hands of thousands of experienced poultry breeders.

Write for samples and prices, and remember that our Baby Chick and Developing Feed is guaranteed in writing just as our other feeds are.

CHICKEN SALAD.
By R. T. M.

There is nothing nicer for luncheon or dinner on a hot day than a good chicken salad. The chicken should be parboiled and seasoned with salt and pepper before removing the meat from the bones. Cut the meat in dice when cold and arrange an attractive bed of lettuce. Chop two hard boiled eggs which have been well chilled and add a tablespoonful of chopped walnut meats and a few chopped stuffed olives. A little chopped, crisp celery greatly improves the salad. Arrange the salad on the lettuce leaves, sprinkle with salt and pepper and add a mayonnaise dressing. Garnish with grated hard-boiled yolk of egg and small pickled beets.

* * *

CANNED CHICKEN.

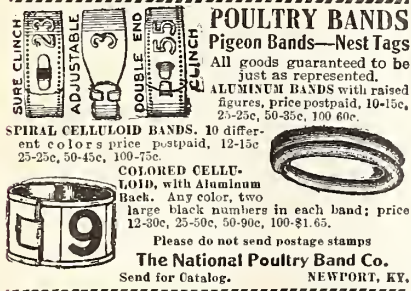

It is time now to can early hatched surplus cockerels. After the chicken is dressed and drawn, wash thoroly and cool. Cut up as usual and boil until tender, salting same to taste. Remove the meat from the bones and fill sterilized jars with the cooked meat and stock in which it was boiled. Have the jars full to the very top. Put the rubber and glass top in position and partly close, but do not clamp down until after the jars have been placed in hot water bath and processed for three hours from the time the water starts boiling. Seal and remove from the bath. When cool, store in a dark place.

OH! RATS!

We Can't Afford to Feed and Harbor Aliens Working to the Kaiser's Interests.

ONE evening about six weeks ago I called on a fellow-bachelor friend in West Toledo, and in the midst of some important poultry discussion we were interrupted by a large-sized racker in the partition or wall, which my friend explained was rats, and that they had been disturbing him at night for some time. This changed our subject to rats and the methods of getting rid of them. I mentioned to Joe that our mutual friend Mr. B— over the East Bridge had told me a couple of years ago about his house being overrun with mice and rats and that finally he "gassed" them by attaching a small hose to a gas jet, with the result that he cleared the premises, and continued to repeat the dose whenever one appeared, which was seldom. "Harry," shouted Joe, "that is another display of your excellent memory and I intend to play to lose on that idea. If success crowns my worthy efforts, in one week's time I shall be sitting on Mr. Hoover's right hand—if not on his hand, it will be a nicely upholstered piece of mahogany next to him. You just sit where you are, keep tab on the rat and watch me." I watched. He hurried down the hall returning shortly with a long rubber tube. There was a gas jet in the room close to the wall where the rats were holding forth. He next secured a hammer and a spike, drove the spike thru the wall near the base board, making a hole large enough to partly insert the tube. Removing the tip, the tube was attached to the gas fixture and all was set for the experiment. While waiting for Mr. and Mrs. Rat's return we discussed the chicken-rat business at some length, and it was casually mentioned that a hose attached to an auto exhaust pipe and the engine started should dislodge all pro-Germans and even the Huns in the trenches. Joe was confident that if this scheme worked O. K. we would have a chance to pay interest to the Huns for their limburger perfume attacks on the Allies at the front. When the rats arrived the gas was turned on, and from all the racket it seemed they could not get away fast enough.

Having arranged to do some work for a Mr. Miller near Erie, Mich., I went up there early next morning, so did not see Joe for a week. In the meantime I found both Mr. and Mrs. Miller much concerned over the loss of so many young chicks by the rat route. Mr. Miller was careless or forgetful about purchasing traps, but had just secured a lot of one-inch mesh wire netting, intending to fence in the biddies and chicks. Upon watching and investigating, we concluded that the rats, old and young, were harbored under a 12x14 wood shed, away from the barn, house and chicken house, but not more than 75 feet from either building. There was also a pile of logs and old fence posts close to this shed, where the

runs and nests seemed to be. I told Mr. Miller of the council of war held in Toledo by Joe and myself, and asked him to wait till I ran down to town, call a special session with Joe, obtain reports, and endeavor to plan a jitney surprise assault.

Joe's report was encouraging—not a rat for a week—and when I described the weather conditions out at Mr. Miller's place, he very solemnly declared that "the Kaiser was licked, good and plenty," and he himself and his Ford, and his two fox-terriers, and his two friends, Duncan and Chapman, who each owned a terrier, "would all be in at the finish." In fifteen minutes all preliminary arrangements were made with the reserve forces for a heavy assault on the enemy at three the next afternoon. I journeyed ahead to set the scenery, props, etc., and had Mrs. Miller phone her neighbors a complimentary for the matinee. Mr. Miller and I jacked up the shed from the ground and got the wire netting ready, after which we drove all the rats we could from the other buildings to their own apartments. At 3:30 o'clock the boys and dogs arrived, accompanied by 25 feet of hose. We backed Lizzie in near the shed, then circled the shed, wood pile and Lizzie with the wire netting, making a circle of nearly 200 feet. The audience, not large, was expectant but somewhat skeptical. I don't believe any of them had ever seen a terrier after rats, and these four were all experienced ratters. The opening scene was sudden and surprising. There was no "speechifying" or impressive ceremonies or frills of any description. What happened was that Joe's Bijo spied or smelled a rat and out of Lizzie streamed a streak of terriers. We had only just got the netting stretched when everything and everybody was in action. Four of us grabbed clubs, while Joe got the 25-foot gun ready for action. First round lasted ten minutes, and after a good drink of home-brewed buttermilk the engine was started and the end of the hose shoved in the burros. Joe's "Limburger perfume" supplied lots of action for the next twenty minutes. It really was the busiest twenty minutes I ever put in. When the rats were driven out in numbers, the neighboring women and children gradually fell back from the fence, but their retreat was orderly and their faces were to the foe, bound not to miss any of the scene. It was hot work. In the round-up we counted 83, old and young, and three had escaped when one of the dogs, in making a flying catch, tumbled into the netting, raising it from the ground. Joe thinks those three are still on a marathon. How many very young rats were suffocated in the burrows we can't begin to guess. Several old rats, we are sure, had young in the nests under the ground.

Mrs. Miller served us all a supper such as only country people can serve. Joe insists on calling it a banquet, an opera supper, a feed for the gods, and would like to learn if all farmers' wives can cook pies and other things like Mrs. Miller. A standing invitation was extended us to come out any time, and at strawberry and peach time in particular.

Net expense: Three gallons gasoline and

SPROUTED OATS—WINTER EGGS

The Vapor-Bath Sprouts produced by the Close-To-Nature machines possess an efficiency for prolific egg-production not found in sprouts grown the old way or in many so-called grain sprouters. A sweet, succulent, tender, edible, palatable sprout is grown in the Close-To-Nature Vapor-Bath machines.

Sprouted Oats From One Bushel Of Grain

CLOSE-TO-NATURE GRAIN SPROUTERS

The **DOUBLE-QUICK**, the **ALL-METAL SECTIONAL**, the **LAMPLESS**, three kinds and all sizes from a few hens to 1,000,—made by the pioneers and largest manufacturers of Grain Sprouters. The Grain Sprouter or Perpetual Poultry Silo runs up the egg yield and cuts down the feed bill. Turns high-priced grain into low-priced feed. The Close-To-Nature Vapor-Bath machines sprout in 20 to 30 hours and force growths of 1 to 2 inches daily, thus producing the best of easily-digested, highly-efficient, egg-producing feed. Circular free.

CLOSE-TO-NATURE COMPANY 38 Front Street COLFAX, IOWA

Keeler's White Wyandottes—5 firsts Chicago

Egg records 200 to 273. Eggs and stock now half price. 2000 chicks growing, ready Aug. 15. Summer sales list and 64 page art catalog free.
CHAS. V. KEELER, R. F. D. 11, WINAMAC, IND.

two hours lost time from work; which is offset by making some jolly good friends and all the fun we had, which none of us would have missed had we lost a week's time from work. Mr. Miller expressed himself thusly: "Ain't had so much fun since hog killin' time," and Joe solemnly echoes, "Amen! them's our sentiments."

Chapman and Joe are both enthusiastic Ford owners and both insisted on a charcoal display on the machine on our home trip which read:

"The Ford in wartime."
 "We 'gassed' the enemy with a Ford."
 "We can't a-Ford to feed and harbor aliens, working to the Kaiser's interest."
 "Huns lose 83."
 "No prisoners taken."
 "Maneuver successfully carried out by five American citizens assisted by four fox terriers."

Benton Harbor, Mich. H. C.

Order Your Fertilizer Now.

The U. S. Department of Agriculture is urging farmers to make known their fertilizer needs for the fall planting at the earliest possible date. It points out that this will enable dealers to combine their orders into full capacity carload lots.

This step is made necessary by the difficulties in handling freight at this time. The railway systems of the country are taxed to the utmost to move the tremendous volume of supplies for our troops. Many farmers who ordered their spring fertilizers late did not receive them until after planting time. Some failed to get them at all. Prompt action will tend to avoid disappointment this fall and enable every farmer to start his crop right.

The intelligent use of fertilizers is one way by which the farmer can increase crop production and at the same time make the labor expended produce more than formerly. There was never a time when the use of fertilizers was so profitable as now with crop prices high and labor scarce.

The railroads of this country are now being operated by the United States Government. Co-operate with your Government by ordering your fertilizer early. It will relieve the car shortage.

IMPORTANT.

The annual meeting of the American Poultry Association will be held in Chicago the 12th to 15th of this month. This we consider the most important meeting ever held by this association. It is the patriotic duty of every member to attend. The very life of the Standardbred poultry industry is at stake. The American Poultry Association members can save it. This is the opportunity for the members to show their loyalty to the American Poultry Association and the Standardbred poultry industry. Come, and let us council together.

ILLUSTRATED BREEDERS CARDS

Rates for Illustrated Breeders' Cards: With small sized illustration (to be furnished by us), 40 words 1 month \$3.00, each additional word 7c; 40 words 3 months \$8.00, each additional word 20c; 40 words 6 months \$15.00, each additional word 37c; 40 words 12 months \$25.00; each additional word 62½c. Numbers and initials count as words. Terms: Cash with order. Minimum charge, 40 words. Copy for advertisement, plainly written, should reach this office by the 15th of month preceding date of issue. ORNAMENTAL

IN VIEW OF THE FACT that I am now serving my country in the Army and have no time to give to the care or supervision of my birds, I have decided to dispose of my entire stock of ornamental land and water fowl. This most excellent stock of pure-blooded birds, that I have taken years to collect, is offered to you at extremely reasonable prices. My flock includes Pheasants, English Ring-Neck, Silver, Golden, Lady Amherst and Reeves; Ornamental Ducks: Redheads, Canvasbacks, Bluebills, Mandarins, Spoonbills, Pintails, Green-winged Teal, Blue-winged Teal, Cinnamon Teal, Wood Ducks, White English Calls, Mallards, Black Mallards, and Gray English Calls. We also have Canadian Wild Geese, Egyptian Geese, California Valley Quail, Bobtail Quail, and dozens of varieties of pigeons. All orders or inquiries will receive the prompt personal attention of my farm manager, Mr. B. E. Rogers, and all shipments will be made without delay. Complete bargain list with prices will be sent on request. Write today. Send 25 cents for our instruction booklet, "Management and Care of Pheasants and Other Ornamental Fowl." P. J. Sexton, Fair Oak Farms, Dept. A, Waukegan, Ill. 8

PET STOCK

BEAUTIFUL ANGORA CATS and kittens; make the best ratters, \$5 up. Stamp for reply. Bay View Farm, North Haven, Maine. 6-8

FULO-PEP

POULTRY FEEDS

Produce Most Pounds Poultry Meat— Produce Most Eggs at Least Cost

THAT'S the kind of Poultry Feeds you want—feeds which in the same time and at much less cost will put *extra pounds of meat* on each bird and develop *larger, earlier laying* pullets.

The Quaker Oats Company have been making feeds for animals for half a century, thereby acquiring expert knowledge, experience, facilities, second to none, and naturally are qualified to manufacture the *best poultry feeds in the world*.

FUL-O-PEP POULTRY FEEDS have no equals—our customers' experiences prove it. *2-pound Broilers at a Feed Cost of Only 18c!*

Think of that! Have you ever raised 2-pound broilers at 2 months old on only 18c worth of feed? Or 3-pounders at 3 months old? No, but you can do it with FUL-O-PEP FEEDS. Hundreds of poultry raisers who never did it before are doing it right along now with FUL-O-PEP FEEDS. Just read this letter from E. J. Acree, Brazil, Indiana, breeder of Imperial Blue Barred Plymouth Rocks:

E. J. ACREE
Breeder of

IMPERIAL BLUE BARRED PLYMOUTH ROCKS Eggs in Season and Stock for Sale at All Times

QUAKER OATS CO. Brazil, Ind., July 26th, 1918.

Gentlemen—I have been feeding your "Ful-O-Pep" Growing Mash to my chicks this season and I find it is by far the best feed I have tried in the mash line. Chicks fed this mash have made almost phenomenal gains in size and weight. Cockerels three months of age weighed 3 lbs. to 3½ lbs. Cockerels in one flock put on 1½ lbs. in 31 days, and some of the growthiest ones in last hatch put on 1 lb. in 18 days. These are the best gains I ever had with a flock of youngsters at this season of year. Very respectfully, E. J. ACREE.

OATMEAL

The Big Successful Poultry Man's Secret of SUCCESS with Poultry

The Success of FUL-O-PEP Poultry Feeds is a result of the *same thing* which the big successful poultry men discovered years ago—the *use of OATMEAL*, which they always feed extensively. But we went *several steps further*. While the base or bulk of FUL-O-PEP FEEDS is OATMEAL, we added *beef scraps, bone meal, green food* and other *protein ingredients*, completing a line of feeds which even the big poultry men find produce *phenomenal results*.

No wonder we get hundreds of enthusiastic letters from amateurs and experts in all parts of the U. S. telling us how *They Produce a Pound a Month Per Bird*. You can do it—*anyone can do it* with these wonderful feeds. If your chicks do not put on 1 lb. of weight a month, you are losing money. Weigh them—know what they are doing. FUL-O-PEP FEEDS make the greatest growth at the least cost.

We have the same enthusiastic letters on egg production. They tell us they never had such egg results. The secret is simply this: Until we brought out FUL-O-PEP DRY MASH, most people fed scratch feeds for eggs—**SCRATCH GRAINS DON'T MAKE EGGS**. Don't forget that. To get eggs give your hens FUL-O-PEP DRY MASH—a feed scientifically made to make hens lay, and it does it. We guarantee it.

With FUL-O-PEP Poultry Feeds you have a line of feeds for every feed need.

FUL-O-PEP Growing Mash for all growing fowls.
FUL-O-PEP Dry Mash for pullets and laying hens.
FUL-O-PEP Chick Feed for young chicks.
FUL-O-PEP Scratch Grains for the evening meal.

Each sack contains easy to follow feeding directions, and if followed you can't fail to get surprising results. Write for a copy of our FUL-O-PEP Poultry Calendar—a poultry book that is different—practical—helpful. Experts say: "The best poultry book published." Ask your dealer for FUL-O-PEP Feeds, if he can't supply you, write us.

A FUL-O-PEP White Wyandotte Pullet, 3 months old—weight 3½ lbs.

A FUL-O-PEP White Leghorn Cockerel, 9 weeks old—weight 2½ lbs. Bred and owned by Chas. Erker, 2008 N. California Ave., Chicago, Ill.

TESTIMONIALS

The Quaker Oats Co.,
Chicago, Ills.

Gentlemen:—Owing to freight delay, our chicks were some three weeks old before we received your FUL-O-PEP DRY MASH and GROWING MASH, but can say that we have been quite fortunate with our chicks. Out of 100 hatched we have raised 96 and they are sure fine. Some of our neighbors asked us what we fed our chickens to make them grow so. They were growing so much faster than theirs. Can also say that our chickens were the first on the market from this locality and commanded the highest market price. As our chickens are a mixed lot, have had no photos taken of them. Wish you could see some of our pullets. A neighbor used some of the poultry feed which she liked very much, especially the Growing Mash. Yours truly,

R. S. ARMITAGE.

Ardmore, Ill., Feb. 11, 1918.
The Quaker Oats Co.,
Chicago, Ills.

Dear Sirs:—Have used some of your Mash which I bought at The Fair, and think it great. Please send me your poultry book and calendar and oblige, Yours truly

E. W. GOLDING,
Ardmore, Elmhurst, Ills.

Evanston, Ills., 2145 Maple Ave.,
June 4, 1918.

Gentlemen:—I am certainly pleased with the results of feeding your FUL-O-PEP MASH. My record of eggs received thus far this year, is far above the number I received up to this time last year, and I am confident that my gain this year is due to feeding FUL-O-PEP MASH.

Yours very truly,
ROBT. KOEN.

TESTIMONIALS

Duluth, Minn., Feb. 4, 1918.
The Quaker Oats Co.,
Chicago, Ills.

Dear Sirs:—Received your valuable book and calendar "FUL-O-PEP" and find by my experience in the poultry business that the facts it contains are true, so the poultry feeds you make must be all you claim for them. Yours very truly,
ODIN BOLMA.

Big Falls, Minn., June 17, 1918.
The Quaker Oats Company,
Chicago, Ills.

Dear Sirs:—We have now used your Scratch Feed—Dry Mash and Growing Mash—and I must say they are by far the best feeds I have ever used. I am always ready to speak a good word for your goods. Yours truly,

OLE C. JOHNSON.

Early, Iowa, April 19, 1918.
Quaker Oats Co., Chicago, Ills.

Gentlemen:—Have 150 baby chicks I am raising on FUL-O-PEP FEEDS, and I never saw a healthier bunch in my life. They are three weeks old and look more like they were six. Yours truly,

CHESTER L. MASON.

Beecher, Ills., March 14, 1918.
The Quaker Oats Company,
Chicago, Ills.

Dear Sirs:—FUL-O-PEP certainly has done my chickens good. I get more eggs now since I feed them with FUL-O-PEP than I ever did before. My chickens are so used to it, I think they can't go without it any more. Yours truly,
MRS. FRANK MOLDENHAUER.

A group of 5-month-old White Wyandottes. These birds were raised exclusively on FUL-O-PEP POULTRY FEEDS. FUL-O-PEP GROWING MASH was kept before them constantly in self-feeders. Each evening they were fed FUL-O-PEP SCRATCH GRAINS.

Style of portable brood coop which we recommend for farm and back-lot poultry keeping. Cockerels from this brood were marketed as broilers at eight weeks of age, weighing 2 lbs. each. Raised in these coops, without any range, on FUL-O-PEP GROWING MASH and FUL-O-PEP CHICK and SCRATCH FEEDS.

The Quaker Oats Co., Poultry Feed Dept. APJ, Address Chicago, U.S.A.

The Marvelous Newtown Giant Stands Supreme Among Incubators

A strong statement—but we have *ample reason* to believe it to be *absolutely true*. Our faith is justified by the *consistently satisfactory performance of the machine itself under all conditions and in all parts of the world*.

The Newtown Giant is the only incubator for you if you require the machine which will positively "hatch the most chicks, the best chicks with least labor and at lowest cost." Below are a few reasons for acknowledged Newtown supremacy:—

Supreme in Efficiency

Actual performance in all climates, under all the varying conditions the world over, has demonstrated the Newtown to be the most efficient hatching machine.

Supreme in Construction

This applies to every part of the machine. The most exacting care and the very highest skill are used in manufacturing the Newtown.

Supreme in Durability

The Newtown is substantially built and will last a lifetime. Every part is carefully inspected and strongly put together. Each machine is completely assembled before shipment. This insures accurate fitting and perfect operation.

Supreme in Improvements

This has been the greatest factor in Newtown success. Only those features which stand the most severe tests are adopted. They include the Automatic Coal Feeder, Automatic Regulator at the Heater, Automatic Regulator of Heat, Ventilation and Moisture at each compartment, Automatic Eggs Turner, Automatic Temperature Indicator and Automatic Electric Alarm.

Supreme in Service

Nothing is left undone to insure that every Newtown user shall get the very best and greatest possible service from his machine. Everything is designed for convenience and service.

Supreme in Satisfaction

Every Newtown customer is a satisfied user. Ask the poultryman who owns one. A great many people who purchased Newtowns last year have already placed orders for increased capacity to be installed at once. This is the final test.

Supreme in Sales

Because they are supreme in Efficiency, Construction, Durability, Improvements, Service and Satisfaction, the sales of Newtown Giant Incubators are more than doubling each season.

Our new booklet—"Proof of Efficiency"—and complete catalog are yours for the asking. Every earnest poultryman should have them. Better write for them NOW!

Read the Evidence—

University of Notre Dame, } Notre Dame, Ind.
College of Agriculture, } May 21, 1918:

The operating expense of your machine was the lowest of any incubator we have used this season. We greatly admire the incubator in every detail.

W. A. JOHNS, Dean, College of Agriculture,

Zeeland, Mich., May 30, 1918.

Our 16,800 egg Double Deck Newtown Giant Incubator is doing good work, and I am ready now to recommend the Newtown Giant Incubator. I cannot give you record of our hatches just now but may be able to do so later on.

THE WYNGARDEN HATCHERY,
D. M. Wyngarden.

Odessa, New York, May 21, 1918.

I am so well pleased with the 3000 egg Newtown Giant Incubator that I feel I should write you about my success. The first time I filed it I had 2300 strong chicks from 3000 eggs. I am at present operating another mammoth machine of another kind, and find the Newtown much superior, especially in regard to uniformity of temperature, economy of fuel and ease of operation. The automatic egg-turning device is much appreciated after turning by hand. Would like to sell my other machine and buy another Newtown.

CAKLEMOOR FARM—Harvey J. Couch.

Bloomfield, Nebraska, June 10, '18

I have had a grand success with your machine. Have had 90% hatches each time. It is sure good—takes care of itself. I'm engaged in business and no trouble to run the machine besides.

C. F. STEFFENS.

Pittsfield, N. H., June 4, 1918.

Your machines have given the highest satisfaction, and should be glad to have you use my name at any time in advertising or as reference.

C. E. PRATT;

Brookhaven, L. I., N. Y., May 28, 1918.

I set my Newtown Giant Incubator with 1226 eggs and tested out 100, leaving 1026 eggs to hatch, and I took 852 chicks from the machine. A little better than 80%. That is what I call doing business. I have now two of your 11½ Brooder Stoves, and they are as good as the Incubator, and that cannot be beaten. I will recommend it above all others to all inquiring friends.

J. FRANK SMITH.

Wallingford, Conn., May 31, 1918.

Will say that we have just finished our hatching. We set 3675 eggs, hatching 2369 chicks, using one ton of coal.

THE GAYLORD FARM—H. L. Bushnell.

Criddersville, Ohio, May 22, 1918.

In regard to the 1200 egg Newtown Giant Incubator which I am now operating, will say that I am more than pleased with it, and would not exchange it for twice the capacity in lamp machines. Operating expenses are so low that we do not give that part of it a thought when hard coal is obtainable. About six cents a day pays for the fuel consumed. The machine hatches every egg that is hatchable—we have taken off as high as 130 chicks from a tray of 150 eggs set. Up to date we have hatched 4000 this season.

B. E. CRIDER.

Seven Valleys, Penna., May 21, '18

About the 6000 D. D. Newtown Incubator, wish to say the hatches were even better than we hoped for. While the winter was a severe one our February hatches, three of them, averaged better than 66%, and the average for all hatches this far, the first February 6th and the last May 17th—is some over 70% of good chicks from all eggs set. The way hatches are still coming we think the season average will be raised some, and the quality of the chicks is pretty well shown in the fact that at this writing we have orders for 9500 chicks for 1919. Reference to fuel consumption, we wish to say is but slightly more than it was with our 3000 egg incubator.

Seasonable Suggestions for Fall Work

Getting Things Shipshape for Winter Quarters Means a Busy
Time for Poultrymen Big and Little

By Prince T. Woods

THE busy fall season for poultrymen, big and little, is again at hand and with it the necessity of getting things shipshape for winter quarters.

Summer ends September 22, and it has been a peculiar and interesting summer in many respects. It was ushered in, in many sections, with a severe freeze on the early morning of the first day. We have had dry spells, wet spells, alternating cold and heat, and streaks of dull, lifeless humidity. It has thus far been an exceedingly bug-infested season and we have had plagues of many sorts of bugs and plant lice—swarms of lice even attacking our white pine timber in hordes of millions. Yet in spite of all the drawbacks crops have done fairly well, chickens and live stock have done exceedingly well under unfavorable feed conditions, and, all in all, it was the best "old summer time" that 1918 handed out to us and those of us who are "back on the land" made the most of the summer we had.

Labor continues scarce and high in price and there is much work that must be done before cold weather. The fall harvest time will be exceedingly busy and short handed. The days are rapidly growing shorter and every available hour of daylight will have to be utilized to its utmost capacity.

Poultry houses need a thoro overhauling to put them in shape for winter quarters. Roofs must be mended to make them tight to keep out rain and snow water. Windows need cleaning, zinc tacks to hold in place any loosened panes of glass, and a good application of putty to make them weather-proof. Paint will not come amiss when one can apply same where most needed. The whole poultry house, inside and out, should be put in shipshape condition. Clean up, disinfect and sweeten with whitewash or with applications of crude petroleum. Wood floors and cement floors need to be cleaned and sprinkled with crude petroleum and, when dry, covered with a liberal application of sand or dry earth. Earth floors should be dug up for a depth of about 8 inches and the old earth carried out to be used on the land, new earth being used to replace the old. Small, earth-floor houses can be moved to new ground to save labor. Runs should be spaded or deeply plowed, spread with slaked lime, the latter harrowed or raked in, and then sow the runs to rye. Old, soiled litter and nesting material may be spread and plowed under on garden land, or should be burned. Give the poultry quarters a good sweetening generally—it pays.

Corn should be cut and allowed to cure in the shock before the stalks are injured by frost. The stover will then be in better shape for use as litter or for stock feeding. Properly cured corn stover, shredded, not only makes fine litter, but is good feed for fowls. Those who have no corn crop to harvest will do well to buy well cured corn on the ear and store it away for winter feeding. If one has no corn crib, ear corn may be sacked in grain bags and hung to the rafters in a shed or other outbuilding out of the reach of rats and mice. There is no better poultry feed than well ripened, well cured corn on the cob. Feed it on the cob, or have it ground, cob and all, to use in mash mixtures.

Those who are fortunate enough to have suitable storage

facilities, and sufficient cash, to lay in a stock of small grain and feeds will be wise to do so this fall. Oats are plentiful and as cheap as they are likely to be. Poultrymen who can and will club together to buy mill feeds can get same, when available, at wholesale dealers' prices in car lots. A considerable saving may be effected by buying thru local co-operative associations.

Potatoes are fairly plentiful and about as cheap as they may be expected to be. The small potatoes—too small to market—make excellent poultry food and will save grain. If well dried out and then stored in a good cellar these small spuds keep well. We bag them and hang them to floor timbers in cellar out of reach of rats. We feed them raw to poultry and cows and hogs, also feed them cooked for poultry and hogs. Cabbages, beets, mangels, stock carrots and unmarketable apples are all stored for winter feeding. Squashes and pumpkins also are used as grain savers. We aim to have an abundance of winter keeping vegetables and fruits stored away for use of the family and for all live stock.

Our yearling hens, the ones we intend to winter and those we have reserved for the family table, have all been on woodland range—orchard range is good where there is no woodland—where greens and insect life are abundant, all thru August and part of July. These birds will stay on range until well molted and will go into winter quarters before settled cold weather. Most of them have been laying uncommonly well all summer and may be counted on for a good supply of eggs until the early pullets are well established in laying. Those we intend to breed from next spring will be housed first and encouraged to let up on egg production until eggs are needed for the early broods. They will get an ample supply of hard grains, greens and vegetable food, but only a limited supply of concentrated mash.

The early pullets will go into winter houses soon after the middle of September and should all be housed by the last of October. They have been getting practically the same ration as laying hens for some time and are beginning to shape up in good style. Some will be laying by the latter part of September and most of them should be in full lay before Thanksgiving. The pullets need a little special attention. When first housed, they should have liberal yard room and an abundance of green food. One of the best ways to supply fall greens for pullets is to sow the runs to rye. Do not crowd these youngsters. See that they have abundant house and yard room and plenty of room on the roosts. Keep the houses open. Fall colds in young stock are commonly the result of crowding the houses, closing the houses too much at night and overcrowding on the roosts, as well as sleeping and crowding in bunches on the floor. When pullets begin to lay they should be pretty much all appetite and must be fed liberally on wholesome food in variety. They will stand heavy feeding on grains and concentrated mash if supplied with plenty of greens and fresh raw vegetables. They must have plenty of clean, fresh drinking water. There is practically no danger of overfeeding laying pullets and there is very grave danger of underfeeding them.

Later hatched pullets will not need to be housed as early, but should go into winter quarters before settled cold weather. They will require rather heavy feeding from now on to shape them up and mature them well before housing time. Do not crowd them. Keep them in small flocks and have them occupy open-front sleeping quarters. Utilize available range for the flocks until the heavy frosts kill the pasturage. Frozen green stuff does not make satisfactory food.

Most of the cockerels, except those intended for breeding, sales, or for the home table, should be marketed when they make small roaster size. A good many of our back-lot friends have canned their surplus chickens this season and will can more this fall. This is a good plan and the canned chicken will prove a very satisfactory meat supply during the coming winter.

It is a good plan to store away a liberal supply of dry earth or sand under cover for use on poultry house and brooder floors later on.

Contrary to popular belief, we are of the opinion that pullets or fowls kept exclusively for egg production are much better off if kept without any males in the flock. They certainly lay just as well, or better, as when running with males; the non-fertile eggs are preferable for storage and table purposes.

In many sections oyster shells for poultry feeding are not plentiful nor readily purchased. Crushed clam shells, mussel shells, or other sea shells, will serve in place of crushed oyster shells when the latter are not available, but we prefer oyster shells for providing our flocks with dependable egg-shell material and needed lime. It will be a wise plan to lay in a full supply for use the coming season.

For use in mashes, and for littering brooders for baby chicks, we prefer good cut clover made from well-cured clover

rowen. Next to this comes alfalfa. Supplies should be purchased early this fall, while the opportunity for prompt delivery is reasonably good.

Chestnut size hard coal for brooder and incubator use should be stocked at once. It may not be possible to get a supply in winter and early spring when needed for immediate use.

While conditioning birds for the fall and winter shows is practically a continuous performance from shell to showroom, there is much that may and should be done in the way of special care and grooming for show specimens. Be sure to do your utmost to help your local poultry exhibitions, get your birds into competition and help keep up the interest in Standardbred poultry.

Standardbred poultry means better poultry and greater uniformity, and there is great need of more and better poultry. Do your bit for the Standardbreds. More and better Standardbreds means more eggs, and our Yankee soldier boys yearn for more eggs. According to reports from the Y. M. C. A. huts "over there," the first call of the American soldier when he seeks "eats" at a Y. M. C. A. hut is for "fried eggs, fried on both sides." It is stated that Mrs. Stroud, a cook in a Y. M. C. A. hut in Liverpool, fried 1,236 eggs "on both sides" for American soldiers in one ten-hour day. The call for eggs is increasing "over there" and in every hut there is a demand for "fried eggs, both sides."

The American hen is no "slacker." If our boys want eggs, they must have them, and Bidly is going to be right on the job.

Winter as many layers as you can properly feed and care for, so that they will be productive. Keep up the egg supply so that there may be no unnecessary shortage of hen fruit that may be "fried on both sides" for our own boys "over there."

WINTER GREENS FOR POULTRY

Paper Read Before the Tulare Poultry Association,
February 4, 1918. *By Charles Weeks, Palo Alto, Cal.*

EVERY poultryman should have a poultry garden. This poultry garden is absolutely necessary in order to get maximum results in the poultry business, whether for eggs or meat. This garden requires careful planning and preparation so that a good variety of green feed can be had every month in the year. It is impossible for the poultryman to make much money with hens by buying only mill feeds and grains.

The dairyman cannot make a profit by buying all the feed his cows consume. He must grow alfalfa and other feeds for the silo.

The profit of the poultryman increases in direct proportion to the tonnage of greens produced and fed.

No poultryman has ever succeeded on a dry, barren place to any appreciable degree. The most successful have a large variety of green feed.

The very first piece of work on any poultry ranch is to lay out the poultry garden and plan the planting so that a good variety of crisp, tender greens can be had 365 days in the year. The next order of business is to see that these succulent greens find their way to the feed trough of the hens at least once each day and in sufficient quantities to have some left over at each feeding time.

The more variety the better. The best tonnage is produced from kale, mangel wurtzel (either red or yellow), alfalfa, cabbage, chard and green barley.

February is the time to start the hotbeds for kale plants and cabbage and mangels. These plants should be grown quickly and set out when not too old.

The soil and water conditions for a poultry garden are of first importance. The soil should be a rich sediment loam. Not too sandy, for then it will burn out in hot weather. Not adobe, for then it is hard to work and too cold in early spring.

A pumping plant is better for the poultry garden, for then you can turn on the water any time it is needed. Here in California water for irrigation is absolutely necessary.

Plow the sediment loam deep, and have seed bed in fine condition. Set out the early kale and cabbage in March or April. For kale, put in hills three feet each way. Cabbage can be set two feet each way. Use jersey kale or thousand-headed kale. A good giant cabbage is the Autumn King.

Mangels can be transplanted from beds if allowed to get larger than one's finger before transplanting. They need to be well watered until started. The most common way is to drill in rows about two feet apart and thin down to six or eight inches between each plant.

If the soil is rich and well watered, these will grow so fast that they cannot be cultivated except when the leaves are picked off. We make it a rule to run thru with the one-horse cultivator as fast as a crop of leaves are stripped off and follow with the hoe. This makes a complete cultivation every three or four weeks, and it is irrigated just before each cultivation.

It is well to irrigate kale and beets in trenches or furrows, as the tops grow so rank that it is impossible to get thru the patches. We pick the tops from the mangels every three or four weeks, just the same as kale; also, the under leaves of the cabbage are stripped off, leaving the heads quite bare.

I use a tremendous amount of poultry manure on my kale, mangels and cabbage. This forces a quick, tender growth when well watered. Kale that is not well watered grows blue and tough and is too bitter for the hens. I pile on poultry manure from two to six inches deep between the rows, then turn on the water, and the growth is so luxuriant that the sun hardly ever strikes the ground.

Every three or four weeks during the summer season we have a heavy crop of crisp, succulent, tender tops that are

sweet and nourishing, and are eaten with a relish by the hens.

During the summer months we feed kale, mangel tops and alfalfa. For winter greens we have the roots of the mangels, cabbage and green barley. Kale runs also well thru the winter, but does not grow much after the frosty nights.

Barley is cultivated into our alfalfa patch in September, so that we cut barley all winter where we cut alfalfa all summer. Thus we get twelve cuttings per year from the same ground. We pile on the poultry manure after each cutting of alfalfa during the summer and flood it well. This makes a quick, tender growth that is very sweet and relished by the fowls. It is astonishing what tonnage is produced in this way. Water, soil and plenty of manure will produce as high as 300 tons per acre in mangels and kale.

The secret in winter greens is to have the tonnage already grown when the frosty nights come.

The climate is such at Palo Alto that we have our beets and cabbage grow in the ground all winter and pull them as we need them.

If you were on my ranch at 1 o'clock on any day, you could see the red combs of 6,000 hens sticking their heads thru the opening to the long troughs on the outside of the pens and eating greens. Not one kind, but three or four kinds, well mixed. Today (the 4th of February) we feed heavily of shredded mangels, along with green barley and some alfalfa that grows protected up thru the barley, and on Saturdays a big head of cabbage to each pen, enough to last over Sunday.

We manage in this way to have greens every day in the fall and winter, and our egg yield during November, December, January and February runs close onto 50 percent. On some pens it is as high as 67 percent during the month of December, from late hatched pullets.

In colder places, mangels and cabbage could be pulled and put away in a shed. I have tried carrots, but they do not produce enough tonnage and are rather tedious to raise and gather. I am also trying Giant Marrow cabbage, which bids fair to make as good tonnage as kale and is of a fine sweet flavor, well liked by the hens.

Cabbage for winter feed should be planted out of the hot-beds about August or September, so that it will have a good growth before frosty nights.

With a large tonnage of mangels and cabbage on hand when frosty nights set in, with kale to fill in and barley already grown in the alfalfa patch, winter greens can be assured.

Bear in mind that if you have not the conditions for growing greens in large quantities, you might just as well stay out of the poultry business. If you are to succeed, be sure you have the correct conditions to start with. If you have these conditions, fertile, sediment loam soil, cheap irrigating water in large quantities, and any amount you want, and not too far from a good market, if you have these conditions, with a good climate thrown in, then you can go ahead and be assured of success.

With well bred hens, housed in small open-front houses, well cleaned, with green feed of several varieties before them all the time, and a variety of grains with rich, dry mash, where they can wait upon themselves, your profits are assured, and if you make less than \$2 per hen per year, you are not doing as well as can be done.

In a dairy country, where you have plenty of milk, it will add much to your profits to feed a quantity of thick cheese on top of the green feed each day. This will get the highest production of eggs possible.

Another feature that is adding to the success of poultry

ON THE BARRED PLYMOUTH ROCK FARM OF J. W. PARKS, ALTOONA, PA., BOX J.

(6) "Home, Sweet Home." (7) Our style of movable colony houses and portable fences for young stock. (8) Our fox terriers make life miserable for any stray rats. (9) Heavy egg breeding and winner of American Rock Club special at Youngstown, O. (10) Winning pen at Missouri contest.

is that of co-operation. A co-operative community, where feeds can be purchased in quantities and produce handled in a block, has many advantages, and so many that a poultryman cannot afford to be outside a community of this kind.

The Poultry Producers' Associations of both Central and Southern California is a movement that will standardize our products and put the business on a stable basis. Have patience with these organizations and stand by them to a man, for they are the greatest movement that has ever been launched for the good of both producer and consumer.

Disposing of the Cull Young Stock

How to Crate Fatten—A Good Ration—When to Market. First Prize Article
AMERICAN POULTRY JOURNAL Monthly Contest.
By Otto E. Hackman

IN EVERY flock, no matter how well bred, there are always a number of culls, in some flocks more than in others, and it becomes a problem to decide how best to dispose of them. With poultry feed at present prices no one can afford to hold onto inferior stock for any length of time. Every day the culls are kept increases their cost and decreases the profits on the good birds. Moreover, these culls will not bring as good a price per pound later on in the season as they will now.

Culling out all the cockerels that are in any way inferior for good breeding birds and putting them on a special fattening ration and later selling them as broilers or roasters seems to me to be the best procedure. A great advantage to be gained by disposing of all undesirable birds as soon as possible is that more time and better quarters can be devoted to the rest of the flock.

Either pen fattening or crate fattening may be resorted to, to get the birds in marketable condition. The latter method usually brings the best results. The birds are in this way under the full control of the feeder and he is in a position

Col. Harris Weinstock has a broad plan that will revolutionize marketing conditions and bring the producer closer to the consumer. Co-operation is the salvation of the poultryman.

There are three distinct results obtained by the liberal use of green feed for poultry:

1. Green feed keeps the flock healthy and saves in loss of hens.
2. Green feed saves grain and mill feeds, and also causes better assimilation of that eaten.
3. Green feed stimulates the production of eggs.

to regulate the amount and kind of food required to put on a given amount of weight. When the birds are accustomed to having unrestricted range, it may not be advisable to transfer them to confined quarters and a fattening ration too abruptly. Having been accustomed to unlimited range, they will not take kindly to close quarters and are apt to be easily put off their feed and to thus lose weight instead of gaining it.

The birds which show a tendency to be nervous and restless and which do not consume much food at a time should be kept in a separate pen in which they can move about freely. They will fatten better under such conditions. They should be gradually taken off of their accustomed feed and the fattening ration substituted, while birds which have been confined in runs can be put into crates at once and given the special ration from the start.

Crates for fattening poultry may be constructed of any material in the way of waste lumber which is usually lying around the farm. Care should be taken to have the crates large enough to comfortably accommodate ten or twelve birds each. Too much space should not be permitted, as this allows of the fowls moving about too freely, but on the other hand cramped quarters will result in crowding and sweating, and this is conducive to removing flesh rather than putting it on. Also, if the space is overcrowded the birds will fret and worry, and in such cases the birds get off their feed and make no gain.

The crates may be enclosed on all sides except the front, if desired, but it is preferable to have all the sides slatted, permitting a free circulation of air. In the front side of the coop the slats should be run up and down and be spaced about two inches apart. A trough should extend along the entire length of the coop in front, by means of which all the food should be fed, the birds eating by inserting their heads between the slats. A piece of board about a foot long and five or six inches wide should be nailed to each end of the coop, extending out in front about six inches. Notches should be cut in these boards and the trough fitted into the notches, giving it a good support. The trough can then be easily lifted out and cleaned when desired, for it is imperative that no food be allowed to remain in the trough and become sour. The bottom of the crate should also consist of slats, spaced one-half inch apart, so the droppings will fall thru, thus keeping the floor free from filth.

Two weeks is the length of time required to put broilers in prime market condition. A longer time than this is inadvisable because the birds usually get off their feed and refuse to eat enough to make any gain after having been stuffed for two weeks. They usually make considerable gain in weight the first two weeks, but afterward the gain is so little, if any at all, that it does not justify the time and expense necessary for it. Just as soon as the birds show a tendency to take less food or fail to make gain in weight, they should be marketed.

A good fattening ration consists of 4 parts cornmeal, 2 parts bran, 2 parts ground oats, 1 part middlings and 1 part beefscrap. A little bonemeal, charcoal and salt is beneficial if mixed with the mash. This should be mixed up by using either whole milk, skim-milk or buttermilk, if any of these

Barred Rock cockerel, on farm of M. E. Thomson, Dept. A, Austin, Minnesota.

can be obtained at a reasonable price. Otherwise, water must answer the purpose. The mixture should be a thin batter, just so it will run off a spoon, and should be fed twice a day only—but all they will eat up clean. If any remains it should be removed at once, lest the appetites of the birds become impaired.

Before beginning with the ration, the fowls should be confined in the crates the first day without giving any food at all, allowing only water to drink. When starting them on the ration after the first day's fast, give only a small amount at first, but gradually increase the amount till they take all they will consume. If the fowls become restless, darken the coops with a cloth.

Each poultryman must decide for himself whether it is more profitable to market his fowls dressed than to ship

them alive to market. In all probability, unless he is familiar with up-to-date methods of dressing poultry, he will be better off to ship them alive. But poultry that has been well fattened, dry picked and properly cooled will bring the highest prices in all markets. There is a certain bloom to a dry-picked, well iced bird which will not easily come off and which finds ready purchase among discriminating buyers.

Many poultrymen have the advantage of a nearby market where they can retail prime market poultry at top-notch prices. The best prices are usually obtained by selling to clubs, hotels and country road houses. In many sections the private family trade is excellent, but as crate fattened poultry must be sold when ready for market, the poultryman must have his market at the right time.

How to Keep Looking on the Bright Side

Our Flocks are Decreased—We Have Houses and Runs Empty but are Keeping the Business Going Without Loss, Helping to Feed Ourselves and Marketing the Surplus. Second Prize Article A. P. J. Monthly Contest. *By Mary Wayne Brown*

FOR a number of years before the war, which now seems a long time ago, we made our living raising Standardbred poultry. In those days grain was cheap and plentiful, and while prices were not always what they should be for poultry products, yet because there were several of us devoting our time and efforts to the undertaking, we managed to make a comfortable living. When I say, comfortable living, I do not mean that we lived luxuriously or even so well as many of our neighbors lived on salaries, but we were always sure of a good living and we learned to take our vacations as we could get them, a day now and then when the work and income would permit.

With the coming of high-priced grain we were forced to reduce our poultry work to "family size." When I say, family size, I do not mean a few birds in the backyard, but a flock of one hundred or more, just a good war-time flock. Last year we got the matter fairly well in hand, but this year we have it down to a science. We hatched about 125 chicks, and when we began eating them in July, we had 115. As soon as the cockerels were in the neighborhood of two or three pounds, we culled out all the cockerels which did not promise well—that is, off in shape or coloring—and canned them for winter use. There isn't any nicer meat than good canned young chicken and we have a nice little row of jars on a closet shelf that will be very handy to turn to next winter. As the flock develops, we cull out every bird that does not promise well and make a dinner of it.

The yearling stock is treated much in the same manner. We now have few yearlings on hand, having saved only the best for breeders the coming winter. We do not believe that it is wise to depend on pullets and cockerels for breeding purposes and always select the best birds from the pens of the previous season for use in the breeding yards. These birds are not forced in any way and by the first of the year are in the pink of condition to begin the business of reproducing themselves. When we had big flocks, we used to sometimes keep over birds of which we were not wholly sure of their worth, but now that we cannot have but a few we have only birds of true merit.

Early in the spring we began putting down eggs for home use and have enough on hand to last us the year round to putting-down time again; so that we are able to sell the eggs which we are now getting from last year's pullets, which helps considerably in paying the grain bill.

We have made every effort to have a large garden this year, and, in addition to supplying the home table with vegetables, we have grown a great amount of green stuff for the poultry. We are digging potatoes now, and will have enough small ones to last our flock for some time. Then there are the usual leaf vegetables, and later root vegetables, which will keep them going the greater part of the time until the grass begins to get green in the spring. By following out this method in keeping a small flock, even with grain at \$5

a bag, as it was so much of the time last fall and winter, we are suppling the home table with poultry and eggs at less cost than if we were buying same in the market and what amounts we may be able to get for stock and eggs in addition to this, we consider fair remuneration for the labor we are putting into it.

This is about the best plan that we have been able to work out under present-day conditions. Of course, our general living expenses are earned outside of the work with poultry, but we are in this way holding onto our flock of best birds and hope eventually to again take up the breeding of Standardbred poultry as a business. Altho our flocks are greatly decreased and we have houses and runs empty, yet we are able to keep the business going without loss, and incidentally helping to feed ourselves and market a surplus.

While eggs and poultry are fewer on farms and village lots than ever before, the prices paid for these in the market are not accordingly as high as one would suppose. This is a condition which cannot continue. I do not believe that the

S. C. Rhode Island Red cock, on farm of Gerld Thomson, Dept. A, Austin, Minn.

average person will forego the fresh egg in the family dietary, especially as people are as never before learning the value of eggs as food. Many eggs cannot be sold at an excessively high price such as may occur in seasons of scarcity, but the benefit to the poultryman will come not thru \$1 a dozen eggs once or twice a year, but thru higher prices for eggs in the so-called flush season. Under present conditions eggs should never go below 50 cents a dozen. They are exceptional value at that price and no one who has a knowledge of food values would consider them other than cheap at that price. We have seen them go somewhat below this figure within the last six months, but I do not believe that such will be the case next season.

There is no way by which we may know the actual decrease in the number of fowls in this country during the past year, but one has only to look about to realize that it is great. "One hundred fowls on every farm" will not replace the thousands on big poultry plants that have been slaughtered. The

problem which the established breeder has to face is that of carrying on until conditions begin to better. I believe this may be done by following the plan which I have outlined, since by such a plan there is no risk while continuing the business on a small scale. The careful breeder can also learn a great many things of value while handling a small flock which would be apt to be overlooked where a great many birds are kept. I am keeping my eyes open and endeavoring in every way to learn what I can out of the experience. Nothing ever happens but what we can learn valuable lessons therefrom if we are awake to the opportunity. Too many are going about bemoaning war-time conditions and thus blinding themselves to the right course to pursue. Let us bear in mind what the old philosopher said about earthquakes: "They're somewhat shaky at the time and rather disconcerting, but how would we have ever known there was such rich ore under us if the quake hadn't left this cleft in the earth?"

Fight Poultry Lice and Mites Now

Helpful Information Gleaned from Bulletins 533
and 801 of the U. S. Department of Agriculture

LICE and mites affecting poultry multiply very rapidly at this season of the year. Now is the time to fight them and to keep everlastingly at it until the birds are certain to go into winter quarters free from vermin.

Both lice and mites hatch, grow to adult breeding size and reproduce themselves, in hordes of these profit-killing, health-destroying, parasitic pests, in an incredibly short time. Bulletin No. 533, "The Chicken Mite: Its Life History and Habits," by H. P. Wood, and Farmers' Bulletin No. 801, "Mites and Lice on Poultry," by F. C. Bishop and H. P. Wood, of the Bureau of Entomology, U. S. Department of Agriculture, contain much useful information concerning lice and mites and their extermination. Herewith we present gleanings from these bulletins which we believe will prove of special interest and particularly helpful to our readers at this season.

POULTRY LICE.

Poultry lice are not fitted for sucking blood. They feed on portions of the feathers or on scales from the skin, and their presence in any considerable numbers is responsible for serious injury.

Chickens hatched after April 1 and brooded by hens experience a high mortality, much of which appears to be due directly or indirectly to lice. The lice often leave the hens and pass to the chickens before these become dry after emerging from the shell.

The first symptoms of lice infestation usually are droopiness, lowered wings, and ruffled feathers. Diarrhoea follows, and the chickens then often die in a few days, or, when older, sometimes fall a prey to various diseases. Fowls may lose weight and sometimes die as a result of lice or succumb to some of the common chicken maladies.

There are seven species of lice common to hens, spoken of as body lice, head lice and feather lice, according to usual places in which they are found. The different species intermingle to a considerable extent.

The eggs are deposited on the down of the feathers, either singly or in clusters, according to the species of lice. The eggs hatch in from four days to a week. The adult stage is reached in from 17 to 20 days after the eggs are deposited. The heat of the fowl's body is necessary for hatching the louse eggs, and the lice themselves die in a short time when off the fowl.

CONTROL OF POULTRY LICE.

There is no fundamental reason why a flock should not be entirely freed from lice and maintained in this condition. Reinfestation comes principally from stray fowls which gain access to the poultry yards and from purchased stock added to the flock.

Treatment of the entire flock during the late summer and

early fall is recommended. At this time of year weather conditions usually are favorable to dipping, most of the young fowls are well matured, and much of the superfluous stock has been disposed of, so that there are fewer birds to treat. It is better to have treatment precede molting. Poultry houses and runs should be disinfected and it is well to make a general clean-up at the time the flock is treated for lice. Care should be taken to avoid the escape of fowls from infested to uninfested pens.

The authors of the bulletin tested a number of materials for lice destruction and found nothing else so satisfactory as *sodium fluorid*. It is exceedingly poisonous to all species of chicken lice and it kills both adults and young, including the young which emerge from the eggs present at the time of treatment.

Sodium fluorid can be obtained in two forms, known as commercial and as chemically pure. Both are in dry state, the former being a dry powder and the latter consisting of small crystals somewhat lumpy. Commercial form is cheaper and is more convenient for application by the dusting method. The chemically pure form is preferable for the dipping method. Owing to limited demand the material is not ordinarily found in drug stores. Druggists can obtain it readily from manufacturing chemists. It is important that the name *sodium fluorid* be carefully stated to the druggist to avoid error.

In treating poultry with sodium fluorid, if proper methods are followed, a remarkable degree of control is obtained. One application of sodium fluorid to all fowls on given premises will completely destroy all lice present. It is essential to make sure that the treatment is thorough and that every fowl is treated. If one infested chicken escapes, it will in a short time reinfest the entire flock.

Application of sodium fluorid in dust form is comparatively slow of action. It takes four or five days for all the lice to disappear. "The pinch method" is recommended for dry dusting. When applying the material by this method it is placed on a table in an open vessel and the fowl is held by the legs or wings with one hand, while with the other hand a small pinch of sodium fluorid is placed among the feathers next to the skin about as follows: One pinch on the head, one on the neck, two on the back, one on the breast, one below the vent, one on the tail, one on each thigh, and one scattered on the under side of each wing when spread. It is advisable to hold the chicken over a large shallow pan, as in this way the small amount of material ordinarily lost is recovered.

The dipping method is recommended as much more quickly effective in killing the lice. Fowls and feathers are not injured. The first requisite is a warm, sunny day, so that the

fowls will dry quickly. Windy weather should be avoided. In dipping fowls, as described below, the feathers do not get thoroughly wet, and if the operation is finished an hour before sundown, the fowls will become dry before going to roost.

In using the dipping method, all that is necessary is a supply of tepid water and a tub and a sufficient supply of sodium fluorid. The water should be measured into the tub and three-fourths of one ounce of commercial or two-thirds of an ounce of chemically pure sodium fluorid added to each gallon of water. It is readily dissolved by stirring. The tub should be filled to within 6 or 8 inches of the top. Add more solution from time to time as tub content is lowered through dipping fowls.

In dipping the fowls it is best to hold the wings over the back with the left hand and quickly submerge the fowl in the solution, leaving the head out, while the feathers are thoroly ruffled with the other hand so as to allow the solution to penetrate to the skin on different parts of the bird. The head is then ducked once or twice, the bird is lifted out of the bath and allowed to drain a few seconds, and is then released. The total time required for an individual fowl is from 30 to 45 seconds.

Sodium fluorid is very destructive to lice without producing ill effects on chickens. The dust may cause temporary irritation of air passages and sneezing. Dust reaching the skin of operator and allowed to remain a number of hours will cause local irritation and burning. The solution does not injure hands, except in cases where sores are present, which may become slightly irritated. The solution should not be kept in galvanized iron vessels any great length of time, as it will injure them. Sodium fluorid should be kept in closely stoppered bottles.

The cost of dipping, including labor, is less than one cent per bird treated when treating 100 or more fowls.

The thoro application of flowers of sulphur as a dusting powder is quite effective in ridding fowls of lice, the cost is comparatively low and the sulphur is not disagreeable to handle. No injury of fowls has been noted when sulphur is used as a dusting powder.

Dipping fowls in a soap solution, made by dissolving one ounce of laundry soap in a gallon of water, will destroy all lice present, but a second dipping 10 days later is necessary in order to destroy the lice that have hatched from eggs which are not killed by the treatment. The soap causes thoro wetting of feathers and fowls require more time to dry. Should only be attempted in favorable weather.

Mercurial ointment or blue ointment, as often recommended, will reduce the number of body lice but has little effect on the head and wing lice. For head lice on young chickens carbolated petrolatum, applied in small quantities, has been found quite satisfactory. Dust baths are not to be depended upon to rid fowls of lice.

THE CHICKEN MITE.

The chicken mite, "red mite," feeds chiefly upon the blood of chickens and fowls. It is white or gray in color except when full fed, when it is bright red or dark red, according to the state of the blood which it contains.

The mites breed in cracks and crannies of woodwork of poultry house, roosts and nests. The eggs hatch in 48 hours. In about 24 hours after hatching the larva becomes a blood-sucking nymph, passing from this stage into a second-stage nymph after a period of about 24 hours or less. Adult stage is reached with the next molt, and within 12 hours after gorging herself with blood the female begins depositing eggs.

The rapidity with which the mite may reproduce is amazing. The possible progeny of one female in five weeks is conservatively estimated at 1,631 individuals, or, considering the duration of life of a female as eight weeks, her progeny would total 2,609 mites.

The mites die off much faster in the absence of food during the hot summer months than they do in the winter. All stages on a stick of wood lived 91 to 113 days in the months of September to January, inclusive.

The usual habit of the mite is to feed at night. Two hours before dark a fowl was put on a roost containing a large number of hungry mites. Very few mites ventured far out

of their hiding places at this time. A few did go to the fowl. At dark, two hours later, only four mites were found to have fed and left the fowl. One hour after dark nearly 600 mites had fed and left the fowl. One and a quarter hours later 535 more fed mites left the bird. Mites continued to drop in smaller numbers until after daylight. All stages of mites will go on a fowl, feed, and leave it in less than two hours. They do not necessarily all crawl off the fowl before it leaves the roost; both fed and unfed mites may be retained in the feathers when fowls are running about.

It would be advisable for a person introducing new stock into his mite-free flock to use a little caution. New stock not known to be free of mites should be allowed to roost the first few nights on a new roost wrapped with pieces of folded paper, preferably black. The object of using the paper is to furnish a convenient place for mites to hide. The paper may be examined and if mites are found the fowls should be kept on this roost for five or six days until no more mites come off. If mites are discovered, by removing and burning the papers and treating the roost thoroly with kerosene or crude oil, any danger of the mites getting back to the fowls can be avoided.

When mites are found on house walls the infestation must be a heavy one. Direct rays of sun act as a powerful killing agent when mites are exposed to them. A crack in a board, or only a rough place, or it may be in the dry manure, or about nails, etc., all provide suitable dark places for mites to propagate.

Mites may be spread in following ways: 1. By infested fowls transferred to clean localities. 2. By use of boxes and crates in which infested fowls have been kept. 3. Thru the carrying by man of mites on his clothing, thereby starting infestation. 4. Thru the carrying of mites by sparrows, and probably by pigeons, from one place to another in their feathers. 5. By horses, cattle, dogs, cats, and certain wild animals, such as foxes, skunks and weasels; also rats and mice. 6. By migration of the mites to buildings in contact or close proximity to infested premises.

Mites may kill sitting hens, brood hens and young chickens. They seriously injure fowls and may cause them to become victims of poultry diseases.

Crude petroleum applied to woodwork of poultry house, nests and roosts will destroy mites if applied thoroly. It may be put on with a sprinkling pot and a large paint brush. For use in a sprayer the crude oil must be thinned with kerosene. Crude petroleum retains its killing power for several weeks.

All complicated nests and roosts should be avoided. Use simple nests and roosts which can be easily removed for cleaning. Apply crude petroleum to roosts, dropping boards and to nests, walls and floors if signs of infestation. Repeat once a month for three treatments to make sure of killing all mites.

OTHER MITES.

Scaly leg is caused by a species of itch mite. Application of crude petroleum or of sulphur ointment will rid the fowl of this pest.

Another scab mite attacks the comb. Plain sulphur ointment,* or compound sulphur ointment, will rid the bird of such mites if applied two or three times, three days apart, to the affected area.

Another itch mite, the depluming mite, causes loss of feathers. Application of sulphur ointment to the bare parts and to the base of feathers about this area is the remedy.

There are various other mites affecting fowls, not very common or abundant, and apparently not causing serious injury as a rule, which is fortunate, as treatment is difficult.

A favorite chick ration in the early 'Eighties was: fifteen pounds of oats, twenty pounds of corn, ten pounds of barley, all ground together into meal. Mix in five pounds of wheat bran. Bake this meal into a cake, mixing with milk, same as any johnnycake. Bake hard, crumble into scalded sweet milk just before feeding and feed moist but not sloppy. Recommended for chicks up to three weeks old.

Philander Williams Memorial Meeting of the American Poultry Association

Forty-third Annual Convention, Held at Lexington Hotel, Chicago, August 12-15, One of the Most Harmonious and Beneficial Gatherings Ever Held by This Association.

By Theo. Hewes

LOOKING at the annual meeting from every angle, we believe there was more real good work accomplished, work that has a greater bearing on the future success of the American Poultry Association, than any one meeting we have attended in the past twenty years. For a great many years there have been some members attending the annual meeting who came for the sole purpose of doing work and a lot of it. They had no other reason for being there and they have done their best to inject this spirit into others, but unfortunately they did not always succeed. Many, decidedly too many, attend the meeting to have a good time and they were perfectly willing to throw all the heavy jobs on the willing workers, with the result that our conventions were strung over several days and the strain on the workers grew to such intensity as the hours dragged along until it came to a point where the nerves snapped and a few pointed remarks at the wrong time would start a small row that would soon spread thru the convention, bringing with it hard feelings and uncomplimentary remarks. I mention this fact here for comparison only, for it was the byword of this convention, not by one member, but by practically all of them, "Did you ever see so much real harmony and such little contention among the members on important subjects?"

The facts are that every man and woman who attended this meeting brought with them the sense of their personal responsibility to the American Poultry Association and felt from the very opening moment they had come here to do their bit and that every moment was valuable time to all and this was no time for recreation, but a mighty good time to get right down to "cases" and do some real constructive work.

The officers had planned a program that omitted all frills and money-spending side shows; the result was that more work and better was done than at any meeting in recent years, and this work was so divided that no one broke down under it and everyone left after the meeting adjourned with a better feeling and with more money in their pockets than ever in the history of our annual conventions.

The Lexington Hotel lived up to its tradition of giving more than it advertised and for once in the history of the American Poultry Association a vote of thanks was tendered to the management and the employees of the hotel that had served us to the entire satisfaction of all.

MONEY CAME EASY.

For many years we have thru the sale of Standards and the addition of new life members had money pouring into our treasury from all directions and in such quantities as to encourage reckless expenditures and many times we have on short notice and without proper consideration of the subject voted out immense sums of money for which the association did not receive adequate returns. Artists and committees felt there was sufficient money to pay bills and they did not hesitate to charge the highest prices for services and sometimes it seems there were a lot of expenses where there were no services at all. The older members who have dropped out of active association work for the past few years have

watched the seeming waste and finally becoming alarmed at the way we were drifting did not hesitate to utter a few words of caution to the boys and asked them to right about face and take a careful invoice of stock before going farther. As a money making proposition the financial statement as issued just prior to the annual convention proved conclusively that we were taking enormous risks. Work outlined was important and should not be stopped, but there must be some scheme worked out that would guarantee greater receipts.

When the matter was called to the attention of the finance committee, we found they were not only willing but very anxious to have suggestions from the older members. As a result a conference was called and suggestions offered that we believe will immediately relieve the pressure and eventually put the association back onto a good financial footing. In doing this we have injured no one. Mr. Cooper's resolution calling for donations from the members to assist in emergency or war time work met with universal favor and more than \$1,400 was subscribed at the first meeting. The president was instructed to write a letter to the members asking for contributions to this fund, and it was recommended that if possible \$5,000 be secured in this way to carry on this work.

Now just a word of caution: When this letter is received by you, don't, please don't, assume for one moment that the American Poultry Association is bankrupt or that there is any danger

of its going out of business. The American Poultry Association is your best bet now, as it always has been, but we do need this money in order that important work that you as a breeder are personally interested in may not slow up, so please give to this fund as liberally as you can and you have my personal guarantee that every dollar will be judiciously expended.

Following are a few suggestions that were offered by the older members and recommended by the financial committee, which we feel will straighten everything out to the satisfaction of all.

Little by little we have taken from the poultry press and the individual members the revenue on the sale of Standards until it reached a point where it was not possible for them to longer push the sale of the book, the commission not being of sufficient importance to warrant the space taken in advertising. This was changed at the annual convention and the wholesale price of the Standard in lots of 12 or more to the members or publishers was reduced to \$1 per copy, the retail price to remain the same. This, of itself, will add to the revenue of the association at least five thousand dollars within the next 12 months and now that each and every member attending this convention knowing what the conditions were in regard to the new members for the past year and having it pointed out to him or her that their respective states were not furnishing the proper quota, they are going home to get down to work to increase this membership. The recommendation of the finance committee was that the initiation fee should be \$5 instead of \$10 and that all members joining under this provision should pay annual dues of \$3 per year after the first

PHILANDER WILLIAMS,
First president of American Poultry Association, in honor of whom 43rd annual convention was named.

year. The old system, the one that has been in force since the American Poultry Association was inaugurated, was a life membership fee of \$10 without any dues, and it is clearly evident to anyone who knows anything about finances that your only hope of continuing in business would be by securing new members, and should you fail to do this, you could only hope for bankruptcy, and this change has come, about at a mighty good time to prevent our association from running on the rocks. Every member of the judges' section and every local association can well afford to buy at least 12 copies of the Standard now, as it is a money maker for you.

Much interest and quite a little comment was caused by the new National War Emergency Poultry Federation. This new organization, endorsed by some of the brainiest men of the poultry fraternity, and men who have only one thought, that of doing the most good for all branches of the poultry culture, were very anxious that the American Poultry Association should join them and become a part of the new federation. The old members of the American Poultry Association, and especially those who represent the fancy, felt that the step was not a good one, that it might and possibly would eventually eliminate the old organization, and they did not feel that the new federation has had sufficient experience or sufficient prestige to warrant our coming in as a body.

This feature of the convention took up quite a bit of its time. Both sides were given an opportunity to present their views and best arguments, pro and con, so that our members may know just who was for and against the measure, but the final vote was 37 to 32 in favor of retaining our own independence and not becoming a member of the federation. The new federation, however, is going ahead and will do a lot of good work. Reese V. Hicks has been employed to represent it and headquarters have been opened in Washington, with Mr. Hicks in charge, and we know that in any matters that come up directly concerning the American Poultry Association Mr. Hicks will be just as free to render service and do all in his power to assist the members as tho he was not associated with the federation. It is well to understand at this time that practically everyone who is a member of the new federation is also a member of the American Poultry Association, and with the two organizations, both working for

the best interests of the fancy and commercial poultry culture, we should accomplish more than ever and we do not believe there will be any conflict between the two.

Under the system adopted at Cleveland, several departmentals all working with and as a part of the American Poultry Association, we have been able to do a lot of constructive work without interfering with the general line of procedure of the convention. As an illustration, the judges section, the baby chick section and the incubator and brooder sections are able to hold independent meetings where they can care for their own affairs, thrash out their own differences and bring in their reports to the general body, which are usually accepted without debate, as the members feel these men are better qualified to legislate on these subjects than the ordinary laymen who know practically nothing about the business that is very vital to these big interests.

In the judges section, the question of eliminating all disqualifications except natural defects was thrashed out by this body and at one time every member but three favored the resolution and asked that a committee of three be appointed to draw up and present to the convention a report on the valuation of such defects as are changed from disqualifications to defect so that judges might know just how to value them in making their awards. Mr. Delano was appointed chairman of the committee to revise this section, but at the afternoon meeting when called upon for the report, he had none to offer but made the statement that when the committee got together it found it could not go into the matter, as it was not at all practical. He said when we started to make one change we began to realize the necessity of making a lot of other changes in order to make all conform, and we consider it best that the matter should be dropped for the present. This was the report finally adopted by the judges section and there will be no changes in the present disqualifications until the next revision of the standard in 1923.

A petition was presented by H. V. Tormohlen, president of the American Brown Leghorn Club, asking that the Standard description of the dark female and light male be inserted, so that judges have correct information on these important classes when making their awards. This petition was endorsed by practically all prominent Brown (Continued on Page 798)

Notary Public.

What is a Fancier?

What is a fancier? How does a fancier differ from a breeder, or either of these from the commercial poultryman?

There are some good friends of ours who are continually lauding the "fanciers" and speaking disparagingly about "commercial poultrymen." Some of them want the old American Poultry Association to be an exclusively fanciers' organization, run by and for fanciers only.

We confess we have yet to learn exactly what they mean by "a fancier"—have never yet had a clear cut definition of the term as they use it. The old American Poultry Association has been pretty much under the same control for years, there has been mighty little variation of the political machine for a long time.

Some of the men who claim to be dyed-in-the-wool fanciers do not own a chicken and have not bred nor exhibited poultry of their own breeding for many years. Some of them, by their own statement, have been more or less engaged from time to time in trading in poultry, buying and selling, for both market and breeding purposes. Some men who are generally conceded to be among our foremost fanciers are also decidedly "commercial" in the conduct of their poultry business, but in our opinion this does not necessarily make them any less real fanciers, provided they are fanciers. Some others who have gained recognition as master breeders of the utmost in quality in Standardbreds of the breed they favor, seldom or never advertise, exhibit little and chiefly for the pleasure of competition with other breeders, and give away almost as many hatching eggs and breeding specimens as they sell.

We think that it is an unfortunate mistake to attempt to draw too fine distinctions between classes of poultrymen or to stir up class prejudice. We are all poultrymen and all are or should be devoting a part of our energy to breeding better Standardbred poultry. Each and every one of us has much in common with and is dependent upon the others for the progress and successful conduct of our particular branch of the poultry business. This should be plain to all, except those of exceedingly narrow vision.

Any person who makes a business of dealing in poultry, whether for sale of exhibition and breeding stock, hatching eggs, baby chicks, market poultry and eggs, must of necessity be a "commercial poultryman" if he does business in hope or expectation of making a profit. At a recent meeting of poultrymen the question was raised as to "What is a producer under the law?" The officially recognized definition was that any person who actually produces and sells even one dozen eggs or a few chickens is a "producer" within the meaning of the law of the land, but he or she must in fact have produced or raised the goods sold. So any person who produces and sells poultry and eggs of any sort in the expectation of profiting thereby is a "commercial poultryman." But the term "fancier" is in its application so elastic and so broadly used that one is sometimes at a loss to know why some breeders of poultry may be of the elect, while others, equally devoted to the breeding and perpetuation of Standardbred fowls, are not considered as belonging within the inner circle.

To our mind any person who is a true lover of Standardbred poultry, who devotes a share of his

time to breeding poultry and painstakingly building up better quality fowls, and helping others to succeed in a like undertaking, working toward an ideal of perfection, is a fancier, whether or not he devotes himself to some commercial branch of the business from which he derives part or all of his living. We know men who certainly are fanciers, who have devoted much time and energy to furthering Standardbred poultry interests, yet who do not own any poultry. We know men who operate large egg farms or market poultry plants, who also breed and exhibit some of the finest Standardbreds seen in our big shows—are they not fanciers as well as “commercial poultrymen?” We know other men who have devoted a lifetime to breeding and perfecting a strain of Standardbred fowls, who are consistent winners of world-wide reputation, who advertise extensively and claim big incomes from their “fancy poultry business”—are they not commercial poultrymen as well as “fanciers?” We know breeders of purebred poultry who have devoted years of study and work to perfecting the breed of their choice, who seldom exhibit but sometimes give away or sell specimens which win ribbons—are not these men fanciers?

Is it not about time to bury the hatchet and to endeavor to eliminate friction? Nothing is gained by stirring up class feeling and factional fights. Get together and work together, “one for all and all for one,” in the common interest of more and better Standardbred poultry. What we need is harmony, unity and co-operation.

If we are breeding and boosting for Standardbred fowls, we are all *poultrymen*, and does it matter so much after all that we should be identified by the special but indefinite classification of fancier, breeder, commercial poultryman, or whatever term may apply?

However much we may quibble and evade the issue, our poultry interests are all common interests. We cannot separate and isolate them in little exclusive groups and get anywhere. Every human being on this planet has interests in common with every other human being, we are all to some degree dependent upon one another. We may be too blind to see it, but we cannot escape the fact. The sooner we get our blinders off and see the light, the better it will be for all of us.

Do It Yourself!

If you want anything done, *do it yourself!*

We are rapidly approaching a period in human events when such a course becomes absolutely essential. War needs are rapidly absorbing our man power, skilled labor is difficult to secure and the price is above the means of the average poultryman's purse.

Carpenters, painters, plumbers, blacksmiths, and other skilled mechanics are, or will be soon, in the army and navy or busy on government contracts. A good many towns are already without a resident physician. The mother of the household, as was the case in earlier times, must be both nurse and doctor in all but serious cases. It is decidedly “up to” us all to *keep well*.

There are many odd jobs and repairs about the poultry plant and farm, which when labor was cheaper and plentiful we used to turn over to local

mechanics, that we now must learn to do for ourselves. All the members of our family have always had the knack of taking hold of this sort of work, and, as the last seven years we have lived nearly four miles from the nearest town, we have not called in much outside labor for ordinary repairs.

A wealthy summer resident, who summers here but winters in New York City, called on us recently and had much to say about the labor situation. He said he wanted to get a pump and water supply system installed in his shore home, as his mother expected to be there the year round from now on, and he wanted a convenient, easily worked system which could not readily get out of order. He could not get a contractor to promise to do the job promptly, so he tackled it himself. “Do you know,” he said, “I've learned more about pumps, pipes and tools the past two weeks than I ever knew there was to learn.” He managed to do a very creditable job, and he was mighty proud of the fact.

A fellow townsman, who has always depended upon a village water supply, was without water most of last winter, because the privately controlled supply service broke down. He decided to put in a well of his own, but on consulting the well driver he found the price prohibitive. He is installing a good driven well for himself.

One of our foremost poultry fanciers has always kept a supply of paints and oils on hand and keeps his poultry buildings as bright with paint as a ship, doing the work a little at a time whenever convenient. He enjoys the work, too.

Painting jobs, glazing windows, odd carpenter repairs of all sorts, chimney cleaning, in fact any repair work about the farm can be attended to very satisfactorily by the home folks if the work is done before the job gets too big—just another case of the stitch in time that saves nine.

An extensive kit of tools is not absolutely necessary. A handy drill, vise and anvil combination is an essential piece of work-bench equipment. For carpenter's tools, a good hammer, shingling hatchet, ratchet brace and assorted bits, iron square, homemade miter box, Simonds combination saw, putty knife, set of chisels, glass cutter, ratchet screwdriver, one medium panel saw, one rip saw, draw shave, bench plane, nail set, two twelve-inch wood hand screws, sliding T bevel, spirit level, two-foot rule brass bound, 100-foot metal tape, combination hollow handle tool set, draw knife, dividers, wire cutter, chalk line and chalk, make a very useful assortment that will fill most farm needs. For odd plumbers' jobs and other mechanical work the following will be found necessary: large and medium monkey wrenches, large and medium Stilson wrenches, revolving spring punch, rivet set, assorted copper and iron rivets with burrs, assorted bolts, combination pliers, socket wrench set, tinner's snips, assorted files, pipe cutter of right size to take pipes in use on plant, screw plate set with taps and dies of size to take same pipes, soldering copper, stick solder and soldering paste, gasoline blow torch, driving cap for well pipe. A good combination grindstone and emery wheel, oil stone, and saw filing and setting outfit, are essentials, for every workman must learn to keep his tools in order.

One can add to or reduce the number of tools in this outfit, but we have found a use for all of tools named and a number of others. We find a wrecking

TO OUR READERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every advertisement in this issue is signed by trustworthy people, and to prove our faith we will make good to our subscribers any loss sustained by virtue of their having purchased fowls or goods from one of our display advertisers.

All we ask is, that in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. In all cases in writing to advertisers say, "I saw your ad in American Poultry Journal."

bar and both round and wedge point crowbars, a post hole digger and a combination fence stretcher are essentials we cannot get along without. We have accumulated our outfit of small tools gradually and add to them from time to time as replacement becomes necessary or we find something we particularly need. The country auction is a fine place to pick up essential equipment of this sort, if you don't let yourself get carried away with the auction fever.

There is an old saying that "you never know what you can do until you try," and this is particularly true about doing

little things and odd jobs for oneself that in more easy times it was customary to hire somebody else to do. It will pay every poultry keeper to think twice before hiring expensive skilled labor in these war times: "Can I afford to hire this done? Perhaps I can do it just as well myself, and save a good big day's pay."

Get into the game. If you want anything done, do it yourself.

Make the Best of It.

CHEER up! Don't waste too much time on complaints and don't whine! Make the best of things as they are and work for better things.

One of our good friends, with an independent income and unused to work except as he felt like it for recreation, is complaining bitterly because the war has developed conditions which will make him change his habits of life a bit—he is well beyond draft age. Really he hasn't been touched yet except in a small way thru the "pocket nerve" and thru the need of doing things for himself because he can't hire as readily as he used to.

According to the press reports, Bernard Baruch, chairman of the War Industries Board, says: "The United States must prepare for deprivations. Up to this time, no man or woman has lacked for anything because of war conditions. It will be otherwise in the future. * * *

"We are living today in a highly organized state of socialism. The state is all; the individual is of importance only as he contributes to the welfare of the state. His property is his only as the state does not need it. He must hold his life and his possessions at the call of the state.

"Civilian requirements and the non-essential industries must yield to the needs of military establishment. There is but one important thing before us: To win the war.

"I should not hesitate to take anything anyone might have for his own advantage if the taking would benefit the whole of society and help win the war. Every man's life is at the call of the nation and so must be every man's property."

We believe that the above is correctly reported and it certainly sets plainly before the people how we must get in the war. Mistakes will be made. Seeming injustice will occur. But we may look and hope for readjustment on a safe and sane basis.

Poultrymen and some other food producers appear to have suffered unduly from what has seemed unfair discrimination in favor of the consumer. Most of us have taken our medicine and tried to grin, even tho we saw everything we possessed slipping away from us, while apparently more fortunate individuals were profiting unduly. Lack of efficient organization has prevented poultrymen from getting what they believe to be their just due, and some individuals

Potter "Redybilt" Poultry Houses

\$19.75
4 x 5 ft. Potter Redybilt House complete with equipment.
With Runway, \$24.00

Start Right NOW With the RIGHT Equipment

Meat is getting scarcer and the world is on short rations. Now is the time to get started producing poultry.

Poultry gets on the market in less time than any other form of meat—to say nothing about supplying your own needs.

You can make a success if you get the right equipment—the right house and nesting and roosting fixtures.

Potter Poultry Houses Roosts, Nests, Etc.

have been on the market for over ten years, and are used and recommended by thousands of poultry keepers who want the best and buy the best in poultry houses and equipment. You start right when you buy a Potter portable with complete outfit of roosts, drop board and nests.

Portable : Sanitary : Inexpensive

A clean, sanitary house means healthy hens and lots of eggs. Houses shown here are taken from our catalog. Twenty styles of houses and coops to select from, ranging in price from \$3.50 up, and everything we make is absolutely guaranteed.

DON'T BUILD. We can supply you with better, cheaper, more complete ready (factory) made hen houses, roosting and nesting fixtures, coops, etc., because we buy lumber in carloads, cut and fit all parts perfectly by machinery and deliver the house, coop or fixture you need in convenient sections all ready to set up.

\$43.00
10 x 8 ft. Shed Roof Potter Redybilt House, equipped with 5-ft. 3-perch Potter Henhery Outfit.

UNOBSTRUCTED VISION
PATD 1916

have gone broke. We believe that eventually the poultrymen and other food producers will come into their own, for our President has stated positively that they should have and are entitled to a fair and just profit—in other words, a living wage for their useful and necessary work. But it is essential that poultrymen present their case in an effective manner and show by indisputable proof that they are not getting fair and just consideration. Something must be done for the producer. It is all very well to try to keep prices down to the consumer, but this should not be done at the expense and heavy loss of the producer. We believe that the National War Emergency Poultry Federation is going to help bring about due consideration for the producer. President Reese V. Hicks is established in an office at Washington for the purpose of presenting the poultry producers' case. He is well qualified to present and discuss poultry producers' problems and, if he is free to act without being unduly hampered, we believe he will accomplish much good for poultrymen generally. He certainly knows what the breeder specialists and practical poultry keepers are up against. He will need the help and support of every poultryman, big and little.

The poultry situation is not unlike the position the milk producers were in at the beginning of the war. The milk producers, thru their efficient organization, are only beginning to get simple justice. In editorial discussion of the Chicago milk situation, *Wallaces' Farmer* says:

“All the evidence, in our opinion, points to the fact that the Chicago milk producers are now, for the first time in many months, getting a square deal—no more, no less. The entire Chicago situation has been a clear illustration of the necessity for farmers playing the price game as typical business men. There is no other way of meeting the blind, heartless city forces at work. Of course, in the long run it may be worth while to educate the city people as to the items which enter into cost of production.”

That will apply with equal force to the poultry situation. The general pub-

PARKS 200 EGG STRAIN
BRED-TO-LAY
BARRED PLYMOUTH ROCKS

1889 ← → 1918
29 Years of Trapnesting

FACTS Must Be Looked in the Face Without Flinching.

Our boys are “over there” in the midst of the greatest and most cruel battle the world has ever known. They are performing their task in a manner that brings a glow of pride to every American. Thousands of them will be wounded, and the experience of our allies has been that fresh eggs are one of the prime necessities in the hospitals.

Are You Doing Your Share?

Are you producing all the eggs you can, in the most economical manner? There is no profit or patriotism in feeding good grain to an unproductive bird.

Edward Brown, one of the world's greatest authorities on poultry subjects, says: “Breed from the high normal layers in your flock, and not the phenomenal layers.” That's the kind Parks' Strain is—High normal layers. They prove it everywhere, in the hands of my customers and in the laying contests.

Parks' Bred-to-Lay Barred Plymouth Rocks

are the answer if you are looking for “Money in Poultry.” Twenty-nine years of careful trapnesting and pedigreeing have made them what they are—the world's greatest high normal layers.

Catalog giving history of strain, and valuable information, a dime. Surplus Stock Circular Free.

J. W. PARKS

Box J

ALTOONA, PA.

lic has made it manifest that it knows little and cares less about poultrymen's problems, and it does not care how many poultrymen go bankrupt so long as the prices of eggs and poultry can be kept down.

It does not help win the war to compel producers to produce poultry and eggs at a loss or get out of the business into some other line of work. We are producers of necessary foods—foods much needed to win the war—and sooner or later a readjustment is coming when the consumer will have to pay cost of production plus a living wage for the producer. Efficient co-operative organization will help bring about this readjustment.

One is bound to admire and respect the attitude of most poultrymen under the discouraging conditions since we entered the war. Complaints have been few and mainly made in an effort to secure fair and just consideration. Some men who have been forced out of business have quietly made a new adjustment of their affairs and engaged in other work for a living. Others have tried to take their losses cheerfully and are still doing their utmost to carry on. There are mighty few lines of business that would have been so persistently carried on under such conditions of loss and discouragement. It has not been pleasant to see other lines of business apparently making big profits out of the poultryman's misfortune. The reports of profiteering on the part of big business, made by the federal trade commission, particularly when alleged profiteering in feeds has made it so difficult for poultrymen to carry on, have brought the injustice of the situation more forcibly home to poultry keepers. But with the publicity which is now being given to investigation findings, the apparent intention of our government to clean up the whole situation, we may hope for better times soon.

There are better times coming, tho we are not yet to have it all fair weather and plain sailing for a little while. Whatever may be in store for us, we must cheer up and make the best of it. Poultrymen will continue to carry on and patriotically do their utmost.

Buy Now!

Now is the time to buy breeding and laying stock to carry thru the winter. Transportation conditions, tho poor enough, are better this fall season than they are likely to be in the winter and spring.

Breeding stock, or yearlings and pullets for layers, if purchased now for immediate delivery can be secured at bargain prices. Where it is possible to secure delivery of new stock before cold weather, results are usually more satisfactory all around. It pays to buy what you need in the fall and house the birds where you can winter them comfortably. For laying stock it is essential. For breeding stock, we believe better results can be secured from fall purchases—other things being equal and the birds properly housed and cared for—than from stock that is subjected to trying transportation conditions and a change to new quarters and new conditions just prior to the time when needed for breeding.

This is also a good time to stock up with supplies, equipment and feeds needed for winter and early spring use.

When the early spring rush season is on, delays are frequent and vexing. The thrifty will make their purchases now, save money and save time, as well as avoid disappointment.

Help the Poultry Shows.

IN A pamphlet discussing "The Agricultural Situation for 1918" the U. S. Department of Agriculture says, concerning the poultry shows:

"The continuance of poultry exhibitions, maintained almost wholly by the poultry specialist, is certainly justified during the present emergency.

"The poultry shows themselves afford an opportunity for interesting individuals in poultry keeping, and have served as effective centers from which to launch and extend the campaign for increasing poultry production."

Uncle Sam is backing the poultry shows, thru special exhibits at the big shows by the Animal Husbandry Division of the U. S. Department of Agriculture, by detail work of extension service agents at shows big and little, and thru Girls' and Boys' Poultry Club exhibits at local poultry shows and fall fairs.

The poultry shows need the help and patronage of everyone interested in Standardbred poultry. The shows increase interest in poultry and create a big army of beginners in poultry work. Everybody should be a "booster" for the poultry shows. Are you doing your bit?

As we really begin to get in the war it becomes more and more apparent that we are going to be called upon to depend very largely for our surplus of poultry and eggs, with which to supply the general public, upon the small flocks whether on the farm or the town back lot. Under war conditions only a comparatively few specialists can carry large flocks. The extension in both directions of the draft age limit is certain to make a further drain upon the ranks of food producers. Already many poultrymen are with the colors—nearly 26 percent of the first draft was drawn from those engaged in some branch of agriculture—and many more are bound to be included in the great man-power machine which is essential to our ultimate victory over the Huns. We must reach out and interest more people in poultry keeping, bring more boys and girls into the ranks of the breeders of Standardbred fowl, and the well conducted poultry show—aided by the poultry press—is the place to begin the campaign, the center from which it may be successfully extended in all directions.

In answering the question: "Is the poultry show essential?" Uncle Sam's Animal Husbandry Division says:

"If poultry production is to be increased or even generally maintained, poultry shows must be continued, multi-

RESULTS

Cincinnati, O., Jan. 30, 1918.
Mr. John G. Poorman,
Tinley Park, Ill.

Dear Sir:

Enclosed please find Money Order (\$30.00) for a White Rock cockerel for your special mating. Kindly give me some information as to his ancestry, as I intend to breed him to some extra heavy laying hens. These hens were raised from chicks purchased from you in 1915 and 1916. Have trapnested them and some of the records are 280, 242, 216, 201, 200—not from the date of their first egg, but from November 1st to November 1st, same as the official laying contests.

Please ship as soon as possible via American Express to Elmwood Place, to be marked, "Will be called for."

Bertley Farm produces chickens that for looks, for health, for productiveness, are the best that money can buy.

We have 4000 fowls; all select stock, no culls; we can give you *just what you want*.

Address BERTLEY FARMS, Glenwood, Ill.

plied and improved. To discontinue them is to deprive the other agencies for reaching the public and attracting its attention of a considerable part of their efficiency. War conditions and the necessity for increased production to meet wartime demands cannot wait on experimental readjustments of factors which have grown into certain relations. Improvement and greater efficiency must be along the lines of experience and within the limits it indicates as safe.

"War conditions make it necessary to plan and conduct shows so that they will make less than the ordinary demands upon transportation facilities—to help

First cockerel at Madison Square Garden, 1916. Also first cock at same show, 1918. Owned by Floyd P. Schuyler, Dark Cornish Specialist, Savanna, Ill.

and not to handicap other war agencies. In considering the effects of war conditions upon American poultry shows, the fact that stands out most prominently is that the uncertainties of transportation tend to limit the area from which a show can draw exhibits. When such a condition comes as a sudden emergency, there is justification for asking preferential treatment for shipments of exhibits; but, when it is known long in advance that the obstruction to shipment will probably exist, patriotism should lead show managers to endeavor to fill

DEPT. A

AUSTIN, MINN.

their classes with nearby exhibits and exhibitors to patronize nearby shows."

Just read that over again. "If poultry production is to be increased or even generally maintained, poultry shows must be continued, multiplied and improved." That puts it squarely up to fancier-breeders, poultry associations, show managers, and the poultry press generally, to boost for the poultry shows and to encourage more and better exhibitions. Heed the statement made concerning transportation, but don't call off your show. Uncle Sam is boosting the poultry shows because he believes—as we do—that they are an important educational factor and essential in encouraging the production of more and better poultry. He wants you to be a booster for the poultry shows—and there should be no "slackers" here.

**DR. WOODS' NOTES
AND COMMENT**

September Days.

O sweet September, thy first breezes bring
The dry leaf's rustle and the squirrel's
laughter,
The cool fresh air whence health and vigor
spring
And promise of exceeding joy hereafter.
—George Arnold.

* * *

Summer is almost over. We haven't had very much real summer weather either. Wonder if this is another of those sudden "shortages" chargeable to "war conditions?" We should get a good Indian summer, and that is one of the pleasantest seasons of the year.

* * *

Early pullets should go into winter quarters soon. They must be comfortably housed, without crowding, should have plenty of yard room at first, abundant greens and liberal feeding. In deciding on pullets and yearlings to keep over winter, give space only to sound, vigorous, healthy specimens.

* * *

It takes heavy feeding to get the most out of pullets kept for egg production. Well matured specimens should be laying soon, and if kept for egg production they should be pushed for a good yield. Encourage them to eat plenty of a good concentrated mash mixture. The demand for eggs is increasing, adult fowls

Are helping win the war

Carefully line-bred for generation after generation for egg production, perfect health and vigor, high vitality and unequalled Standard requirements. They "live, grow, lay and pay" all over the continent better than any other strain in existence.

My usual fine exhibit will be at the Great New York State Fair this month. Those of you who go to Syracuse will realize the magnificent uniform Standard qualities in my flocks.

The unequalled records of my birds at Madison Square Garden, New York, Boston, Chicago, New York Palace, Syracuse, Minneapolis and many other leading shows north and south are given in full in my printed matter—that is yours for the asking.

LIBERTY BONDS and WAR SAVINGS STAMPS are accepted in payment for birds or eggs for hatching. You can make your money help win this war and then secure the fine birds you need. Owen Farms is running full capacity and the fine flocks here are available to help you add to the much needed poultry products of the country. You can help Uncle Sam in the next Liberty Loan drive and then use your bonds to procure your poultry needs. Book your orders in advance for future delivery.

1918 Youngsters

are far and away the most promising ever on Owen Farms. Big, sturdy, early hatched birds for early breeding and early shows. Strong, healthy April and May hatched birds for the later shows and fine June chicks for the very late shows.

Write me fully and frankly your exact requirements and if you will tell me the amount you wish to invest, it will enable me to give you my best advice and exactly describe what I can send you.

Adult Birds

Have choice cocks and hens for showing and breeding. Not as many as in former years, but better in quality and lower in price for any given quality. The exact bird, or birds, you need are here for you when you need them.

Owen Farms Service

It has always given me great pleasure to have prospective customers write me complete data regarding their requirements, and ask for my advice. Have gladly given them the results of my many years experience and helped to make their investment profitable.

Every inquiry will have my personal attention and every order will be selected for you by either Mr. Davey or the writer. Our long experience is at your service.

are letting up on egg yield, and pullets should be made to do their utmost.

* * *

Our chickens have been grown on green range, with liberal allowance of oats, corn and mash. The cockerels are in fine shape and we have been having some wonderful fries and roasters. The pullets are shipping up in fine style and are full of promise. Yearlings on woodland range are beginning to get new plumage and should be well equipped with new suits of winter clothes before cold weather. We have no prejudice against early molters, provided the birds are properly molted and are in good order.

Altho, if our labor is counted—we have no farm help and have not had since April—we are not breaking even with expenses, we are carrying on to the best of our ability and marketing a considerable amount of foodstuffs which are surplus above family needs and we shall go into winter quarters with a fair amount of stock. We have had frequent feed famines due to local shortages and transportation difficulties, but unless conditions grow considerably worse we do not expect to cut down our live stock beyond present limits. We are carrying about 75 head of yearlings, nearly equally divided between White Rocks and Black Langshans, and will have about 50 early pullets and some 30 cockerels—most of the latter to be utilized as family food supply. Two fine Duroc-Berkshire pigs, a barrow and sow, are making wonderful growth and should give us a good supply of pork and a breeding gilt. Two excellent grade Guernsey cows are holding to a fine milk yield, in spite of drouth-killed pasturage, and we have a promising heifer calf from one of them and a newly arrived bull from the other. This promising male will probably be made into "baby beef." Corn has done fairly well and may mature a fair crop if frosts hold off long enough, but in any event will supply a good amount of fodder. A field sowed to Sudan grass did not come up to expectations, partly because of poor seed and partly because of unfavorable weather conditions, but it has been utilized as green fodder—weeds and all—and has worked out better than expected. Potato crop is fine in both yield and quality. The potato patch was planted early enough to require careful guarding during the severe freeze on the first day of summer, when the plants were all in blossom, but it has proved that we did a good job staying up all night to keep the bonfires burning. Most folks about here lost their early potatoes and the middle and late crops were stricken with blight and lice. We didn't get an opportunity to give the beans a third cultivation and we expected trouble from the weeds which flourished in this part of the garden, but the weeds proved a big protection during the dry weather and later cold wet spell, with the result that we did not have any rust or blight and we did not have any trouble from plant lice which infested

TEETH AND TONIC FOR HENS

Uncomfortable

Hens Never Lay	
One Size 3 Ounce 50 Cts.	<p style="text-align: center;"><small>Monsieur From Lice</small> LAY BETTER</p>

Joram's Lice Rid
Keeps Them Comfortable.
Directions on every can

THIS STUFF WORKS!

What poultry keeper can say that his flock is free from lice? These abominable vermin take all the pleasure and profit out of poultry keeping—they make the hen uncomfortable and mope—they kill the chicks—they even kill the grown hens. It has been said by an authority that lice are responsible for more dead birds than any other enemy of poultry.

JORAM'S LICE RID KILLS THE LICE

It is a remedy for lice that never fails to work. It kills lice, and it prevents lice from getting onto the birds afterwards. **JORAM'S LICE RID** will kill **HEAD LICE** on CHICKS.

EASILY APPLIED

JORAM'S LICE RID is not like the other lice killers on the market—you KNOW they don't work—but JORAM'S goes after them in a "DIFFERENT" way. Vermin have a "base" of operations, just like submarines. You apply JORAM'S to the "base"—and the lice never move from there. That's where they die.

JORAM'S LICE RID IS ABSOLUTELY GUARANTEED to do the work, if directions are followed, or money refunded.

CHEAP It costs less than 1 cent per bird to apply JORAM'S LICE RID, and that's the end of it. You need this key to success in poultry raising. You need it now. One size, 3 ounces for 50 cents.

G. L. DU BOIS, Distributor, COBDEN, ILLINOIS.
Mention the American Poultry Journal when writing to advertisers.

all the gardens about here. We had plenty for the table, for canning, and a good yield of seed. Peas have been a prolific crop since June 17 and lasted later in the summer than is usual hereabouts. Tomatoes blighted to some extent, but on the whole garden stuff has done well. Hay has been a short crop and we are having some difficulty in buying a full winter's supply. We do not expect to worry over the fuel shortage, as we have hauled out an ample amount of cord wood to see us thru. There is still a tremendous amount of work to be done before cold weather, but it is a heap more satisfactory doing it for oneself instead of depending on doubtful hired help.

* * *

If anyone is in need of real exercise, we can recommend cutting, making and housing a ton of hay entirely by hand labor without help. It beats golf in every way and has more practical value. The scythe, fork and rake will beat any set of golf clubs ever carried by a cadie. If one desires to string out this sort of entertainment thru the summer season, try using a scythe to cut green stuff to supply two cows daily thru a prolonged dry spell. It may be a lot of fun to make a long drive and to put a small white pill in a tin can on a level green, but there's a lot more satisfaction in mowing a good clean wide swath.

* * *

Interest in the fall fairs and next winter's poultry shows is good and augurs well for business the coming season. Local poultry associations should make a special effort this season to put on a good poultry exhibition with special features to catch and hold the interest of beginners. The poultry section of Uncle Sam's Animal Husbandry Division is prepared to offer suggestions and assistance to make poultry shows a success and is urging more and better poultry exhibitions. Secretaries of local poultry associations should get in touch with Harry M. Lamon, senior poultry husbandman, U. S. Department of Agriculture, Washington, D. C.

* * *

Now that the National War Emergency Poultry Federation has taken the initiative and put its president, Reese V. Hicks, into an office at Washington to look after the interests of poultrymen, we believe it is the duty of every person and organization interested in the poultry industry, or allied business, to get back of the movement and give it hearty support. Mr. Hicks is an ex-president of the American Poultry Association and a loyal member of that organization. He is well qualified to serve in the important office for which he has been selected, being a producer, fancier-breeder, judge of Standardbred poultry, with long experience in various branches of the business as well as being long associated with poultry journalism. He has positively stated that the new federation is not to conflict in any way with the A. P. A. In fact, the latter organization was among the first listed for membership in the federation and President Richards of the A. P. A. was made a vice-president of the federation.

This is no time for a split in the ranks of poultrymen or for a division of interests and effort. Every fancier, breeder, practical poultryman, baby chick man, incubator manufacturer, supply and feed dealer—in short, everyone interested in

Shorten the Molt-Hurry the Pullets

Fall and winter eggs bring the high prices. This season they promise to be higher than ever. Get your birds to laying early. Keep them at it all winter. Make bigger profits than ever before. Right now, today, you should begin giving your flock

Pratts Poultry Regulator The Guaranteed Poultry Tonic and Conditioner

It shortens the molting period by weeks, prevents loss during this critical period, makes the hens lay early and often. It brings the pullets to early laying maturity, strengthens and invigorates them for a hard winter's work.

In a word, Pratts Poultry Regulator will make *your* layers begin profitable egg-production weeks earlier than they otherwise would, keep them laying heavily and steadily during the period of high prices, protect their health, enable them to earn big money for you. *Make the test at our risk.*

Pratts Poultry Disinfectant keeps the poultry plant sanitary, drives disease away, destroys lice and mites. It is inexpensive—pleasant—non-poisonous—highly efficient.

Our dealer in your town has instructions to supply you with Pratts Preparations under our square-deal guarantee—"Your money back if YOU are not satisfied"—the guarantee that has stood for nearly 50 years.

BIRDSEYE VIEW OF OAK DALE FARMS, BOX A, LE ROY, MINN

the welfare of the poultry industry—should boost for the National War Emergency Poultry Federation and help to make it a complete success. It is folly for anyone to say that fanciers have nothing in common with the new federation. Everyone connected in any way with the poultry industry has in-

terests in common with all other poultrymen; the fanciers should have more in common with this movement than the others, for the fancier-breeder's success is dependent upon the success of other branches of the poultry industry. Put aside all doubts, forget differences of opinion and bury prejudice. Union of

all poultry interests in one big, harmonious, efficient, co-operative organization is essential to getting the Standard-bred poultry industry where it ought to be. We have been muddling along from bad to worse overlong. Here is a chance for a "get together" of all poultry interests for the common good of all. Let's make the most of it. The federation is pushing a campaign for "Twenty-five Thousand One-Dollar Members" and a great many of the life members of the American Poultry Association are joining, and believe that by so doing they will be able to accomplish loyal service to the old organization and help boost a big co-operative movement which will benefit the whole poultry industry. Here is an opportunity to put into effective operation the strength of a union of all poultry interests in one big, organized effort which embraces all poultry associations and every branch of the poultry business and allied business. It does not matter whether or not the movement has come in the precise manner which we hoped for—the federation is a fact, it has the support of the poultry representatives at our state agricultural colleges, it is now on the job and doing business, and earnest, honest, capable men—loyal members of the A. P. A., too—are working hard to insure success. So get into the procession and be a booster. Let's have a united poultry industry.

Reese V. Hicks, president of the federation, reports that headquarters of the N. W. E. P. A. were opened at 918 F Street N. W., Washington, D. C., the first week in August. This is prompt action and promises well.

* * *

Once again we are up against a serious sugar shortage here in the East and are asked to voluntarily do without sugar for two months or so. For the most part, the people are cheerfully accepting the situation and doing without sugar except for a modest allowance of two pounds a month for children. However, it is difficult to understand a line of reasoning which considers it necessary to supply candy manufacturers with sugar by the ton while homes must go without sugar; we have many candy manufacturers in our state and they do not appear to be limiting their output to any considerable extent. Also, it has one guessing when professional baseball

Are Your Hens Doing Their Best ?

More eggs and chickens is the crying demand today. Never has there been a time when the right kind of poultry feed meant so much in results and profits.

Badger Poultry Feeds

Badger Poultry Feeds are solving the feeding problem for thousands of successful poultry raisers. They contain the necessary food elements, keep egg production at maximum, build strong healthy fowls, because they are prepared by experts who combine practical experience with scientific knowledge.

CONSERVATION SCRATCH

Your fowls must have a good scratch feed. Conservation Scratch meets the Government demand for conservation of wheat. It is a scientifically selected combination of clean grains which analyze high in food value and supply exactly what is required for a high quality scratch feed.

Use Krause Mash for your mash feed. It has made a splendid record, is a remarkable egg producer and is always uniform in quality. Krause Mash and Conservation Scratch will keep your stock in pink of condition. Conservation Chick and Developer Feeds are unrivaled for promoting rapid and healthy growth of young chicks.

players are exempted from military duty until the close of the season, as being engaged in essential employment, while farmers and poultrymen, both married and single, are being promptly drafted and often taken on such short notice that they have no time to settle up their business affairs or get the farm and plant into competent hands. Is sport more essential than food production? Is candy an essential or a luxury?

* * *

There seems to be a considerable mixup in the matter of feed prices, especially so in the fixed prices on wheat by-products. According to government statement, the price on wheat "mixed feed" on July 1 was fixed at \$26.88 per ton, bulk, in carload lots. On July 22 a new fixed price on the same product was given as \$31.88 per ton, bran at \$31.13 and middlings at \$32.63 per ton. In order to get these prices one must buy of the mill direct for cash and order a full carload of each feed. The price bagged was stated to be around \$6 additional per ton. Supposedly any farmer or group of farmers could buy at these prices, but we have not been able to learn of anyone who has been able to buy at the fixed price, altho this price was supposed to prevail f. o. b. station at Eastern points. Dealers here are still getting from \$2.40 to \$2.85 per 100-pound bag for mixed feed in ton lots and our local grain dealer told us on August 8 that he had to pay \$46 per ton for mixed feed in sacks in carload lots. There is a decided scarcity of wheat by-products here in the East and men who are in the feed trade state that we may expect a shortage until the new crop of wheat is milled.

* * *

According to recent quotations of our local organization, the Old Colony Co-operative Poultry Exchange, the best prices on grains and feeds which it has been able to secure for members are as follows, per 100-pound sack (sacks 30 cents extra on hard grains): Corn meal, \$3.45; cracked corn, \$3.60; whole corn, \$3.60; gluten feed, \$2.80; scratch feed, \$3.80; stock feed, \$2.60; oats, \$2.15 (per 2 bushels); spring bran, \$2.35; spring middlings, \$2.35; flour middlings, \$2.68; ground oats, \$2.37; hominy feed, \$3.05; dry mash mixture, \$3.85. These prices are considerably easier than they have been and are wholesale to members only.

Under present conditions it is undoubtedly the wisest policy for backlotter and small flock poultry keepers to buy scratch grain and ready-mixed mash mixtures. Where a reliable brand is purchased results are more satisfactory all around. Of course, owners of large

flocks may find it more economical to buy separate grains and feeds and do their own mixing. We have been using a ready-mixed mash all summer and combining it with liberal feeding of corn and oats. The mash we get contains both fish meal and fine beef scrap, and

Are The Winter Quarters Ready?

NEARLY everyone realizes that poultry and livestock will not thrive or produce their best when confined in dirty, dark and gloomy living quarters. In winter eggs and dairy products bring their highest price, and poultry and livestock spend most of the time indoors—without the benefit of sunshine and fresh air. Therefore it is most important that buildings be kept bright, cheerful and sanitary, as a help to better production and also as insurance against the introduction and spread of contagious disease, which if once started is apt to spread rapidly and cause the loss of the entire season's profits.

The time and trouble it takes to mix whitewash and the double work of again going over the same surface with a disinfectant keeps many men from giving this sanitary work the attention they know it deserves. This disagreeable task can be turned into an easy, rainy-day-job if you will use

a snow-white paint, in powder form, combined with a germicide, or disinfectant, that is many times stronger than pure carbolic acid. Carbola is neither poisonous nor caustic, but it kills lice, mites, fly-eggs, etc., and is as effective as anything on the market in keeping the germs of contagious diseases that affect poultry and livestock from spreading through your flock or herd.

Carbola is ready to use as soon as mixed with cold water—no straining or waiting—and can be applied to wood, brick, stone or cement surfaces or over whitewash, with a brush or spray pump. One gallon covers about 200 square feet.

It will not blister, flake or peel off, has no disagreeable odor to taint milk or other food products, does not spoil by standing so can be kept on hand ready to use when wanted. The dry Carbola is unexcelled as a lice powder.

Use It Instead Of Whitewash

Carbola will increase the light in your poultry houses, stables, pig pens, cellars and dairy buildings—make them sweet-smelling and sanitary—a pleasanter place to work in—improve their appearance—all in one operation. Carbola is used and endorsed by thousands of poultry, dairy and breeding farms, and many agricultural colleges and experiment stations. Order today so you will be sure and have it when you want it.

the welfare of the poultry industry—should boost for the National War Emergency Poultry Federation and help to make it a complete success. It is folly for anyone to say that fanciers have nothing in common with the new federation. Everyone connected in any way with the poultry industry has in-

terests in common with all other poultrymen; the fanciers should have more in common with this movement than the others, for the fancier-breeder's success is dependent upon the success of other branches of the poultry industry. Put aside all doubts, forget differences of opinion and bury prejudice. Union of

all poultry interests in one big, harmonious, efficient, co-operative organization is essential to getting the Standard-bred poultry industry where it ought to be. We have been muddling along from bad to worse overlong. Here is a chance for a "get together" of all poultry interests for the common good of all. Let's make the most of it. The federation is pushing a campaign for "Twenty-five Thousand One-Dollar Members" and a great many of the life members of the American Poultry Association are joining, and believe that by so doing they will be able to accomplish loyal service to the old organization and help boost a big co-operative movement which will benefit the whole poultry industry. Here is an opportunity to put into effective operation the strength of a union of all poultry interests in one big, organized effort which embraces all poultry associations and every branch of the poultry business and allied business. It does not matter whether or not the movement has come in the precise manner which we hoped for—the federation is a fact, it has the support of the poultry representatives at our state agricultural colleges, it is now on the job and doing business, and earnest, honest, capable men—loyal members of the A. P. A., too—are working hard to insure success. So get into the procession and be a booster. Let's have a united poultry industry.

Reese V. Hicks, president of the federation, reports that headquarters of the N. W. E. P. A. were opened at 918 F Street N. W., Washington, D. C., the first week in August. This is prompt action and promises well.

is prepared at a nearby elevator. There is considerable advantage in being able to buy nearby products, as transportation delays are frequent. Small lots of from a few hundred pounds to one or two tons are subject to long delays in freight, but where a group of producers or a co-operative association can buy in carlots there is less trouble in getting delivery, altho it may be rather slow.

* * *

We have just received the summer issue of *The Puritan Hen*, a new poultry paper "published every little while" by the New England Poultry Producers' Exchange and distributed free to all present and prospective members. This publication is devoted to the conservation and promotion of New England poultry interests and to the upbuilding of the exchange, and contains the prospectus of this new co-operative poultry association. Those interested in the association and its work should write to R. L. Morgan, Clerk, New England Poultry Producers' Exchange, 393 Main Street, Worcester, Mass. The exchange has adopted a "Blue Diamond" trademark which will appear on all packages of poultry produce marketed for members, and a Boston store is soon to be opened. The officers of this organization are: Howard P. Gilmore, president; William H. Saart and Paul P. Ives, vice-presidents; Walter B. Farmer, treasurer; Ralph L. Morgan, clerk; directors, J. H. Lord, H. P. Gilmore, A. M. Lovenberg, W. H. Saart, R. L. Morgan, Brooks Farrar, W. H. Mayo, Paul P. Ives, Lester Tompkins, W. B. Farmer; "at large," J. C. Graham, W. F. Kirkpatrick, D. J. Lambert, Chas. E. Allen and H. M. Tucker. Howard W. Selby, of Springfield, Mass., is manager.

Here is an interesting article which we found in *The Puritan Hen*:

Food Value of Eggs.

Eggs are one of the cheapest foods to be had to take the place of meat. We quote from a government bulletin: "The principal food element furnished by eggs is protein, the nitrogenous tissue-building element whose presence in considerable proportions also gives meats, fish, milk, cheese, etc., their special food value. Eggs can therefore be substituted in the diet for the latter foods without altering the proportions of protein consumed. In addition to protein, eggs also furnish fat and a number of valuable elements, including sulphur, phosphorus, iron, calcium and magnesium in an easily assimilated form, and are believed also to be rich in certain essential vitalizing elements called vitamins.

Like milk and unlike meats, eggs do not contain substances convertible in the body into uric acid. Their shells constitute the only waste materials. Ninety-seven percent of the portion eaten — a high proportion compared to other foods—is digested. No extended cooking is necessary for eggs and therefore, a saving of time, labor and fuel in their preparation when they are compared with other foods. For all these reasons eggs deserve an important place in the diet for use at times in place of other foods rich in protein, provided egg prices are not so high as to outweigh the other considerations.

Remember that a dozen eggs ought to weigh at least 1½ lbs. and we will assume that you pay in the cold weather \$1 per dozen for them. Ninety-seven percent of this purchase is all good, healthy food. A good steak at 75 cents per pound will be found to be one-third bone and waste fats. In other words, you have paid 75 cents for two-thirds of a pound of meat. The real cost of this food is therefore \$1.12½ per pound.

In the case of the dozen eggs that you bought for \$1, you only paid at the rate of 66 2/3 cents per pound, because you buy 1½ pounds for a dollar.

This simply means that of the two foods meat is costing you \$1.12 per pound against eggs, the better food, at 66 cents per pound.

Conducted by
 Prince T. Woods, M. D.

Questions about poultry are answered in this department free for all readers of American Poultry Journal. Where answers are desired by mail, a stamp for reply is requested. Address all query letters to the managing editor, Dr. Prince T. Woods, Lock Box 4, Silver Lake, Mass.

How Many Pullets in 14x15 Open-Front House?

Q. Please advise me how many Ancona pullets I can keep in a Woods open-front house, 14x15 feet. I want to use these birds for layers during coming winter and do not want to crowd them. W. P. H.

Johnson City, Tenn.

A. Fifty pullets will be about right for comfort and best results. If necessary you can make the house accommodate 60.

No Droppings Boards.

Q. Of what use is the droppings board? In my opinion, it makes just that much extra surface to keep clean. If it caught all the droppings it would be a different story. Perhaps it serves a use in preventing drafts at night. My idea is no dropping boards, placing the roosts at proper height from the floor. Of course, keep the whole place clean. Denver, Colo. W. J. D.

A. The use of droppings boards is a matter of individual preference. We have a dozen poultry buildings and only have dropping boards in one of them. The chief reason is that with this particular house, which is a portable one, the dropping boards came with it. We do without a dropping board because it saves labor and one does not need to clean out the house so often. Roosts are at rear of house and the hens scratching away from light throw more or less earth and litter back over the droppings. Roosts are usually placed about two feet above top of sills in earth floor houses or a like distance above floor in a wood or cement floor house. There are times when one is housing exhibition stock that it is convenient to have dropping boards, which should be cleaned daily and well covered with dry earth or other absorbent; but for layers or breeding birds we have not found them necessary.

Where droppings are to be saved for sale dropping boards are essential, for the droppings must be saved dry and free from foreign material. We use all droppings for dressing garden or grass land and it is more convenient for us to have them housed until they can be carted and spread in one operation. As long as there is no offensive odor from the droppings and they remain dry beneath the roosts, so that the birds do not foul their feet, we feel that there is no objection to their remaining under the roosts. If the droppings advertise their presence by proving offensive to a sensitive nose, they should be removed at once. With good management, it should not be necessary to clean the poultry house more than three times a year—early spring, midsummer and fall. At these seasons the droppings can be applied directly to the land. Every time manure is handled and moved adds to its cost. If we had a back-lot flock we probably would use dropping boards

and keep the manure in covered barrels, to be used as needed. There is a wide difference between handling large flocks on a farm and a small back-lot flock.

Poultry House in South.

Q. What kind of a poultry house would you advise building on a small

plant south of Jacksonville, Fla.? Would a wire enclosed building, made of so-called "wire lath," used for stucco work, be sufficient? C. C. P.

Jacksonville, Fla.

A. We have not had any experience in keeping poultry in Florida, but we believe that in so genial a climate a poultry house with good rainproof roof and with side walls made of heavy 1/4-inch mesh wire cloth, or of the "wire lath" as you suggest, would be all the house needed. Heavy 1-inch mesh poultry netting would serve, unless thieves are troublesome, in which case it is too easily cut with tin shears. In tropical or semi-tropical climates a roofed shelter to protect roosts and nests from rain and wind storms is all that is needed. We have seen some excellent poultry

**SUCRENE
 POULTRY MASH**

Prof. C. H. Burgess, Michigan Agricultural College, has learned from experience that "no matter what sort of feed one can prepare from the ingredients to be obtained at retail, he can do still better on feeds accurately prepared by feed manufacturers."

**Sucrene Poultry Mash and Scratch Feed
 Meet Every Poultry Requirement**

Chick growth and egg production demand the same nutrients. Grain alone does not supply them. Sucrene Poultry Mash is necessary for both. It contains the strong protein element for bone, flesh, feathers and rich blood, in growing poultry; and, combined with Sucrene Scratch Feed, supplies the materials for yolks, whites and shells necessary for maximum egg production.

Composed Only of High Quality Materials

Sucrene Poultry Mash is composed of high grade meat scraps, corn feed meal, alfalfa meal, corn distillers' dried grains, wheat bran, linseed meal, palm kernel meal, calcium carbonate and a little salt.

Sucrene Scratch Feed contains only clean, sound grains in correct variety and proportion to insure best results.

Raising a thousand chicks "with practically no losses by disease" and "doubling egg yield in three weeks," are Sucrene Poultry Feed records.

Try Sucrene Feeds. Save feed money; save trouble; make your poultry profits sure. Order a 100-lb. sack of each feed from your dealer at once. The coupon or a post card brings you full information and important facts about care and feeding of poultry.

Ferris Leghorns

LAY WINTER EGGS

For eighteen years Ferris White Leghorns have been bred to lay more eggs at all seasons than ordinary hens, and to lay particularly well in winter when eggs are highest. We do not breed from hens that are not good winter layers. We can't afford to, for with one of the largest poultry farms in the country we must have winter eggs to make it pay.

Thousands of poultry keepers in all parts of the country are having unusual success with Ferris stock; hundreds of customers in Canada also, and we have made successful shipments to Scotland, Japan, Australia, Nicaragua, Alaska, Philippine Islands, Bermuda, Cuba and Mexico. We guarantee safe arrival anywhere.

ALL STOCK IS SHIPPED ON APPROVAL. You can return within three days any birds not satisfactory and money will be refunded. (We will ship C. O. D. if you want to see the birds before paying for them. Send only \$1.50 for a pen of five, and 20 cents each for larger numbers to guarantee express charges.) We insure all stock for 30 days. Any birds that die or get out of condition will be replaced free of charge. Their breeding value is also guaranteed. Any male that does not produce fertile eggs, any hen that does not lay hatchable, good-shaped eggs replaced free.

Special Aug. and Sept. Prices

We have three grades of laying stock. Stock from our heaviest laying strain with trapnest records of 230 to 264 eggs will cost as follows.

EARLY HATCHED COCKERELS \$9.00 each, \$8.10 each for 10 or more. Yearling hens or early pullets \$4.50 each—1 male, 2 females, \$18.00; 1 male, 4 females, \$27.00; 1 male, 8 females, \$40.50; 1 male, 12 fem., \$54.00; 7 males, 100 fem., \$385.20.

STOCK FROM 200 TO 230-EGG STRAIN—the kind we recommend for breeding and laying where large flocks are required: Early hatched cockerels \$6.30 each, \$5.40 each for 10 or more. Early pullets or yearling hens \$3.15 each; 4 females, 1 male, \$18.90; 12 females, 1 male, \$42.30; 100 females, 7 males, \$294.30; 100 females without males, \$256.50.

UTILITY STOCK FOR LAYING AND BREEDING. Not bred from trapnested stock, but from stock that we can guarantee to be better than the average. Cockerels \$4.50 each, \$3.60 each for 10 or more. Hens \$2.25 each, \$180.00 per 100. Pullets \$2.70 each, \$225.00 per 100. Four hens, 1 ckl., \$13.50; 12 hens, 1 ckl., \$28.80.

WINNERS FOR ANY SHOW. We can furnish cocks and cockerels hatched directly from our Chicago Coliseum winners at \$30.00 to \$100.00. Hens and pullets at \$15.00 to \$50.00. These birds will win at any fair. They have splendid low tails, good heads, wonderful shape in every section, and pure white plumage. We have hundreds of early hatched cockerels and pullets to select from and will guarantee them to please you. Remember that for several years Ferris Leghorns have been leading winners at the Chicago show, winning in 1915, 3 firsts and numerous other prizes, including silver cup for best display and silver cup for best five cockerels. In 1916 we won all specials, all 1st and 2d prizes; last Dec. we won 3 first and 16 other prizes, so no matter where you wish to show, we have the birds that will win for you.

This 1918 Catalog Is FREE

Send for your copy today. Describes fully the stock, eggs and chicks quoted above. Contains photos showing 35 acres of White Leghorns; describes our methods of feed and care; how we improve laying qualities; list of winnings at 20 big shows; many letters from customers; prices of exhibition, breeding and laying stock, eggs for hatching and day-old chicks. Even if you are not now in the market for stock, we will be glad to send you a copy. Mail postal now while you have the matter in mind.

GEORGE B. FERRIS
905 Union Avenue Grand Rapids, Mich.

houses in the South that were practically all open, wire front and the rear and side walls made of slats spaced about one inch apart. We shall be pleased to have poultry keepers in the far South send us photos, plans and description of the poultry house they find best suited to their locality.

Formula for Dry Mash and Scratch.

Q. Please give me a good dry mash formula. The following feeds are more readily obtained here: Corn meal, ground oats, wheat bran, wheat middlings, stock feed, fish meal and beef scrap. For scratch grain we have cracked corn, feed wheat, oats and barley. How would you mix them?

Lynn, Mass. J. C. B.

A. For mash mixture use equal parts by weight of feeds named and about 10 percent each of fish meal and beef scrap. Make your scratch grain mixture 100 pounds cracked corn, 64 pounds oats, 48 pounds barley and 20 pounds of feed wheat.

Feed Bags.

Q. What are burlap feed bags worth? I have a good many saved which contained bran and mixed feed.

Worcester, Mass. C. H. H.

A. Feed sacks are very scarce, having been bought up for shipment overseas. If you have any use for them would not sell them, as in a very short time one may be required to furnish his own feed sacks; in fact, in most purchases of feeds and all hard grains the buyer is obliged to pay 30 cents each for sacks. Feed sacks in good order will sell to collectors and feed dealers at from 20 to 30 cents each, according to condition and quality. Heavier sacks, such as are used for meal, are bringing even higher prices. Those who have use for sacks will find that it will pay to take good care of them and hold onto a sufficient supply for their own use.

A Matter of Judging.

Q. In showing a pullet, what age should it be? Should pullet be undeveloped in comb, wattles and lobes? Is a pullet too far advanced if she has been laying for one or two weeks? If a pullet is shown equal in type and up to Standard in the majority of sections, and had been laying for one or two weeks, and a younger pullet, say about four months old, both pullets equal in all sections, would the younger pullet win over the older? Kindly give page of Standard dealing with this subject. Above information is wanted in regard to S. C. White Leghorns. If younger pullet was placed over the older, could a protest be made? C. W.

Merritton, Ont., Canada.

A. This is a matter for the judge handling the class to decide. All things being equal, the one nearest Standard weight should win, if size and weight are proportionate (see "Instructions to Judges," pages 35 and 36, Standard of Perfection). Condition would be an important factor in deciding between the specimens. A pullet which had been laying would not be likely to be in as good show condition as one which was just about to arrive at laying maturity. Age is not so important as type and condition, but "the size must be proportionate to the weight, preserving the ideal shape and type of the Standard

specimens." As a general rule, it is not good policy or good sportsmanship to protest awards. It is to be assumed that a competent judge has good and sufficient reason for placing one specimen above the other in awarding prizes. The Standard weight for Leghorn pullets is 3½ pounds.

Leg Weakness in Ducklings.

Q. Please tell me the cause of leg weakness in young ducks. They have free range of a large orchard, but do not have running water. They are supplied with plenty of drinking water. They get this leg weakness from the time they are six weeks old until full feathered. Have little use of their legs, but after sitting for an hour or more can get up and walk all right for a while, tho they get that way again the same day. There are several of mine that grew faster than the others and they have never had this weakness. Would it be anything in the growth of the ducks? These ducks have dry sleeping quarters. Have not furnished them with much sand or grit. Mrs. A. H. Galena, Ill.

A. Cause is probably too heavy graining and not sufficient lime in ration. Limit the grain ration and let them depend more on greens for food. Keep a box of finely crushed oyster shells where they can have ready access to it at all times. Also supply sharp sand for grit. Supply some good beef scrap in their mash.

Growth on Back of Cock.

Q. I have a Barred Plymouth Rock cock that has a bad sore on his back. When first noticed it was about as large as a cent and had a high, cone-shaped scab. I removed scab and treated it with carbolated vaseline. It seemed to respond all right. Soon it was growing again and finally got to be as large as a hen egg. It does not have the appearance of an abscess, but is covered with a growthy scab and also has an odor, which may come from this scab being removed or may not. The growth is at least an inch high, and the flesh around it looks red and inflamed. It must be about three inches in diameter. Do you think there is a chance of curing him? The bird appears well otherwise.

Groton, Conn. H. D. L.
A. From your description, this appears to be a malignant growth. We would not attempt further treatment. Better kill the bird and burn the carcass.

PURITAN POULTRY FARM Rt. 2 ZANESVILLE, OHIO

Intestinal Worms.
Q. What will kill worms in chickens? Have about 75 Buff Orpingtons affected. Worms are two to three inches long and about the size of a darning needle. The chickens are very pale and inactive and have poor appetites.
C. A. Kingfisher, Okla.

A. The worms are spread thru droppings. Clean up and disinfect poultry quarters. Let the chicks go without food for 24 hours, then give each chicken five drops of oil of turpentine in a tablespoonful of warm milk. Feed crushed garlic bulbs in mash. Finely chopped raw onions are also valuable for flock treatment; if not eaten readily they may be mixed with mash.

Droopy Chicks.
Q. Please tell me what to do for my chicks. They begin to droop and appear to be starving. Have lost a good many of both hen-hatched and incubator-hatched chicks. They are affected within about a week old, some paste up behind and some do not. I feed them bread, milk and rolled oats.
T. R. M. Red Boiling Springs, Tenn.

A. Trouble may be due to lice or mites, in which case the cause should be easily discoverable, and the remedy is to get rid of the vermin. Possibly your flock is infected with white diarrhoea. Better send some chicks to your state experiment station for examination. If white diarrhoea, the fault is with the parent stock. See information on this subject in book, "How to Raise Chicks," which our book department will supply for 75 cents postpaid.

Colds in Young Chicks.
Q. I have about 150 Leghorn chicks and 11 young geese in the same yard. About three weeks ago the chicks got a cold and are not over it. Have been using a remedy, but they are not getting much better or worse.
Mrs. P. K. Gilman, Ill.

A. It is a mistake to allow geese to occupy the same yard with young chicks—bad for the chicks. Wash nostrils and eyes of chicks and apply camphorated vaseline to nostrils and cleft in roof of mouth. See that sleeping quarters are dry, clean, well aired and not crowded. Feed the chicks liberally. Put the geese in a separate yard.

Silage for Poultry.
Q. I read on page 89 of July A. P. J. that J. G. Halpin recommends the use of silage for poultry feeding in winter. I would like to know what he makes it out of and how he keeps it from souring.
A. S. Lancaster, O.

A. Write to Wisconsin College of Agriculture, Madison, Wis. The article referred to was quoted from a circular by J. G. Halpin of that institution. Silage just as it comes from the silo is sometimes fed plain to hens or is mixed with the mash. Silage is made of various fodders, chiefly corn. Any readers who have had experience in making silage especially for poultry will confer a favor by sending us a detailed report concerning silo, preparation of silage and use in poultry feeding. Where there is a silo for preserving fodders for the cattle, the matter of supply for the poultry is a simple one. We do not think it would pay to build a silo for the sole

purpose of putting down green fodders for poultry.

Shipping Boxes for Half Grown Chicks.

We have had a number of inquiries for shipping boxes for half-grown chickens. It would pay any manufacturer making a specialty of such to advertise. In our section of the country live chickens from one pound up are shipped in crates.

Mating Related Stock.—Red Color.

Q. I bought a number of Rhode Island Red chicks. The pullets developed good type, but were off in color. I bought a good male this spring from a reliable breeder to mate with these females. He is a bird of fair type, good color and very vigorous. The eggs ran fine in fertility and hatched well. The early pullets are doing fine and all are darker than their mothers. Would you advise mating this male bird to his pullets, or would you keep to the same mating for another season? Would you mate one of the best cockerels back to the hens or would you buy another male? I am after eggs, but if I can do so I want to get better color and type without hurting the egg yield. These hens are not record-breakers, but they have done well. W. H. T.

Great Falls, Mont.

Would mate the cock bird to ten of his best pullets and five of the best hens. Believe that it will be to your advantage to get male from the same breeder to mate with selected females from balance of your stock if you intend to have two breeding pens. Be sure that all breeding birds are healthy and vigorous.

Poultry Manure for Grass.

Q. I have a considerable quantity of poultry manure and can get more nearby. Do you consider this good for application to old sod land and how should it be applied to land which is to be newly seeded to grass?

Whitman, Mass. E. M.

A. We consider poultry manure one of the best fertilizers for grass land. Properly prepared, it makes a fine dressing for old sod. For this purpose you will probably get the most out of it by applying the manure in the late fall or early spring before the grass starts. Compost it and make it as fine as possible before spreading. For fall laying down of grass, it is best to apply the poultry manure after plowing and to harrow it in. In this way you get all there is in it and the grass gets a good start before the heavy frosts come.

Egg Eating and Feather Pulling.

Q. What can I do to prevent my hens from eating their eggs? Have one flock that also pulls feathers, the hens eagerly eat up every feather that drops. How can I stop them?

Lexington, Ky. T. A.

A. Both bad habits are often the result of crowding, idleness, and a poorly balanced ration. Give the birds liberal range or keep them busy working for a part of their food in deep litter. Feed green food freely. Use a little salt to season the mash. File the beaks at point with a flat file, blunt the beak until it shows pink but does not bleed. This will put an immediate check on egg eating and will discourage feather pulling. Provide dark nests.

The Morris White Orpingtons

"THE PROVEN LEADERS"

GET started with them for the coming season. They are winners at the big shows, winners in the egg-laying contests. More points won at Chicago

Prince I, First Cock Madison Sq., Jan. 1, 1916, and Jan. 1, 1917

Coliseum and Madison Square Garden the last two years than by any three of our competitors combined. All thru the five winter months our five pullets now in the egg-laying contest at Leavenworth, Kansas (51 pens competing), ranked either first or second, and led all Orpingtons by over 100 eggs.

The Morris White Orpingtons are the real war-time fowls—combining beauty, meat, and eggs. They have the snow-white color, true Orpington type, heavy bone, great size, and best of all—eggs in winter when they have real value.

We Have Several Hundred Cockerels and Pullets

now nearing maturity that are ready for fall fairs, winter shows, laying contests and breeding pens.

Leggett's Columbian Wyandottes

SPECIAL—We are now offering a few fine breeders from all of our matings at one-half their worth. If you want the greatest values, write now. Cockerels and pullets mostly all spoken for. Free circular. H. A. D. LEGGETT & CO., 24 N. Nash Pl. BURLINGTON, VT.

remove some of the wood of this season's growth. Make the cuttings so that there will be one bud below ground and one or two above. Dig a trench, making one side straight up and down. Place the cuttings in trench. Fill trench about half full of dirt. Now tramp as solidly as you would were you setting a post. This is the secret of quick growth of the cuttings. Fill to top with soil, but do not pack this upper soil. Cuttings so planted will take root and make some growth in fall. Next spring they will start off on the jump, and by fall be large fine plants, which can then be set permanently. Late in fall, mulch the cuttings quite heavily. Be sure to do this. If you do not, they will be injured by freezing and thawing and may be thrown out of the ground by the heaving of the soil by frost.

* * *

Go over the bushes of all small fruits and cut out now any diseased branches. Go thru the orchard and note the growth of each tree. If the trees be bearing ones, any limbs to be cut off should now be marked and removed any time after the leaves fall. If young trees, do not do the trimming until next spring. This inspecting each fall while the leaves are on the trees is very important.

See to it that any wounds the trees may have suffered this summer are properly covered by good paint which contains no turpentine.

This is the ideal time to plant and transplant peonies. If you remove a peony clump, be sure to divide the roots when transplanting. Rarely will a peony do well unless so treated in transplanting. There are many of the hardy flowers, vines and bushes which ought to be planted now. I have planted the oriental poppies in the fall and never lost a plant. For years I tried to get a start with these gorgeous bloomers by planting in the spring. I could not get them to live.

* * *

The American Fruit Grower says:

Growing peonies from seed brings pleasure, and often a profit, to the person who will give this work a fair trial. When your peonies are thru blossoming, and are opening their pods, gather their seed and plant about an inch deep in a well prepared seed bed. For the first two years, mulch this bed at seeding time in the fall, and uncover in the spring. Keep them free from weeds. In the latter part of August or the forepart of September of the second year after planting in the soil, dig and plant all the little roots from 6 to 12 inches apart, in rows 30 inches apart. Cultivate and care for them until they bloom, which will be two or three years later. Perhaps you will have some that will tax your patience on account of their tardiness, but be patient until they all bloom.

Choose those that look the best to you and transplant in September. Plant three feet apart in the row and let the rows be four feet apart. You will be surprised with the results of your undertaking. Nature's artist has made no two peonies alike. All are different, and neither pen nor words can describe them.

* * *

I have bought a farm on the eastern shore of Maryland, level ground, sandy clay, and wish you would tell me what trees to plant for best results here. I would like to plant a few of all kinds, also small fruit. Will trees which grow well around Rochester, N. Y., do well here?
Massachusetts.

D. Baker.

If you are going to plant fruit trees for a home supply only, it is all right to plant "a few of every kind." If you are planting a commercial orchard, such a planting would be very unwise. For the home orchard you should plant Henry Clay, Yellow Transparent, Willson Red June, Duchess, Wealthy, Stay-

How to Build Poultry Houses

of all kinds and descriptions. It gives complete plans. How to make feed troughs, nest boxes, water troughs, roosts, dropping boards, brood coops, brooder houses, fattening coops, colony houses, winter and summer houses, etc. Price 50c. **AMERICAN POULTRY JOURNAL PUB. CO.** 623 Plymouth Court Chicago, Illinois

man. These are the best apples of their season for your locality and are named in order of ripening. In peaches, would recommend the following: Mayflower, Red Bird Cling, extra early; Alton Carmen, Champion, Early Elberta, Fitzgerald, early; Captain Ede, Belle of Georgia, J. H. Hale, midsummer; Banner, Sea Eagle Improved, Late Elberta, Late Salway, October Elberta, Krummel October, very late. You will find any of the standard pears suited to your Maryland condition. However, I advise you to make your planting largely of Lincoln. Of course, you will want a few of other sorts. The Lincoln will not blight. At least it has not for me in 20 years, and that is a pretty good test. Make your cherry planting wholly of Early Richmond and Montmorency. In plums you will not have room if you "plant a few of every kind." Use America, Gold, Mammoth Gold, Omaha and a few of the Japanese varieties. In small fruits use the standard varieties. Be sure to make a liberal planting of Royal Purple raspberries. This is a wonderful cropper of large and fine fruit. Will yield more fruit per bush than any other raspberry. Yes, trees and vines produced in New York will be all right for planting in Maryland. You must arrange to keep a few colonies of bees. Be sure to make your start with pure Italian stock. Use the ten-frame, double-wall hive. With such hives the bees winter safely outdoors.

My Golden Bantam sweet corn, heavily fertilized with hen manure, is anything but bantam corn. It is exceedingly large in ear for this variety and of extra good quality.

In this section the potato crop is not so heavy as usual owing to the effect on the vines of the aphids. These pests came early this season and by July 10 many fields were brown and practically dead. I prepared for the enemy. Began spraying with Sulphocide and Cal-Arsenate mixture early. This had the effect of killing the beetles, and I think kept the ants from carrying the aphids to the vines, as the odor of the Sulphocide was distasteful to the ants. Still the vines would have been infested by the aphids if I had not kept busy. I sprayed four times with Black Leaf 40, adding a goodly quantity of Whale Oil soap. This was effective and at this writing (August 1) my late potato vines are as green as in the early summer. I will have a very heavy crop.

I have just moved to a place that has plenty of raspberries, but, unfortunately, they are located where I must build my chicken coop and run. I would like to have your advice as to method of transplanting and care afterward. I have been told that if I cut them down they will grow better and bear more fruit. Is this so? They are a very large, sweet berry and deep red.
John E. O'Brien.
Illinois.

The fowls will not, unless the patch be small, and the fowls closely confined therein, do the vines any harm this fall. As soon as the wood of vines is matured (in early November) cut out all dead wood. Dig up vines and cut live wood back to about six inches of root. Heel in the vines, covering them with, at least, two feet of earth. Do not be afraid of getting in too much earth. You can't do that. Then throw some litter over the top of the mound. Transplant in the spring as early as possible.

Will you please tell me if it would be all right to plant apple trees here in the fall or is it too far north? When is the best time to plant currant, gooseberry, raspberry and blackberry vines?
J. H. Crone.
Minnesota.

It would be unsafe to plant apple trees and raspberry and blackberry bushes in your state in the fall. You can safely plant currant and gooseberry bushes in the fall. Be sure to mulch the bushes well, so as to protect the roots. It will be unnecessary to cover the tops. You can secure your apple trees this fall and heel them in if you so desire.

* * *

Referring to your reference in July issue to use of slug shot on cucumbers, leads me to think you may know something of the use of nitrate of soda as a fertilizer. The directions say, use a teaspoonful to each gallon of water. I apply about a quart of this solution to a hill of cucumbers, or to 6 to 8 feet of a row of peas or a pint to a cabbage plant. Now, at this rate, about how often should the solution be applied? This point my information is very meager on. I have used tobacco dust very successfully for aphids. This dust or slug shot, either one, can be diluted with lime and made to go farther.
A. W. Beale.
Iowa.

I have used nitrate of soda as per your plan for many years. As a rule, I give the vegetable plants about four applications a season. Of course, this cannot be given as a set rule, for plants and seasons differ in needed treatment and growth development. I have found that when nitrate of soda is properly applied it is a wonderful stimulant to plants. If you want to greatly increase your pea yield apply this fertilizer as per your plan to the vines when they are well up again in about two weeks, and again just as the pods begin to set. You will be surprised the way the pods will grow and fill out. Great care must be observed in the use of nitrate of soda. The safest way to use it in the home garden is to dilute it in water, as stated by my correspondent.

* * *

What is the best thing to do for cabbage worms? Is there anything that will keep these butterflies away? Will arsenate of lead do or is it too strong? It is almost out of the question to get Paris Green any more here and London Purple is out of stock all the time.
William Cax.
Iowa.

Hammond's slug shot is the best and safest thing to use in keeping cabbage free from worms. It is death to the worms and non-injurious to human beings. I know of no way to keep the butterflies from depositing their eggs on the cabbage plants. But so long as the worms can be killed by the use of slug shot, the laying of the eggs is of no consequence.

SPROUTED OATS—WINTER EGGS

The Vapor-Bath Sprouts produced by the Close-To-Nature machines possess an efficiency for prolific egg-production not found in sprouts grown the old way or in many so-called grain sprouters. A sweet, succulent, tender, edible, palatable sprout is grown in the Close-To-Nature Vapor-Bath machines.

Sprouted Oats From One Bushel Of Grain

CLOSE-TO-NATURE GRAIN SPROUTERS

The DOUBLE-QUICK, the ALL-METAL SECTIONAL, the LAMPLESS, three kinds and all sizes from a few hens to 1,000,—made by the pioneers and largest manufacturers of Grain Sprouters. The Grain Sprouter or Perpetual Poultry Sito runs up the egg yield and cuts down the feed bill. Turns high-priced grain into low-priced feed. The Close-To-Nature Vapor-Bath machines sprout in 20 to 30 hours and force growths of 1 to 2 inches daily, thus producing the best of easily-digested, highly-efficient, egg-producing feed. Circular free.

ROBADEL POULTRY FARM A. C. ROBERTSON, Owner COS COB, CONN.

First Madison Square Garden cockerel and pullet, January, 1918. Bred and owned by Morris Poultry Farm, Lebanon, Ohio.

In answer to Calvin Boyd, Indiana: Cox Orange is an apple of high quality but rather difficult to produce profitably. George Powell of New York is growing them successfully and has been shipping them to England, receiving big returns thereon.

* * *

I noticed in a recent issue of A. P. J. you advised a correspondent to stop off in the Piedmont Valley of Virginia, on his way to

Florida, and to investigate the farm and fruit lands of the Virginia section. What part of Virginia is this? What kind of land? Why is it cheaper than here in Indiana? Here in Randolph and Delaware counties, land sells for from \$100 to \$250 per acre. I am now a renter and want to buy somewhere. I have often heard of the Shenandoah Valley of Virginia. I want to buy level land for general farming and where the winter or feeding season is not quite so long as it is here. Would like to have you tell me what you can about Virginia, at least the level part of it. What

is the price of land there and what are some of the drawbacks?
Indiana. Wm. M. Cline.

There are a number of reasons why land is cheaper in Virginia than in Indiana and the Central West. The tendency has been to go West. Another reason is that after the war of the rebellion Virginia was in a bad way. Her plantations were ruined. She was without men and capital to reconstruct her

farms. In the valley of Virginia and in the Piedmont section of the state are lands as rich and productive as the best lands in the Central West. These Virginia lands are today producing more grass per acre than the best grass lands of the West. The corn yield is as heavy. Virginia is not surpassed or equaled as a live stock state. The climate is delightful in the Piedmont and Valley of Virginia sections. The water is abundant and pure. The timber for home and farm use is plentiful. I think the people of these two sections of Virginia live better than do the people of any other section in all the United States. There is a lot of poor land in Virginia—poor from an agricultural standpoint. The good land of Virginia cannot be bought for low prices. Good land, wherever it is located, demands a good price. Yet land as good as the best in the Central West can be bought for half the money in Virginia.

* * *

Would like your advice as to what is affecting my grapes. Some of them show a purple spot and burst open on that side, exposing the seeds.

R. T. Scaife.

Illinois.

There are two kinds of insects which cause worms in the berry of the grape. One of these is the larva of a moth. This worm is about one-half inch long, of a bluish black color, that spins a web and lets itself to the ground. The other is the grub of the curculio. Thoro spraying with arsenate of lead will effectively control both insects, altho the curculio can be more effectively controlled by constant cultivation of the soil about the base of the vines.

* * *

Every season I have several letters asking me how to treat beans and peas to keep them free from insects when held over for winter use or for seed. I treat my beans and peas and, in fact, all seeds with carbon bisulphide. This is a heavy volatile liquid. The fumes are very inflammable and caution must be taken to keep the liquid away from a flame or even a lighted pipe. The fumes of the liquid are heavier than air, so the liquid should be placed in a shallow dish on top of the seed being treated. I put the seed in an airtight box, which I had made for this special purpose. To each peck of seed I use one ounce of the liquid. This kills any insect there may be in the seed, also any insect eggs. The seeds thus treated germinate when planted as well as untreated seed. Neither does this treatment spoil any grain or vegetable for eating. Any box may be used in treating seeds, but care should be taken to have it as near airtight as possible.

- In answer to P. C. McNamara, Ohio:
1. Good farms, with good improvements, can be bought in Southern Minnesota for \$75 to \$175 an acre. This land is very productive.
 2. Northern Missouri is a very rich farming section. Great crops of corn, hay and all grains are raised. Land there brings \$100 to \$200 an acre for well improved farms. Of course, now and then a farm can be bought for less money.
 3. The cut-over lands of Wisconsin are being purchased at a rapid rate by Iowa farmers. A man sells his Iowa farm for \$250 to \$300 an acre. He goes

to Wisconsin and gets a farm for himself and one for each of his boys—and has money left. Those cut-over lands are wonderfully productive in grass, potatoes and such crops. Of course, it means a pioneer life for the men who go there and make farms of this new, unimproved, wild land. But men will prosper there, I am sure. These lands are selling from \$10 to \$75 an acre.

4. You say in your letter: "I have 80 acres of as good land as there is in Ohio. I can sell it for a big price." You have not asked me for advice as to selling this home farm and going out into a new county to make a home. But

Just What You Will Need This Winter

This is the FAULTLESS Automatic Feeder

All you have to do is to fill the can of this feeder with wheat, corn, oats or any other kind of feed, either mixed or separate. When the chickens are hungry they pick at the cross bar; this causes some feed to drop to the ground where the chickens can pick it up. No feed spoils or is eaten by rats or sparrows. **You can save enough feed in one month to pay for these feeders.** Besides the saving of fuel, you save work.

Here Are Our Low Prices

This feeder holds 1/2 bushel of feed. It is made of heavy rust-proof material. It weighs six pounds packed for shipping. Order by No. 153.

8-quart two for \$2.50
16-quart each \$1.75

And What is More, we will send you two 8-quart feeders, same style as above, both for \$2.50. These two feeders weigh nine pounds and will not be sold singly. Order by No. 152.

Here is the Feeder for Your Low Coop

Or for Your Baby Chicks

It holds five quarts, will feed any kind of feed, either mixed or separate. It is built on the principle of the large FAULTLESS Feeder and is furnished complete with brackets, which can be attached to the wall or side of a coop at proper height. This feeder is beautifully painted and with ordinary care it will last forever. It is guaranteed to feed your stock perfectly from the time the chicks are able to eat until ready for the ax. We sell this feeder for \$1.00. It weighs 3 1/2 pounds when packed. Get one today and feed your chickens right. Order by No. 151.

We carry a full line of poultry appliances and remedies. We also manufacture the well known Simplex Genuine Feather Brooders and Hovers—both heated and fireless. Send for our CATALOG; it will interest you.

GLOBE ELEVATOR COMPANY
25 Seneca Street Buffalo, N. Y.

I cannot resist the temptation to tender advice. Why sell the home place, which you say you have lived upon for nearly 35 years? Why, at your age, set the door against peace and plenty and go out in search of a new home, which can never be as dear to you and give you the comforts your present home is and does? Why, man, you are living in the Garden of Eden! "As good a farm as there is in Ohio!" Why, that means as good a farm as there is in all the world. Unless there is some special, important reason for so doing, do not leave this farm—this home. It's yours. It's paid for. You have put the best of your years into the making of it. It ought to be very dear to you. Don't leave it!

* * *

I have upon demand surrendered a number of magnificent walnut trees to the government. It was hard to give up these trees. I have known them ever since I was a child—played beneath their branches and gathered nuts from them for all these years. "Damn the Kaiser!"

* * *

In answer to J. A. Kearns, Kansas: Yes, there is much good farming land in Columbia County, N. Y. The principal crops are corn, rye, buckwheat, potatoes and fruit. Dairying is a leading industry. The county is most favorably situated for good transportation to large markets within reach of the farmers. Farms can be bought for from \$25 to \$300 an acre.

* * *

Our Progressive strawberry plants are yielding heavily now and we are having strawberry shortcake daily. These so-called everbearing plants are all right for a home supply, altho I would not

discard the bed of spring-producing sorts. I do not think the everbearers will ever be a success commercially.

* * *

We will dry a large quantity of sweet corn this month. To our taste it is far superior to canned corn.

Readers Open Forum

Information at the State Fair.

FAIR-TIME is drawing near, and no doubt thousands of our readers will be visiting the leading state and county fairs. Much of the information to be gleaned on these occasions should prove of practical value. When one goes to the fair he probably has several objects in view—a holiday, a good time and some specific purpose that has to do with the conduct of his business of farming. In connection with this latter object we desire to direct attention to the efforts made by exhibitors to bring prominently to your notice material and apparatus that will be of practical benefit to you.

Do you fully realize what these exhibitors bring to the fair? They bring the very latest improvements—the most efficient machinery or material that ingenuity can devise; and it is up to you to study carefully what they have to offer, because of the beneficial returns to you personally. If you are going to buy a farm implement of any kind, you will see many different makes. They will be carefully explained to you, and it is wise to make comparison. Machinery and implements are capable of thorough demonstration at the fair; one learns of them by seeing them, to better advantage than by reading; but there are other products that are not susceptible of demonstration—such as stock foods, fertilizers, cements, dips, etc. These are subjects that are worthy of further study at your leisure.

This leads us to a consideration of the printed matter distributed at fairs. We often wonder when we have seen a man accept a circular issued by a reputable house whether he appreciates what he is receiving. Circulars issued by reliable people are not issued to mislead, in any sense of the word. They present to the reader, in a practical manner, a great deal of information which, if he bought it in text-books, he would have to pay for liberally.

Such booklets and circulars often represent the very latest word in scientific research. They are, for the most part, written clearly and to the point, for practical results. Oftentimes, if one reads them carefully, he will receive information that means many dollars in his pocket in the course of a year. It is the wise man who, when he receives circulars descriptive of material in which he is interested and that which he can use, preserves them and reads them at his leisure. He will be amply repaid for doing this.

Take the literature you receive at the fair home with you, read it carefully—and profit by it!

Better Opportunity for Poultrymen.

I have been a reader of A. P. J. for a long while and enjoy every department in it. I raise poultry on a small scale, work in the city, and produce poultry and eggs in the country. I enjoy my work with poultry very much

and am planning matters so that when I am no longer able to earn my living at my regular work, I will have this poultry work under way and can fall back on it.

I have a fine egg trade, selling the eggs right here at home, so have no expense for marketing them. I have a fine flock of layers this year, and as nice looking youngsters as I have seen for a long while. I think there will be a better opportunity for poultrymen thru the southern section of the country than ever before within the next few years.

New Orchard Ladder.

A new orchard ladder invented by Conradin Jecklin, of Lowell, Wis., is somewhat similar to a tripod in design,

Orchard ladder in use trimming outer branches of a tree. Notice slope of ground, no branches touched by the ladder, which is supported solely by the extended brace standard with no stay chains attached. (See Readers' Open Forum.)

with the upper portion of the ladder narrowed to permit of its insertion between branches, and with the base of the ladder broadened to give it a firm footing. An extensible leg makes it possible to use the ladder on a side hill where it would be difficult or impossible to use the ordinary ladder. The ladder stands independently, despite any incline of the ground, the third leg or prop member also being extensible.

Washington, D. C. Lester Sargent.

Wants Southern Department.

For many years I have been a reader and booster for the AMERICAN POULTRY JOURNAL. Ten years ago we had very few large farms devoted to thoroughbred poultry down here and no doubt a portion of your JOURNAL could not be profitably given Southern poultry interests. Now it is different. Here in Louisiana especially, we have a number of large places and countless backlotterers who

Richard L. Camp.

Change of Heart for Poultry Editors.

I have been very busy disposing of everything pertaining to poultry keeping and in getting started in other work. An opportunity presented itself to dispose of the farm advantageously and I thought it wise to discontinue this line of work for the time being. However, I intend to go back into poultry keeping later on, probably in the Middle West or the Eastern part of the country. Conditions here remain about the same. There has been no great increase in the price of eggs nor any material reduction in the price of feeds. I continue to take an interest in the business and as I have more time to devote to furthering the business now than formerly, I intend to do all I can along that line. The difficulty is in getting facts before the public, as it is customary to have half of an article deleted by the editor. I notice, however, that some of these editors are undergoing a change of heart, as they are publishing matter now that would never have been considered a year ago. A whole lot of the editors of poultry papers used to mistake desires for realities and spend their time in idle dreaming, but it seems that some of these visionaries have had their bubbles burst by the pressure of conditions and they are now lamenting the fact that the government doesn't step in and do something that will permit them to go back to their practices of weaving fantastic theories about things not entirely familiar to them.

Perhaps those engaged in poultry keeping are not aware of the indifference with which the rest of the people seem to regard their trials and tribulations, the difficulty of their lot giving them, perhaps, an undue idea of the importance of their work. Here in this city, ships are the one thing of importance and thus crowding from the minds of the people all consideration for those not engaged in manufacturing them. Most of these people are drawing salaries in one day equal to the poultryman's monthly wage. E. R. Johnson.

Care of Fowls During Molt.

The time is now at hand when fowls are passing thru a critical period. Ragged and ill-appearing birds and loose feathers will be much in evidence from now until cold weather sets in. The molting process is a severe strain on the fowls and it is essential that they have the best of care at this time to prevent trouble later on. The most robust bird can be practically ruined by improper care at molting time.

Those who raise exhibition birds appreciate the fact that shade is essential to the show bird. Mottled and twisted feathers and feathers with shaded tips develop during the molting period and are usually attributed to a lack of protection from the hot sun. When any such feathers make their appearance, they should be pulled immediately so a new feather to take the place of the defective one will have an opportunity to come in. Especially do fowls of white plumage need shade as a protection during the molting season. The white plumage will usually come in free from brassiness if this protection is taken.

Fowls should never be confined in bare runs, but this is especially true at molting time. Both shade and green food should be plentifully supplied at this time. If there is an absence of shade, shelters should be provided. When the new feathers are coming in and the sap in them, the sun can do great harm, especially to the white-feathered varieties.

The ration of the molting fowl should have due consideration. It should not be so poorly balanced as to produce fat instead of feathers. Wheat and oats have always been considered the best grains to feed at this time, but as wheat cannot be used for poultry feed, we must substitute. Barley and oats will serve the purpose, and more oats should be fed in place of the wheat. It is not advisable to feed too much corn at this time. Sunflower seed is a valuable addition to the grain ration during the molt and should form about one-twenty-fifth part of it, as it tends to bring out the gloss in the plumage.

It is not advisable that the hens keep up heavy egg production while in molt. The molting process is a severe tax on the bird and no effort should be made to keep up laying at this time. Withhold all stimulating food and substitute such foods as help to make feathers. Animal food and good mashers are desirable, but should not be overdone. A mash consisting of two parts bran, two

parts middlings, one part cornmeal and one-tenth part each good beef scrap and linseed meal is good to feed at this time. Buttermilk or skimmed milk when obtainable at a reasonable price should be used in mixing the mash. Stir in fresh pulverized charcoal and feed the mash once a day.

The males and females should not be allowed to run together during molt. Separate sexes as soon as breeding season is over and do not allow together until the birds have their new coat of feathers. Do not coop either males or females in too limited quarters. They need plenty of room for exercise.

The molting period can be controlled to a considerable extent. Continuous heavy feeding will delay molting a few weeks. On the other hand, scanty rations will cause the fowls to lose flesh and cause the feathers to ripen and drop out quickly. If it is desired to have the birds molt early,

give them short rations for about two weeks and then gradually put them back on full rations again.

Indiana. Otto E. Hackman.

Stop Hatching Weak Chicks
 With Cheap Incubators
 Remember, it is not how many you hatch that counts, but how many you raise. A Queen costs but little more, and the extra chicks that live and grow soon pay the difference.
Queen Incubators
 Hatch Chicks That Live and Grow
 Built of genuine California Redwood. Redwood does not absorb the odor from the hatching eggs. Cheaper woods, and pasteboard lining in iron and tin machines, retain the odors to weaken and kill the hatching chicks.
 The Queen is accurately regulated—taking care of temperature variation of 70 degrees without danger. Not cheap, but cheap in the long run. Catalog free.
Queen Incubator Co. Lincoln, Nebr.

How to make 'em produce eggs!

EVERY hen is worth her weight in real cash these days — high priced eggs are here to stay for many years; the demand for eggs is growing daily and every hen must be made to do her part.

Pullets are frequently sluggish; so many of them wait till midwinter or early spring to lay—push them along, make them lay early while the top market prices rules. If they were hatched late bring them on faster to early fall maturity. *Read this letter:—*

Dear Sir:—
 Princeton, N. J., January 24, 1917.
 I have on hand your letter of Jan. 22nd, requesting egg records of pens of birds which were not given Sloan's Liniment. The following will give you an idea of the difference of egg production in pens in the same house as those which were treated with the liniment.

Pen No. 2.	75 W. Leghorns, Jan. 1, 1917,	10 eggs
" "	" " " " " 8, " "	17 "
" "	" " " " " 15, " "	20 "
Pen No. 3.	65 W. Leghorns, Jan. 1, 1917,	9 "
" "	" " " " " 8, " "	10 "
" "	" " " " " 15, " "	17 "

Since this date (Jan. 15, 1917) Pen No. 2 is producing 46 eggs per day, and Pen No. 3 is producing 37 eggs per day. I started giving Sloan's Liniment on Jan. 17. I think this speaks well for the treatment. As to the cost of the additional labor and expense to try this treatment is as follows:

Sloan's Liniment	4 bottles	\$4.00
Labor	15 minutes	.15
Profits		\$4.15
46 additional eggs per day		
Figuring one week 7x46--322 at .05--\$16.10--\$4.15--\$11.95		

I am now trying this liniment on my breeders and I have noticed that their combs are brightening up and seem to have taken on a new life, I will let you know the results of this treatment. I think this covers the subject very thoroughly and I certainly appreciate your kindness in suggesting the experiment.
 Very truly yours, LIVINGSTON SWENTZEL.

Here's the way to do it—Read carefully

For every ten layers that you wish to get in shape, pullets or hens, give 20 drops of Sloan's Liniment mixed with one pint of moist mash every day for three days and then give the same dose twice a week throughout the year.

For growing youngsters, give 10 drops of Sloan's Liniment to ten youngsters in half a pint of moist mash twice a week only. Put five drops of Sloan's Liniment in every quart of drinking water.

Purchase a bottle of Sloan's Liniment from your nearest dealer. The small size contains enough to last ten birds two months or more. The large size contains 18 ounces or six times the small size. It's wise economy. One bottle will prove its profitableness and the many other uses you will find for Sloan's Liniment in the household will warrant your having a bottle on hand at all times.

NOTE—You will not find these special poultry directions in the circular with the bottle, so keep this advertisement.

"Lady Blackburn." 330 eggs in 365 days. (See Australian Winners, Readers' Open Forum.)

A. P. A. Convention.

(Continued from Page 767)

Leghorn breeders of this country and, we believe, should be granted at the very earliest moment. The Barred Plymouth Rock breeders should also have this color clause inserted in the Standard and it will undoubtedly be acted upon at the next annual meeting, and men who are opposed to it are only standing in the way of progress. These classes have become Standard in all of the leading shows of the United States and we compliment Mr. Tormohlen and his progressive club in advocating this much needed improvement.

The Blue Plymouth Rock breeders presented a petition asking for admission of their variety to the Standard, together with a copy of the proposed Standard. This Standard calls for Plymouth Rock shape and Blue Andalusian color, with the usual disqualifications that cover other members of the Plymouth Rock family. Undoubtedly this petition will be acted upon favorably at the next annual meeting.

THE BABY CHICK SECTION.

The writer spent considerable time with the baby chick men and I think I have a better inside knowledge of what these men are doing and what they intend to do than ever before. In fact, I am glad of this opportunity to put myself on record in regard to the baby chick business, as I was one of the many who condemned the business in the first place, telling the boys, some of them who have since made thousands of dollars out of the business, that I did not believe it could succeed; that I felt they were only building a monument that would fall down and destroy them. An open confession is always good for anyone, so I am making it at this time and take my hat off to the boys who have made a success of this branch of poultry culture. I really believe they are today doing more business from the dollars and cents standpoint, than any other one branch, except the market poultry that is gathered in small quantities from immense fields, and now that the United States postal authorities have granted them the privilege of shipping chicks by parcel post, they are even promising to go farther and insure the safe delivery of their shipments.

This branch of poultry culture is bound to be one of the big interests and an industry where men with good judgment and capital can make safe investments with every reasonable assurance of earning fair interest on their investment. While the plants as they are operated today seem enormous, there is no doubt that within a short time the largest we have any record of will look small in comparison to what we will find in the near future.

A few of the 5,000 Regal White Wyandotte chicks being raised under ideal conditions on the farm of John S. Martin, Port Dover, Canada.

Conforming to the request of our postal authorities that some standard size shipping boxes be adopted, the following sizes were agreed upon: for 12 chicks, a box 6x8x5 in.; for 25 chicks, 11x9x5½ in.; for 50 chicks, 18x11x5½ in.; for 100 chicks, 11x18x5½ in. It was further recommended that all 100-chick boxes have four cells and all boxes less than 100 at least two cells. This information is given thru the AMERICAN POULTRY JOURNAL at this time for the benefit of the paper box manufacturers and it is well to make note of it, because it is very evident to the writer that the business will multiply in 1919 over that

of former years. All purchasers of baby chicks will be interested to learn that the Baby Chick Association has decided to pay postage on all shipments by parcel post, so that much of the correspondence that has been conducted in the past in reference to the payment, charge of postage, will be eliminated and the advertised price of chicks will include the postage.

The incubator and brooder manufacturers held a very interesting session and, like the American Poultry Association, did a lot of constructive work. It was believed for many years that men who were interested along the same lines

and who were investing a lot of money in the manufacturing and distributing of incubators and brooders could give better service to their patrons by working independently; in fact, each fellow seemed to feel that what he knew about the business should be his own personal asset and not be given to any other manufacturer. They have finally awakened to the fact that an exchange of ideas and discussion of problems that are constantly confronting them in the general line of work, especially in improvements in the incubators and brooders, is of great benefit.

The report of the secretary of the poultry judges section showed that this departmental was in the very best financial condition, with sufficient money to go ahead. In a short time it is going to issue a booklet with halftone illustrations of all of the members, and a short paragraph giving some facts in regard to the judge's ability, list of exhibitions where he has served as an expert, etc. It will be further suggested that as near as possible the association give preference to these recognized judges in making up its list for the season of 1919.

The work of editing this book has been turned over to D. E. Hale, of Chicago, and copies of it, together with constitution and by-laws of the association, may be secured from him or from O. L. McCord, Peoria, Ill., president; or Geo. W. Hackett, Kansas City, Mo., secretary-treasurer.

Just before adjournment a resolution was offered by Henry P. Schwab, of Rochester, N. Y., asking that the American Poultry Association, in convention

assembled, go on record as calling this the Philander Williams Memorial meeting of the American Poultry Association. This resolution was unanimously adopted.

POULTRY DISPLAYS AT AGRICULTURAL FAIRS IN WAR TIME.

Prepared by the Animal Husbandry Division, United States Department of Agriculture.

THERE are three great general agencies for the development of the poultry industry. Named in the order of their origin and described in single terms, they are: the show, the press, and the platform.

The first exclusive poultry show in America was held at Boston in 1849. Before it there were displays of poultry at agricultural fairs; after it the poultry departments became one of the big attractions at many fairs, and special poultry shows became numerous. For some twenty years then exhibitions of poultry were the principal factor in the development of interest in the improvement of poultry.

About 1870 the first poultry journals appeared, and about 1900 the organized educational movement began. As the beginnings of the modern poultry show are found in the occasional exhibits at the early fairs, the beginnings of poultry journalism are found in occasional articles in the agricultural papers, and

the beginnings of educational poultry work in the occasional essays and addresses on poultry subjects given before agricultural societies or published in their proceedings.

It was not by chance that the shows came first: *it was because they are fundamental.* The beginning of the extension of interest in poultry in those who were not born with it comes when one who has improved poultry shows it to the public under conditions that challenge comparison with other poultry. Poultry journals were established both to give the news of such events, when reports of shows were demanded, and to disseminate knowledge of the ways and means of improving poultry.

War conditions do not change the nature of the relations of the agencies for the promotion of interest in poultry, but do disturb their operation, and tend to upset their natural equilibrium. One of the first effects is interference with the holding of exhibitions. Difficulties of transportation reduce the exhibits and the attendance at shows. Efforts of the managers to overcome such difficulties raise the question of the status of the poultry show in war-time: Is it essential?

If poultry production is to be increased, or even generally maintained, poultry shows must be continued, multiplied and improved. To discontinue them is to deprive the other agencies for reaching the public and attracting its attention of a considerable part of their efficiency. War conditions and the necessity for increased production to meet war-time demands cannot wait on experiment readjustments of factors which

ANDREWS

EFFICIENCY KOOP & KOOP DE LUXE

"The Koops Without a Nail"

YOU can't afford to take a chance on heavy, clumsy coops that nine times out of ten crumple the feathers and bruise the combs of prize birds. Every way you figure it, these Andrews Koops save money, time and labor. At the Poultry Show they can be knocked down and stored in little space.

To encourage poultrymen everywhere to exhibit at the shows, Mr. Andrews has maintained the low "before-war" prices—the first cost being the last cost, as they can be used over and over again. They are light and cut express charges in half. No hammer—no nails. Can be put together in a minute and come knocked down.

EFFICIENCY KOOP
(Recommended for shipping breeding birds)

KOOP DELUXE
(Recommended for shipping exhibition birds)

Sizes	Dimensions	Price per 1/2 doz.	Sizes	Dimensions	Price per 1/2 doz.

Poultry club exhibit at Virginia State Fair, Richmond, Va.

have grown into certain relations. Improvement for greater efficiency must be along the lines of experience and within the limits it indicates as safe.

War conditions make it necessary to plan to conduct shows so that they will make less than the ordinary demands upon transportation facilities, and help and not handicap other war agencies. In considering the effects of war conditions upon American poultry shows, the fact that stands out most prominently is that the uncertainties of transportation tend to limit the area from which a show can draw exhibits. When such a condition comes as a sudden emergency there is justification for asking preferential treatment for shipments of exhibits; but, when it is known long in ad-

vance that the obstruction to shipment will probably exist, patriotism should lead managers to endeavor to fill their classes with nearby exhibits and exhibitors to patronize the nearby shows.

In all propaganda for increased poultry production in war-time the policy has been to make use of existing means of reaching people, to co-operate with some established agency in such a manner that it will be permanently strengthened and made more efficient. This policy indicates the agricultural fairs, and especially the local fairs, as the best field for immediate action in this direction, because the agricultural fair either has a live poultry department which can expand to meet the emergency or has a comatose one which

Poultry club exhibit at Georgia State Fair.

ought to be infused with new life. Appreciation of the opportunity afforded at the agricultural fairs does not overlook the advantages of winter shows in their special field; on the contrary, it looks toward an increase of small winter shows as a direct result of making the poultry departments of small fairs more attractive and instructive.

The development of a good poultry show, whether at a fair or independently, has always been the result of the interest and efforts of a few poultrymen. Where shows are being held under efficient management, those in charge should have the hearty support of all poultrymen in the vicinity. Where the field is clear, local poultrymen should confer with the fair management and endeavor to secure its co-operation in a special effort to make the display of poultry one that will stimulate interest in the community.

The attitude of the poultrymen making such a proposal usually determines the attitude of the management of a fair toward it. If the poultrymen are enthusiastic and ready to do the work necessary to make the display of poultry a notable one, the fair management is usually prompt to respond and willing to give the poultry department its share of space, publicity and prizes. But the mere suggestion that the fair should have a better poultry department, with the implication that it is up to the general management to see that this feature is put on a par with others, has very little force with men who, as a rule, are giving free service in the general management and relying upon those with like public spirit to help in details of departments in which they are especially interested.

The first rule for making a successful poultry exhibition—whether in a big city or in a sparsely populated county—is to interest as many people as possible in it. Activity on this line should be the first step and should begin even before the management of the fair is approached. The latter can respond more promptly and more liberally when informed that so many poultry keepers would, with suitable inducements, enter so many birds, than when asked to authorize offers of inducements as the preliminary to a canvass for exhibits. At any time, and especially now when many things not ordinarily done are done from patriotic motives, a movement of this kind draws its first and best support from those who enter it early with more consideration for the public good than for any personal advantage it may bring to them.

Everyone who has poultry that he thinks is a little better than his neighbor's should be urged to show it at the fair. With Standard poultry as generally distributed as it is now, there is probably no place where a fair is held that cannot supply from some farm or poultry yard fairly typical specimens of the popular varieties of poultry. Everyone who has such stock should be urged to send something to the fair as a contribution to the movement to create more interest in poultry. As a rule, stock of no standard breed has not distinctive character which would give it interest in an exhibition, but occasionally a person has non-standard poultry which in appearance or performance is better than ordinary, and such exhibits may well be solicited. This is not only

the appropriate way to recognize the person who has done something well—if not on usual lines—but it is from this class of exhibits that the new things in the poultry world come. Our greatest shows regularly make provision for such exhibits in their "any other variety" classes.

Besides soliciting exhibits from those who already have good poultry, it is good policy to urge such of them as appreciate better quality than they have to purchase birds to show at the fair. Interest can also be helped if people of some prominence in the community who have not perhaps had any interest in poultry can be induced to take it up and to import some good stock to show at the fair for their own credit and for the benefit of those who attend and who might not otherwise have the opportunity to see really good stock of that particular kind. These suggestions are not theoretical, but are simple statements of the means that for seventy-odd years have been successfully used by promoters of poultry exhibits in places where they had been neglected.

One of the most important things to observe in developing the poultry exhibit at fairs is to follow the standard method of classifying fowls for exhibition and for the award of prizes. The original method at fairs and at the early shows was to show birds in pairs, male and female, and award the prizes for pairs. The standard method is to show birds either singly or in pen of a male and four females. Innumerable experiences have demonstrated that providing separate classification for cock, hen, cockerel and pullet in each variety gives the widest recognition and fairest distribution of prizes to meritorious individual birds, while the classification for pens of five birds with appropriate prizes in the class gives the breeder who can make a fine exhibit in it the special reward he deserves. It is a matter of poultry show history that the adoption of the Standard classification almost invariably starts the poultry department at a fair on a course of enlargement and progress.

Another essential thing in making a poultry department interesting and instructive is the employment of a qualified judge. Nothing is so discouraging to the novice in exhibiting poultry as the decisions and explanations of the judge who is supposed to be good enough for a country fair, tho he would not be considered for a minute as judge at a show where substantial interests were involved in the decisions or where experienced exhibitors were showing. The judge at a large showing making decisions on very close comparisons of birds of very even quality may be exempt from explaining his awards in detail, but the judge at a small show has only half done his work when he has made his decisions—the other half is to tell exhibitors why certain birds are better than others and where the best on exhibition there might be improved. A judge who does this well can easily double the influence of a first poultry show for good in the community.

With the poultry always the main feature of a poultry department, such accessory features as can be secured should be provided. Exhibits of appliances and supplies always interest the general public and those little versed in methods of poultry culture. Many

things familiar to the experienced poultry keeper, that he would not stop to look at in a show, and hence suppose they can add nothing to its attractiveness, are of special interest to novices.

Wherever possible, the attendance of one or more representatives of the state college or experiment station should be secured for demonstrations and lectures. In any case, arrangements should be made for a supply of literature from the state institutions and the United States Department of Agriculture for distribution to visitors, and for the display of a full line of the posters used in promoting poultry production.

Prepare Your Winners

in the greatest coop that ever graced a showroom. We were the originators of the all-wire exhibition coop for poultry and have the only perfect folding all-wire compartment coop on the market. We have cooped most of the large shows, and have sold thousands of coops to breeders for private use with the greatest satisfaction. Why? Because ours is the original all-wire coop; because we have features that cannot be used on any other coop; because every part is made and welded by electricity expressly for the

KEIPPER COOPS

because our prices are within reach of all and have not advanced with the cost of manufacture.

We make special coops for rabbits and cavia.

Coops rented to shows with the privilege of purchasing.

Special designed single coops sent by parcel post.

Write us your particulars and send for our illustrated catalog. Whether you want one coop or a carload, we are at your service.

Associations and Shows

Secretaries are Requested to Send in News Items of Interest About Their Shows for This Department

New Turkey Club Formed.

The International Turkey Club was formed at the American Poultry Association meeting. The following officers were elected: Chas. McClave, New London, Ohio, president; Ed. Gesner, Nora, Ill., vice-president; Mrs. E. I. Fowler, Rochelle, Ill., secretary; H. A. King, Ossian, Ind., chairman of executive committee. The club will promote closer co-operation and efficiency among turkey breeders. The first club meet of the new club will be held at Chicago Coliseum Show, December 3 to 8, 1918, where special cash prizes will be offered for the turkey class. As secretary of the International Turkey Club I would be pleased to receive suggestions or ideas from members or from persons wishing to become members. I

need your help and assistance in making the club what it should be. There are many reasons why every turkey breeder should join this club, the membership of which is only one dollar. Bring your birds and meet us all at Coliseum Show.

Rochelle, Ill. Mrs. Eli Fowler, Sec'y.

Southern A. P. A. State Show.

The late State Poultry Show of South Carolina was said by many exhibitors to be the best sales show they had ever attended. In many varieties every bird was sold that the owners would part with. Here is an opportunity for northern breeders to make a successful and profitable showing in southern territory. The

show is held at Columbia, S. C., October 28 to November 1. Judges Newton Cosh and J. Harry Wolsieffer, of Vineland, N. J., will place the awards. These judges of national reputation are a guarantee that the best birds will win. The names and addresses of all exhibitors are on the coops before the show opens and remain there. The selling price of every bird for sale is on the coop card, and when the bird is sold a red sales card is tacked up to prevent any error in returning after the show. A. P. A. medals and specials, silver cups, gold leg bands, and several hundred dollars in extra cash specials. Write for premium list to Frank C. Hare, Clemson College, S. C.

Light Brahma Club Meet.

Elaborate plans are in the making for insuring a large entry of Light Brahmas and a representative attendance east and west of members at the annual meeting of the American Light Brahma Club at the forthcoming Chicago Coliseum Show. Judge Chas. I. Balch, of Manchester, Conn., and Judge F. H. Shellabarger, of Iowa, will place the awards. When this club met at the Coliseum in 1915 it won the honor of having the largest entry of any specialty club holding its annual meeting there that year and the Light Brahma boys are confident of putting on the same large entry of high quality birds again this time. Secretary Harvey C. Wood of Bound Brook, N. J., will attend and in the meantime will be glad to hear from anyone expecting to enter his birds or attend the show in person.

Announcement.

The third annual show of the Williamson County Poultry and Pet Stock Association will be held in Johnston City, Ill., December 9 to 14, 1918. We are expecting and planning for more than twelve hundred birds of the various breeds to be exhibited. It is our aim to make this the largest show in the state, outside of the Coliseum Show in Chicago. Joseph Dagle, Richard, Iowa, has been secured to do the judging. Mr. Dagle needs no introduction to the poultry fanciers. He is widely known as a fair and competent judge. He will deliver a lecture one night during the show, which will be announced later. Begin now to condition your birds to have them ready for the big show. Write to G. W. Felts, secretary, Johnston City, Ill., for premium list, entry blanks or any information you may desire.

Pittsburgh Show.

The Poultry Exhibition of Pittsburgh, Pa., will hold its annual show at Motor Square Garden, Pittsburgh, Pa., January 20-25, 1919. J. Leonard Pfeuffer, the general secretary of the Pittsburgh show, will give every one who is interested full particulars in regard to premium lists, closing date, etc. Write him to Commonwealth Building, Pittsburgh, Pa.

The catalog of the Southeastern Fair, Atlanta, October 12-19, is now being mailed and can be had on request to R. M. Striplin, secretary, Atlanta, Ga. The poultry- and pigeon classes are the same as that of all the big fairs and the premiums about the same. Efforts will be made this year to increase the interest and entries to make the poultry department in keeping with the other big features of the fair, which now has only two or three equals in the United States, the total prize money this year being \$70,000.

The National Partridge Wyandotte Club will hold its annual meet at the Kansas City Poultry Show, January 13-18, 1919.

International Single Comb Black Minorca Club of Illinois will hold its state meet in connection with the fifth annual poultry show at Mt. Olive, Ill., December 12 to 15, 1918.

Inter-State Fair at South Bend, Ind.

The fifth annual fair of the Inter-State Fair Association will be held at South Bend, Ind., September 10-14, inclusive, and a special effort is being made this year to have the poultry department the largest poultry exhibit in the middle west (the Hagerstown Show of the West). Liberal cash prizes are offered, with free transportation to the grounds, and all exhibits will be returned to owners within the state as per the new ruling made by the Railroad Administration. The judges are: D. E. Hale, Chicago, Ill.; W. C. Pierce, Hope, Ind.; J. C. Johnson, Brighton, Mo. All birds cooped free in new Keipper coops; uniform cooping thruout. The birds will be in charge of Superintendents C. R. Montgomery, Paul A. Heiermann and J. M. Goss, all members of the local poultry association. All exhibitors are assured their birds will receive proper care and attention by capable men. For premium list and entry blanks write C. R. Montgomery, J. M. S. Bldg., South Bend, Ind.

Report of International Egg Laying Contest at Storrs, Conn., for Month Ending July 31.

Storrs, Conn., August 10, 1918.

On August 1 the hens in the laying contest at Storrs were a little over 3,000 eggs behind their record for the corresponding period last year. It is believed that the hens themselves are just as good and that they get just as good care. There are, however, two factors which contribute to lower yields. One of these is the fact that these hens went thru the worst winter that New England has experienced for 100 years and the other is that the hens have not received the same feed nor as good quality. During July the total yield for all pens amounted to 16,027 eggs, which is 1,750 less than for June, and 1,100 less than for July of last year.

The following table shows the number of birds in each breed, the average amount of grain and mash consumed, also the average number of eggs produced by each breed during July:

	Grain	Mash	Eggs
180 Plymouth Rocks.....	30.4	54.0	147
160 Wyandottes.....	29.7	49.2	145
170 Rhode Island Reds.....	29.8	52.6	139
430 White Leghorns.....	36.3	42.5	180
60 Miscellaneous.....	35.8	43.2	161
1000 Average all breeds.....	33.1	47.4	160

The Oregons, entered by Agricultural College at Corvallis, repeated their June performance and won the blue ribbon or first prize for July with a yield of 249 eggs. Hollywood Farm's pen of White Leghorns from Hollywood, Wash., were awarded second prize with a production of 227 eggs. Oak Hill Estate's pen of the same breed from Uniontown, Pa., were a close third with a yield of 226 eggs.

The best individual record continues to keep away ahead of the pace set in the last contest. A year ago the best performance for the first nine months was 206 eggs by a Barred Rock, whereas a White Wyandotte in the present contest has laid 232 eggs, with three months to go.

The nine leading individuals to date are as follows:

White Wyandotte, Bridgeton, R. I.....	232
Barred Rock, Palenville, N. Y.....	203
"Oregon," Corvallis, Ore.....	202
Barred Rock, Pittsfield, Mass.....	197
"Oregon," Corvallis, Ore.....	194
White Wyandotte, Columbia, Conn.....	192
White Wyandotte, Bridgeton, R. I.....	192
"Oregon," Corvallis, Ore.....	192
White Leghorn, Hollywood, Wash.....	192

For the past few months there has been more or less unrest among poultrymen both as individuals and as organizations. All over the eastern section of the country people have felt that the price of feed was too high, the price of poultry products too low, that there was need for organized effort in buying and selling.

In view of such unsettled conditions and the feeling on the part of many poultry farmers that their poultry was no longer profitable, the management of the contest began to believe that perhaps there would not be the same interest in laying competitions another year as has obtained heretofore.

The fact is that the college now has over 80 applications and only a total of 100 can be received, and this three months before the next contest opens. Breeders from a dozen states are already planning to send birds to Storrs next November.

COLISEUM

Poultry & Pet Stock Show, Chicago

TENTH ANNUAL EXHIBITION

December 3, 4, 5, 6, 7 and 8, 1918

THE one show west of New York that for nine consecutive years has met every obligation in full and in cash, without the sale of one dollar of its capital stock.

THE COLISEUM SHOW

has introduced more new features that work to the interest of the fanciers than all other shows in this country combined. It is the one exhibition that caters to all classes of breeders, and helps in the right way to promote the interest of all fanciers, large and small.

A WINNING AT THE COLISEUM

is without question the most important win that can be made in this country, no matter what part of this country you may be located. A winning at this great show will put you on the map and insure you good prices for your stock.

THE COLISEUM SHOW

has never sold concession space to a faker. Only legitimate concessions are allowed, and we pride ourself on the fact that we are the only national show in the world that absolutely guarantees its concessionaires to its patrons.

THE COLISEUM SHOW

is the greatest sale show in America, and the only show that we know of where a legitimate sale of \$5,000 was made by one exhibitor. Coming as we do on the same dates as the Great International Stock Show, we put our exhibitors in touch with the greatest buying public in the world, as more than 100,000 stockmen from all parts of the world come to Chicago on this date.

The Light Brahma Club, the International Plymouth Rock Club, the International Turkey Club, the National Bantam Club and the American Rouen Duck Club will hold their meetings with us this year, with other important clubs now voting and quite likely to decide in favor of the COLISEUM.

YES, THE COLISEUM SHOW

will pay cash prizes in 1918. And in addition to our regular cash list we will pay more cash specials than ever in the history of the show. This is no time to retrench on expense. The breeders need all the encouragement they can get, for God knows they have been hit hard enough. In addition to our cash prizes

THERE WILL BE SIX \$50 TROPHIES

for best display in six important breeds. These trophies are without question the most valuable prizes ever offered at any show and are offered for the best ten entries in a breed, instead of variety, as formerly.

THE COLISEUM PREMIUM LIST

will be mailed earlier this year than formerly. All exhibitors at the 1917 show will receive the list without request; others are requested to write the Secretary, so their names may be added to the mailing list.

The Lexington Hotel, Chicago, has been selected as headquarters. This hotel is located at 22nd St. and Michigan Blvd. Street cars stopping in front of the Coliseum stop in front of the Lexington; or exhibitors may walk, as the distance is only six squares.

A BIG NEW FEATURE

will be added this year—one that has been requested by the exhibitors and one that will be appreciated by every exhibitor, as it gives to the exhibition and the public something they have always needed. Don't fail to send for list, and please remember

ALL ENTRIES CLOSE NOVEMBER 15

Chicago and suburban residents may get information in regard to concessions from James W. Bell, care American Poultry Journal, 523 Plymouth Court; but for premium list address the Secretary, 25 West Washington St., Indianapolis, Ind., until October 15th; after October 15th, Lexington Hotel, Chicago, Ill. THEO. HEWES, Secretary.

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

win at the Imperial Show of all the world, Madison Sq. Garden, N. Y., January, 1918, a new record unequalled in all history, as follows:

EVERY FIRST PRIZE OFFERED

Cocks	- - - -	1st, 2d, 3d, 4th, 5th.
Cockerels	- - - -	1st, 2d, 3d, 4th, 5th.
Pullets	- - - -	1st, 2d, 3d, 4th, 5th.
Hens	- - - -	1st, 2d, 3d, 5th.
Exhibition Pens	-	1st, 2d, 3d, 4th, 5th.

One of the Great Imperial "Ringlet" Males. Observe the Wonderful Shape, Color and Barring.

Sweepstakes Champion Male and Female; Color and Shape Specials Male and Female; Best Five Males; Best Five Females; Best Display, and every other Special Prize. This is the capstone to their unexampled record at New York for 30 victorious years. At the last four shows—1915, 1916, 1917, 1918, they have won 19 First Prizes out of 20 offered. Every bird bred on my farm. Supreme at Madison Square Garden is Supreme Everywhere!

BARGAIN SALE FOR 1918

My Special Sale List is now ready and offers the most extraordinary bargains in extreme high quality breeding and exhibition birds of First Prize Madison Square Garden blood. This is your opportunity to secure Madison Square Garden winners, and sons, brothers, sisters and daughters of these winners, birds of this richest First Prize Sweepstakes blood at prices far below their values.

This Special Sale List

is full of the rarest bargains ever offered in the history of Barred Rocks and it will be to your best interests to write me for copy at once and secure the birds you need at saving prices. A copy will be mailed immediately upon request.

BARGAINS IN EGGS

from the finest matings in the world—\$5.00 per setting now. This is only one-third of my regular price. 100 eggs \$35.00.

Get Your Hens and Pullets Ready NOW For Big Egg Production THIS FALL AND WINTER

DRY MASH
Makes
Eggs

From now
until next summer you
will get a fancy price for your eggs.

Get your laying stock ready NOW for big egg production during the season of big prices and big profits. Don't think for a minute that your hens won't lay in the winter—No greater mistake could be made. They WILL lay in Fall and Winter if you provide them with a feed that contains the same egg-making materials that they pick up in the Spring and Summer months when on free range.

Remember this—it is not the season entirely, but the kind of feed your hen gets that regulates her egg-making machinery. Hens were made to lay, and if you provide the feed that nature intended her to have, you'll get eggs in Winter as well as Summer.

You can't get eggs by feeding scratch grains, because scratch grains do not supply the hen with egg-producing qualities. The feed that will make your hens lay abundantly right through the Fall and Winter months is

SCRATCH
GRAINS
Don't
Make
Eggs

FUL-O-PEP DRY MASH

FUL-O-PEP DRY MASH is not an experiment—our experience with our own poultry and the experience of our patrons has proven conclusively that this feed will make hens produce eggs AT ANY TIME—Winter as well as Summer.

Our Poultry Feed experts discovered by continued experiments and by watching the natural habits of the hen when on free range, that there were certain food elements that it was necessary for the hen to have, if she was to produce eggs. We learned that she must have the same kind of feed that she picks up herself in the Spring, when nature provides such feeds. We have put these same feeds in FUL-O-PEP DRY MASH, so that now poultry raisers are independent of season—they can get eggs the whole year round.

Begin NOW to feed your hens and pullets FUL-O-PEP DRY MASH and you will get eggs this Fall and Winter in abundance. WE GUARANTEE IT. FUL-O-PEP POULTRY FEEDS are for sale by nearly all feed dealers—if yours can't supply you, write us.

Free Poultry Calendar Book

Send us your name and address and we will send you FREE, one of our most valuable poultry books ever published. It is written by a leading poultry expert and gives you some valuable inside information on how to make money from poultry. Write for YOUR FREE COPY TODAY.

THE QUAKER OATS CO., Chicago, Ill. Sharon, Tenn.
Gentlemen: I received the FUL-O-PEP Poultry Calendar you sent me, and must say that it contains more information for the poultry raiser than anything I have found yet. It really affords a fellow more information than all the best poultry journals. I have read it from cover to cover.
Yours very truly, C. A. PITTS.

The Quaker Oats Co.

Poultry Feed Department APJ
ADDRESS
Chicago, U. S. A.

PROOF

J. H. BIENLER, Proprietor of the Strausburg Poultry Yards, Strausburg, Ill., says:

"We cannot do business without your feed, FUL-O-PEP DRY MASH is the best we ever fed our hens to make them lay. Have tried nearly all kinds, but they do not do the work as FUL-O-PEP DRY MASH will do it."

SHOW BIRDS AND FOUNDATION STOCK

from the finest flock of

S. C. White Leghorns

in the world.

To the already great flocks of Oakdale Farms we have added the famous stock of one of the world's most famous Leghorn breeders.

We have purchased the stock and good will of

D. W. Young, of Monroe, N. Y.

The Young Strain is the oldest in the country, the foundation having been imported from Italy by Mr. Young's father in 1855, and has ever since been bred in their yards. The record of its winnings in the showroom stands unequalled.

At the Last Madison Square Garden Show They Won

1-2-3 Cocks 1-4-5 Hens
1-2-3-4 Cockerels 1-3 Pens
2-3 Pullets

and every special prize offered.

We Have Just Won at the North Dakota Fair, 1918

1-2-3-4 Cocks 1-2-3 Hens
1-2-3 Pens

Had 30 birds entered,
Captured 31 ribbons.

We believe that our statement that these combined flocks make the finest collection of Leghorns in the world will stand undisputed.

Our mammoth, perfectly equipped farm is prepared to furnish you the best. Your inquiry will receive prompt attention and your order the same consideration as if we were selecting the birds for our own use.

Send for catalog describing our stock, method and farm.

Cut Your Feed Bill

by using

MAKE Brand

Wild Seed Squab Feed

It is the cheapest complete feed for pigeons you can buy and squab experts have found it to be the best.

Pigeons Thrive on It

Nothing is more relished by the penned up squab breeder than wild grains—the seed of weeds and native plants such as his free flying brothers pick up on forage. Our brand is selected by experts and tested for results. It is unadulterated. Every ounce has full food value.

Send \$1.00 for sample bag of 25 lbs. and circular telling of results obtained from it in years of experience.

SINGLE COMB BLACK LEGHORNS

From Imported Stock

600 Grand Birds For Sale

HERE is a grand opportunity to secure top-notch stock of a breed that is not overcrowded. It is a long, thorny road to success when you are raising birds that every Tom, Dick and Harry has. Invest in a variety where they will **have** to come to **you** or a very few competitors. Breeders of stock in other than the so-called "popular" varieties are nearly always sold out.

The Black Leghorn Is No "Fly-by-Night"

They were admitted to the Standard by the American Poultry Association in 1874, and at that time displayed the remarkable prolificacy and early maturity that makes them so desirable. Many prefer them over the White Leghorns on account of their lustrous, greenish-black plumage, which does not soil like the light colored breeds. The Blacks are one of the most popular varieties in England, and will have a boom in this country.

Watch the Laying Contest Reports and You Will Find the Black Leghorns
Right at the Top

*Don't Miss This Grand Opportunity

SUCRENE

Poultry Mash With Buttermilk

The Scientifically Correct Feed For Every Stage of Poultry Life

Saves the young chicks—promotes health and rapid growth. Supplies hens with all the vital nutrients necessary for maximum egg production, which are not found in any grain ration.

Do not blame the hen for not laying more eggs. She does the best she can on the feed she gets, and you are probably making the same mistake that thousands of other poultry feeders are making—feeding too much grain. One hundred pounds of average grain ration contains nutrients for but little over half as many whites as yolks for eggs, and hens can't lay half formed eggs.

Value of Dried Buttermilk for Chicks and Hens

The addition of dried buttermilk to the other high quality materials in Sucrene Poultry Mash gives this feed greatly increased value for young chicks and laying hens. The acid in the buttermilk prevents or destroys the germs which cause the death of 25% to 40% young chicks every year. Buttermilk also supplies the vital life giving, growth promoting and special egg producing material, not found in any grain or meal ration.

Half the Hen's Daily Ration Should Be Sucrene Poultry Mash With Buttermilk

Everyone knows the high feeding value of dried buttermilk for poultry. Combined with the other high quality materials in Sucrene Poultry Mash with Buttermilk it balances the grain ration—provides the animal protein which hens crave at all times, the life and vigor promoting fat, the calcium carbonate or mineral matter for shells—enables the hen to complete all the eggs which nature impels her to form.

Sucrene Poultry Mash with Buttermilk is composed only of the following high quality materials: Dried Buttermilk, Meat Scraps, Corn Feed Meal, Alfalfa Meal, Wheat Bran, Linseed Meal, Palm Kernel Meal, Calcium Carbonate and a little Salt.

Guaranteed Analysis: 18% Protein, 31-2% Fat, 50% Carbohydrates, 12% Fibre.

Keep Sucrene Poultry Mash with Buttermilk before your hens all the time in hoppers. They eat only as much as they need without waste.

Get Winter Eggs

The high protein content in Sucrene Mash helps hens quickly through the moult, supplies the necessary feather building and body maintaining materials—restores egg laying capacity in time for winter laying.

Give them Sucrene Scratch Feed twice daily. It is the pure grain ration for laying hens, composed only of corn, wheat, kaffir, sunflower seed, buckwheat, barley and oats. Stop wasting money on high priced unmixed grains. Sucrene Feeds are more economical and you can rely on results.

Order a 100-lb. sack of each feed from your dealer. If he can not supply you at once write us. The coupon or a post card brings you free Illustrated Literature on how to succeed with poultry. Write for it.

RESULTS

Cincinnati, O., Jan. 30, 1918.
Mr. John G. Poorman,
Tinley Park, Ill.

Dear Sir:

Enclosed please find Money Order (\$30.00) for a White Rock cockerel from your special mating. Kindly give me some information as to his ancestry, as I intend to breed him to some extra heavy laying hens. These hens were raised from chicks purchased from you in 1915 and 1916. Have trapnested them and some of the records are 280, 242, 216, 201, 200—not from the date of their first egg, but from November 1st to November 1st, same as the official laying contests.

Please ship as soon as possible via American Express to Elmwood Place, to be marked, "Will be called for."

John G. Poorman,
Tinley Park, Ill.

Dear Sir:

Enclosed find my check for \$15.00 for which, with my credit of \$10.00, kindly book my order for 50 Class A day-old chicks.

If possible, I would like to receive this shipment by American Express not later than the 15th of April.

This sure has been tough laying weather for the last sixty days, but you may be surprised to learn that the Poorman Orpingtons have been hugging the 50 percent mark for December and January and have outlaid some White Leghorns which I had given to me last year.

With best regards for the season's success, I am
Very truly yours,
N. A. P.

Buy Your Foundation Stock Now

My catalog contains descriptions of my plant by representatives of the leading poultry publications, reports of many of my customers, and also my methods of breeding, care and management. It is fully illustrated and very instructive, and will prove to you that my prices are very reasonable.

The individual prices of my breeding and laying stock have not been advanced. A male bird today will cost you no more than it would two or three years ago—a better bird at the same price.

Liberty Bonds Acceptable

*Start right, by writing for my instructive catalog today.
It has helped others, and it will undoubtedly help you.*

Seventy-Four Years a Poultry Fancier

An Appreciation of Isaac K. Felch, Pioneer American Poultryman.

By Prince T. Woods

ISAAC K. FELCH, one of the pioneers in American Standardbred poultry culture, died at his home in Natick, Mass., at 10:30 p. m., Saturday, August 31, age 84 years, seven months. After a long and useful life largely

devoted to the interests of thorobred poultry, work which he continued well into the present season, rest came quietly and peacefully, "God's finger touched him, and he slept." He was born in Natick January 17, 1834.

To many thousands of poultry keepers all over the American continent he was fondly known as "Uncle Isaac" and he was probably the best known poultryman of the United States. For a longer period than the average lifetime he has been a constant contributor to the agricultural and poultry press. No writer has ever developed a more fertile pen, and obscure indeed must have been the poultry publication which failed to carry an article on timely poultry topics at frequent intervals during the past half century from this well known "Sage of Natick."

According to his own story published in *Farm-Poultry* in 1899, I. K. Felch has been seventy-four years a poultry fancier. Here we quote from the article:

"From 1844, the eleventh year of my age, dates the first of the causes which produced the fancier, I. K. Felch. Then the sale of six hens, and a male bird thrown in, for \$2, gave me funds to purchase the first pair of fowls known as a specific breed, the 'Mexicans.' * * * *

"At that age I would go hungry and walk miles to obtain a coveted pigeon, or a fowl I had seen to my fancy.

No one mated to preserve breed character. Farm flocks were never uniform. How was a child to act but in the grooves his elders had followed before him? There was no poultry paper."

But the boy with the fancier instinct was not satisfied to stick "in the grooves his elders had followed." He read everything he could get hold of which related to poultry and the history and breeding of domestic fowls and, like most

boys, he developed a fondness for a number of breeds, such as were available in those early days, and he became infected with "the Shanghai craze" in the late forties. Speaking of this experience, he said: "In the fall, when I sold several trios at \$2 a specimen, the excitement commenced, and I confess that when I sold four for \$12, I received more satisfaction and felt richer than since when I have several times sold Brahmas for \$100 each. Taking money for fowls was a new sensation in connection with my poultry, and chicken raising in old Natick received an impetus which continues to this day."

The boy Felch soon developed into a fancier-breeder, growing up, so to speak, with the newly developed poultry industry. The Boston Poultry Show of 1849 marked the beginning of poultry culture for exhibition purposes and young Felch was in the very heart of the country where poultry enthusiasm was at high mark.

H. H. Stoddard, veteran poultryman and editor of that pioneer poultry publication of the early seventies, the old *Poultry World*, in a historical article for the late *Poultry World* of 1910, classed I. K. Felch with Charles A. Sweet and Philander Williams as "the three main pillars of Standardbred poultry culture in America." Stoddard's beautiful tribute to Felch was happily dated just prior to

I. K. FELCH IN 1863.

Uncle Isaac's seventy-sixth birthday. Here it is:

"As for dear old Ike, I cannot trust myself to speak as I would like, for he, thank heaven, is still with us, and it might

appear as if I were 'slathering' him. He was intellectually the brightest, or anyway the quickest of the three, Sweet occupying the half-way place. When in A. P. A. or whatever council of fanciers, a question came up, he made his conclusion 'quicker'n lightnin',' and it was generally mighty near right, too. His work was that of a judge and a Standard maker, as well as that of a writer and wonderfully skilled breeder, and considering both his remarkable ability and the great length of his service in these fields, it is not likely that his equal will turn up in a hundred years. There never was a dishonest hair on his head. An intense love of justice was a quick instinct with him, an invaluable possession of a judge whose path is scattered with temptation 'thick as leaves in the valley of Vallambrosa.' His fine sense of humor, quick appreciation, and genial disposition made him a delightful member of any chance social circle of fanciers. In debate, if his positive and impetuous manner sometimes gave offense, his self-command and never failing courtesy, on getting a second breath, generally smoothed everything over. His writings on poultry are very voluminous and as instructive as extensive. His ingenuity in formulating rules and methods of judging was as remarkable as the enormous number of fowls he pro-

meeting with much opposition after applying for admission to the Standard. We quote:

"Finally at Worcester, Mass., in 1883, Langshan breeders determined to take the A. P. A. by storm, and they did. * * * Making an exhibit that ran across the large hall, in a double row of coops, the Langshan breeders presented a petition carrying twelve hundred signatures of breeders asking admission to the Standard.

"That old patriarch, then in his prime, I. K. Felch, stood before the assembled convention, and unrolled the petition, then stepping quickly into his chair, he held the petition above his head and the end yet almost touched the floor, and he was a tall man, turning to the convention he said: 'Gentlemen of the American Poultry Association, twelve hundred Langshan breeders are knocking at your door, will you admit them?'—they admitted them.

"Then came the crucial test; there was a large class of birds, but there was no such thing as a Standard to judge them by. Mr. Felch then was instructed to look over the exhibit, draw a Standard for the breed, and then place the awards according to his Standard." He did it, and it was a good Standard.

Altho a thoro fancier and a strong advocate of Standard-bred poultry, Uncle Isaac was strong for breeding true to nature and for retaining the utmost in practical qualities. As his was a strong influence in Standard making, it is quite possible that we owe to him in large measure the fact that specimens nearest Standard perfection usually are the type which possess merit in productivity. Writing in 1881, Mr. Felch said:

"A breeder and dealer is compelled to produce what will sell, and he has all classes of customers; as a fancier all will pursue the course that affords the most pleasure. But the farmer and poulturer wants to know which course brings the most money for the outlay.

"The writer cannot say aught but the truth; and the better of all is what is the *natural, practical, and productive merits of the breeds*; what type is produced for the least cost of food consumed and that which produces the largest number of eggs in a year. Facts are stubborn things."

His rule for building up a business as a breeder was: "Sell none but A No. 1 birds as thorobreds, killing all that are not, and you soon enjoy the enviable position of a first-class breeder and also a first-class poulturer."

The good work accomplished by I. K. Felch for Standard-bred poultry will live for generations to come. He not only had the fancier spirit but he had vision and sound common sense. No one will deny that this skilled breeder, veteran poultry judge of countless shows thruout the country for the greater part of a lifetime, and maker of Standards, was a true fancier, yet he ever sought to combine the beautiful with the useful, while recognizing to its full value the purely ornamental or the unusual. In an article written for the *Poultry Monthly*, on "Poultry a Means of Wealth," in 1887, he said: "Many of us are rearing fowls for the love we have for the beautiful found in animated nature, but take from this industry its utility, and the numbers raised would be but as a handful of sand compared to that which makes up the ocean's shore. This influence you see in the ornamental breeds, in the scarcity of numbers in our exhibits of them.

"Those breeds having the greatest practical worth, being the greatest layers, those producing the largest eggs and the best meat as broilers and roasters, those laying the larger number of eggs in the winter months, these will ever be the kind to hold the popular call and the steadiest sale, and their breeders will always be 'tided' over a dull season, while the breeder feels more quickly the fluctuations of the market whose tastes lead him to breed those termed ornamental.

"We have only to survey the field to find that a majority of the breeders, who make poultry culture a business and means of support, are breeding the most practical kinds."

During his long experience as a fancier-breeder, Mr. Felch bred many breeds and varieties and was a skilled judge of all bred-to-Standard poultry. Under the firm name of I. K. Felch & Son, his advertisements have been models of plain straightforward statements of facts, which were in themselves an assurance of honest dealing. "Felch Offers," etc., came

nounced on in shows, in every part of the country for years on years. He was the schoolmaster who taught a generation of fanciers how to judge fowls."

In writing of Felch in 1883, the editor of the *Poultry Monthly* said: "His writings, which can be found in the files of the *Massachusetts Plowman*, *American Cultivator*, *Country Gentleman*, and many other publications, including the several poultry journals, represent an encyclopedia of his experience as a poultryman. In his articles and actions as a judge he has been independent and fearless, adhering to the 'Standard of Excellence' according to his best judgment. It is safe to say if Mr. Felch doesn't know a good bird when he sees it no man does."

I. K. Felch did important work in bringing about the organization of the American Poultry Association and in the preparation and adoption of a Standard. In fact, when Standard making was needed, Felch's ability in that direction was usually called into action. An interesting story in this connection is told in an article on Langshans in *AMERICAN POULTRY JOURNAL* for April, 1917. The Langshans had been

The above illustration is reproduced from *American Poultry World* for January, 1910, and accompanied an article by H. H. Stoddard, in which he paid a tribute to I. K. Felch as one of "The Three Main Pillars of Standardbred Poultry Culture in America."

to mean to the buying public a guaranty of quality whether for breeding or exhibition purposes. During recent years he has bred chiefly White and Barred Plymouth Rocks, White Wyandottes, and his original pedigree strain of Light Brahmas, which latter, according to the published records, he founded about 1847. He was a lover of all thorobred stock and interested in all livestock breeding. At one time he was advertising Jersey cattle and collie dogs quite extensively, as well as his several breeds of poultry.

We believe that Mr. Felch was one of the first breeders to adopt the plan of "farming out" mated breeding stock and eggs for hatching to have stock reared for him, thus giving profitable employment to many people in the neighborhood of his home town and securing for his customers a larger number of desirable sales specimens to select from.

He was always a friend and helper of the beginner in poultry culture, ever ready to extend a helping hand, and always recognizing the beginner as the very life of the Standardbred poultry business of the future, and during the last few years his writings have been almost wholly for the purpose of aiding the novice. It is a matter of record that he made his maiden speech as a lecturer on poultry in 1873. Since that time, and particularly since the development of poultry courses at our agricultural colleges in later years, he became one of the most popular of lecturers on poultry subjects. About thirty years after Uncle Isaac made his maiden speech, we had the pleasure of giving a talk to a class at an agricultural college immediately following an all day's session of the class with Mr. Felch. The students had been greatly impressed with Uncle Isaac and he had given them much to think about, as well as the time of their lives—for he possessed a rare gift of real American humor. We certainly enjoyed the nice

things which both class and the instructor had to tell us about the day with I. K. Felch. Beginners always liked him, he knew how to get their interest and how to hold it. He was always cordial and ready to talk, and, to use one of his own phrases, "He could speak so you can see it."

Always a strong supporter of the American Poultry Association and a power in the building of its Standard, he was made president of that organization in 1898, and the year following, on retiring from the presidency, he was appointed a member of the advisory board.

The funeral services of I. K. Felch were conducted by the Meridian Lodge of Masons, of which he was the oldest member. He leaves a daughter, Mrs. W. O. Hunt, and a son, Arthur E. Felch, who was associated with him in business and is well known in the poultry fancy.

THE FOLLOWING WAS WRITTEN BY CAPT. JAS. E. WHITE, AND APPEARED IN THE SEPTEMBER, 1878, ISSUE OF THE AMERICAN POULTRY JOURNAL, FORTY YEARS PREVIOUS TO MR. FELCH'S DEATH.

I have often thought when reflecting on the physical construction of man, that the great Architect did not comprehend at the beginning how much his grandest work would have to contend with; sickness makes fearful inroads upon man's earthly tenement, and life's battle against want and intellectual serfdom gradually but surely wears away the resisting power necessary to confine the steam generated by the eternal fire burning in the fire box at the head of the human engine; year after year the waste goes on, and man, when he should be in his full strength and vigor, is a wreck only fit to be sent into the shop for repairs. Man should have been made

with the strength of an engine, with action swift as the lightning, and rugged and enduring as the everlasting hills. This is what man should have been, but is not. What a grand work such a man could have accomplished and what a curiosity he would be to us poor devils.

The man who, in my opinion, approximates the most closely to what man should have been is I. K. Felch, of Natick, Mass. He is a combination of physical strength, great nervous action, which is kept in subjection by a strong judgment and intellectual manhood. Work that would make ordinary mortals groan as if upon a rack, and grow prematurely old, is boy's play to him, and all he undertakes is accomplished systematically and, of course, is well done; in his specialty he can carry on the work of a dozen other men and come out fresh and blooming as a daisy. In breeding fowls he follows no theory, but is guided by an experience which is worth more than all the theories ever advanced, and his success and stock

demonstrate that the lessons of the past have not been rudely cast aside and forgotten.

Some of the best of the stock owned by him is kept at his own place, and receives his constant attention, but a large number of well-to-do farmers, living within a few miles of Natick, are pressed into the service and annually rear large flocks of thorobred chicks for him. In all such cases Felch mates up the breeding stock and examines the young weekly; no move is made without consulting him, and the man who violates the confidence reposed in him had better pass in his checks and move to a more congenial clime. Some of the finest Light Brahas I ever saw were in his yards, and his other stock was as fine as can be found anywhere East. One farmer was breeding two fine yards of Brown Leghorns for him, and I must say I never saw such magnificent birds of that variety in my life. Writers may say what they please about Felch's ideas of breeding, but a visit to his yards will convince any intelligent breeder that he knows what he is about.

Is Everything Shipshape for Winter?

Make a List of What Must Be Done to Place Your Birds in Good Quarters Before Cold Weather Comes. First Prize Article American Poultry Journal Monthly Contest.

By Marion Morse Ewing

AS THE cool, frosty air whistled across the open stretch by the poultry house this morning, did it remind you that everything is not yet in readiness for the long cold winter to come? Yes, there are a good many things to be done before the ground hardens and feathery white snow flakes cover the earth. During the past month I have been making a list of these things from time to time as I happened to think of them. The "must be done's" come first, and after those there is a long list of "near" necessities which I hope to gradually cross off the list as I am able to accomplish them.

I consider the housing of the pullets of first importance. If they are to begin laying early, they must be comfortably housed by October. Accordingly I spent a good part of my spare time getting the house in readiness for them. I just set to one sunshiny day and had a thoro housecleaning, took everything out of the house that was movable, gave the whole

interior a good sweeping and spraying, cleaned the floor, and then went outside and scrubbed up all the equipment, such as nests, hoppers, drinking fountains and perches. While these were given a further sunning after cleaning, I applied more disinfectant in cracks and crevices.

When the house was thoroly dried and aired out, I placed fresh litter on the floor (fortunately I am able to get straw), put the equipment in place with freshly filled hoppers and drinking fountains and in the evening moved the pullets, which I have been banding from time to time as I select well developed birds, into the house. For the first two or three days I keep the birds in the house, supplying them with waste greens from the garden. This is done to accustom them to their new surroundings so there will be no difficulty in their returning to their new quarters when allowed on range. In the course of a few days, I allow them in the small yard which is wired in, and by the time I have picked the tomatoes and other late vegetables which they are apt to destroy, they are given free range over the farm until snow comes. I believe this fall range helps greatly in the final development of the pullets and in sending them into the winter lay in a robust, healthy condition. After a month or six weeks of picking around the farm where grain and weed seeds of all kinds are plentiful, and greens are everywhere to be had for the picking, not to mention all kinds of bugs and worms, the pullets are in the very pink of condition, as their bright colored combs and sheeny plumage attests.

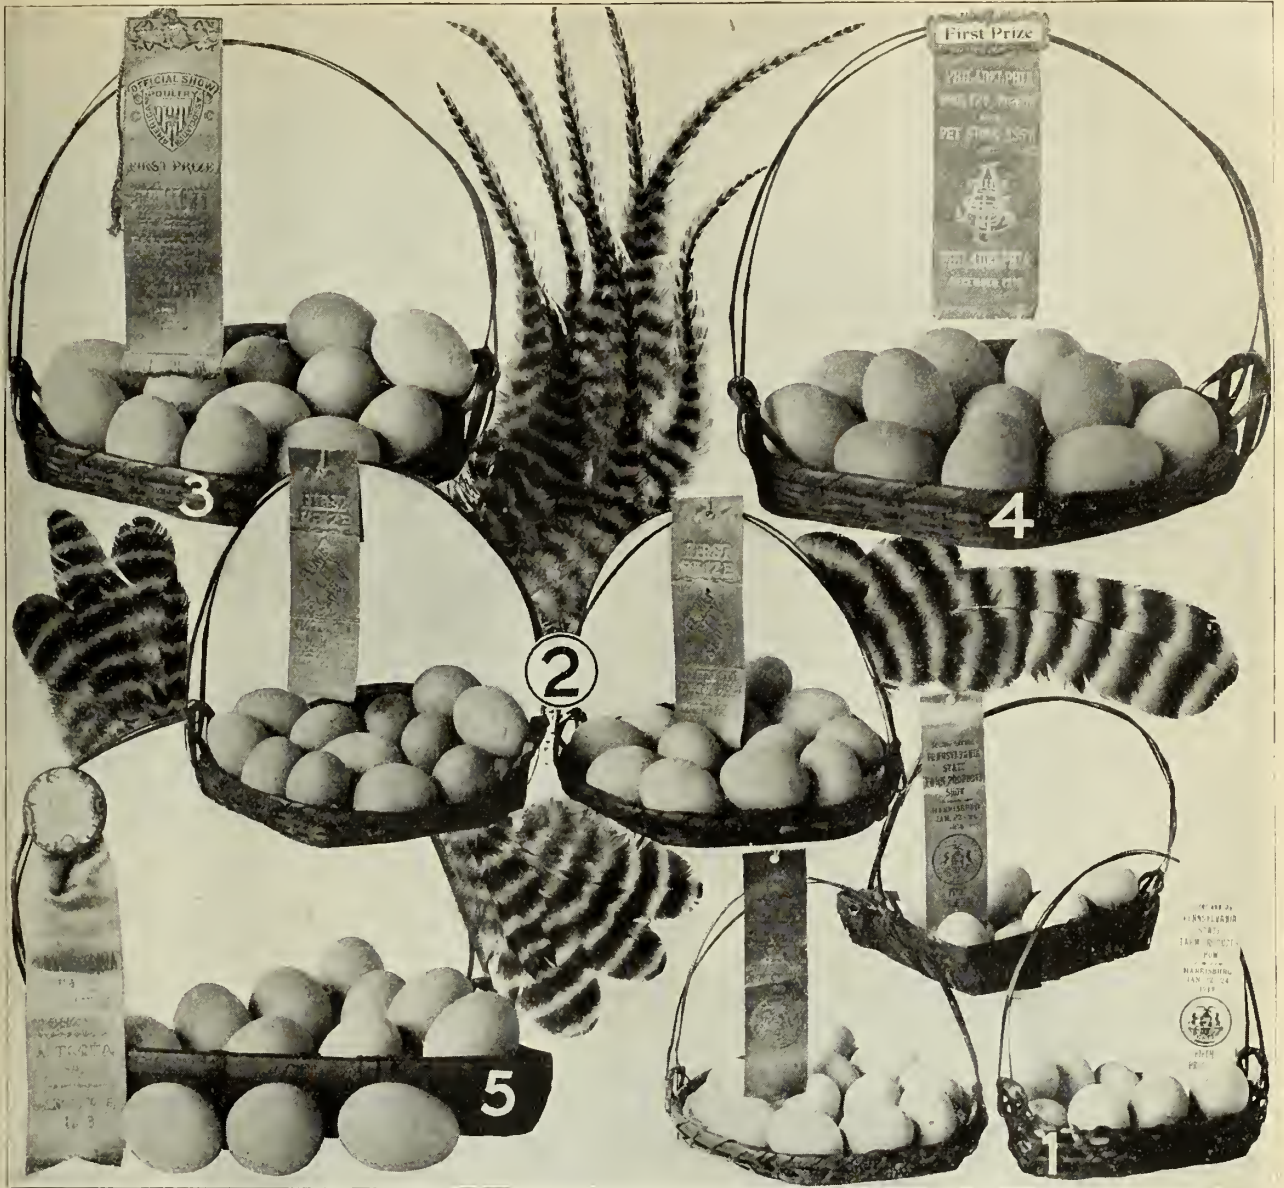

When I have crossed off of that long list "housing of pullets," I feel that the first lap of the race with Old King Winter is won, and I go about the other little tasks whenever opportunity offers with a light heart. There is the yard to be spaded up and sown to rye, and the pullets to be given frequent dustings, and the corn fodder to be shocked along the north side of the yard as a windbreak, and the cockerels to be sorted over and disposed of as their development admits, and a sharp lookout kept up for rats and mice. At this season of the year, these rodents are trooping in to shelter for the winter and they are sufficiently quickwitted to pick out a poultry or feed house where there is no danger of the larder becoming depleted. The fall is the finest time of the year to kill off rats and mice and it is time well spent. Every one killed means a dollar or two saved for the one who is paying the feed bills. It takes some time to get the rat and mouse extermination crossed off the list. In fact, I really never get it crossed off, but keep up an eternal fight against them, but I always put it on the list in large letters and every little while I make a cross after it, showing them I have killed off a millionth part of the horde which is constantly besetting our grain stores.

Every few days when I am about the fowls I keep a

SILVER KING II,

Champion Silver Campine three consecutive years at Chicago Coliseum Show. Owned by Frank E. Hering, South Bend, Ind.

Some prize-winning eggs, produced by J. W. Parks, breeder of Barred Rocks, Box J, Altoona, Pa. (1) First, third and fifth prize best dozen brown eggs, Harrisburg, Pa., State Agricultural Show, over 100 dozen competing. (2) First prize best dozen brown eggs, Rochester, N. Y. (3) First prize best brown, first prize heaviest brown eggs, Johnstown, Pa. (4) First prize heaviest dozen brown eggs, Philadelphia, Pa. (5) First prize best dozen brown eggs, Altoona Show, over 1,200 eggs in show.

weather eye on the good lookers. There is the pullet which I have had marked for the show room for weeks back and sometimes she doesn't seem to be coming on just the way I had hoped she would. The other morning I was more than surprised to find another pullet in the flock which had completely eclipsed my best one. And so that means that both of them are going to the show. I had only intended to send a hen and a pullet, but already I have three marked for entrance and before the entries close I may add to that number. Of course, I have to spend a little time every day with these birds—just a few minutes—and now they are as easily handled as I could wish. I have the egg record of the hen for her pullet year and if she does anything like as well this year, and gets placed at the show, I shall feel that fancy and utility go hand in hand in this specimen.

During the first weeks the pullets are in their new quarters I spend a few minutes every evening seeing that they are not crowded on the roosts, or acquiring that filthy habit of roosting on nest boxes. I spread them out fairly even on the roosts and if they take to roosting on hoppers, fountains or nest boxes, I rig up some device to prevent their getting a foothold on any and all of these places. If they cannot get on them, they will quickly take to the roosts provided for

them and there will be no further trouble along that line. There should also be enough nests provided so that no necessity exists for crowding on the nests or laying on the floor.

I endeavor to store as many greens for winter feeding as I can. Cabbage and mangels and small potatoes are all good, and while I do not supply the birds with anything like as much in the green food line in winter as I am sure they would consume if they had it, yet the little they get makes variety and supplies a valuable food.

For record keeping I find a record blank posted in each house the most convenient way. A pencil fastened by a cord to the wall should be attached. Many people feel in these strenuous times that they cannot afford time to keep records. It requires very little time to keep flock records and it is a great satisfaction to know at the end of the month just what the flock has done to pay its board bill. I have become so accustomed to keeping egg records that I do not feel that I could keep poultry with any degree of satisfaction without a record of the number of eggs laid. Individual records require almost constant attendance and while I have done this with some flocks in years past, I cannot now give the time to it that I would like, but flock records are possible for every poultry keeper. I count the eggs as I gather them and mark

them down on the record before leaving the house. If the birds do not seem to be laying well when it is time that they should lay, I test them and discard those that show no prospect of laying. This happens once in a while, but it is rare to find a well grown, rightly developed pullet which will not respond to good food and good care by laying a reasonable number of eggs. There is, however, always a chance to weed out unprofitable birds in a good-sized flock of poultry. Birds that have been laying heavily sometimes break down and should be marketed. With present prices of grain I do not like to keep the unlikely cockerels a day longer than I can avoid, so what I don't sell, I can. The meat of the young cockerel is better than it is when the birds are older

and the expense of feeding is avoided by early canning.

As the cold weather approaches, there is one danger which should be guarded against, and that is the habit of babying the fowls. On the first cold night, the houses are frequently tightly closed or curtains are put down in front of roosts. The cold weather comes on by degrees and all the time the fowls are becoming accustomed to it. Moreover, they are getting a fine coat of feathers and down and they should be getting plenty to eat; so why worry about a frosty night? Just leave the door or the front all open, making sure the birds are not in a draft, and that the roof is fairly tight, and there will be no danger from colds or secession from laying every cold snap.

The Value of a Good Poultry Paper

The Poultry Journal Is the Backbone of the Poultry Industry and Should Have the Support of Everyone Engaged in the Work. Second Prize Article American Poultry Journal Monthly Contest. *By W. H. Hood*

IN ALMOST every walk of life we find those who are eager to acknowledge that which most has helped them to succeed, for while success lies within the effort put forth by the individual, yet invariably some outside influence has been the deciding factor. Only a very short time ago, I knew absolutely nothing about poultry keeping. It was a subject that I had not even thought about. I was fond of poultry and eggs as food, but that was as far as my interest in poultry extended.

With the urgent call for more interest in food production, I began to think of what I could do to help out. We have a fine orchard plot back of our house in a good-sized town, and it seemed to me that poultry was about the only meat food that I could produce. I thought of sheep and hogs, but there were reasons which prevented raising either of these animals on our land and accordingly I began to look about for a flock of hens.

I inquired several places where I had seen poultry, but it seemed to me that people were asking tremendous prices for poultry and I resolved not to be taken in. Just about this time as I was waiting for my train to be made up one evening

and I was casually looking over the offerings on the newsstand, I noticed a copy of a poultry journal and immediately purchased it. I had never noticed or thought of there being such a publication before and as I read it, going out on the train, it was somewhat of a revelation to me. I was greatly interested in the advertisements and somewhat amazed when I read prices on breeding stock offerings. For several days I read and reread that paper and it seemed to me that poultry was a very exhaustive subject, but I resolved to learn a little about it every day and to engage in the undertaking.

I made my start by purchasing 100 day-old chicks from an advertiser in the JOURNAL and rigged up sufficient makeshift equipment to care for them, from suggestions read in the JOURNAL and felt myself fairly launched in the business. But there were so many things I did not know that I very evidently needed to know, and wanted to learn, that I thought it would be a good plan to take all the poultry journals I could, and read them all carefully. I had purchased a book or two and was gleaning considerable information from them, but there were lacks in my knowledge of poultry keeping that needed rectifying. I was somewhat disappointed in some of

the poultry papers after I got them and looked them thru, but in addition to my "one best" I decided to subscribe for one or two others, and thus my education began.

A Single Comb White Orpington Cockerel owned by Robadel Poultry Farm, Cos Cob, Conn.

With the first day-old chicks I did not succeed very well, for it was early in the spring and while we were having a cold, damp spell of weather. I did not know enough to realize that the chicks were cold and uncomfortable and in the course of a few weeks I only had forty of the one hundred left. Not being discouraged, I bought 200 more White Rock chicks. It was in April and the weather was fine. I had been reading up a lot relative to the care of day-old chicks, how they should be fed and mothered, and the necessity of their having a warm place to flee to when cold or damp. I saw that a poultry farm not a great distance away was selling off several breeds which were about to be discontinued, and I happened to visit this farm a day or two before my day-old chicks were due to arrive. Among other breeds being sold, there was a fine flock of Rhode Island Reds in which there were several dozens of broody hens. I carried home in the back of my little Tin Liz ten of these hens—great motherly, patient creatures, which their owner assured me would make ideal mothers for the chicks about to arrive. Following the advice in the AMERICAN POULTRY JOURNAL, I placed these hens on darkened nests, after having thoroly dusted them, and when the chicks arrived a few days later, they were divided up among the ten hens and placed under them at night.

It seemed a little to me like going it blind to place these perfectly good, fluffy chicks under those great heavy, ungainly hens and then go away and leave them all night to their fate, but in the morning they all seemed to be as contented and happy as if they had made the arrangement themselves. These hens proved to be the greatest labor savers that I have ever employed. They relieved me of all the trouble of trying to keep those 200 chicks warm and comfortable and that was some stunt. I followed a plan of feeding which one of the editors of the AMERICAN POULTRY JOURNAL had recommended, gave the chicks the run of the orchard, watered them regularly and never saw a finer sight than those growing, hustling chicks, picking about in the orchard. They grew and developed well, and we began eating the cockerels early in the season.

There was an open shed on the place which we converted

into a poultry house, following plans which I read in the JOURNAL. It was some undertaking to decide which birds should be kept and which we should eat, but in the end most all the pullets were found to be well developed and healthy. so they were placed in the converted laying house early in the fall, according to "Hoyle" (AMERICAN POULTRY JOURNAL) and they lived right up to what was expected of them by beginning to lay in November—Thanksgiving week, to be accurate. We kept a few of the cockerels, and some of them will go into our breeding pens this winter.

Thru that long cold winter, and it was the coldest one within the memory of the oldest inhabitant, we fed and cared for our birds according to the rules laid down in our favorite JOURNAL. The laying kept up well thru the winter, like the grain prices, but we were not discouraged, because those new-laid eggs tasted better than any food we were able to buy. I carried eggs in and sold to others in the office two or three times a week and got the top market price for them, with no extra expense for marketing.

As spring approached, I was undecided whether to attempt the hatching of chicks or to again purchase day-old chicks, but as my time was limited I decided not to attempt home hatching and again placed my order where I had received honest and courteous treatment the year previous.

The chicks arrived in good order and altho conditions were equally as good for successful rearing of chicks, I lost a greater percentage the past season than in my novice year. However, I have an extra fine bunch of pullets now in the laying house, and we have some rows of canned cockerel on the pantry shelf, as well as a goodly flock of surplus birds in the cockerel pen.

As I look back over the past two seasons I cannot refrain from asking myself, to what main factor do I owe my success with poultry? There can be but one answer. Whatever success I have attained along this line, is due to the sound, helpful advice which I have gained month by month from the columns of a good live poultry journal. How otherwise could I have reared these fine flocks of fowls, kept them in health and in laying, when as a matter of fact less than two

First prize Silver Campine cockerel at Chicago Coliseum Show. Owned by Frank E. Hering, South Bend, Ind.

years ago I did not know upon what poultry subsisted?

Apparently few poultry keepers realize what a great proportion of their success they owe to the poultry papers. I have visited a number of small plants during the past summer and in every case found the owners following suggestions which they had adopted from having read them in such and such a poultry paper. The poultry paper is the means by which all the latest and most practical methods of poultry keeping from every part of the country are gathered together, and sorted, and placed on file, for the good of every other poultry keeper. If a man in New Mexico conceives a useful, practical device for labor saving in his poultry work, he writes about it to the "Readers' Open Forum," and men and women engaged in similar work in all parts of the country are benefited thereby. Or a poultry keeper in Maine, or Pennsylvania or Kansas has a good idea in regard to co-operative selling and buying, he writes about it to the editor and presto! next month sixty thousand or more poultry keepers read about it, and as the months go by, the co-operative buying and selling among poultrymen becomes a fact. A man has an idea that he can tell which hens are laying or

about to lay. He writes it to the poultry papers, and everywhere poultry keepers adopt the idea and thousands of non-productive hens are marketed in every city thruout the land, and the grain these hens should have otherwise been wasting put into hens and pullets which are shelling out eggs.

Poultry and eggs are two of the finest food products we have. Knowing this, and considering the work which first-class poultry magazines are doing in educating novices like myself in the art of producing poultry and eggs, how shall we estimate the real value of the poultry paper? As one who realizes what he has gained thru reading poultry periodicals I would place the economic value of this class of literature very high, and foremost among essential publications. Let each reader of this and every other poultry periodical stop and consider what it means to him to have at his command a central office in his favorite poultry magazine, which is ready to answer all calls, emergency or otherwise, and to give him the benefit of the experience of poultry workers from every section of the country. The poultry journal is the backbone of the poultry industry and should have the support of everyone engaged in poultry work.

Poultry Work in Winter Quarters

Suggestions for Fall and Winter Care of Breeding and Laying Stock.

By Prince T. Woods

THE end of October should find breeding and laying stock safely housed in permanent winter quarters. If the growing chicks have been properly cared for during summer and early fall, the first pullets should be well advanced in laying, while later ones are making rapid progress toward maturity.

The yearlings, and selected two-year-olds, should have finished or be nearly thru their molt, and should be plump and in good condition to resist the rigors of coming winter. Fowls which have had good care during summer and autumn can be depended upon to do good work as winter layers, but if they have been neglected and do not go into winter quarters in good order, there is little hope of getting them into lay before Christmas.

When fowls go into winter quarters they must not be shut in too closely. While the mild weather lasts, the closed houses should be run wide open, taking care that there are no thin air currents, or drafts, about the roosts at night. With modern open-front houses, the caretaker will not have to worry about the ventilation. Poultrymen using ordinary types of closed houses will find this matter of ventilation of vital importance at this season of the year. Where open-front houses are used the birds are sure of a plentiful supply of fresh air at all times, and this is important in the prevention of late fall and winter diseases. Fresh air all the time is absolutely necessary for keeping the birds in best health and vigor.

If one begins the practice of shutting the fowls up snugly in a closed house, without due regard to proper airing at frequent intervals, the birds are almost certain to develop catarrhal colds which may later develop into roup. Thin drafts of cold air in a close house will sow the seed for more sickness in a single night than would be likely to make its appearance were the fowls allowed to roost in the open exposed to the elements. Too close confinement in any tight, ill-ventilated house is equally certain to be productive of disastrous results. The front windows of closed houses should be kept open night and day when weather will permit. When cold, stormy weather comes, the windows may be closed at night, but should be open for the greater part of the day, particularly when the sun can shine in. Usually it is better not to entirely close the front windows at any time and they can be fitted with burlap screens to keep out snow and rain. Failure to properly air the house will cause "house sweating" and dampness, and the flock will not thrive in a damp house. Fairly deep poultry houses, with roosts at the rear well back from the entirely open or partly open front, the front having a southerly exposure, make the most satisfactory winter quarters.

There is a big difference between using well-ventilated or open-front houses and permitting fowls to roost out in the open—the difference between comfort and discomfort. Roosting in the trees may be productive of no harm in summer and early fall, may be beneficial in some cases, but in the greater part of this country, except the far south, harm may result if fowls are allowed to roost out of doors when the severe and changeable late fall and winter weather sets in. The open-front house affords comfort and protection. The birds are well sheltered by a tight roof overhead, snug side and rear walls protecting the roosts against draft and preventing too great loss of natural bodily warmth, and the cold, chilling winds and storms cannot reach them, while they have an ample supply of fresh air, which is essential to life and health.

Of equal importance to a comfortable, well-aired, roomy house, is liberal feeding on sound wholesome food in reasonable variety. An elaborate ration is not necessary. Many grains and seeds are useful for poultry feeding, and in normal times a wide variety of ground feeds may be available, but one can get excellent results with a very simple ration. Simple rations, made up chiefly of the more readily obtainable feeds in the home locality, should rule in war time,

Exercise is desirable when birds are confined in winter quarters. It helps to keep them out of mischief and helps to prevent bad habits like feather pulling and egg eating, as well as keeping the birds in good condition with keen appetites.

Part of the grain ration fed in plenty of litter is the best way to promote exercise. Automatic feeds may be used to scatter the grain and are great labor savers. Bright, sweet, clean, new straw makes the best litter. Wheat and oat straw is preferable to rye straw, as rye straw sometimes is affected with a dangerous smut which will poison fowls. Forest leaves—free from mold—pine needles, hay-mow chaff, chaff from the grain cleaners, and planer shavings all make good litter material. Hay is the least desirable, as fowls are certain to eat more or less of it and some may become crop-bound. Litter material must always be clean and sweet, never musty or moldy. It should be removed to the manure pile when it becomes damp and fouled, and a fresh supply provided. The spores and germs which multiply in moldy, musty, damp and rotten litter will cause canker, chicken-pox and other diseases.

A simple and satisfactory grain ration, for use in automatic feeders or scattering in the litter, may be made by mixing 20 pounds of sound corn, either cracked or whole, with 10 pounds of heavy, clipped white oats—feed wheat and barley mixed may be used in place of oats if available. Supply also a good dry mash mixture in a hopper. Beef scrap may be

fed separately in another hopper or fine beef scrap or fish meal, or both, may be combined with the mash mixture. Succulent vegetable food should be fed liberally. An abundance of clean fresh water must be provided. Clean snow will serve in place of water in extreme cold weather. Raw vegetable food is best fed in racks or from pockets of poultry netting on side walls of house. Give only as much as is readily cleaned up each day.

As long ago as 1864 the Massachusetts State Board of Agriculture recommended a similar ration for laying fowls in winter and such rations have been in successful use ever since by many practical poultrymen in New England who make a business of producing market eggs. Here is an extract from an article by E. A. Samuels, published by the Massachusetts Board of Agriculture in 1864:

"The poultry house prepared and the flock selected, the farmer should see that they have proper care and food; that unhealthy fowls are restored or removed; that those hens which incline to sit are provided with eggs; and that chickens when hatched are taken proper care of. Fowls in confinement require an abundance of pure water, ashes to dust in, and nourishing food. Of grain, equal parts each of Indian corn and oats is very acceptable; at least three times a week scraps of meat should be thrown to them, and a supply of crushed oyster shells or clam shells should be accessible at all times. Green sods also thrown frequently into the fowl-yard will be of great advantage. These few attentions are all that is necessary with laying hens."

These simple rules for poultry feeding have continued to give satisfactory results for more than half a century. We have improved on them by keeping beef scraps and mash before the birds, supplying prepared clover and alfalfa and succulent vegetables in place of green sods, which are not often obtainable, but some of our war-time rations have followed Mr. Samuels' plan pretty closely.

A good dry mash for winter feeding may be made of 25 pounds each corn meal, standard wheat middlings, wheat bran, and fine beef scraps, all well mixed and fed from a hopper. Equal parts beef scrap and fish meal, or all fish meal may be used in place of all beef scraps if desired. Cut-clover or cut-alfalfa, in the proportion of about 15 percent by weight, may be used in the mash. Or this cut hay may be scalded and fed separately once daily. Season water used for scalding with a little salt.

The dry method of feeding requires less labor than any other plan. The scratch grain may be fed from a feeder and the mash from a hopper. Feeding may be once a day or once or twice a week, according to capacity of feeders and hoppers. If these devices are used they should never be permitted to become empty. Dry feeding will yield good results, but there are many poultrymen who still cling to moist mashes for their flocks. In feeding a moist mash it apparently makes little difference whether the mash is fed in the morning, at noon, or at evening—whichever is the most convenient—so long as a regular system of feeding is carried out. Heavy feeding in the morning with a bulky moist mash is likely to promote a lazy habit in the flock and the greedy ones may gorge and then seek some quiet place to sleep it off. We would prefer to feed a moist mash later in the day and keep the birds busy scratching for grain in the litter.

A good moist mash may be made by mixing equal parts by weight of corn meal, ground oats, flour middlings, wheat bran, and beef scraps. Scald a quantity of cut-clover or alfalfa—about 15 percent of the ground grain to be used—

with lightly salted hot water. Use enough hot water to mix the whole amount of mash required. Then mix in enough mash mixture to make a crumbly mash. Let stand until sufficiently cool for feeding. The scratch grain used with this mash may consist of a mixture of two-thirds corn and one-third oats, with about 10 percent of feed wheat added. Some who feed moist mashes feed once a day, giving the whole daily allowance of mash and grain at one time. Others feed scratch grain in morning and mash in mid-afternoon, scattering sufficient hard grain in litter at time of mash feeding to insure fowls going to bed with full crops, and of there being enough grain left in litter to start them to work when they leave the roosts in the morning. When a hen scratches in litter she should find enough to pay her for her work. The precise method of feeding does not matter so much, but it is absolutely necessary to adopt some method of feeding and then be regular as clockwork about it. Fowls must be kept well fed if they are to be productive.

Granulated charcoal, grit, crushed oyster shells and water should be kept before the fowls at all times.

Back-lotters and small flock poultry keepers will generally find that the ready-mixed scratch feeds and mashes are more convenient for their purpose than home-mixed rations, and as reasonable in price, present conditions of feed and grain market considered.

Fowls which are to be used for breeding next spring should not be forced for eggs now. It will be best to keep them on a diet of chiefly hard grains and vegetable food, feeding but little concentrated mash. Where dry mash in hoppers is used, arrange the hoppers so that they can be closed for greater part of day if desired, when feeding breeding stock. When eggs are soon to be required for hatching, the mash can be fed more freely, but do not jump from short rations to heavy feeding. Feasting-after-famine conditions are likely to be followed by molt. Cut-clover and cut-alfalfa are aids in securing fertile hatchable eggs. Flocks kept for egg production should have plenty of concentrated mash, they should consume approximately as much mash as hard grain, weight for weight.

A New Constitution

Among other things of interest to the poultry industry the forty-third annual convention of the American Poultry Association, held in Chicago, August 12-15, decided that the association needs another new constitution. The new constitution committee, which is to report to the 1919 annual meeting, includes Thomas E. Quisenberry, Frank W. De Lancey, Grant M. Curtis, John S. Martin and Charles D. Cleveland. This committee is to confer with all members of the A. P. A. and the different state organizations in order to prepare a constitution broad enough to meet the needs of these strenuous times. A worthy object, but it will take some vigorous action to keep pace with the times at the rate history is making and established customs are being revolutionized nowadays. Those who have suggestions to make should put them in writing and send same to Thomas E. Quisenberry, Box 206, Leavenworth, Kansas.

It is strange how so many of us turn toward constitution mending and new constitution building as a sort of panacea for all organization and administrative ills—is this because we are so thoroly imbued with the necessity for "constitutional vigor" in our breeding flocks? There are times when it does seem as if we have rather an oversupply of laws and rules and a decided lack of common sense interpretation and application of same. Editor De Lancey, one of the new constitution committee, is enthusiastic over the prospects and, if one may judge from editorial comment, thinks that a new constitution will prove the remedy for all ailments with which the A. P. A. is supposed to be afflicted. He says, in part—

"It did not require a Moses to lead the A. P. A. out of the wilderness. Take another guess.

"A new constitution means reconstruction and reconstruction means rebuilt."

We do not question the good intent in the above quotation, but we believe that it will be wise to get "out of the wilderness" before we begin to crow about what we are going to do. If we must brag, the bragging would have more grace if it followed actual accomplishment. Too often the greater part of enthusiasm is wasted in boasting about what is going to be done, and it soon peters out, so that too little effort is put into the real work which needs to be done.

A new constitution does not necessarily mean reconstruction or rebuilding. The American Poultry Association adopted an entirely new and carefully prepared constitution four years ago, at the thirty-ninth annual convention, in Chicago, August, 1914. It was prepared by a committee appointed at the Atlantic City convention in 1913, at least one member of which is on the present new committee. The resolution calling for a new constitution at Atlantic City meeting referred to "the last general revision of the constitution and by-laws, which took place in 1906," and explained the need of a new constitution because of rapid growth of the organization, a wider field of activity, the many branch organizations, and the rapid expansion of the poultry industry. This new constitution was discussed and adopted section by section at the Chicago convention of 1914. Men with wide experience in organization work helped to build this constitution of 1914 and, as a whole, it was considered to be both desirable and suited to the needs of the times. There are many members who feel that there have been many official acts since its adoption which were not in accord with the letter or meaning of this constitution. We may safely assume that the new constitu-

tion, adopted at the beginning of the big world war, did not rejuvenate, reconstruct or rebuild the A. P. A. It takes far more than the adoption of a constitution, or the promise of a new constitution a year hence, to rebuild an organization.

If the A. P. A. is to undergo reconstruction and become modernized, there is much that needs doing and every member will have to help. We still believe that a real leader is needed, and up to present writing we haven't seen anyone exhibiting symptoms which would qualify him to be the Moses of the A. P. A. We need not give up hope on that account, for real leaders have a habit of being born of emergency out of unsuspected material and ours may arrive at the critical moment.

Please do not misunderstand us. We have no desire to attempt dictation of the conduct of A. P. A. affairs. Our comment is intended as suggestions for the good of the cause, an expression of our views and nothing more. From our point of view the A. P. A. has had an overdose of editorial and supply business control and too little activity by real poultrymen. The editors, manufacturers, supply and feed dealers certainly should provide substantial backing for the A. P. A.—it is to their best business interests to do so—but they should let the breeders of Standardbred poultry run their own organization.

From our viewpoint the A. P. A.'s troubles are largely due to inactivity on the part of members who should be among the most active, and to administrative and financial mismanagement rather than to faulty constitution—altho the constitution may need revision in spite of the fact that it has been subject to almost continuous tinkering. Such constitutional changes as may be necessary could more easily be secured thru amendments than by adoption of an entirely new constitution, and at less cost in all probability. We venture the statement that only a very small percentage of our membership, including the officers, are familiar with the contents of the present constitution as amended to date.

We have too few members who are really active and too many who are really "dead wood," members who were solicited to pay for a \$10 life membership to swell the returns at some annual meeting and who ceased to show any sign of interest thereafter. The present manner of conducting annual conventions is a handicap. A few members of "the machine," who get their expenses paid by the association or by private interests "with an ax to grind," can usually be depended upon to attend all conventions, but the average member, living at a distance from the convention city, cannot afford to attend or cannot get away from his business. Such representatives of the "rank and file" as do attend the meetings are drawn from nearby sources and include both new and old members, often largely new, many of them attending their first convention and the local group at each convention being made up very largely of persons wholly unfamiliar with A. P. A. affairs and the issues under consideration. This gives the "hot air" orators a big lever with which to sway the sentiment and control the vote of the convention. It is not good business.

It seems to be pretty generally conceded that the A. P. A. needs to be reorganized and modernized. What is the best way to bring this about?—certainly not by clinging to old methods and established precedent. As has been suggested by several earnest

members, it would seem to be wise policy to attempt reconstruction from the outside of the circle toward the center. That is, build up the organization along the governmental lines which have proved a success in the building of our great united Nation. Let the local town and county poultry associations thru elected delegates organize state and provincial associations. We believe that the present constitution indicates the way this may be done. Also let the general membership elect certain officers and directors to constitute a central governing body to act at annual meetings, in conjunction with elected delegates from the recognized state organizations, and to direct the work of the whole united organization in the period between annual meetings. That would seem to be the really American way to do the work. Of course no international organization, occupying the field which the A. P. A. pretends to cover, can hope to get the best administrative results without paying good salaries to its executive officers and making them earn said salaries or give place to some one who will.

The \$10 life membership is a difficult handicap to overcome. In these times—or even before the war—no big organization can hope to successfully do business on the revenue from a \$10 life membership fee, plus the profits on sales of books and supplies, and occasional donations. Ten dollars is not a big enough fee to permit any organization to carry a member for life. Every new life member is an added obligation taken on at a loss, and, be it remembered, the A. P. A. does not get all of the \$10. Experienced men in organization work have figured that a life membership fee of \$40 is about as low as any organization can afford to accept. This matter has been discussed and "cussed" for a long time, but we do not seem to get anywhere. To date no one seems to have found a way to dispose of this difficulty, for it is contended that once a member has been accepted for life, on payment of a \$10 fee, there is no way to compel him to assent to an assessment of annual dues unless he volunteers to do so. Yet a large proportion of our membership seems agreed that the easiest way out of association financial difficulties would be to have an initiation fee and regular annual dues. As affairs are now conducted and with present organization, we would seem obligated to carry all present life members without further assessment and to apply any system of annual dues only to new members who join after a new membership rule has been adopted. This places an unfair burden on prospective new members and gives discriminating favoritism to the old members. There should be a way out.

Possibly the remedy might be found in sending out a call for members to attend the next annual convention for the purpose of dissolving the old association and reorganizing and legally incorporating as a new organization with constitutional provision for a just initiation fee and regular annual dues. This, of course, should not be undertaken without first securing the best legal advice obtainable. Undoubtedly the old name and all prestige of the old organization could be retained. Other business organizations have accomplished it, tho some of them have been obliged to carry all of the old life members who proved to be "conscientious objectors." We believe if the matter is fully understood to be for the best interests of the Standardbred poultry industry and the international organization that the

MOULTING HENS

Don't let nature take its own time to revive the dormant egg organs after the moult. Feed a tonic. Dr. Hess Poultry Pan-a-ce-a will start your pullets and moulted hens to laying promptly. It contains Nux Vomica and Quassia—tonics that promote digestion and tone up the dormant egg organs. It has iron for the blood and internal antiseptics. It makes poultry healthy—helps to make hens lay.

Buy Pan-a-ce-a according to the size of your flock—a penny's worth for each hen, to start with. The dealer will return your money if it does not do what we claim. 30c, 60c and \$1.25 packages. 25-lb. pail, \$3.50; 100-lb. drum, \$12.00.

COLEMAN MILES EGG FARM

MT. CARROLL, ILL.

First Prize Cock at Madison Square Garden, December, 1916

CANADA'S BEST

At the Canadian National Exhibition, Martin's Regal White Wyandottes make a record winning. In a class of 28 Cocks, 28 Hens, 34 Cockerels, 40 Pullets and 6 Pens, they won as follows: Cocks 1-2-3-4, Hens 1-2-4-5, Cockerels 1-2-3-6, Pullets 1-3-5, Pens I; Bronze Medal for Best Collection.

Winners at New York State Fair: Cocks 1-2-5, Hens 2-3-4-5, Cockerels, 1-2-3-5, Pullets 1-2-3; Pens, young, 1; Pens, old, 1.

Fifteen years ago the Regals were making similar winnings, proving conclusively that they have kept up to, and even ahead of, Standard requirements. Not only in the show-room, but also as a utility fowl, the Regal has no superior. For years my Dorcas line has been trap-nested for heavy egg production and strong, vigorous growth. For all-round practical worth, the Regal Dorcas strain leads all others.

5000 Cocks, Hens, Cockerels and Pullets for sale—5000—in Singles, Pairs, Trios and Breeding Pens.

Cocks and Cockerels (choice breeding birds), \$8, \$10, \$15, \$20 and \$25.
Hens and Pullets \$4, \$5, \$7.50 and \$10.
Breeding Pens \$25, \$35 and \$50.

PORT DOVER, ONT.

TO OUR READERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every advertisement in this issue is signed by trustworthy people, and to prove our faith we will make good to our subscribers any loss sustained by virtue of their having purchased fowls or goods from one of our display advertisers.

All we ask is, that in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. In all cases in writing to advertisers say, "I saw your ad in American Poultry Journal."

objectors will be few in number, almost a negligible quantity. Surely this is "worthy of thought," as our late Secretary Cambell used to say.

We know that there are some of the older members who feel that the A. P. A. is primarily a "fanciers' organization and should be for fanciers only." We can sympathize with that feeling, but we should have considered that phase of the matter long ago before we let down the bars and, in order to finance our organization, solicited membership from every person interested in poultry who would pay the required \$10 fee. We needed the money, but in accepting the money we obligated ourselves to give these members a voice and a vote in the proceedings and we greatly widened the field of the association beyond the exclusively "fancy for fancy's sake only." We cannot escape that obligation now, nor should we wish to. Each and every poultryman, whether he be a fancier or whatever may be his special designation, has interests in common and is dependent in a large degree upon every other poultryman. We must have unity and co-operation if we are to succeed. There is already a branch organization for those who feel that they must have a club devoted exclusively to the fancy. Divided interests and factionalism will not benefit any of us, nor will it help the Standardbred poultry industry.

We hope that the 1918 convention has started something that will get us out of old ruts and bring about really helpful reorganization and rebuilding of the

Who Wants a Pony?

We have given away over 500 Shetland ponies to Boys and Girls, all over America.

Now we are going to give away several more ponies—the finest we could buy—and we want every family that takes this paper to stand an equal chance.

If you are a boy or girl, send in your name, and if you are a father or mother of a boy or girl, be sure to send in your child's name. Remember, no charges of any kind and nothing to buy. Just send in your name.

No matter where you live, no matter how young, every child will stand the same good chance to get a Pony, with buggy, harness, saddle, bridle and blanket. Send in your name right now.

Pony, Buggy and Harness Given

This picture shows one of the Shetland Ponies we are going to give away—a beautiful 3-yr. old black pony about 42 inches tall, weighing about 300 pounds.

We also give with some of the ponies, Buggy and Harness, just as you see in this picture; also Saddle and Bridle.

If you would like to have an outfit like this send your name and address right away.

(106)

Send Your Name for Free Pony Pictures

We want to send a colored Pony Picture Circular free to every Boy and Girl that sends in his or her name. It gives the names and shows the pictures of the ponies we are giving away, with children riding them out on the farm where they live. It shows one of the ponies hitched to the beautiful Buggy we are going to give away, with six children taking a ride. It shows a picture of The Pony King out on the Pony Farm, talking to 15 children who live near the farm and who come over to ride the Ponies. Every boy and girl should get this Pony Picture Circular. Send your name now and get Circular FREE.

The Pony King

610 Webb Bldg.

St. Paul, Minn.

Just Send Your Name

When you send in your name, we shall tell you how to get a Free Pony and also send you some Pony Pictures showing the Ponies we are giving away. Write your name below or send it on a postal card.

THE PONY KING,

610 Webb Bldg., St. Paul, Minn.

My Name is.....

P. O. Age.....

State R. F. D.

Children

Be sure to take this chance to get a Pony. Don't wait. Write your name and address in the corner, cut it out and send it to me. I will then send you the Colored Pony Picture Circular free and you will have an equal chance to get one of the Real Live Ponies I am going to give away soon. Get your pencil and write your name now.

Parents

You will be interested in the Pony Circular I send and your child will enjoy it. He or she stands the same good chance as any other child to win one of the five Shetland Ponies I am giving away, no matter where you live. Remember, I am giving Five Ponies at one time—not just one—so you see there are five chances to win one. Send in your child's name.

Pat given to Flossie

"Pat" was given to Flossie Meredith, Jasper County, Ia. Flossie sent in her name, just as 600 other children did, who received Ponies from the Pony King. Flossie writes: "Pat" is as round as an apple, as slick as a mole and ready to go whenever he is told. People say he is the finest pony that ever came to town."

Potter "Redybilt" Poultry Houses

A \$39.50 Potter House Portable, open front, fresh air, scratch shed house, equipped with 5-ft. 3-Perch Potter Hennerly Outfit for 30 hens.

Don't Build - It's Cheaper to Buy

An old reliable Potter ready-made henhouse can be purchased for less than it would cost you to build one. They have been used and recommended for over 16 years by thousands of poultry keepers, all over America. Aclean sanitary house, nests and roosts mean healthy hens and lots of eggs. Do your part and the hens will do their part.

Roosts, Nests, etc., Ready to Use

A \$6.60 Potter Outfit

6-ft. 3-perch, 10-nest Hennerly Outfit for 36 hens. Same style made in 12 sizes.

For Less Than Cost of Making

Sanitary, portable, inexpensive. You start right when you install Potter outfits - roosts, nests, drop-boards coops, hoppers, etc. Get rid of makeshift, unsanitary disease-breeding fixtures and make a bigger success of your flock.

Get the Potter Book - it shows over 100 pictures of portable houses, coops, hennerly outfits, etc. Mailed free for two red stamps to cover postage.

POTTER & Co. 56 FOREST AVENUE DOWNERS GROVE, ILL.

American Poultry Association. There appears to be much that needs doing and every member should do his or her part to help. We have only just begun to get a glimmer of the light which may lead us "out of the wilderness" and we cannot afford to waste energy in crowing until we have actually attained our goal. These suggestions are made wholly without personal bias, and we hope that they will be accepted in the same friendly spirit and desire to be helpful with which they are offered.

I. K. Felch Memorial Number.

THIS NUMBER of the AMERICAN POULTRY JOURNAL is affectionately dedicated to the memory of that "grand old man of poultrydom," Uncle Isaac K. Felch, who was personally known and loved by thousands of our readers and teacher to many thousands more. He was a valued contributor to this JOURNAL since its earliest issues. He was a great power for good in the poultry world and one of the strongest advocates of Standard-bred poultry. In the length of his period of service, wide experience as a skilled breeder, the remarkable scope of his work as a teacher of poultry culture, writer on poultry topics, poultry judge thruout the whole American continent, and maker of standards for pure-bred poultry, we may not see his equal for many generations.

The article, "Seventy-four Years a Poultry Fancier," appearing in this issue is a brief appreciation of I. K. Felch; to do him and his work full justice would take a book the size of an encyclopedia. We know our readers will read it with

Homestead Campines

The word that dominates in the world of

the birds we bred this year are the finest flock we ever raised. These beautiful Silver Campines will gladden the heart of any poultry lover. Our young stock is now ready for delivery, full of health, vigor, beauty and quality. Our birds are noted for their heavy laying qualities.

THE VIGOROUS STRAIN

Exhibition Stock

Now ready for the fall and winter shows. Our winnings at the leading shows, such as Madison Square Garden, Boston, and New York State Fair, prove that we have the foundation, and

Box A

WAYLAND, MASS.

CAUTION: Any Bone Cutter claiming to be MANN'S without F. W. MANN CO. cast on its surface, is an imitation. The genuine MANN'S is made only in Milford.

Make Your Hens Lay

Write today for our free poultry books and learn at once what it might take you, alone, years of costly experience to find out. You know how eager fowls are for bugs and worms. Our book tells why. Briefly, it's the animal food they want, and **must have**, in order to thrive best. Chicks, laying hens, cocks, all need it—to develop frame, muscle, feathers, to produce many eggs, to produce fertile eggs. To replace bugs and worms in winter, or, for yarded fowls, feed freshly cut raw bone, prepared with

MANN'S LATEST MODEL BONE CUTTER

Try One Free—No Money Down

This feed is four times richer in protein (the egg-making, body-building element), than corn is, and it is more easily digested and assimilated. **Save** money by cutting down your grain ration. **Make** money by getting more eggs when eggs are worth most and by having better eggs for hatching stronger chicks, earlier and heavier broilers.

Mann's Latest Model Bone Cutter cuts the bone (and all adhering meat and gristle) into a fine, soft mash that fowls of all ages relish and can put to immediate use in producing profit for you. It turns easily, cuts rapidly, never clogs, wastes nothing. We sell it on **10 Days' Free Trial**, without money or deposit in advance—so you may be sure it is right. We even pay its freight back if you are not satisfied.

WRITE FOR FREE BOOKS TODAY. To read them is to know how to feed poultry for most profit.

F. W. Mann Company, Box 56, Milford, Mass.

interest and they will find much therein that is helpful. Standardbred poultry culture owes much to Mr. Felch and his good work will benefit poultrymen for years to come.

**Commercialism or Patriotism—
Which?**

EVERY little while during the past year or two some zealous extremist in the fancy raises the plaint that the good old A. P. A. is in the control of rank commercialists. Just think a moment, Brother Poultryman, before you repeat that statement—are you really *in the war?* or are you just on the outside looking on?

Just bear in mind that one of our most used slogans the past two years has been, "Food Will Win the War." Remember, too, that America has undertaken the gigantic task of feeding more than half the world, and that with the ranks of our food producers already depleted thru furnishing 26 percent of the first draft, and the new draft calling men from 18 to 45 years of age still further will thin out our producers of food-stuffs. With a world crying for food and still more food, with our own country and all our allies on rations—comfortable rations tho they be—it is not wise policy to cry commercialism because our international poultry organization is endeavoring to do its bit. All food production must and should be on a common-sense commercial basis; the practical and useful are essential to the successful conduct of the war, and even the old A. P. A. doing its utmost for the "meat and eggs" side of the poultry industry would be doing little enough at best. Most states in the Union are already demanding that all men up to 50 years of age devote at least 36 hours a week to useful work essential to the winning of the war. Many of the world's best artists, lovers of the beautiful and true fanciers at heart, have given up big incomes to become workers in the camouflage corps. Everywhere men with the true fancier spirit are turning their attention from whims and hobbies to essential war work and they are making good. The fancy will not suffer; it will benefit in the end and eventually we shall have a still better and finer fancy built on the sound foundation of the greatest good for all.

This is no time to stir up strife between fanciers and practical poultrymen. We need harmony and unity. All of us should be working together for the common good of all. Those who feel disposed to complain about "the decline of the fancy"—and we are not willing to admit that there has been any really serious departure from the true fancier spirit—should read the article by that "Father of the Standardbred Poultry Industry in America," the late I. K. Felch, published in *Poultry Monthly*, November, 1899. Uncle Isaac was a true fancier, and he also possessed vision

BROODER

For \$4.96, including heater, you can build the simplest, most efficient, and most satisfactory brooder ever made. Wind-proof; fire-proof; rat-proof; fool-proof. Can be built by anyone in an hour, with saw and hammer. Plans 10c.

Dollar-Making Facts For Poultry Keepers

What is Pratts Poultry Regulator?

A positive tonic and conditioner for poultry of all kinds and ages. *A health-builder and health-preserver.* Not a food.

What does it contain?

Roots, herbs, spices, mineral substances, etc. Each ingredient performs a certain duty. The combination spells "health insurance."

What does it do?

Pratts Poultry Regulator makes and keeps poultry healthy, vigorous and productive. It shortens the molt, sharpens the appetite, improves digestion and circulation, hastens growth and increases egg-production. *It saves feed* by preventing waste due to poor digestion. *It prevents disease* by keeping the birds in condition to resist the common ailments.

Has it been fully tested?

Yes! In general use for nearly fifty years. The *original* poultry conditioner. Imitated, but unequalled

Does it give general satisfaction?

Positively! *Satisfaction guaranteed or money refunded.* Test it at our risk. Increased egg-production will prove that "Pratts makes hens lay."

How is it best used?

Daily in small quantities. For adults, a tablespoonful daily for 10 birds. Younger stock in proportion. Mix with dry or moist mash.

What does it cost?

Nothing, because *it pays big profits.* One cent a month per hen is the *investment* required.

Where can I get it?

From 60,000 Pratt dealers. There is one near you. Direct from the manufacturer, prepaid, if your dealer can't supply you.

How can I learn more about it?

Ask the Pratt Food Co., Philadelphia, for valuable FREE BOOKS on poultry keeping. Write today!

The Safest Way to Ship Your Prize Birds

Birds shipped in heavy old wooden coops most times present a sad spectacle when they finally reach their destination, despite the trouble taken to "nail" them up securely. With broken feathers and bruised wings and combs they are not in very good condition either for show or breeding purposes.

Not only do clumsy wooden coops injure the birds but they shoot the transportation charges way up. And, under the best of conditions they are ready for the scrap heap after they have been used once or twice.

"The Koop Without a Nail"

ANDREWS

EFFICIENCY KOOP & KOOP DE LUXE

"The Koops Without a Nail"

do away with all this risk in shipping birds. They come knocked down—can be assembled in a minute without hammer or nails—and can be used over and over again. No excess freight; no bruised birds.

And what makes them more than worth the price is that they are selling at "before-war" prices. Here they are:

EFFICIENCY KOOP (For shipping breeding birds)			KOOP DELUXE (For shipping exhibition birds)		
Sizes	Dimensions	Price 1/2 doz.	Sizes	Dimensions	Price 1/2 doz.
Pet Pigeons, Bantams, etc.	22 3/4 x 13 1/2 x 12	\$3.00	Pet Size	22 3/4 x 13 1/2 x 12	\$5.40
Single, 1 to 3 birds	22 3/4 x 13 1/2 x 24	3.30	Single Size	22 3/4 x 13 1/2 x 30	6.60
Double, 2 to 4 birds	22 3/4 x 19 1/2 x 24	4.50	Double Size	22 3/4 x 19 1/2 x 30	8.70
Pen, 5 to 8 birds	22 3/4 x 23 1/2 x 24	5.10	Pen Size	22 3/4 x 23 1/2 x 30	9.90

Koops sold in half-dozen lots only

Other accessories in the famous Dollar Making Line include

Egg Trays, Parcel Post Butter Boxes, Irrigation Roosts, Egg Carriers, Baby Chick Carriers, etc.—each a standard of its kind.

In ordering goods allow a month or two for delivery under present congested conditions. Where embargoes preclude freight shipments goods will be sent express or parcel post.

We pay freight charges on all shipments of \$10.00 or over. On smaller orders enclose transportation charges, otherwise goods will be sent express collect. Address Dept. A

and a strong fund of practical common sense. Here is the article:

THE FANCIER A PRACTICAL POULTRYMAN.

Necessity Compels Him To Be One.

By I. K. FELCH.

The time was when to say one was interested in the practical, would completely shut him out from the thorobred trade. But each year has driven the fancier to become, in part, a poulterer, and the poulterers or practical breeders, as we now term them, have come to know that the profits largely depend upon raising none but straight, thorobred stock, and indulging only in first crosses for practical demands. Thus have we seen the fanciers becoming poulterers, and the poulterers fanciers—and both have been the gainers thereby.

The fancier, at the present day, cannot sell more than 60 percent of his product for thorobred purposes, and in all the American breeds, except the White Wyandottes, we cannot say that more than 40 percent of the product satisfies first-class breeders as breeding and exhibition stock; while Light Brahmas, White Wyandottes and White Leghorns may produce 75 to 90 percent of first-class birds. On the other hand, the poulterer caters to the poultry and broiler demand, so far as the males he raises are concerned, but that he may sell his females to the fancier adheres strictly to thorobred stock, and mates so as to secure the largest number of females to score the greatest number of points. This gives him an added profit upon such as he sells to thorobred trade. Thus you see the two wings of the poultry industry becoming more and more closely allied in their interests.

The fancier is doing the advertising that is building up the poultry industry; the poulterer is saving the money the other pays for advertising, content to have the fancier for his customer for his likely and high-scoring females, while he sacrifices to the market demands his male product. It is a question which is making the most money and which position is safest to occupy. Their relations are certainly closely linked. They in the future must stand together, or every breeder will be forced into the position to represent both branches of the poultry industry.

I have seen this state of things growing for the twenty-five years I have been prominently before the poultry world, and if I say today, the fancier who would and is holding a prominent position before the purchasing public, does not offer to the thorobred trade over 50 percent of his product; the demand is such for merit that to go beyond that is to lose caste, as a fancier. The remainder must be sold to the poulterer. This offsets the purchases of the females of breeders, who do not advertise, and sells his male get to the kitchens of the land. Therefore, one can see that these two interests cannot afford to quarrel, and as the age is one of specialties in all business, perhaps both are better off for this condition of things which is now controlling the poultry industry.

The fancier will control the sale of the thorobred trade, will do the heavy advertising, and his experience will secure the confidence of the buyers of thorobred stock. The poulterer breeder cannot afford to advertise to sell his females only, and will continue to find his market for his best females with the fancier, who breeds them to his Standard males, and furnishes the results to the finer trade of the land. I do not say that this is best, as I do not care to meddle with other men's business. This extreme mating and the sacrifice of the males is an evil from which the poultry trade at large is suffering; but each wing of this industry will continue to do that which will bring the most money, therefore cannot afford to become enemies. The practical breeder and raiser cannot afford to kill females for broilers or poultry until they have been forced to lay for 12 months, and then the early-molting specimens become more profitable the second year as egg producers; besides, many times a modest pullet grows into Standard color and weight, and sells to the fancier for twice her practical worth to the poulterer. Thus one sees that the thorobred must occupy the yards of both; the modest specimens in both are sacrificed to kitchen uses, the best controlled by the fancier. The lower 50 percent must be managed until sold to the best advantage by the practical breeder or old time poulterer.

The above was written by I. K. Felch when he was a member of the A. P. A. advisory board, just after retiring from the presidency of that organization, in those "good old days when the true fancier spirit reigned in the A. P. A." He was giving his views based on a quarter of a century of keen and com-

AN INVITATION

to every Breeder of Pure-bred Poultry

MANY hundreds of you good men and women have been using BUGBEAR for protecting your poultry against lice and red mites this year.

YOU already know that BUGBEAR, when dissolved in benzine or solvent naphtha, makes the strongest and most durable kind of lice paint at a total cost of less than 50c per gallon.

YOU know, of course, that BUGBEAR is sure death to red mites, body lice, nits and disease germs, and that when it is spread on a band of cloth around the ends of a roost it prevents red mites from reaching the sleeping fowls.

THESE are some of the ways in which BUGBEAR has been helping you increase profits during the outdoor months. But we want to make sure that you also understand how helpful BUGBEAR will be during the coming winter, so we send you this invitation.

WE invite every pure-bred breeder who reads this advertisement to try BUGBEAR this fall and winter *at our risk*. Simply fill out and mail the attached coupon form and we will ship you a 5-lb. pail at our expense.

WHEN you get the BUGBEAR we want you to dissolve ½-lb. in a gallon of coal-tar, benzine or naphtha and do three things with this dissolved BUGBEAR:

1. After thoroughly cleaning one or two roosting platforms, paint the top surface thoroughly with the BUGBEAR. It will make the wood waterproof and decay-proof, kill germs and odors, prevent liquids from soaking into the wood, and be a great help in preventing manure from sticking or freezing tight to the platform.
2. Next, paint the outside of your grain bin or feed barrels with a heavy coat of BUGBEAR. It prevents the wood from gathering moisture during the damp weather, kills the germs of mold, and rats and mice will practically never gnaw wood that has been painted with this product.
3. Last, take the rest of the dissolved BUGBEAR and use it to paint the bottom and sides of wooden brooders, colony houses, hen coops or other equipment that comes in contact with the ground. It will absolutely prevent their decaying and will make the wood permanently waterproof.

PUT the BUGBEAR to every test you can think of for 60 days. Use it to paint your hen roosts, nest boxes, feed hoppers, mash troughs, wooden pen floors, interior walls—anything and everything where insects, disease germs or decay can find lodging. At the end of two months either send us \$2, or return the unused portion of the pail of BUGBEAR and you owe us nothing.

WE do not know of any other product that will do half the things that BUGBEAR will do, or do any of these things half as well as BUGBEAR will do them. Use BUGBEAR around the poultry house this winter and see how it lightens your work, keeps the poultry plant dry, sweet and free from pests—and how it improves the health of your flock in every way.

There is a 5-lb. pail of BUGBEAR waiting for you. Where shall we send it?

THE REILLY COMPANY, Indianapolis
Plants: Indianapolis, Minneapolis, Mobile, Seattle, Norfolk

— — — — — Mail this Coupon — — — — —

THE REILLY COMPANY, Dept. E-11 Indianapolis, Ind.

I accept your invitation to try BUGBEAR at your risk. Send a 5-lb. pail by parcel post prepaid to my address. At the end of two months I will either send you \$2.00 or return to you the unused portion of the BUGBEAR.

STOP PONDER ACT

Here is the poultry house you have been looking for and should have. Abundance of fresh air without drafts—dry as a bone—sweet as a nut, summer or winter. Simple in design, easy to build or apply, magical in results. Discard or remodel the old-style, rain-soaked, sun-baked, snow-swept, bad-smelling, disease-breeding types and own a house that will give you real satisfaction. Fully tested, used by leading agricultural instructors; it is revolutionizing the whole ventilating and housing problem. Read this:
Chicago, July 8, 1918.

"I built one of your sanitary houses as per plans and am highly pleased with it. It cost considerable (war times), but, pays great dividends in satisfaction, appearance, eggs and health of the flock." (Signed) R. E. Dickson.

Plan book contains ten cuts, giving designs for utility, fancy, commercial or back lot poultry keeping. If you ever have, are or expect to keep poultry you need this book. Price \$1.00, personal checks \$1.10. Descriptive literature on houses, caponizing and S. K. BURDIN, Suite 16, 104 Stibbard Ave., TORONTO, ONT. feeding, 6c in stamps.

petent observation. Much that he said will hold good at the present time—at least the interests of fancier-breeders and practical-breeders appear to be more closely linked than ever, each being dependent upon the other, each sells to the other, and both have many interests in common. If the A. P. A. reflects the trend of the times, if it is working to bring about a closer bond of relationship and unity between fanciers and practical breeders, it is only doing its part to live up to its tenets, "Progress, Purity and Protection" in its field of work for "Every Poultry Interest." Instead of "knocking," we should all get together and "boost." Perhaps an element of "commercialism" may have crept into the A. P. A., perhaps it may be a factor for ultimate good and may be essential to the times. But if the old A. P. A., with all its alleged shortcomings for which it has been much criticised, is really taking a deeper interest in the practical and useful side of poultry culture, if it is bringing about a closer union of the beautiful and the useful, and perhaps working toward greater harmony and a more united poultry industry, even committing that once considered heresy of helping to promote increased production of "meat and eggs," let us hope that this is really due to true American patriotism and a desire to do its part in the winning of the war.

"In the Good Old Days."

IN THE good old days, when nobody ever did anything he "hadn't oughter," the so-called "nonessential disqualifications" were quite as much under discussion as they have been periodically ever since, including the last convention of the A. P. A. The "good old days," meaning as they do to every generation, the days of our youth and prime. Of course, in those days no one ever indulged in fak—, beg pardon, we mean "conditioning and grooming," and everything was lovely in the fancy, tho poultry editors did have a habit of constantly preaching the need of "unity and harmony" in the fraternity. Remember how prone you are to tell that son in his 'teens that such things were not done when you were a youth?

Nevertheless, the files of the papers of that day tell us the story of a certain eminent fancier and judge, now gone to his reward, and another fancier-judge, who is still with us—thanks be!—who had a rather heated controversy over the nonessential disqualifications, the eminent one contending that he would vote to remove all disqualifications except general ones, such as all deformities, vulture hocks where they shouldn't appear and other defects which would seriously interfere with breeding quality, while the judge, who is still with us, contended that such utterances were backsliding and heresy. All in all, the "good old days" were strangely like the present, except that memory gives them a rosy hue and we view them with the perspective which years have given.

When we feel inclined to condemn "Bill Jones and John Smith" for plucking a few off-colored feathers, which will occur in even the best families of poultry, no matter how strong the blood lines nor how long the pedigree, it might be well to reflect a little, "lest we forget." Perhaps the following editorial comment from the pen of H. H. Stoddard, veteran editor of the "good old days," published

in the old *Poultry World*, at this season nearly thirty years ago, may help us to be a little more lenient with "legitimate conditioning":

"Bill Jones and John Smith are busy these days.

"They arise much earlier than usual.

"They carry frequent dishes of food to their chickens.

"They are constantly catching and examining some of the best ones.

"They ruffle up the feathers, and *I do believe they pull out a feather now and then.*

"Have the chickens too many feathers, that thus they pull them out? They have, my little son, *too many of that kind!*

"But what kind are thus extracted? They are the kind that *don't match with the rest of the suit*; the colors may be as bright, but they are of a different pattern.

"See! There is a red feather that was pulled from the hackle of a Plymouth Rock cockerel. Isn't it just as pretty as the black and white feathers? Quite as pretty, my son, and they evidently think it too pretty to remain there. If the judge should see it, there is probably no feather on the cockerel that would so attract his attention.

"But what means all this care, this early rising, frequent feeding, careful examination of feathers, and sly removal of some? It means, my son, that at the county fair, while some will be gazing at the great pumpkins and squashes, others interested in the bulls and cows, and still others absorbed in the 'agricultural hoss-trot,' Bill Jones and John Smith intend to capture the prizes on poultry. They are exercising their feathered stock now so as to get them into trim to come in best three out of five and allow no one to take the pole from them when the race is on."

Oh, yes, "the good old days" were all right, approaching perfection—almost—quite right like the present day. We are all just as human now as then—and maybe more so.

Prepare NOW for the Big Harvest Next Spring! Hatching and Selling Day-Old Chicks

Is the big money-making end of the poultry business today and will continue to be for years to come. Are you getting your share of it? Many, many millions of Day-Old Chicks—at top prices—will be needed to supply the demand the coming season. **How many are you ready to furnish?**

Last season the demand was far in excess of the supply. Day-Old Chick producers were **swamped** with orders. They'll be swamped again next season. Don't wait until the orders come pouring in—to find that you haven't nearly as much incubator capacity as you need. Get ready **NOW!**

With a Blue Hen Mammoth Incubator The Big Time, Labor and Money Saver

You can turn all the eggs in 5 to 10 seconds and better than by hand. Test the eggs in half the usual time, largely eliminate cooking, attend to self-regulating heater in 3 minutes per day, secure 2½ times usual capacity in the same space, and get big money-making hatches besides.

"Headquarters for Big Hatches"

While the hatching season is still several months away, the time during which Mammoth incubator shipments can be made without great delay and uncertainty is limited to the next few weeks.

Blue Hen Mammoth Heaters (excepting small size) **do Fine Work with Soft Coal**

Tell us what your present incubator equipment is and what capacity you want for the coming season—so we can send you our handsome Mammoth catalog and full information about The Blue Hen. The few minutes it may take you to write us now may mean hundreds of dollars in your pockets later on!

PARKS 200 EGG STRAIN BRED-TO-LAY BARRED PLYMOUTH ROCKS

1889 ← → 1918
29 Years of Trapnesting

For Nearly 30 Years (almost alone) We Have withstood the Knocks and Championed This Bred-to-Lay Cause

It didn't take the war to awaken us to the fact that EGGS and MEAT were really the backbone of the industry. While the first record of our strain kept in 1889 showed an average of only 96 eggs each for the 16 hens, they have been steadily climbing upward, until today they are justly conceded to be

America's Oldest and Greatest Laying Strain Barred Plymouth Rocks

They outlaid over 2600 birds in four Missouri Laying Contests. Birds from 37 states and eight foreign countries. We've brought the EGG BASKET and the Standard of Perfection into a closer relationship, as our winnings (Rochester, N. Y.; Washington, D. C.; Wheeling, W. Va., etc.) show.

No, we never get excited over the chance phenomenal layer. HIGH NORMAL LAYING has been our aim. A flock of 128 hens averaged 208 eggs. It is such records that we are proud of.

Pullets did everything you claimed, fairly laying their heads off
HELPING TO WIN THE WAR, writes J. C. Raspe, Raspeburg, Md.

4 More Eggs per Month

or only one more egg a week

Makes the difference between a Loss and a **Good Profit!**

Here's the way it figures out:

4 eggs per month
 12 months
 48 eggs at 4 cents each equals \$1.92

\$1.92 added income per year from each hen is quite an item, isn't it? Stock that is bred to produce this added profit is the kind I raise. For 29 years my efforts have been directed to producing high-record, trapnested layers, and I have succeeded. My birds are not pampered weaklings, but strong, vigorous producers, reared in the vigorous climate of Vermont, where none but the fit survive. I raise my birds in such numbers that I am able to offer high record bred stock at about half what others ask. Here is a good opportunity to buy.

YEAR-OLD BREEDERS FOR

FOUNDATION STOCK

Barred and White Rocks, Brown and White Leghorns, White Wyandottes, Reds, from trapnested stock, with records of

180 to 200 eggs, each.....\$3.00 210 to 249 eggs, each.....\$4.00

8-WEEK-OLD PULLETS, \$1.25 to \$1.50

from 200-249 egg record stock, and will be laying this winter when eggs are high and worth getting. The many years of breeding for egg production back of these pullets are a guarantee that you will receive an overflowing measure of value. Grand Cocks and Cockerels out of record dams, 16-week-old Pullets at \$2 and \$3 each. 100 Yearling White Wyandottes, pedigree stock, "state tested," at \$3 each for lots, with pedigrees.

Sunnyside Poultry Farm R. C. BLODGETT, Prop. Box 1002, Bristol, Vt.

Increasing Consumption Encourages Production.

EAT MORE poultry and eggs. Urge your friends to consume more poultry and eggs. Encourage them to become boosters in a campaign for greater use of poultry products on the home tables of the nation.

Increasing consumption of a food product encourages increased production. It cannot work any other way. The producer is influenced by demand. When he sees that consumers are slowing up on the use of his product, he begins to hedge and to produce less, he has learned by experience that a slowing up of demand is followed by an oversupply and prices below production costs in most cases.

Eggs are one of our best and cheapest foods. They have never yet sold at a price in excess of their actual value as food when compared with cost of other foodstuffs. Eggs are good food, good for everybody, young and old, and particularly good for children and invalids. They come in a clean and sanitary original package and there is practically no waste. If eggs were bringing one dollar a dozen, they would be better and cheaper food than many meats at present prices. Eat more eggs—the more eggs everybody eats, the more eggs will be produced.

As for table poultry, it will be difficult for the housekeeper to find among the other meat foods equal value and usefulness for the same money that may be had in a prime, well finished fowl or roasting chicken. Poultry for the table can be prepared in a multitude of appetizing ways. It is good, wholesome food and there is very little waste in a poultry carcass if the cook handles it properly. In our home we are strong for poultry and eggs; they are the chief meat foods used, and we grow our own. Poultry has never sold at as high a price, value and variety of ways it may be cooked and served considered, as most meats. Go out among your friends and do a little missionary work to demonstrate to them that it will be good policy for them to eat more poultry and eggs and that they will live much better if poultry products are used more freely. They will thank you for it, when they really learn how to make use of poultry and eggs. Stimulate consumption as a means of increasing production. Do it now.

M. E. THOMSON

DEPT. A

AUSTIN, MINN.

"Boost" the Poultry Shows.

THE POULTRY show season is now beginning in earnest. Poultry exhibitions are necessary to keep the interest in Standardbred poultry at topnotch. The fall fairs and the winter shows will do much good in helping the campaign for increased production of poultry. Do your part to help make this show season a success surpassing all previous efforts.

The general public is interested, unusually so, and the breeder who neglects his opportunities this exhibition season is not alive to the possibilities of the Standardbred poultry business. And do not forget or overlook the beginners and potential poultry fanciers, who will attend such shows in large numbers. It is good business to devote plenty of time and effort to interesting and instructing beginners, but more than that, it is for the best interests of the poultry industry as a whole, and it is certain to help in bringing about the increased food production so much desired by our Uncle Sam.

Every novice, who, thru the constructive work of far-seeing breeders this show season, becomes a poultry breeder or a producer of market poultry and eggs, will be a help in the great work which is now the chief objective of the whole united nation—to win the war. Do not overlook or sidestep any opportunity which may present itself for you to do your part. The first poultry show either makes or discourages the novice. The result depends largely on how much attention you pay him and how much effort you put into enlisting him in the army of Standardbred poultry producers. The "cold shoulder" or the brusque response to his queries will tend to discourage him. Do not wait for him to make advances. Seek out the beginners, who are wandering about as if lost, and make them welcome. It is up to you veterans to do the getting acquainted and if you fail to round up the novices, doing service as a recruiting officer for the fancy, it will be your fault as well as your loss if you do not get them interested and hold their interest. Just remember what it meant to you, when you were a beginner, to have some poultry judge or breeder come up, with a smile of welcome and hearty handclasp, and offer to explain exhibits to you.

Attend the poultry shows. Exhibit when and where you can. Do your part to "boost" the poultry shows, but do not overlook any opportunities to be helpful and to make beginners feel that they are welcome and at home among friends. It is up to you, Mr. Exhibitor—that is just one particular in which the present-day exhibition does not come up to the shows of earlier days. The lectures, special educational exhibits and moving-picture shows of poultry work are all good, but we overlook our "one best bet" if we fail to make the beginner feel that he is a part of it all, that he is among friends, and that he is a most welcome addition to the fraternity.

**Make 'em Lay!
Start 'em early! Get more high priced eggs!**

FALL and winter eggs pay best—late winter and spring eggs are not profitable—every young pullet or slow molting hen can be easily speeded up into an egg layer in a simple manner.

Why not get the best there is in your flock—take the big profits that come from early eggs. Avoid all the ailments that cut down egg yields — keep the whole flock alive and going at top speed. Read the following letter:—

Philadelphia Pa., January 8, 1917.

Dear Sir:—

I desire to advise you further in writing of what I consider the wonderful work done by Sloan's Liniment, which I first tried about two months ago at your suggestion.

As I have told you several times, the atmospheric conditions in my laying house are the worst that I have ever experienced in my dealings with poultry. I have been unable to overcome the damp condition existing in the house, the litter being so wet that it is almost possible to wring the water from it. On December 31st I changed the front of one of my houses, to the open front style, and the birds were only in this room about two days when the floor was almost as wet as in the other rooms.

About six weeks ago I started feeding Sloan's Liniment to my pullets to increase the lay, which had not been up to normal. As I advised you in my letter of the 5th ult., it worked wonders increasing the lay from four to sixteen eggs in about three weeks and it kept increasing until we were getting as high as 27 eggs a day about the middle of December, when I first began experiencing the trouble with dampness referred to above. Since then the egg yield, of course, has not increased, but the remarkable part of it is that notwithstanding the fact that the houses have been frightfully damp for three weeks or more, I have not had a serious cold among my birds. There is some sneezing in the flock but I have examined them carefully every night and I have been unable to find one bird with a serious cold that would necessitate treatment of any kind. I am fully convinced that the reason for this ability to withstand adverse conditions is the fact that they have been strengthened to no little degree by the Sloan's Liniment that I have been feeding now for almost two months, and without the added vitality from the Sloan's I do not like to think of what the result might have been.

Very truly yours,

HARRY A. DEEMER.

Here's the way to do it—Read carefully

For every ten layers that you wish to get in shape, pullets or hens, give 20 drops of Sloan's Liniment mixed with one pint of moist mash every day for three days and then give the same dose twice a week throughout the year.

For growing youngsters, give 10 drops of Sloan's Liniment to ten youngsters in half a pint of moist mash twice a week only. Put five drops of Sloan's Liniment in every quart of drinking water.

Purchase a bottle of Sloan's Liniment from your nearest dealer. The small size contains enough to last ten birds two months or more. The large size contains 13 ounces or six times the small size. It's wise economy.

One bottle will prove its profitability and the many other uses you will find for Sloan's Liniment in the household will warrant your having a bottle at hand at all times.

NOTE— You will not find these special poultry directions in the circular with the bottle, so keep this advertisement.

Dr. Woods' Notes and Comment

AUTUMN.
 Think, O grateful, think!
 How good the God of Harvest is to you;
 Who pours abundance o'er your flowing fields,
 While those unhappy partners of your kind
 Wide-hover round you, like the fowls of heaven,
 And ask their humble dole.
 * * * —Thomson.

Have you done your utmost in food production? Try to better this year's best during the coming season. Food is needed. Increased production of eggs and poultry will be a great help.
 * * *

Cull out the wasters and market or can them. Do not attempt to carry more male birds than you actually need for breeding or for sales. Feed is not plentiful, there will be a sufficient supply for legitimate needs, but it should not be wasted. Feeding grain and feeds to non-productive fowls or to non-essential stock, is waste. Do your utmost to make every pound of feed used for poultry bring in its full value in eggs and essential stock.
 * * *

Keep the pullets and yearling laying stock well fed. Liberal feeding and regular feeding are necessary to keep the birds productive. Underfeeding is wasteful. The fowls must have a sufficient supply of wholesome food in reasonable variety to sustain life and provide a surplus with which to make eggs. In addition to grains and ground feeds, meat food, in

the form of beef scraps or fish meal, and green foods are very necessary at this season of the year.
 * * *

Clover rowen, properly cured and prepared in the form of "cut-clover," should be stored for winter use. It is one of the best foddors for use in the mash. Clover helps to get winter eggs and it helps the fertility and hatchability of eggs. If you have not put in your supply of cut-clover, better get it now while the getting is good.
 * * *

Cabbage is a better fall food than a winter one. Cabbages can be fed to best advantage while the fowls are molting. If cabbage has been frosted, it should be thawed in cold water before feeding.
 * * *

Stock carrots, beets, mangels, small potatoes, etc., should be fed liberally to supply succulent vegetable food, now that the heavy frosts have damaged the green forage on range. Squash, pumpkins, and cull apples are best cooked, by thoro boiling, before feeding. Use them in moist mash mixtures.
 * * *

Keep a good dry mash, containing fine beef scraps or fish meal, or both, before the fowls at all times. Feed corn, either cracked or whole, liberally on frosty evenings. See that the birds go to roost with full crops.
 * * *

Feed regularly. A feast one day and a famine on another will not bring eggs.

S. C. Buff Orpington hen. Owned by Walhalla Poultry Farm, Osceoda, Mich. Winner of first prize at America's two greatest shows—Madison Square Garden and Chicago Coliseum.

Mention the American Poultry Journal when writing to advertisers.

The early pullets are beginning to lay. Keep them at it. Can the "slackers." If pullets are properly handled, comfortably housed and well fed, egg production should steadily improve and it will if you are on your job.

Fowls will not lay well unless supplied with plenty of drinking water, as well as food. Keep the fountains or buckets full of clean fresh water. Even if a brook or pond is accessible, do not fail to supply water in fountain or bucket in or near the house. There are always a few birds that will go thirsty rather than make a trip to the brook or pond. Clean snow is preferable to solid ice or warm water in the drinking vessels in extreme cold weather. The fowls eat snow eagerly. Warm water is likely to wet the plumage or head gear and cause frosting and colds.

While water is an essential in keeping fowls healthy and productive, this does not mean that water leaking thru the roof should be permitted. See that the roof is tight and all leaks fixed before winter weather sets in.

Do not delay longer. Get that supply of dry sand, gravel, and loam, under cover at once for use on floors and drop boards during the winter. Sand is useful for pen and brooder floors, gravel makes good grit if not too coarse, loam is desirable to use as an absorbent to cover droppings.

Grit and oyster shells are essentials. Keep a supply before the fowls and chickens at all times.

Last month we urged immediate stocking of coal needed for incubator and brooder use. The fuel shortage is real and the need is great. The fuel administration is going to do all it can to see that poultrymen using coal for incubator and brooder heating get the necessary supply, but it can't make coal grow in your coal bin. Many towns have already received their full allotment of coal, including chestnut coal for incubator and brooder use. The poultryman who has failed to stock up with amount of coal needed in his work of increasing poultry production will have to get very busy at once or get left.

If you have not already joined the National War Emergency Poultry Federation, do it now. Your bit will help. The office at Washington is open and doing business, endeavoring to be helpful to poultry producers of all classes and to see that the industry is properly represented in the national capital in these strenuous war times. Everyone interested in poultry should join. The annual membership fee is one dollar, which must accompany application, but contributing members can pay as much more as they please to help the good work along. Send your application and your dollar today to Reese V. Hicks, president National War Emergency Poultry Federation, 918 F St., N. W., Washington, D. C. Be sure to give your full name and address and state in what manner you are connected with the poultry industry. Checks or other form of remittance should be made payable to S. T. Edwards, treasurer, N. W. E. P. A.

In looking over the files of American Poultry Journal, we were interested to learn that the late I. K. Felch came to Chicago in 1865 and remained in this city for seven years. In 1866 Mr. Felch was one of the founders of the first Chicago Poultry Association and was superintendent of its poultry exhibition. In this capacity he sold stock to the value of \$1,128, on which the Chicago association received a commission of \$112.80. At this time "Long" John Wentworth was president of the Chicago society, and according to the reports "Long John" and I. K. Felch were "some" poultry team. While Mr. Felch devoted a large part of his time to poultry work, he was, in those early years, identified with the New England shoe manufacturing industry, and for fifteen years was a commercial traveler in the shoe trade. From the early seventies, however, he devoted himself exclusively to poultry culture. In the early nineties, Editor Bates of the A. P. J. said:

"Mr. Felch is what the Journal terms a practical fancier. He derives his revenues from his flocks and collie dogs. He does not raise stock for the purpose of spending money otherwise obtained. Poultry culture has sustained him and his family for twenty years without any other means.

"A man of Mr. Felch's personality cannot go thru life without touching the extremes of feeling and awakening relative emotions. He is of fine presence, commanding, masterful; and he can no more help arousing hostility than he can prevent the inflowing of genial regard. We have not always coincided with his views, nor acceded to his requests, but whenever we differed, that difference was accepted

BUY Winter Feeds

EGG MASH

Silver Quill Egg Mash is our quality egg producer. It contains 27 different ingredients, as follows: Wheat bran, alfalfa, corn meal, oat meal, wheat middlings, meat scraps, bone meal, ground fish, powdered limestone, capsicum, rice polish, salt, dried milk, powdered cocoa shells, barley meal, old process oil meal, wheat flour, locust bean meal, flaxseed, blood flour, ground peas and beans, coconut meal, cottonseed meal, feugreek, anise and malt sprout meal.

Many poultry raisers make the mistake of not feeding a good dry mash. While scratch feed is a necessary part of the hen's food ration, its main function is to supply bodily nourishment and to furnish a reason for exercise, while egg mash is for the one purpose, that of egg production. Analysis: Crude fat, 4%; crude protein, 19%; crude fiber, 10%.

No. 518921 1/4 100 pounds Egg Mash. Chicago, Indianapolis and Columbus price\$4.55
Kansas City price..... 4.80

Because Indications are that feed prices will be high this Winter.
Because In ordering now, you will avoid price fluctuation and delay.

Because If you fill your feed bin now, you will avoid it necessary to embargo shipping.

Laying Mash

Silver Quill Laying Mash is a good feeding mash for eggs. Like our Egg Mash, it should be fed dry. It contains the following ingredients: Meat scraps, linseed oil meal, corn feed meal, wheat bran, wheat middlings, ground oats, alfalfa meal, etc. Its analysis is as follows:

Protein	15%
Fat	4%
Carbohydrates	45%
Crude fiber	10%

No. 518967 1/4 100-lb. bag. Chicago, Indianapolis and Columbus price.....\$3.65
Kansas City price..... 3.85

Dried Buttermilk

Dried buttermilk is a comparatively new factor in animal feeding. It has been tested and proved, however, to be a good ingredient for mash feeds. Not more than 10% should be mixed in a mash of your own mixture.

Reputation Dried Buttermilk is made from pure fresh buttermilk, from which 90 to 93 pounds of water are removed from every 100 pounds. Its lactic acid content is an aid to digestion and the assimilation of food. The guaranteed analysis is as follows:

Crude fat	5%
Crude protein	25%
Crude fiber	none

No. 518946 1/4 100-lb. bag. Chicago, Indianapolis and Columbus price.....\$9.45
Kansas City price..... 9.00

Meat Scraps

Silver Quill Meat Scraps analyze 50% protein and 8% fat. They contain the animal protein that is essential in balancing the hen's rations. Vegetable protein alone cannot be depended upon to produce the maximum egg yield.

SCRATCH FEED

Silver Quill Scratch Feed is the best grade scratch we are able to secure. It consists of corn, kafir corn, barley, oats, buckwheat, sunflower seed and the percentage of wheat permitted by the United States Food Administration. Its analysis is as follows:

Crude Fat (Minimum)..... 2%
 Crude Protein (Minimum)..... 9%
 Crude Fiber (Maximum)..... 5%
 Carbohydrates..... 69%

Silver Quill Scratch Feed contains only clean, sweet grains free from chaff. Scratch feed gives vitality and life, and should be fed with Silver Quill Egg Mesh for maximum egg production. The price is low considering quality.

No. 518902 1/2 No grit. 100-pound bag.
 Chicago price.....\$3.75
 Indianapolis price.....3.60
 Columbus, Ohio, price.....3.75
 Kansas City price.....3.89
 Silver Quill Economy Scratch Feed is a low priced, well balanced scratch, consisting of wheat, cracked corn, kafir corn, barley, oats, wild buckwheat, sunflower seed, and not over 4% grit and 4% shell.
 Economy Scratch Feed shipped from CHICAGO only.
No. 518922 1/2 100-pound bag. Price.....\$3.45

Why? Are lower now than they will be at any time. Beware of the danger of Winter freight congestions. We have warehouses in Columbus, Ohio, Indianapolis, as well as Chicago. This should insure lowest freight. Send all orders direct to our Chicago office. You need not worry if conditions later make it impossible to ship to your particular territory.

Oyster Shells

Owing to the scarcity of oyster shells we will be obliged to raise the price November 1st to \$1.15 per 100 pounds.

Silver Quill Oyster shells are guaranteed genuine. They are round and dried, not turned, and carefully screened and washed.

Remember, you may be able to add a 100-pound bag of oyster shells to your order for Egg Mash or Laying Mash without increasing the freight charges.

IMPORTANT!

REGARDING FREIGHT RATES.

We wish to remind you that since the Government has revised freight rates it is now possible to ship 200 pounds and, in some cases, 300 pounds for the minimum freight charge that you would have to pay if you bought only 50 pounds or 100 pounds. The minimum freight rate is now 50 cents. You can buy and have shipped 200 pounds and, to some places, as high as 300 pounds, at the same freight you would pay for only 100 pounds. To save all possible freight charges, do not order less than 200 or 300 pounds.

and Co., Chicago, Illinois

BUY Winter Feeds and Supplies NOW

EGG MASH

Silver Quill Egg Mash is our quality egg producer. It contains 27 different ingredients, as follows: Wheat bran, alfalfa, corn meal, oat meal, wheat middlings, meat scraps, bone meal, ground fish, powdered limestone, capsicum, rice polish, salt, dried milk, powdered cocoa shells, barley meal, old process oil meal, wheat flour, locust bean meal, flaxseed, blood flour, ground pens and beans, coconut meal, cottonseed meal, leungreek, anise and malt sprout meal.

Many poultry raisers make the mistake of not feeding a good dry mash. While scratch feed is a necessary part of the hen's food ration, its main function is to supply bodily nourishment and to furnish a reason for exercise, while egg mash is for the one purpose, that of egg production.

Analysis: Crude fat, 4%; crude protein, 19%; crude fiber, 10%.

No. 518921 1/4 100 pounds Egg Mash. Chicago, Indianapolis and Columbus price\$4.55
Kansas City price..... 4.80

Why?

Because Indications are that feed prices are lower now than they will be at any time this Winter.

Because In ordering now, you will avoid the danger of Winter freight congestion and delay.

Because We can now ship feeds from our warehouses in Columbus, Ohio, Indianapolis, Ind., and Kansas City, Mo., as well as Chicago. This should mean quicker delivery to you and a saving in freight.

Because If you fill your feed bin now, you need not worry if conditions later make it necessary to embargo shipments to your particular territory.

by him in the frank and manly spirit which a man of honest purposes and convictions is ever ready to express.

"Mr. Felch's prosperity as a poultry breeder proves conclusively that the business is profitable when treated as any other industry must be in order to win success. True, he is a man who would have made a mark in any calling, but that fact does no more than to emphasize the truth of the proposition. He has made it a 'calling' by being in earnest in all the details. As a breeder, judge and dealer, he stands among the foremost and most widely known poultrymen in America. He is a man of broad intelligence; perhaps the best speaker, and surely the most atrocious penman in the ranks. His opinions are sought after by publishers because they know that readers demand them, but we have often thought it would be a saving of time and patience to send him a typewriter (the machine, of course) as a Christmas present.

We know that the above will be of interest to many readers, and, as one who has for more than twenty years handled considerable of Uncle Isaac's "copy," we can sympathize with Editor Bates' comment concerning the typewriter. Uncle Isaac never used one in the preparation of articles, so far as we have knowledge of them.

* * *

A. P. A. members may be interested in the following paragraph from an article entitled "Unity, the Great Desideratum," by Jos. H. Hamill, of Globe, Arizona, published in Poultry Monthly in 1895:

"We are not among those who view despairingly the present discord in the poultry fraternity over methods of judging, neither do we regard the strife between the American Poultry Association and the Decimal organization as interecine. In truth, we are of the opinion that the free discussion in the poultry press of the questions at issue, altho at times marred by intemperate language, will be productive of good, and that out of chaos will come order and harmony."

* * *

In looking over an April, 1918, bulletin of Purdue University, Indiana, entitled "Cost of Raising White Plymouth Rocks," we find the following interesting statements:

"Based on 9 and 10 weeks of life, it took 4.8 to 5.6 pounds of grain and 6.5 to 8.5 pounds of skim-milk to produce a two-pound W. P. R. broiler."

"Based on 28 weeks to grow a W. P. R. pullet, it required 30 to 37 pounds of feed and 22 to 37 pounds of skim-milk."

"Based on 24 weeks to produce a 6½-pound roaster, it required 27 to 34 pounds of feed and 22 pounds of skim-milk."

"Based on 41 weeks to produce a 9½-pound capon, it required 64 to 67 pounds of feed and 62 to 79 pounds of skim-milk."

"None of the data contained in the foregoing discussions are absolute, but they are indicative. Any poultryman rearing Plymouth Rocks, Wyandottes or Rhode Island Reds could take the amount of feed consumed by the birds in this experiment, multiply it by the cost of feeds in his locality, and easily obtain a fair estimate of what it would cost to feed his birds during any period of growth."

The bulletin will make interesting reading for any grower of American Class varieties, but its findings are neither final nor conclusive. The rations used in the 1917 experiment—the tests covered 1916 also, on a different ration—were: Grain—8 lbs, sifted cracked corn, 2 lbs, sifted cracked wheat, 2 lbs, steel cut oats; mash—2 lbs, bran, 2 lbs, shorts, 1.2 lbs, meat scraps. Plus green feed, grit, ground bone and buttermilk in abundance. As chicks developed, coarse cracked corn and whole wheat were substituted and oats eliminated except that during summer and early fall of 1917 whole oats and a prepared scratch feed were fed, as they were cheaper.

From the evidence submitted the feeding in these Indiana tests was not the market poultry feeding we practice here in the East, where some of the finest finished market chickens are produced. We have been growing White Rocks for market for quite a number of years, and we still grow them, tho not in as large numbers at present. We cut out broilers except for home use quite a while back, but when we are making White Rock broilers we aim to get a two-pound chicken in 8 weeks if we can and 10 weeks if we must. Growing broilers is a different proposition from growing roasters; with the former the forced feeding comes early, with the latter it comes after frame building is well advanced. We would be disposed to look upon 6½-pound males at 24 weeks as either "stags" or material growing into breeding stock. We make roasters, in this section, out of straight White Rocks and out of Brahma-Rock first crosses. The roaster chicken is almost always a capon, tho we often run the pullets among the "winter chickens"—summer and early fall hatched—thru as roasters, along with the capons. In investigations which we

The Story of CORK INSERT for Ford Cars

CORK INSERT
Transmission Lining for Fords

—one that goes into low or reverse steady and quiet, without that jump and jerk—that mends the brake quick and sure, and stops with velvety smoothness, instead of noisy chattering and racking vibration which causes repairs and ruins the rear end. Tells what users say about

—how it outlasts several sets of ordinary linings because less pressure is needed. Has made records of 10,000, 15,000—up to 50,000 miles of perfect service. Also tells about Cork Insert No-Slip Fan Belts and better Brake Lining for big cars.

Oat Sprouter \$2.49

For \$2.49 you can build the simplest, most efficient, easiest to operate and best oat-sprouter ever constructed. A boy can make one in an evening with no tools but saw and hammer. Thousands in successful operation. Plans with plain directions for building, 10c postpaid.

E. PUTNAM, Route 1005 ELMIRA, N. Y.

have conducted, it takes approximately 64 pounds of feed to make an 8-pound soft-roaster in from 22 to 24 weeks with White Plymouth Rocks. With Brahma-Rock crosses we can and do get 9 1/2 to 10-pound roasters at 22 to 24 weeks, but with more feed in about the same proportion to weight. We do not use skim-milk or buttermilk often because it is seldom available, or, if we have it, we usually are putting it into hogs. In A. P. J. for December, 1917, we published a table showing the approximate amount of feed required to produce an 8-pound White Rock roasting chicken at six months old. Of course, this table does not include green forage which is obtained freely on range while the chickens are making frame and until heavy fall frosts have spoiled the pasture. Here is the table:

Chick rations	4 lbs.
Bran	8 lbs.
Beef scraps	12 lbs.
Corn—cracked first, then whole.	40 lbs.
Total	64 lbs.

There is a vast difference between putting 64 pounds of feed thru a chicken in from 22 to 24 weeks and taking 41 weeks to do it. The longer it takes to grow chicken meat the less it is apt to bring in the market and it costs more for labor and housing. We have made White Rock soft-roasters to weigh 10 pounds at 6 months old and Brahma-Rock crosses two pounds heavier at the same age. The pullets of the cross will often tip the beam at 10 pounds at that age. They are marketed before they lay, if possible, and they would never make profitable layers.

Lays One Thousand Eggs.

Aristocrats in every poultry flock in Indiana ruffled up their feathers a little and walked haughtier than ever when word filtered thru their midst that Purdue's Joan of Arc, a plain little White Leghorn on the Purdue University Farm at LaFayette had set a world's record for production when she laid her one-thousandth egg. A number of the hens in the Purdue flock scoffed, because the world's champion never in her seven long years had laid 200 eggs or more a year as they had.

However, it is a notable fact that these 200-egg birds have lived too fast a life, and after a year or two of fame in the great white way of chickendom, have gone the route of all fast livers. Due honor should be paid this little, peaceful, unassuming queen of the layers, who does no more than cackle over her deeds and part in supplying the nation's food.

Seven years ago last March this now famous bird picked her way to freedom thru the walls of an egg shell. During her young days as a pullet she displayed no unusual talent, looking and acting like her sisters and cousins in the Purdue flocks. However, in October, when she was barely past the half-year mark, she started on her march to the world's record, something for which chickens of all colors, sizes and breeds have striven for centuries, so poultry tradition goes.

The first year she was in the egg business, Purdue's patriotic hen produced 147, or more than 12 dozen eggs. The next year, fall of 1912 to fall of 1913, she did the unusual, bettering her mark of the first year by 15. The presidential campaign of 1912, with the accompanying excitement, only spurred her on to greater efforts, apparently.

The third year brought reverses to her business and she could show only 119 eggs on the right side of the ledger at the close of the year. The fourth year, fall of 1914 till 1915, was her boom period and that year she laid 185 good Hoosier eggs, fit for any king—of the entente powers. The following year business continued good at the Joan of Arc room on the Purdue farm and 160 long marks on the tally sheet were in her favor at the close of the year. From 1916 to the fall of 1917 she lost some of her old powers, but still chalked up 127 eggs, about 40 more than the average Indiana liddy is able to do in a year.

From last October until August 20 this bird demonstrated her patriotism to the world by laying 100 eggs in spite of the infirmities of age and she gives promise of going well above the thousand mark before her books are closed for the fiscal year.

The feat of Purdue's Joan of Arc is all the more remarkable when the average life of the layer is only two years. In her seven years of service for humanity she has laid her own weight thirty-three times over, has produced more than 83 dozen eggs and figured only at market price, perhaps 30 cents a dozen, they were worth \$25.

"Every year we have had her she has more than paid her board," said Prof. A. G. Phillips, head of the poultry department. "One of the men said she was worth her weight in gold, but the reader will have to draw his own conclusions." T. R. Johnston.

Purdue University.

The Meanest Job on the Farm—work so disagreeable that it often is left undone, even though leaving it undone means smaller production and sometimes severe money loss—is mixing and applying whitewash. You can turn this disagreeable task into an easy, pleasant, rainy-day job. You can save yourself time, labor, money, and get better results. You can do both your whitewashing and your disinfecting at one operation. You can make your farm buildings, cellars, etc., lighter, better looking, a pleasanter place to work and a healthier place for your livestock to live if you will use

CARBOLA
The Disinfecting White Paint

a snow-white paint in powder form combined with a germicide, or disinfectant, that is many times stronger than pure carbolic acid. Carbola is neither poisonous nor caustic, but it kills lice, mites, fly eggs, etc., and will help prevent the germs of contagious diseases that affect poultry and livestock—roup, white diarrhea, cholera, glanders, contagious abortion, etc.,—from getting a start and spreading thru your flock or herd.

Carbola is ready to use as soon as mixed with cold water—no straining or waiting—and it can be applied to wood, brick, stone or cement surfaces, or over whitewash, with either a brush or a spray pump. One gallon covers about 200 square feet. Carbola will not blister, flake or peel off, it has no disagreeable odor to taint milk or other food products, it will not clog the sprayer, it doesn't spoil by standing. The dry powder is unexcelled as a lice powder.

Use It Instead of Whitewash

in your poultry houses, stables, hog pens, cellars, out-buildings, etc. Make them sweet smelling and sanitary. Satisfaction guaranteed.

- 10 lbs. (10 gals.) \$1 and postage
- 20 lbs. (20 gals.) \$2 delivered
- 50 lbs. (50 gals.) \$4 delivered

Trial package and interesting booklet for 25c postpaid

Your hardware, seed, paint or drug dealer has Carbola or can get it. If not, order direct—shipment by parcel post or express the day order is received.

Consider Seriously

the possibilities in my

"Famous" Anconas for you.

They're very heavy layers of fine white eggs. Winter and summer they work. They're winners of worthwhile prizes at shows ranging from the World's greatest to County Fairs. They're active, beautiful birds that anyone would be proud to own. They are doing their bit to win the war by producing good food. I wish you would seriously consider this strain on which I have put so many years of thought. It's excellent. You'll find it fills the bill with you.

Won't you drop a line for my Free Book that gives proof of their profitable qualities?

H. Cecil Sheppard, Box M2, Berea, Ohio

IT IS SURELY the "Golden West," so far as the Mid-West is concerned this season. The crop yield is a record-breaker and prices are very high. The great fields of golden yellow corn will soon be invaded and the returns will be great. Everybody is prosperous and as happy as it is possible to be in these war times.

There is always something to take the joy out of life. Each season seems to bring a new insect or fungus disease to damage our fruit and vegetables. I have a number of late tomato vines which are not staked. Every tomato which touched the ground was entered by a cutworm. I cut several of the tomatoes open and in each one I found a great big cut worm. This is a new one so far as my experience goes.

We are getting 35 cents per pound for our honey. At that price for honey, bees are the most profitable things we have on the place. The high price and scarcity of sugar has sent the price of honey upward. I have always urged A. P. J. readers who are in a position to keep bees to put in a few stands. I have never received less than 15 cents per pound for comb honey, and at that price there is a big profit in it.

I live in Iowa and intend planting some apple and cherry trees. Would like your advice as to what to plant, that is which varieties of apples and of cherries. Is the fall a good time to plant these trees? Also, what should be done to protect them during the winter? Are apple and cherry trees planted the same distance apart?

Do you know where I can buy good apple and cherry trees in Iowa? If not there, where should I buy them? What time in the fall is the best month to plant?

Missouri.

Henry Senereid.

You do not state in what part of Iowa you intend to plant your orchard. For southern and central Iowa, would plant Delicious, Grimes' Golden and Black Ben apple trees. For Northern Iowa, Wealthy, Patton's Greening and Iowa Brilliant. In cherries, plant Montmorency and Early Richmond, making the planting two-thirds Montmorency. Fall planting of apple and cherry trees in Iowa is not advisable. You should wait until next spring and then get the trees into the ground as soon as possible. I have found by experience that it is best to secure the fruit trees in the fall and heel them in. By so doing the trees are in the ground all winter, where the root of a tree properly belongs, instead of being kept in a packing shed all winter. Then, too, trees so treated are on hand the moment needed for planting. In heeling in the trees, select a location where water will not stand. Dig a slanting trench the length of the longest tree,

two feet deep at the end for the roots and ten inches at the top end. Trench should be wide enough to allow the stock to be well spread apart, as the dirt must be well packed and no air spaces left. Mud the roots thoroly in thick mud. Sift the dirt on and cover up the entire tree, root, body and branch. When the earth

MEYERSDALE, PA.

is all on, tramp the surface down hard to turn water. As soon as the ground has frozen about four inches, cover the trench with two feet of straw or stable manure. Do not uncover until spring, just as you are ready to plant. The straw covering on the root end of the trench should extend out on the ground at least three feet beyond the roots to insure complete protection to the stock lying nearest the surface. Set your apple trees 30x30 feet, the cherry trees 20x20 feet. There are a number of reliable nurserymen in Missouri and Iowa.

The woods near our place this season produced hundreds of bushels of wild cherries and grapes, as well as gooseberries. These fruits were eagerly sought by the people and many who could not afford to pay the high prices at which cultivated fruit of these sorts was selling will have a goodly supply of winter preserves, etc. A lot of the cherries were made into wine.

We have just bought a home. The lot is 60x200 feet. We want to set out fruit trees. There are no trees on the lot. We expect to make a specialty of raising chickens—no garden. We want trees for shade as well as fruit. What to set out and the kind is the thing we want to know. We desire early apples and some late ones. Also pears, peaches, plums, cherries, etc. The lot is a ridge and slopes back and front, being high in-center. The lot fronts to the south. The back part of lot is full of gravel. The center and front has a clay subsoil, with no sand or gravel.

Arkansas. W. D. Corya.
For early apples plant Henry Clay, Liveland Raspberry and Duchess. You ought to have a few Wealthy for fall. For winter varieties plant Delicious, Senator, Champion and Black Ben. Would plant all Montmorency cherries. For peaches—Early Elberta, J. H. Hale and Kimmel October. You will find it difficult to raise pears owing to the damage by blight which is prevalent in your state. Advise you to plant a few Lincoln. I have had this variety on my place here for twenty years or more and it has never shown signs of blight. You will find Omaha, America, Golden and Endicott a grand good lot of plums. Of course you will want to plant some Eclipse, Worden, Niagara and Concord grapes. Also Red Cross and Diploma currants and Champion and Oregon gooseberries. You should plan to keep a few stands of bees. You will find the north side of your ground better suited (so far as sun exposure is concerned) to raising fruit than the south side. Fruit planted on land with a southern exposure usually comes out in bloom early and is liable to be caught by spring frosts.

If you have not made the currant and gooseberry cuttings as you should have done last month, do it now. Plant as directed in this department.

DR. HESS INSTANT LOUSE KILLER

KILLS LICE ON POULTRY AND STOCK

Don't let your hens be pestered with lice during the moult. They will need all their strength and vitality then. You can rid them of lice easily, certainly, quickly, by using Dr. Hess Instant Louse Killer, the dependable, guaranteed remedy. Dr. Hess authorizes every one of his 28,000 dealers to sell it on a money-back guarantee. Sprinkle on roosts, in coops, sift in feathers, put it in the dust bath and your hens will do the rest. For lousy colts and other stock, stroke the hair the wrong way with one hand, with the other sift in the Louse Killer.

Get the American Poultry Journal 3 years for One Dollar

Get 50% More Eggs

Feed Sprouted Oats

MAKE three bushels of fresh, green, tempting feed from one bushel of oats, wheat or rye. Turn loafing hens into money-making egg producers—have eggs to sell when prices are highest—get fertile eggs for spring hatching—all at a big saving in feed cost. Every poultry raiser should have a "Successful" Sprouter. Saves its cost in a few days' feeding and then keeps on saving money and doubling up your profits for a lifetime service. Just what's needed in fall and winter to keep hens laying and needed again in the spring to make chicks grow into lively profit-producing birds. Write at once for complete 1918 offer. Sold on trial and pays for itself before trial runs out.

"SUCCESSFUL" GRAIN SPROUTER

Practically All Steel—Made in Sections

Double steel walls—metal trays. Cannot be compared to wooden sprouters. Warp proof—shrink proof—swell proof—nothing in it to rot—food cannot mold. Glass doors. Each section a separate compartment. Start with enough sections for your needs and add more as you need them. Here is a money maker. It has increased egg yields 50 per cent—in some localities more. Takes only 15 minutes a day of your time. Sprouts oats in 24 hours and then grows an inch of crisp green sprouts every day. One feeding of sprouted oats at noon each day increases the egg yield, cuts feed cost one-third. Write for full details. Famous booklet, "Proper Care and Feeding of Little Chicks, Ducks, Geese and Turkeys," 10 cts. Write today.

DES MOINES INCUBATOR COMPANY
561 Third Street Des Moines, Iowa

All We Claim For It and More

Madrid, N. Y., May 23rd, 1916
Des Moines Incubator Co.

Last February I ordered a No. 4 Sprouter from your Company and has been in steady use since we received it and we still intend running it longer. It is all you claim for it and then it is "some more." In fact we are well satisfied with it. It is so handy to operate and has nothing to get out of order. I can and will recommend the Des Moines Sprouter for cheap Green Feed for Hens.

Ray E. Henry.

FERRIS LEGHORNS Lay Winter Eggs

For eighteen years Ferris White Leghorns have been bred to lay more eggs at all seasons than ordinary hens, and to lay particularly well in winter when eggs are highest. We do not breed from hens that are not good winter layers.

All Stock Is Shipped on Approval.—You can return within three days any birds not satisfactory and money will be refunded. (We will ship C. O. D. if you want to see the birds before paying for them. Send only \$1.50 for a pen of five, and 20 cents each for larger numbers to guarantee express charges.) We insure all stock for 30 days. Any birds that die or get out of condition will be replaced free of charge.

We have three grades of laying stock. Stock from our heaviest laying strain with trapnested records of 230 to 264 eggs will cost as follows: **Early hatched cockerels**, \$10 each, \$9 each for 10 or more. Yearling hens or laying pullets, \$5 each—1 male, 2 females, \$20; 1 male, 4 females, \$30; 1 male, 8 females, \$45; 1 male, 12 females, \$60; 7 males, 100 females, \$428.

Stock from 200 to 230 Egg Strain.—The kind we recommend for breeding and laying where large flocks are required. Early hatched cockerels, \$7 each, \$6 each for 10 or more. Laying pullets or yearling hen, \$3.50 each; 4 females, 1 male, \$21; 12 females, 1 male, \$47; 100 females, 7 males, \$327; 100 females without males, \$285.

Utility Stock for Laying and Breeding.—Not bred from trapnested stock, but from stock that we can guarantee to be better than the average. Cockerels, \$5 each, \$4 each for 10 or more. Hens, \$2.50 each, \$200 per 100. Pullets, \$3 each, \$250 per 100. Four hens, 1 cockerel, \$15; 12 hens, 1 cockerel, \$32.

Winners for Any Show.—We can furnish cocks and cockerels hatched directly from our Chicago Coliseum winners at \$30 to \$100. Hens and pullets at \$15 to \$50. These birds will win anywhere. They have splendid low tails, good heads, wonderful shape in every section, and pure white plumage. We have hundreds of early hatched cockerels and pullets to select from. For several years Ferris Leghorns have been leading winners at the Chicago Show, winning in 1915, 3 firsts and numerous other prizes, including silver cup for best display and silver cup for best five cockerels. In 1916 we won all specials, all first and second prizes, and last December we won three first prizes and 16 other prizes, so no matter where you wish to show we have the birds that will win for you. Here are our winnings this fall:

Missouri State Fair, Sedalia, August, 1918—3 firsts and 8 other prizes.

Michigan State Fair, Detroit, September, 1918—All first prizes; 13 prizes on 14 entries.

Interstate Fair, South Bend, Ind., September, 1918—4 firsts; 16 prizes on 16 entries.

West Michigan State Fair, Grand Rapids, September, 1918—4 firsts; 18 prizes on 18 entries.

We will exhibit at several other shows this fall. Watch our winnings.

This 1918 Catalog Is FREE

Send for your copy today. It describes fully the stock quoted above. Contains photos showing 35 acres of White Leghorns; describes our methods of feeding and care; how we improve laying qualities; list of winnings at 20 big shows; many letters from customers; prices of exhibition, breeding and laying stock, eggs for hatching and day-old chicks.

GEORGE B. FERRIS
905 Union Avenue Grand Rapids, Mich.

I am going to plant an orchard this year and would like some advice as to what you would plant for early and late bearing apples, peach, plum, cherry, pear, crabapple, strawberry, raspberry and blackberry. I want to plant enough for my own use and also for local trade. When should I plant? Is it better to break up ground before one plants an orchard? Could one sow bluegrass or timothy in orchard ground? Please mention reliable nurseries close to me. Elmer E. Peeples, Illinois.

Would advise you to plant Yellow Transparent, Liveland Raspberry and Duchess for early apples. For late varieties, plant Delicious, King David, Grimes' Golden (double-worked on Duchess) and Black Ben, Peaches: Early Elberta, J. H. Hale, Elberta, Capt. Ede and Kimmel October. Plums: You will do well to plant the hardy American sorts, using Omaha, Surprise, Weaver, Wyant, and Jerry. You will thus produce great crops of very good plums, while with the more showy kinds you would have lots of trouble with winter injury and your crop would be light. You might plant a tree or two of Gold America and Endicott, to try them out. Cherries. Montmorency, without one-fourth of the planting to Early Richmond. Do not plant heavily to pears, as the blight is very prevalent in your state. Would confine the planting of pears to Lincoln and Seckel. Crabapples: The Florence is "worth all other crabs put together," as one grower puts it. I cannot advise you as to what varieties of strawberries to plant. This is something which you must learn by noting the kinds adapted to your locality. Write your state horticultural people. Give them a full description as to your soil, how well drained it is and the exposure. You will find the Royal Purple and the Cumberland the best and most profitable raspberries. The Royal Purple is a large purple fruit and this variety will produce more bushes of fruit to the acre, two to one, than any other raspberry. The Cumberland is the best and most prolific of the Black Caps. The Cuthbert is the best of all reds, but it is likely to winter-kill with you. The Snyder is the most hardy of all blackberries. There are better sorts, but commercially none can compare with the Snyder for your locality.

By all means break up the ground this fall. Never plant fruit trees or berry bushes in sod if it can be avoided. Do not seed down the orchard. Keep it cultivated until about July 15 each year. Then plant a cover crop. This cover crop should be plowed under each spring. After the apple orchard is five years old, you can let it grow to grass, provided you cut the grass each July and pile it around the trees, never removing a bit of the grass from the orchard.

Every fall and spring I have a number of inquiries as to how to determine the number of trees or bushes to plant to the acre, to be set certain distances apart. Here is the answer: The number of square feet in an acre is 43,560. Divide this amount by the number of square feet required for each plant. Thus, to find how many currants are required for an acre, planted 4x6 feet—six times four equals 24 and 43,560 divided by 24 equals 1,815, the number of currant bushes required for an acre.

By parcel post I am sending you two apples from a tree on the farm of Mr. Forsythe of this place. You will notice one is a real Russet. The other is of the Winesap family, I think. Now, these apples grew on the same limb, not over six inches apart. Every limb on this tree is about equally divided between these two kinds of apples, which is considered a rarity here. No one here ever saw anything like it and I would like to hear from you on the subject thru the columns of A. P. J.

W. H. Harris.

OWEN FARMS

**S. C. R. I. Reds
White Ply. Rocks
Buff Orpingtons
& S. C. W. Leghorns**

are known all over the world as the best flocks of these varieties.

The record of my birds at Madison Square Garden, New York (where 418 Owen Farms birds have won the blue), Boston, Chicago, New York State Fair, Pittsburgh, and the leading shows of the South, has never been approached.

Thousands of Owen Farms birds have won firsts in the hands of customers.

**My Latest Winning
at the Greatest of all Fall Fairs
New York State Fair
SYRACUSE, SEPT., 1918**

FIRST DISPLAY IN EACH VARIETY

Reds—1st and 2d cock; 1st and 3d hen; 1st and 3d cockerel; 1st, 2d and 3d pullet; 1st old and 2d young pen, and best display.

White Rocks—1st and 2d cock; 2d and 3d cockerel; 2d pullet; 1st pen and best display.

Buff Orpingtons—1st and 3d cock; 2d and 4th hen; 2d and 3d cockerel; 1st and 2d pullet; 2d old and 1st young pen; best display.

White Leghorns—1st and 3d cock; 2d and 4th hen; 2d, 3d and 4th cockerel; 1st and 2d pullet; 1st old, 1st and 2d young pens and best display.

Customers have won all over the country this fall in both old and young birds.

What You Will Find Here

1. Golden Rule treatment.
2. Exceptional value.
3. Unequaled Standard quality.
4. Unexcelled utility qualities.
5. Perfect health and vigor.
6. Naturally grown birds, on free range with same feeding.
7. Utmost courtesy.
8. Absolutely square dealings.

Old customers will endorse every one of these truths. New ones will find them facts.

If you want the highest quality birds for show and breeding at fair prices; if you want strong properly grown utility birds at fair prices; if you want prompt and careful consideration of your inquiry; if you want to make your poultry business successful, you will come to OWEN FARMS.

Liberty Bonds and Savings Stamps taken in payment. You can help Uncle Sam win this war and then secure your poultry needs.

My August and September trade was well ahead of 1917. The break will come soon. Now is the time for you to get ready to share in the vast volume of business in thoroughbred poultry that will soon be done by the breeders that have the birds.

Over 6,000 birds are on Owen Farms. Among them are the ones you need. Write your exact requirements and receive a quotation. Come and see for yourself if possible. If you cannot come, write.

It is quite common for bud varieties to show on a tree. As a result we have five strains of Rome Beauty apples. All are typical Rome Beauties, some with better coloring and some better size. You say "every limb on this tree is about equally divided between these two apples" and you may well say it is considered a rarity. I should think it was. That is bud variation gone mad. But I strongly suspect that someone has been busy, very busy, on that tree with a budding knife and some buds. The apples were badly rotted when received.

I wish Theodore Hewes would write more often for the American Poultry Journal. When one reads an article by Theodore Hewes, one has a feeling that Theodore is sitting near by, telling you a very interesting and instructive story.

Noting what you said in June issue about winterkilling of trees, beg to advise you that here in northern Illinois, which has about the same climate as northern Iowa, there was some damage from the severe weather last winter, but nothing serious. The only plum tree that I lost out of a dozen varieties was an Endicott Mammoth Gold, but it sprouted above the bud and is coming along fine again. For the last two years my plums have bloomed freely; this year they set a little fruit, which fell off, but no harvest. Trees are young, four to five years old. With age, will they be likely to do better? Do you know of a variety that can be relied on for a crop at least once in two years? My ground is too valuable to be given up to trees that bear foliage only. Six years ago I planted about forty peach trees. This year I got perhaps 250 peaches. All those trees will be cut down and cherries planted instead.

My Whitney crabapples are fine, as are also the Florence. I fenced off with wire netting about an acre of the orchard. In May and June this area is a jungle of clover, alfalfa and other grasses. I wanted something to keep the grass down, so I tried sheep, but they immediately set to trimming off the low branches and eating the bark on the trunks of the trees. As a result I had to cut out the sheep. Of course, I had plenty of chickens, but they were not exactly satisfactory, as they would eat the grass close, near the poultry houses, and leave the jungle a hundred feet away untouched. Besides, they have a habit of starting a hole and then digging down in the same place until part of the orchard is full of these pitfalls, into which one is liable to tumble unless he watches his step carefully. Finally I tried geese, and they are very satisfactory. They wander all over the orchard and keep the grass nipped down in good shape, doing no damage so far to the trees. They do not touch the fallen fruit, because it is too large for them to swallow, but if quartered they eat the wormy apples ravenously. When fall comes we will eat the geese with the assistance of the neighbors and early next spring I shall again buy eggs and hatch out half a dozen goslings to keep down the orchard undergrowth. The beauty of geese under these conditions is that they get their living during the summer for about nothing. Of course I shall keep chickens also, giving them the run of the orchard, but geese are better lawn mowers, and besides are not always digging holes. To be sure, they cover the ground with manure where they rest at night, but if kept in a lot a little distance from the house, this is not objectionable; anyway, they are less obnoxious in this respect than ducks. W. V. S.

Illinois.
I want to thank W. V. S. for his very interesting letter. I had been thinking of writing an article advising the keeping of geese in the orchard. It seems to me nearly every orchard could profitably keep a flock of geese. Will other orchardists who have kept geese please give our readers their experiences?

In answer to P. R. Rand, Ohio: You will find Rome Beauty apple trees a profitable va-

NEWTOWN Giant Incubator

Hatches the Most Chicks—
The Best Chicks—
With Least Labor—
And at Lowest Cost—

You cannot ask or get more; you should not be satisfied with less. Newtown efficiency and economy will insure your success.

The Newtown Mechanical Eggs-Turner

is a big labor-saver. Where other large incubators are used, much time must be spent in turning the eggs twice daily. The *Newtown Mechanical Eggs-Turner* has changed this. Take ten seconds to turn the crank and all eggs in the machine will be turned better than you can turn them by hand. No eggs are cracked or dropped and broken. No "bunching" on the trays.

Read this Report from Michigan Agr. College

"Relative to our hatches with the Newtown Giant Incubator. We have brought off three in all. The first gave us 92% of the fertile eggs, second 91%, and the third a little better than 92%."

"The incubator gives us chicks that can be shipped by parcel post as far as Texas, W. Colorado and Northern Minnesota. The greatest number found dead,—in shipments ranging from 200 to 400 chicks,—no more than four. We are very enthusiastic about the Newtown Giant."

(Signed) C. H. BURGESS, Assoc. Prof. of Poultry Husbandry.

If you demand highest efficiency plus economy and certainty, write for complete Newtown catalog today. Please state the size incubator in which you are interested. Remember, it is to your advantage to place your order early.

Fall and Winter - Colds and Roup

Fall and early winter is the worst time for poultry sickness. A good time now to use **Germozone**

Made originally for human beings and still so used extensively for sores, wounds, inflammations or irritations of skin or scalp or catarrhal discharges—it fits nine-tenths of poultry diseases.

Germozone

Made for man—it is all the better for poultry or stock. Sores, wounds, skin diseases, loss of hair, fur or feathers, roup, canker, sore head, chicken pox, cholera, white diarrhoea, bowel complaint, the one best remedy, and the ideal flock treatment, preventive as well as curative, is **Germozone**

Twenty years in use, many a prosperous man nowadays remembers how his mother or grandmother doctored her chickens or bound up his stubbed toes, cuts or bruises with the same old reliable **Germozone**

Germozone

No dealer can consistently decline to handle Germozone. We supply the tablet form by mail. Germozone is generally handled by dealers in the liquid form, but the tablets are just as good and are so easily available. 75 cents per package. No charge for postage. C. O. D. if desired.

With a package of Germozone we will send free on request a Lee Poultry Library of 5 books telling best ways to handle poultry, at every stage of the game—from egg to dressed for market—most successfully and profitably.

GEO. H. LEE CO., Dept. 302, OMAHA, NEBRASKA

Makers also of Lee's Lice Killer, Lee's Egg Maker, Lee's Louse Powder, Flyo-Curo, Lee's Dip, Lee's Hog Remedy—also household remedies and Egg-O-Latum, the great Winter Egg preservative. All in above books.

Used by the big chicken raisers of the country. Used and recommended by the great American School of Poultry Husbandry. Used in all of the poultry contests at that station and they always show best results. No other poultry medicine can compare with **Germozone**

Germozone

And it is so universally useful on the farm, in the home or poultry yard. Hundreds of factories, many now working on munitions, use it always in case of injury in preference to "Peroxide" or other antiseptic. I have seen many great wounds healed quickly without a scar by use of **Germozone**

Germozone

But the great big use is its prevention of poultry troubles by giving it regularly two or three times a week in the drinking water. Roup, canker, colds, bowel trouble, limber neck, etc., are rare in flocks that regularly get **Germozone**

Germozone

riety to plant in your Ohio river bluff lands. It is an apple of fair quality, a good looker and sells well.

Yes, I think you are right in your idea that when prohibition of liquor becomes national there will be an increased demand for grape juice, and that now is a good time to set out vineyards.

I have never heard of the Grange apple of which you speak.

I am writing for a little information relative to your speciality in the poultry line—the Houdans. I am a veteran breeder and for 33 years have been at it most of the time, and being more or less of a writer and a judge, have shifted around among breeds a great deal. I originated the White Wyandottes 32 years ago. Possibly others may have done the same thing, but I have never met anyone who did.

I am just taking up the Houdans. Never tried them before, altho have long been an admirer of them. I wish to know about their laying qualities. Do they lay a large number of eggs—say, average 120 to 160 without tramping and breeding for large numbers?

Are their eggs fairly large, as a rule? Are they non-sitters?

Again, how about their meat and table qualities, both as to quantity and quality?

Still again, are they hardy? Do they stand cold weather well and thus lay fairly well in winter? Also, are the chicks strong and is the mortality rate low?

Yet again. If you can answer most of the questions in the affirmative, why do not more breeders take them up and breed them as an all-purpose fowl?

Brother Rigg, you will notice most of these questions are of general interest. I am asking you to reply to me in person, briefly perhaps, but the questions are to serve for a more lengthy reply in A. P. J. to give the breed more of a boost. I will take hold of them now in earnest and want to do all I can to place them where I fully believe they belong, in the very front rank of the most useful and profitable breed for fancier and farmer alike.

Lowa. Horton B. Green.

1. The Houdan, under good care, will lay 120 to 160 eggs per hen per year.

2. Eggs are larger.

3. I consider the Houdan the best of all table fowls. They are non-sitters. Once in a while one will want to sit.

4. They are hardy. They will stand cold weather better than most breeds, their combs and wattles being protected by crest and beard. The chicks are strong and therefore healthy.

5. The Houdans, like a number of very useful and profitable breeds, have been sent to the rear by the commercialists who are now in full control of the American Poultry Association. Please bear in mind I have no Houdans for sale.

If you buy a \$100 bond of the Fourth Liberty Loan you are lending the United States Government enough money to feed a soldier in France a little more than seven months. Or you have furnished enough money to give him a complete outfit of winter and summer clothing, including shoes and stockings, and slicker and overcoat and blankets, with enough left over to arm him with a good revolver. You have done that much to beat back the Hun.

It takes \$35 more to arm him with a rifle with a bayonet on it, and if you buy a second \$100 bond you furnish him this rifle and 1,000 cartridges for it; and there will still be enough of your money left to purchase a good-sized bomb to throw in a dugout, or demolish a machine gun together with the Huns operating it.

Buy Now.

IF YOU contemplate buying breeding stock for next season, now is the time to do it. A great many people seem to think it economical to put off buying the next season's breeders as long as possible, probably figuring that there is a material saving in avoiding the cost of feeding the birds between fall and breeding time. Moreover, they have the use of their money until that time. There is also a lessening, in risk in avoiding the possibility of loss by death or disease during the winter. These facts notwithstanding, the best time to buy breeding stock is now. The results are bound to be better where the breeding birds have been housed comfortably thru the winter in their breeding pens. Eggs from such birds are much more likely to hatch and the offspring will invariably be more rugged and healthy. Usually some of the best values are obtainable in the fall offerings of breeders.

I have bought breeding birds in both spring and fall since I became interested in poultry culture a few years ago and my advice to the beginner is, buy in the fall all birds required for your breeding pens for the following season. Breeding birds should be in their new quarters long enough to feel thoroughly acclimated and at home before the actual breeding season begins.

R. L. Long,
Michigan.

The Best Chicken Year.

It is always interesting to read the communications from different sections of the country in American Poultry Journal. In our part of the country there is very little poultry left and few chickens have been hatched this past season. However, this has been the best chicken year that I have ever known—that is, the best season to raise chickens, and I have fed the poorest feed because I could get nothing better. I sold off some of my hens in Boston for 35 cents a pound and broilers for 38 cents. Grain prices here are as follows: Bran, \$2.90; middlings, \$3; mixed feed, \$3.10; stock feed, \$3.40; meat scrap, \$5; oats, \$2.60; corn, \$3.50—and too poor to use at that.

I am wondering if the War Emergency Association will be bulldozed by some of the other associations and their wire-pulling politicians. I am afraid some of them are so firmly dug in at Washington that it will be difficult to dislodge them for a time at least. It looks as tho the packers own a good many wire-pullers, and are hiring others to do their barking for them. I think that when the utility man's throat is cut the fancier will have to quit business, as well as the feed dealer, the incubator man and the poultry press. I can't see how they can get along without one another very well and it is time for each and every one of them to take note of the fact.

Rockford Poultry Supply Co.
Lock Box 3, J. 201
Rockford, Illinois

I do not see how western farmers can afford to feed grain to poultry any more than we can here in the East, except at a loss, under present conditions, for he must lose on his grain if he feeds it to hens. However, I am not ready to give up, and shall keep about 40 hens and pullets the coming winter, hoping that things will change, when I will stock up again, but it is money out of pocket now to feed poultry, since the price of eggs and poultry meat has in no way kept pace with the cost of producing same. It is singular how ignorant the general public is in regard to the value of eggs as food. It has not begun to understand yet that an egg at 5 cents is cheaper than a lamb chop at 15 to 20 cents.

Keep up the fight for better poultry and a living for raising it. Edwin C. Smith, Maine.

Geese on Poultry Land.

I was interested in a recent article in your magazine relative to raising more geese on farms. I believe this is one way in which we can greatly increase the amount of poultry grown on farms. Wherever there is good pasture land, there should be a flock of geese. Geese live almost wholly on pasture during the months the grass stays green. They attain a goodly size the first season and there is no better eating than young roast goose. I believe that those with meadows and pasture land could very materially increase the food supply by rearing a flock of geese at small expense and without great effort. I trust that A. P. J. will give us more articles on goose culture in coming issues. H. D. Johnston, Pennsylvania.

Poultry Feeds.

It has been my practice for some time, and I have not seen the disadvantage of it yet, to use commercially prepared feeds. I use a grain scratch feed, morning and night, in a good litter of wheat straw, and give an equal amount of dry mash at noon in a "no waste" hopper. I prefer, and most heartily endorse, grass runs for summer, and sprouted oats for winter, but advise feeding sprouted oats at from one to two inches long, as the oat itself will not become musty and will do the birds good. To hold oats until the sprouts are three or four inches long, the oat itself becomes musty and frequently decayed, and thus unfit for the birds to eat.

The feeding of young stock is the most important task in the work of producing a productive flock of birds, for therein lies the seed and unless it is properly cared for, good results cannot be obtained. It is my plan to start chicks and continue for about three weeks on buttermilk chick food and I have thus reduced to a minimum the chance of disease. The chicks need a good grass range and all the wholesome grains they will eat right thru the entire growing period. If hatched sufficiently early, they will then be ready for the laying pens in early fall and reward their owner by laying well thruout the winter. J. E. Mattingly, Indiana.

Going to the Fair?

This is a busy year for men, women and children. Everywhere I go, I see people working early and late. This is especially true in all agricultural districts. People are striving against great odds to harvest crops, as they never did before in their lives. I have seen women, whose sons are battling in France, toiling early and late in the fields at home in an almost superhuman effort to help keep the food supply up to normal. It is no easy task with the strong, capable helpers gone, and no others to take their places on the farm, for the farming operations to be kept up to normal. Only by the never-failing, unmatched courage and helpfulness of the farmers' wives and the young children has the work gone on. There was a time, not so very long ago, when farmers were denounced for allowing their wives to work in the fields, but today these same wives should be acclaimed the best and most true-hearted of women. This has been a long, wearisome season for many farm people—harder labor, longer hours, a poorer crop season than we have known for years; but the fall fair season and the time of winter poultry shows is at hand, so forgetting all the trials we have

had, let us take the time off and attend the fair or show. Look over the stock and see what there is that is good and send it in to compete with the Smith and the Brown stock. Take time to select the best and groom it well; and if the children have any pet stock worth showing, see that it is properly entered in the young owner's name. If the whole family cannot attend on the same day, arrange matters so a part can go on one day and the rest on another. But see to it that your wife has her pick of days or, better, see that she goes more than one day.

It will do you all a lot of good to go to the fair or show. You will meet old-time friends and renew acquaintances. You will be able to view, side by side, the products of the workers of the community at large, as well as all the latest appliances for use in your work. You will gain inspiration for the coming year's work, and you will go home tired and weary and a bit distracted by the noise and confusion, but with something to enjoy for a long time to come from having gone to the fair or show.

T. F. Rolfe.

Illinois.

Winter Eggs.

Everyone who feeds a flock of hens or pullets wants them to lay during the winter months. If they commence in October or November and keep it up right straight thru, so much the better. There is not much encouragement in feeding poultry at present grain prices if they fail to lay. Now, I have had many different breeds of poultry and tried various experiments in feeding, housing, etc., but I have reached the conclusion that there is no royal road to winter egg getting. It is simply a question of having the pullets hatched early enough to admit of early laying; that is, by the beginning of winter, and then to give them all the food they want to eat. I am not very particular about houses, so long as a window, door or entire front is left open all the time.

The chief reason hens and pullets do not lay is that they do not get enough to eat to keep them in health and supply them with enough surplus material to make eggs. Heavy feeding is absolutely essential to good egg production. The birds must be supplied with food regularly. It does not work out to advantage to feed heavy today and forget to feed tomorrow. I have known laying to cease without apparent cause when a pen of birds was being hopper-fed. On investigation the hopper was found to be totally empty, the owner having filled it the week previous and expected the contents to last two weeks, but the fowls had eaten all they wanted the first week and all but starved the second. To get eggs, we must feed heavily of grains, no matter how high in price grain may go. It is an inexcusable waste of good material to feed only half enough to a flock of hens. Double the quantity if necessary; at least, be sure you are feeding enough to insure egg production.

Kansas. Milton T. Jones.

War Rations for Poultry Fattening.

On account of the scarcity of wheat middlings, many poultry raisers are finding that it will be necessary to use substitutes in their crate-fattening rations. If ground oats and barley meal are available, a very satisfactory ration may be made of 55 pounds of cornmeal, 20 pounds of ground oats, 20 pounds of barley meal and 5 pounds of fine meat scrap. Heavy feeding of cornmeal gives a yellow fat and skin, while if oatmeal and barley meal

make up a large part of the ration the fat and skin will be lighter in color.

Either of the mashings mentioned is intended to be fed with milk, either skim milk or butter-milk, using 1½ to 2 pounds of milk to each pound of mash. If milk is not available, add 10 pounds of fine meat scrap and mix the mash with water.

The mash mixed ready for feeding should have the consistency of a good buckwheat cake

batter. It is not necessary to mix the mash fresh more than once a day, as a slight fermentation makes it more palatable and more digestible.

The chickens to be fattened should be given nothing to eat or drink for at least 12 hours after they are placed in the crate. This permits the digestive tract to become empty and in better condition to receive the concentrated fattening mash.

Make Them Lay

You see that little lantern in the cut on the left side; it does the trick; it **Makes**

Hens Lay. 300 candle power; it makes day out of night. You surely must have read how, by extending the light in the laying house in fall and winter, fowl **Lay More.** Proven fact; system used most everywhere on the Pacific Coast; now being used in the East by poultrymen and state experiment stations. I use this lantern and you will too. Be a live one, up and doing. Eggs will be 75c a dozen soon; you will want to increase output. This simple, powerful 300 candle power light will make them lay more.

Write now for descriptive circular. Write plainly, please. DR. J. H. PRUDHOMME, Box A, Thurmont, Md.

SHOW-BIRDS GALORE

More than 2400 "Aristocrat" Barred Rocks are now growing up into superb, magnificent show-birds. The "Aristocrats" are those glorious Plymouth Rocks which are making such a

SENSATIONAL SWEEP OF VICTORIES

thruout all America—from the Grand Palace show, N. Y., to San Francisco; from the foremost shows of Canada down into South America—winning out at such great shows as the annual **National Barred Rock Show** (the greatest of the great), **Chicago, N. Y. Palace, Guelph, New Orleans, the "Tri-State,"** the **"World's Fair,"** **Cleveland, Texas State,** and many, many hundreds of other shows. This is probably the most victorious campaign ever made by any strain of chickens. (Can furnish show-birds in all classes for any show—remember this.)

WONDERFUL LAYERS

At the same time these superb show-birds are also among the world's foremost layers, establishing equally remarkable records—records up to 260 eggs per year. They are, truly, great all around—great layers, great market chickens, great show chickens—all combined. They are in a word

Questions and Answers

Conducted by
Prince T. Woods, M. D.

Questions about poultry are answered in this department free for all readers of American Poultry Journal. Where answers are desired by mail, a stamp for reply is requested. Address all query letters to the managing editor, Dr. Prince T. Woods, Lock Box 4, Silver Lake, Mass.

Pigeons for War Purposes.

Q. Would like information concerning carrier or homer pigeons used as messengers on the battlefields. Can you furnish names of breeders of such pigeons? Is there a market for the young stock? Are they of any value for other purposes besides carrying messages? Would like to try a few as a fancy or hobby.
Denver, Colo. A. C. L.

A. You will usually find advertisements of homer pigeons, both for sale and wanted, in our classified ad department. Consult this and the last few issues. For information as to need of homer pigeons for war purposes apply to commander of nearest military post or the War Department at Washington, D. C. Homers make excellent squabs for table purposes.

White Rock-R. I. Red Cross.

Q. Please tell me what kind of chickens I have. I mated four S. C. Rhode Island Reds with a White Plymouth Rock cockerel. I now have fifteen chicks and they are white and black speckled, with a dash of reddish brown. Some tell me they are only just chickens, but to me they are a fine-looking flocks of birds. The Reds I mated are fine layers. Do you think these pullets will be good layers?
Danbury, Conn. C. E. M.

A. Your chickens are White Plymouth Rock-Rhode Island Red crossbreds. This cross commonly gives a color similar to Columbians, but if you breed them you will only get mongrels. The pullets should prove good layers. Force them for eggs and then eat or can them. Better mate those Rhode Island Red hens with a good R. I. Red male the coming season.

Disposing of Cockerels.

Q. I have a few Barred Rock cockerels of good stock and would appreciate your advice on what points to consider in selecting those I keep. I have a 1910 Standard, but know it is out of date. Feed is so high it might be better to kill them and purchase a male when I need one. Chicken men here say that it is costing 30 cents per head per month to feed fowls. I read all your and Mrs. Woods' articles in A. P. J. and always enjoy them. Conditions you mention in relation to feed are much the same here.
Mrs. W. F. T. Lowell, Ariz.

A. We would not keep more cockerels than you expect to have use for. You should be able to sell some to neighbors for breeding

purposes. For your use in selecting males to keep, the Standard you have will serve very well. Choose those specimens which come nearest to filling the requirements, but above all else, select strong, vigorous, healthy specimens that have matured well. We are culling many of our surplus chickens this season. Our book department will be very glad to sell you a copy of the latest edition of the Stanard. We are much interested in your report of Arizona conditions.

Leg Joints Swollen.

Q. What is the matter with my chickens? I am feeding them a good scratch feed and mash, plenty of green feed, grit and charcoal. They seem all right when I feed them in the morning. By night I find a few limping and the next day they can hardly stand. Some of them have the first joint of one leg swollen. They eat, but finally die in about four days. I have treated them for almost everything, but can find no cure.
Cincinnati, O. C. A.

A. There is probably something wrong with the beef scrap or some other ingredient of the mash you are using. Better discontinue the mash. Feed largely on sound hard grains and greens. See that the sleeping quarters are clean and dry. Do not crowd the chickens and do not shut them in too closely at night.

Spoiled Feed Probably.

Q. There is some sort of disease affecting our chickens. Have examined several and there does not seem to be anything wrong except that there is a sack of yellow membrane around the heart, about the size of heart. They seem all right and look all right, but just refuse to eat. Some drop over dead. They are in medium flesh and it seems to take more of our Speckled Sussex than the Orpingtons. Is there any cure?
Garden Grove, Ia. S. S.

A. Trouble is probably due to spoiled feed, tho some of the chickens may have been exposed to extreme temperature changes, or crowded in close coops at night. The feed which is available for poultry feeding this season is not all it should be; much of it is spoiled. There is not much that you can do except see that the flock is comfortably housed and fed on sound feed. Cull out any which show symptoms of weakness and market them before they begin to go to pieces.

Off-Color Feathers; Sex of Geese.

Q. I am a reader of A. P. J. and like it fine. Please tell me what is the matter with

HUNDREDS OF EARLY HATCHED

Aldrich White Orpingtons

Now Ready to Win in Any Competition

At Greatly Reduced Prices

To those who BOOK THEIR ORDERS DURING OCTOBER AND NOVEMBER we will give a special discount from our regular prices, for any birds for the coming season's shows. If you wish a WINNER FOR YOUR FALL OR WINTER SHOW you can not afford to pass this offer by, as it positively will not be good after December 1st, and those who book their orders early will be surprised at the reduction we offer, full particulars of which will be given upon application.

When placing your order for White Orpingtons remember the ALDRICH WHITE ORPINGTONS have been the largest winners in all of America's Best Shows for many years, having won FIRST COCKEREL at MADISON SQUARE GARDEN four years in succession; also we have furnished more winners than any other White Orpington breeder to customers during the last five years, and our strain is the only Exhibition Strain that has made high records in the National Laying Contests regularly since 1913. Send for our catalogue describing "The Great Winter Laver. Therefore the Best Payer."

ALDRICH POULTRY FARM, 5080 N. High St., Columbus, Ohio

my chickens—they have white feathers on neck and wings. Will these feathers fall when they get older. Please explain how to tell sex of geese. A. S.

Harmony, Minn.

A. You do not say what variety of chickens you have. In many varieties white feathers in young stock are molted and replaced with breed color when birds are mature.

The only sure way to tell sex in geese is to turn back the vent and look for the penis. If you find it you know that you have a male bird. This is method employed by veterans in the goose business. All the other indications may fail even the most experienced.

Wants to Buy a Farm.

Q. I have a chance to buy a 25-acre farm, 24 acres tillable and rest woodland. It is 9 miles from Wilkes-Barre, Pa., which is an ideal market. It has four large poultry houses, a small house of seven rooms and other small outbuildings. Creck right thru land. Can I make a success on this farm with fruit, a few acres of truck, and raising part of feed for stock? Could I raise enough feed for my poultry, one cow and two horses? Would you advise me to hire my plowing done instead of keeping two horses? How many chickens would you advise me to start with? I like Barred Rocks and White Leghorns. Would this be a good choice? Also Pekin or Runner ducks? How many hens can be housed comfortably in a 12x20 open-front house? Wilkes-Barre, Pa. J. S.

A. Apparently you have had little or no agricultural experience. Under present conditions it is quite a stunt for an experienced farmer to get a good living for himself and family on a small farm. Whether or not you would make a success of it depends very largely upon how capable you are and on your having sufficient means to support yourself and the farm until you can make it "break even" with operating and living expenses. It will also depend quite a good deal upon the farm, tho there is much very excellent farming land in that section. If you intend to go into poultry extensively—and we should advise against it at this time—you will have to get your grains and feeds very largely of others, tho you can grow part of what is needed. The farm ought to grow feed to support the cow and horses. You will need one horse anyway. Whether or not it is cheaper to hire plowing and harrowing will depend on how much land you cultivate, what farm machinery you own, and upon local conditions. Keeping horses is costly, but so is man and horse labor. With a pair of good horses, you could probably get plenty of work outside your own farm to help you along with your venture. But if you have been doing office work, or factory work in a town, don't imagine that you can go out on a farm, do a full day's work and keep at it. The average town man may work pretty well on the farm for a day or two, but he quickly gets used up, and, as a rule, he lasts longer if he does not attempt to do more than half a day's work at the start. Taking chores and regular work combined, the average work day on the farm is from 14 to 16 hours long.

We would recommend starting with a small family flock of fowls, say 30 head, and keeping only one breed. Either of the breeds you favor is good. Pekin ducks would probably give you best returns for market purposes, tho the Runners are excellent layers. The house will accommodate from 50 to 60 fowls.

Arsenite of Antimony.

Q. Where can I get the one-thousandth of a grain tablets of arsenite of antimony recommended for rattling in throat in fowls? How should it be given? J. C. B. Cleveland, Ohio.

A. Try Boericke & Tafel, homeopathic pharmacutists, Cincinnati, O. Firm also has stores in many large cities. Give one tablet to affected bird three times daily. For flock treatment, dissolve 10 tablets in a pint of drinking water and allow no other drink.

Feeding Questions.

Q. I have 100 yearling hens and 100 pullets, all Orpingtons. Would like to know how to feed them for eggs this winter, using the feed we have. We have corn, oats and rye for scratch grain. Can get bran and beef meal. Would you grind the grains named for mash? How would you feed the scratch grain and how mix and feed the mash? Will have from two to three gallons of skim-milk a day. For green feed, will sprout oats and have some potatoes. Mrs. C. M. H. Clinton, Ill.

A. Mix your scratch grain: 60 pounds corn, 30 pounds oats and 10 pounds rye. You can feed the scratch mixture in litter either by hand or with automatic feeders. If the feeders are used you will need one 8-quart feeder for each 25 hens, so that all can use

"Golden Rod" Buff Orpingtons

are bred for heavy egg production and exhibition qualities, and their 20 years of winning at the NATIONAL SHOWS AND EGG-LAYING CONTEST proves that they are BRED RIGHT. If you have never raised poultry you owe it to yourself, and country, to do so now. them conveniently. You may need to vary your grain mixture from time to time according to appetite, giving the birds most of the grain which they show preference for. To feed 200 layers will require approximately 16 quarts of scratch grain per day. Feed a moist mash to use up the skim-milk. Grind corn and oats together, bushel for bushel, to make a provender for use in mash. Of this provender take 60 pounds and mix with 30 pounds bran and 10 pounds beef meal. Make ground feed into a crumbly mash with the skim-milk. Potatoes may be boiled and mixed with the mash. Give what they will eagerly clean up of sprouted oats daily. You will probably find it more convenient to feed the moist mash in afternoon. They will eat just about as much mash as hard grain. It is a good plan to scatter some grain in litter at time mash is fed, enough to permit fowls to go to bed with full crops and have a little grain left in litter to start them at work when they leave roosts first thing in morning. At morning watering time they should be fed scratch grain in litter to keep them busy thru the day. If automatic feeders are used, the fowls will work the feeders and scatter the grain, the labor of hand feeding is saved and it is only necessary to keep the scratch grain feeders filled, never permitting them to become empty.

Conjunctivitis.

O. We have Partridge Cochins and Brown Leghorns. Some are diseased and have large humps under the eye. The swelling is under left eye. Five birds are affected. Right side of head is all right. They are all laying and appear to be all right otherwise. What do you advise, A. M.
Glasnevin, Sask.

A. Trouble is conjunctivitis, probably due to extension of inflammation in mouth and throat. Examine mouths for canker. If canker is found, treat it by dusting on the canker patches the following powder: Finely powdered sugar of milk, 1 oz.; gum arabic powdered, 1 teaspoonful; finely powdered permanganate of potash, 1 grain. Mix. Powder will turn purple when it touches wet canker patch. Two or three treatments should be sufficient. Do not attempt treatment of the eye. In a short time you will find that light pressure of thumb or finger below the swelling will force out a yellow, cheesy mass from eye and the face will return to normal.

High Mortality in Chicks.

O. Can you tell me what causes the death of my baby chicks? I use a good incubator. I have strong, vigorous breeders, which are free range stock. They are fed well with grain and a good dry mash recommended by Iowa State Agricultural College. Hens and cock were never sick. Breeders are high-class S. C. White Leghorns. Eggs were well cared for and gathered twice a day, and turned daily while holding, averaging from about 6 to 8 days old before setting. Incubators maintained good even temperature. Eggs turned and cooled twice a day. Four different incubators full have only hatched from 40 to 75 percent, and of first hatch about one-half died; second, all died; third, all but one died, and fourth, are dying. All died the same way.

Weather conditions fine for first and fourth, but very damp for second and third. Seemed strong at first and for first few days eat well. From the third day until they are dead they begin to droop, down becomes roughed up. No signs of bowel trouble at first, only after they begin to droop. They keep getting weaker until they just settle to the ground and make no struggle at all—just seem to sleep and pass away in several hours' time. These chickens were fed buttermilk at first, with fine sand and a commercial milk mash, also a very fine grain feed made from Indian corn, kafir corn and a little charcoal and millet.

Will chickens eat gravel too large for them to handle? I ask this because after dissecting a few I noticed that intestines in places seemed enlarged by some of the small gravel and sand which I had fed them. Liver seemed O. K. Plenty of grit in gizzard. Feed seemed to be well digested as it was passing thru the intestines. None at all in crop or gizzard owing to fact that they had not eaten for a day or two. These chickens show no sign of disease, only weakness and death. Others thruout this section report low percentages in hatches and high mortality. My own eggs sold to others gave a normal hatch, while eggs bought of others made an undesirable record for me and hatched reasonably well for others. Ottumwa, Iowa. C. J. M.

A. Would advise you to consult with the poultry husbandman at the State Agricultural College. We do not believe that your chicks were affected with so-called white diarrhoea, for if such had been the case others who had eggs of yours would have reported trouble. We do not like your method of feeding baby chicks. The trouble looks very much like acute indi-

Tycos INCUBATOR THERMOMETERS
90c mean extra chicks hatched—every time. Demand a Tycos with the incubator you buy. Equip your present machines with Tycos at your dealers or Tested and guaranteed. Booklet, "In postpaid from us incubator Thermometer Facts"—free.
Taylor Instrument Companies 100 Ames St. Rochester, N.Y.

gestion. Of course, faulty incubation may account for your poor hatches, but it does not fully account for the wholesale losses of baby chicks. We do not approve of your first feed, nor of feeding sand and gravel in a soft feed where chicks are forced to eat it. The chicks will eat sand and gravel enough without being forced. It is well known that your state had much soft corn last season and it is possible that spoiled corn is partly the cause of your trouble. Only sound, well-cured corn should be used in making chick feeds, and preferably it should be old corn.

We suggest that before you start another hatch you read over your incubator instructions carefully and make sure that you are operating strictly according to manufacturer's directions. When your next batch of chicks is hatched, do not feed them for 60 to 72 hours after hatching. For first feed give them dry cracker crumbs rubbed up with hard boiled egg and a little rolled oats. For first week stick to this egg and cracker feed combined with feedings of good, sweet, sound chick feed. Get a copy of "How to Raise Chicks" and read it carefully. This book, cloth bound, may be had of our book department at 75 cents a copy, postpaid. The size of things a chicken may swallow is limited only by the ability of the chick to stretch its mouth and throat over the object and force it down.

Cock or Cockerel—Which?

Q. I have some young pullets and cockerels. I am going to keep ten pullets this winter. I want to know whether it would be better to keep one of the cockerels to breed from or to keep the cock bird I bred them from. The cock was not related to the hens. He is strong and vigorous. I do not care about the prize bird part of it, but I want to keep the mating that will bring strongest chicks. I am going to sell the hens and want to know if it would be best or not to breed the father to his pullets. F. J.

Kanawha, Iowa.
A. Keep the cock bird and mate him to his pullets.

Moldy Sprouted Oats.

Q. Kindly advise what chemicals may be used to keep sprouted oats from getting moldy. The sprouting trays are always kept

in the cellar and I have had no trouble from this source until up to a month ago. H. K. Ilchester, Md.

A. If oats are fed when sprouts are about 1 inch to 1½ inches long, there will be very little molding. Wash trays frequently in strong soapsuds and dry in sun. Also wash and rinse oats before sprouting. Submerging the oats in a weak solution of formaldehyde for ten minutes is a preventive. Use four fluid ounces of formaldehyde to 9 gallons of water. This quantity is sufficient to treat 10 bushels of oats. Solution should also be used for cleansing trays when empty.

Cut-Clover.

Q. Where can I get cut-clover for poultry feeding? Do you consider it essential for a back-lot flock? I intend to breed my fowls in spring. E. F. Cleveland, Ohio.

A. Your feed dealer or poultry supply house should be able to furnish you with cut-clover. You will find cut-clover advertised in A. P. J. We consider it an essential for both layers and breeders; believe that it is a help to better fertility, better hatchability and better chicks.

Forcing Molt.

Q. I have a flock of Black Minorcas. They are a little over a year old now and have proved great layers. They are very slow in beginning to molt and I believe that they will not be thru when cold weather sets in. How could I hasten them along a little? Detroit, Mich. P. E. J.

A. Would not attempt forcing the molt. Your letter was written the latter part of August and we think you are just a little too much in a hurry. It is not a good plan to force molt of birds intended for breeding. Feed your Minorcas well, give them plenty of cabbage and other greens, as well as the scratch grain and dry mash. They will probably molt all right in good season.

Difficulty in Determining Sex.

Q. I am a beginner and have 200 White Wyandottes, at this date 4 months old. I have no way of telling the cockerels from the pullets. None of the birds crow. How can I determine the sexes? S. R. Bergenfield, N. J.

A. By the time this is published you have probably learned to distinguish between the sexes. The headgear of the cockerels is redder and coarser. Also, if you examine the saddles you will find pointed saddle feathers developing on the cockerels.

Dark Combs and Diarrhoea.

Q. I have 200 Leghorns which layed very well all last winter. This summer they all have diarrhoea, no appetite and quite a number have dark purple combs. I have been giving them sunflowers every day, leaves and the whole business. Would this cause bowel trouble? I feed scratch grain in morning. Dry mash before them all the time. About 10 a. m. give for green feed sunflowers, leaves and all. At noon I give oats in litter. Between 5 and 6 o'clock I gave them steamed alfalfa mixed with laying mash and beef scraps. They relished this very much. Do you think I fed them too heavily. Some of the birds are better since I gave them Epsom salts, but most of them are sick. E. R. Wellsville, N. Y.

A. You have been overfeeding on concentrated mash and overdoing the feeding of sunflowers. We would not feed sunflowers that way. Better cure the seed and then use only a small amount of it in the scratch grain. The combination of rich, unripened sunflower seed and heavy feeding on moist mash, with dry mash always before them, is altogether too much of a good thing. The birds are probably overfat internally and have enlarged livers. It is doubtful if they are fit for anything, altho those not really sick may be marketable.

Biddy's Friend Hatcher and Brooder Coop

Don't run the risk of losing valuable hatches either thru rats or other reasons by using improper coops. Different from any other coop. First used for hatching and then as a brood coop.

THE USE OF LEG BANDS.

By P. T. W.

OLD-TIMER, this is not for you, but for the beginner, so pass on, please. There are many beginners in poultry culture this season, which is a good thing for the industry, and a surprisingly large number of them have written to us to know what leg bands are used for. Most of us are too apt to forget that things which seem as plain as A-B-C are Greek to the beginner.

Leg bands are made of celluloid and of metal, the latter chiefly of aluminum or of brass wire with aluminum tags. Celluloid bands are made in nine colors, and celluloid, in colors and numbered, is used in making special combination metal and celluloid bands. The colors, numbers and letters are for convenience in keeping identification records. The bands are made in suitable sizes for all breeds and for fowls and chickens of all ages, as well as pigeons. Some special bands are made with lead seals and are sealed with pliers, sometimes a special tool carrying the poultryman's own special seal or letter.

The bands are usually put on the bird's leg like an anklet, but in some special pedigree work a small metal band is attached to the web of the wing of the growing chick and remains in that position, covered by feathers, thruout the life of the fowl.

Of course, the primary use of the leg band is for purposes of identification of the specimen and for convenience in keeping a record of it by number. The plain spiral celluloid rings in colors are particularly useful for instant identification of birds when in runs or on range. They are commonly used to denote the year in which the bird was hatched. For example: blue might denote a 1915 chick; red, one hatched in 1916; white for 1917 and green for 1918 hatches. They are also often used to identify special matings and to avoid mixing such by accident or thru carelessness of the attendant. Thus all the birds in one mating might be marked with yellow bands, in another with black bands, and so on thru the nine colors which may be furnished. Bands may be had in metal with different colored celluloid and consecutive numbers as high as the breeder cares to go and with special letters if required. This provides for a wide range of identification marks in pedigree work where accurate records of the birds must be kept. Thru the use of colored and numbered bands individuals and families can be instantly identified if records of the numbers and colors are accurately kept. Plain metal bands are supplied with numbers as high as one needs to go.

Bands are necessary for identification of exhibition specimens sent to shows for competition and for this purpose sealed bands are much in favor, as they are not easily removed or changed as are spiral or spring bands or those simply clinched on.

Numbered leg bands are necessary where fowls are trapedsted for purpose of securing egg record or for pedigree breeding purposes. We believe that Prof. Philips, Purdue University, has worked out a good system of banding for special pedigree work and issued a bulletin on the subject. Those interested should write to Prof. A. G. Phil-

AMERICAN POULTRY JOURNAL
523 Plymouth Court, Chicago

ips, poultry husbandry department, Purdue University, LaFayette, Indiana.

In keeping an egg record by means of leg bands and trapnets, a special record sheet is kept in a convenient place in the poultry pen. When the fowl is taken from the nest, her leg band number is marked on the egg with pencil, and on the record sheet under date of laying the egg is recorded to the credit of the number of the hen. This provides for a record of the hen and identification of her egg for pedigree hatching.

There are many variations which may be made of flock and individual bird identification and record keeping thru the use of leg bands and thru combined use of bands and punch marks in web of bird's foot, or combined use of the wing band and leg band. As the beginner becomes familiar with their use he will adopt the system most suited to his needs or perhaps develop a system of his own.

A wide variety of leg bands for ordinary and special purposes is to be found advertised in the columns of A. P. J. and most manufacturers are prepared to furnish advertising literature treating of the use of leg bands on request. Write them.

HOW TO FEED TO GET MORE EGGS.

Highest Egg Prices in History Present Great Opportunity to Poultry Raisers.

Egg prices are going up every day. Indications point to the highest winter prices in history. Feed is high, but poultry raisers who know how and what to feed will get more eggs and better prices than ever. More money can be made from poultry than ever if you cut out the drones and use the most efficient methods.

Our readers should send at once for a free copy of the new 16-page bulletin by Prof. T. E. Quisenberry, president of the American Poultry School, Box 206, Leavenworth, Kan. It tells "How and What to Feed for Heavy Egg Production and to Cut the Cost of Feed." He gives special free information on how to increase the production of high-priced winter eggs. Hundreds of hens fed and cared for under Prof. Quisenberry's direction have laid 200 to 298 eggs during a single year, while the U. S. Government reports show that the average hen produces only 60 to 80 eggs a year.—Adv.

Wonderful Egg Producer.

Any poultry raiser can easily double his profits by doubling the egg production of his hens. A scientific tonic has been discovered that revitalizes the flock and makes hens work all the time. The tonic is called "More Eggs." Give your hens a few cents' worth of "More Eggs," and you will be amazed and delighted with results. A dollar's worth of "More Eggs" will double this year's production of eggs, so if you wish to try this great profit maker, write E. J. Reefer, poultry expert, 3897 Reefer Bldg., Kansas City, Mo., who will send you a season's supply of "More Eggs" Tonic for \$1 (prepaid). So confident is Mr. Reefer of the results that a million dollar bank guarantees if you are not absolutely satisfied, your dollar will be returned on request and the "More Eggs" costs you nothing. Send a dollar today or ask Mr. Reefer for his free poultry book that tells the experience of a man who has made a fortune out of poultry.—Adv.

INDIANA STATE FAIR.

By THEO. HEWES.

More and Better Birds Than Have Been Exhibited Here in Eight Years — Sales Good in All Departments and a Large Attendance Day and Night.

OH YE of little faith, who imagined that the fancy poultry business of this country was dead and buried, should have attended the Indiana State Fair and witnessed the resurrection. The entries were larger than at any time within the past eight years, the quality the best we have ever had and the buying public was here with money to pay good prices for good birds. It is a well known fact that when the Indiana fanciers decide to put over something, they usually put it over, and when they unite to make a thing a success, it has never yet been a failure. This year when we saw other states falling down on the number of entries and a seeming lack of interest on thorobred poultry, we decided to give to the world an object lesson of what can be done when a united effort is put forward to do it.

The result was, between twenty-one and twenty-two hundred entries in the poultry department alone, with a throng of prospective buyers crowding the aisles from early morning until late at night.

You boys from other states that have had cold feet and who have believed that the fancy poultry business had gone to pot had better awaken and shake the dust out of your eyes and get started again; if you do not, the Hoosier fanciers will get the business away from you.

Every important breed and variety was well represented, and while some of the old time favorites of Indiana showed a lack of proper conditioning, there were enough good ones to make the show representative to the public and they had an opportunity to see a high class exhibit, and being encouraged by the entries of the breeders, to go into the business in the right way.

The pet stock fanciers, not to be outdone by the poultry fanciers, made a nice display of rabbits and cavies, and this will be one of the big features of this fair in the future, with proper classification of all animals and first-class judges awarding prizes.

Barred Plymouth Rocks were represented with fifty single entries and six pens; this class was not as strong as we usually find in Indiana, but at that decidedly better than most of fairs held this fall, and it is a well known

fact that this state can and does produce some of the best Plymouth Rocks in the country.

The White Plymouth Rocks were a show by themselves, with U. R. Fishel, with forty-eight birds, winning every money prize, except third hen.

Buff Plymouth Rocks were larger in number of entries than last year, and the winnings in young birds especially strong.

The Columbian Rocks had only a small class; this variety does not seem to catch on well in the Hoosier state.

The Silver Wyandottes were one of the best exhibitions we have ever had at the state fair, and the quality equal to many of our winter shows.

The Golden Wyandottes have never been very popular in Indiana for some cause or other; there were thirty-four single entries and two pens; the quality the best we have had for a long time, and it looks like new life for this one-time popular variety. Let us hope so at least.

The White Wyandottes had a big entry and the winners were of exceptional merit; first hen and first pullet we believe equal to anything that has ever been shown at the state fair.

The Buff Wyandottes had only a small class. The Single Comb Reds had a very creditable showing in number—not, however, up to former years—but quality equal to that of other

IMPERIAL "RINGLET"

BARRED PLYMOUTH ROCK COCKS, WINNERS OF EVERY PREMIUM OFFERED— FIRST, SECOND, THIRD, FOURTH AND FIFTH PRIZES— AT MADISON SQUARE GARDEN NEW YORK JAN. 1918. BRED OWNED AND EXHIBITED BY E. B. THOMPSON AMENIA N. Y.

E. B. Thompson
1918

classes and many of the young birds will undoubtedly be heard from later on in the big shows.

In the Rose Comb class, Wm. Overman showed an old pen that has never been surpassed in quality at this fair, either in shape or color, and a pen that will be heard from later, as they are just going thru the molt and show that exceptionally dark, even surface admired by old fanciers but seldom met with as early as September.

Light Brahmas, the old-time favorites, had twenty-five single entries and seven pens. Frank P. Johnson winning every prize, except first hen. This prize went to Chas. McClave, who had one of the best hens shown in the state; this hen was one of the old-time, real light Brahmas, the kind that made the breed famous when I. K. Felch and other old-timers were pushing them to the limit; a good, long back, with the bird standing well up on her legs, with almost perfect markings in neck, wings and tail.

The Dark Brahmas, Buff, Partridge and White Cochins, while shown in good number, were not in the same high quality we would like to see. The birds in most cases were cocks and hens and were shown in bad molt, and the young birds not well enough matured.

The Black and White Langshans had a good class and some exceptionally fine quality.

The Single Comb Brown Leghorns were a show by themselves. There were 54 entries in singles and ten pens. They led all classes in number of entries and let it be said to the credit of the Brown Leghorn breeders, the quality was in keeping with the number. The State Fair Association recognized the light and dark matings, making a class for them and paying cash prizes on all of them, with the result that we had a real winter show in quality, and I do not believe that any breeder at any time or place, winter or summer, has ever put on an exhibition of Single Comb Brown Leghorns that from cocks to pens equaled the one put on by Herman Rikhoff at this state fair. It was the unanimous opinion of judges and breeders alike, that this one exhibition was the best that was ever shown either at the state fair or a winter show and it proves what a fancier can do who is fortunate enough to have a wife that is interested with him in the business. We think it is only fair at this time to call attention to some of the breeders in this state that have made a national reputation for themselves to give a little of this credit where it belongs, to the wives of these fanciers. Take Mrs. Rikhoff, Mrs. U. R. Fishel and Mrs. Chas. V. Keeler as an illustration; had it not been for the co-operation of these three ladies, we question very much if these three breeders, whose names are known wherever fancy poultry is bred, could have made the reputation they have made and I hope this little special mention may encourage other fanciers' wives to assist in the right way to make their husbands' business successful by assisting in taking care of the chicks, for it is a noted fact that the first eight weeks of a chick's life tells the tale of its success or failure in the show room.

The Rose and Single Comb White Leghorns were out in force, with some of the best quality in males and females shown here in years.

Buff Leghorns had a good class, but the birds hardly up to size, many of the young birds carrying their chick plumage.

The Single Comb Minorca a big entry, with John L. Brown, Anderson, Ind., and H. A. King, Ossian, Ind., scrapping it out for honors. Mr. Brown handicapped his exhibit some by holding many of his good birds back for the New York State Fair, but even at that won the best display.

The White Faced Black Spanish was the surprise of the show, there being thirty single entries in this old-time variety. A few months ago I called attention to this old-time breed in a short article in the American Poultry Journal and it seems this article has done

When George Newell discovered that he could Increase Egg Production

100%

by the use of artificial light in his poultry houses in the early mornings and evenings of the short, dark days of winter, he opened the way for far greater profits in the poultry business. The only drawback to Mr. Newell's system has been that most poultrymen were not located where they could install electric lights. This

deficiency has now been remedied by the

Acorn Uni-Lite

The Light That Shames Electricity

A Portable Three-Hundred-Candle-Power Light

which burns 15 hours at one filling—costing only a quarter of a cent per hour for light that in brilliance, whiteness and steadiness puts any electric incandescent light in the shade. It burns common gasoline or kerosene. Is storm-proof, bug, rain, sleet and snow-proof. You can upset it and roll it around without the slightest danger. No odor, no smoke, no wicks to trim.

During the short days of winter it keeps your hens busy to eat enough to ast them through the long, cold night—they have nothing left for eggs. Keep one of these lanterns burning in your poultry house early in the morning, and for a while in the evening, and see your egg production jump. Write for special proposition to poultry raisers. HOPE, INDIANA

Just What You Will Need This Winter

This is the FAULTLESS Automatic Feeder

All you have to do is to fill the can of this feeder with wheat, corn, oats or any other kind of feed, either mixed or separate. When the chickens are hungry they pick at the cross bar; this causes some feed to drop to the ground where the chickens can pick it up. No feed spoils or is eaten by rats or sparrows. **You can save enough feed in one month to pay for these feeders.** Besides the saving of fuel, you save work.

Here Are Our Low Prices

This feeder holds $\frac{1}{2}$ bushel of feed. It is made of heavy rust-proof material. It weighs six pounds packed for shipping. Order by No. 153.

And What is More, we will send you two 8-quart feeders, same style as above, both for \$2.50. These two feeders weigh nine pounds and will not be sold singly. Order by No. 152.

Here is the Feeder for Your Low Coop

Or for Your Baby Chicks

It holds five quarts, will feed any kind of feed, either mixed or separate. It is built on the principle of the large FAULTLESS Feeder and is furnished complete with brackets, which can be attached to the wall or side of a coop at proper height. This feeder is beautifully painted and with ordinary care it will last forever. It is guaranteed to feed your stock perfectly from the time the chicks are able to eat until ready for the ax. We sell this feeder for \$1.00. It weighs $3\frac{1}{2}$ pounds when packed. Get one today and feed your chickens right. Order by No. 151.

We carry a full line of poultry appliances and remedies. We also manufacture the well known Simplex Genuine Feather Brooders and Hovers—both heated and fireless. Send for our CATALOG; it will interest you.

SIMPLEX SUPPLY HOUSE, Peterson Bldg., CHICAGO, ILLINOIS

much to revive an interest in them. I met several fanciers at the Indiana State Fair who complimented the article and said that if we can be assured that a journal like the American will give some consideration to this old-time breed, we will push them as they should be pushed; but for years they have been neglected and practically no attention paid to them, with no representation at the shows, until we found that there was practically no demand for the good ones. I studied the exhibition closely this year; being in competition myself with a few birds and I can say truthfully that the birds here displayed were equal to any we have ever had at any show for the past ten years; good, big birds, with good combs, and several of the males and females with exceptionally good faces.

The Andalusians and Anconas had only a small class, but some of the birds were real good. Like the Spanish, the Andalusians need a little boosting once in a while. The Anconas were a disappointment, as we usually have a strong class at the State Fair and certainly no one variety of the Mediterranean is better advertised than this popular breed, both in Rose and Single Comb.

Buff Orpingtons—There were 36 singles and ten pens in this class. Taking the entire exhibit, I do not believe it was shown in as good condition as former years. The old birds were not finished, except a few hens in the open class, while the cockbirds were in many cases almost ragged. The winning cockerels and pullets, also first young pen, were quite well along and one could get a good idea as to what they will do at the early shows. The three winning hens in the open class were good; they were almost thru molt, good in shape, and while a little stronger in color than some, looked like they were real top-notch hens.

White Orpingtons were a good class and some exceptional quality. Wm. N. Otto, Indianapolis, and Frank Jacobs, Anderson, Ind., both showed a good string. Mr. Otto's first hen, we believe, was as good as ever was shown at the state fair. The Black Orpington class had a little larger entry than the White Orpingtons, and the first cockerel in this class was undoubtedly the best young bird shown. This bird was equal to any that has ever been shown at the state fair and decidedly better than many that are shown at the winter shows.

The Dark Cornish a small class, but some good birds.

The Speckled Sussex a good class and some corking good ones among them, the Moraine Farms, Dayton, Ohio, being out with one of their best show strings and we believe winning every money prize.

The White Crested Black and White Polish had about the same entry as former years, with exceptionally good birds among them.

The Hamburgs, Houdans and Campines about the same entry as former years.

BANTAMS.

For several years the Bantam breeders have complained about their exhibitions not being properly displayed, they being compelled to exhibit in large cages in a dark part of the building where the birds do not show to good advantage. This year the Bantams were displayed in tents outside the building, in Bantam cages, with perfect light and ventilation. This exhibit was really one of the big attractions of the poultry show and was crowded from morning until night. The quality was good and almost every variety of Bantam was shown in sufficient numbers to make competition keen and the fanciers were scrapping for every premium, from first to third.

Turkey and water fowl were a disappointment, due to the fact that the premium money offered on these heavy birds does not warrant the breeders in bringing out a strong show. A resolution was offered by our state association recommending an increase in premiums on turkeys and geese and assurance was given by the management that it will increase the premiums for 1919. So for future exhibits we may look for a big entry, as many of the best turkeys and geese in the country are bred in Indiana.

NEW MANAGEMENT.

It would not be fair to close this article without a few words in regard to the new management in charge of the poultry exhibit. Mr. Pickhard, the member in charge, selected Wm. Overman and W. W. Zike as his assistants and these gentlemen introduced some new and beneficial features, the best we have had in the poultry building in the past ten years. In fact, this show was run like a poultry show should be run. Everybody "Johnny on the spot," every coop numbered and every class assigned before the birds arrived, with no hitch or delay in cooping, and it was the unanimous opinion of the exhibitors that it was the best managed poultry show we ever had at the state fair. A petition has been presented to the state board requesting that these gentlemen remain in this depart-

Choice Cockerels of the Foremost Winning Strains

BUFF ORPINGTON Cockerels from first cock, 1916 Coliseum show.
S. C. W. LEGHORN Cockerels, Smith's strain, none better in the world.
R. C. ANCONA Cockerels, from first cockerels both Chicago shows, 1917-1918.

These are well-developed birds, carrying the qualities that have made their progenitors winners at America's strongest shows. If you want the best, here it is. Send today for literature and describe your needs.

H. T. WINDSOR, RIDGELAWN, BATAVIA, ILL.

Leggett's Columbian Wyandottes

SPECIAL—We are now offering a few fine breeders from all of our matings at one-half their worth. If you want the greatest values, write now. Cockerels and pullets mostly all spoken for. Free circular. **H. A. D. LEGGETT & CO., 24 N. Nash Pl. BURLINGTON, VT.**

ment, with the promise from the breeders that they will make this one of America's greatest fall poultry shows if they will do this.

The Southern Seed Co., realizing the importance of this exhibition to the poultrymen of this state, issued a catalog with names and addresses of the exhibitors, with the coop numbers assigned to each exhibitor, and this catalog was given away free. This was a new feature and the Southern Seed Co. is entitled to the thanks of the poultrymen for this courtesy, as thousands of these catalogs were distributed and it makes a winning of decidedly greater value to every one. The judging was all completed on Tuesday and all premiums paid on Friday.

THE QUAKER OATS CO. PUTS OUT A LITTLE SHOW OF ITS OWN.

The Quaker Oats Co., one of the most progressive of the feed manufacturers of today, rented space near the Coliseum, erected its own tent, brought on a nice exhibit of hogs and poultry and demonstrated just what its feed will do in bringing early maturity and good growth to these valuable products. Its food was on display, with real representative men to explain the methods of feeding, and with the hogs and poultry on exhibit to prove all that company has done. An immense business was done and we may look to every other feed manufacturer to follow this system.

U. R. Fishel made one of his famous exhibits. When Fishelton comes out you can bank on it there is going to be something worth while to see in White Rocks. The boys all crowded over in the White Rock alley when U. R. and Edward began to uncoop, and believe me there was something to look at. Forty-eight birds entered, white as a snow bank and every one of them right up on their toes in the pink condition. It takes work, and a lot of it, to fit a show string of white birds in early September, but it pays to do it right, as proved by the awards. Mr. Fishel won every ribbon in the class, except third hen.

We regret to learn that J. C. Fishel is seriously ill. He has been under the weather for several months and the attending physician does not seem to be able to get him around. His exhibit of White Wyandottes was missed by the public and there were many calls for him during the week.

Walter Young, of Dayton, let us take a look at his string of Speckled Sussex. Mr. Young has made Moraine Farms famous with this popular variety. His birds were shown in elegant shape, and it is needless to say made a killing. Mr. Young judged a number of the classes and gave the best of satisfaction.

When I learned that the Illinois State Fair had fallen down on its entries this year, I put out an S. O. S. signal to about thirty of our breeders, with the result of 2,180 real birds for the old Hoosier state.

If you think the business is dead, that it is time to call off big shows and state fairs, please come over to God's country and soak up a little enthusiasm. This was the most successful state fair ever held in Indiana. There was nearly \$30,000 more money on the gate than any previous year; there were more entries in live stock than ever before; there was more real enthusiasm than I ever saw displayed at this great state fair. The slogan was, "We've got the best of our boys at the front in France, and we want them to know we are keeping the house in order for them to return to when they make this world a safe place for real people to live in." Take a little of this home to yourself, every reader of the A. P. J. This is no time to retrench or count postage stamps. Put some bread on the water and it will come back with the greatest dividends in the history of the business. This war may last a year; it may last ten; but Indiana will be right up there fighting to the last.

For forty-five years the American Poultry Association has unceasingly labored in behalf of better poultry—Standardbred poultry, if you will, the kind that for forty-five years has stood for the most profitable kind. During these forty-five years of history in the American Poultry Association there have been brought into existence all the various breeds and varieties of land and water fowl, all of which have proved of value to the resources of America. At the forty-third annual meeting of the American Poultry Association it was deemed advisable, and voted unanimously, that the fanciers of America contribute to a "War Emergency Fund" such a sum as they could patriotically devote to the cause of more and better poultry and to the publicity campaign now being started. At the meeting \$1,500 was pledged in fifteen minutes, so that the American Poultry Association feels confident of prompt support in this nation-wide campaign. Every fancier or lover of Standardbred fowl is earnestly asked to make a contribution to the War Emergency Fund by sending his offering to E. B. Campbell, secretary, American Poultry Association, Mansfield, Ohio.

Over 100,000 of these popular **POCKETBOOKS** now in use. Are You a Member of the **100,000 Club?** You can't afford to stay out!

The 1919 Model of our well-known "American Bankroll"—a combination **Billfold, Coin-purse, Checkbook holder, Card and Photo-case**, 3x4 3/4 in. folded, of **Fine Black Seal Grain Genuine Leather**, postpaid, only **69c** (\$7.45 Per Doz.)

Iron strong, yet wonderfully limp and flexible. We engrave any name in 23-K Gold free (name of city 20c, street number 20c, Fraternal Emblems 25c extra). You'll find place for coins, currency, cards, photos or passes, etc. Also the Memo-Diary, an interesting book of 48 pages, brimful of necessary information, such as **First Aid, Presidents of the U. S., Health Information, Dates and Payments due, Addresses and Telephone Numbers, etc.**

The **American Bankroll** is also sold in a very strong **Black Morocco Grain Genuine Leather** for **\$1.00** (or \$10.80 Per Doz.)

This is your **Sunday Pocketbook**. Send postage stamps or money order. If you don't think you have gotten more than your money's worth, we will refund immediately. THE COLISEUM

CHICAGO

The World's Greatest Poultry and Pet Stock Show

Will Hold Its

TENTH ANNUAL EXHIBITION

December 3, 4, 5, 6, 7 and 8, 1918

The Show Opens on Tuesday and Closes on Sunday Night

Regardless of increased rental almost doubling that of former years; regardless of increase in every item of show expense; regardless of war and the thousands of inconveniences occasioned by the war,

THE GREAT COLISEUM SHOW

will be held as advertised. This, we feel, is our solemn duty to the loyal fanciers of this country, and we will not shirk this responsibility.

THE COLISEUM

is the one show west of New York that for nine consecutive years has met every obligation in full and in cash without the sale of one dollar of its capital stock. The same liberal guarantee is offered you for 1918.

THE COLISEUM SHOW

has introduced more new features that have worked to the betterment of the fanciers than all other shows in America combined, and this year we will introduce two additional features that will revolutionize the poultry shows of this country.

A WINNING AT THE COLISEUM

on any breed or variety in 1918 will carry with it a greater advertising value than any win you can make this season. The dates are ideal, coming ahead of extreme cold weather and ahead of all other National shows, on the same dates as the great International Stock Show. We put you in touch with the greatest buying public that will congregate anywhere this winter. Our reputation as a sales show is established. Not one year but every year the calls surpass the supply for high class birds, and, so far as we are able to learn, it is the only show where a legitimate sale of \$5,000 was ever made by a single exhibitor.

THE COLISEUM SHOW

is the only National show that absolutely guarantees its concessionaires. It is our proud boast that we have never sold space to a faker.

Yes, the Coliseum Show Will Pay Cash Prizes

In fact, there is more real cash offered this year than ever before. This is no time to retrench or count postage stamps. This is the time for big things and we represent a big industry. The legitimate breeder needs all the encouragement the shows can give him and we are giving it freely. In addition to our liberal cash prizes, there will be a \$50 trophy for the best ten Plymouth Rocks, a \$50 trophy for the best ten Reds, a \$50 trophy for the best ten Leghorns, a \$50 trophy for the best ten Orpingtons and a \$50 trophy for the best ten Wyandottes.

THE PREMIUM LIST IS NOW READY

All exhibitors at the 1917 show will receive the list without request; others should write the secretary for a copy at once, as the list will not be mailed indiscriminately. Old exhibitors not receiving the list by October 10 will write for it, as there is much uncertainty about mail delivery. Entries positively close November 15. For list of judges, see notice published in this issue.

Address of secretary until October 15, Indianapolis, Ind. After October 15, Lexington Hotel, Chicago. The Lexington Hotel has been selected as headquarters.

Chicago and suburban residents desiring space in the Coliseum may get information from James W. Bell, care of American Poultry Journal, 523 Plymouth Court; but for premium list address

THEO. HEWES, Sec'y.

HAPPENINGS of INTEREST

in the POULTRY WORLD

D. W. Young Sells Out.

D. W. Young, the man who made S. C. White Leghorns so popular in this country, has sold his entire flock of Leghorns and poultry equipment to Oakdale Farms, of Austin, Minn. This sale, of course, includes all his celebrated Madison Square Garden winners,

D. W. YOUNG.

and Oakdale Farms are certainly to be congratulated upon securing this great string of birds. It has been an acknowledged fact for years that Mr. Young was the foremost S. C. White Leghorn breeder in this country, and by securing this entire flock the Oakdale Farms become leading factors in both the showing and breeding of S. C. White Leghorns in the middle west, if not in the entire country.

Another Big Sale of Leghorns.

Eugene Smith, Aurora, Ill., has disposed of his entire flock of S. C. White Leghorns, good will, etc., to C. R. Hopkins, of Osage, Iowa. This, of course, includes all Mr. Smith's prize winners. During the past few years Mr. Smith has made a most excellent record with his S. C. White Leghorns at the leading shows in the middle west and succeeded in building up a very high-class flock of this popular variety. It is our understanding that Mr. Hopkins intends to follow in the footsteps of Mr. Smith and he will, no doubt, exhibit at the leading shows this season. American Poultry Journal wishes him every success.

Associations and Shows

Secretaries are Requested to Send in News Items of Interest About Their Shows for This Department

Valuable Trophies to Be Given at Coliseum Show.

Herewith is shown an illustration of what is probably the most valuable trophy ever offered at a poultry show.

This service set consists of a silver water, size 12x18 inches, genuine Sheffield silver water pitcher and six triple plated gold-lined goblets.

Awards will be made in the following manner: All varieties of the breeds listed above will be considered and a trophy awarded to the breeder having the best ten entries in that breed. Parti and solid-color compete in all breeds listed that have the two colors in their several varieties. The judges in making their awards will be governed by Standard equality, and will give due consideration to all sections in parti-colored birds

Five of these trophies are offered at the Chicago Coliseum Show this year. One for each breed will be given for best ten birds in each of the following breeds: Plymouth Rocks, Rhode Island Reds, Leghorns, Orpingtons and Wyandottes. They are being offered by the following well known feed manufacturers of Chicago: The Quaker Oats Co., Hales & Edwards Co., Albert Dickinson Co., Park & Pollard Co. and J. J. Badenoch Co.

The placing of these cups has been left to the secretary of the show, and the breeds selected are the ones that have had the largest entry for the past five years.

that are hardest to bring to perfection. No special entry is required to win these trophies and they will be awarded at the show. The only provision is that exhibitor must have ten or more entries in order to become eligible in competition.

We do not believe there was ever a special offered that carried with it the advertising value of these trophies.

If you did not exhibit at the Coliseum Show last year, or if you have changed your address since that time, do not fail to send your name to the secretary. For further information write Theo. Hewes, secretary, 25 West Washington St., Indianapolis, Ind.

Keep Your Eye on Kansas City.

The second annual exhibition of the Heart of America Poultry Show will be held in Kansas City, November 25 to December 1, 1918, and promises to eclipse its wonderful success of last year, a record that we feel we can point to with much pride and satisfaction. Our show was pronounced by leading poultry authorities one of the finest and best conducted poultry shows they had ever

attended. The Heart of America Show will again offer its usual cash premiums in addition to many valuable specials. Our show has been favored by two national meets this year, with others still voting, and we hope Kansas City will be their choice. Our premium lists will be ready to send out about October 1 and will be sent to all of our last year's exhibitors without request; all others should write Charles Grunske, secretary, 1514-Elmwood avenue, Kansas City, Mo., so

tion, "Avicola Mexicana," is growing and it is confidently believed that it will become one of our largest and most enterprising affiliated associations.

Secretary E. B. Campbell is to be congratulated upon her success in introducing the American Poultry Association into Mexico and we trust that the fanciers of the United States will co-operate with the Asociación Avicola Mexicana in promoting the friendliest relations and that all will aid in improving the varieties of poultry in Mexico and also in promoting a number of local poultry shows as well as one big international show. The gentlemen interested in the organization of the Mexican association are all men of affairs and are willingly doing their part to promote more and better poultry in Mexico.

The officers of the first national poultry organization in Mexico are: Rudolfo Guerrero, secretary executive board; J. Martinez Reding, elective member executive board; Francisco A. Cano, vice-president executive board; Juan Pablo Cazaree, president executive board; Luis Antonio Franco, election commissioner; Gullermo C. Prieto, vice-president; Orlando Avenue, president; Lesneis Perez Zuniga, secretary; Ing. Servero Esperza, treasurer.

For further information address the secretary, Lesneis Perez Zuniga, Ahuacatitla, 1 Atzacapetzalco, D. F., Mexico.

Pennsylvania Poultrymen Show Great Enthusiasm.

It is a great thing to get poultrymen together to discuss their problems and bring about the needed "class feeling." Poultry shows and field meetings are the source of tremendous inspiration, create and maintain enthusiasm. And they afford most favorable opportunities for the making of pleasant acquaintances and the development of the get-together spirit, the basis of the necessary co-operation upon which a bigger and better poultry industry is being erected.

One of the most successful field meetings of the year was held August 8 by the Delaware County Poultry Association, one of Pennsylvania's live organizations of poultry growers. This was an all-day meeting, and in spite of the intense heat some seven hundred people attended one or the other of the two sessions. Enthusiasm and interest ran as high as the thermometer, and the latter tried to make a new record.

The program was an exceptionally strong one, carrying the names of speakers who are national figures in the industry.

It would be difficult to select a place better suited for a meeting of this kind than the Pratt Food Company Experiment Farms, near Morton, Pa. This large establishment is finely equipped with buildings of varied kinds and all the up-to-date furnishings one would expect to find on a modern poultry plant. The hundreds of interested visitors were given full access to all buildings during the day and so learned much of value which they can apply to their own work.

Superintendent Thomas G. Samuels was everywhere, exhibiting his cherished birds and answering innumerable questions.

The program was carried thru without a hitch. Careful provision had been made for the comfort of all visitors, thanks to the efforts of President J. S. Keller of the Pratt Food Company, and of Mrs. and Miss Keller, who were tendered a vote of thanks by the association.

Let us have more meetings of this character. They are a boon to the industry as a whole and to the individual poultryman.

Nebraska State Show.

The Nebraska State Poultry Association announces thru this journal to the poultry public that extensive plans are now in operation to make the Nebraska State Poultry Show of 1919 the greatest in its history.

Liberal premiums in cash and trophies will be given to every winner and all are of sufficient importance to attract any fancier or breeder in the country.

Last year this association held the largest and best show west of Chicago, and will this year exceed any previous effort.

This association is an incorporated state institution and money is appropriated to carry on the development of the poultry industry of the state. Every show held by the State Poultry Association for thirty-three years has been a complete success.

No breeder can afford to miss this real quality show, which will be held at Holdrege, Neb., beginning January 20, 1919. Write for full particulars to M. G. Scudder, Sec'y, Kearney, Neb.

COLISEUM GETS WHITE WYANDOTTE CLUB MEETING.

\$150 in Cash Prizes.

The National White Wyandotte Club will hold its annual meeting at the Coliseum Show, Chicago, December 3-8. There is \$150 in cash offered on this variety. Every White Wyandotte breeder in the country should ar-

range to exhibit and personally attend this meeting. You owe it to the Coliseum; you owe it to your club, and above all else, you owe it to this popular variety that is making such wonderful egg records in the laying contests in all parts of the world. Write today for premium list to Theo. Hewes, secretary, Indianapolis, Ind.

The Coliseum Show, Chicago, Announces Judges.

Regardless of the increase of rental and many other handicaps that have been placed on the management, the Coliseum Show will be held December 3 to 8, as advertised. The Garden Show will be held late in January, as we understand, getting away from the holiday rush of express that has been more or less of a handicap to both the show and exhibitors. Eastern fanciers desiring an early winning will do well to take advantage of this great western sales show, as there will be some six weeks intervening between the close of the Coliseum Show and the opening of the Madison Square Garden Show. Coming as we do on the same dates as the International Stock Show, more than 100,000 stockmen from all parts of the world will be in Chicago on that date. They are liberal buyers and always looking for the best in fancy poultry.

Following is a list of judges selected to award the prizes, together with the classes they will pass on. There may be some slight changes in this list, but in the main they will stand as listed.

James A. Tucker, Rhode Island Reds, Barred Rocks; exhibition males, cockeriei bred females and cockeriei bred pens. W. W. Henderson, Barred Rock exhibition females, pullet bred males and pullet bred pens. A. F. Kummer, White Plymouth Rocks and White Orpingtons. Harry Adkins, Partridge Rocks and Partridge Wyandottes. Leo A. Lee, Columbian and Silver Penciled Rocks, Columbian and Silver Penciled Wyandottes. Leonard Rawnsley, Buff Orpingtons and all Sussex. George Greenwood, Black and Blue Orpingtons. Charles McClave, White and Black Minorcas, all Anconas and Hamburgs. D. W. Young, all White Leghorns. Herman Rikhoff, Buff, Black and Silver Leghorns

Uncomfortable		Joram's Lice Rid
Hens		Lice Rid
Never		Keeps Them
Lay		Comfortable.
One Size	3 Ounce 50 Cts.	Directions on every can

THIS STUFF WORKS!

What poultry keeper can say that his flock is free from lice? These abominable vermin take all the pleasure and profit out of poultry keeping—they make the hen uncomfortable and money—they kill the chicks—they even kill the grown hens. It has been said by an authority that lice are responsible for more dead birds than any other enemy of poultry.

JORAM'S LICE RID KILLS THE LICE

It is a remedy for lice that never fails to work. It kills lice, and it prevents lice from getting onto the birds afterwards. JORAM'S LICE RID will kill HEAD LICE on CHICKS.

EASILY APPLIED

JORAM'S LICE RID is not like the other lice killers on the market—you KNOW they don't work—but JORAM'S goes after them in a "DIFFERENT" way. Vermin have a "base" of operations, just like submarines. You apply JORAM'S to the "base"—and the lice never move from there. That's where they die.

JORAM'S LICE RID IS ABSOLUTELY GUARANTEED to do the work, if directions are followed, or money refunded.

CHEAP It costs less than 1 cent per bird to apply JORAM'S LICE RID, and it lasts the rest of it. You need this key to success in poultry raising. You need it now. One size, 3 ounces for 50 cents.

G. L. DU BOIS, Distributor, COBDEN, ILLINOIS.

A SURE DESTROYER IS

Licene

BECAUSE—

LICENE is LIFE to the chicken and DEATH to lice.

LICENE is applied twice a year; kills lice and nits and cleans Scaly Legs more effectively than any other known remedy.

LICENE is easy to handle and easy to apply.

LICENE costs less and accomplishes more.

100% GUARANTEE

If LICENE does not destroy every louse and "nit" or does not clean Scaly Legs, we will, within 30 days, refund your money and no questions will be asked.

Price 50 cents a tube, enough for about 150 to 200 birds. Delivered by mail. The Licene Co., 1500 Pontiac Bldg., Chicago

and Buff Minorcas. W. G. Warnock, all Brown Leghorns. Fred Shellabarger, Light Brahmas, cocks, pullets and young pens; all Langshans and all Cochins. Charles Balch, Light Brahmas, cockerels, hens and old pens. Charles Brendt, all Cornish. George Wells, Keeler and Black Wyandottes. Charles V. Keeler, Buff Plymouth Rocks, Silver, Buff and Golden Wyandottes. H. A. Pickett, all turkeys, all water fowl, all Polish, Blue Andalusians, Buttercups and Buckeyes. T. J. Roundtree, all Campines, all non-standard varieties. R. P. Krum, all Bantams.

Pet Stock Judges—Charles Gibson, John C. Fear and James E. Young. Others may be added to the pet stock list.

The premium list is now ready for mailing. Entries close November 15. Headquarters for show, Lexington Hotel, Chicago. Address of secretary until October 15, Indianapolis, Ind.; after October 15, Lexington Hotel, Chicago.—Theo. Hewes, Secretary.

The National Rose Comb White Leghorn Club offers to its members only, and providing there is competition, handsome special certificates on Rose Comb White Leghorns as follows: one each to best shaped male, best shaped female, best colored male, best colored female, champion male, champion female, and best display; also special silk badges to champion male and champion female.—J. M. Chase, secretary, Walkkill, N. Y.

SHOW DATES

This list has been compiled from information received from secretaries or judges. If the dates of any poultry show in which you are interested do not appear hereunder, kindly have the secretary mail the necessary information to us and same will be published in our next issue.

ANNOUNCEMENT

Smith's White Leghorns

Purchased by C. R. Hopkins, Osage, Ia.

THE entire flock, business, good will, etc., of Smith's Strain White Leghorns, as bred for several years by Eugene Smith, of Aurora, Illinois, has been purchased by C. R. Hopkins, of Osage, Iowa, who has successfully bred this strain for the past three years and made sensational winnings at important Western shows. Mr. Hopkins knows the quality of this strain, and how to breed them, and will be glad to serve Mr. Smith's old customers and such new ones as want the best in White Leghorns. This strain has produced more winners at Chicago Shows during the past eight years than any other, **bar none**, and the young stock this year is better than ever—and that is going some. Address all correspondence and requests for catalog or prices to

C. R. HOPKINS, Route A2, OSAGE, IOWA

THE MORRIS WHITE ORPINGTONS

(THE PROVEN LEADERS)

Begin the show season 1918 by going over the top to a glorious start, winning at Ohio State Fair, Columbus, with 8 entries, 1st cock, 1, 3 hen, 1, 2 cockerel, 1, 2 pullet, 1st pen.

Michigan State Fair, Detroit, 11 entries, 1st cock, 1, 2, 3 cockerel, 1, 2 hen, 1, 2, 3, 4 pullet. At both these shows, held on the same dates, competition was very keen, history again repeats itself, line breeding tells the tale, both in the show room and laying contest our birds excel in type, color, size, head points, and prolific egg laying.

Our pen of pullets in the egg-laying contest of Leavenworth, Kansas, has laid 144 more eggs than all other Orpingtons competing. Pullet No. 273 led all competitors for the first five winter months, defeating 551 birds of all standard varieties.

We have hundreds of show birds and breeders of this dual purpose strain ready for the show room, laying contests, and breeding pens.

Remember, the Morris White Orpingtons have won more points than any other three exhibitors combined at the last three Madison Square Garden Shows. Engage the Proven Leaders NOW and make sure of winning the blue.

SACRIFICE SALE

On account of shortage of labor and demands of other business, I must reduce my flock, and sell males and females at half real value.

Best Laying Strain of Leghorns in the South

One customer writes: "The pullets I have are as good for my purpose, and on a flock average, as any in the world." In the four winter months of 1917-18, 85 pullets averaged more than 60% egg yield.

My pen was first in the North American Laying Contest in May and in July, against leading English and American breeders.

Have won at Memphis, Tenn.; Little Rock, Hot Springs, etc., shows repeatedly.

For Sale **1000 B. P. ROCKS** Including

One of our Boston Birds

FIRST PRIZE Boston Winners

AND STOCK BRED FROM BOSTON WINNERS

We Won 1917 at the National Barred Plymouth Rock Club Meet, Boston (did not compete 1918), all Seven Prizes on Cockerels, First Pen Chicks, First Pen Fowls, First Pen Mated for Cockerel Breeding, National Trophy Silver Cup for Best Cock, Cockerel, Hen, Pullet and Hen; also many other prizes.

50 COCK BIRDS

superior breeders or show specimens, \$10 to \$100 each; limited numbers of choice Hens, the kind that winners are bred from; Cockerels and Pullets, some of the finest we ever raised, part now ready, more as they develop; prices according to grade and selections made for individual requirements.

Male birds of our breeding hold, so far as our knowledge goes, the record for prices actually received for individual males. A phenomenal Madison Square Garden First Prize Record during the period there shown. Also a "silencing record" at Boston.

BRADLEY BROS. Box 909 LEE, MASS. Circular We please our customers

FAIR OAKS BARRED ROCKS

Champion Barred Rocks

Game and Ornamental Fowl

We have the birds and want the breeders to realize it.
We never had as good a bunch headed for the show room.

—and that means a good deal when you consider that last year we had more winners at the National Barred Rock Club and Illinois Centennial Shows than all breeders in the United States combined.

1000—Head of Superior Young Stock for Sale—1000

bred from the above winners and others like them. They will give ground to no competitors this winter, no matter where they come from.

GREAT BARGAINS IN BREEDERS

300 head fine yearling old stock, including our winners, with 40 cock birds in the list. Now is the time to secure your breeders. They are lower in price now than they will be in the spring, and it is much better to put them into their new quarters in the fall so that they will become acclimated and satisfied by breeding time. The results are much more satisfactory.

Send 25 cents for our instructive booklet. "Management and Care of Pheasants and Other Ornamental Fowl." Also complete bargain list with prices of our Ornamental, Game and Waterfowl.

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

The Imperial "Ringlets"

Are Recognized Throughout the World
as the

Leaders of All Barred Rocks

One of the Great Imperial "Ringlet" Males.
Observe the Wonderful Shape, Color and Barring.

Their record at America's Imperial Show, Madison Square Garden, N. Y., for 30 years stands without parallel.

At the last 1918 Garden Show they won every first prize offered. At the last four shows, 1915, 1916, 1917, 1918, they won 19 first prizes out of 20 offered. First Prize Pullet and Champion Female the last four successive years—every prize and ribbon offered on cockerels, viz: 1st, 2nd, 3rd, 4th, 5th, the last five years in succession and under three different judges—every bird bred on my farm.

**Supreme at
Madison Square Garden
is Supreme Everywhere**

Grand Winning Show Birds

The finest that all America has ever produced are now on my farm ready to win Blue Ribbons and Silver Cups for you in any competition in the world in Cocks, Cockerels, Hens, Pullets and Pens. Their matchless "Ringlet" barring wins under all judges. **As layers they are pre-eminent:** In my catalog are testimonials from customers giving positive "Ringlet" laying records up to 283 eggs in 10 months.

Prizes and Silver Cups

have been won by my customers on the Imperial "Ringlets" in more than a thousand show rooms throughout the civilized world—you can win the same laurels. I will sell you grand exhibition birds for any show and breeders of this richest First Prize New York Blood in elegant single birds, trios or pens mated to produce prize-winners.

*If you want the best in Barred Rocks, you must have my Imperial "Ringlets."
My customers are my first thought, and nothing is too good for them.*

RICHLY ILLUSTRATED CATALOG UPON REQUEST

EGGS

from the finest exhibition matings in the world—now \$5 per setting. This is only one-third of my regular price. 100 eggs \$35.

AMERICAN POULTRY JOURNAL

**FOR THE BOY OVER
HERE AND OVER THERE**

Seven organizations with the single purpose of doing their bit toward winning the war by helping to keep the military and industrial armies fit, are co-operating in a war drive November 11 to 18, to raise \$170,000,000 for their work at home and overseas. These seven organizations are: The Young Men's Christian Association, Young Women's Christian Association, National Catholic War Council, including the Knights of Columbus, Jewish Welfare Board, Library War Service, War Camp Community Service, and Salvation Army. These organizations have joined hands in carrying to our boys the touch of home care and comforts from their own homes to the fighting fields overseas. We at home should join hands in providing funds in order that this service of home comfort may not break down for a dollar a single day.

Keep Your Hens Laying All Winter

Don't make the mistake of trying to get eggs this Winter by feeding Scratch Feeds—**SCRATCH FEEDS WON'T MAKE EGGS** because they do not supply the hen with the necessary ingredients to produce eggs. Your hens will lay in Winter as well as Summer if you supply them with the same egg-producing feed that they pick up themselves in the Springtime. The feed that supplies these ingredients—the feed that will keep your hens laying all winter is

FUL-O-PEP DRY MASH

This wonderful egg-producing feed is the result of continued experiments by our poultry feed experts. By watching the natural habits of the hen we learned that if she was provided with the proper kind of feed to keep her egg-making machinery working—if she was supplied with the same egg-making ingredients that she picks up on free range in the Springtime—she would lay eggs in Winter as well as Summer—it's the feed and not the season entirely that regulates egg production. **FUL-O-PEP DRY MASH** is the raw material from which an egg is made—it is a combination of green food, animal foods and grain protein foods finely ground and correctly balanced to make a feed as near to nature's egg-making material as it is possible for expert feed knowledge, science and experience to produce. Keep it before your hens all the time and you will get eggs in abundance this winter—**WE GUARANTEE IT.**

SPECIALTY BREEDERS OF WYCKOFF'S S. C. WHITE LEGHORNS
 ACKNOWLEDGED EVERYWHERE THE WORLD'S GREATEST LAYING STRAIN
 UNSURPASSED IN STANDARD QUALITIES

AURORA, N. Y. Sep. 26th., 1918

Blatchford Calf Meal Company,
 Waukegan, Ill.

Gentlemen:

We are pleased to give our hearty endorsement to the Blatchford Egg Mash and Milk Mash as being all that you claim for them.

The Milk Mash we find to be the very best feed for starting and growing chicks, keeping them in perfect health and making the most rapid development. It practically takes all the risk and uncertainty out of the rearing of a lot of youngsters.

The Egg Mash brings out the maximum laying of the hens and pullets, and keeps them in perfect, physical condition. Never any danger of indigestion or stock out of condition. In feeding Blatchford's Egg Mash during the past season to 1100 selected breeders, we ran as high as 830 eggs in a single day, and averaged 800 eggs per day for weeks.

By combining the Egg Mash and Milk Mash, equal parts, during the moulting time, it reduces this period by half, producing a quick splendorous growth of new feathers and soon putting the birds in condition for another season's business.

We are constantly receiving letters from all parts of the country asking advice on feeding and for some time past we have kept on our desk a supply of the feeding directions found in each bag of Blatchford's for inclosing in our reply to those letters, advising them to follow directions and they can do no better than to use these feeds.

It is not possible, at the present time, for the poultry breeder to purchase on the market suitable ingredients from which to prepare his own feeds, nor at as low a cost as to be had already prepared and properly blended in Blatchford's Milk and Egg Mash.

You have rendered to poultrymen of the country a high service with your #1 quality products.

Yours very truly,

C. H. WYCKOFF & SON

Tell Me If You Want My New 1919 Book

It's Ready—Waiting for You

HERE'S our New Catalog for 1919. I don't think it will take much urging to get you to send for it. The opportunities for poultry raisers were never so great. Prices for eggs and chickens are high, the market demand is enormous, and the patriotic call is for everybody to raise more poultry.

But I don't need to tell you that. What I want to say, is that this book is bigger, better, and more complete than any we ever published in years past. It's a *practical* poultry raiser's book, and I know you will want a copy at once.

Send In Your Name Today

I don't claim to be much of a writer, but I am sure you will find this book helpful. It's gotten up from our own twenty-seven years' experience and the experience we have had in starting about 800,000 customers in all parts of the country. It deals with poultry raising as the great majority of of poultry raisers follow the business. Not a lot of cut and dried poultry lectures, but *practical* experience, and I will be glad to send a copy to anyone who writes for it.

Old and New Customers —Write Us

Those who received Johnson catalogs know that we publish more than a catalog of incubators and brooders. It is a large book, with pages 9 x 12 in., but only 6 pages are taken up in describing Old Trusty. The rest of the book is filled with helpful hints and practical suggestions: "The Feed Question," "The Best Breeds," "When to Start Hatches for Best Results," "The Best Size Incubator to Buy," "Egg Farming," "Marketing Eggs and Chickens," "How to Spot the Money Makers," "How to Hold Down Expenses," are just a few of the subjects treated in this new book.

800,000 Satisfied Customers

I don't want to brag, but I believe we come pretty close to being headquarters for incubators and brooders. The reason why is in Old Trusty itself. Common-sense construction and genuine value at the lowest possible price. Built in handy home sizes, make big

hatches in any weather. But our catalog tells the story. Send for your copy today.

Use the Coupon—Or a Postal

Suit your convenience. I would rather get a letter if you have time to tell me something about poultry, but send your name today anyway and be sure to get the book.

Yours very truly,

Harry Johnson,
The Incubator Man

M. M. Johnson
Company
Clay Center,

Have you used an incubator before?

What breed of chickens do you keep?

Hens Will Serve You Well If Served Sprouted Oats

Get the Facts About Our Grain Sprouter. Learn What It Has Done for Your Brother Poultry Raisers and What We Guarantee It for You

MAKE three bushels of fresh, green, tempting feed from one bushel of oats, wheat or rye. Turn loafing hens into money-making egg producers—have eggs to sell when prices are highest—get fertile eggs for spring hatching—all at a big saving in feed cost. Every poultry raiser should have a "Successful" Sprouter. Saves its cost in a few days' feeding and then keeps on saving money and doubling up your profits for a lifetime service.

Just what's needed in fall and winter to keep hens laying and needed again in the spring to make chicks grow into lively profit-producing birds. Write at once for complete 1919 offer. Sold on trial and pays for itself before trial runs out.

"SUCCESSFUL" Grain Sprouter

Practically All Steel —Made in Sections

Double steel walls—metal trays. There is nothing else like the "Successful" Sprouter. It's a brand new idea. Cannot be compared to wooden sprouters. It is warp proof—shrink proof—swell proof—nothing in it to rot—food cannot mold.

Made with glass doors. Each section a separate compartment. Start with just enough sections for your needs and add more as you need them.

Here is a money maker that proves its worth right at the

Test seed corn and start your plants the easiest and surest way with this Des Moines Grain Sprouter.

20 lbs. raw (3 pecks) oats as shown above makes 70 lbs. of sprouted oats as shown below in the "Successful" Sprouter

This in one week's time—the best green egg-making feed obtainable.

SPROUTED OATS

Read These Letters From Owners

"Successful" Sprouter Best of All Jamestown, N. Y., Sept. 12, 1918.
Dear Sirs: In reply to your letter of recent date will say that I have no objection to your publishing the letter I wrote you some time ago. I have used a number of different makes of Sprouters but the one I will use from now on will be the one THAT'S BEST, THE DES MOINES "SUCCESSFUL" OAT SPROUTER. As the results obtained from your Oat Sprouter it must be that your Incubator is in the same class.

Oscar R. Weborg, Prop.
Chautauqua County Poul. Yards.

All Hens Commenced to Lay

Watkins, N. Y., April 20, 1918.
Gentlemen: I enclose name here with whom I am sure you can sell one of your sprouters. I like my sprouter very much. Sprouted oats is all I feed my hens at noon and they are certainly doing fine. Just as soon as I commenced to feed them the sprouted oats they all commenced to lay and have kept it up all through the cold weather. I certainly am well pleased with it. I can keep them on a third less feed. Very truly yours, Mrs. D. Siltor.

start. It has increased egg yields 50 per cent—in some localities more. Takes only 15 minutes a day of your time. Sprouts oats in 24 hours and then grows an inch of crisp green sprouts every day. One feeding of sprouted oats at noon each day is all that's needed to increase the egg yield. And at the same time you cut your feed cost one-third and settle your green feed problem once and for all. Write for full details.

Write Your Name in the Coupon or on a Postal and Mail Today for Circular and 1919 Offer

We could show you scores of more letters like these, but why not show you the "Successful" Sprouter itself and let you see how it can save money and make money for you every day you use it. Famous booklet, "Proper Care and Feeding of Little Chicks, Ducks, Geese and Turkeys," 10 cents.

RESULTS

Cincinnati, O., Jan. 30, 1918.
Mr. John G. Poorman,
Tinley Park, Ill.

Dear Sir:

Enclosed please find Money Order (\$30.00) for a White Rock cockerel from your special mating. Kindly give me some information as to his ancestry, as I intend to breed him to some extra heavy laying hens. These hens were raised from chicks purchased from you in 1915 and 1916. Have trapnested them and some of the records are 280, 242, 216, 201, 200—not from the date of their first egg, but from November 1st to November 1st, same as the official laying contests.

Please ship as soon as possible via American Express to Elmwood Place, to be marked, "Will be called for."
J. J. H.

Special Pair Mating—S. C. White Orpingtons

RESULTS

Grosse Ile, Mich., Feb. 5, '18
John G. Poorman,
Tinley Park, Ill.

Dear Sir:

Enclosed find my check for \$15.00 for which, with my credit of \$10.00, kindly book my order for 50 Class A day-old chicks.

If possible, I would like to receive this shipment by American Express not later than the 15th of April.

This sure has been tough laying weather for the last sixty days, but you may be surprised to learn that the Poorman Orpingtons have been hugging the 50 percent mark for December and January and have outlaid some White Leghorns which I had given to me last year.

With best regards for the season's success, I am
Very truly yours,
N. A. P.

Buy Your Foundation Stock Now

My catalog contains descriptions of my plant by representatives of the leading poultry publications, reports of many of my customers, and also my methods of breeding, care and management. It is fully illustrated and very instructive, and will prove to you that my prices are very reasonable.

The individual prices of my breeding and laying stock have not been advanced. A male bird today will cost you no more than it would two or three years ago—a better bird at the same price.

Liberty Bonds Acceptable

*Start right, by writing for my instructive catalog today.
It has helped others, and it will undoubtedly help you.*

No. 11

Artificial Light Stimulates Egg Production

By George G. Newell

George G. Newell for several years made a study of egg production and made this matter a hobby as a diversion from strenuous duties as an auditor. As a result of this study, he experimented with artificial light and wrote "A Revolution in Egg Production," published by American Poultry Journal Publishing Co. in 1916.—EDITOR.

GRATIFIED at the general interest shown thruout the country in the very general practical application of artificial illumination as an aid and stimulus to egg production, I am led to write you on this subject. When this means to increased egg production is first brought to the attention of anyone interested, it seems absurd on the face of it that artificial light should have any effect at all on the output of eggs, and this seeming absurdity is quite natural,

as the simple furnishing of artificial light does not in any way supply nourishment to the fowls; and, as eggs are produced only thru the process of assimilation of food, and the change in form of nourishment as it passes thru the digestive and generative organs of the fowls, the natural inference is that artificial lighting can have no effect and cannot increase production.

This seeming absurdity is the great stumbling block in the mental process necessary to a serious consideration of this subject. The caption of the article in the *Chicago Tribune* on January 5, 1915, on the subject of my experiments was, "Plays Electric Light Joke on Chix and They Lay for It." The *San Francisco Call* said under the caption "Cruelty to Hens in Darkest Chicago." "There

GEORGE G. NEWELL
Originator of the Idea of Using Artificial
Illumination in Poultry Houses

is an ingenious gentleman in darkest Chicago who takes about the meanest advantage of his hens that comes to our attention." These two comments are typical of the attitude of mind toward this subject before it is understood. One of these comments suggesting that fowls can be "fooled" into laying, and the other suggesting that fowls in some way suffer from the effects of artificial light. Both of these premises are wide of the mark. Just like every new discovery or invention, the reasons for success are simple and plain when once thought out and put into practical use.

In actual use the furnishing of artificial light gives the same

opportunity for the exercise of judgment, as does the variety, quantity and balancing of the rations; and I can readily see that mistakes may be made in the degree or length of time in which such light is furnished. Bearing this qualification in mind, I cannot see, from my own experience, where any conditions unfavorable to the flock can be created by the use of artificial light, but I can see many ways whereby the owner as well as the flock can benefit by its application.

The general success attending the use of this method proves out the conclusions arrived at in the initial experiments.

From coast to coast the use of artificial light has increased production and has stabilized the industry by making this increase possible during the periods of natural scarcity—thus turning the poultryman's unprofitable months into a period of greater profit than his former most profitable season.

In fact, the use of artificial light makes it possible, by the exercise of judgment, for the poultryman to control his production regardless of weather conditions, whether from sudden or prolonged untoward changes in temperature, from dark or inclement climatic conditions, or even during the molting season.

This one thing lacking, when furnished, can be made the key to unlock the door of opportunity, by means of a lengthened "hen day," to enable the poultryman to attain success only limited by his skill in furnishing the necessary surroundings to the comfort of his flocks and the balancing of rations to obtain results. It also puts the poultryman in a position to bring fowls to laying maturity at will, irrespective and independently of the calendar, and by this means enables him to insure still further a regular output thruout the year.

The means used for illumination are various—some using ordinary lanterns, some improved lamps, or kerosene and gasoline gas generating lamps, and others electricity. Of course, when obtainable, electric light is not only far more convenient but also under better control.

Among well known persons in the poultry world who have become interested in artificial lighting are J. B. Roe, Pasadena, Cal.; M. E. Atkinson, Hollywood, Wash.; James E. Rice, Cornell University, Ithaca, N. Y.; E. E. Emerson, Burbank, Cal., and E. B. Martin, Downey, Cal. These are only a few representative of the interest aroused. The Cornell Poultry Project alone has over 50 members who are using artificial light successfully. They all, without exception among those I have read of, secure an increase in egg production by the use of artificial illumination, which does not feed the fowls or appreciably add heat to the housing quarters. The only reason I can see for these results is the lengthening of the "hen day," unless there might be some benefit derived from the cheerfulness furnished by the light. Among other communications received was one, of recent date, from Luther Banta, B. S., Poultry Husbandry, New York School of Agriculture,

Alfred, N. Y. Mr. Banta had read "A Revolution in Egg Production" and wanted to add to his researches. Among other subjects, Mr. Banta was interested in: The effects on

Pullets in a busy night scene, picking up the additional feed necessary to lay more eggs in winter.

hatching results; the effect on hatchability of pullet eggs as compared with hen eggs; how continued illumination for years affected hatchability; the schedule of illumination; whether I still continued the schedule in August (during molt); whether changes in feeding system were made on account of light; the effects on the molt; whether the interior quality of eggs was affected; whether I had known of the use of artificial lighting previous to experimenting.

I replied to Mr. Banta, to the best of my ability, which was not as conclusive as I should wish because of the handicaps under which I operate. I mention these queries as showing the various points which are brought up when this subject is gone into.

In conclusion, Mr. Banta furnished the interesting information, that he had found evidence of light being used over 30 years ago in a laying house. This information furnished by Mr. Banta shows either that practical results were not worked out, that extravagant claims were made, or extravagant results expected, or that the significance of the subject was not understood—otherwise a general application to the industry would have developed.

All the instances of which I have heard or read, date after the appearance of the article in the *Chicago Tribune*. From and after this date we began to hear of success in increasing production. This article was widely copied. The *Rexall Store Almanac* for 1916 copied this article; the *Electrical World*, February 6, 1915, took up the subject; *Every Week* published an article, and the good work went on. The premises are sound, the reasoning simple, and there is no magic about furnishing artificial light. I cannot see that it furnishes any stimulus, in any manner. It is simply a means of control of conditions which enables the poultrymen to either intensify their errors of feeding, or to take advantage of the producing powers of the fowls to their own profit. It removes the *one block* which has hindered poultrymen in their efforts to furnish spring and early summer conditions to their fowls for the purpose of securing fall and winter eggs.

Having tested this matter thoroly for some years, I have never yet failed to get immediate response in egg yield as a

return for a lengthened day. The schedule has been varied according to circumstances. At present (these are war times) the schedule is about an hour from 9 to 10 P. M.—thus getting the fowls off the roost for feeding—and it works and produces results. The schedule, however, must not be irregular, or suddenly changed by shortening the time, or it will start a molt. I have not been able to detect any ill effects, either on the health of the fowls or quality of eggs, which can in any way be attributed to light furnished; but I have secured control of an output in eggs in steady quantity at all seasons.

With normal daylight, the months of scarcity are September, October, November, December, January, and, with inclement weather, February. With an artificially lengthened day I secure as great a production during these months as in spring and summer.

The great quantity of eggs produced under natural conditions in spring and early summer can be attributed to climatic conditions, the variety and quality of food available to the fowls, and the lengthened day.

Feeding conditions can be controlled by the poultryman and he has succeeded fairly well in this control for some years.

The conditions of the advanced season, including broodiness, the shortage of bugs, worms, etc., and the various discomforts of the fowls also have a tendency to curtail the supply. Most of these matters are also subject to control, and we are able by artificial illumination to simulate spring and early summer conditions in fall and winter by lengthening the day sufficiently to enable the fowls to sustain themselves in comfort and have a surplus of nourishment for producing eggs.

Fowls do not lay eggs because "cajoled," "forced" or "fooled" into doing so, but from choice when conditions are favorable. The reproductive process is always greatest when life is most vigorous, and heavy laying is no exception.

When put into general practice, artificial illumination is destined to produce a steady flow of fresh eggs and a consequent supply, for the ever existing demand, thruout the year. When this is accomplished, the public will demand that when purchasing eggs on the market there shall be no question as to the kind of eggs they receive. Eggs and the producers and purveyors thereof will then have to travel on their merits. "Mighty oaks from little acorns grow" and I look forward to great results from artificial illumination as "A Revolution in Egg Production."

Comment on Eastern Poultry Situation

Everybody Carrying On. No "Cold Feet." Some Readjustments Necessary. Conditions Improving.

By Prince T. Woods, M. D.

AT A MEETING of poultrymen in one of the central states the latter part of the summer, a member in the flush of oratory, dilating on the opportunities in the poultry business and the success which had been met with in his locality, said to a visitor from the Atlantic coast: "The only reason you fellows in the East have not done better business is because you had cold feet!" Of course it was simply a rash statement made under stress of oratorical excitement and we do not recall that any reply was made.

We have been living in the heart of the eastern poultry raising country for some time. Even under the stress of war conditions, serious feed shortages, and many difficulties which have had to be met, we have not found any cases of "cold feet." Eastern poultry breeders have been sturdily optimistic in the face of conditions which would have discouraged a less hardy race. Mind you, we are referring to actual producers of poultry, not men who merely talk about what ought to be done in the poultry business, who do not own a chicken and earn their living working for some concern that sells goods to poultrymen.

Blind optimism is folly. Most of our leading men today have been emphasizing that fact for some time past. It takes far-seeing, common-sense optimism to carry on in the face of trying conditions which must be seen, met and overcome. You don't drive an automobile at full speed into a blocked road bearing the sign "Danger! Bridge Down." That is, you don't do it if you are wise and expect to get thru safely—you make a detour.

Eastern poultrymen had a most unusual situation to meet. This section of the country is dependent for its grain and feeds upon the grain producing and milling country of the central states. Grain could be more cheaply produced there than here, and today, altho the East is producing more grain than it has done before in many years, it still appears that the "corn and wheat belt" producers can grow grain far more economically than we can. Transportation conditions and unusual war-time demands shot grain and feed prices up almost out of sight in our markets, and there were periods of very serious grain and feed shortage—we still experience a good deal of difficulty in getting supplies to feed our flocks. Warm footed optimism alone will not carry a man thru when feeds are difficult to obtain at any price, and for weeks and months at a time when his expenses are eating up two dollars for every dollar he takes in. When it comes to "cold feet," we actually received in our correspondence more complaints about "hard times" and poultry difficulties from readers in other sections in a few weeks, than we have had in two years from this eastern poultry raising country.

One prominent eastern fancier, when things were looking decidedly unpromising, wrote us: "I haven't cold feet, but I'm wearing thick stockings to keep 'em warm, and I'm hanging on like a puppy to a root and shan't let go my holt till I am yanked off. Cost of everything is big and getting bigger, profits are at zero. Still we hang on, have got to hang on some way." He is still hanging on, has smaller flocks than usual, but some of the best quality he ever bred and grew, and he is working overtime both on and off the plant. He has to have outside work in order to stick. Another breeder, a man we know well, has a good big flock of pullets and some fine cockerels which he says he hopes "will clean off the slate at the grain dealer's while the credit is still good."

Eastern men have been forced to adjust their business to war-time conditions in this congested section of the country, which is so exceedingly busy with war activities and which is the starting point of all men and supplies headed for the front. It is the front on our own soil and at times the war has seemed very close to our doors. So far as poultry goes a good many egg farms and market poultry plants have been forced out of business. The prices obtainable for eggs and poultry did not adjust themselves readily to the increasing

cost of production, and even now the prices of poultry products are just *beginning* to approach the mark at which they should be. Large commercial poultry enterprises in this section were not encouraged, were even discouraged by the authorities, apparently with the view that the central and southwestern states could produce and sell us eggs and poultry more cheaply than they could be produced here on grains and feeds which must be shipped in over railroads already overburdened.

But eastern poultry breeders and fanciers have not been discouraged, and are not discouraged today. They may not

have as large flocks as usual, but they are still carrying on and have good Standardbred quality that is even better than usual. Many are in army, navy or other branch of government service. We have just as many real fanciers today as we ever had, and probably more. Some of the big farms are gone. There have been many beginners who have started, kept on until the half grown chicks began to really develop appetites and show how much they could eat, and then some have sold out and quit—but a reasonably good percentage are going to stick, and most of these will make fanciers. Farm flocks and back-lot flocks are smaller and not as common as in more favorable times, when almost everybody "kept chickens."

Today, October 9, the demand for eggs and poultry is improving, even tho prices are showing an upward trend. The wholesale price of eggs at the farm is 80 cents a dozen and fat fowl bring 34 cents per pound alive. These prices seem high to some, but to be in fair proportion to production

costs they should be higher still. The newspaper press in our big cities has, as a rule, been hostile to the producer and has clamored to keep down the price of farm products. Now and then some immoderate person gets a letter published declaring that dairy men and poultrymen are "profiteers," but such attacks are not as common as they were a few months ago. Milk is getting a good deal of publicity and is being boosted as a cheap food. The milk producers' association has been a help in getting the right sort of milk talk before the public. Eggs and poultry are still in great need of similar publicity work. The hen needs a good press agent to boost her produce and demonstrate its big value. Value considered, milk, eggs and poultry are still the cheapest foodstuffs in our market.

Recently some salaried grouch in the big city yelped even louder than usual about the price of milk, the profits producers are popularly supposed to be making, and emphatically stated that eggs are not worth 85 cents a dozen. His published letter brought a prompt response from a good friend of ours who

First prize Silver Campine pullet at Chicago Coliseum Show. Owned by Frank E. Hering, South Bend, Ind.

is a practical poultryman of long and successful experience. The poultryman's letter was about as follows:

"Your letter from Mr. — today can very easily be answered by his going into the milk, hen, or farm business himself and buying Liberty Bonds with the milk he raises, or eggs, or produce.

"It should be very easy for him to buy a farm, or hire one even, and try it out. He is following the line of least resistance, apparently, and buying everything he consumes, and, at the advance of two cents a quart, kicks. Mr. —, go into the game and try it out. Yourself, like many others, like to kick because it's human nature. How many hours a day do you work? If you raised milk or eggs and poultry for a living, you would work fourteen days a week, and have enough worry to give you nervous prostration. There seems to be joy in kicking and knocking the food producer.

"We are buying all tools and equipment on an eight-hour basis, and selling our produce on a sixteen-hour day basis, plus the worry and the risk of losses. Take your choice, Mr. Consumer, either produce what you need yourself or pay a fair price for it, the pleasure will be yours. Make a little more effort and kick a little less, and you will not only buy Liberty Bonds but milk, eggs and other produce as well."

If more producers would reply to the complaints of consumers it might prove a good thing. Sometimes it takes a little jolt in the right place to bring about a proper under-

standing between all parties concerned. We are still carrying on at our farm and producing all we can without going into a deep hole. We sell our surplus produce but we expect the consumer to pay us a fair price for it. If he "kicks" we courteously suggest that he buy elsewhere or better still get into the business and produce what he needs for himself. We get plenty of advice about growing most of our grains, etc., and are told that we cannot expect to charge a "high price" for our labor. Why not? Isn't our skilled labor worth just as much as other skilled labor doing as essential work? Isn't our home-grown grain and fodder to be valued at the price it would bring if we sold it in the open market? All things produced on a farm cost money in somebody's time and labor. There are a lot of folks—not all city folks either—who still think because things are raised on the farm that they cost nothing. It is high time that fallacy was exploded.

One dollar an hour is not an uncommon wage at war industries, plants around here for even little skilled labor. An ordinary farm hand can demand and get 50 cents an hour and mighty few of them will work for that. Some harvest hands are getting from \$10 to \$14 a day on eastern farms that used to be able to get plenty of men for less than that amount a week. If the poultryman or farmer goes into a munition plant or factory to work and takes any members of his family with him, each worker gets paid on the eight-hour day basis and "time and a half" or "double time" for overtime, holidays or Sundays. If the same man works his farm or poultry plant, he and his family have to work from 14 to 16 hours a day, seven days a week, and he takes what he can get with no allowance made for the labor of other members of the family. That is what we are up against here in the East, and we believe similar conditions prevail in a large part of the whole country. Food production needs to be on a safer and more sound basis, one that will insure a square deal and fair and just profits for the producers.

No, we don't find any "cold feet" among poultrymen here in the East. Most of us are carrying on and doing our utmost. We are making the best of things we cannot help and endeavoring to better the things we can help. Readjustment is slow, but it is coming, just as better things are coming with it. We believe that the outlook for the poultry business is more promising than it has been for some time. Prices are likely to be better equalized throughout the whole country. The central states poultrymen will benefit, many of them have already benefited, by the very condition which have worked difficulty for those of us who are located in the coast states, but when the real readjustment comes, as it is sure to come, poultrymen everywhere thruout the country are going to share in the better business.

We need to get together, to work together and to join in a nation-wide co-operation for the good of all and the progressive improvement of the whole poultry industry. Not only do we need to keep up the campaign for boosting Standardbred poultry, but we should keep hammering away on a strong publicity campaign to urge the value of eggs and poultry as food, to demonstrate to the public that poultry produce is really cheap food, all values considered, and to encourage increased consumption of poultry products.

Eggs at 85 cents a dozen may seem high in price, but that is largely because we have always had them too cheaply. Grain at present prices seems easier now than it did to us when prices first began to climb skyward, because we have already experienced considerably higher prices. Just bear in mind that illustration of comparative prices and values given by the N. E. Poultry Producers' Exchange. Here it is:

Remember that a dozen eggs ought to weigh at least 1½ lbs. and we will assume that you pay in the cold weather \$1 per dozen for them. Ninety-seven percent of this purchase is all good, healthy food. A good steak at 75 cents per pound will be found to be one-third bone and waste fats. In other words, you have paid 75 cents for two-thirds of a pound of meat. The real cost of this food is therefore \$1.12½ per pound.

In the case of the dozen eggs that you bought for \$1, you only paid at the rate of 66⅔ cents per pound, because you buy 1½ pounds for a dollar.

This simply means that of the two foods meat is costing you \$1.12 per pound against eggs, the better food, at 66 cents per pound.

Bourbon Red Turkeys Valuable on Farms

Experiences in Turkey Raising. How and What to Feed.
 First Prize Article American Poultry Journal's Monthly
 Contest.

By C. M. Brumfield, Van Bibber, Maryland

IN SELECTING a breed of turkeys for a farm flock, I decided that the Bourbon Reds would suit my purpose better than the other varieties, because they are more domestic. The Wild and part Wild, as the name implies, wander far off to the tangled undergrowth of a woods or an almost impenetrable thicket, and can elude the nest hunter to

A 10-lb. S. C. Black Minorca hen which won 2nd hen at Chicago Coliseum, 1915, 1st hen 1916, and 2nd hen 1917. Owned by Royal Poultry Farm, Box 500, Ossian, Ind.

her utter distraction. I have found the Bronze variety much like their wild sisters in nature but my experience with the Bourbon Reds is that if given a convenient straw stack or rick of fodder, the hen will choose it for her nesting place for the first eggs. Later on in the season, the second, third or fourth time, the Bourbon Red hen will probably select a nearby fence row, or bunch of weeds, but not far away, and never a real thicket.

This matter of ease in finding the turkey hen's nest is a decided advantage on the farm. Moreover, the hens are not subjected to the always prevalent danger in our vicinity, of country-roaming dogs which delight in breaking up turkeys' nests and usually kill and eat the birds.

As a rule, a turkey hen lays fifteen or sixteen eggs the first laying. Some lay twenty-two to twenty-five eggs, but such are generally infertile, especially if any unusual number is laid. Each litter the hen will lay a few eggs less, and, if broken up from sitting each time, produce as many as five lots of eggs, the last time laying not more than eight or nine.

In mating, a young tom should not be used. This is true of all breeds of turkeys. A two-year-old tom is as young as is safe to use for breeding, but a three-year-old bird is better. After the third year I usually market the gobblers as they get cross and troublesome as they grow older, but nevertheless they are fine for the breeding pen for a number of years more. I have a beautiful big Bourbon Red tom with fine dark markings which I have used in the breeding pen for the past two seasons, but shall not keep him more than another season.

The interest shown in the poults by the male bird is most interesting. This season I had an early flock of poults which the tom took under his care, even hovering them on the ground at night while the mother hen went off to lay again, having cared for them only two or three weeks when very small. By this most unusual co-operation of the parent birds, the mother turkey is able to bring out numerous flocks of young, and while she goes about this marvelous work of

nature, the stately, proud and wonderfully plumed gobbler takes upon himself the care of the growing poults and displays intense pride in his work. He instructs them in all the intricacies of gathering a living from the fields, in all the arts of caring for their health, in all the wonders of their proper development. And he is apparently never weary of this work nor for one moment considers it beneath the dignity of one filling so important a place in the country landscape as the strutting gobbler.

Last season I sold all the first litter of turkey eggs at a good profitable figure and when the hens began laying the second time, I set the eggs under the largest turkey hen I have, giving her eighteen eggs. Three of the eggs were broken within a few days, probably due to her great weight but out of the fifteen eggs remaining, she hatched fourteen strong poults. Friends condoled with me saying that one after another they would die off, but they persisted in living, surprising even my hopeful self, and I sold them for breeding birds later on. As a child I had lived on a farm where turkey raising had been tried and practically given up as a lost art, but when I returned from the city, after some years spent there, I went at turkey raising with all the hope of a novice, notwithstanding the discouragement which some of my friends and family lent to the undertaking. A sage member of our family visiting me about that time and seeing my fine flock of Bourbon Reds, remarked that it was just as well to take a good look at them *then*, as a turkey is a bird that won't even *try* to live!

I feed the little poults chiefly hard-boiled eggs finely crumbled, using infertile eggs for this purpose. I also give them plenty of chopped onion and cured from sour milk. In the course of ten days or two weeks they are fed small grains and are allowed to roam over the grain fields. The little poults are kept penned up for a week or two and then allowed their freedom, except in rainy or bad weather.

I believe overfeeding kills more turkeys than scanty rations.

First cock and champion male at the National Club Meet, Chicago, 1917. Owned by C. R. Hopkins, R. A2, Osage, Iowa.

Turkeys roam about, picking up practically their entire living from the fields and meadows during spring, summer and fall, and if they have been given a good start on curds, onion tops, and hard-boiled infertile eggs with a little grain, they will balance their own ration and find what is good for them.

I have been most fortunate in not having the dreaded backhead disease in my flock, but I have seen every one of great flocks of beautiful Bronze turkeys die of that disease.

As a market fowl the Bourbon Red cannot be beaten. They are meaty and full breasted and the flesh is juicy and tender when cooked. I have never tasted finer flavored meat nor served any which called forth more favorable comment. A properly roasted, nicely browned Bourbon Red turkey will prove an ornament and satisfaction on any family board that will not soon be forgotten. The flavor is all that can be desired and the quality is of the highest.

In the winter we feed our turkeys mostly corn. They roost under open shelters and are never confined to close, overcrowded buildings. They should be given an occasional feed-

ing of onion tops, chopped onion or cabbage leaves thru the winter.

There is no market fowl which will bring as good a price as a well grown, nicely dressed turkey, for there is no other fowl which is as meaty and worth as much. More turkeys might be profitably grown on farms in grain-growing communities, for it is not the garnered grain upon which they subsist during the greater part of the year but that which they glean from newly harvested fields, from the early pickings of grass and weed seeds thru to corn-husking time. They are active gleaners and extract untold juices and unknown worth from the tiniest weed seeds to the most alert grasshoppers, applying the same to their needs and natural development.

Locating and Planning of Poultry House

Concrete Foundation, High Location and Open Front House Preferred. Second Prize Article American Poultry Journal Monthly Contest.

By *Otto E. Hackman, Ft. Wayne, Ind.*

WITHOUT doubt we will find many beginners in poultry culture who will construct their first permanent poultry house this fall. This is a matter which should receive considerable planning and forethought.

Before the building operations are begun, the location should be carefully decided. If an undesirable location is chosen in the matter of locating a permanent house, it will prove a source of regret and dissatisfaction for all time. Therefore before throwing a spadeful of earth, or driving a nail, go over the ground carefully and select the most desirable site, taking into consideration when making the choice, convenience, surroundings and drainage. A spot of land higher than the surrounding ground should be chosen. The drainage problem is then easily solved. The ground, if sloping away from the building on all sides, will carry all water away from the house, and not into it, as would be the case were the house located on a low spot. A poultry house on low land is subject to

flooded and damp floors and is therefore not conducive to healthy stock. The floor and litter should always be kept dry and the house should be so located that it will get a maximum amount of sunshine.

Whether to set the house on walls, posts or pillars must also be considered, altho this is not so important when the house is located on high, dry land. Personally, I prefer a good concrete foundation. The expense is not so great when its permanence and usefulness is taken into consideration. One great advantage in the concrete foundation is that it is perfectly rat and mouse proof and with proper care one need have no fear of these rodents carrying off grain if the poultry house rests upon a good concrete foundation. It is also water proof and wherever the drainage is not all it should be, the concrete foundation is to be preferred.

The walls, if made of good material, properly proportioned, need not be very thick. A four-inch wall will answer for

most any building. Of course, the wall must be deep enough in the ground to bring it below the frost line. Here is the way to mix the concrete for good results. The proportion should be 1:2:4. That is, 1 part cement, 2 parts sand and 4 parts gravel are used, the proportions always being mixed by volume.

First dump the sand on the mixing platform and spread it out until it is only a few inches thick. Then spread the cement on as evenly as possible and mix both together thoroly by turning over with a shovel. When thoroly mixed, add the gravel, and shovel as before. Then wet it down and work the water thru the whole mass until of the proper consistency which is neither very wet nor dry but rather crumbly. It is now ready to put in the forms, which may be constructed of old boards, and tamped down. Spread the concrete out in layers about six inches thick and pack down thoroly. Keep covered from the sun for five or six days to prevent quick drying. Sprinkle the outside of the wall each day so that it will not dry out faster than the inside of the wall.

If the house is to be of good size it will prove both more serviceable and less expensive if made rather deep, instead of long and narrow. Especially in the northern states should the poultry house be of good depth. I like a house from 16 to 20 feet deep and if more than 25 feet long would always choose the latter depth. The fowls will be more comfortable in a house constructed in this manner. The roosts being

self-ventilating. An abundance of fresh air is constantly being admitted while the stale air is at all times escaping. There is no stench-laden air in the fresh air house. The combs of fowls in open-air houses seldom become frostbitten. The wattles also are practically free from frostbite if drinking vessels are provided which prevent the wattles from being immersed in the water.

The yard problem is one which should receive careful attention when locating the poultry house. Yards should be sufficiently large to allow the fowls an opportunity to exercise. This is especially true in regard to breeding stock. To confine breeders in small runs where no green stuff is grown and where the ground cannot thus be kept pure and free from taint will surely impair their vitality and constitutional vigor.

If the yards are to be located on one side of the house, an effort should be made to have them sufficiently long to prevent the fowls from picking off all the green grass and thus rendering the yards bare. Small runs cannot be kept in grass for any length of time. In case the yards must necessarily be so small that green stuffs will not have continual growth therein, and the poultry house is so located as to allow

located in the back part of the house are thus far enough away from the open front to prevent any draft from striking the birds, consequently the fowls are protected from cold blasts of air and are more comfortable and far healthier as a result. A long narrow house is also more expensive to build than a short deep one.

The type of house should also be considered. The fresh air or open front pattern house is in great favor with up-to-date poultry keepers. The old closed type house has been discarded entirely by the most successful poultrymen. It is a fact that fowls housed in fresh-air or open-front buildings are far more rugged and healthy than those occupying closed, warm houses. In the fresh air house, dampness is practically unknown and the fowls do not suffer from the cold, for while the interior of the house is cold, the birds are not affected, as the air is dry and cold and dry air does not have the "bite" that damp, stale air in a closed house has. There are no ventilation problems to solve in the fresh-air house, for it is

a yard on both north and south sides, it is advisable to have double runs. One can then allow the fowls to have the run of one yard while the other is sown to quick-growing green stuff. As soon as the first yard is bare the fowls are turned into the other yard and the first is resown. This process is kept up the entire season.

However, some poultry houses are so situated that a yard on each side of the house is out of the question. If the pens inside the poultry house are rather large, this can be remedied. A double yard for each pen can be arranged on the one side of the house. The yards will necessarily have to be narrower of course. Each yard should be just half as wide as the pen inside the poultry house. One gate will answer for each double yard, the gate to be as wide as each single yard. Have the gate hinged to the end post of the center fence. When yard number one is to be closed, the gate is swung across opening of same and hooked, thus closing it to the fowls and allowing yard number two to remain open. When the fowls are to have the run of yard number one, the gate is swung across the opening of yard number two, thus closing it, and at the same time opening yard number one.

Thanksgiving

Thanksgiving time will soon be with us once again. How rapidly the months fly by, and how much has been crowded into the past twelve months. Most of us are living more in a month now than we used to live in a year or two. It is a good time in which to be alive and doing useful work, even if the old world isn't quite as peaceful a place as it ought to be.

Altho the dark war clouds still cover most of the earth, there are bright rifts in the blackness where the blue sky and golden brightness shine thru. In spite of everything we have much to be thankful for. Even if there were nothing else we can be thankful that things are no worse than they are—and they might easily be. We can be thankful that our brave "boys" are making good both at home and "over there." Thankful that the folks at home are co-operating to back up "our boys" and help win the war. Thankful for the Red Cross, the "Y," the K. of C. and not forgetting the little advertised but wonderfully efficient and helpful Salvation Army that is doing such good work close to the front. Thankful for the bountiful harvest and the abundant meat foods, which the men behind plow, feed pail, and seine have produced that we may have bread, meat and fish. Thankful for a thousand and one things, many of them too intimate and precious to name. Yes, indeed, we have much to be thankful for at this 1918 Thanksgiving season.

November should be a good month, September and early October were stormy and blustery enough to almost insure a fine and seasonable fall. Better plan to make Thanksgiving even more than a day of giving thanks and day of feasting and prayer. Surely there is some sailor or soldier boy, far away from his own home, who is in camp near you and who could be given the wholesome pleasure of a real home Thanksgiving by your fireside. Entertain one or two of "our boys"—and more if you can—at a real old-fashioned Thanksgiving dinner. Turkey may be high in price, but it is not overhigh, all things considered, and either roast prime fat fowl, capon, or green goose makes a dinner that anyone can feel thankful for, particularly when served with all the fixin's. The food administrator has let down the bars a whole lot since he first started fence building.

Make it a real Thanksgiving this year, and don't fail to share the "good cheer" with others who may be less fortunately situated.

War and Poultry

At this season of the year we may expect peace proposals and peace talk. The enemy made similar proposals at this time last year and the year before that. Some folks and some writers are talking freely about the war being over soon and the end in sight. It is just as well to turn a deaf ear to that sort of thing at this time. Instead of taking your war news from the big type headlines, pin the faith in the plain statements of men like General Pershing and his staff. He has indicated that, while "our boys" are making good even beyond hopeful expectations, the end of the war is not in sight; some of the biggest work is yet to come and stubborn resistance is certain.

One of the best things we have seen was the reply of a Scotchman when asked "When will the war end?" "In just 38 years," he said, "one year more to end the fighting and thirty-seven in which to wind up the barbed wire." The Scot probably knows as much about it as anyone else, and he had been "over the top" more than once.

Whatever happens, we are going to have a big army and navy for quite a long time—not only to win the war, but to insure peace after the war. The ranks of food producers have been seriously thinned by war needs. We are going to be obliged to recruit food producers from among the women and children and returned veterans, as well as among those men not fit for military duty. There has been great need of food producers this year and the need will be much greater next year. We must have increased food production in order to help win the war. Poultry and eggs are going to be more important than ever, as necessary foods for the young and for convalescents and also as substitutes for beef and pork.

It is greatly to be desired that the production of poultry and eggs be increased during the coming season. Poultry and egg prices are beginning to reach levels more consistent with the cost of production of these valuable foods. There is a demand for more poultry keepers, and as matters progress we believe there will be more and more incentive to engage in poultry work. The government, through the Department of Agriculture, is working to promote interest in poultry keeping and to encourage beginners to engage in poultry culture. It is devoting its energies to increasing the production of Standardbred poultry.

This is certain to help the business of the breeder and fancier. The demand for market poultry and eggs is strengthening and there is promise of better rewards for the poultterer's labor. All of this augurs well in favor of better business

"Bulletinitis"

"Bulletinitis" is a name which has been given to an epidemic form of hysteria, prevalent in these war times, which is

characterized by the affected parties—be they bureau or association officials, committees, propagandists, or what not—issuing bulletins of very stale information, frequently repeated, under the illusion that they are rendering most important "news service."

Uncle Sam, through the War Industries Board, requires publishers to save every possible bit of paper, labor and power. Publications may be mailed only to subscribers who have paid in advance. Hereafter no free exchange of "editorial exchanges" will be permitted, and editors must subscribe for publications other than their own if they desire to have them. Conservation of paper and the chemicals which go into the manufacture of print paper is the chief object in view. Yet, but a few weeks ago the Hon. Joseph Walsh of Massachusetts, in a speech before the House, accused our Uncle Sam of being the biggest paper waster in the country and made himself famous with this paraphrase of a one-time popular song: "Every Little Bureau Has A Bulletin All Its Own." The facts seem to be on the side of the Gentleman from Massachusetts, for Washington has had "bulletinitis" in its most contagious epidemic form ever since America got into the war. One official is credited with saying that the bulletins issued in Washington in one month would be almost sufficient to smother the kaiser and the whole Prussian army. The "Official Bulletin" sent out to the newspapers has long been a joke as a retailer of stale news, many weeks after such news has appeared in the newspapers and leading magazines. Probably a specific will be found for this wholesale bulletin making in time and the mails will be relieved of a big burden and a great saving in print paper will be effected.

We did not expect a great deal of the National War Emergency Poultry

Federation when it first opened its office in Washington to look after the interests of poultrymen, but we did think that the president and office manager, Reese V. Hicks, possessed sufficient good solid common sense to be immune to an attack of "bulletinitis" no matter how "catching" it might prove to be.

for poultrymen during the coming season. So keep up the fight for more and better poultry bred to Standard. Keep business going and boost your favorite varieties. By the time the war is over the poultry industry ought to be on a better foundation than ever before.

Sunnyside birds are profitable because "profit" has been the keynote of my efforts for 29 years. To secure it I have trapnested and pedigreed my layers in order to breed from none but the highest record birds. I have been successful in producing these profitable layers in large numbers, which enables me to offer them at about half what others ask for the same grade

Year-old Breeders for Foundation Stock

Barred and White Rocks, Brown and White Leghorns, White Wyandottes, R. I. Reds, from trapnested stock with records of 180 to 200 eggs, each.....\$3.00 210 to 249 eggs, each..... \$4.00

12-week-old Pullets, \$1.25 to \$1.50

Don't be a slacker or keep slacker hens. These pullets are from 200-249 egg stock and will be shelling out the eggs this winter when eggs are high. They will pay for themselves in no time, and you will still have the hen.

Grand Cocks and Cockerels out of record dams at half value

16 to 20-week-old Pullets... \$2.50 and \$3 each

Yearling Reds and Barred Rocks, "state-tested" pedigreed stock, \$3 in lots, with pedigrees.

2400-egg Candee Incubator for sale cheap

Special Offer—100 White Wyandottes, state tested, with records, \$300 for the lot

TO OUR READERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every advertisement in this issue is signed by trustworthy people, and to prove our faith we will make good to our subscribers any loss sustained by virtue of their having purchased fowls or goods from one of our display advertisers.

All we ask is, that in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. In all cases in writing to advertisers say, "I saw your ad in American Poultry Journal."

When the Federation's first "news service" bulletin appeared several weeks late, we thought there might be an excuse for it, possibly, as an aid in getting members for the organization. Alas, this alleged "news service" bulletin appears to be in a fair way to become a monthly affair and a fixed method of wasting good paper and of spending organization funds. If there is any excuse for "news service" bulletin No. 2, dated September and received at our desk October 7, it does not appear in the publication which in an announcement "To the Press" states:

"The reports, abstracts, summaries and news items herewith presented are of immediate and unusual interest to the entire poultry industry. These items of news are for immediate release."

Of the alleged "news" in this bulletin we do not find anything which was not

A Regal Feat

Regal White Wyandottes

have always been consistent winners. This fall they scored a double victory. At the Canadian National, in a class of 28 cocks, 28 hens, 34 cockerels, 40 pullets and 6 pens, they won as follows: Cocks, 1-2-3-4, Hens 1-2-4-5, Cockerels, 1-2-3-6, Pullets 1-3-5, Pens 1, Best Display.

First Prize Cock at Madison Square Garden, December, 1916

At the great New York State Fair, in a large quality class, they won: Cocks 1-2-5, Hens 2-3-4-5, Cockerels 1-2-3-5, Pullets 1-2-3, Pen (old) 1, Pen (young) 1, and Best Display for the 13th time.

These winnings were made on two entirely different strings, proving conclusively that I have good birds by the hundreds, yes, thousands. To have large flocks of young birds fully matured by the first of September, means that I have winter layers. It also proves that these winter eggs are fertile and produce chicks that live and thrive under the adverse climatic conditions of severe Canadian winters. In other words, Regal White Wyandottes are real utility birds, but they are show birds as well.

My Dorcas line, after fifteen years of trap-nesting, will show records that compare favorably with any strain in the country.

5000 COCKS, HENS, COCKERELS AND PULLETS FOR SALE 5000

Cocks and Cockerels (choice breeding birds) \$8, \$10, \$15, \$20 and \$25. Hens and Pullets, \$4, \$5, \$8 and \$10.

Special Exhibition birds a matter of special correspondence.

100 acres devoted to White Wyandottes. My stock is all farm raised. Many birds now ready for show. Order at once and get first selection.

Port Dover, Canada

already very stale long before the "news service" bulletin reached us, having already been published in the September poultry journals or in the daily press. It looks to us like a waste of print paper, time, labor and Federation funds and we hope it will be discontinued, unless it is possible to make it a real source of advance information on important subjects in time for publication before the "news" has already gone stale many weeks.

We do not see any purpose served by this alleged "news service" which could be better met, at far less expense, by a brief form letter mailed in good season from the Federation headquarters to the editors of the several poultry publications. One more bulletin added to the great mass already retailing stale "news" is only an added burden in war time. We hope those in charge of Federation affairs will wake up to this fact and promptly recover from "bulletinitis."

We believe that the Federation can and should do much good work for the poultry industry. Poultrymen should join the organization and boost for it. There will be good use for every dollar which the Federation can add to its treasury. By a common sense campaign of active, aggressive work this new "War Emergency Federation" could accomplish something. But it is not going to get anywhere by passive acceptance of the prevailing mania for publishing bulletins or by following the line of least resistance.

Either cut out the "news service" bulletin, Mr. Hicks, or make it really mean something and serve the "news" while it is "hot from the griddle." Give us a little real action instead of a horrible example of the bulletin habit. Personally we had rather receive one good newsy personal letter, even if we were told we could not print the information, than to receive a whole mail bag full of "news service" bulletins which repeat only ancient history. We have always looked upon the men now in charge of the Federation affairs as "live wires" in the poultry industry. Give us a few "sparks" from the "wire" before they cool off.

Wheat By-Products.

THRU July, August and early September we were urged to stock up with wheat mill feeds—bran, middlings, and "mixed feed"—to make sure of our necessary winter supply of these essential poultry and dairy feeds. A price was fixed f.o.b. Eastern points for such feeds, bulk in carload lots, with an additional charge for bags when supplied sacked.

Smith's White Leghorns

NOW OWNED BY C. R. HOPKINS, OSAGE, IOWA

THE business, good will and flock of White Leghorns of Eugene Smith, of Aurora, Illinois, has been purchased by me and this stock is now on my farm at Osage, Iowa, including many of the winners at Chicago and St. Louis. This is the strain that has produced more winners at Chicago shows during recent years than any other, and has given the greatest satisfaction among customers. The stock this year is even better than ever, and I am prepared to furnish you with winners or utility birds of this remarkable strain at reasonable prices. Address correspondence at requests for catalog to

What Others Say.
 I can now save enough on feeds to pay for the entire course. **F. M. HILL, LaGrange, Ill.**
 I would not take the price of the whole course for the lessons on breeding and mating. **F. L. NOYES, American Fork, Utah.**
 I could have eeced about \$400 had I taken your course before I started. **FRANK SAWYER, North Woburn, Mass.**
 The knowledge I have gained from the disease lesson is worth the price of the course. **GEORGE W. MORRIS, Russellville, Ky.**
 I have been in the building business for 30 years but your lesson on Poultry House construction is the best I have ever seen. **E. M. WIGGIN, Kansas City, Kas.**
 Your lesson on baby chicks is just what we have been looking for. Last year we lost 650 chicks out of 1600. This year we lost 65 out of 1600. This is the result of just one of your lessons. **GEO. M. JONES, Secondock, Calif.**

A Complete Poultry Education

I have made it possible for you to obtain right in your own home, during spare time, a complete—thorough—and practical knowledge of poultry husbandry such as you could get nowhere else except at an agricultural college.

In a course of lessons taught by mail, I have completely covered the science of poultry husbandry and made it so plain and simple that anybody can understand it. I give you knowledge it has taken me a lifetime to acquire.

I show you how I make hens pay a big profit each year. I show you how I got 2,354 eggs from ten hens in a year. I show you how to feed for a big egg and meat production, how to select a site for your poultry plant and how to build your houses (right here I save you many times the price of the course)—how to get winter eggs and spring broilers—how to incubate and raise baby chicks—how to mate and breed—how to avoid and treat poultry diseases—how to show and win at poultry shows—how to dress and market poultry for the highest profits. In other words there is no phase of poultry culture that you are not taught thoroughly. Hundreds of our students tell us that each lesson is worth the price of the whole course.

You cannot afford to be without these lessons. They pay for themselves many times each season in increased egg yield—in preventing losses from disease—in knowledge. The broadest guarantee it is possible to write covers this course. If you are not satisfied you do not pay.

Get Our Free Book Today

Our Free Book "Dollars and Sense in the Poultry Business," fully explains how we can help you to make more money and save money raising chickens. It explains in detail just what our lessons teach you and what they can do for you. Just fill in and mail the attached coupon or send your name and address on a post card, no letter necessary, and a copy will be sent you by return mail.

The Leading Pen

(all varieties competing)

Second Best Individual Record

Best Monthly Record

five months in succession

192 Eggs in the Lead

over other Leghorns entered

THAT is the enviable and SUPERIOR record "HILLVIEW" Leghorns have made to date in the Missouri Laying Contest now running.

HILLVIEW WHITE LEGHORNS

ARE HELPING UNCLE SAM

The UNEQUALED RECORDS of our Leghorns, both in AMERICA'S GREATEST SHOWS and in the NATIONAL LAYING COMPETITIONS put "HILLVIEW" Leghorns in a class ENTIRELY BY THEMSELVES—FACTS ARE ALWAYS FACTS—when we say we have the world's most beautiful and leading laying strain of White Leghorns, we back up this statement with *actual performances!!* This is not a mere "lip message" to get you to buy; to get you to invest your hard cash in just ordinary Leghorns. Our arguments have a base, a REAL ROOT. Really careful breeding, strict attention to every single detail in mating, hatching, rearing and feeding. It has taken REAL HARD WORK to produce the HILLVIEW "STANDARD-BRED" LEGHORN of RIBBON-WINNING qualities and EGG-LAYING habits.

IN THIS WAR TIME you can't afford to buy anything but the very best! "Hillview" Leghorns ARE THE BEST.

HILLVIEW FARM is running full capacity, producing Single Comb White Leghorns of the Highest Possible Quality to the very limit of its equipment capacity. Thousands of birds are now ready to be placed in your hands so that you too can help and add to the much needed poultry products of the country; so that you too can "do your bit" to HELP WIN THE WAR.

We are prepared to furnish you BLUE-RIBBON WINNERS for any show in the country at the most reasonable prices—great big youngsters with long concave backs, neat five-point combs, well up on deep yellow legs, long hocks and pure white plumage; BIRDS that will WIN THE BLUE! Birds that will SHELL OUT EGGS and MAKE YOU A HANDSOME PROFIT on your investment.

O. J. LABAHN,
Seeley and Gen'l Mgr.

Those who attempted to stock up with wheat by-products, except in a few instances, were unable to buy, and the few who did secure a supply were obliged to pay considerably more than the stated prices. It developed that most mills sack their wheat by-products in process of manufacture and comparatively few could or would supply such feeds in bulk. The mills were permitted a better price on mixed carlots, and either could not or were not prepared to accept orders for straight carloads of any one feed. Also the sacked feed could be more economically shipped than the feed in bulk. Instead of eastern buyers being able to get middlings, for instance, at \$32.63 per ton in bulk f.o.b. Boston points, the lowest price which came to our knowledge at which buyers here could get orders filled was \$40 per ton, sacked, in carlots, plus freight from mill in the west. However wheat mill feeds were hard to get and cheap under the circumstances at any price we could get them for. The wheat feed shortage amounted to almost a famine.

It develops that there is necessity for strict economy in the use of wheat mill feeds in order that there will be enough to go around among the feeders who require such for dairy cattle, poultry and young calves or pigs. Altho much of the wheat is yet to be milled, there apparently may be a nation-wide shortage of wheat feeds, partly due to a greater percentage of wheat being used for flour making and partly to other reasons. Early in October farmers were asked to pledge themselves as follows:

"In order to assist the food administration in the distribution of mill feeds I hereby undertake on honor not to use wheat mill feeds for any other purpose than the feeding of dairy cattle, poultry, young pigs or young calves, or the preparation of a weekly bran mash for work animals. I will not feed any more wheat mill feeds than is customarily fed to such animals, and I further agree not to have at any one time more than a 60-day supply of feedstuffs on hand."

That "60-day supply" clause is hard on the man who has been able to lay in a winter's stock of feeds for his herds and flocks, but we believe that the intent is only to prevent a few from hogging all of the wheat feeds. A recommendation is made that more of the standard commercial mixed feeds be utilized in the feeding of farm animals. Most of us have been going pretty close to the limit on that already.

Wheat mill feeds are necessary for dairy cows if we are to get the best returns in milk and butter. Bran and middlings are needed in poultry rations, particularly where we have to do without feed wheat, and also in the feeding of young stock. Undoubtedly there are some poultry feeders who could feed less bran and middlings to their flocks and still get practically as good results.

In any event it is apparent that the food administration believes that there is and will continue to be a considerable

The Elliott Poultry Farm
Route 7, Box 87, Mansfield, Ohio

shortage of wheat mill feeds. The new lots which are coming on the market are being sold at the fixed prices for such feeds, which the higher than we at first were led to expect, are easier than we have been paying for many months. Wheat feeds being cheaper in price than other feeding stuffs, as a rule, there will be a tendency to use such wheat feeds to the exclusion of other feeds, which is just what the food officials wish to prevent. They desire to equalize distribution and allow all feeders big and little to share alike. The pledge to use wheat feeds economically is a voluntary one, made on honor, and no one has any reason to raise any serious objection to it. We believe that any feeder who can show that he is only stocking his normal requirements should be permitted to carry more than a 60-day supply if he is so located that it is better economy all around for him to do so. The man on a farm remote from market and subject to long hauls and difficult freight transportation should receive more consideration than the man located close to a good grain market.

We understand that if all feeders cooperate to conserve and feed sparingly the wheat mill feeds, we may expect such wheat by-products to continue at present fixed prices, while if there is any considerable violation of the voluntary pledge asked, the fixed prices on wheat by-products may be removed and the price of wheat feeds be permitted to soar in accord with the law of supply and demand.

Evidently there will not be available a large supply of wheat mill feeds during the coming season. It is only fair that all should share alike and most feeders will want to do the right thing. Use bran, middlings and "mixed feed" in your poultry and dairy rations and for young stock as you find it necessary to use them, but use such wheat feeds economically and without waste. It is reported that the western feeders near milling points have been absorbing most of the wheat feeds because of the lower price and convenience in securing supplies. With the reported probable shortage of such wheat mill feeds, these more favorably located feeders, as well as all others, should willingly agree to the pledge asked by the food administration and practice economy in use of wheat by-products, along with the rest of us, in order that there may be enough to go around.

All any of us should ask or expect is a square deal and equally fair treatment for everybody in the distribution of both feedstuffs and foods. Just now, and for some time past, the man who

First Prize

As a Prized Winner

Nine first prizes out of a possible ten, for eleven consecutive years at the great Madison Square Garden, New York, Poultry Show, is the premier performance of the Sheppard strain of Anconas. Hundreds of owners of these birds win great success at state and county fairs and smaller shows. The same strain of

Sheppard's Famous Anconas

are most noted layers of large white eggs. And they're very attractive in their grace and activity. Start with these Anconas this late summer or fall—and make the right start by getting my free book right away.

H. Cecil Sheppard, Berea, O.

is located at a distance from supply centers and the big markets is decidedly at a disadvantage.

Eastern Fall Fairs Hard Hit.

THE EPIDEMIC of Spanish influenza which swept over the Atlantic states early in the fall, starting in New England, hit many of the fall fairs and poultry exhibits a hard blow.

So prevalent and fatal did the plague prove to be that health officials found it necessary to close schools, churches and all places of amusement where crowds might gather. Many fall fairs which hold poultry exhibits were obliged to cancel dates. This was a hardship to many breeders of exhibition poultry who were caused some expense and loss thereby, but there was no complaint and no reason for any. The plague simply had to be checked and brought under control and everyone was glad to do his bit to help fight the epidemic.

At present writing—the second week in October—the influenza appears to be under control and with favorable weather the danger should be past by the time this is published. The forced closing down of fairs and other places where crowds congregate will do no harm, the small losses of a few individuals are nothing compared with the big gain for the people as a whole. Interest in the winter exhibitions will be greater than ever in consequence of the closing of some of the fall fairs, and next season, under much more favorable conditions, we hope and trust our fall fairs should be bigger and better than ever.

Don't Overlook Opportunity.

NEVER be misled by the saying that "Opportunity knocks only once at your door and then passes on." That may have been true in earlier times, but we doubt it.

Opportunity knocks many times at your door every month in the columns of AMERICAN POULTRY JOURNAL. You overlook and neglect your opportunities if you fail to read A. P. J. carefully, advertising columns and all, each month. Advertisers are offering bargains in necessities of all kinds. Breeders are presenting unusual opportunities for purchase of desirable breeding stock in all the leading Standardbred breeds and varieties.

Don't overlook your opportunity. If you intend to make a start with poultry the coming season, better invest in breeding stock now. There is still time to get good delivery and have your stock safely housed in its new home before the more severe winter weather sets in. The prices are right and it is a good time to buy. Both adult and young stock is now available for prompt shipment.

Make the most of your opportunities now. Poultry culture promises to be both interesting and remunerative in 1919, and most certainly increased production of poultry and poultry products is going to be needed.

Barred Wyandottes White Wyandottes

—PRIZE WINNERS—GREAT LAYERS—

On Whites won 4th and 5th cock, 1st old pen, 3d young pen at Trenton in strong competition. Our Barreds are running uniformly well this year. Breeding cockerels and pullets, \$5 and \$7 each; show birds, \$10 up.

AND COMMENT**

The Building of the Ship.

Our hearts, our hopes, are all with thee,
Our hearts, our hopes, our prayers, our tears,
Our faith triumphant o'er our fears,
Are all with thee—are all with thee!
—Longfellow.

Welcome, Indian summer! This is one of the finest seasons of the year, the few warm days before the arrival of real winter, but all seasons are good, though we like cold winter least of all.

Thanksgiving! Make it a memorable one. It doesn't matter whether the dinner be turkey, prime fowl, fat capon, roast goose, or just plain plump chicken, this is the season when well-fatted poultry should come into its own. Eat more poultry and eggs and so conserve beef and pork.

Our grass land laid down the second week in September is showing the effect of the fall rains and is putting on a nice soft green carpet. A mixture of red top, timothy, and red clover, it should make good hay next season if we can only get poultry manure enough to keep it coming. We laid down about three acres with grass seed this fall, but we don't like to recall the cost of plowing and harrowing to prepare the seed bed.

New York State Agricultural College has made a splendid exposition of the cost of raising a dairy cow. We wish someone would be equally thoro in showing the cost of raising an average American class pullet to laying maturity. The cow cost was figured when feeds and foders, as well as labor, were cheaper than now, but the table is valuable just the same. In spite of what some folks seem to think, cows and hens raised on the farm are not "grown for nothing," they cost money in somebody's time and somebody's feed and fodder which would bring money if sold. New milch cows are today selling around \$200 to \$250 in our section and they don't show any big profits at that price. Here is the table of cost of raising a cow, if you want to figure it for your home locality, just figure it at present day costs of feeds, fodder, etc.

Amount Used in Raising			
	Cow	Price	Cost
Whole milk,	433 lbs.	\$3.04 per cwt.	\$13.32
Skim milk,	212 lbs.	.75 per cwt.	1.59
Grain,	589 lbs.	59.00 per ton	17.38
Silage, etc.	1,777 lbs.	8.00 per ton	7.11
Hay, etc.,	3,558 lbs.	18.00 per ton	32.02
Human labor,	52.5 hours	33 per hour	17.32
Other costs—bedding, horse, labor, use of buildings and equipment, interest on heifer and feed, value at birth, losses due to death, miscellaneous charges, less value of manure.....			17.79
Total cost of cow.....			\$106.53

In considering above remember that today in our section the low price on grain for

NEWTOWN Giant Incubator

Hatches the Most Chicks—
The Best Chicks—
With Least Labor—
And at Lowest Cost—

You cannot ask or get more; you should not be satisfied with less. Newtown efficiency and economy will insure your success.

The Newtown Mechanical Eggs-Turner

is a big labor-saver. Where other large incubators are used, much time must be spent in turning the eggs twice daily. The *Newtown Mechanical Eggs-Turner* has changed this. Take ten seconds to turn the crank and all eggs in the machine will be turned better than you can turn them by hand. No eggs are cracked or dropped and broken. No "bunching" on the trays.

Read this Report from Michigan Agr. College

"Relative to our hatches with the *Newtown Giant Incubator*. We have brought off three in all. The first gave us 92% of the fertile eggs, second 91%, and the third a little better than 92%." "The incubator gives us chicks that can be shipped by parcel post as far as Texas, W. Colorado and Northern Minnesota. The greatest number found dead,—in shipments ranging from 200 to 400 chicks,—no more than four. We are very enthusiastic about the *Newtown Giant*."

(Signed) C. H. BURGESS, Assoc. Prof. of Poultry Husbandry.

If you demand highest efficiency plus economy and certainty, write for complete Newtown catalog today. Please state the size incubator in which you are interested. Remember, it is to your advantage to place your order early.

COMMON SENSE

You CAN get More Eggs!

There's a reason for everything. If your hens aren't laying it's because they're not getting the kind of rations that makes eggs.

When you start to use

Common Sense Scratch Feed and Egg Mash

your hens will start to lay more eggs than ever before. There's a reason for it—COMMON SENSE SCRATCH FEED AND EGG MASH contains the food elements in the right proportions that long experience and experiments have proved necessary for healthier hens and more eggs. Thousands of experienced breeders have testified to that.

What we claim for COMMON SENSE FEEDS we guarantee—there's a written guarantee in every bag; if you're not satisfied that COMMON SENSE SCRATCH FEED AND EGG MASH produces more eggs and healthier hens than you ever had before—we'll buy back what you haven't used and pay all transportation charges. Isn't this inducement enough for you to at least try COMMON SENSE? Tell us where to send samples and our descriptive booklet—and send your dealer's name.

The FAMABELLA COMPANY, Inc.
Dept. N
1107 Grand River Ave.
DETROIT MICH.

cows is between \$59 and \$70 per ton, with cow hay around \$29 to \$35 per ton, and human labor for farm work bringing 50 cents an hour. When we look facts in the face \$200 is not such a big price for a good milch cow just in that. But the same plan of cost, figuring on your pullets at laying age, and you'll begin to feel that a good healthy pullet ready to lay is very cheap at \$3 and quality pullets should easily be worth not less than \$5 each—considerably more than that if of exhibition quality.

Just to interest yourself look over your accounts for 1918 season and find out what your pullets cost you. Take the case of an American class pullet which reaches laying age at seven months old and about 6 pounds weight. You can figure costs on approximately the following items:

- Value as a baby chick.
- Grain and feeds, including animal food, 48 lbs.
- Human labor, at approximately half a minute per day per pullet, 2 1/4 hours.

Figure the cost of housing and use of equipment, interest on investment, value of use of green range, losses through death, and miscellaneous expenses less actual value of manure and add that to above costs. Doesn't the average healthy pullet at laying age seem cheap at \$3?

Cull the flocks and fatten the non-producers for the Thanksgiving day trade. Two weeks on whole corn in abundance, with a little beef scrap, grit, and plenty of drinking water, will turn the trick. Keep them penned so that they will not waste the flesh they are making in overmuch exercise.

Do not try to do entirely without wheat feeds or feed wheat in the poultry rations. Some sort of wheat feed is essential to best results. There seems reason to believe that there may not be sufficient wheat feeds to go around throughout the season, unless they are used very economically and some means is taken to equalize distribution. If "standard" middlings are used in the mash less bran or no bran at all will be required, for standard middlings contain a good deal of reground bran as well as ground screenings. If a fair amount of feed wheat is available for mixing with the scratch feed, less bran and middlings or wheat "mixed feed" will be required in the mash. If wheat "mixed feed" is used in the mash, the bran and middlings may be eliminated. Where corn and oats are the staple feeding grains the poultry should have a fairly good percentage of wheat feeds in the mash. If the mash is largely corn meal and oats or corn and cob meal, use feed wheat more liberally in the scratch grain. While poultry will do quite well on a corn and oats ration with occasional feedings of barley and buckwheat when available, we do not believe it wise to use continuously an exclusively wheatless ration. We do not understand that poultrymen are asked to make their rations wheatless, merely to use feed wheat and wheat by-products economically and not to use them in excess of actual needs and customary usage.

One of the best mashes for laying or stock birds at this season of the year may be made by boiling cut potatoes in their jackets in a big iron kettle out of doors and then making into a crumbly mash with a mixture of corn chop and standard wheat middlings, about equal parts. Use the liquor in which the potatoes were boiled for mixing the mash and crush the potatoes in it. If about 10 percent good beef scrap is boiled with the potatoes, it makes an even better mash. Waste pumpkins, squash, beets, etc., can be utilized in the same manner to the advantage of flock and owner. Commercial mash mixtures may be used for stiffening the vegetable brew if desired. Feed what the fowls will clean up quickly once a day. It is best served freshly cooked and warm.

We have never permitted gunning on our farm, altho our point is one of the best black duck and wild goose stands on Silver Lake. However our boy, just turned fourteen, has reached the shotgun stage of development and is beginning to keep the larder stocked with game of various sorts, while also turning to trapping and saving different sorts of pelts. Already he has furnished us with a brace of wild ducks and we are looking for a Canadian wild goose soon. The geese are either not as plentiful as usual this season or are rather late in going south.

Our Canada Cap yellow flint corn and Rhode Island smoky white flint corn have both matured fairly well this season in spite of severe late and early frosts. These are the best two sorts of flint corn for planting in localities where the season is short and fickle. Our corn has matured well, the ears are well filled to the tips and the grain is hard and firm. Some that was husked and hung in the kitchen is dry enough to mill. We haven't all our corn harvested and husked yet, not so much because of the size of the crop, for we could do with much more than we have, but chiefly because of difficulty in finding time for harvest work. Labor simply cannot be had for farm work. The yellow flint corn makes a fine meal and is excellent for stock feeding. It gives a fairly good yield of good long ears. The smoky white flint corn is the most wonderful producer we ever had. Often two good ears on a stalk and sometimes three. This variety is inclined to sucker profusely and to grow ears on the suckers close to the ground. Some of it formed imperfect ear corn on the tassel, and we had more or less double, triple and even quadruple ears in the same husk. Of course these freak ears produced only feed corn fit for immediate use. This white corn sports red ears freely. It matures quickly and hardens rapidly, the ears are rather shorter and bigger round than the yellow flint. It makes an excellent meal for making cornbread and Rhode Island johnnycake when the corn is thoroughly cured and dry. The meal is quite sweet and when mixed with whole milk or cream for making johnnycakes ("griddle cakes" in some localities) it requires little or no sugar. As for season, it is the best short season corn we know of. We had a hard frost and freeze on the morning of the first day of summer, June 22, when our corn was under ten inches high, and our early potatoes were in full bloom. Big bonfires of hardwood all over the place all night long helped to protect our crops. We did not lose by the freeze tho most of the folks around here did. Then we had another killing freeze on night of September 11, which killed our neighbors' corn but only touched ours lightly. Yet in spite of this short season both the white and yellow corn matured and ripened well, except a short piece which was too close to a pine grove. The seed we used was grown on the farm of a poultryman in a neighboring town.

Last spring M. C. Wilson, Oil City, Penn., sent us a few ears of a yellow sweet corn which he has been developing. He directed us to fertilize it liberally with R. C. White Leghorn droppings, but as we hadn't any we used a good mixture of White Rock and Black Langshan dressing with excellent results. We never had finer sweet corn nor any which kept in season longer. It was not so early as some but when the corn came it lasted until killed by the frost. The stalks were a rich green, striped with deep red in most cases. Usually two good ears to a stalk and sometimes three, the ears of good size and well filled. It went so well on the table and remained tender for so long that we did not mature as much seed as we want for next year. The early frost caught the corn too soon, but we hope we have enough to make a good patch next spring. We do not know the name of this excellent sweet corn. Perhaps Mr. Wilson will advise us later on that subject.

Give liberal feedings of whole corn on cold evenings, which warn of colder nights. See that the birds go to bed with full crops. Buckwheat is a good variety feed for use in cold weather.

If the pullets are not producing as they should, boost them a little by encouraging them to eat more. See that they have plenty of concentrated mash as well as good scratch grain and some succulent vegetable food. It takes liberal feeding to get eggs. Pullets cannot make eggs on kind words, bureau bulletins, and just enough food to keep them alive. They need grain, mash, meat food, greens and water in abundance, and all of the food must be wholesome in quality.

Birds intended for the winter shows should be in training now. We do not believe in close confinement when birds are being conditioned. Accustom them to cooping in coops of exhibition size, but let them out now and then for exercise. Get them used to handling and train them to pose to show their points to best advantage. Feed them enough wholesome food in variety to keep them in good order and up to weight, but do not feed heavily on concentrated stuffs which will get the females to laying and the males to growing beefy combs. Be gentle in handling the birds and groom the plumage by stroking with a soft cloth. Keep the coops and pens supplied with clean straw litter. Male birds which are to be shown with females should be accustomed to their coop mates. With a little care and patience even wild specimens can be trained to pose and not to fear handling. The well

You Can RELY on the BUCKEYE Line

Thousands of professional and amateur poultry raisers have learned to depend on the Buckeye line for unfailing results. Their experiences have taught them to insist on the "Buckeye" label when buying poultry equipment. You cannot make a mistake in following their lead whenever you need an incubator or brooder.

BUCKEYE THE PERFECT INCUBATOR

Built for results, not to meet competition. Although Buckeye prices are reasonable, we have always built up to a standard, not down to a price. The Buckeye has earned a national reputation by hatching a vigorous chick from every hatchable egg. Because of this reputation over 6000 leading dealers are glad to recommend and guarantee it. Operates in any temperature down to freezing. Requires no artificial moisture; very little attention. All sizes—60 to 10,500 egg capacity. For complete description and price, send for our big free catalog.

STANDARD Colony Brooder

This is the Brooder that is guaranteed to raise every raisable chick. It is such a remarkable brooder that we will allow you to write your own guarantee. We will sign any reasonable warranty that you care to write, and stand back of it to the limit. The Standard is easily kept clean; very inexpensive to operate. Burns hard or soft coal, coke or gas. Our new catalog gives complete description of the various sizes and prices of Standard Brooders. Also contains letters from many of our 50,000 satisfied users. Sent free on request.

BUCKEYE OIL-BURNING BROODER

The Buckeye is a scientific Oil Burner that raises healthy, vigorous chicks. Dead air space insulates against cold. Fumes from oil burner never reach the air which chicks breathe. Constant current of warm, fresh air for chicks. Low in price and very inexpensive in operation. Will give perfect satisfaction. See catalog for details.

SEND FOR FREE CATALOG

The Buckeye catalog is full of money making hints for the poultry raiser. Fully describes all "Buckeye" poultry equipment. Quotes lowest prices. Gives experiences of successful raisers. Send for free copy today. Your name on a post card will do.

Questions and Answers
 Conducted by
 Prince T. Woods, M.D.

Questions about poultry are answered in this department free for all readers of American Poultry Journal. Where answers are desired by mail, a stamp for reply is requested. Address all query letters to the managing editor, Dr. Prince T. Woods, Lock Box 4, Silver Lake, Mass.

Keeping a Flock on Shares.

Q. Would like to have your opinion on following: A neighbor of mine is moving to town and wants me to keep 12 pullets and a cock bird (Barred Rocks) for her. What proportion of eggs could I allow her?

A. We do not like agreements to keep live stock made on a share basis. Several times we have had farmers keep flocks of fowls for us and in every case the farmer has had all the produce of the flocks for his trouble. We have always considered that he earned all the eggs produced by keeping the fowls and returning them to us in good condition. Unless your neighbor pays for the feed, should not consider that she is entitled to a share of the eggs.

Under present day conditions, if anyone were to bargain with us to keep a flock of fowls for them, we would not even consider undertaking it unless the owner of the fowls agreed to pay for all the grain and feed required for the flock. The owner would have to stand all risk of loss thru sickness, accident, etc., furnish packages for shipment of eggs and pay transportation on them. In such case the owner might fairly expect one-half of the eggs produced.

As you state your case, it is our opinion that you are entitled to all eggs produced to pay you for accommodating the neighbor by keeping and caring for the flock until she takes them off your hands. Perhaps you should also have compensation for your trouble, but that is for you to say.

Torn Backs.

Q. A number of my hens have badly torn backs. What is the cause and the remedy?

A. The torn backs are caused by sharp edges and points of toenails of cock bird. Sometimes caused by long sharp spurs, but more often by razor-edged toenails. Very heavy males are most likely to cause trouble. With knife and file blunt the sharp points and edges which cause the trouble. Remove injured hens from flock. Cleanse the wounds thoroly. Freshen the edges of the tear and trim off ragged parts to leave smooth edge, then sew up wound with sterilized white silk. Remove the stitches when healing has

fixed edges of wound in place. Keep hens away from male until injury is completely healed and skin is free from scab.

Defects in White Wyandottes.

Q. (1) I am very much interested in White Wyandottes but do not know anything about them. Are there two distinct breeds, single and rose comb? This spring I bought two sittings of very fine world's champion eggs from individual hens at \$1.50 each. Four of the chicks have single combs.

A. (1) The White Wyandottes are very excellent fowls, both as egg producers and as table poultry. The Standard requires rose combs for all varieties of Wyandottes. The rose combed fowls throw some single combed "sports." Such should not be used for breeding purposes.

Q. (2) I notice, too, some with green legs and one chick with feathers on its legs. I do not even feel sure of the few others that look to be pure bred.

Meyer's Famous R. C. Reds

Our Pen No. 59 holds the Highest Official Red Record ever made in any laying contest.

Our pen No. 22 was first prize pen 1916-17 American Laying Contest. Our hen No. 6 in the Missouri National Egg-Laying Contest laid 114 eggs in 120 days. This shows that Meyer's Reds are leading all others. They are the world's supreme. They win first year after year, in competition with the best blood in the world. We have the finest lot of young stock we ever raised. If you wish the best, write us your wants.

Mention the American Poultry Journal when writing to advertisers.

A. (2) Green or greenish legs and feathers on shanks or down between the toes are defects noticed in a number of strains of White Wyandottes. Green legs, stubs, down and feathers on legs disqualify the specimen but do not necessarily mean that it is not pure bred. Such defective birds are culls. No matter how good the breeding stock may be a rather considerable proportion of the progeny will have to be culled out for defects. The proportion of specimens which will closely approach the Standard ideal will be small. This is one of the reasons why specimens which very nearly fill the requirements for Standard perfection bring high prices. The difficulty in securing first class exhibition specimens in any breed is a part of what makes breeding Standard breeds worth while and adds to the pleasure and interest of breeding good fowls. We should lose much of our satisfaction in producing good ones if such were easily obtained without the exercise of patience and skill in breeding.

Q. (3) Is very red skin all right for Wyandottes?

A. (3) No. The skin of the Wyandotte should be yellow. Head gear should be bright red. Red blood vessels and pigment may show at sides of the yellow shanks. Old fowl may show red skin on abdomen and about rump at molting time. White skin is a not uncommon defect. Chicks that are not fully fledged, slowly feathering young males, sometimes show very red skin on bare parts due to sunburn and exposure to weather.

Q. (4) Would you advise toe-marking chicks with a poultry punch when they are 4 months old or older? C. W. Charlottesville, Va.

A. (4) Would not toe-mark chicks with an ordinary poultry punch except soon after hatching. Toe-marking half-grown stock is seldom satisfactory as the holes are likely to skin over and be lost. A fairly large hole made with a harness punch will often prove permanent, but, as a rule, the most satisfactory way to mark half-grown or adult stock for identification is with numbered leg bands. Leg bands can be had in a sufficient number of colors and wide enough range of numbers to suit all purposes for identification and pedigree work.

Do not be in too great a hurry to condemn a growing chick for defects. Sometimes specimens which do not seem promising when half-grown prove remarkably good when fully matured.

Hardy Breed for City Lot.

Q. I have a small place in the city and want to keep a few chickens, principally for eggs. Can I have a chicken yard 25x50 feet with plenty of shade. House 8x12 feet. My business requires me to travel about half of the time, so I do not expect to try to raise more than a few chicks each spring with hens. What do you think of Black Minorcas for what I want? Which do you consider the better suited for my purpose, the Minorcas or the Rhode Island Reds? If the latter, which would be better, the R. C. or S. C.? Would you consider some other breed more satisfactory? If so, why? How many birds could be kept in space mentioned, without access to live greens of any kind? Mobile, Ala.

A. Probably the Rhode Island Reds, either S. C. or R. C., would answer best for your purpose under conditions named. They are very hardy and able to stand confinement, with little care and attention. The Black Minorcas are an excellent breed but require careful attention and it is probable, as you must be away from home a large part of the time, that one of the hardy American class breeds would suit you best.

You will need to supply succulent greens and vegetables in season and should furnish cut clover or alfalfa in winter.

Fifteen to twenty fowls will be plenty for the space you have available.

The American class varieties do remarkably well when fed by hopper and automatic feeder method—a plan suited to your needs. Probably Reds or Wyandottes, which have little tendency to put on internal fat when heavily fed, would give you very satisfactory results.

Incubator Hatch Failed.

Q. Please tell me why my eggs did not hatch. Had air incubator. About 50 percent had grown chicks in and some would break the shell and had sticky stuff on them which dried after they pipped. Some say too much moisture and some tell

me not enough. My breeding stock was in fine condition. Have S. C. White Leghorns, Deleon, Texas. C. M. F.

A. Possibly you did not run your incubator strictly according to manufacturer's directions. You do not state where the machine was located nor the make. From what you tell us we are inclined to believe that you did not take sufficiently good care of the eggs while saving them for hatching, some of them may have been kept overlong. Eggs for hatching should be kept in a cool place. If kept too long or if exposed for any considerable number of hours to a temperature of 70 degrees or above that, the results on incubation would be about as you describe them. Eggs for hatching should be kept at a temperature not above 60 degrees nor below 40 degrees, and the fresher they are when set the better.

Corn Chop and Corn Meal.

Q. Please tell me the difference between corn meal and fine corn chop. I read so much about corn meal being used in poultry rations. Wouldn't whole corn ground to a fine meal do just as well? What is the difference? W. J. K.

Loretto, Colo.
A. You could not have anything better for one of the ingredients of your poultry mash than cornmeal made by grinding whole corn into a moderately coarse meal. Corn meal should be from shelled whole corn, but in commerce often includes the meal which results in grinding cracked corn. Feeding meal varies greatly in quality due to the quality of the corn from which it was made, the age of the meal and the conditions under which it has been kept. The unbolted meal is preferable for poultry feeding. Recently we have had meal offered us as "corn meal" which had every indication of being corn and cob meal, made by grinding the ear corn, cob and all.

"Corn chop" is a name which is differently used in different localities. Properly it means a coarse corn meal or chop made by grinding shelled whole corn. The name is sometimes applied to coarse feeding meals containing chiefly corn but with the admixture of a small percentage of some other grain, and in some localities it is applied to a corn and cob chop such as is made in a common farm mill by grinding ear corn. When you buy corn chop you should get only a coarse unbolted meal from whole corn. A "chop" is the entire product of the mill when any grain is ground, and in its coarse meal includes the bran, the middlings and the fine meal or flour—simply a coarse meal of the entire grain.

Early Molting Hens.

Q. I have about 40 year-old hens that laid well until about three months ago when they quit and began to molt. Now—September 18—they are almost done molting. Would you advise me to feed them for eggs this fall and winter? If they lay well this fall and winter will it have any effect on the fertility of the eggs next spring and summer and the number of eggs laid next summer? L. F. C.

Lebanon, Ind.
A. You can't eat your cake and have it too. Those hens will probably lay fairly well without any forcing. If you force them for eggs this fall and winter, you will not be likely to have as good fertility in spring as you would if you carry the hens over on a comfortable ration without pushing them for eggs. They are not likely to lay late into or thru next summer.

House Disinfection in Fall.

Q. Would you advise whitewashing or otherwise disinfecting a poultry house as late as November? Am moving on to a farm November 1st and want to put the poultry house there in shape for immediate use. It needs disinfection and a thoro cleaning. M. A.

Manchester, N. H.
A. Unless you can immediately and thoroly dry out the house with artificial heat, using a good stove, we would not attempt to whitewash so late in fall. Give the poultry house a thoro cleaning, then sprinkle floor and paint all woodwork well with crude petroleum.

Corn and Cob Meal for Hens.

Q. Would you advise use of a meal or chop made from ear corn, ground cob and all, for making poultry mash? How would you use it? We raised our own corn and have our own mill for grinding the corn, cob and all. F. E.

Middleboro, Mass.

Increasing The "Egg Money"!

SURELY you want all the money your flock can make for you—almost no labor is required to get every egg the hen can lay—you will be handsomely repaid for your trouble.

The laying hen that hunts the sunny corners on the first chill day and that looks for these warm spots until late spring, can be made over into a happy, busy egg producer in almost no time—a profit payer.

Read this letter from a well-known Breeder!

Dear Sir: Princeton, N. J., January 15, 1917.

According to your suggestion, on January 3rd this year I gave a pen of 125 White Leghorns, a warm, moist mash the composition of which is the same that is used at the North American Egg Laying Competition, and to this mash I added three drops of Sloan's Liniment to every bird. Before I started this feed the pen was giving a ten percent egg yield, and from checking my records I can report the following results:

January 3, 1917.	125 W. Leghorns	Egg Yield	12
" 8, ..	" ..	" ..	42
" 14, ..	" ..	" ..	76

This I call a wonderful record especially with a pen of birds hatched the first week in June. I am getting better results from these birds than I am from my pullets hatched the latter part of April and May. Tomorrow I intend to start Sloan's Liniment with all my 2500 Birds including all my breeders. I shall let you know the results

Thanking you for the information which has produced such wonderful results, I am,

Very truly yours,
LIVINGSTON SWENTZEL.

Here's the way to do it—Read carefully

For every ten layers that you wish to get in shape, pullets or hens, give 20 drops of Sloan's Liniment mixed with one pint of moist mash every day for three days and then give the same dose twice a week throughout the year.

For growing youngsters, give ten drops of Sloan's Liniment to ten youngsters in half a pint of moist mash twice a week only. Put five drops of Sloan's Liniment in every quart of drinking water.

Purchase a bottle of Sloan's Liniment from your nearest dealer. The small size contains enough to last ten birds two months or more. The large size contains 13 ounces or six times the small size. It's wise economy. One bottle will prove its profitableness and the many other uses you will find for Sloan's Liniment in the household will warrant your having a bottle on hand at all times.

NOTE—You will not find these special poultry directions in the circular with the bottle, so keep this advertisement

HARNLY'S White Orpingtons

SPECIAL BARGAINS IN BREEDERS AND EXHIBITION STOCK
Mary K. Harnly 2301 Elisha Ave. Zion City, Ill.

A. Coarse corn meal—from shelled corn—is commonly considered better for poultry than corn and cob meal, but good results have been secured with the latter. The chief objection to corn and cob meal is the amount of coarse fiber, which is in excess of 6 percent. Considering the shortage of wheat mill feeds, you ought to be able to turn your corn and cob meal to good account and make a saving in wheat by-products. Grind your cob meal as fine as your mill will permit to avoid coarse bits of cob fiber. Mix two parts—by weight—corn and cob meal with one part ground oats—hulls sifted out—and add about 30 percent good fine beef scrap. This will give a good mash without wheat by-products. If you can get wheat middlings, an addition of from 10 to 20 percent will improve the mash; so would the addition of a like amount of barley meal. However, corn and cob meal, with sufficient fish meal or beef scrap to boost the protein, will make an excellent poultry mash without use of other grains and feeds. It is a good war ration and a mighty good thing to fall back on in a mill feed shortage.

White Orpingtons.

Q. I am interested in White Orpingtons and have always thought that with proper care in feeding, housing, selection, in fact in every way to keep them hustling and growing, that if they possess the laying qualities they will begin laying when from 6 to 7 months old.

My birds were hatched May 15, 1918, and at time of writing about 80 percent will weigh 4 pounds or better, with one cockerel weighing 5½ pounds. Will it be possible to have the pullets laying by the last of November or early in December?

W. S. F. A. As your birds were about four months and five days old when your letter was written they show fair growth, season and growing conditions considered. If you can get good grains and feeds, and will push feeding, they should nearly double their weight by time they are seven months old—possibly do even better. The thing to do is to make as good, rapid, healthy growth as possible before severe weather sets in. They will need plenty of good beef scrap—or other animal food—succulent vegetable food and good sound grains and feeds. They should have the frame already to build for size and weight. With good care and liberal feeding, comfortable quarters and avoiding crowding, you should have some of the pullets laying by Thanksgiving and most of them in full lay by Christmas.

Eggs in Water Glass—Solution "Milky."

Q. I have been putting down eggs in water glass in a stone jar without a top. Have been putting the eggs in just as I get them. Just noticed that the water is becoming milky. Please let me know if this will injure the eggs. A. B. C. Richmond, Va.

A. If the water glass solution was properly prepared and the eggs clean and free from cracks when put in solution, everything should be all right. The solution is usually "milky" if left uncovered or frequently disturbed. Better provide a cover for the jar to keep dirt out of it. A wooden cover will answer.

Feeding Questions.

Q. (1) What amount of feed in weight should I give each hen per day?

A. (1) Do not feed by weight. Feed according to appetite. A medium size hen will average about 2 ounces of scratch grain and 2 ounces of dry mash mixture daily in addition to greens, water, grit, oyster shells and charcoal.

Q. (2) What kind of feed should be given poultry and how often?

A. (2) Keep a good dry mash mixture in a hopper all the time. Use a good commercial ready-mixed mash or make a mash according to one of the several formulas which have been printed in this paper from month to month. A mixture of cracked corn and whole oats makes a good scratch grain which should be fed in litter twice daily. Or use one of the many more elaborate and excellent ready-mixed scratch grains. We have recently published several good articles on feeding fowls.

Q. (3) Have been feeding Purina Chowder, but as this costs \$4.50 per hundred, I

VENTILATION

Don't waste time, money and patience on old style low, damp, drafty, unhandy poultry houses. After years of experimenting I have perfected a simple design, easy to build or remodel, that overcomes these serious faults. Book giving plans, details and illustrations \$1. Personal checks \$1.10. Satisfaction guaranteed.

S. E. Burdin, Suite 16, 104 Stubbard Av. Toronto, Ont.

Mention the American Poultry Journal when writing to advertisers.

think it a bit expensive. Scratch feed costs \$4.75 per hundred.

A. (3) The mash named is well recommended and the price is consistent with other feed prices. A good home mixed mash will cost close to \$4.25 or \$4.50 per 100 pounds at present writing. Here in the East we have been paying above \$5 per 100-lb. bag of grain for so long that this fall's prices seem much more moderate.

Q. (4) I recently bought 25 pullets and about 10 cockerels—these latter I intend to get rid of—some Brown Leghorns, Partridge Wyandottes and a few mixed. Intend to keep these pullets laying this winter and in spring start with good stock. Do you think it wise to keep Leghorns and some American table birds? I thought of Rhode Island Whites. A friend of mine suggested White Wyandottes or White Rocks. Am very much interested in your publication.

Newark, Ohio. J. A. C.
A. (4) We hope you are successful with your mixed flock of pullets, but we believe you would have found it more satisfactory in every way to have made your start with a smaller flock of pure bred stock of one variety. Better get into Standardbreds and stick to them. Either the White Wyandottes or the White Plymouth Rocks will give you excellent results. Both Brown Leghorns and Partridge Wyandottes are excellent fowls, if you have secured good pullets from well bred stock, but from your letter we take it you have taken over a mixed flock of uncertain parentage. It will be wise for you to pen the Leghorns and the Wyandottes separately. Better choose one good, all-purpose Standard variety and stick to that. One variety is plenty for back lot poultry keeping.

Too Much Soft Corn or Frosted Greens.

Q. Please tell me what kills my geese? Have lost three full grown geese this fall. They seem well and look fine. Eat and drink well, but each week lately I have found one dead. They just drop over and flop their wings and are gone. Never had anything like it before. Cannot find anything they get to eat that is poisonous. Cut one open and it looked all right. Liver seemed a little light in color. It was not overfat. They had running water all summer until last three weeks. I keep a pail of water at the well for them. They stay around the house all the time except once in a while they go to the edge of the corn field and eat corn. I feed them clean old corn but nothing else, as they can get plenty of grass.

George, Iowa. Mrs. C. E. B.
A. We believe the trouble is acute indigestion. This may be caused by too much grain, too much soft new corn, or may result from eating frosted grass or greens, especially if they feed on it before sun has dried off the frost. Perhaps some goose grower among our readers may have had similar experience and can offer more light on the subject.

Poultry raisers who expect to use coal-burning brooders and incubators next season should make their plans early. This is the advice of the U. S. Fuel Administration and will be promptly heeded by the judicious poultryman. The amount of anthracite coal to be shipped will be materially reduced. In fact those states west of the Mississippi must secure their anthracite coal from other sources than the East. In so far as Missouri is concerned, poultrymen can secure some of the western anthracite coal either from Colorado or Arkansas, says H. L. Kempster, of the University of Missouri College of Agriculture. It is also suggested that screened coke can be used. Action should be taken immediately for next spring's needs. If this is done there need be little if any difficulty experienced. One must not figure on the Fuel Administration making special allotments next year as it did last.

REMOVAL TO WINTER QUARTERS

The ideal way to manage laying hens is to have suitable houses at maturity, with other yards or ranges suited to the flock while growing, and have each flock of layers occupy the same quarters all their lives. If pullets must be moved from the quarters they have occupied during the growing season, every effort should be made to make the change as little disturbing to them as possible. The method of removal will not be the same for all cases and conditions. Each poultry keeper must consider the situation as it exists for his stock and adapt his treatment to the circumstances.

How to Build Poultry Houses

of all kinds and descriptions. It gives complete plans. How to make feed troughs, nest boxes, water troughs, roosts, droppings boards, brood coops, brooder houses, fattening coops, colony houses, winter and summer houses, etc. Price 50c. AMERICAN POULTRY JOURNAL PUB. CO. 522 Plymouth Court Chicago, Illinois

The Complete Egg Food for Heavy Laying Hens

SUCRENE POULTRY MASH with BUTTERMILK

Laying hens require a stronger protein feed than any other animal because the hen's egg is a strong protein product. Moulting hens require it to produce new feathers, which are 87% protein, and to restore their egg forming capacity in time for winter laying. No grain or combination of grains fully supplies the need. It is also deficient in minerals.

Surprising egg yields have been obtained from hens fed Sucrene Poultry Mash with Buttermilk and Sucrene Scratch Feed. It makes a complete, correctly balanced egg producing and body maintaining ration. Its protein and fat are evenly balanced to form a practically equal number of yolks and whites; also supplies calcium for shells.

High Quality Feeding Materials That Are Worth Your Money

Sucrene Poultry Mash with Buttermilk is composed of Dried Buttermilk, Meat Scraps, Corn Feed Meal, Alfalfa Meal, Wheat Bran, Linseed Meal, Palm Kernel Meal, Calcium Carbonate 1%, salt 1/2%. Guaranteed analysis: 18% Protein, 3 1/2% Fat, 50% Carbohydrates, 12% Fibre.

Sucrene Scratch Feed is the necessary grain ration, composed of sound, clean grains carefully selected and correctly proportioned: Corn, Wheat, Kafir, Sunflower Seed, Buckwheat, Barley and Oats. Guaranteed analysis: 10% Protein, 2 1/2% Fat, 46% Carbohydrates, 5% Fibre.

It Will Cost You Nothing

to get the benefit of the work done by our poultry feeding experts. Buying high priced grain which produces no eggs is a dead loss. Sucrene Poultry Mash with Buttermilk and Sucrene Scratch Feed is the scientifically correct combination for maximum egg production winter and summer; and you can rely on profitable results when fed as directed.

Order a 100-lb. sack of each feed from your dealer. If he can not supply you at once write us. The coupon or a post card brings you free illustrated literature on care and feeding of poultry.

Dr. G. H. Humphrey, Woodbine, Iowa

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

OVER a considerable portion of the country, the finishing touches should be given to the work of properly planting and preparing plants, vines and trees for the long winter which will soon be upon us.

Now that the ground has begun to freeze, all plants or bushes or shrubs which need winter protection should be covered with straw or any like material. Most plants, bushes and shrubs, tho perfectly hardy, are benefited by a mulch of manure.

If you have not given the fruit trees and berry bushes a thoro spraying with Scalecide, do it now, provided the temperature is not below 48 degrees. This spraying will kill all the insects which have taken up winter homes in the trees, and go a long way toward insuring full bloom next spring.

Prune and cover the grape vines. Of course, if you have a large planting of grapes, it is not practical to cover them, but for the home yard, where the winters are severe, it pays to cover the vines each fall.

Do not fail to mulch the strawberry bed well with farm yard manure. Then scatter straw over the plants. Do the best you can for all your growing things. By so doing you will be happy this winter and the trees and vines will thank you, and fully reward you for all your work.

Our heartfelt sympathy goes out to Mr. and Mrs. F. Donald Baerman, in the death of their son Roswell, who was fatally injured in a trolley car accident in Elizabeth, N. J., on September 9.

W. V. S., Illinois, whose letter in the October issue told us of his successful experience with geese in the apple orchard, writes as follows:

"About ten days ago the geese about which I wrote you recently, commending their efficiency as grass eaters in the orchard, began eating the bark on small apple and plum trees. They kept pecking

away until they had nearly girdled several. I cut all their heads off. The old hen for me after all! Maybe I'll try pigs next year as our village has repealed the ordinance against them. Besides they dearly love the sweet quack grass roots, a nuisance that infests this section."

I do not understand this. Never before have I heard of geese destroying young fruit trees. The trees could cheaply have been protected by wire wrapping. The young trees will have to be protected or pigs will destroy them. Hogs and pigs in a bearing orchard are all right but I would not want them in a young orchard.

The findings of the Agricultural College of Iowa show that the apple orchards of the state are making more money than any other form of agricultural work. For a period of ten years these orchards have returned a net income of \$107 an acre, equal to \$1,186.50 valuation per acre. F. P. Spencer, of Fremont County, this season cleared \$20,000 from his 80-acre apple orchard, or \$250 an acre. Of course, these orchards are properly cared for and are not a secondary consideration in the working plans of the farms upon which they are located.

Dr. Woods in advising a correspondent in Florida to adopt the open front poultry house is correct. I have carefully noted the manner in which poultrymen house their fowls in Florida. Without exception the successful breeders there have what can be termed open houses. It is simply a roofed space, with sides and ends wholly open. One breeder at whose house I used to spend considerable time, had a concrete floor. This floor was sprayed with a liquid lice killer once a week. No feeding was done on this floor. By means of the use of the open house and the cement floor, the ticks and other insects which so annoy fowls in Florida were kept down, there being no place for these pests to harbor.

S. C. Black Leghorns

FROM IMPORTED STOCK

A Grand Lot of Show Birds for Sale

Here is a great opportunity to secure top-notch stock in a breed that is not overcrowded. Raise a breed that is not to be found in every backyard and be in a position where customers will have to come to you or a few competitors for stock. Black Leghorns are on the boom and the breeder who starts now will reap a rich reward. They are excellent layers, as shown by their records in laying contests.

The Foundation of Our Flock Was the
Best Imported Blood We Could Secure

Make a good winning at your show this winter and gain a reputation that will enable you to cash in handsomely in the spring on hatching eggs and baby chicks.

Don't Miss This Grand Opportunity. Write Today for Full Information.

Howard L. Goss Box A Austin, Minn.

What would you recommend for commercial planting of fruits in Clare County, Michigan, of the following fruits: Apple, peach, pear, plum, cherry, quince, grape, gooseberry, currant, raspberry, blackberry, dewberry and strawberry?
New York.

F. N. Clark.

Would advise the following varieties: Apples: Wealthy, McIntosh Red, Delicious and Senator. Pears: Lincoln, Flemish Beauty, Seckel. Cherries: Montmorency, Early Richmond and Sula Hardy. Quince: Orange, Van Deman. Grapes: Concord and Worden. If for a commercial orchard: Concord, Worden, Niagara, Brighton and Eclipse. Gooseberry: Oregon Champion—outbears Houghton and Downing two to one and fruit runs large on old bushes. Peaches: Early Elberta, J. H. Hale and Krummel October. Plums: Omaha, Surprise, Terry, Endicott and America. Currants: Red Cross and Diploma, with about one-fourth the planting in Fay's Prolific. Raspberries: Cumberland for black and Cuthbert for red. Would make the raspberry planting largely Royal Purple. This is a wonderful berry. Fruit is large and of a bright purple color. The vines are hardy and very prolific. This variety will outbear any other two to one. Blackberries: Mercereau, Ward and Snyder. Dewberry: Lucretia. Strawberries: I do not like to advise as to varieties of strawberries you should plant. The strawberry is very particular as to soil and environment. Consult growers in your locality.

* * *

"Chris Ringhausen, the largest apple grower in this neck of the woods, started the ball rolling last week when Mr. Ringhausen sold his entire crop to Cohen, Bernstein & Radtke, of Chicago, for approximately \$40,250, the purchaser to assume all risks and responsibilities in picking, packing and marketing the crop. Mr. Ringhausen thinks there will be at least 23,000 barrels. This is the biggest apple deal ever pulled off in Calhoun county."—Calhoun County, Ill., Journal

Commenting on this Stark's Tree Talk says:

"So accustomed are the newspapers of Illinois to reporting big orchard profits the above announcement was sandwiched in with a lot of local happenings of little interest, and yet the information condensed in this article is of much interest, because it carries a message of hope and points a road to sure success, that will gladden the heart of many a farmer who has land suitable for fruit growing."

Here is a man with about two hundred acres of rough land, who is making more than \$40,000 a year—practically all of it is clear profit. Last year Mr. Ringhausen cleared \$28,000 on this same orchard. It has been only a few years ago that we knew of Mr. Ringhausen as a farmer struggling to make "both ends meet" on his Calhoun county farm. Finding that farming did not pay him well enough, he took up commercial fruit growing. At first he continued to farm—planting corn, etc., between his young trees, and in this way growing about as much grain as he did before planting his trees. He did not have to wait long for his trees to begin bearing. Since that time Mr. Ringhausen has been increasing his orchard until he now has two hundred acres in bearing orchard at the home place near Hardin, Illinois, and has vast orchards in other parts of Calhoun county, also in Jersey county.

The value of Mr. Ringhausen's experience to others is in the splendid example he has set. Today Mr. Ringhausen is a wealthy, influential and useful man in his community. He has attained these heights not by working miracles or performing a difficult job. He has succeeded simply by turning his hands to the line of business that offered the surest success. The work of growing fruit is not difficult. It is simply doing an ordinary kind of work at the right time, just as the crop of corn or oats must be attended to at the right time. Any man who can learn how to grow a crop of corn can learn how to grow a crop of apples.

Fruit is food, and the man who produces an abundance of fruit is giving much assistance in feeding the hungry of the world. Take Mr. Ringhausen for instance, he is producing more food on his two hundred acres than is being produced on many farms of his county, where grain only is grown—and he has become very wealthy in doing it.

* * *

Would like to know when is the proper time to put out an orchard and of what should I plant for home and local use? I want apple, peach, pear, cherry, grape, strawberry, raspberry, blackberry and plum. Both early and late fruit of each variety. How much space will I need and how far apart should I plant the trees? Would it be all right to sow grass or rye in the orchard? Would like names of good reliable nurseries.
Illinois. Elmer E. Peoples.

The proper time for planting an orchard in your locality is early spring. For a home orchard the following plantings will prove

YOUR pullets need an abundance of wholesome, energizing, egg-producing feed, if they are to be good layers this fall and winter. It must be a feed that supplies the elements contained in the green stuffs and natural food they have been getting, and in addition the proper proportion of other egg-making, body-building materials.

Badger Laying Mash fills this order. It is an ideal feed for pullets and hens. It will start your pullets right, keep them laying, give them energy and strength. It will put your hens in splendid condition for steady fall and winter laying, will quickly restore their tone and vigor which the molting period has lowered.

BADGER Laying Mash

BADGER Laying Mash is wholesome and easily digested. Chickens crave it and thrive on it. It contains a liberal percentage of high-grade meat scraps combined with a careful selection of sound, sweet grains, carefully re-cleaned and uniformly mixed. It is ready mixed and can be used for either hopper or damp

crumply mash feeding. Badger Laying Mash never varies in quality. It is made of the best materials and the right materials, the correct proportions of which have been determined by practical tests. It is unquestionably the mash feed for your use, for it will give you big returns for your money.

Higher Prices for Eggs

CLEAN-shelled, wholesome, full-meated, newly laid eggs, are bringing higher prices every day. The opportunity for profit in egg and poultry production has never been greater. To take full advantage of it requires careful feeding and the use of feeds that give big returns.

Thousands of poultry keepers are daily proving the value of Badger Laying Mash and other Badger Poultry Feeds. They are using them in preference to other feeds because of their unvarying high quality, reliability, and the big results they produce.

Regular use of Badger Laying Mash, Conservation Scratch Feed and other Badger Poultry Feeds will solve your feeding problems—will put your flock on a good profit-paying basis.

Ask your dealer for Badger Laying Mash, Conservation Scratch and other Badger Feeds. If he cannot supply you at once give us his name and we will see that you get them without delay. Send for **FREE SAMPLES** of Badger Laying Mash and Conservation Scratch.

Less Than

One Gallon

of Oil

Per Day

HARRYSBOURG BROODING DEVICES ARE DEPENDABLE. Last spring the Government ordered a sample hover for the Government Farms at Panama, and on September 20 we received its order for twenty more. Constructed for long service, stove has cast metal top, and cast metal rim around the top edge of canopy; HEAVY METAL WICKLESS BURNER, making a perfect blue flame like natural gas, and burning continually the entire season without cleaning.

PLENTY OF HEAT for coldest weather. Absolute control of heat in mild weather.

AUTOMATIC VALVE working like a carbureter.

VENTILATION SYSTEM producing strong, healthy chicks.

MADE IN TWO SIZES. Large 50-inch canopy, capacity 100 to 600 chicks, and small 33-inch

canopy (burning three days on one gallon of oil), capacity 50 to 200 chicks.

SPECIAL OIL-BURNER STOVE. If you wish to change from coal to oil, we furnish you with our special stove which you may use with your coal stove canopy.

SEND FOR CIRCULAR. We can interest you

Harrysbourg Poultry Farm, Inc. : Dunkirk, N. Y.

satisfactory. Apples: Duchess, Transparent and Liveland Raspberry for very early. Wealthy for fall and Delicious and Grimes' Golden for winter. Peaches: Early Elberta, J. H. Hale and Krummel October. Pears: Lincoln and Seckel. Raspberry: Cumberland and Royal Purple. Make the planting largely Royal Purple. Cherries: Montmorency. In the home orchard plant but one kind of cherry. You will then get most of the fruit for yourself, while if you have a tree or two of kinds ripening at different seasons, the birds will get most of the fruit. Grapes: Eclipse, Green Mountain, Niagara, Worden and Concord. Blackberry: Merseureau and Ward. Plums: Omaha, Endicott and Surprise. Strawberry: Consult local growers.

Planting distance will vary in different localities and under different soil and climatic conditions. Orchards on very strog soil should be set somewhat farther apart, that is the trees, than trees set in medium rich soil. Proper distances to plant are as follows: Apples: 30 feet apart. Apricots: 16 to 20 feet apart. Asparagus: 1 to 2 feet between plants, in rows 3 to 3½ feet apart. Blackberries: 3 to 4 feet between plants, in rows 6 to 8 feet apart. Cherry: (Sour sorts) 16 to 20 feet apart. Cherry: (Sweet sorts) 20 to 27 feet apart. Currant: 4 feet between plants, in rows 5 feet apart. Gooseberries: 4 feet between plants, in rows 5 feet apart. Grape: 8 to 10 feet apart, or 8 feet apart in rows with rows 10 to 12 feet apart. Hedge Plants: 1 to 2 feet apart. (To get a thick hedge quickly, plant two rows 10 inches apart, with plants alternating—that is, no two plants opposite.) Mulberries: 22 to 28 feet apart. Pecan: 35 to 40 feet apart. Peach: 16 to 20 feet apart. Pear, Standard: 20 to 27 feet apart. Pear, Dwarf: 10 to 16 feet apart. Plum: 15 to 20 feet apart. (On rich soil Japanese sorts should be planted at least 20 feet apart.) Quince: 10 to 16 feet apart. Raspberries: (Black) 3 feet between plants, in rows 6 to 8 feet apart. Raspberries: (Red) 3 feet between plants, in rows 5 to 6 feet apart. Rhubarb: 3 feet between plants, in rows 4 feet apart. Roses: 2 to 2½ feet apart. Walnut: 3 to 40 feet apart.

Practice clean culture of the orchard by all means. Do not seed down a young orchard, and never keep peach trees in sod. You can raise vegetables on ground between trees if you plant such vegetables as can be harvested by July 15, when the orchard should be sowed to buckwheat or rye. This will give you a cover crop which will protect the trees in winter. In early spring plow under this cover crop and cultivate orchard until July 15 or thereabouts. Then put in a cover crop again. This will keep the soil full of humus and the trees will thrive. It is hard for young trees to make proper growth and development in sod.

* * *

A. T. Hall, Illinois, says: 'Every farm should have an orchard of good trees, quality sorts, which should be given the best of care.'

Mr. Hall is a preacher who practices what he preaches. On his farm he has an orchard of 45 acres of bearing apple trees. He is a very busy man with his 500 acres of rich Illinois land, but his orchard is never for a moment neglected. He grows all the usual farm crops and makes a specialty of fine stock raising. You may say that he has not time to properly attend to his orchard but you are mistaken. His is one of the best and best cared for orchards in the United States, and he finds that his orchard gives him the best returns of all his farm enterprises. During the past five years he has not failed to get an annual crop, and during that time the 45-acre orchard has paid him 15 percent net income on the entire valuation of his 500 valuable acres. Bear in mind that before the war apple prices were low, and that during the war the price of farm crops have been high. Yet last year his orchard made him more money than all his other crops. He considers his orchard an insurance against crop failure on the rest of the farm. With Mr. Hall it is "prosperity and plenty" and the orchard turns the trick.

F. A. KAUP BUFF ORPINGTON FARM

Est. 11 years. The farm with no dissatisfied customers

Box 1101 : GLEN ELLYN, ILLINOIS

This was but a few days ago, yet we have in completion the grandest painting I have ever been privileged to behold. Standing in my library window, looking out over the big lawn to the south, the picture is spread before me. And what a wonderful picture it is! In front are the horse chestnut (Buckeye) trees, every leaf of which is deep and glowing red. Just behind and somewhat taller are the hard maples, clothed in a garb of brightest yellow, while in the background stand the giant white oaks with their vivid green mantle. Hundreds of blackbirds are in the trees, noisy over their preparation for the flight southward, where cold will not harm them. Squirrels scamper up and over the trees after nuts, and on to various parts of the yard and orchard, where they are storing nuts for use when all will be cold, and winter storms blight and wither all before them. I am informed by a lady standing by my side that the mingling of red and yellow and green would be an incorrect color scheme for a lady's gown. But I tell her that J. Frost has never undertaken the painting of a lady's gown. He is too busy touching up the landscape of all the great northern country each season, and must rest during the summer days. Also that his color scheme is absolutely perfect and harmonious, for from his judgment and verdict there is no appeal. We have planned a long trip down the Iowa river, where we will be able to see his picture stretching along the miles. What a good and glorious privilege it is to live in this world!

* * *

The rye and buckwheat we sowed this fall has made a splendid growth. It will be of great benefit to the trees this winter in protecting the roots from the cold. It will hold the sun, and thus add moisture to the soil. In the ground to be planted to corn and potatoes, etc., it will add humus and insure a good crop next season. By growing cover crops we get all these benefits. We also prevent the loss of plant food during the winter. I am enthusiastic over cover crops. I wish I could grow red clover here as a cover crop but the climate is too severe.

* * *

When I picked the grapes this fall I left a few bunches here and there for the brown thrushes and catbirds. And they have thanked me for this every day by eating the grapes almost constantly. It seems never before have they remained with us so late. Hereafter, I shall do as I did this season and leave part of the crop for them. When they finished picking their share of the crop they left for the south. We had a very enjoyable visit the last day of their stay. They were in the vineyard all day chattering to me, and I believe they told me they were going, that they would be back in the spring and hoped to find the grape crop promising. I told them how much I appreciated their help in the orchard in ridding it of insects, wished them a pleasant visit and safe return.

* * *

Everything in the orchard and garden will go into winter quarters in splendid shape. We had enough fall rain to put the proper moisture in the ground, and there is no danger of roots killing because of the earth being dry. The currant, gooseberry and raspberry bushes have been heavily mulched with coarse manure. I am figuring on a full crop next season. I always do this and rarely am disappointed.

* * *

How much we shall all miss I. K. Felch! More than forty years ago I looked to him for inspiration and advice and always was benefited by his counsel. When I read of his death I turned to the files of the American Poultry Journal of the far back days, and lived with him again as I did in those golden days. We have all lost a friend and wise counselor in the death of I. K. Felch.

* * *

In answer to C. C. Cleaves: I cannot advise you whether or not it is best for you to sell your Wisconsin farm and move to Virginia. You refer to Bath county. Bath county is located on the western border of the state, 120 miles northwest of Richmond. Its mean altitude is 2,195 feet. Its people are Scotch-Irish, having moved from Pennsylvania in 1740. A portion of the county is mountainous, the rest rich bottom lands, very fertile, the small in area. It is mainly a grazing section. It is a natural grass soil. Bedford county is at the eastern base of the Blue Ridge mountains. It is one of the best agricultural counties in the state. Water is soft, timber abundant. Staunton is out in the Shenandoah Valley. It is situated in one of the richest farming sections of the state. It is a wonderful fruit section thereabout. Make a thoro personal inspection of Virginia before buying land there.

* * *

In answer to Warren Davis: The old orchard on the farm you have just purchased in Wayne county, can, I judge from your statement of its condition, be made to

And Easy Lessons in Judging

By FRANK HECK

A BOOK that is new in character and the most valuable and interesting production ever published for breeders of exhibition fowls. No other book or similar publication comes within gunshot of it. It is in a class by itself.

The time has gone by when a breeder can pick up birds right out of the yards and win with them without special preparation. This is true even in the smaller shows. There are always at least a few hustling, enterprising breeders in nearly every locality who are keenly alive to the financial profit and the honors accruing from winning over all competitors. These breeders use all legitimate methods for putting their birds in show condition.

Faking and Legitimate Preparation, Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Consider also the immense advantage you would have in being able to detect such forms of faking as can be discovered in cases where there may possibly be a dishonest exhibitor in the class.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained.

You need the book to protect yourself against the dishonest fakir and you need it to put yourself on an equal footing with your honest competitors. It will save you dollars in useless entry fees, and it will show you how to win the coveted prizes and honors which your rivals would otherwise receive. The price of the book is

\$2.00

and it is worth the price. Have you ever bought a poultry book on general topics or disclosing some system or so-called secrets, and upon receipt of it had your expectations drop with a dull thud of disappointment? Well! this is not that kind of a book. *Don't put off sending your order. You need the book now. Address*

Wouldn't You Like to Know

- How to Bring Out the Bright Red Color of Combs, Face and Wattles.
- How to Straighten Lopped Spikes or Blades of Combs.
- How Small Patches of White are Covered Up in Red Ear Lobes.
- How Back Plumage is "Fixed" to Reduce the Angle at the Tail and Give a Nicer Curve to the Back.
- How to Clean the Plumage of Parti-Colored Fowls for Show Without Washing.
- Removing Creaminess and Brassiness from White Birds.
- Covering Up Off-Color in Black Plumage, Including Purple Barring.
- How to Improve the Color of Any Parti-Colored Bird.
- How to Make a Bird of Its Own Accord Pose in the Show Coop.
- How to Add Lustre to Plumage of Dark Colored Fowls.
- How to Add Weight to Exhibition Birds Quickly.
- Coloring Yellow Legs.
- How Side Sprigs Are Removed Without Leaving a Scar.
- How Foreign Color is Removed from Beaks.
- How the Plumage of Red Birds is Treated to Secure a Darker Shade of Color and Lustre.
- How White Tips Are Sometimes Removed from Barred Rock Plumage.
- Removing Traces of Stubs Pulled from Legs.
- How Foreign Color is Removed from the Edges of Large Feathers.
- How Dark Streaks Are Removed from the Quill of White Feathers.
- How Unscrupulous Exhibitors Have Been Known to Prevent a Competitor's Birds from Showing Properly.
- Putting Birds in Show Condition That Have Missing or Broken Feathers in Main Tail or Wing.
- Preventing Purple Barring in Black Fowls.
- Preventing Show Room Growth and Lopping of Comb.
- How Feathers Are Spiced.
- Feeding to Produce a Darker Shade of Buff.
- How White Ear Lobes Are Treated for Small Defects in Color.
- A Frequent Cause of Large, Beefy and Lopped Combs and How to Prevent Them.
- How to Artificially Moulit Fowls in Near Half the Regular Time.
- How to Secure and Hold Profuse and Leg Feathering on Feathered Legged Varieties.
- A Practically Unknown Cause of Lopped Combs and the Remedy.
- How to Prevent Light Colored Legs.
- How to Increase Gloss Sheen and Depth of Color in Moulting Male Birds.
- A Good Stimulant and Preventative of Colds in Birds Shipped to Shows in Extreme Cold Weather.
- How to Prevent Combs from Freezing When Birds Are Exposed.
- One of the Causes of Off-Colored Feathers in Parti-Colored and Black Fowls. How to Remedy the Defect.
- How Sickie Feathers Are Shortened Without Clipping the Ends.
- What to Feed to Promote Feather Growth.
- Tonic for Maintaining Health and Appetite in Show Birds and to Counteract the Effects of Confinement.
- Preventing Brassiness From Appearing in White Birds.
- How to Clean Paint From Birds That Have Come in Contact With Newly Painted Coops or Houses.
- How to Prevent Color Cuts on Plumage by Stopping the Flow of Blood From Comb, Wattles, Etc., When Injured in the Show Room.
- Complete Detailed Instruction for Washing and Chemically Bleaching White Birds.
- How Black or Gray Specks in White Plumage Are Hidden.

The above subjects are only a portion of the contents. There are many other equally interesting, important and valuable secrets, many of them being alone worth the price of the book. There are many seemingly "little" things that are of great importance and that you would never think of.

The Easy Lessons in Judging are also a feature of the book and will teach you the principles of scoring fowls.

bear abundantly for many years. Secure some experienced orchardist and have him treat the trees early this winter. He will cut out all dead wood and properly shape up each tree. As this orchard has been in sod for many years you must not plow deep when turning over the sod for if you do, you will injure the feeding roots of the apple trees. It is the near surface roots which do the feeding to supply the whole tree. Do not plow up the sod this fall. Do this early next spring. Then cultivate the orchard thoroughly until about July 15, when a cover crop should be sown. Of course you must spray the trees. Give them a good spraying with Scalocide this fall and again in the spring before buds open. They use arsenate of lead for later spraying. As the trees are very large, and pretty thoroughly shade the ground, I would not try to raise vegetables between the rows as you suggest. If you can secure barnyard manure, fertilize the orchard heartily with it next spring. I would not try to save the pear and peach trees of which you speak.

* * *

In answer to I. L. Barnes, Iowa: You can successfully raise the Jonathan apple by working the Jonathan on Hiernal stock. The Jonathan is not hardy on its own roots for northern Iowa. I think you have been misinformed in regard to the Grimes' Golden for planting in your locality. It is not hardy enough. True you might get a few crops, but when a test winter came, out would go your Grimes' Golden trees. Worked on Hiernal stock it would be somewhat more hardy, but I advise you not to include Grimes' Golden in your planting. Plant Wealthy, Patlou's Greening and a few Duchess, Yellow Transparent and Iowa Brilliant. Of course you will want to make a liberal planting of Delicious. For a commercial orchard plant Wealthy, Patlou's Greening and Iowa Brilliant.

* * *

I have a long and very earnest letter from Mrs. Nelson Price, of Minnesota, in which she seeks my aid in her efforts to keep her two sons on the farm. It is such a human nature story Mrs. Price tells me—how the husband and father, aided by Mrs. Price, carved out a home and a farm on the prairies of Minnesota; of the hardships and deprivations they endured in the making of their farm and home. Now it is a home in the best sense and the farm is valuable and productive, yet the young men—the sons—will have nothing to do with it, but are working in St. Paul. I wish I could solve this problem for this father and mother, but I cannot. The case is the same as confronts thousands of parents. Right here among my acquaintances we have a number of such cases. Of course, in nine out of ten cases the young men are making a mistake, but they cannot see it now. Meantime there is sadness in the home and the hearts of the father and mother are bleeding.

* * *

This week we have been storing our root crops or rather finishing the storing of them. I think the food value of root crops is not fully appreciated by poultrymen and stock raisers. Many roots can be raised almost without cost, as many of them can be sown after the spring crops have been gathered from the garden and field.

* * *

In answer to F. A. Kanss, Wisconsin: You can prevent winter sun scale on your apple trees by giving them a painting of Sulfolice. Use one part of Sulfolice to two parts of water. Apply on the south and southwest of trees with a paint brush. You speak of a white wash. This is also good. The following is a good formula:

- Quicklime30 pounds
- Tallow 4 pounds
- Salt 5 pounds

Water enough to make flow well. This makes a tenacious whitewash, not easily washed off by rain. I have found that Sulfolice prevents damage to young trees by mice and rabbits.

* * *

At this writing, September 30, our asters are a wonderful sight. We have one bed containing several hundred plants of the Giant Crege variety. I have never before seen such fine asters. The individual flower is extremely large and the plant very prolific in bloom. With Queen of the Market and Crege, one may have asters from early until late.

* * *

I have two stands of bees, the one is in good condition, from which I have taken 14 pounds of comb honey. The brood chamber seems to be entirely filled (8 frames) and there appear to be a lot of bees in it; altho I haven't examined the frames except by looking at them thru the space between the frames and by lifting the hive which is very heavy. The other stand did contain bees but was winter killed. I left this hive stand near the other one, after cleaning it out. The frames still have the combs in, but no honey, and in some places are dark and dis-

How to Reduce Costs by Half When Shipping Birds

It's all in the coop. When you use heavy wooden coops you pay more for shipping the coops than for shipping the birds. Besides, nine times out of ten, they arrive with broken feathers and bruised combs and wings, despite the trouble taken to "nail" them up securely.

ANDREWS

EFFICIENCY KOOP & KOOP DE LUXE

"The Coops Without a Nail"

are the ideal coops for shipping birds. They are time and money savers any way you figure it. They are exceedingly strong and constructed to protect the birds, but so light they cut shipping charges in half. They come knocked down, take up little space and can be put together in a jiffy without hammer or nails. They can be used over and over again so the first cost is the last cost.

Andrews' Coops are selling at strictly "before war" prices. Efficiency Koop for shipping breeding birds, \$3.00 to \$5.10 per half dozen. Koop De Luxe for shipping exhibition birds, \$5.40 to \$9.90 per half dozen according to size. We prepay freight on orders of \$10.00 or over. Smaller orders are sent express collect. Address Dept. A.

The World's Largest Poultry Specialties Manufacturers

SPROUTED OATS—WINTER EGGS

CLOSE-TO-NATURE GRAIN SPROUTERS

The Close-To-Nature vapor bath machines produce the succulent sprouts, the vegetable milk, and the grape sugar that bring the eggs. Cut down the feed bill and run up the egg yield. From one bushel grain make two to four bushels of the best of egg-producing green feed. Germinate grain in 20 to 30 hours and force growths of an inch or more daily. We are the originators of the grain sprouter and its largest manufacturers and make three kinds and many sizes from 1/4 bu. to 8 bu.—a few hens to 1,000.

The Double Quick:—the original sprouter, Cypress case outside, galvanized steel grain chamber inside, insulated double walls, for use in zero temperatures, the most efficient and economical sprouter ever put on the market.

The Metal Sectional:—Made of galvanized steel, built in second sections as you need them. Two size bases—small base and sections for back-lot flocks; larger base and sections for egg farms.

The Lampless:—For use in furnace and other heated rooms. Trays slide, not stack up. Drip pan has drain tube. The most convenient lampless now advertised. Get our circulars giving full information on sprouted oats and eggs.

RELIANCE REMEDIES COMPANY : : : EL PASO, TEXAS

More Eggs?—Use Germozone

A hen with rosy, red comb, bowels in perfect order, free from the common diseases of roup, colds, etc., (and vermin, lice, mites, etc.,) and properly fed, is almost certain to turn out a good profit in eggs.

Other troubles generally start from the bowels. Even lice do not bother much the strong, vigorous, healthy hen. Bowel trouble results most often from eating musty or spoiled food. Excess grain in damp litter, feed boxes, etc., soon gets musty or moldy and that is poison for chickens.

A little Germozone in the drinking water at regular intervals is not a medicine in such cases but is a preventive and corrective of conditions that later cause bowel trouble. We recommend one tablet or one teaspoonful liquid Germozone to a quart of water in the drinking water all day two or three times a week, or every day as a last drink at night.

Germozone is sold by druggists or seed stores most everywhere. We supply both liquid and tablet form.

Ask your dealer. If not obtainable send to us. Prices now are:

GEO. H. LEE COMPANY, Dept. 302, OMAHA, NEB.

colored, nearly black. Now just a few weeks ago I found the hive to be occupied and on opening it found several of the frames all covered with bees, big clusters of them, but all the cells are empty and they have no supplies. What shall I do with this hive to save the bees? I do not know where they came from or how long they have been in the hive. The bees from the other hive did not swarm to my knowledge as I gave them a super early and widened the entrance this summer. Should the bees in the empty hive be fed all winter or united with the other stand? I have a quantity of old granulated sugar that is dirty and unfit for human use that might be fed to the bees, Illinois. Otto E. Hackman.

The fact that hive No. 2 contains no brood comb, hatching bees and eggs shows conclusively that no queen is present in the hive. It is now too late to attempt to build up this colony by re-queening or by giving them stores. The only thing to do is to unite the two colonies. Smoke bees in No. 1 very thoroly. Then smoke bees in No. 2. Place No. 2 on the ground on a cloth. Now dump bees from No. 2 on cloth. Smoke a little and they will enter hive No. 1. Smoke hive No. 1 occasionally while bees are going in. At any time during the spring or summer months if you find a hive in condition of No. 2 take a frame from a strong colony and place it in hive. Be sure there are eggs in said frame. The bees will then rear a queen of their own. Or you can introduce a laying queen. Be sure to examine hive No. 1 carefully. See that the bees therein have enough supplies for winter and to use in brood rearing early next spring. You can feed the sugar of which you speak. Make a rather thick syrup. Feed in one of the regular feeds. Do not set feed out of doors if there are bees near you. If you do you will have robber bees attack your colony and no doubt destroy it.

I notice you always recommend planting the Lincoln pear tree. Please tell me where I can get that variety.

Indiana. H. H. Shreyer. You can secure Lincoln pear trees of the Stark Bros. Nursery & Orchard Company, Louisiana, Mo. There are a lot of the Lincoln coreless pear trees on the market. They are worthless. Plant a few Seckel pear trees with the Lincoln. This for proper polonization of the Lincoln.

During the following few months many readers of the American Poultry Journal will study on the list of fruit trees which will comprise the home planting next spring. The common error is for such persons to choose a list of fruits and varieties of high merit without regard to the proper consideration of how well these varieties will be suitable to the climatic conditions they will be called upon to endure. It is a wholly natural mistake which most inexperienced planters make. I know how easy it is to make this mistake. In northern Iowa several planters put out Wealthy and Patlou's Greening years ago. These are hardy trees and these orchards have annually paid big returns. Wealthy is of high quality, but Patlou's Greening is not, but is fair in quality, a good looker and seller. Higher quality apples could be planted but they would be dead ere this.

Readers Open Forum

The Story of a Beginning.

THE underlying reason for undertaking a new venture is apt to prove interesting, for there is a "why" for every condition upon the face of the earth. I sometimes look at a flock of fowls and wonder why their owner chose that particular variety. Of course, there are instances where fowls have been bought just because they were low in price, but where a man takes up a hobby or a business like poultry raising and has the freedom of choice, he is apt to select a variety for some real reason.

Personally, some years ago I was drawn irresistibly toward the poultry house at the state fair in a far western state and I could not help noticing that there was always a

six years old, my mother gave me a twenty-five-cent "shin plaster" with instructions to go to a neighbor some distance away and purchase a rooster for the home flock of hens. I was justly proud of the commission, but my elder sisters objected to my undertaking so important a journey. "I know he is young," said mother, "but he is a man of untrammelled mind and logical deductions—let him go."

I delivered the money to the lady having roosters for sale and asked for a view of the birds. She had several large cockerels of the Light Brahma order and urged me to take one of those. I probably would have fallen for it, but there suddenly appeared upon the scene a cock bird of no particular pedigree, but profusely red as to plumage

White Orpington hen bred and owned by William N. Otto, 4815 Central Ave., Indianapolis, Ind.

group of interested people in front of the coops containing some fine big red roosters and their demure but scarcely less colored female companions, while pen after pen containing beautiful white plumaged birds were all but neglected by the many.

This was confusing to a constant reader of Petaluma periodicals and a solution of the seeming paradox was sought by inquiry. I did not ask any of the interested exhibitors but casually picked my man out of the crowd—and he was a big black coon with his eye on the "red rooster" coops. He was not an educated "cullud gentleman," but just a common, every day, honest looking negro. For a second he looked blank at my question, evidently not being accustomed to exercising his brain, but Nature soon came to his rescue and he fell back upon the black man's lore of stored up and transmitted chicken knowledge. "W'y, boss, a good chicken's jes' nacherally gotter be red. Yassa! yassa! It's a Kansas fact. Yassa, he done suttinly bound to be red!"

There you are! I had the answer from a first hand primitive source. It carried me back to my own experience in the little home town where this story is written. Just turned

and I chose him. The family were not particularly pleased, but I was allowed to keep the bird, but it was not until years after, when broken somewhat in health, that I returned to the farm determined to take up poultry work in earnest. My first work was to demolish an ancient wreck described as a poultry house and to erect a new building along accepted modern lines. Two coal burning hovers were then purchased and set up in either end of the new house. A nearby hatchery was visited for the purpose of buying day-old chicks. The lady in charge was capable and full of tact. She elicited the information that I was long on theory but short on practice as regards modern methods of poultry keeping, and gave me good advice. Among other things she asked if I had decided on any particular breed.

"Well, I must have good layers and good table fowl and"—here I relapsed into the language of the coon—"they just naturally gotter be red!"

The lady was not in the least perturbed. "Very well," she said, "I have a big hatch of R. C. Rhode Island Reds coming off now. You can have fifty of them and in about

"Fried Chicken?"

MEMBER FOOD ADMINISTRATION

FRIED CHICKEN, eh, mother?

Those Sheppard Famous Anconas in our backyard certainly are the best layers of large, white eggs I've ever set eyes on—and when we want an extra nice meat dish without feeling that we're taking beef from our Boys, we can kill a cockerel or a hen and the slightly game flesh is mighty tasty eating. Write to Mary and ask her if she's started Anconas yet—or perhaps it would be best to ask Mr. Sheppard to send her a catalog. I'll do it tonight. She'll cut the cost of living just as we have.

ADDRESS:

H. CECIL SHEPPARD
BEREA, OHIO

three weeks I can let you have one hundred or more additional."

I carried home forty-seven of the liveliest little rascals that ever came out of a shell, tucked them safely under a hover set to a temperature of 90 degrees, wrote out a three years' subscription for the American Poultry Journal (acting on the lady salesman's advice) and became a full fledged breeder of Rose Comb Rhode Island Reds.

In caring for the chicks, we adopted as our watchwords, safety and system. As we used soft coal, the stoves were cleaned morning and evening. The floors were cleaned every day while the chicks were babies, and a cheap disinfectant was used. We used a prepared chick food, supplemented by a Johnnycake baked in the kitchen range. The chicks were kept in for a few days, and whenever the weather was bad, but were soon allowed a little run outside. Water was kept before them at all times and at seven weeks they were allowed the run of the place, and certainly took it! Never were chicks more busy. They invaded the garden, believing my work therein was merely a bug and worm hunt for their benefit. In the truck patch they followed unweariedly in the wake of the plow and the cultivator, until I finally had to fence them out to protect the crops.

I am moving this fall to Wyoming into a great farming district where nearly all the people are farmers, tho the town is a Government town. I shall be glad to send you matters of interest in regard to poultry conditions in that section from time to time the coming year.

Colorado.

Gerald Wach.

Early Laying Pullets.

This is the time when early hatched, well matured pullets should begin to lay. Probably there are many beginners who are wondering why their pullets are not laying one or two eggs each a day, and such are apt to get discouraged where laying is long delayed. A pullet to lay in November, December or January, must have been hatched early and well fed and cared for up to that time. Almost any pullet that lives thru till April will lay. She just can't help it, but in order to get eggs in the fall and early winter, plenty of food and good care must be bestowed upon the birds. A good many novices in feeding a flock of pullets when eggs are not forthcoming will try cutting down the rations, especially as the feed bills keep growing.

It is an unwise proceeding to cut down

Two prize-winning Silver Campine cockerels.

Owmed by Frank E. Hering, South Bend, Ind.

On July first we had our first fry from the April eleventh hatched chicks and since then we have enjoyed once or twice a week the finest meat to be had anywhere. I confess I never knew there is such a difference in "just chicken," but, brother, there is, and the Red is in a class by himself in this respect.

I had a little field of about four acres of oats sown as a cover crop, and because of lack of time these stood in the shock for a long time before threshing, meanwhile making a fine range for the flock of youngsters and rendering valueless the figures on feed costs at this time. However, as the oats yielded sixty bushels to the acre after the chickens had fed on them, I should worry.

We feed whole corn and oats in straw, and a dry mash of wheat middlings, giving a small amount of beefscrap. Plenty of beets, carrots, turnips and small potatoes are fed after being slightly cooked. Oyster shell, grit and coal ashes are always before them and they are given an occasional feed of milk. Most of the food given our flock is produced on the place. I feed a lot of whole corn principally because the birds seem to prefer it. Somehow a hen loves to grab a whole grain of corn above all else.

Illinois. H. L. Howard.

Predicts Dollar Eggs.

I have been greatly interested in what your paper has had to say in reference to prices of eggs and poultry during the past year or so, and hope you will keep up the good work. Denver papers are urging people now (September 24) to store eggs for winter use. Eggs are quoted at forty-eight, fifty and fifty-five cents a dozen and everyone is being urged to put up eggs in water glass if they want to have an egg with their ham and bacon for breakfast next winter. The papers say eggs will sell for a dollar a dozen here the coming winter and at present production costs I do not see how any one can keep poultry unless they do go to that figure or higher.

I like the American Poultry Journal and read it from cover to cover. It is the best poultry journal printed. I have been reading it for several years and like the Open Forum and editorial matter especially well.

Automatic Poultry Appliances

Box 21, NEW LONDON, CONN.

that all the pullets are eating is only what they require for their best development and to enable them to begin laying. The birds require more good nourishing food just before maturity than at any other time and with a good growing flock of pullets there seems to be no limit to their capacity for consuming grain. To deprive them at this time of all the food they require, is to delay laying indefinitely.

If the pullets have been brought in off of range and are restricted in yard room, some green food should be provided. Waste cabbage, root vegetables, such as beets, mangels, carrots and small potatoes, will help to fill this requirement. They should also be supplied with animal food in the form of beef or fish scrap. The houses should not be closed up because of cold nights. The birds have been accustomed to open coops thru the summer and have on their feather coats. They are prepared for cool nights and will keep in health if allowed a constant supply of fresh air night and day and plenty of good wholesome food.

Do not expect yearling hens to lay at this season of the year. They will prove valuable for breeding purposes and produce eggs for hatching in the early spring or late winter, but the hens are too busy now with their fall coats to lay eggs. I figure that my pullets have cost me in the vicinity of \$3.50 each to bring into laying this fall, for they have had the best of care and every grain they have consumed has cost real money. The yearling hens have laid well up to the middle of August and gradually since that time the yield has dwindled until the first of October. I find only one or two eggs in a house. My yearling hens are in good shape and valuable for breeding purposes and I intend to keep the best of them over for breeding without forcing them for laying, and even tho they do not lay until the latter part of February, the expense of keeping them until that time will not be so great as that of bringing a pullet to maturity. It seems to me that by next year the people in cities will have to pay what it costs to produce eggs or go without. There may be plenty of poultry in storage, but I do not think there are enough eggs to make up for the great reduction in eggs produced on farms today. I do not know of any locality where the number of fowls kept has not been tremendously reduced—more so than that of any other animal on the farm, unless it is the horse, and if these gasless Sundays continue poor old Dobbln may get a new lease of life by another year!

Pennsylvania. J. T. Smith.

Poultry Raising on City Lots.

I started to hatch early this season, as I had secured a sprouter and was able to provide my chicks with the necessary green feed. I let the sprouts grow about 2 to 3 inches and then cut them off with the scissors and then let the sprouts grow again. Thus I could harvest green feed several times from the same oats. The chicks relished it very much and how they did grow.

For the older fowls I let the sprouts get one-half to one inch long and then feed it all, sprouts, roots and the oat, which is still there at that stage of the growth.

Started January 1 with 72 Red pullets and hens and in spite of the very severe winter weather in January and February they laid up to May 15 3,677 eggs, when I sold half of my breeders.

Started hatching on February 15; had a 67 percent hatch, placed them in my hot water brooder and raised them all. Hatched in all 664 chicks, sold 512 baby chicks and kept 152, of which I did not lose over half a dozen. Average hatch of the season was 85 percent of the fertile eggs.

Total expenses of my flock today amount to \$174.64; total receipts, \$222.82; but no account is kept of the fowls and eggs consumed at home. I also have on hand now 180 head of birds, young and old. This was all done on two city lots and all the feed to buy.

Walnut, Ill.

R. C. Meishner.

If your hens are not producing all the eggs they should, feed them

MILKOLINE

Everyone knows the superior value of BUTTERMILK as a conditioner, but the main objection heretofore to most buttermilk feeds has been the excessive cost, inconvenience and expense of handling, no guaranteed standard and the poor keeping quality during the different seasons.

Overcome all these difficulties by using MILKOLINE, the base of which is PURE MODIFIED BUTTERMILK, with the proper acid and fats added to make it a satisfactory substitute for buttermilk.

MILKOLINE contains a sufficient amount of vegetable oil to form a proper balance and is further acidified to produce the most beneficial results as a valuable addition to the grain foods, and as a wonderful aid to the digestion and elimination of disease germs, thereby allowing the hens to derive more nutriment from every ounce of feed they eat.

Feed Milkoline to Your Laying Hens

So confident are we that MILKOLINE will stimulate the egg producing organs of the hen and help digest the egg forming ingredients from the foods they eat that we do not hesitate to guarantee that MILKOLINE will increase the egg production of your flock.

Give MILKOLINE a trial and convince yourself. If you are not entirely satisfied with results, write us and we will gladly and promptly refund your money.

We have thousands of testimonials from satisfied customers.

MILKOLINE will keep an indefinite length of time in any climate and will not mold, rot, sour or lose its acidity.

Stop buying buttermilk of uncertain quality.

Use MILKOLINE and you will always be sure of an even, uniform acidity at a cost of two cents a gallon, when mixed according to directions.

For feeding, mix one part MILKOLINE with fifty parts water.

ASK YOUR DEALER FOR MILKOLINE. If he does not handle it, do not delay ordering direct from us.

All shipments made promptly on receipt of price.

Booklet and more information FREE for the asking.

Young Pigs and Hogs Thrive on Milkoline

A long-felt want for the hog raiser as well as the poultryman. Keeps young pigs and hogs toned up so that they can resist disease, take on weight quickly and develop rapidly.

Just What You Will Need This Winter

This is the FAULTLESS Automatic Feeder

All you have to do is to fill the can of this feeder with wheat, corn, oats or any other kind of feed, either mixed or separate. When the chickens are hungry they pick at the cross bar; this causes some feed to drop to the ground where the chickens can pick it up. No feed spoils or is eaten by rats or sparrows. **You can save enough feed in one month to pay for these feeders.** Besides the saving of fuel, you save work.

Here Are Our Low Prices

This feeder holds $\frac{1}{2}$ bushel of feed. It is made of heavy rust-proof material. It weighs six pounds packed for shipping. Order by No. 153.

And What is More, we will send you two 8-quart feeders, same style as above, both for \$2.50. These two feeders weigh nine pounds and will not be sold singly. Order by No. 152.

Here is the Feeder for Your Low Coop

Or for Your Baby Chicks

It holds five quarts, will feed any kind of feed, either mixed or separate. It is built on the principle of the large FAULTLESS Feeder and is furnished complete with brackets, which can be attached to the wall or side of a coop at proper height. This feeder is beautifully painted and with ordinary care it will last forever. It is guaranteed to feed your stock perfectly from the time the chicks are able to eat until ready for the ax. We sell this feeder for \$1.00. It weighs $3\frac{1}{2}$ pounds when packed. Get one today and feed your chickens right. Order by No. 151.

We carry a full line of poultry appliances and remedies. We also manufacture the well known Simplex Genuine Feather Brooders and Ilovers—both heated and fireless. Send for our CATALOG; it will interest you.

SIMPLEX SUPPLY HOUSE, Peterson Bldg., CHICAGO, ILLINOIS

DEVELOPING A STRAIN OF HIGH LAYING LEGHORNS

By C. T. Patterson

The problem of high egg production is of vital importance at the present time. The hen which lays 90 eggs per year just pays for her feed. The hen which lays 91 eggs is one egg profit. The hen which lays 200 eggs per year is 110 eggs profit and this one hen is as much profit as a flock of 110 hens which lay only 91 eggs each per year. Producing the high laying average is of far more importance than the phenomenal high laying few.

The results of a number of tests with various methods of selecting and breeding for high egg production indicate that the "Index" method of selection is superior to all others. The first year's trapnest record is only 72 per cent accurate in the selection of high and low egg producers, while the Index is 87 per cent accurate. The Index is a method of determining the hen's ability to perform instead of measuring her performance for a long period of time. It is one thing to know what a hen did do, but another thing to know what she could have done. A factory may have a producing ability of 300 articles per year, yet through no fault of the factory it may produce only 100 or 200 articles. A hen may have a performing ability of 300 eggs per year, yet through no fault of the hen she may produce only 100 or 200. The year's production is the performing ability less the handicaps. Unless the value of the handicaps is given, the year's production is of little value.

The "Index" is determined by measuring the hen's performance for 60 days under the most favorable circumstances. It is then possible to measure the hen's ability to perform. The hen should be trapnested through March, April, May and June of the first laying year and from this time take the highest 60 days from which the hen's index value is obtained.

The hen which lays 30 eggs in 30 days has reached nature's maximum rate of an egg per day and if she continues for 10 months at this rate, it is a 100 per cent year's work of 300 eggs with 65 days left to molt and get ready for the next year. The average hen produces about one-third of her life's production the first year, then 900 eggs is considered a 100 per cent life's production.

The Index is taking 30 days production as the rate and the 30 days production instead of using 10 months and 3 years. The hen which lays 23 eggs in 30 days and 25 eggs during the next 30 days has an index value of 700 eggs for life or 233 for the first year. This is found by multiplying the rate 28 eggs by the persistency of 25 eggs, then take one-third to get one year's index. The index of the male is the same as that of his dam.

By using the Index method of selection the average production of the flock has been increased 50 per cent in 5 years.

After trying and observing the many methods of selecting and breeding for high egg production, it is evident that the Index is the true method of measuring a hen's performing ability.

Experts Sometimes Make Mistakes.

In an October magazine we found a very interesting article on efficiency in poultry, keeping by the several known college "expert." Among the several illustrations we noted one picture of a poultry house which appears to have been reproduced from a photograph we took several years ago on one of the most successful of Rhode Island's egg farms. Beneath the house picture we read, "A very poor poultry house. Hens cannot lay well in such a house."

That only proves that sometimes even efficiency experts make mistakes. The house is a very good sort for the locality in which it is used. This particular house is one of a large group of similar buildings that have housed some of the best laying flocks in the state of Rhode Island for the past quarter of a century or more. In fact, one can take a trip thru the egg farming section of Rhode Island today and find this type of poultry house in use on a large majority of the farms there. Guess again, Mr. Expert! P. T. W.

Notice.

The readers of American Poultry Journal are hereby notified that Hickory Dell Farm, Glenbeulah, Wis., have been accepting orders for stock, but have not been making shipments, and the proprietor, it is reported, has left for parts unknown. All those who have sent orders to Hickory Dell Farm, and have not received satisfaction should at once take the matter up with the postal authorities, either thru their local postmaster or direct to the Third Assistant Postmaster General, Washington, D. C.

Open Air Poultry Houses

For All Climates

by

Prince T. Woods, M. D.

Are You Going to Build a Poultry House?

If you are you need this book

It will save you money

A practical book on modern, common sense poultry housing for beginners and veterans in poultry keeping. What to build and how to do it. Houses that will promote health, vigor and vitality in laying and breeding stock. Tells plainly and in detail just how to build Open Air Poultry Houses, and what to build of, so that anyone with few tools can readily construct the kind of houses used and recommended by the most successful breeders. The best and most practical work on the subject. Don't build or make alterations without this valuable book. 48 illustrations of poultry houses, plans and diagrams, and photographs of construction work. Shows how to care for your houses and fowls to get better poultry, greater egg yield and fertility and freedom from disease. 88 pages, printed on best quality paper; handsomely bound in cloth. Price, 75c. postpaid.

WITH THE EGG LAYING CONTESTS

STORRS EGG-LAYING CONTEST.

Storrs, Conn., Oct. 5, 1918.

First honors for the month of September in the egg laying contest at Storrs went to the "Oregons," the ten birds in the pen laying 219 eggs. Pen 73, White Leghorns belonging to A. P. Robinson, of Calverton, N. Y., was second with 206 eggs to its credit. Pen 78, owned by E. A. Ballard, Chestnut Hill, Pa., won third honors with a total of 189 eggs. The total production for all pens was 13,201 or 44 percent. This is a decrease of 2,251 eggs or 5.8 percent from last month's production.

The accompanying table shows the average pen production for September, the average amount of grain and mash consumed by each pen of the chief breeds, and also the average for the entire 1,000 birds in the contest.

	Grain	Mash	Eggs
180 Plymouth Rocks	32.8	45.6	139
160 Wyandottes	32.1	48.9	140
170 R. I. Reds	32.3	44.7	125
430 White Leghorns	31.6	41.8	130
60 Miscellaneous	33.4	46.4	126
1000 Avg. all breeds	32.1	42.8	132

The ten leading individuals in the present contest are away head of the ten best hens for last year. The following tables show the ten best hens in the present egg laying contest and also the ten leading hens for the past two contests.

Wh. Wyandotte	195	Bridgeton, R. I.	284
Barred Rock	112	Palenville, N. Y.	254
"Oregons"	524	Corvallis, Ore.	251
Barred Rock	23	Pittsfield, Mass.	247
"Oregons"	525	Corvallis, Ore.	245
Wh. Wyandotte	192	Bridgeton, R. I.	244
Wh. Wyandotte	186	Columbia, Conn.	241
"Oregons"	528	Corvallis, Ore.	237
Wh. Leghorn	673	Hollywood, Wash.	233
"Oregons"	529	Corvallis, Ore.	232

The ten leading individuals for the years 1916, 1917 and 1918 are as follows:

1916	1917	1918
No. Eggs	No. Eggs	No. Eggs
272	255	284
257	241	254
253	241	251
252	241	247
250	239	245
249	238	244
245	237	241
244	232	237
244	229	233
237	227	232

It is interesting to note that at least one of the individuals is going to break all previous records for all past contests. White Wyandotte No. 195, owned by Obed G. Knight, of Bridgeton, R. I., is the highest producing hen in the egg laying contest. She has laid 284 eggs and the possibilities are that she will break the high record held by A. P. Robinson's White Leghorn hen No. 728 which laid 286 eggs in the fifth contest.

ARKANSAS STATE LAYING CONTEST

Selection and Care of Pullets. By S. R. Stout, Assistant in Poultry Husbandry.

It will pay any one who raises poultry to spend a little time in the late summer and early fall to select the pullets that they wish to keep for winter layers. If any and all pullets are kept busy, there will be very little or no profit derived from egg production. Especially is this true with the present price of feed. Therefore the success of the poultryman depends upon the selection of his laying stock and then upon the care given this stock.

In selecting pullets for layers, the first thing to look for is birds with perfect health and plenty of vitality. Next, select the busy, wide-awake pullets; and then, those with the ideal body type. No bird that is unhealthy or is low in vitality will ever develop properly for any purpose. A laying hen is always the busy hen, and likewise the busy, wide-awake pullet is usually the one that develops into the good layer.

In regard to the body type, the mistake must not be made of disregarding the breed shape or type, for there cannot be one egg type for all breeds. Depth and width of body comes first in selecting the egg type, for without ample room for the digestive and reproductive organs they cannot attain their maximum development. A rather long body carried high in front and low behind; neck medium in length; head medium; comb and wattles large and well colored; body V-shaped when viewed from side, top and rear; close, compact feathering, short, stout beak and bright eyes are all requisite in

the ideal type. The legs should be short and set wide apart. It is also the best practice when breeding for egg production to select the pullets of good size. They usually lay larger eggs and have a large abdominal cavity which provides more room for the vital organs.

After the selection is made, proper care is very essential. Pullets must have good feed of the proper composition and plenty of it, clean, fresh water and a well ventilated house, which must be kept clean and free from lice and mites.

It is not a good practice to force the pul-

lets intended for egg production, but they must be kept growing and developing gradually. In order to have them mature for late fall and winter laying, they should be hatched early enough to allow them to reach their proper development normally and without forcing.

In the early fall, the pullets should be removed from the range and put in the laying house. They will then become accustomed to their new surroundings before the laying season starts. If they are moved after they once start laying they will invariably stop for a short time.

After they have been put in winter quarters, a good laying ration should be fed. The following is the ration used at this station and is giving good results: Cracked corn, forty-five per cent; feed wheat, ten per cent; and oats or barley, forty-five per cent. This varies with the season, but for the fall the above are the proportions to

Announcement Extraordinary!

America's Two Greatest Strains of

WHITE ORPINGTONS

The
ALDRICH
White
Orpingtons

The
MORRIS
White
Orpingtons

now both have their home at
The Morris Poultry Farm, Lebanon, Ohio

On October 14, without reserve, every Cock, Hen, Cockerel and Pullet, together with good will, mailing list, etc., were purchased by J. S. Morris, proprietor of The Morris Poultry Farm, and on October 15 they were all trucked to The Morris Farm and placed under the skilful and expert management of Harold Rawnsley, superintendent of The Morris Poultry Farm.

THE ALDRICH WHITE ORPINGTONS

have been winning at America's largest shows for many years, having won 1st Cockerel at Madison Square Garden four years in succession and have furnished more winners to customers than any other strain. This is the only exhibition strain that has made high records in the egg-laying contests regularly since 1913. The show-room record, the producing and breeding record of The Aldrich White Orpingtons is well known to every breeder of White Orpingtons.

THE MORRIS WHITE ORPINGTONS "The Proven Leaders"

again "go over the top" to victory with the following September winnings to their credit:

OHIO STATE FAIR
Columbus

1st Cock; 1st and 2nd Cockerel; 1st and 2nd Pullet; 1st and 3rd Hen; 1st Pen.

MICHIGAN STATE FAIR
Detroit

1st Cock; 1st, 2nd and 3rd Cockerel; 1st, 2nd, 3rd and 4th Pullet; 1st and 2nd Hen.

TRI-STATE FAIR
Memphis

1st Cock; 1st, 2nd and 4th Cockerel; 1st, 3rd, 4th Pullet; 1st Old and 1st Young Pen.

It is the intention of the management of this farm to keep and breed these two great strains of White Orpingtons separate and distinct. Customers can procure Aldrich White Orpingtons or Morris White Orpingtons and depend on getting just what they order.

Orders placed for breeding or show stock from the two best blood lines of White Orpingtons the world has ever known, in November, will be allowed a discount of 20 percent from regular prices. Write us at once and get our November price list on stock.

THE MORRIS POULTRY FARM

Lebanon, Ohio

New Method Increases Profit

The new, simple Philo System plan gets the most from poultry—provides the ideal conditions for maximum production with less expense than other methods—bigger profits, smaller losses.

Thousands of hens that are producing for their owners barely enough to pay the cost of feed would go into the "200-egg" class of big profit payers with the right care and housing.

A dozen hens in the new Philo System house shown above should pay for themselves, their feed and the cost of the house within a year. It is scientifically designed, combines features that bring best results from the fowls with conveniences that make it a pleasure to care for them. Requires space 6x6 ft. Ideal for city lot.

LEG BANDS

All Kinds, Aluminum or Celluloid, for Poultry and Pigeons. Spiral Celluloid—12-15c, 25-25c, 50-45c, 100-75c. State breed and sex. Get our circular of other bands, etc. H. A. STEVENS & CO. Box 355-G Aurora, Ill.

use. This scratch feed is to be fed twice a day in a deep litter. The dry mash which should be before the birds at all times consists of the following: Equal parts of corn meal, wheat bran, wheat shorts, ground oats and meat scraps, and two ounces of salt to the hundred pounds of mash. If the pul-

lets are where they can run on a grass lot or on a rye patch, green feed need not be supplied; but otherwise sprouted oats should be fed. Where milk is available, it is a very good practice to feed it and it will prove very profitable. Always supply clean, fresh water, grit, oyster shells and charcoal.

THE CONTEST

The 100 pullets in the Fourth Arkansas State Egg Laying Contest produced for the month of August 81,239 eggs, or an average of 12.59 eggs per birds. The following is the standing and individual records of the pens for the month of August, 1918:

Pen	Breed and Owner.	Individual	Aug.	Total	Weight
18	S. S. White Leghorns. E. F. Lines, Fayetteville	19-23-22-25-14	195	768	1299.5
6	S. C. White Leghorns. Downer's F. & P. Farm, Rogers	18-10-15-14-17	75	754	1282.0

Where the sum of the individual records does not equal the total given, the difference is accounted for by the floor eggs, which could not be credited to any individual but are credited to the pen.

I hereby certify that the above is a correct report of the Fourth Arkansas State Egg Laying Contest for the month of August, 1918.

H. E. DVORACHEK, Professor of Animal Husbandry in charge of contest. MARTIN NELSON, Dean and Director Arkansas Agricultural Experiment Station.

Get More Eggs on Less Feed.

Egg prices this winter will undoubtedly be the highest in the world's history. Those who know how to feed to get winter eggs will reap enormous profits, while improper methods mean a loss.

Prof. T. E. Quisenberry, one of the world's greatest poultry authorities and President of the American Poultry School, Box 206, Leavenworth, Kan., has issued a 16-page bulletin on "How and What to Feed for Heavy Egg Production and to Cut the Cost of Feed." This Bulletin will be mailed Free to interested readers, while they last. Hundreds of hens fed and cared for under Prof. Quisenberry's direction have laid 200 to 298 eggs per year, while the normal production, according to the U. S. Government reports, is 60 to 80 eggs per year.

Write today for your copy of this valuable Bulletin.—Adv.

A Notable Event.

DURING the opening decades of the last century when Yankee skippers in clipper ships were carrying the Stars and Stripes to all the far lands of the globe, showing their heels, so to speak, to the fastest ships of all other nations, they left a legacy of romance to which America will never tire listening. In those days when the sluggard was not pampered by a paternalistic government and cajoled into doing a share of his duty it was found that if the gnawings of a man's stomach did not suffice

Main entrance at Oak Dale Farm.

in keeping him busy, a belying pin was often very efficacious. And no one denies that those days were ones of prosperity and advancement. During those times America built the foundation for the great nation that is now looked to by the whole world with thankfulness and gratitude if a friend; with fear if an enemy.

The Yankee masters brought back from their long journeys the choicest products of all lands—the teas, spices and silks of the far east, the rich furs of the arctics, the precious jewels and luxuries of the wide world. And among the many good things in their cargoes when they returned, probably none have been of more lasting benefit to their country, or added more to its riches and prosperity than a few White Leghorn chickens brought back by the captains who touched Italy.

From the first few birds and some later importations have sprung the millions of these egg machines that dot the farms and cities of the earth, and it is entirely fitting that probably the most representative flock of these birds in the world should have the setting of Oak Dale Farms, Austin, Minnesota. Here forty acres of some of the best land on God's footstool have been occupied with the most practical and at the same time handsome buildings and equipment that money and ingenuity could devise.

R. J. Thomson, president; B. H. Naldrett, manager, Howard L. Goss, secretary, and all other members of the company are enthusiastic fanciers, and are satisfied with nothing but the best in any of their undertakings. After experimenting with several other breeds they finally selected White Leghorns as their ideal fowl. They achieved remarkable success in producing heavy layers and prize winners.

Now, a long time ago, before you and I were boys, a fancier down east became interested in the newfangled breed of chickens that had been brought from Italy by the sea captains. He decided to import some for himself; choice specimens, direct from their native heath. This he accomplished in 1855. The gentleman's name was Young. He was the father of D. W. Young, of Monroe, N. Y. This one strain from the original importation has been bred direct by father and son for all these years, and is probably the most famous and noteworthy flock in the world. Mr. Young is a master breeder and his winnings at Madison Square Garden have stamped his efforts with the seal of approval.

Satisfied with nothing but the best, in September the Oak Dale people purchased the entire stock, good will, etc., of Mr. Young and moved the flock, including his Madison Square winners, to their farm at

Hundreds of automobiles overflowed a three-acre field and blocked the main highway.

LeRoy, Minn. It is their custom to hold an annual poultry exhibition at their farm, but the one held by them September 15, 1918, marks an epoch in the poultry industry. The event was widely advertised in the poultry press and newspapers thruout the adjacent territory, and the reader may judge for himself from the pictures shown herewith, whether or not it was a success. It is variously estimated that from six to ten thousand people attended, the automobiles of the guests overflowing a three-acre

OWEN FARMS

*S. C. Rhode Island Reds
White Plymouth Rocks
Buff Orpingtons and
S. C. White Leghorns*

are known all over the world as the best flocks of these varieties.

The record of my birds at Madison Square Garden, New York (where 418 Owen Farms birds have won the blue), Boston, Chicago, New York State Fair, Pittsburgh, and the leading shows of the South, has never been approached.

Thousands of Owen Farms birds have won firsts in the hands of customers.

MY LATEST WINNING

At the Greatest of All Fall Fairs

New York State Fair

SYRACUSE, SEPT., 1918

FIRST DISPLAY IN EACH VARIETY

Reds—1st and 2d cock; 1st and 3d hen; 1st and 3d cockerel; 1st, 2d and 3d pullet; 1st old and 2d young pen, and best display.

White Rocks—1st and 2d cock; 2d and 3d cockerel; 2d pullet; 1st pen and best display.

Buff Orpingtons—1st and 3d cock; 2d and 4th hen; 2d and 3d cockerel; 1st and 2d pullet; 2d old and 1st young pen; best display.

White Leghorns—1st and 3d cock; 2d and 4th hen; 2d, 3d and 4th cockerel; 1st and 2d pullet; 1st old, 1st and 2d young pens and best display.

Customers have won all over the country this fall in both old and young birds.

WHAT YOU WILL FIND HERE

- | | |
|----------------------------------|--|
| 1. Golden Rule treatment. | 6. Naturally grown birds, on free range with same feeding. |
| 2. Exceptional value. | 7. Utmost courtesy. |
| 3. Unequaled Standard quality. | 8. Absolutely square dealings. |
| 4. Unexcelled utility qualities. | |
| 5. Perfect health and vigor. | |

Old customers will endorse every one of these truths. New ones will find them facts.

If you want the highest quality birds for show and breeding at fair prices; if you want strong properly grown utility birds at fair prices; if you want prompt and careful consideration of your inquiry; if you want to make your poultry business successful, you will come to OWEN FARMS.

Liberty Bonds and Savings Stamps taken in payment. You can help Uncle Sam win this war and then secure your poultry needs.

My trade since August first has been well ahead of 1917. The break will come soon. Now is the time for you to get ready to share in the vast volume of business in thorbred poultry that will soon be done by the breeders that have the birds.

Over 6,000 birds are on Owen Farms. Among them are the ones you need. Write your exact requirements and receive a quotation. Come and see for yourself if possible. If you cannot come, write.

field and choking the highway. The entire plant of forty acres was alive with interested people. They were entertained with music by two bands, instructive and entertaining addresses by speakers of national reputation, and vaudeville sketches. Attractive young ladies in uniform handled the crowd, explained the exhibits and collected over \$600 for the Red Cross. Buttons were sold for 10 cents up showing that the wearer was helping to re-chicken-ize France. The choicest birds were prepared and shown in exhibition coops, where they at-

tracted interest commensurate with their high quality and reputation. Tho the writer has repeatedly been told it "wouldn't pay," he believes that public auctions of thorobred poultry would prove profitable. If hog breeders can average as high as \$300 and \$400 per head at public sale, he does not see why the same rule would not apply to poultry. The experience of Oak Dale Farm shows that the crowd can be collected by proper advertising and arrangements. Who will be the pioneer?

AMERICAN POULTRY JOURNAL
523 Plymouth Court, Chicago

Why More Money.

By JOHN FIELD, the Oklahoma Farmer.

The people of the farms of America never fail to support in the fullest measure every activity relating to the war when it is presented to them properly. Their magnificent response to the campaign for Christmas members of the American Red Cross and for funds for the Red Cross last spring, and their prompt purchases of more than their share of bonds of the third and fourth Liberty Loans, showed that previous apparent indifference was due to faulty organization and incomplete presentation of the nation's needs.

The proceeds of the sale of Liberty Bonds

are spent by the government to develop and maintain army and navy. The Red Cross has its own field of service, but there are other agencies, united in a war work campaign at the request of President Wilson, which are asking for \$170,500,000 in the campaign, November 11 to 18. These organizations are: Young Men's Christian Association, Young Women's Christian Association, National Catholic War Council (Knights of Columbus), Jewish Welfare Board, War Camp Community Service, American Library Association, and the Salvation Army. These bodies do what they can to take something of home and its good influences along with the boys wherever they go. They keep our soldiers from feeling that "nobody cares" about them personally by doing for them the little things which the folks at home would do, if only they were where they could. The soldier is not always fighting. He is not always on duty, but he must be doing something. The military organization takes care of the business of war. The organizations now asking for your support supply what they can of pleasure, comfort, and relaxation for the men engaged in war. They work constantly against the disintegrating influence which war has on individuals engaged in it, striving to sustain the mental, moral, and spiritual development of our boys as you would do if they were at home. And so when this campaign for funds to support the United War Work is on it should have the support of every rural community in the fullest measure. Lack of local evidence of the activities of these organizations, where they are not needed, must not prevent appreciation and understanding of what they are doing in camps, cantonments, and battle lines where nothing else can take their place. You will be sending a little bit of home and mother, father and the children, the church and its good influences, to your boys in the army and navy when you contribute to the United War Work Campaign. The more you give, the more you will be sending to them. Give what you know you should—not just your share.

Artificial Light in the Poultry House

has increased the egg production of some flocks as much as **100%**

GEOERGE NEWELL discovered that by the use of artificial light in his laying pens during the early morning and evening of short days, he doubled his egg yield. He put the results and methods of his experiences into a book called

A Revolution in Egg Production

This book is not a collection of clippings and theories like so many poultry books, but contains the results of commonsense ideas which have been put to test and found practical. They do just what they say they will do—**increase the average egg yield 100%.**

Why Poultry Pays and How to Make It Pay

By Morgan Bates. A "straight from the shoulder" talk on raising poultry from the money-making point of view. It gives the beginner sound advice about starting in. Covers all subjects. Price 50c.

AMERICAN POULTRY JOURNAL PUB. CO.
623 Plymouth Court Chicago, Illinois

Successful Poultry Culture

Treats on all subjects appertaining to the poultry business. The chapter telling how to save three-fourths of your feed bills is alone worth many times the price of the book. 128 pages, profusely illustrated. Price 50 cents.

American Poultry Journal Pub. Co.
523 Plymouth Court, Chicago, Illinois

It is profusely illustrated and contains chapters on Care and Feed in General—Balancing the Ration—Conditions Should Be Watched and Noted—What to Feed—Underfeeding—Overfeeding—Automatic Feeders—Fussing vs. Economy of Time—Water Problems—Housing, Ventilation and Light—Trap Nesting—Incubators or Hens for Hatching—Brooding Problems—What Breed?—Meat Production—By-Product—Yards and Exercise—Spring and Summer Eggs—Fall and Winter Eggs—Care of Eggs—"Ask the Birds; Their Judgment Is Good"—Production Under Present Conditions—Production Records.

Cloth bound, 112 pages, handsomely illustrated, postpaid, price \$1.00

WINNINGS of A. P. J. ADVERTISERS

This column is open to all American Poultry Journal display advertisers and is compiled from information furnished by the advertiser. Complete winnings of all exhibitors at the larger poultry shows as New York, Chicago, Boston, etc., are published in the issue following the show dates, together with a report of the show by an American Poultry Journal representative.

U. R. Fishel, Hope, Ind., reports the following winnings on his White Plymouth Rocks at Greater Cincinnati American Poultry Association Show, August, 1918: Cocker, 1-2-3-4-5; hen, 1-3-5; cockerel, 1-2-3-4-5; pullet, 1-2-3-5; pen fowls, 1-2; pen chicks, 1; Special, best display. At Indiana State Fair, 1918: Cocker, 1-2-3; hen, 1-2; cockerel, 1-2-3; pullet, 1-2-3; pen fowls, 1-2-3; pen chicks, 1-2-3.

Louis H. Perry, Clay, N. Y., reports the following winnings: At New York State Fair, September, 1918, on Rose Comb White Leghorns, 2-3-5 cock; 1-5 hen; 2-3-4 pullet; 2-3 ckl.; 1-2-3, old pen; 1 young pen; silver cup for best bird; \$10 special for best display. On Rose Comb Buff Leghorns, 1 cock, 1 hen, 1 ckl., 1 pullet, 1 pen. At Hartford, Conn., September, 1918, on R. C. White Leghorns, 1-3 hen; 1 ckl.; 1 pullet. On R. C. Buff Leghorns, 1 cock, 1 hen, 1 ckl., 1 pullet.

John S. Martin, Box 51, Port Dover, Ont., Canada, reports the following winnings on his White Wyandottes: At the Canadian National Exhibition, 1-2-3-4 cocks; 1-2-4-5 hens; 1-2-3-6 ccls.; 1-3-5 pullets; 1 pen; bronze medal for best collection. At New York State Fair, September, 1918, 1-2-5 cocks; 2-3-4-5 hens; 1-2-3-5 ccls.; 1-2-3 pullets; 1 young pen; 1 old pen.

Sunswick Poultry Farm, Box J, South Plainfield, N. J., reports the following winnings on the S. C. Buff Orpingtons at the late Trenton, N. J., Fair: 1-2 cock, 1-4 hen, 1-3 ckl, 1-2 pl, 1 old pen, 1 young pen; special for best display in English class; special for best cockerel, all breeds; special for best pen, all breeds.

Walhalla Poultry Farm, Oscoda, Mich., reports the following winnings at Tri-State Fair, Memphis, Tenn.: On Buff Orpingtons—1-2-3 cock; 1-2-3 hen, 1-2-3 ckl, 1-2-3 pl, 1 old pen, 1-2 young pen. On Buff Minorcas—1-2-3 cock, 1-2-3 hen, 1-2-3 ckl, 1-2-4 pl, 1-2 old pen, 1-2-3 young pen. Also all club specials on Buff Minorcas.

Wilburtha Poultry Farms, Trenton Junction, N. J., report the following winnings on S. C. Rhode Island Reds at New Jersey State Fair: 1-4 cock, 1-3 hen, 1-4-5 ckl, 3 pl, 1 old pen, 1 young pen.

Pratt Food Company, Philadelphia, Pa., reports the following winners, made by birds from the Pratt Experiment Station, at the late New Jersey State Fair, Trenton, N. J.: On S. C. Black Minorcas—1 cock, 1-2-3 hen, 4-5 ckl, 2-5 pl, 2 young pen, 1-2 old pen. On R. C. Black Minorcas—1-2 cock, 1-2 hen. On R. I. Reds—3 ckl. On Pekin Ducks—1-3 drake, 1-3 duck, 3-4 young drake, 1-2 young duck, 1 young pen, 1-2 old pen. On Mallard Ducks—1-3-4 drake, 2-3-5 duck, 1-2-3 young drake, 1-3-4 young duck. On White Chinese Geese—1-2-3 gander, 1-2-3 goose, 1-2 young gander, 1-2 young goose.

U. R. FISHEL Box A **HOPE, INDIANA**

THE HANOVER FAIR.

Great credit is due Mr. C. N. Myers of Hanover, Pa., and his assistant, Jas. T. Huston, for the magnificent exhibit of poultry at the Hanover Fair, Hanover, Pa., Sept. 17-20, 1918.

In writing us on Sept. 23, Mr. Huston says: "Mr. Myers and the writer have been greatly interested in the success of this exhibition and you cannot say too much in regard to this fall fair event inasmuch as it was the greatest fancier show it has been my privilege to attend in a long time. Over 115 exhibitors showed nearly 2,000 birds, no 'string men,' every exhibitor a specialist in his line. The building was crowded to the door, making it necessary to hold an overflow under a temporary roof. Some classes ran to 100 birds of the single classes. There were no odd varieties shown, but straight, clean, good competition brought exhibitors from as far south as Georgia, all sections of New York, New Jersey, Pennsylvania and Maryland."

Following is a complete list of awards:

Buff Plymouth Rocks—John H. Fleishman, 4 cock, 2 hen, 3 ckl. Geo. W. Wege, 3 cock, 3 hen, 1-5 ckl, 1-5 pl, 3 pen. Brish Bros., 2 cock, 4 ckl. E. E. Blair, 4 pen. Kerlin Farm, 2 ckl, 3 pl. Jos. H. Hertz, 1 cock, 1-4 hen, 2-4 pl, 1-2 pen. Jas. H. Vincent, 5 cock, 5 hen.

Barred Plymouth Rocks—Robert J. Walden, 1-4 cock, 1 hen, 2 ckl. Lewis Swartzbaugh, 2 cock, 1-4 pl. Wm. Overbaugh, 3-5 cock. O. H. Harner, 2 hen. W. G. Boileau, 1-3-4-5 ckl. E. S. Egger, 2-3-5 pl.

White Plymouth Rocks—C. N. Myers, 1 cock, 2-3-4-5 hen, 2-3-5 ckl, 1-3-4-5 pl, 2 pen. Horace W. White, 2 cock, 1 hen, 1-4 ckl, 2 pl, 1 pen. Park W. T. Loy, 3-4-5 pen.

Partridge Plymouth Rocks—H. J. Roth, 1-3 cock, 1-2-3 hen, 1 ckl, 1-2-3 pl. Frank A. Little, 2 cock, 4-5 hen, 2-3 ckl, 4 pl, 1 pen.

An Announcement.

The Cleveland Poultry Breeders' Association at its last regular meeting held the 3d inst., after due and thoughtful consideration of all the questions involved, decided, by a unanimous vote, not to hold a show this year. The reasons for the action noted above are many and obvious, two of which only will be cited.

First, and the prime reason, we find that for the only hall available in our city the rent asked is almost prohibitive, in fact it is positively so when all things are taken into consideration.

Second, and as a sequence to the first, the many and various conditions that have been forced upon us all by the war make it impracticable and well-nigh foolhardy for our association to attempt to give an exhibition worthy of its traditions. We are not of those who argue "that any kind of a show would be better than no show at all," for we do not believe it. We have endeavored in the past to maintain A1 exhibitions, and we have no desire at this time to attempt an undertaking that, in all probability, would lower our standard.

While the action cited above is reluctantly taken, yet we deem it best for all concerned that we postpone the holding of a show for one year, or until times become more propitious. Our association is intact and fully alive to the situation, and when the proper time arrives will make a "come back" that

AT MEMPHIS TRI-STATE FAIR

Moraine Farm Speckled Sussex made a clean sweep, winning:

**1, 2, 3, Cocks 1, 2, 3, Cockerels 1, 2, Young Pen
1, 2, 3, Hens 1, 2, 3, Pullets, 1, 2, Old Pen**

Eventually you will breed Speckled Sussex, the best table fowl.

Get started with a pen of Moraine Farm birds. They pay a profit in meat and eggs. Send for catalog and enclose 20c. for two beautiful color prints of male and female Speckled Sussex.

THE NEW REVISED EDITION

of the

Standard of Perfection

Now ready, and will be the only recognized authority on all Standard requirements of American-bred Land and Waterfowl until 1923—eight years in service.

Since 1874 the American Poultry Association has issued under copyright, many editions of the Standard, but this issue is, without doubt, the masterpiece.

It is the one great book most used by judges, fanciers and breeders, and the only recognized authority in awarding prizes in the poultry shows of the United States and Canada.

The new edition contains 112 full-page illustrations of Chickens, Bantams, Ducks, Geese and Turkeys by America's foremost artists.

A new nomenclature indicating each section of all Standard breeds and varieties—male and female.

A glossary of fifteen pages describing and illustrating many technical terms used by poultry breeders.

A complete list of recognized disqualifications for each American Standard-bred breed and variety.

A chapter on cutting for defects. A full and complete Standard description of each and every recognized Standard breed of Land and Waterfowl, giving the Standard requirements in every section, weight, size, color, markings and shape.

No Poultry Breeder Should be Without a Copy

Buy a copy and know the Standard requirements for all American Standard-bred breeds and varieties. Price, cloth, \$2; Sent postpaid.

will be highly pleasing to itself and the fanciers. To those fanciers who gave us their support in the past we extend hearty and appreciative thanks, and ask, for the present, their patient indulgence as well as their valued co-operation in the future.

Respectfully,

Geo. H. Poulson, Pres.,
A. E. Rehburg, Sec. Pro Tem.

Cleveland, O., October 4, 1918.

COLISEUM GETS AMERICAN BUFF WYANDOTTE CLUB MEETING.

Important Notice to Buff Wyandotte Breeders.

The notice of this meeting was received after the Coliseum premium list had been printed and many copies mailed. Following is a list of specials that are offered in addition to the ones printed in premium list:

CLUB SPECIALS.

The American Buff Wyandotte Club, Andrew C. De Hass, Albany, N. Y., secretary, offers to club members only, a club cup for best cock, club cup for best hen, club cup for best cockerel, club cup for best pullet and club cup for best pen. Also club ribbons, one for best shaped male, one for best shaped female, one for best colored male and one for best colored female. If not a member of the club, send \$1 to Mr. De Hass before the close of the entries.

The Coliseum Association will offer a \$25 cup for best display, \$5 cash for 10 best colored birds by one exhibitor and \$5 cash for 10 best shaped birds by one exhibitor. The Coliseum regular cash specials as printed in the premium list offer for 50 entries, \$10 cash for best display and \$5 cash for second best display. For 100 or more entries, \$25 cash for best display, \$20 for second best display and \$15 for third best display. These cash specials are offered in addition to the regular cash prizes covering all varieties. Chas. V. Keeler will judge the class.

Remember entries close November 15. For premium list address the secretary, Theo. Hewes, Lexington Hotel, Chicago, Ill.

Pittsburgh Eighth Annual Show.

Owing to the dates as announced heretofore conflicting with the Madison Square Garden, it was decided to change same and hold the Pittsburgh Show the week of January 13 to 18. The following judges and classes which they will judge were decided upon. There might be some slight changes, however, in same: Richard Oke, all Orpingtons, Cochins and Cochins Bantams; Chas. McClave, all Leghorns (except Buffs), Barred Rocks, Lakenvelders and turkeys; Len Ravensley, Red, Cornish, Sussex and all Bantams, except Brahmans and Cochins; Thos. C. Samuels, Minorcas, White Wyandottes, Spanish, Langshans, R. I. Whites and Buckeyes; F. I. Bradford, Andalusians, Brahmans, Buttercups, Campines; Fred A. Poertner, Buff Rocks, all Wyandottes (except White) and Buff Leghorns; George H. Hilderbrand, White Rocks, Partridge and Silver Laced, Hamburgs, Houdans and Polish; Wm. F. Auerswald, Columbian Rocks, Waterfowls, Faverolles.

It was also decided to use the Keiper Cooping Company coops at the coming show. In reply to a request from President Richards of the American Poultry Association, it was decided to donate a booth to the association to further the interest of the A. P. A. The premium list will be ready the early part of December and former exhibitors will have one mailed to them when published. The prizes and entry fees will practically remain the same as last year. Those desiring further information should address the secretary, J. Leonard Pfeuffer, Commonwealth Bldg., Pittsburgh, Pa., and premium list will be sent when published.

Greatest Thanksgiving Poultry Show.

The 1918-19 show season for Standard bred poultry will open with one of the best shows to be held, when "The Heart of America Show" swings wide the doors of the great Convention Hall at Kansas City, Mo., Thanksgiving week, to what now gives every indication of being the most successful exhibition season in the central states for many years past.

This show has finally secured the use of all of the great Convention Hall, which makes one of the largest and best lighted show rooms in America.

A list of licensed American Poultry Association judges second to none, representing North, East, South and West, have been secured to place the awards. These judges include J. H. Drevendstedt, of New York; Jas. A. Tucker, of Michigan; E. C. Branch and V. O. Hobbs, of Missouri; Capt. Harlo J. Fiske and Russell F. Palmer, of Kansas, and Walter J. Burton, of Texas.

The premium list for this show is now ready and will be sent to any breeder who writes to Chas. Brunske, secretary, 1914 Elmwood Ave., Kansas City, Mo.

Embargo on Shipment of Live Stock by Express.

To All Poultrymen and Members of the American Poultry Association:

The American Railway Express Company, the name now given to all former express companies, and now under Federal management, has advised the American Poultry Association that as a war measure an embargo, effective between December 10 and 31, will be placed upon the express shipments of all live stock, live animals and live birds in all the territory east of the Missouri River to St. Louis, and thence east of the Mississippi River to the Gulf of Mexico. In all other territory poultry shows may be run as usual. Such a ruling precludes the possibility of shipping Standard-bred fowl to poultry exhibitions in territory covered by the embargo between these dates, and as a consequence said ruling might conflict with your show, provided it is planned to have our association draw birds from territory requiring express shipments.

In view of the ruling of the American Railway Express Company, it is hoped that your association will arrange matters, and hold its exhibition either before or after the period of the embargo. Call a meeting of your association at once, and make arrangements to hold your exhibition. Get into correspondence with your judge for new dates, for the embargo will change the judge's arrangements and it will be necessary to meet the new conditions in the best possible manner. Quick action on the part of your association, at this early date, will enable it to hold a show before December 10 or immediately following December 31. Wishing your show success, I remain,

Yours respectfully,
E. E. Richards, President.

In order to secure the co-operation of the American Poultry Association judges, and all others as well, the following message has been forwarded:

To American Poultry Association Judges:

The American Poultry Association is advised by the American Railway Express Company, the Federal designation of all express companies, that as a war measure, an embargo is to become effective December 10 to 31, during which time no live stock will be transported by express in all territory east of the Missouri River to St. Louis, and thence east of the Mississippi River to the Gulf of Mexico—Minnesota included.

It has been thought advisable to give you advance notice of this embargo, so that you may be given ample opportunity to re-arrange your judging dates and to be able to meet the new requirements for judges' service. Get into correspondence with your associations under contract at once. Many associations will be glad to change their dates to meet these war conditions.

Respectfully,
American Poultry Association,
E. B. Campbell, Secretary.

Some Interesting Facts About the Coliseum Show—The Last Call.

The 10th annual exhibition will be held in the Coliseum building, Chicago, Ill., December 3, 4, 5, 6, 7 and 8, 1918, with December 2 to get in and December 9 to get out. The show opens to the public on Tuesday and closes Sunday night.

Every breed and variety has been taken care of with some cash specials, in addition to the regular cash prizes. The association will pay the same prizes as last year, with additional cash on turkeys and geese.

The following specialty clubs will hold their annual meetings at the Coliseum this year:

The American Light Brahma Club, with \$110 in cash and two \$25 cups and club ribbons.

The American Wyandotte Club, with \$85 in cash, a \$25 cup and club ribbons.

The National White Wyandotte Club, with \$200 in cash and club ribbons.

The International Plymouth Rock Club, with \$150 in cash and club ribbons.

The International Turkey Club, with \$50 in cash and club ribbons.

The Rouen Duck Club, with cups and ribbons.

The combined show of the Chicago Bantam Club and the Middle West Bantam Association.

The National Breeders and Fanciers Association, representing every fur-bearing animal known to man, with \$100 in cash, numerous cups and other specials.

In addition to these club meets, the Rose Comb Rhode Island Red breeders have put up \$100 in cash that is to be divided into four displays.

The Single Comb Rhode Island Red breeders have put up \$50 cash to be divided into three displays.

There are five \$50 trophies, without a question the best that have ever been offered at any poultry show in America; one each to be awarded to the best 10 birds in the following breeds: Plymouth Rocks, Wyandottes, Rhode Island Reds, Leghorns and Orpingtons, all varieties of these breeds to compete for these trophies and

Get More Eggs Waste Less Feed

Increase income—reduce costs! Make your hens lay heavily now while eggs are bringing high prices. Prevent feed waste due to sluggish or imperfect digestion. Make every hen lay by using

Pratts Poultry Regulator

The sure-fire egg-producer which has triumphantly stood every test of nearly a half-century of general use.

Pratts Poultry Regulator is not a severe stimulant which gives but temporary results. It does not force but induces hens to lay because it builds them up naturally, puts them in such fine physical condition that regular egg-production is bound to follow. And it keeps them laying right through the period of high prices. It assists the birds to thoroughly digest and make use of every particle of food, thus prevents waste and reduces feed costs. Test it with a part of your flock and compare results.

Pratts Roup Remedy should be used occasionally, especially during changes of the weather, to prevent roup and colds which are so common during this season of the year. If these and related diseases appear in your flock, Pratts Roup Remedy will prevent them from spreading and will save the sick birds.

Our dealer in your town has instructions to supply you with Pratts Preparations under our square-deal guarantee—"Your money back if YOU are not satisfied"—the guarantee that has stood for nearly 50 years.

THE COLISEUM

CHICAGO

The World's Greatest Poultry and Pet Stock Show

Will Hold Its
TENTH ANNUAL EXHIBITION
December 3, 4, 5, 6, 7 and 8, 1918

The Show Opens on Tuesday and Closes on Sunday Night

Regardless of increased rental almost doubling that of former years; regardless of increase in every item of show expense; regardless of war and the thousands of inconveniences occasioned by the war,

THE GREAT COLISEUM SHOW

will be held as advertised. This, we feel, is our solemn duty to the loyal fanciers of this country, and we will not shirk this responsibility.

THE COLISEUM

is the one show west of New York that for nine consecutive years has met every obligation in full and in cash without the sale of one dollar of its capital stock. The same liberal guarantee is offered you for 1918.

THE COLISEUM SHOW

has introduced more new features that have worked to the betterment of the fanciers than all other shows in America combined, and this year we will introduce two additional features that will revolutionize the poultry shows of this country.

A WINNING AT THE COLISEUM

on any breed or variety in 1918 will carry with it a greater advertising value than any win you can make this season. The dates are ideal, coming ahead of extreme cold weather and ahead of all other National shows, on the same dates as the great International Stock Show. We put you in touch with the greatest buying public that will congregate anywhere this winter. Our reputation as a sales show is established. Not one year but every year the calls surpass the supply for high class birds, and, so far as we are able to learn, it is the only show where a legitimate sale of \$5,000 was ever made by a single exhibitor.

THE COLISEUM SHOW

is the only National show that absolutely guarantees its concessionaires. It is our proud boast that we have never sold space to a faker.

Yes, the Coliseum Show Will Pay Cash Prizes

In fact, there is more real cash offered this year than ever before. This is no time to retrench or count postage stamps. This is the time for big things and we represent a big industry. The legitimate breeder needs all the encouragement the shows can give him and we are giving it freely. In addition to our liberal cash prizes, there will be a \$50 trophy for the best ten Plymouth Rocks, a \$50 trophy for the best ten Reds, a \$50 trophy for the best ten Leghorns, a \$50 trophy for the best ten Orpingtons and a \$50 trophy for the best ten Wyandottes.

THE PREMIUM LIST IS NOW READY

All exhibitors at the 1917 show will receive the list without request; others should write the secretary for a copy at once, as the list will not be mailed indiscriminately. Old exhibitors not receiving the list by October 10 will please write for it, as there is much uncertainty about mail delivery. Entries positively close November 15. For list of judges, see notice published in this issue.

Address of secretary until October 15, Indianapolis, Ind. After October 15, Lexington Hotel, Chicago. The Lexington Hotel has been selected as headquarters.

Chicago and suburban residents desiring space in the Coliseum may get information from James W. Bell, care of American Poultry Journal, 523 Plymouth Court; but for premium list address

THEO. HEWES, Sec'y.

awards will be made to the 10 entries that come nearest to Standard perfection, regardless of color.

A class is made in the Coliseum for every breed and variety of breeds, Standard and non-standard, and cash prizes will be paid to all of them.

Entries in all departments will positively close November 15. If you have not received list, send for it today, as it will be mailed only on request.

For premium list and information in regard to concession space, write Theo. Hewes, secretary, Lexington Hotel, 22d St. and Michigan Blvd., Chicago, Ill.

Black Leghorn Club News.

The American Black Leghorn Club will hold its annual meet at Madison Square Garden this year. The club offers a handsome silver cup for best display, also four beautiful rosette, or elaborate special ribbons for best cock, hen, cockerel and pullet. Other specials will be announced later.

Every interested breeder of Black Leghorns should become a member of the club. The club is giving valuable service to members. Trying to give the variety greater publicity and to bring out larger exhibits at the shows.

The membership dues are but \$1. This includes initiation fee. Also entitles member to compete for the cups and special ribbons which the club offers. — Albert Brust, Jr., 822 Harrison Ave., Scranton, Pa.

Buff Rock Club.

Jos. H. Hertz, Hanover, Pa., the newly elected secretary-treasurer of the American Buff Rock Club, writes us that he is going to make every effort to bring this club to the front. With the assistance of the president, C. R. Baker, Abilene, Kas., and the other newly elected officers, we feel sure that much will be accomplished. Every breeder of Buff Rocks should be a member of this club. The dues are only \$1 per year. Join the club and help boom your favorites. For full particulars write the secretary, Jos. H. Hertz, Hanover, Pa.

Madison Square Garden Show.

On September 26, just after we had gone to press with our October issue, we received a telegram from Chas. D. Cleveland, secretary of the Madison Square Garden Show, informing us that the thirtieth annual Garden show would be held January 24 to 28, inclusive. This is several weeks later than has been the custom of holding this show, but these dates will not conflict with any of the other large shows, and we really believe will be better than holding the show during the holiday season. For full particulars write Chas. D. Cleveland, Eatontown, N. J.

The American Buff Wyandotte Club recently elected the following officers: President, J. J. Dansro, North Clarendon, Vt.; eastern vice-president, S. A. Howland, Granville, N. Y.; western vice-president, S. A. Power, Fairfield, Iowa; central vice-president, Charles Howison, Sandwish, Ill.; southern vice-president, T. S. Hewke, Winter Park, Fla.; Canadian vice-president, Angus Johnson, Ridgetown, Ont.; secretary-treasurer, Andrew C. De Hass, Albany, N. Y. The club national meet will be held in connection with Coliseum Show, Chicago, December 3 to 8, 1918; the eastern meet at Madison Square Garden; the western meet at Minneapolis; the southern meet at Orlando, Fla., and the Canadian meet at London, Ont. Every breeder interested in Buff Wyandottes should join this club and compete for the many handsome specials to be awarded to club members this season. For full particulars address the secretary, Andrew C. De Hass, Albany, N. Y.

Oak Dale Farms Not in Competition at Coliseum.

A rumor has been circulated that Oak Dale Farms, Austin, Minn., intended to exhibit White Leghorns at the Coliseum Show, Chicago. R. J. Thomson, president of Oak Dale Farms, requests us to give publicity to the fact that they will not show White Leghorns in competition at the Coliseum Show under D. W. Young. They expect, however, to send a number of the Young S. C. White Leghorns to the show simply as an exhibit to go along with the birds of Oak Dale Farms. This exhibit will cover a floor space of 20x30 feet. This statement by Mr. Thomson should assure those who had an idea that Oak Dale Farms intended to exhibit S. C. White Leghorns under Mr. Young after purchasing his entire flock, that such is not the case.

Campbell's "Never-Wear" Judging Stick is what you need. Made of telescope brass tubing. Nicely nickeled. Special this month, \$2 each. C. A. Campbell, 1913 W. 59th St., Chicago

SHOW DATES

This list has been compiled from information received from secretaries or judges. If the dates of any poultry show in which you are interested do not appear hereunder, kindly have the secretary mail the necessary information to us and same will be published in our next issue.

DISEASES OF POULTRY

By D. V. Salmon. 252 pages; 72 illustrations. Every poultryman needs this book. The cause, symptoms, care and remedies for each disease fowls are subject to are given. Price 50c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

America's One Great Poultry Book—

the De Luxe edition of the PLYMOUTH ROCK STANDARD AND BREED BOOK. Prepared and issued by the American Poultry Ass'n. Now on the press. Accepting advance orders.

It tells about Barred, Buff, White, Columbian, Partridge, Silver Penciled and Barred Rocks

In completeness, clearness and exactness of text and instructional value and beauty of illustrations it has never been approached. Following are a few of the important topics covered:

Introduction: This includes History of Breed Standards, Nomenclature, Glossary, Official Score Card, Explanation of Scale of Points, Instructions to Judges, General Disqualifications, Cutting for Defects, Standard Measurements, Symmetry, Color Terms, etc.

Breeding Standard Fowls: This includes Origin of Fowls, Breeding of Standard Fowls, Does "Like Produce Like"? Why Fowls Differ in Breeding Value? Why the Male is "Half the Flock", Prepotency, Mendelism, Strain Building, In-Breeding and Line-Breeding, Breeding from the Best, Double Mating, Relative Value of Characters, Characters Controlled by Sire and Dam, Mating to Offset Defects, Influence of Individual Disposition, Importance of Constitutional Vigor and How to Preserve it, Breeding for Color in Plumage, Relation of Under Color to Surface Color, Importance of Trapping Records, Age of Breeders, Number of Females to Male, Stud Mating, Period of Fertility, How to Introduce New Blood, Longevity,

Early Maturity, Grading and Crossing, etc.

Practical Poultry Breeding: How and When to Start, Back Yard Breeding Pen, Housing and Sanitation, Feeding the Breeding Pen, Hatching and Brooding, Care of Growing Stock, Feeding for Growth, How to Maintain the Health of the Breeding Flock in Confinement, etc.

Exhibiting and Judging: Regulation Development Conditioning, Washing, Cooping, Care at Show, Care after Show, Judging, etc.

Utility Section: Plymouth Rocks in Laying Contests, Plymouth Rock Standard shape and weight with reference to Egg Production, Plymouth Rock Egg, Breeding for Egg Production, Methods of Commercial Plymouth Rock Breeders, The Egg Market, Commercial Egg Production, Plymouth Rocks as Table Fowls, Broilers, Roasters, Soft Roasters, Capons, Special Fattening for Table Fowls, Killing, Dressing and Marketing, etc.

These and all other subjects are treated in a plain, easy-to-understand manner by the best authorities and illustrated by Franklane L. Sewell. Every breeder of Plymouth Rocks, any variety, must have this book if he would be up-to-date and successful. The pictures alone are worth many times the price of the book. Don't neglect your opportunity to get ahead—send your order today.

RIKHOFF'S S.C. BROWN LEGHORNS

LET others magnify their winnings as they may. The fact remains that no breeder at any time or place ever made a record that would even approach my winning at the great Indiana State Fair, Sept., 1918.

Think of this record before placing order

In the largest class in the show, and in competition with six of the best breeders, I won 1-2-3 cock, 1-2-3 hen, 1-2-3 cockerel, and 1-2-3 pullet, exhibition—1-2-3 cock, 1-2-3 cockerel, and 1-2-3 pen, light mating. 1-2-3 hen, 1-2-3 pullet and 1-2-3 pen dark mating. Thus, following my Winnings at the great Coliseum and Madison Square Garden shows, stamps my strain as America's best. I can furnish you single birds, trios or pens, exhibition or breeding stock, that cannot be duplicated in price or quality.

Write your wants and let me start you RIGHT

(HERMAN F. RIKHOFF)
305 Saks Bldg., Indianapolis, Ind.

Choice Cockerels of the Foremost Winning Strains

BUFF ORPINGTON Cockerels from first cock, 1916 Coliseum show.
S. C. W. LEGHORN Cockerels, Smith's strain, none better in the world.
R. C. ANCONA Cockerels, from first cockerels both Chicago shows, 1917-1918.

These are well-developed birds, carrying the qualities that have made their progenitors winners at America's strongest shows. If you want the best, here it is. Send today for literature and describe your needs.

SHOW-BIRDS GALORE

More than 2400 "Aristocrat" Barred Rocks are now growing up into superb, magnificent show-birds. The "Aristocrats" are those glorious Plymouth Rocks which are making such a

SENSATIONAL SWEEP OF VICTORIES

throughout all America—from the Grand Palace show, N. Y., to San Francisco; from the foremost shows of Canada down into South America—winning out at such great shows as the annual National Barred Rock Show (the greatest of the great), Chicago, N. Y. Palace, Guelph, New Orleans, the "Tri-State," the "World's Fair," Cleveland, Texas State, and many, many hundreds of other shows. This is probably the most victorious campaign ever made by any strain of chickens. (Can furnish show-birds in all classes for any show—remember this.)

WONDERFUL LAYERS

At the same time these superb show-birds are also among the world's foremost layers, establishing equally remarkable records—records up to 260 eggs per year. They are, truly, great all around—great layers, great market chickens, great show chickens—all combined. They are in a word

THE WORLD'S GREATEST MONEY-MAKING STRAIN OF CHICKENS

Write me today and let me show you how you can make more money with "Aristocrat" Barred Rocks than with any other variety of chickens.

Mother Rabbit can duplicate this ten times a year!

The New Rabbit Culture and Standard

BY ROTH AND CORNMAN, REVISED BY C. R. DEARDORFF

Third Edition (Revised and Up-to-Date) Now Ready

The best and safest guide for the experienced or amateur breeder. Tells what you must know and do clearly, concisely, and according to approved methods. Contains 132 pages, describing and illustrating all the leading breeds and varieties of Rabbits and Hares; discusses Feeding, Breeding, Housing and Yards, Diseases and Remedies, Selection of Breeders, Judging, Preparation for the Table, etc.; is, in fact, an encyclopedia of the best available knowledge. Among books on Rabbits, it has no superior. It is to the Rabbit Breeder what the "American Standard of Perfection" is to the poultryman. Thirty illustrations of all principal varieties.

One of the many who recommend this book is M. L. Thayer, a rabbit expert of the highest standing. In the California Rural World he advises that the man starting to raise rabbits get some literature before buying stock. He recommends this book.

AN EXPERT'S OPINION OF THE BOOK—What the Ex-President of The National Pet Stock Association of America Has to Say About It.

Dear sir:—The copy of "The Rabbit Culture and Standard" has been received and read entirely through. I wish to compliment the Editors on producing the first real good work on Rabbits in the United States, which should be a great help to all those seeking accurate knowledge. I was greatly impressed by the Foreword which emphasizes the possibilities of the meat industries which very few seem to realize and which must soon come into favor in this country same as it has in all of those on the other side. This book explains it in a much clearer way than it has ever before been my privilege to read. It will prove that rabbit meat is worth per pound just as much as poultry, pork, mutton or beef, in fact, very few realize what a nice delicate meat it is when cooked. The demand has always been greater than the supply, and with this good hook explaining the way, it should be more simple for the beginner to see the right path. Yours very truly,
WILLIAM I. LYON.

A Great Rabbit Boom Is Now On

Americans are thoroughly awake to the wonderful value of Rabbits and Hares as meat food to replace beef and pork. Easily bred and quickly raised, very prolific, requiring little space, easily prepared for the table—no other animals today so thoroughly meet our needs. Europeans have used them for many years and esteem them highly.

Breed Hares and Rabbits

The demand is greater than the supply. One breeder recently received 32 inquiries and orders in four days. Most of these he could not fill. WILL YOU? It's Patriotic, Pleasant and Profitable. "Rabbit Culture and Standard" will guide you.

UNITED WAR WORK CAMPAIGN

By Charles Dillon

Don't let anyone tell you that the Y. M. C. A. or some other of the seven organizations in the United War Work Campaign, makes your boy pay for the things he gets at the front! There's nothing to it. In the front line the "Y" sells nothing. Chocolate, fruit, soup, and cigarettes are given away for the asking, to the amounts of hundreds of thousands of dollars. In the canteens farther back tobacco, which is the largest item, is sold at the same prices as in the quartermaster's stores, the "Y" standing the transportation loss, which amounts to a very large total. The "Y," which is the

name used by soldiers everywhere for the Y. M. C. A., never has, and never will make one cent of profit on its activities.

This is just as true of the Salvation Army, the Jewish Welfare Board, the War Camp Community Service, the K. of C., American Library Association and the other war work organizations. They are not in the war for profit; they are our representatives in camps of this country, and in the other countries where our men are fighting, our representatives sent out to supply the comforts and entertainments, and the helpful companionship or advice which will make life worth while living, and bring our boys home in better condition than when they left.

General Pershing in General Order No. 33, asked the Y. M. C. A. to take charge of the canteen. He had seen the Mexican boys before and after the arrival of the "Y," he knew what that organization could do.

My father fought in the Civil War, and his father was in the Revolution. I have no record of what was said by the soldiers in '76, but I do know that my own father agreed, after a year in prison camp, that war was precisely what Sherman said. You all know the word. War is bad enough at any time, even with all the best of comforts we can provide, with the best of care and hospitals, and convalescent camps, war is bad enough. It is so bad that our men are fighting with extra determination to see to it that we shall have no more of it after the present job has been finished. If we expect our men to do a good piece of work; if we want these boys to come back to us fit and able to take up their work on the farms, in the stores, colleges, business houses or on the farms as strong or stronger than when they went away, we must respond freely whenever we are asked to give in the support of activities such as are included in the United War Work Campaign.

President Wilson decided before the Fourth Liberty Loan was launched, that all these activities of the seven organizations, the Y. M. C. A., the Y. W. C. A., the K. of C., the Jewish Welfare Board, the War Camp Community Service, the American Library Association and the Salvation Army should be consolidated under one head, and instead of going to the country frequently for money to support them, it would be better to ask for one amount.

You can save that much by keeping your motor car in the garage one day. You waste more than a dollar every week in feeding the stock, no matter how careful you are. It was figured out some years ago that the average farmer wasted enough corn in a year in feeding his livestock to pay his share of the tax required to build and maintain a good hard-surfaced highway past his farm.

I have often thought what we all need to do in rural America is to put to some wise use the money we waste. Here is a chance. Don't miss it.

H. A. D. Leggett, 24 N. Nash Place, Burlington, Vt., informs us that he has taken over the interests of H. A. D. Leggett & Co., and will carry on the Columbian Wyandotte business in his own name in the future.

Alex Nelson, Austin, Minn., has bought the entire flock of Barred Rocks of M. E. Thomson, of the same place, and will continue the sale of stock, etc. This is one of the finest flocks of Rocks in the northwest, and we predict success for Mr. Nelson in his venture.

Andrew C. De Hass, formerly located at Middletown, N. Y., has moved to Albany, N. Y. Mr. De Hass is secretary of the American Buff Wyandotte Club.

John Poorman, the man who makes 'em lay at Tinley Park, Ill., says he did more business the first six days of September than during the entire month last year. That sounds good.

A. C. Williams, the veteran fancier of Ravenna, Ohio, has disposed of his great flocks of Speckled Sussex and Buff Orpingtons to the Willinez Farm, Hoimdel, N. J. Mr. Williams parts with his birds with regret, as fancy poultry was his hobby and the winter shows his annual vacation, but the press of other business makes it impossible for him to give the poultry proper attention. The birds are in good hands, tho. as the purchasers are enthusiastic fanciers.

STORM, WIND and BUG PROOF

MORE EGGS

Big Increase in Production Possible

Poultry breeders are making big money by lighting their hen houses with "Knight" Lighting Systems. Send for full particulars and also let us tell you about our

400 CANDLE POWER LANTERN

Gives a rich mellow light, resembling daylight. Burns 15 hours on one quart of oil. No smoke, odor, wicks to trim or chimneys to clean. Just the thing for all purposes. Use it anywhere, any time. Guaranteed. Safe and reliable.

623 Plymouth Court, Chicago, Illinois

You Can Speed Up the Growth of Your Chicks

Quick growth is the cheapest growth—the greatest gain on the least feed. Quick growth means health, vigor, vitality—low mortality. Quick growth means profit. Force your chicks by feeding them

Succulenta

It is a concentrated poultry food containing certain mineral elements essential to rapid, sturdy growth of chicks. It is quickly soluble in water. Simply dissolve one wafer in a quart of the birds' drinking water. If Succulenta is not entirely satisfactory, your money will be returned without a quibble.

Harvey A. Drew, Vernon, N. J., writes: "I herewith enclose an order for \$5 worth of Succulenta. A pen of 5 pullets that were Succulenta chicks won the December Cup in the National Egg Contest with 113 eggs." He says Succulenta is "a great help in raising chicks." Try Succulenta in your flock.

Succulenta will make your chicks grow and your hens lay. When ordering please give your feed dealer's name.

HAPPENINGS of INTEREST
in the POULTRY WORLD

Pennsylvania State Poultrymen Enjoy the Hospitality of Frank McGrann.

Frank McGrann, of Lancaster, Pa., secretary of the Pennsylvania State Poultry Association, sent out nearly 700 invitations to poultrymen to be his guests on his farm on Saturday, August 24. Over 300 responded, and a very enjoyable afternoon was spent in listening to a number of most interesting addresses delivered by speakers of considerable reputation in the poultry industry. Prof. P. H. Stonebrum, of Philadelphia, who has recently been elected president of the association, succeeding T. F. McGrew, who resigned, was in charge of the speaker's platform.

To live up on the occasion Mr. McGrann had his own band of 26 pieces furnish the music. Mr. McGrann also prepared lunch for all who attended. One of the results of the outing was the enrollment of 64 new members and the association now has a membership of 461 and they are making a strong effort to secure 1,000 by January 1, 1919. Mr. McGrann is certainly devoting his best efforts to the poultry interest in his state.

Gene Smith, the erstwhile White Leghorn breeder of Aurora, Ill., was a caller a few days ago. Gene has made so much money at the chicken business that he sold out and is going to stop work. Look out for Crowder, Gene!

Morris Poultry Farm, of Lebanon, Ohio, has purchased the famous White Orpington flock of the Aldrich Poultry Farm, Columbus, Ohio. Combined with their already great flock, this makes one of the greatest collections of this breed in the country.

1st and champion cockerel at the National Barred Rock Club Meet at Chicago, 1918, nearly 400 Barred Rocks competing. Owned and bred the past season at Fair Oaks Farms, Box A, Waukegan, Ill.

PRODUCING WINTER EGGS IN WAR TIME.

Special Bulletin to the Poultry Publications Prepared by Animal Husbandry Division, U. S. Department of Agriculture.

EVERY American hen six months old or over should lay in the next six months not less than sixty eggs. Every American poultry keeper owes it to his country, to himself, and to the hen to get those eggs. Hens that cannot produce to that standard should not be kept. Poultry keepers who cannot reach it with ordinary good stock should quit and stop using valuable feed and time to little purpose. But no one should admit that he cannot reach it until he is sure that he has failed after doing his part intelligently and conscientiously, and no one who faithfully follows the instructions in this article will fail to reach the very moderate standard of production demanded.

Two widely different popular ideas about the

control of egg production are responsible for most of the failures to get the right view of the subject. From old times those whose efforts to make hens lay were not satisfactory have maintained that the control of egg production was beyond human skill—that hens would not regularly and reliably respond to treatment which should result in good egg production. In recent years this view has been partly displaced by the idea that egg production is regulated by some special factor—as, heredity, balanced rations, or some favorable peculiarity of location, or of the type of house used.

The first view is entirely wrong. The law of cause and effect holds in egg production as elsewhere. The other view is partly right. Heredity, environment, and feed influence egg production; but it is still, on the whole, an erroneous view and misleading, because egg production depends not upon any one thing but upon the favorable conjunction of all the factors entering into it.

The uncertainty of results in the management of laying hens comes from the difficulty of making and maintaining the necessary combination. The requirements of egg production, and particularly of winter production, are brought out clearly, and their distinct im-

portance and mutual relations are emphasized in a classification which resolves them into eight essentials: (1) suitable stock; (2) comfortable quarters; (3) kind treatment; (4) regular attention; (5) abundant water; (6) wholesome feed; (7) liberal rations; (8) congenial exercise.

Suitable Stock.

The stock for winter production must be—seasonably hatched, well grown, well matured, vigorous.

As a rule the good winter laying is done by pullets, for the good laying birds usually molt so late in the fall that the molt shortens production in the early part of their second winter. Hence pullets are the poultry keeper's main reliance for eggs at the season of highest prices.

Comfortable Quarters.

The poultry house should be roomy, clean, well ventilated, well lighted, yet with arrangements for light and ventilation of such construction that the house may be made snug in severe weather.

By a roomy poultry house is meant one of such dimensions and having the fixtures so placed as to give open floor space appropriate

FAIR OAKS BARRED ROCKS

We have the birds and want the breeders to realize it. We never had as good a bunch headed for the show room

—and that means a good deal when you consider that last year we had more winners at the National Barred Rock Club and Illinois Centennial Shows than all breeders in the United States combined.

1000—Head of Superior Young Stock for Sale—1000

bred from the above winners and others like them. They will give ground to no competitors this winter, no matter where they come from.

GREAT BARGAINS IN BREEDERS

300 head fine yearling old stock, including our winners, with 40 cock birds in the list. Now is the time to secure your breeders! They are lower in price now than they will be in the spring, and it is much better to put them into their new quarters in the fall, so that they will become acclimated and satisfied by breeding time. The results are much more satisfactory.

Fair Oaks Farm

P. J. Sexton, Prop.
B. E. Rogers, Gen. Mgr.

Waukegan, Illinois

to the size of the flock, and bring the roosts at the rear far enough from the front windows to keep the birds comfortable on cold nights even with the windows partly open.

A sanitary cleanliness in the poultry house is closely associated with the matter of ventilation. It is not practical to remove the manure from places occupied by poultry as frequently and thoroughly as from the quarters of the larger animals. The character of the droppings of fowls, however, is such that the normal droppings of healthy birds, where they are not accumulated in masses, may remain for quite a long time without becoming offensive or in any way being injurious to the birds. Poor ventilation, by keeping these droppings saturated with moisture, makes the presence of even small quantities objectionable; while good ventilation, by drying them quickly, makes them inoffensive until they have accumulated so much that their removal is desirable.

Modern practice in the ventilation of poultry houses is to ventilate by means of open windows and doors, in and near the front of the house, giving all the fresh air possible without exposing the birds to temperatures at which they plainly suffer from cold. The common rule for ventilation in extreme cold weather is to give ventilation enough to prevent the deposit of frost or moisture on inside walls. Where so dry a condition of the air in the house is maintained the birds are not much affected by low temperatures and by changes of temperature; they do not contract colds so easily, and they lay more steadily.

Kind Treatment.

Broadly considered, this means much more than is usually associated with the idea of kindness to animals. The poultry keeper should not only be easy in all his movements about the care of the poultry, but should take care that no one and nothing else disturbs or annoys the birds. Hens that are nervous and easily frightened should not be kept where they are regularly or frequently disturbed, for they will not lay well under such conditions. If nervousness and excitability is a breed characteristic, and the annoyances which occur or exist cannot be removed, the only remedy is to dispose of the stock and keep a breed of more phlegmatic temperament. Where an individual hen, or a few such hens, are easily disturbed and communicate their alarm to the flock, such hens should be taken from the flock. If the keeper has a habit which excites the flock he should correct it. He cannot afford to indulge it and try to accustom the hens to what is obviously objectionable to them.

Regular Attention.

This is the most important point in the management of laying hens. In reality it applies to, and is a part of, every detail of the care of fowls, but it deserves separate and special mention, because irregularity is the most common cause of unsatisfactory egg yields. Regular attention does not necessarily mean attention at frequent regular intervals. The times of attendance may be far apart or infrequent, as daily, or under some circumstances at even longer intervals between giving supplies of feed and water. The essential thing is that the hens' wants shall always be properly provided for in due season. In the care of live stock pampering at one time does not compensate for neglect or indifferent care at another.

Abundant Water.

Keeping the poultry supplied with water in freezing weather is one of the most troublesome tasks of poultry keeping. As far as market egg production is concerned, the problem is made much less difficult by keeping no male birds with the hens. It is consideration for the males whose long wattles, wet in drinking, are often badly frosted on cold mornings that leads many poultry keepers to defer giving water until late in the morning. The hens

WINNERS OF EVERY FIRST PRIZE PANAMA-PACIFIC EXPOSITION

Winners—Yesterday—Today—Tomorrow. Trapped for high egg production. Pure-blooded and Standard type, the highest goal in Poultrydom. At the California State Fair, Sacramento, September, 1918,

WE WON { Best Pen in the Show } All breeds and varieties
 { Best Male in the Show } competing
 { Best Female in the Show }
 Also every FIRST PRIZE in the Leghorn Class

Our exhibition birds will win for YOU in any show. We guarantee them to win. Four to six months old breeding cockerels now ready for delivery. They are typy, sturdy and will sire egg producers.

How to Raise Chicks

128 pages, profusely illustrated. An a to z manual for everyone who keeps fowls. Written by Prince T. Woods, a man who knows how and how to teach others. Cloth bound, price 75c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

should have water accessible at all times. Whether the water is liquid or frozen (ice or snow) is immaterial, provided they can get it. Supplying them with dry or slightly moistened grain when they lack water causes indigestion and is generally injurious to the birds and wasteful of the feed given them.

Wholesome Feed.

In the general shortage of the more desirable kinds and better grades of grainstuffs usually fed to poultry there is a tendency to attempt to economize by using low-priced by-products and very inferior grades of the common grains and the common by-products. Almost invariably it is a mistake to use such to the exclusion of better feeds. The safe and sure way is to start the hens laying by feeding good quality feeds, and then partially substitute the cheaper ones, regulating the amounts used by the readiness of the hens to eat the changed mixture and by the continuance of good condition and production.

This applies to all classes of feeds—grains, vegetables, and animal feeds. Sufficient supplies of the two last-named determine the wholesomeness of the diet as a whole. Maintenance of steady egg production under changing weather conditions is much more certain when the vegetable and meat feeds are adjusted to the temperature than when a uniform combination of the three classes of feeds is used continuously. A formula for combining the three, for ordinary winter weather, is to reduce the meat and increase the vegetables in warm winter weather, and reduce the vegetables and increase the meat in extreme cold weather. This adjusts the "balance" of the ration to the temperature conditions and helps to steady production and at the same time keep the hens in good condition.

Liberal Rations.

To lay well, hens must be fed well. While it is probably true that the very best results in egg production can be obtained by a system of "hand feeding" which gives the birds just what they will eat up quickly and clean at one time, the adoption of that principle in feeding calls for the giving of feed from three to five times daily, according to circumstances and the season. The best results are obtained when there is not more than three hours between feeds. Such a system demands too much of the poultry keeper. Economy of his time and energy without waste of feeds is secured when the feed is kept by the hens at all times under conditions that prevent waste. Dry feeding, in hoppers, of at least half of the ground grains given, and the feeding of whole and cracked grains in litter accomplish this.

Congenial Exercise.

The natural and favorite exercise of hens is scratching for feed. They are not, however, inclined to scratch much when no feed rewards their efforts. Feeding the whole and cracked grain in litter deep enough to conceal the grain as thrown into it furnishes just the right condition to stimulate exercise by liberal feeding without waste and for congenial exercise that keeps hens fit without carrying exercise so far that it uses energy from feed that ought to be producing eggs.

Considering winter egg production only, exercise is not absolutely essential. Much good winter laying has been done by flocks with very little exercise. But such flocks do not usually lay as well the rest of the year, and if management is wrong at some other point they are very apt to have more than their due proportion of deaths toward the end of winter.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

OF AMERICAN POULTRY JOURNAL PUB. CO., published monthly, at Chicago, Illinois, for October 4, 1918.

State of Illinois, County of Cook, ss.

Before me, a Notary Public, in and for the State and county aforesaid, personally appeared James W. Bell, who, having been duly sworn according to law, deposes and says that he is the Editor of the AMERICAN POULTRY JOURNAL, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher—AMERICAN POULTRY JOURNAL PUB. CO., 523 Plymouth Court, Chicago, Ill.

Editor—James W. Bell, 523 Plymouth Court, Chicago, Ill.

Managing Editor—Dr. Prince T. Woods, Silver Lake, Plymouth Co., Mass.

Business Manager—James W. Bell, 523 Plymouth Court, Chicago, Ill.

2. That the owners are: (Give names and addresses of individual owners, or if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.)

James W. Bell, 523 Plymouth Court, Chicago, Ill.

Henry G. Eisert, 523 Plymouth Court, Chicago, Ill.

H. M. Bell, Congress Park, Ill.

E. M. Eisert, 1455 Balmoral Ave., Chicago, Ill.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.)—None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting; is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is — (This information is required from daily publications only.)

JAS. W. BELL,

Business Manager.

Sworn to and subscribed before me this fourth day of October, 1918.

(SEAL) ALICE A. SHEHAN,

Notary Public.

(My commission expires June 20, 1920.)

The SCHWALGE Sectional INCUBATOR

The incubator of common sense, not of empty phrases. The one and only incubator that stands absolutely in a class by itself, owing to its unique and exclusive features. The Schwalge will fill your present and future needs, as you may start with a 300 or 600-egg machine, and enlarge to a mammoth machine as your business increases. Additional sections easily added in two minutes.

Two types to start with—300-egg size and 600-egg size. All equipped with full flame vapor oil heater. Clean, reliable, no odor. Each egg chamber containing 150 eggs can be run as a separate unit. The Schwalge is used and endorsed by hundreds of the most successful poultry men.

To appreciate the true value of the Schwalge Sectional Incubator you should send for illustrated catalog, which is free for the asking.

The Schwalge-Smith Company

Elm Street, Elmhurst, Ill.

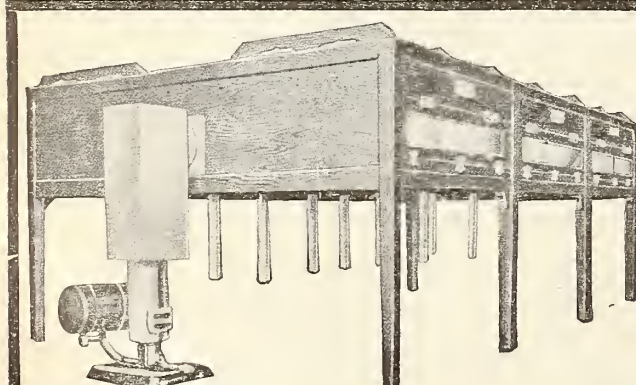

Illustration shows the individual egg chambers of 150-egg capacity each, which can be run as separate units. With this machine you can hatch Chicks, Ducks and Geese, all at the same time, each variety having its own egg chamber.

Recent Inventions for Poultrymen

By Lester B. Sargent, Patent Attorney, Washington, D.C.

A NEW poultry feeder and exerciser, invented by Joseph H. Morrow, of Welland, Ontario, Canada, has an inclined treadmill consisting of a traveling apron passing around two rollers, the upper one of which is mounted in a frame to which the feed-holding hopper is mounted. This upper roller is belted to a second roller mounted on a shaft having a trip, which at each revolution

Poultry Feeder and Exerciser invented by J. H. Morrow, Welland, Ontario, Can. Patent No. 1,268,869.

of the roller moves a shutter carrying rod to a position to release feed from the hopper, which thereupon falls down on the treadmill. The feed entices the poultry to continue operating the treadmill and take more exercise than under ordinary feeding conditions. Patent 1,268,869.

A brooder invented by George Knieriemen, of Atco, N. J., is partitioned into two stories, the heater being in the lower story, with the heating pipe ex-

Brooder invented by George Knieriemen, Atco, N. J. Patent No. 1,268,853.

tending around one end and one side of the upper story of the brooder, where it is partitioned off from the brooding

compartment by wire netting and a curtain. The temperature is regulated by a thermostat. The arrangement of the heating pipe is designed to distribute the warmth with uniformity and to prevent crowding of the chicks. Patent 1,268,853.

A poultry drinking fountain, invented by Elzeard O. Sourcy, of Rush City, Minn., designed especially for cold climates, has heater in a lower compartment under the drinking trough. The main tank of the fountain is in its upper portion. A drain pipe opening out of the trough provides a convenient means for cleaning out the trough without lifting the entire fountain. Patent 1,269,874.

Poultry Drinking Fountain invented by Elzeard O. Sourcy, Rush City, Minn. Patent No. 1,269,874.

LISTEN !!

Eggs are Life Savers and Growth Promoters — Eat More Eggs — Why?

EGGS, milk and leafy vegetables are known as protective foods. They are protective foods because they correct the faulty composition of seeds and tubers.

A SURPRISING thing is that young animals fed only on wheat, oats, barley, corn or other seeds fail to grow.

THE diet will be inadequate if a half dozen kinds of grain or their products, together with peas or beans and potatoes, even when supplemented with moderate amounts of leafy vegetables, unless eggs and milk are used daily.

EGG yolk is about fifty percent fat. When you eat eggs you are eating something that will stay in your stomach longer than milk, or you do not get hungry so quickly. There are growth promoting properties in egg fat and milk fat that are absolutely essential. They are not in vegetable fats or oils, nor are beef or pork fats a substitute.

GROWTH and health are of prime importance to the people of this country. During the period of the war and for some time after, every citizen of this country should do his or her best. The protective foods of growth and health are found in eggs.

GREAT nations eat eggs, milk and leafy vegetables. The price of these foods is of minor consideration. They promote growth, and increase your ability to withstand disease. They are the basis of nutrition.

SHALL we fail to do our duty to our country? If we stint our children and ourselves of these protective foods we cannot expect to do our best, nor can we expect to avoid serious diseases. At least eat an egg a day.

Canada is boasting for increased consumption of eggs. The above is reproduced from the October Canadian Poultry Review. Pass it along to your local paper.

H. F. MOELLER -- Box 137 -- La Porte, Indiana

EVERY month a few more advertisers find that it is more profitable to carry a larger space in the American Poultry Journal only, than to scatter their advertising appropriation among many non-paying publications.

American Poultry Journal reaches all the buyers worth reaching

IF YOU WANT MORE EGGS and BIGGER CHICKS

Send for that Book

"There's the book, John, that helped me double my poultry profits last year. It was written by a Government Expert and tells all about the feeding secrets of famous poultrymen. Why, last winter when you and the other fellows weren't getting any eggs—that book showed me how to feed my hens so that every one of them laid an egg a day. And eggs were selling for 75c a dozen then. That book tells you why

DARLINGS MEAT CRISPS
MAKE EGGS—MAKE MEAT

and will help you make a bigger profit by putting your poultry on a paying basis. You know it takes protein to make eggs, and protein to make your little chicks grow fast. DARLING'S MEAT CRISPS are the best and cheapest kind of high grade digestible protein you can buy. Just add a little to your scratch feed or mash and watch your hens 'shell out the eggs' and your little fellows grow big and fast.

"Take my advice, John, and send for that book now. YOU'LL find it the most valuable book you ever had on poultry. You get it FREE and POSTPAID. Better send a postal for it today to

Darling & Company, Dept. 10 U.S. Yards, Chicago

A Goose Tale.

By V. L. RINGLE, Omaha, Neb.

Noticed in your columns some little time ago the query of a party regarding whether goose eggs could be successfully hatched in incubators, and the reply thereto that efforts along that line were not generally a success. Thought it might be of some interest to relate a little experiment made by myself during the last hatching season with goose eggs.

Have hatched a great many chickens, but never had tackled goose, duck or turkey eggs, so thinking that a nice fat goose might not come in amiss about Thanksgiving time, purchased three Toulouse goose eggs and placed them in a machine containing hens' eggs. This, too, according to all incubator authorities, is radically wrong, as they insist the egg being larger brings the surface of the goose egg too high in the chamber and subjects it to a higher heat than should be used. This is true, but I placed the three eggs in the extreme corner of the machine, and kept them there for the three weeks that this machine ran and then transferred them to a machine which would hatch in one week's time, and at the expiration of the four weeks, in spite of all the adversities suffered by these three eggs in being hatched with hens' eggs and transferred from one machine to another, three little yellow heads poked thru the shells and I made a 100 percent hatch. Immediately remarked that if such was the usual course with goose eggs, would much prefer hatching them than hens' eggs; while I have heard of lots of 100 percent hatches, have never been fortunate enough to procure that good an average, in fact am well satisfied with a percentage quite a little less than that.

Believe more people would raise a goose or two if they realized how easy they are to take care of, especially back-yard poultry raisers or people with just a small yard, as all the goose needs is plenty of grass and water. I tie mine by one leg with a piece of cord about ten feet long and move from place to place every day, and they certainly make good lawn mowers and the growth they make is surely surprising, with no feed but the lawn grass. Will not feed any grain until a few weeks before they are to be eaten, so in these days of high cost of feed think they are quite a conservation.

Contrary to the opinion so many people have regarding geese must have water to swim in, they do very nicely if they have a pan that they can drink from, and I use a flat, wide pan that they occasionally get in and flop around a little, but as to having a pond, it is entirely unnecessary for a small number.

Now, this experiment of mine may have been an accident or the exception we are told of to every rule, but all in all I felt well satisfied with the result.

Poultry Publishers' Association Service.

We do not live to ourselves alone, but we are parts of a Great Whole and, being parts of this Great Whole, we are in nature identical. Hence what injures one of us injures all of us and what helps one helps all. This is the fundamental principle that governs all successful organizations, and it is upon this foundation that the poultry publishers at a meeting in the city of Cleveland, Ohio, August 11, 1916, formed their present organization, called the Poultry Publishers' Association. Up to this time they were fully convinced that "in union there is strength," but did not apply the

Single Comb Rhode Island Reds

Mittendorff Strain. Our strain of Single Comb Reds contains the blood of the best strains of Reds in America, and have size, shape and color, combined with heavy laying qualities. WINNERS at Chicago, Peoria and Quincy. Stock for sale at all times. Satisfaction guaranteed or money refunded.

My Silver Campines at the Coliseum, Chicago For Six Years Sweepstakes Champions

My flock is the result of careful breeding from the best foundation blood imported from England and Belgium. In competition with the world's foremost Campine breeders, they have consistently won the highest honors. This fall—the fall of 1918—I have the finest flock of trap-nested, exhibition and high egg-laying Campines in my poultry history.

If you wish a pen or trio of these marvelous layers of large white eggs, write me, as my prices are reasonable. If you wish exhibition stock for any show in the country, bar none, tell me your wants, and I will guarantee to supply your needs.

FRANK E. HERING

Desk B

SOUTH BEND, INDIANA

knowledge. No doubt there was some fear, for once before it had been "tried out" and for some reason failed. Thanks for the second endeavor, for it has succeeded. In other words, the first attempt really was not a failure, but the process of taking the sap out of a new scheme or business venture. There is a saying, "The greatest among us is he that serves." Those who try to get everything and give nothing, soon get nothing. Giving means not only the bestowing of money and food, etc., but it means far more than that.

"Not what we give, but what we share,
For the gift without the giver is bare;
Who gives himself with his alms, feeds three,
Himself, his hungry neighbor and me."

Our first obligation is service to our subscribers. In these war times, when our Government from necessity is asking us to economize in paper stock, it behooves us to cull reading matter the same as the breeder does his poultry. Give only the very best on all subjects—let it be practical.

Second—The unscrupulous, careless and unworthy advertisers are found out and at once discarded, thereby protecting the honest breeder. A dollar in the pocket of the dishonest advertiser was taken from the pocket of an honest one thru the advertising columns of the paper.

Third—At our last meeting held at Chicago in connection with the American Poultry Association we recommended that the news as published in the A. P. A. Bulletin be given the poultry papers, their strongest ally, who would devote sufficient space each month and thereby save this expense to the A. P. A. This was at once voted on and accepted, so from now on look for it in the poultry papers.

Fourth—Arrangements were made whereby more Standards will be sold to the public. We are anxious that everyone know more about Standardbred poultry. The best way to educate the public to its value is to get more of these books in the hands of the people. This is no time to keep your light under a bushel.

Fifth—We are members of the American Poultry Association, also of the National War Emergency Poultry Federation, and will publish all news submitted to the interests of Standardbred poultry.

Sixth—Our desire is to see a larger active membership in the A. P. A. and will put forth greater energy the coming year for this purpose.

The Poultry Publishers' Association is self-sustaining and its present membership as printed below we feel is deserving of the good will of all breeders, for they have proved their loyalty to your interests in the fact of their many years of service. By your help we can be of greater service.

IN WINTERTIME

your poultry and live stock spend most of their time indoors without the benefit of fresh air and sunshine (the best of all disinfectants) and the risk of sickness—which at least means a lowered production when prices are highest—or the possible loss of the money invested in your stock is greater than at any other season, and makes it doubly important that your buildings be kept thoroughly sanitary.
Because it is so effective and "dries out" so quickly—it can be used any day the temperature for an hour or two is not below freezing—are only two of the reasons why so many farmers, poultrymen and dairymen are enthusiastic in their praise of

CARBOLA
The Disinfecting White Paint

a snow-white paint in powder form combined with a germicide, or disinfectant, that is many times stronger than pure carbolic acid. Carbola is neither poisonous nor caustic, but it kills lice, mites, fly eggs, etc., and helps prevent the germs of contagious diseases that affect poultry and livestock—roup, white diarrhea, cholera, glanders, contagious abortion, etc.—from getting a start and spreading through your flock or herd. Carbola is ready to use as soon as mixed with cold water—no waiting or straining—and it can be applied to wood, stone, brick or cement surfaces, or over whitewash, with either a brush or spray pump. One gallon covers about 200 square feet. Carbola will not blister, flake or peel off, it has no disagreeable odor to taint milk or other food products, it will not clog the sprayer, it does not spoil by standing. The dry powder is unexcelled as a lice powder.

USE IT INSTEAD OF WHITEWASH

in your poultry houses, stables, hog pens, cellars, outbuildings, etc. Make them lighter, sweet-smelling, and sanitary. Satisfaction guaranteed.

10 lbs. (10 gals.) \$1 and postage. 20 lbs. (20 gals.) \$2 delivered. 50 lbs. (50 gals.) 4 delivered

Trial package and interesting booklet for 25c. postpaid

Your hardware, seed, paint or drug dealer has Carbola or can get it. If not, order direct—shipment by parcel post or express the day order is received.

ORNAMENTAL

IN VIEW OF THE FACT that I am now serving my country in the Army and have no time to give to the care or supervision of my birds, I have decided to dispose of my entire stock of ornamental land and water fowl. This most excellent stock of pure-bred birds, that I have taken years to collect, is offered to you at extremely reasonable prices. My flock includes Pheasants, English Ring-Neck, Silver, Golden, Lady Amherst and Reeves; Ornamental Ducks: Redheads, Canvasbacks, Bluebills, Mandarins, Spoonbills, Pintails, Green-winged Teal, Blue-winged Teal, Cinnamon Teal, Wood Ducks, White English Calls, Mallards, Black Mallards, and Gray English Calls. We also have Canadian Wild Geese, Egyptian Geese, California Valley Quail, Bobtail Quail, and dozens of varieties of pigeons. All orders or inquiries will receive the prompt personal attention of my farm manager, Mr. B. E. Rogers, and all shipments will be made without delay. Complete bargain list with prices will be sent on request. Write today. Send 25 cents for our instruction booklet, "Management and Care of Pheasants and Other Ornamental Fowl." P. J. Sexton, Fair Oak Farms, Dept. A, Waukegan, Ill. 10-18-1f

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

The Imperial "Ringlets"
Are Recognized Throughout the World
as the
Leaders of All Barred Rocks

One of the Great Imperial "Ringlet" Males.
Observe the Wonderful Shape, Color and Barring.

Their record at America's Imperial Show, Madison Square Garden, N. Y., for 30 years stands without parallel.

At the last 1918 Garden Show they won every first prize offered. At the last four shows, 1915, 1916, 1917, 1918, they won 19 first prizes out of 20 offered. First Prize Pullet and Champion Female the last four successive years—every prize and ribbon offered on cockerels, viz: 1st, 2nd, 3rd, 4th, 5th, the last five years in succession and under three different judges—every bird bred on my farm.

**Supreme at
Madison Square Garden
is Supreme Everywhere**

Grand Winning Show Birds

The finest that all America has ever produced are now on my farm ready to win Blue Ribbons and Silver Cups for you in any competition in the world in Cocks, Cockerels, Hens, Pullets and Pens. Their matchless "Ringlet" barring wins under all judges. **As layers they are pre-eminent:** In my catalog are testimonials from customers giving positive "Ringlet" laying records up to 283 eggs in 10 months.

Prizes and Silver Cups

have been won by my customers on the Imperial "Ringlets" in more than a thousand show rooms throughout the civilized world—you can win the same laurels. I will sell you grand exhibition birds for any show and breeders of this richest First Prize New York Blood in elegant single birds, trios or pens mated to produce prize-winners.

*If you want the best in Barred Rocks, you must have my Imperial "Ringlets."
My customers are my first thought, and nothing is too good for them.*

RICHLY ILLUSTRATED CATALOG UPON REQUEST

EGGS

from the finest exhibition matings in the world—now \$5 per setting. This is only one-third of my regular price. 100 eggs \$35.

WHAT ARE YOU DOING TO HELP!

"OVER HERE" AND "OVER THERE"

Keep Your Hens Laying All Winter

Don't make the mistake of trying to get eggs this Winter by feeding Scratch Feeds—**SCRATCH FEEDS WON'T MAKE EGGS** because they do not supply the hen with the necessary ingredients to produce eggs. Your hens will lay in Winter as well as Summer if you supply them with the same egg-producing feed that they pick up themselves in the Springtime. The feed that supplies these ingredients—the feed that will keep your hens laying all winter is

FUL-O-PEP DRY MASH

This wonderful egg-producing feed is the result of continued experiments by our poultry feed experts. By watching the natural habits of the hen we learned that if she was provided with the proper kind of feed to keep her egg-making machinery working—if she was supplied with the same egg-making ingredients that she picks up on free range in the Springtime—she would lay eggs in Winter as well as Summer—it's the feed and not the season entirely that regulates egg production. **FUL-O-PEP DRY MASH** is the raw material from which an egg is made—it is a combination of green food, animal foods and grain protein foods finely ground and correctly balanced to make a feed as near to nature's egg-making material as it is possible for expert feed knowledge, science and experience to produce. Keep it before your hens all the time and you will get eggs in abundance this winter—**WE GUARANTEE IT.**

BUCKEYE

THE PERFECT INCUBATOR

For **MORE**
and
BETTER CHICKS

Bill User says: "The Buckeye Incubator hatches a strong, vigorous chick from every hatchable egg I put in it."

Because the Buckeye has taken "guess work" out of hatching it is demanded more and more by the most successful poultry raisers everywhere. You need not depend on "luck" when you use a Buckeye—put your dependence on the machine. Anyone can operate a Buckeye. It is practically automatic in action; requires no artificial moisture and very little attention. Built in all sizes, from 60 to 10,500 egg capacity. There are thousands of "Bill Users" who say that every size is the best for its purpose. Over 6000 of the leading dealers everywhere sell and guarantee it. Letters telling the remarkable results others are getting, together with much valuable information, are contained in our big catalog. Send for a copy of it today.

Give Every Chick a Chance For Life

There is no gamble in chick raising if you use the Standard Colony Brooder, because it will raise every raisable chick. More than 50,000 satisfied users testify from experience to its merits in keeping chicks strong, healthy, contented and thriving. Can be operated in all temperatures down to freezing. Reduces labor by a fourth, operating costs by half. Burns soft or hard coal, coke or gas and requires little attention. We are so sure of it that we let you write any reasonable guarantee you want, and we'll sign it without hesitation. The Buckeye Incubator and the Standard Colony Brooder are the favorites of practically every experienced raiser and are endorsed by Agricultural Colleges and Experiment Stations because they insure the best results every time.

Big Catalog Free—The handsome big Buckeye catalog fully describes each article in the Buckeye line. Gives many poultry hints of great value. Send for a copy today. Your name on a post card will do.

IMPORTANT NOTICE—The embargo on shipments of Standard-bred poultry for breeding purposes has been withdrawn. Breeders may make shipments as usual.

140-Egg
Champion
Belle City

Biggest Hatches Strongest Chicks

That's What You Want — That's What "Tycos" Cup
You Will Get With My Champion Belle
City Hatching Outfit — And I Can Prove It.

The whole story is in my big book—"Hatching Facts", in colors, sent Free. It gives short cuts to success in raising poultry and you will want to start one of these wonderful Guaranteed

Hatching Outfits making money for you. It is a matter of good business and good patriotism to raise all the poultry you can this year. And besides you can make extra big profits by using my

Jim Rohan
Pres.

\$10⁹⁵ 140-Egg Champion Belle City Incubator

Freight Prepaid East of Rockies

The incubator that regulates and ventilates itself — equipped with patented thermometer holder — round cornered, and non-leakable, copper tank — big safety lamp and deep nursery. — The incubator with the Fibre Board double-walled construction, that has led the field for over 13 years. The kind used by Uncle Sam — leading Agricultural Colleges and over 740,000 of America's most successful Poultry Raisers. My \$6.35 World Famous Hot-Water, Double-Walled,

big, roomy, 140-Chick Belle City Brooder (Illustrated below) is guaranteed to raise the chicks, and makes your Hatching Outfit complete. When ordered with Incubator — both cost only \$15.95. Freight Prepaid East of Rockies and allowed that far if you live beyond. You cannot get a better Hatching Outfit at any price. If you are in a hurry and wish shipment to come by express, I will prepay amount of freight towards the express charges, and it will cost but little more.

Read how money is made — what pleasure folks have raising poultry the Belle City way. — Letters and actual photographs prove every statement

A Trusted Servant

My success is due to the perfect working of the Belle City Machines. You have done something to help every working person interested in poultry, to make money. My 140-Egg Champion Belle City Incubators are trusted servants and produce unequalled results.
H. W. Norberry, Mass.

Boy of 16 Makes \$350

It's easy work and lots of fun raising poultry with a 140-Egg Champion Belle City Hatching Outfit. I am only 16 years old, and made \$350 clear last season. Most incubator men forget about the boys and girls, but you give them a great opportunity to make money.
Lyle Schaffer, Ohio

Women Handle With Ease

This year I am using nine of your perfect incubators, because I find them absolutely self-regulating — an incubator a woman can handle with ease — with deep nursery to keep chicks comfortable, with a device to keep thermometer where you place it — that hatches turkeys as well as chicks.
Mrs. Pearl Sarver, Nebr.

"I Wish my
Daddy had a
Belle City

What Others Are Doing You Can Easily Do

And you are perfectly safe in ordering direct from this advertisement—Now. I ship quick from Buffalo, N.Y., Kansas City, Mo., Minneapolis, Minn., or Racine. Besides you share in my

Special Offers

to you. Full particulars come with my catalogue, "Hatching Facts". These special offers provide ways to make extra money. With this Guaranteed Hatching Outfit and my complete guide book for setting up and operating, you are sure to have poultry in abundance, as shown here. Order now or write today for my catalogue — the most practical guide to success with poultry. — This book is free for the asking. A postal will do. Jim Rohan, Pres.

SUCRENE

POULTRY FEEDS

For More Eggs Winter and Summer

When dressing for the table a hen that was not laying you have often found that she carried a cluster of yolks, and you have wondered why she was not a good layer. It was not the hen's fault that she did not complete these embryo eggs and lay them. It was the fault of her feed, which was deficient in the elements necessary to form the whites and shells—a complete protein and mineral matter.

Buttermilk a Fine Poultry Feed

Its value for young chicks and laying hens is universally recognized by practical poultry men. It contains nutritive elements which are vital to poultry life, growth and egg production, and which are not found in any grain ration. Combined with the other high ingredients in Sucrene Poultry Mash, it puts meat on the youngster, feathers on the moulting hen, more eggs in the egg basket.

18% Protein in SUCRENE Poultry Mash with Buttermilk

is the particular kind of protein in which all grain feed is lacking—a "complete protein" which the hen can assimilate and utilize in the production of the whites of eggs. It also supplies mineral matter for shells.

Only materials of highest feeding value, especially selected with reference to the hen's needs, compose Sucrene Poultry Mash with Buttermilk: Meat Scraps, Alfalfa Meal, Corn Feed Meal, Wheat Bran, Flour Middlings, Dried Buttermilk and a little salt.

A "half-and-half" ration of Sucrene Poultry Mash and Sucrene Scratch Feed is the combination which brings full capacity egg yields, winter and summer—supplies hens with nutrients for as nearly an equal number of whites and yolks, with necessary shell forming material, as can be put into a ration.

Increased Egg Yield Pays for These Feeds

Give your hens a chance to make you more money this winter. Sucrene Feeds are not an expense but a big paying investment. Try them. Place your order at once with your dealer. If he can not supply you promptly write us. The coupon or post card brings you our illustrated literature on care and feeding of poultry.

American Milling Company

Dept. 15, Peoria, Ill.
(Sucrene Feeds for All Live Stock and Poultry—18 Years the Standard)

When the Young Chicks Come In Spring—Feed them Sucrene Poultry Mash with Buttermilk. It prevents chick losses because the buttermilk acid destroys disease germs. It also supplies special life and growth promoting materials, not found in any grain ration, and without which young chicks can not grow to full maturity. Brings young chicks to market or laying size several weeks earlier than ordinary feeds.

Please send me illustrated literature on feeds checked below: (15)

Headquarters for S. C. Black Leghorns

□ The Largest and Best Flock in America □

From Imported Stock

BLACK Leghorns are the coming variety of this great breed. Come to headquarters and get the best. Many people prefer the Blacks to any other variety of Leghorns on account of their lustrous greenish-black plumage, which does not soil like the light-colored breeds. The Blacks are one of the most popular varieties in England, and are due for a great boom in this country.

Egg-Laying Contests Prove That Black Leghorns Are Second to None as Layers

Here is a grand opportunity to secure top-notch stock, bred from the best imported birds from the prize-winning stock of English shows, where Black Leghorns are one of the largest and strongest classes. Get in on the ground floor in a breed that is not overcrowded. Be in a position to command good prices for your stock, for buyers will have to come to you, or a few competitors, for their foundation.

A LARGE NUMBER of GRAND BIRDS for SALE

Seize Opportunity by the Forelock.

The World Wants Millions Of Fresh Eggs Your hens need sprouted oats to satisfy the world

Get the Facts About Our Grain Sprouter. Learn What It Has Done for Your Brother Poultry Raisers and What We Guarantee It for You

MAKE three bushels of fresh, green, tempting feed from one bushel of oats, wheat or rye. Turn loafing hens into money-making egg producers—have eggs to sell when prices are highest—get fertile eggs for spring hatching—all at a big saving in feed cost. Every poultry raiser should have a "Successful" Sprouter. Saves its cost in a few days' feeding and then keeps on saving money and doubling up your profits for a lifetime service.

Just what's needed in fall and winter to keep hens laying and needed again in the spring to make chicks grow into lively profit-producing birds. Write at once for complete 1919 offer. Sold on trial and pays for itself before trial runs out.

"SUCCESSFUL" Grain Sprouter Practically All Steel —Made in Sections

Double steel walls—metal trays. There is nothing else like the "Successful" Sprouter. It's a brand new idea. Cannot be compared to wooden sprouters. It is warp proof—shrink proof—nothing in it to rot—food cannot mold.

Made with glass doors. Each section a separate con. Start with just enough sections for your needs and as you need them.

Here is a money maker that proves its worth rig

Test seed corn and start your plants the easiest and surest way with this Des Moines Grain Sprouter.

20 lbs. raw (3 pecks) oats as shown above makes 70 lbs. of sprouted oats as shown below in the "Successful" Sprouter

SPROUTED OATS

Read These Letters From Owners

"Successful" Sprouter Best of All
Jamestown, N. Y., Sept. 12, 1918.
Dear Sirs: In reply to your letter of recent date will say that I have no objection to you publishing the letter I wrote you some time ago. I have used a number of different makes of Sprouters but the one I will use from now on will be the one THAT'S BEST, THE DES MOINES "SUCCESSFUL" OAT SPROUTER. As the results obtained from your Oat Sprouter it must be that your incubator is in the same class.

Oscar R. Weberg, Prop.
Chautauqua County Poul. Yards.

All Hens Commenced to Lay
Watkins, N. Y., April 20, 1918.
Gentlemen: I enclose name here with whom I am sure you can sell one of your sprouters. I like my sprouter very much. Sprouted oats is all I feed my hens at noon and they are certainly doing fine. Just as soon as I commenced to feed them the sprouted oats they all commenced to lay and have kept it up all through the cold weather. I certainly am well pleased with it. I can keep them on a third less feed.
Very truly yours, Mrs. D. Sitor.

Bigger, Better,

More Valuable Than Any Book We Ever Published Before—Let Me Send Your Copy at Once—FREE

Here Are Some Of The Subjects Covered In Our New Book

- How to make Poultry Raising a business.
- How to keep Hens Laying in winter.
- How to get by the feed question with present prices.
- How to make eggs substitute meat.
- How to make a Poultry Farm of your back yard.
- How to get children interested in Poultry.
- What's the best size Incubator to buy?
- What's the best way to save chicks?
- Where do leading varieties of poultry come from?
- Why do early hatches make the most money?
- How to make poultry pay your grocery and meat bills.
- Why does it cost less to produce a pound of poultry than a pound of pork or beef?
- Why do poultry raisers make more money per dollar invested than other live stock raisers?

MAYBE I overstepped the limit a little, but I set out to get up the best book on poultry raising that could possibly be published. I have completed the job. This is a bigger book than any we published in years. If it did nothing more than advertise Old Trusty Incubators and Brooders I hope you would send for it, but it is more than a catalog. It's a poultry book, with solid, practical information which 99 people out of 100 poultry raisers want if they make a success. It's a big book, with pages 9 x 12 inches. It's filled from front to back with the most valuable information for poultry raisers that I could dig up after 27 years' experience. I know you will want this book. I know it will help you. And I know I will be mighty glad to send it if you will

Send Me Your Name and Address

Poultry raisers have more orders than they can fill. And the demand this year is going to be tremendous. Country storekeepers are now paying 45c a dozen for eggs. And this is only early in the fall. Winter prices in the city are going to be higher than ever before. Don't miss this opportunity.

Get The Facts On Feed Prices

When 25c worth of feed will raise \$1.00 chicken or feed a

laying hen that produces five or six dozen eggs in two or three months, feed prices are not too high for profit. As long as chicks are growing or hens are laying they are paying a profit, no matter what the feed costs. The facts are, good poultry raisers are now making more money than ever before.

What would you think of the merchant who went out of business because manufacturers raised their prices of the goods he had to sell? The consumer is willing to pay high prices for eggs and chickens and is glad to get the produce. If you would like to get the profits, send me your name and address.

Old Trusty In 3 Home Sizes We'll Pay the Freight or Express

and guarantee safe delivery. 800,000 customers say Old Trusty is the hatcher for business. Common-sense construction and real value at a low price is the reason why. You are not trying out someone's experiment when you get Old Trusty. It's built in a big factory where big output makes a low price, and comes from a small town where we haven't learned how to get rich quick on good customers. Send for our catalog.

Your truly, Harry Johnson, the "Incubator Man."

RESULTS

Cincinnati, O., Jan. 30, 1918.
Mr. John G. Poorman,
Tinley Park, Ill.

Dear Sir:

Enclosed please find Money Order (\$30.00) for a White Rock cockerel from your special mating. Kindly give me some information as to his ancestry, as I intend to breed him to some extra heavy laying hens. These hens were raised from chicks purchased from you in 1915 and 1916. Have trapnested them and some of the records are 280, 242, 216, 201, 200—not from the date of their first egg, but from November 1st to November 1st, same as the official laying contests.

Please ship as soon as possible via American Express to Elmwood Place, to be marked, "Will be called for."

How Reconstruct the Poultry Industry?

The Minds of One and All Interested in Poultry Culture Should be at Work on Plans for Rebuilding the Industry Along Lines to Cope with After-War Conditions.

By H. E. Noszt

IT IS safe to say that there are not one-half dozen persons in the United States who have formulated any definite plans for the future upbuilding of the poultry industry. Undoubtedly a great many of those interested have given it a thought, realizing that something should be done, but who among the thousands engaged in poultry work has really mapped out any definite plan of procedure to safeguard the business in the days to come? It is not at all unlikely that "the big interests" have provided for every detail in the handling of poultry products in the future with the one idea of paying as little to the producer as possible. The question naturally arises, is the producer going to have anything to say about the price of his product or is he content to allow the other fellow to do his planning for him?

This is the time to work out and carry into effect definite businesslike plans for the reconstruction of the poultry industry. It does not matter what branch of the industry you are interested in, for its interests are all common interests and what benefits one is bound to benefit all. Whenever you hear a fancier say, "O, I don't care how low eggs go in price, I sell mine for hatching at a good figure," you may be sure he is something less than a fancier, since a real fancier is a man of vision and can see beyond the tip of his nose and thus quickly realizes the need for right conditions in the marketing of poultry as well as in breeding and exhibiting it. All forward-looking men are of the opinion that the better the co-operation between fanciers and market poultry growers, the better will be conditions for both of them. We have just fought a great war for democracy and now at the beginning of the reconstruction period it is a good time for the allied interests in poultry production to pull together, wholeheartedly and consistently, for the establishment of real businesslike principles in the conduct of their business. There is no reason why producers of good wholesome food products like poultry and eggs should sell these products at figures which will not cover cost of production—which includes a good living for the producer.

During the past few years there has been a persistent effort on the part of those in authority to discourage poultry production as a business. Those who should be working for the establishment of conditions which will insure the success of exclusive poultry ventures have, on the contrary, been instrumental in broadcasting propaganda directed toward the discouragement of poultry production as a business. The propagation of a doctrine so obviously directed against the best interests of the producer, as well as the consumer, tho probably unintentional, is harmful in the extreme. There is no reason why the production of poultry and eggs should not be engaged in as a business, and the statements made by various authorities during the past few years, that poultry keeping is successful only when engaged in as a backyard or sideline venture should be promptly refuted. We are today experiencing the result of the dissemination of this form of harmful propaganda in the widespread depletion of flocks, a lack

which cannot be made up by haphazard keeping of numerous small flocks.

If poultry and eggs are valuable human foods, as is acknowledged by everyone, then the business of producing them must be made a self-supporting business and not dependent upon a small flock here and a small flock there, nor upon the rearing of medium-sized flocks upon farms where woman's labor is poorly paid and where the grains fed poultry are raised and consequently not paid for. This procedure is most unbusinesslike, and if persisted in, must of necessity fail under conditions which we must presently face. The proposition is plainly up to all those interested in poultry culture, whether poultry production shall become a profitable, legitimate, necessary and important business in this country in the years to come, or whether we shall allow it to drag along without ideas or plans for its future molding and unbuilding. The question arises, to whom shall we go for advice as to its future welfare?

There are various classes of men and women interested in the poultry business. We have the well trained, ardent and capable fancier breeder whose ideas are centered upon the betterment of the breeds of poultry; the market poulterer whose goal is a comfortable living from healthily grown, properly marketed poultry meat and eggs; the backlotter who aims to supply his family with fresh laid eggs and an occasional Sunday dinner; the farmer who spends a little time on a flock of chickens much as he does on a garden or truck patch for family use. In addition to these there are the supply houses, the publishing houses, the poultry food manufacturers, the hatcheries, and various and sundry other concerns all vitally interested in the welfare of the poultry industry. Who among them has outlined a plan for future work with poultry? Who can suggest a workable idea that will enable poultry keepers to stay in business and live.

It seems to me that whatever plans are outlined, *the foundation stone should be that the producer of good wholesome foods have the privilege of setting the price upon his product at a reasonable percentage above the cost of production.* In order to carry this into effect, all allied interests of the poultry industry in the near future should institute a vigorous and well mapped out campaign of advertising, directed toward the education of the general public in the value and use of poultry products and the cost of producing and marketing same. This is merely offered as a suggestion. The object of this article is to incite others to exercise their minds and to express their opinions as to plans for the reconstruction period in poultry culture. We are at a point now where either we will go ahead; or slide swiftly backward if no workable plan is brought forward and put into operation.

In order to bring about any effective work, organization should be back of the undertaking. Now we have various organizations, all supposedly for the same purpose, but apparently not pulling in the same direction. At least so far as the layman has been able to observe we have no organization

working as it should for the poultryman's interests. An organization is only of value when it best serves those interests for which it was formed and by whom it is supported. Out of the poultry organizations now in existence it would seem that some effective method of procedure could be brought about, but there will be needed the combined support of all poultry interests to do it, and the urgent necessity exists for a well formulated plan of work. No one would attempt to erect a building without well considered plans to go by. The architect is an important personage in the erection of a building, his plans are carefully mapped out, and day by day carried into execution. In this way there is something to show for the expenditure of effort and funds,

but a builder without plans might easily spend a lifetime and several fortunes and have nothing but a pile of useless junk to show for it. There is a story told of a tribe of ancients who after several centuries of frittering time and effort "reached the nothing for which they set out."

If the poultry fraternity is to get anywhere, it must have well defined, well organized aims and competent individuals to carry them into effect. Anyone with a good idea as to the future welfare of poultry culture should express it. I should like to see the columns of the poultry papers filled with suggestions along this line, for this would be the only effective way to reach those interested and to aid in stirring up enthusiasm among them. What suggestion have you to offer?

Record of a Year's Work With Poultry

The Only Way to Know the Net Result is to Keep a Record. First Prize Article A. P. J. Monthly Contest. *By H. A. A. Reubush*

SINCE I became interested in poultry work I have found the reports of other poultry keepers of great value, especially those which give records for a full year or more, of work with their flocks. Little can be gained by records kept for a few months only, as it is the year round work which counts. Believing that the record of my flock may prove of value to others, I am sending a full report of my flock of S. C. White Leghorns for one year, beginning October 1, 1917, and ending September 30, 1918.

The flock was housed in an open-front house, and whenever the weather permitted, had a free woodland range. The layers were not all kept the full year, some of them being sold in June and July. Every egg and chicken used on the family table is accounted for as "sold" at the market price at the time used.

The expenditures are as follows:

65 hens, 174 lbs. at 22c.....	\$ 38.28
87 pullets and cockerels, 169 lbs. at 25c.....	42.25
10 broilers, 9 lbs. at 23c.....	2.07
Hatching eggs.....	52.64
Oil for incubators.....	3.39
154 gallons buttermilk.....	7.00
2,325 lbs. coal for brooders.....	12.75
228 lbs. starting food.....	11.40
2,958 lbs. shorts.....	56.42
1,264 lbs. bran.....	23.70
3,033 lbs. wheat screenings.....	64.22
875 lbs. oats.....	19.19
425 lbs. beef scrap.....	17.23
250 lbs. millet.....	7.50
350 lbs. oyster shells.....	3.00
34 bbls. corn (on cob).....	68.80
Hauling coal.....	4.00
Horse hire.....	15.25
Disinfectants, poultry powders, etc.....	16.11
Labor, 675½ hours at 25c an hour.....	168.87
Interest on investment, depreciation of buildings and equipment.....	20.00
Total expenditure.....	\$654.07

RECEIPTS.

1061 2/3 dozen eggs.....	\$363.67
Broilers sold.....	168.51
Hens and cocks sold.....	78.55
40 hens on hand, estimated average weight 3¼ lbs. each.....	33.80
114 pullets and cockerels on hand, average 2½ lbs.....	74.10
Total receipts.....	\$718.63

This left us total net receipts of \$64.56. The hens averaged 105 eggs each during the year, which may not seem a very good showing when compared with the frequently published records of 200 to 300-egg layers, but it is an improvement over our last year's record, which was only an average of 70 eggs per hen.

The highest price we received for eggs was 63c per dozen and the lowest price was 26c. The average price was 34c. While the average cost of feed was \$2.38 per hundred pounds.

The time allowed for labor is estimated and may seem large to some, but I have given as nearly correct as possible without really keeping a daily account of same, which is an almost impossible task on the average farm, where one does not put in all day on the work with poultry.

Mill feeds as well as all other feeds are very scarce here

and I have made over fifty trips for feed, sometimes securing several bags and sometimes none at all. The ready mixed poultry feeds are hard to obtain here.

I live on my father's farm, and he allows me the use of the horse, wagon, etc., without charge, but I have aimed to charge for these at just the cost if it had been necessary to hire them. The charge of 25c per hour for labor is the charge for common labor hereabouts.

Below I give an itemized account of the expenditures and receipts of one flock of chickens hatched in January for early squab broilers.

EXPENDITURES.

460 eggs for hatching.....	\$ 21.42
Oil for incubator.....	1.42
77½ gallons buttermilk.....	3.68
206½ lbs. shorts.....	3.93
179 lbs. bran.....	3.27
117 lbs. wheat screenings.....	2.21
67½ lbs. beef scrap.....	2.74
28¾ lbs. starting food.....	1.29
30 lbs. oyster shell.....	.22
184 lbs. corn meal.....	4.95
1,060 lbs. coal for brooder.....	5.74
Hauling coal.....	2.00
Hauling milk and feed (seventeen trips).....	10.62
Brooder.....	1.00
Incubator.....	1.25
Miscellaneous.....	4.18
Labor, 56 days, 3 hrs. per day, at 25c.....	42.00

Total expenditures.....\$111.92

RECEIPTS.

226 broilers sold.....\$119.35

This leaves the net proceeds for the flock \$7.43. The three hours per day charged for labor looks big, but as these chicks were hatched in January, during the most severe winter we have had for many years, they required almost constant attention, and I am of the opinion that I spent more time caring for them than I have charged for.

The chicks were brooded by a coal brooder, in a 16x20 ft. house, with four large windows in the front and two small ones in the back. The brooder was set at one end, in a square enclosure, about 10x10 ft., made of burlap, and inside of this a circle, about 10 ft. in diameter, of one inch mesh wire netting. The chicks were kept in this wire and burlap enclosure for about two weeks, after which they were allowed to run at will all over the house, except early in the morning and late in the evening.

We put 246 chicks in the brooder house, raised and sold 226 of them, so the mortality loss was uncommonly slight. Part of the chicks were sold at seven weeks and the remainder at nine weeks of age. The prices paid for poultry and eggs in this section may seem low in comparison to that paid in many parts of the country, but it will be noted that cost of production is lower here than in many places.

It is my opinion that the habit of keeping records is one of the best the poultryman can form, since it is his best means of correcting mistakes, which if persisted in make failure inevitable. Every poultry keeper owes it to the industry to keep books and thus assist in placing the business on a better footing.

How to Help the Beginner to Succeed

Breeders Should Instruct Their Customers How and What to Feed Poultry and the Necessity for Sanitary Houses and Yards, Especially Where Range is Limited.
Second Prize Article A. P. J. Monthly Contest. *By Mary Wayne Brown*

IT IS probable that among the many beginners with poultry this year there will be a goodly number disappointed at not getting winter eggs. Every poultry keeper wants to get eggs from his flock during November, December and January when eggs are scarce and high in price. Getting eggs in the fall is chiefly a matter of early hatching and uniform healthy development of the chicks by supplying them with plenty of good wholesome food, grass range where possible, and open air housing. Hatching chicks early will not bring about early laying unless the birds are well fed and cared for during the entire period of growth.

Recently I spent a few days in a growing town where a large number of the householders are keeping a back-yard war-time flock of poultry. At the time I was there (the first week in November) they were experiencing an egg famine of no mean extent. There were practically no eggs in town, flocks on the surrounding farms had been greatly cut down, and were not laying beyond the needs of their owners, and the only eggs to be had were storage eggs, with the exception of a few dozen weekly from a poultry yard on the edge of the town. The proprietor, an enterprising woman and poultry enthusiast, claimed she was never without a small supply of fresh laid eggs at any season of the year. Her receipt for filling the egg basket was "healthy quarters and plenty of wholesome food for the birds."

"The hens and pullets eat just as much when grain is high as they do when it is very cheap, but most people seem to think that hens should consume less because grain is high. I feed my birds all they will eat up clean, no matter whether I am paying \$1.50 or \$5 a bag for grain."

There is always a temptation to cut down on the ration when there is a let-up on egg production, or during those trying weeks just before laying begins, when pullets consume

food by the wholesale in preparation for the work they are to perform. I was interested to investigate conditions a bit in the little town of which I speak and to determine why in all those poultry yards the flocks were idle and their owners crying for eggs. In nearly every case, I believe, it was a lack of sufficient food and healthful surroundings. The birds

A Chicago Coliseum prize-winning S. C. White Leghorn male. Owned by F. D. Rogers, Douglas Road, Elgin, Ill.

were mostly enclosed in narrow, hemmed-in yards, scantily fed once or twice a day, and for the rest dependent upon swill thrown them. The owners did not seem to have any idea of just what kinds of swill fowls will eat, and not taking the trouble to observe what was left by them in the yards, the accumulation in many yards was alarming. I saw miniature mountains of coffee grounds, grapefruit and orange skins, meat bones and the hard shell-like peelings of turban squashes, none of which the fowls could eat, and which consequently served to taint the limited quarters in which the birds were penned. Said one owner: "They don't eat up half the stuff I throw them, so it isn't because they don't get enough to eat that they don't lay." It took some little explanation to show that fowls cannot make eggs out of food which they do not like and in which there is no element necessary for egg production, but at length the light dawned on the novice poultry keeper, who in the course of the conversation had told me that "a lecturer told us we could keep our war flocks on table scraps—but perhaps he thought we threw away good food in our table scraps, but we don't."

The average family usually has more or less waste that can be fed to a back-yard flock of poultry, but it is the business of the poultry keeper to know what the birds will eat and what they will not. All vegetable waste can be utilized for poultry feeding. Even the hard shell of squash or pumpkin is relished if placed over a fire in boiling water for half an

Glenco Perfection, second Black Orpington cockerel, Chicago Coliseum, 1917; sweepstakes cockerel in English class, Iowa State Fair; best cockerel in English class at Heart of America Show, Kansas City, 1917. Owned by Dr. G. H. Humphrey, Woodbine, Iowa.

hour and thus softened so the birds can devour it. Coal ashes and cinders help to sweeten the poultry yard and serve them usefully in the form of dust baths and grit. Bones can only be fed by being ground or pounded up finely and egg shells should be crushed before being thrown into the poultry yard, since there is the danger of teaching the birds the habit of egg eating if allowed to pick at egg shells while still in the form of an egg. In the average household there is considerable waste from fruit, such as apples, that can be profitably fed to the back-yard flock. Feed the peelings raw or cooked in a mash with potato or any vegetable parings, and thicken with meal. Partly decayed apples should be cut in two before feeding or cooked in a mash. Celery leaves, outside leaves from cabbage, turnip, beet or carrot tops make fine green food and are eagerly devoured when green stuffs are scarce.

The novice may consider that these precautions in feeding and caring for a war-time flock are a waste of time, but if he will take the trouble to note results he will discover that only by this attention to detail do flocks of poultry respond profitably to the care given them. In some cases which I have had occasion to observe, the back-yard flock of poultry is a positive menace to the health of the neighborhood, since everything from wash water to soap fat is dumped in the narrow quarters of the poultry yard. The ground soon becomes sour and in time is bound to result in unhealthy conditions. It is too bad that the Society for the Prevention of Cruelty to Animals does not step in about that time and insist on a general clean-up.

There is today need and an urgent demand for more back-yard flocks of poultry. Thousands of men and women in our cities and large towns could profitably take up poultry keeping on a small scale, but a primary consideration should be that they know how and what to feed poultry. Poultry fanciers everywhere should take it upon themselves to instruct all who purchase chicks, breeding or laying stock, that the secret of success is in feeding wholesome grains and foodstuffs and

in keeping the back-yard flock in sanitary surroundings. I believe it would greatly aid the poultry industry if every breeder selling chicks or stock should have printed slips of instructions to be sent the purchaser with every shipment. Let it be plainly understood that poultry of all kinds, from baby chicks up, requires good wholesome food, that no good can result from feeding unselected swill, or thru haphazard feeding of any old thing left from the table. There has been entirely too much indiscriminate advice to novices about feeding poultry on table waste. No family in moderate circumstances has enough table waste to feed more than one hen, and very few families have that much. There will always be a few tid-bits left from the family table which the back-yard flock will relish, but it will always be cheaper to buy eggs at the top-notch price than it will to feed a back-yard flock on table waste. Human food is too scarce and high in price to permit feeding it to hogs or poultry. There is a mean between extremes wherein many kinds of scraps can be utilized to help out in feeding the back-yard flock and if the owner will take the trouble to see that these scraps are fed in the most appetizing, most easily assimilated form, the birds will amply repay his effort.

To get eggs in the fall and early winter from a back-yard flock requires careful supervision. It is being done by many poultry keepers who take an interest in their birds and who realize that in order to get eggs the birds must be fed an abundance of good wholesome grain.

Poultry organizations might profitably take up the subject of education in regard to the care and feeding of poultry and formulate a program for the circulation of advice among beginners. No extensive set of rules is necessary or advisable, but a few simple straightforward words of advice, pointing out the importance of clean, wholesome yards, especially where the range is limited, and the necessity of feeding enough wholesome food to insure proper growth and subsequent egg production would, I feel sure, prove of great benefit to the vast army of beginners with poultry.

"SUN FLOWER MAID"

229 EGGS, NATIONAL EGG LAYING CONTEST

Mating Poultry to Get Practical Results

American Ideals Demand Recognition of Every Element of Beauty Dependent Upon Vigor, Vitality and Capacity for Usefulness.

By Animal Husbandry Division, United States Department of Agriculture

THE TERM "practical" is used here in the broad sense in which it applies as truly to all things that help to create and maintain interest in poultry production as to the things which relate particularly and directly to the production of eggs and meat.

There is nothing in the nature of poultry that would prevent supplying the world with all the poultry products it could use from races of poultry not attractive to the eye and not uniform in appearance. But there is that in the nature of man which makes poultry keepers give more careful attention to flocks in which they take pride, and makes the sight of a uniform, handsome flock effective beyond all other things in extending interest in poultry culture.

PRIDE A FACTOR IN SUCCESS.

It is a general fact in the history of modern poultry culture that interest in poultry having distinctive appearance is essential to any marked increase in poultry products. It is also a matter of common observation that poultry keepers who are indifferent about the looks of their stock rarely make notable successes. Good work with stock that does not look good is not impossible, but what there is of it is occasional, irregular and spasmodic. As a rule the owner of a flock of mongrel-looking poultry that does uncommonly well soon begins systematic efforts to improve its appearance.

A goodlooking flock is a standing advertisement of a certain measure of efficiency in poultry culture. It is plain evidence open to all, of skill in breeding and growing poultry; while performance—especially in egg production is celebrated only so far as detailed accounts of it are published. Appearance speaks for itself; performance in this line must have some one speak for it. Sufficient attention to appearance to secure a pleasing uniformity in a flock is in the highest

degree practical. Experience has shown over and over that where this is lacking, interest is apt to flag and production is not maintained.

American standards for poultry express the characteristic American attitude in regard to combining beauty with utility in the individual bird and in the breed. While a few breed types show the development of superficial characters carried to extremes which unfit the breed for common use, these extreme developments are all of foreign origin, the popularity of the breeds possessing them is very limited, and the influence of the common American demand for use with beauty tends constantly to modify extreme types.

BEAUTY AND UTILITY IN COMBINATION.

The American idea of utility and beauty in combination in domestic animals and birds is, that those forms and elements of beauty which are expressions of actual worth, and those which are attractive and in no way inimical to utility qualities should be cultivated, but that those which are in any measure incompatible with usefulness ought to be eliminated. The elimination or modification of characters undesirable in poultry kept for use under ordinary conditions is distinctive of breeds of American origin, and of American types of breeds of foreign origin which attain any popularity here.

The mating of poultry to conform to the American Standard of Perfection's requirements, and at the same time give good and satisfactory results in meat and egg production, is, in practice, a matter of progressive selection, beginning with selection for the desired utility properties. It differs from ordinary selection for producing Standard exhibition stock in that no measure of merit in any exhibition quality is allowed to offset distinct lack of utility value.

This principle is not as drastic in operation as it appears in statement, for in all the popular varieties of poultry, and

W. J. Wilbur
1918

FIRST AND SECOND PRIZE PENS, WHITE PLYMOUTH ROCKS, AT MADISON SQUARE GARDEN N.Y. 1918 Bred & Owned By, WILBURTHA POULTRY FARMS TRENTON N.J.

in most others as well, the Standard type is either a good utility type, or a reasonable interpretation of the language of the Standard admits of the development of a type that is at least not seriously objectionable from a utility standpoint. The birds rejected in this process of selection are those which conform better to the superficial than to the substantial requirements of the Standard.

WEIGHT A MEASURE OF SIZE.

The first step in this selection is the discarding absolutely all specimens that do not closely approximate the standard weight for their breed. In any standard breed, the standard weights for adult male and female are the most desirable weights for breeding specimens. The weight of a bird in good breeding condition, well-fleshed and firm in flesh, is as satisfactory a measure of size as can be used in selection for breeding, and rigid application of the rule to use only specimens closely approximating Standard weights for adults, with due consideration of type, virtually insures that the stock will be kept up to size.

The weights for adult birds should apply just the same to young birds used in breeding, for immature birds are not fit for breeding and young birds that at maturity are much under weight are most undesirable. Rigid adherence to exact Standard weights is, of course, impractical, but it is advisable to avoid variations of more than five or six percent either way.

After weight, type should be considered. This must be judged with the eye. There is more room and more excuse for latitude on this point than for latitude in weight. Weight is measured by one fixed standard of measurement. Type is made up of several elements, and estimates of type must be more or less a matter of opinion. In common practice selection for type comes down to the rejection of specimens that are unmistakably off-type, to a careful matching for type of the females used in each mating, and to the mating of each male to the females which in union with him will reproduce the breed type most satisfactorily.

CONSIDERATION OF TYPE.

A proper appreciation and consideration of type as it relates to mating covers a number of points commonly treated as independent. Most important is the question of vigor and vitality as expressed in type. The standard type of a breed presents, with a certain size and form, a carriage and symmetry which are the result and expression of vigor, vitality, and a perfectly balanced structure, and are therefore as much a part of type as length, breadth and depth of body, or length and character of neck and legs.

The vitality and perfection of type which make a bird naturally "carry itself well" are possessed in much higher degree by some birds than by others which when stripped of their feathers appear almost identical in form. Almost all birds can be taught to stand for inspection in a pose that shows true breed type, but a bird which does not naturally assume the poses which show its type to advantage is not desirable as a breeder, because its indisposition or inability to carry itself well at all times comes from some structural or constitutional fault which impairs its value as a producer of offspring of marked practical value.

A further test of the vitality and vigor of birds is to observe how they bear unpleasant weather conditions, and sudden changes of temperature—especially changes from warm or comfortable to raw, chilly weather. Susceptibility to such changes shows a lack of robustness of constitution, and poor circulation of the blood. Many birds which look fine in pleasant weather appear dejected and miserable on dull days. Whole flocks often

behave in this manner. However common this may be, it is not normal. Perfectly sound and healthy creatures are not so affected.

CAUSES OF LACK OF VIGOR.

Sometimes wrong management, putting the stock out of condition, is the cause. Bad ventilation in poultry houses, underfeeding, overfeeding—especially the too free use of highly concentrated feeds to force growth or egg production, are common causes of a condition of the system which makes poultry unduly susceptible to ordinary weather changes. Where wrong management is discovered, correct treatment will cure most birds of the habit of huddling about in dull weather. Birds that are noticeably susceptible when the environment is in all respects good ought never to be considered as breeders.

Due consideration of type on the lines indicated above automatically covers the characters and conditions of head and foot points which are co-ordinated with high vitality. A bird that is beyond criticism in those sections may fail to show good general breed type and a carriage expressive of vigor, but a bird that shows these general qualities in high degree cannot be defective in the head and foot points desirable in a breeder, for if it is, its general attitude and carriage are affected.

Appropriate size and type, and the vitality that gives and expresses perfect health and condition, then, are the essentials in mating standard poultry for practical results. On this foundation the breeder who desires to produce birds of high exhibition quality can build with certainty that his stock will also be notable for its practical qualities.

The late James Rankin said: "Persons wishing to start raising ducks can do so to best advantage and at least expense by setting the eggs in summer when they are cheap, and raise the ducks for an egg supply next season."

First prize Barred Plymouth Rock cockerel and sweepstakes champion male at Madison Square Garden, New York, January, 1918. Owned by E. B. Thompson, Lock Box 510, Amenia, N. Y.

Merrie Christmas!

CHRISTMAS, 1918, ought to be a memorable occasion, should be one of the most joyous celebrations of the birth the Prince of Peace in all history.

Seemingly the dawn of a new era, the beginning of real peace and good-will toward men, is at hand. The first half of the war is won, our boys in army and navy have done their part and done it well. Now begins the reconstruction period in which every man, woman and child must play an active part. The biggest four years' war of all time is won. It may take months, perhaps longer, to begin to bring order out of chaos, to stop destruction and to create a foundation of understanding upon which real reconstruction can start. The essentials of victory are with the United States and her Allies.

But the end of the war is not yet. We have not yet reached the fulfillment of the promise in President Wilson's message to Congress when the United States entered the war: "For democracy, for the right of those who submit to authority to have a voice in their own governments, for the rights and liberties of small nations, for a universal dominion of right by such a concert of free peoples as shall bring peace and safety to all nations and make the world itself at last free." The war is won. Yet, the real war is just beginning. All of us have a part in it. The war against intolerance, war against ignorance, war against prejudice, war against disease, war against injustice. A New World and a new order of things has been bought and paid for in the blood of brave men and women. We cannot return to things as they were, to life and business "as usual" before the war, without going backward, and civilization must go forward to a World of Lasting Peace or cease to be. Many civilizations have risen, strutted in pride, then tottered and crumbled because the time was not ripe and mankind too full of pride, lust, and greed to see and think clearly in visions of real progress. Our country entered the war with the avowed ideal to "make the world safe for democracy." Our president gave voice to the promise that we should "be free to base peace on generosity and justice, to the exclusion of all selfish claims to advantage even on the part of the victors." That message has been heard thruout the world and there is widespread revolt thruout the eastern hemisphere against tyrannical autocracy. Revolution of afflicted peoples has helped our victorious armies to win the war. Much now depends upon the wisdom

and justice of statesmen, as well as upon the common sense of the people, in bringing the ideals to full fruit. If we all do our part, Peace and Good-Will to Men will come to a world-wide brotherhood of all men. If we break faith with those who have died for us, if we fail in our purpose and return to the old ruts of "as usual" in the essential things of life—which seems almost unthinkable—if we are false to our ideals, then all the sacrifice has been in vain.

A New World, a world of Peace and United Peoples is opening to us, the opportunity is at hand if we have the strength and the will to grasp it. If we are worthy we may all share in the real redemption of the world and the Great Opportunity is within our reach. A few of the world's really great men seem to realize what is possible to us in the coming reconstruction. There are trying and difficult times ahead, radical changes in social and business life, if we are to be true to our great obligations. Are we big enough? Have we sufficient vision? Have we the strength of character and of purpose to set aside things as they were and to bury our old faults of greed and self-centered conservatism? Only the future can determine.

We can be thankful for the opportunity that is at hand, for the progress which has been accomplished, and hopeful for the future good which must come if we are ripe for it and the time is at hand. So make this Christmastide a joyous one, make it a beginning of *living* what we preach and what we have always sought to teach our children. It is bound to be a memorable Christmas. Do your part to your utmost. Enjoy to the full the pleasure of *giving*, which is greater than that of receiving. The future is bright with happy possibilities. May you and all of yours find this, in its fullest sense, a truly Merrie Christmas.

What is Wrong With the A. P. A.?

What is wrong with the American Poultry Association? Even the promise of a new constitution does not seem to quiet the criticism of men who are considered to be among the most loyal members. There are charges of careless expenditure of funds, indifferent business management, and many believe that the association finances are in a very bad way. Frequently the criticism is confined to letters marked "confidential" or to personal talks. Why do not the loyal members of the A. P. A. come right out in the open and get their troubles off their system in a good straight-from-the-

shoulder fashion? Is it because they fear injury to their personal business or that the "invisible government," supposed to be dictating A. P. A. affairs, may in some way make things unpleasant for them? A review of the poultry journal files for some years past would seem to furnish ample precedent for substantiation of this assumption.

J. H. Drevenstedt, in *American Fancier* for October 20, has this to say concerning "A. P. A. Financiering:":

"The financial status of the American Poultry Association is evidently giving deep concern to some of its older and loyal members, judging by the following letter received several days ago from one of the old A. P. A. warhorses: 'Did you know that the Special Standard Reserve fund which was made up by setting aside 10 percent on all sales of the Standards, and (\$900) was used (by what authority) for current expenses? It makes me sick. Now they are starting in on the last of the funds that Bryant had put away on time deposits into five or six New England banks. At one time this was \$12,000 and now it is \$3,000, and that won't last long.'

"There was some informal talk at the Chicago A. P. A. meeting indulged in by several of the older members at which all agreed that no more money should be voted for anything, without first meeting with the approval of the finance committee, because, as expressed by a prominent official, the finance committee might just as well be a rubber stamp, for the reason that this committee, as constituted in the past, could not avoid O. King all bills for all kinds of expense, duly passed on the floor. The president could, of course, stop a whole lot of this extravagance, but seems to be unmindful of the fact that there isn't money enough in sight to run the A. P. A. another year, a member who put in four days at the Chicago meeting writes us, and adds: 'When I left I thought matters had been fixed to cut out president's salary, and all other expenses possible, and I don't know now who is responsible for continuing this expense.'

"The above remarks are but a part of the aftermath gleaned after the Chicago A. P. A. meet, but they clearly and unmistakably indicate the trend of thought uppermost in the minds of loyal members of the American Poultry Association."

When a man accepts compensation—a salary—for the performance of certain work, whether in general business or in an organization, it is pretty generally understood that he is expected to make good on the job or to retire and give someone else an opportunity to earn the money. In association

work it becomes the duty of an executive board to see that all salaried officers earn their pay, or to retire them and replace them with persons who can and will give value received. We confess that we have not yet discovered what the president of the A. P. A. has been or is doing to really earn his salary. We would like to be informed on the subject.

Here are some items from the itemized statement of the financial condition of the American Poultry Association covering the fiscal year expiring June 30, 1918:

1917.	
Sept. 27,	E. E. Richards, expense 42d convention.....\$ 49.14

LABOR-SAVING DEVICES EMPLOYED ON THE BARRED ROCK FARM OF J. W. PARKS, BOX J, ALTOONA, PA.

(1) Five horse-power kerosene engine that furnishes the power for different labor-saving machinery. (2) The grindstone. No farm is complete without one, and no excuse for dull tools when machine is power driven. (3) Sawing outfit, where we rip our boxes in sections, and work out material for shipping coops, etc. The machine is equipped with a combination saw that will rip or cut crossways successfully. (4) Our peace-maker. We always keep a Guinea cock on hand to use in pens where we have a lot of surplus male birds, or when we break up our breeding pens and put all males together. We put the Guinea in with them and he takes care of all scraps. If you have a flock of hens that get lazy in winter, put a cross Guinea in with them. He will keep them stepping and increase their egg yield. (5) Cutting box. With this small power driven machine we make our own brand of short-cut clover. Chicken manure will build up any ground so as to produce clover, and a good supply of clover is essential to winter egg production and good colored yolks.

First Hen
Boston, 1918

ARE YOU READY?

Are you prepared to do your share

in replacing the world's poultry stock which has been depleted by the war? Are you going to get your share of the profit which will come to those who have the birds to supply this un-

precedented demand? After the war the egg-laying types will be in most demand. And no birds in the world are better layers than the Campines—and no birds are as beautiful. These two facts taken in conjunction produce the most desirable breed.

First Cock
Boston, 1918

"Homestead" THE VIGOROUS STRAIN Campines

are the most desirable representatives of this fowl. They are raised from our prize winners at the largest shows, and we rear them according to scientific methods in the most modern houses on the best of yards and range. No wonder

HOMESTEAD DOMINATES in the World of CAMPINES

Our stock is ready for delivery—full of health, vigor and quality. This year we have the finest flock we ever raised. Write us your needs in

SHOW BIRDS or BREEDERS

HOMESTEAD CAMPINE FARMS Box A WAYLAND, MASS.

TO OUR READERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every advertisement in this issue is signed by trustworthy people, and to prove our faith we will make good to our subscribers any loss sustained by virtue of their having purchased fowls or goods from one of our display advertisers.

All we ask is, that in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. In all cases in writing to advertisers, say, "I saw your ad in American Poultry Journal."

March 30, E. E. Richards, special service rendered March 25 to April 25..	\$150.00
March 30, E. E. Richards, stenography, March 25 to April 25.....	50.00
April 30, E. E. Richards, special service rendered April 25 to May 25....	150.00
April 30, E. E. Richards, stenog., April 25 to May 25.....	50.00
May 1, E. E. Richards, office expense, postage, etc.	70.50
May 28, E. E. Richards, special service rendered May 25 to June 25.....	150.00
May 28, E. E. Richards, stenog., May 25 to June 25.....	50.00
June 29, E. E. Richards, special service rendered June 25 to July 25.....	150.00
June 29, E. E. Richards, stenog., June 25 to July 25.....	50.00

We do not question the legitimacy of the above items, but merely submit them as officially given proof that the president of the A. P. A. received a salary of \$150 per month, with an additional \$50 per month for stenographic hire, which money he collected in advance for "special services rendered." There are a good many members who would

Regal Dorcas White Wyandottes

are the most popular in America today, because they represent the ideal combination of utility and beauty. Fifteen years ago, exhibition qualities were considered of greatest importance, but believing that there would, in the near future, be a demand for a combination bird, I began trap-nesting,

First Prize Cock at Madison Square Garden, December, 1916

and in this way built up a strain invincible in the show room and at the same time compares favorably in egg production with any strain in the world. The tremendous demand for Regal Dorcas White Wyandottes has shown that I was right. In the official egg-laying contests, some of the highest records are being made by Regal Dorcas females. Dr. B. B. Edmonds of Kilmarnoc, Va., writes me as follows:

"I got from my pullet today her two-hundredth egg, exactly nine months and three days since she began laying. The pullets from the last setting of eggs are beauties. Hope I get another such layer. Hatched twelve fine chicks from the setting."

5000 COCKS, HENS, COCKERELS AND PULLETS FOR SALE 5000

Special Exhibition birds a matter of special correspondence.

100 acres devoted to White Wyandottes. My stock is all farm raised. Many birds now ready for show. Order at once and get first selection.

FREE—Send for 20-page Catalog

John S. Martin BOX 51 Port Dover, Ont., Can.

like to be better informed concerning the nature and detail of these "special services" for which the A. P. A. paid in advance.

According to the "summary of disbursements," President Richards' office expenses, fiscal year ending June 30, 1918, were as follows:

For special service rendered, ten months	\$1,500.00
Stenographic hire, ten months.....	500.00
Postage, telegrams, express, etc.....	240.31
Traveling expenses, 1917-18.....	120.09
Multigraphing letters	58.10
	\$2,418.50

Office and traveling expenses, 1916-17 346.19

What did the A. P. A. get for its money? What has it received for the very considerable expenditures under the present administration, and, more particularly, what has the association to show for the close to \$18,000 expended during the year ending June 30, 1918? We merely ask for information, at this time, for the inventory of possessions, as shown in the statement of financial condition, is not entirely satisfactory in more ways than one.

While the present constitution gives unusual power to the president during the period between meetings, and might easily give him control of the finance committee and the auditing of the books, thru control of one member, the same authority gives abundant power to the executive board to take full charge of the management of all business of the association and makes it responsible for the acts of officers. In the case of officers receiving salary for special work, or in the case of expenditures questioned by even one member of the finance committee, it would seem to be the duty of the executive board, as a whole, to make certain that salaried officers make good and to make a thorough investigation, and to take steps to safeguard the interests of the members of the organization who elected them to fill their important office. It isn't a time for letter writing and whispered confidences. If there is anything wrong with the finances of the A. P. A.—that isn't the result of the inadequate plan of organization and membership fees—it is clearly up to the executive board members to peel off their coats and gloves and wade into this matter with bare hands.

We are not prepared at this time to even pretend to have knowledge of what may be wrong with Association affairs, but where there is so much smoke there ought to be some fire, and a whole lot of members have been talking about smelling smoke for a long time. We would like to see them get right down to brass tacks. There are a lot of folks who seem to like to "make a holler"

Smith's White Leghorns

NOW OWNED BY C. R. HOPKINS, OSAGE, IOWA

THE business, good will and flock of White Leghorns of Eugene Smith, of Aurora, Illinois, has been purchased by me and this stock is now on my farm at Osage, Iowa, including many of the winners at Chicago and St. Louis. This is the strain that has produced more winners at Chicago shows during recent years than any other, and has given the greatest satisfaction among customers. The stock this year is even better than ever, and I am prepared to furnish you with winners or utility birds of this remarkable strain at reasonable prices. SAFE! SURE!

Let me send you my book, giving plans, description and details of the only really successful, simon pure, "Fresh Air House" yet devised. Easy to build or remodel. Comfortable alike summer or winter, rain or shine, blizzard or calm. Protect your birds from dampness, drafts and exposure. Neighbors all around me have adopted this house. Thousands of satisfied and enthusiastic customers in all parts of the world.

Merrill, Oregon, October 5, 1918.

"Your house is the best for this climate. In fall and spring 'hot spells' are followed by cold, wet and windy weather, causing colds and roup. I have had no trouble since adopting your house. It is easily adjusted to meet these trying changes." A. E. SUTHERLAND.

Write your name and address plainly, enclose a dollar bill or your check for \$1.10 to cover war tax and exchange, and book containing seven plans and illustrations of this valuable discovery will be sent you by return mail.

S. K. BURDIN, Suite 16, 104 Stibbard Ave., Toronto, Ont.

Palmer's Barred Rocks

are recognized throughout the world as one of the supreme strains of standard bred poultry. Our 36 years experience has developed this strain almost second to none in both the utility as well as fancy standpoint. If you want to win, write us for prices; we can furnish you cocks, cockerels, hens or pullets, pens or farm flocks, for egg purposes or for the hottest of competition, at \$5 to \$25 each and up. We can win for you and please you and guarantee to do so. Write today to

The oldest and greatest winning strain in the central west

ASTONISHING EGG PRODUCER

A scientific germicide called "OCULUM" has (for 12 years) produced MANY MORE EGGS, SUMMER AND WINTER, in all parts of the United States and many foreign countries, without extra feed. It takes only one drop a day to each hen in the feed. William Shinn, Manitoba, Can., writes: "I fed 'OCULUM' last year to 10 W. Leghorns; I got 208 eggs every month for 10 months (November to September)." We'll give you \$5 to beat it WITHOUT "OCULUM." Let us mail you FREE an "OCULUM" booklet full of testimony from Hawkins, Fishel and other nationally known leaders. This booklet tells how to cure Roup, Cholera and W. Diarrhoea with "OCULUM" and how to GET EGGS.

Bottles, 50c and \$1.00. Money back if you want it. Trial bottle, 10c postpaid.

JOHN L. BROWN 65 Indiana Ave. ANDERSON, IND.
Get the American Poultry Journal 3 years for One Dollar

about association matters, with which they are dissatisfied, but who confine their activity to confidences and seem too shy to deliver the goods when there is any probability of publicity for them in the matter. President Richards states that he is not afraid of honest criticism so far as his administration is concerned, but we still remain uninformed as to what he has really accomplished for the A. P. A. Now, if any members have anything on their system that will tend to improve A. P. A. affairs, or which can be considered as constructive criticism, or honest criticism of mismanagement which calls for a remedy, or suggestions as to how the association can shake off the "sleeping sickness" and really accomplish something for the poultry industry, we wish that they would stand right up meeting and "shoot." We would be glad to witness a little real action—not all hot air—even if not wholly in accord with our own views, but we are certainly getting good and tired of receiving alleged information which is conspicuously labeled "personal and confidential."

We understand that the committee on constitution will eagerly welcome suggestions concerning the proposed constitutional changes and reorganizations of the A. P. A. That is all very good so far as it goes. Members should all do their bit or hereafter hold their peace. Meantime there seems to be abundant law in the present constitution and by-laws to answer all present needs, even tho the constitution is frequently ignored and now and then invoked to choke off progressive action, and it would seem that the executive board should be able to find a way to accomplish all that may be necessary in control of business and finances of the association.

A. P. A. Money Matters.

IN A long article in the November issue of *Everybody's Poultry Magazine*, under the caption "A New Constitution for the A. P. A." Charles D. Cleveland says:

"Everyone knows that, generally speaking, the more you tinker with a constitution the worse you are off, and since the A. P. A. has very recently gone to the labor and expense of redrafting its old articles, there must have been some very strong reason why a new committee was asked to undertake a similar task. There is certainly more than one member of the association who will be able to give the correct answer to this question, and the answer is MONEY. It has been perfectly evident to those who have had any intimate connection with the A. P. A. that the attempt to carry on its business under the scheme of \$10 life membership was really absurd. Mathematically it could not and did not work out."

That is one A. P. A. difficulty which AMERICAN POULTRY JOURNAL has pointed out on numerous occasions. There cannot be any change in constitution until after the new committee has reported to the annual meeting in August, 1919, nearly nine months hence. In the meantime, what about A. P. A. money matters? From financial statements including fiscal year ending June 30, 1918, as published, and one recently rendered

Every Year We Have to Return the
Money of Those Who Are Too Late

Don't put it off too long and risk disappointment. You have been thinking for a long time that you would order a few cockerels of

Parks' Bred-to-Lay Barred Plymouth Rocks

but have kept procrastinating. **Do it now.** Put some of this heavy-laying blood into your flock and get those extra eggs that mean **profit.** Parks' Strain is the daddy laying strain of them all—they can't help but lay—it has been bred into them for 28 years by three generations of the Parks family. They have been carefully pedigreed and selected for eggs, and have outlaid over 2,600 birds in five Missouri Laying Contests. They "come back" year after year and win where others seldom make a second winning—and they win, not only in the laying contests, but in the egg and exhibition shows. The wisdom of our breeding is proved by over 21 pounds of favorable reports from satisfied customers in all parts of America and a great number of foreign countries.

Wings of Victory

That's What I Call 'em, John!

They surely are helping carry our nation to victory. Eggs are splendid food—and no better producers of big white hen fruit have been discovered than

Sheppard's Anconas

Keen winter layers they are, too!

The vitality and habits of the "Famous" strain of Anconas is such that they persist thru the longest and coldest winters. Hundreds of families are going to start flocks **this month**—and every one will be helping win the war by producing their own food. With conditions as they are, I anticipate fully five hundred more requests for my free book than I had last year this time.

RESULTS show that my Anconas are great layers.

RESULTS prove that they are matchless prize winners.

RESULTS demonstrate them the most economical all-round bird for the home flock and commercial egg plants.

I'll send this book to all asking for it or until the present edition is exhausted.

H. CECIL SHEPPARD

Box M-2, Berea, Ohio

for month of October, it is apparent that the A. P. A. funds are low and that the organization is spending money faster than it is taking it in. How long can that be kept up without running the A. P. A. on the rocks of bankruptcy?

According to the statement of finances for October, the A. P. A. on October 31, had a balance in Irwins National Bank, Columbus, Indiana, of \$2,000.12 and in the Mansfield Savings Bank, Mansfield, Ohio, a balance of \$312.32, or a total of \$2,372.44 in available cash on November 1. The same statement reports the total Standard Reserve Fund bearing interest Oct. 31, 1918, at \$342.52. It has been pointed out that during the business administration of the late President Bryant, the Association at one time had a Standard Reserve Fund of \$12,000. This certainly has sadly dwindled. What has the A. P. A. got to show for it?

There is no satisfactory statement of the assets of the A. P. A. other than the cash reported in banks, as above. We have not been able to get any figures on the liabilities of the Association. What obligations are outstanding against the A. P. A.? How much does it owe? There are certainly some liabilities which will run into considerable money. Of course during the next two or three months some money will come in for memberships, Standards, supplies, books, etc., but at the present rate of spending there will not be funds enough to carry the organization thru a "long dry summer," until the tinkered and rejuvenated constitution provides for a way to get funds more readily.

According to the October statement President Richards is still drawing his salary, \$150 per month for "special service rendered"—but paid in advance—and an allowance of \$50 per month for stenographic hire. It certainly is unusual, to say the least, to collect in advance for "special service rendered." Among the items of expense for October are:

Oct. 1, E. E. Richards, office expense, for September, postage, telegrams, etc.	\$ 16.68
Oct. 1, Torch Press, Plymouth Rock Breed Book, circulars and printing for president's office.....	28.50
Oct. 1, Torch Press, balance on acct. War Books	201.00
Oct. 17, E. E. Richards, postage, etc....	9.41
Oct. 17, General Printing Co., envelopes for president.....	10.00
Oct. 17, Torch Press, president's office expense, printing, etc.....	17.75
Oct. 17, E. E. Richards, expense to Kansas City	60.59
Oct. 31, E. E. Richards, special service rendered, October 25 to November 25, 1918	150.00
Oct. 31, E. E. Richards, stenographic hire, October 25 to November 25....	50.00

It has always been understood that Mr. Richards is engaged in the publishing business, conducts a poultry journal

Longfield R. C. Reds

Now ready with a choice lot of early hatched birds for the Fall and early Winter Shows. Bred from and in line with the birds that have won more than half of all First Premiums on R. C. Reds at the GREAT CHICAGO COLISEUM SHOW since 1911. Also a few choice adult birds. Priced reasonable and shipped on approval. Write for catalog.

Box 321, BLUFFTON, IND.

LORD FARMS

Single Comb White Leghorn Cockerels

All bred from 200 to 288-egg stock. We have no other kind for sale. Straight American bred Leghorns—no English blood. These cockerels now have several generations of 200-egg bred blood back of them—just the kind you need to increase your stamina, vitality, egg production and general good looks of your flock.

Good Breeding Cockerels Only \$5.00

Extra Selected Birds, \$7.50, \$15

Every bird guaranteed satisfactory at time of sale or birds can be returned at our expense.

BABY CHICKS FOR 1919

If you are going to purchase anywhere from 500 to 5,000 Baby Chicks next season you should be looking around to get your order placed immediately. Remember there are not half the breeders in existence today there were a year ago, and the demand next year will be two to five times as large as last season. A great many will have to go without, so place your order immediately, before our books are filled for the early hatches.

Our reputation for putting out fine healthy stock of grand laying quality is not equaled by any other farm or hatchery in the eastern states. Write us immediately for prices, etc., for next season. Remember we have only one breed—

Single Comb WHITE LEGHORNS

LORD FARMS
Incorporated
Methuen Mass.

of his own, and does not give his entire time to the "special service rendered" the A. P. A. for which he collects a comfortable salary in advance. Without any argument as to the value of the president's services, or whether he should receive a salary or not—tho such a salary has not been the custom in the past—it would seem that, with the Association funds at low ebb, the members, and particularly the Executive Board, should insist that expenditures be cut down to the lowest limit possible, and that the membership be given a full and detailed account of what it has received for its money, what the assets and liabilities of the A. P. A. are, and insist that full value be received for every A. P. A. dollar spent from now on.

The Torch Press, by the way, is located in Pres. Richards' home town. We do not assert, nor do we assume, that there is anything more than carelessness and extravagance the matter with A. P. A. expenditures, but there certainly is dissatisfaction among prominent members concerning Association expenses. The method of securing money for A. P. A. work is not adequate, and from such financial statements as have been submitted there does not appear to be money enough in sight to run the organization thru the year. We feel certain that members would rally with prompt and substantial subscriptions to help the Association carry on if they were satisfied that the A. P. A. would hereafter have an efficient business administration. What do the members and the Executive Board intend to do about it?

Baby Chicks.

WE BELIEVE that the coming season holds unusual promise for those in the baby chick business. In spite of war conditions and difficult transportation last season, baby chicks made good. Parcel post deliveries proved to be satis-

The best part of a lifetime's experience and effort is given to you for nothing

It goes with every "Sunnyside" bird. For 29 years they have been trapnested and pedigreed and none but those with the highest records have been used for breeding purposes. "Blood will tell," and the years of effort tell in these birds. They are profitable layers. By profitable layers I mean birds that lay enough eggs above the labor and cost of keeping them to show a good profit. The past couple of years have been hard sledding for poultrymen, and none but the fit have survived. Sunnyside birds have more than paid their way, and left a profit, and now that better times are in sight, there is no better investment. Of course you like to keep poultry, but where there is no profit there is no pleasure. Keep Sunnyside fowls and enjoy both.

THEY ARE EXCEPTIONAL WINTER LAYERS

They are bred and raised in the vigorous climate of Vermont, which produces strong men and vigorous chickens, so cold weather is no novelty to them. Take a look at the prices below. Nothing extra added for the years of labor back of them.

YEAR-OLD BREEDERS FOR FOUNDATION STOCK

Barred White Rocks, Brown and White Leghorns, White Wyandottes, R. I. Reds, from trapnested stock with records of 180 to 200 eggs, each, \$3.00; 210 to 249 eggs, each, \$4.00.

You Can Get More Eggs!!

WATER Over 90% WATER
of the Egg is WATER

Shows Home-Made, Low-Cost Oat Sprouter, Using Little Putnam Stove.

Therefore to make eggs and lots of them in WINTER TIME your fowls must have water to drink and plenty of it. You simply MUST keep UN-FROZEN water at all times before them! ONE COLD DAY, with the water frozen and therefore inaccessible, may STOP your egg production FOR A MONTH.

A LITTLE PUTNAM STOVE will keep the water unfrozen at ALL TIMES. It holds three pints of oil and burns A MONTH with one filling. (Patented principle.) Requires absolutely NO ATTENTION, except to be filled; never needs trimming.

SPROUTED OATS To obtain the greatest egg yield you must use some form of LIVE GREEN FOOD that is abundant in vitamins, so the scientists and investigators HAVE PROVED. Sprouted oats furnish food of this character in a LOW-COST and convenient form.

THE LITTLE PUTNAM STOVE, used for this purpose, gives you the cheapest and easiest-to-operate, home-made OAT SPROUTER in the world, and it can be made in a single evening by anyone. No tools are required but saw and hammer. The total cost, exclusive of the Little Putnam Stove,

will be less than 50 cents. I shall be glad to send you FREE my easily followed plans for building this Oat Sprouter, also telling you how to use the Little Putnam Stove to keep the drinking water from freezing in COLDEST WINTER WEATHER. Descriptive Circular FREE on request. PRICE OF LITTLE PUTNAM STOVE \$2.00 BY PARCEL POST, prepaid to any address. References, Editor of this Journal.

Mention the American Poultry Journal when writing to advertisers.

factory beyond the most optimistic expectations.

We look for an early start in baby chick orders and for a good demand for chicks out of good Standardbred stock of the leading popular breeds and varieties.

Those who get out and hustle for orders with the right sort of advertising, and deliver the goods in real quality-bred chicks, ought to do a "regular land office business."

Get your chick orders in early. Just as soon as it becomes better understood among the breeders we believe that there will be a big call for custom hatching or hatching to order by well-equipped hatcheries. This plan has worked well in New England. It is a very satisfactory method of getting out early chicks to send eggs to a hatchery, have them incubated by a skilled operator, and receive at moderate cost in due time a nice lot of strong, sturdy, vigorous baby chicks. Hatching or having hatched special lots of eggs for customers and supplying them with the baby chicks, is another plan of custom hatching that works well and will win favor.

Christmas Gifts.

ARE you still thinking about a Christmas gift for that boy or girl of yours? Why not make it a nice breeding pen of Standardbred fowls? For many a boy or girl there is nothing that would give more lasting enjoyment, besides furnishing useful and remunerative home employment.

Food is needed. More food will be needed, and we shall need all the food that can be produced before we have another harvest. It will be a long time before food conditions are normal again. Get the boys and girls interested in poultry. Give them an opportunity to produce poultry and eggs. Later on, when the season opens, encourage interest in the home garden.

For those who have already started with poultry, a fine breeding specimen, needed poultry equipment, an order for eggs for hatching or for baby chicks, will make pleasing and useful gifts. Portable houses may be had in a wide variety of sizes and types to suit all purposes, if there is no suitable poultry building on the home place.

If seeking low cost gifts for young or old, consult A. P. J.'s list of useful poultry books. Or send AMERICAN POULTRY JOURNAL as a lasting Christmas remembrance, one year—twelve monthly issues—for 60 cents; a useful reminder every month for three years—thirty-six monthly issues—for one dollar. For City of Chicago, Canadian, and foreign rates, see top of first editorial page.

Cock Crowing Forbidden.

MILKOLINE FOR POULTRY

It is made from Buttermilk, Modified

People who feed it write us letters like the following:

"I have fed Milkoline for one and one-half years to a flock of 2,500 hens and I find the following to be true:

1st—In former years, worms in poultry has been a source of very considerable loss.

2nd—My average mortality per year with laying hens was 18 percent; last year the mortality was $8\frac{1}{3}$ percent.

3rd—Last year the lay was $147\frac{1}{5}$ eggs per hen. In my ten years experience in the poultry business the best previous year's lay was 142 eggs per hen.

In my opinion, the greatest benefit derived from feeding MILKOLINE to laying hens is the splendid health in which it keeps the flock, thereby preventing disease and derangements of all kinds."

Yours truly,
JAS. E. KEYES,
Box 123, Petaluma, Cal.

But Why Say More!

If interested in "More Eggs" and Healthy Poultry, write for booklet and full particulars.

Milkoline is made in one of America's largest and cleanest creameries from Pure Modified Buttermilk. Not a drop of water do we allow to get into the Buttermilk that Milkoline is made from. You add the water when you give it to your poultry—50 parts water to one part MILKOLINE.

Mention the American Poultry Journal when writing to advertisers.

of our cities, which forbids the keeping of crowing cocks is certainly foolish enough to merit immediate repeal. Poultrymen ought to put up a vigorous fight against it. Anyone may keep a barking dog, a yowling cat or a screeching parrot, but it is a crime, in these cities of highly sensitive nerves, to keep crowing cocks or cackling hens.

It certainly is strange how high-strung and sensitive, even irritable, are the nervous systems of some of our city folks. They are immune to the thousand and one city noises, but the crow of the cock upsets them completely. Somebody ought to wrap these poor nervous souls up in cotton batting and pack them away safely where they cannot be disturbed by lowing cattle, the music of the poultry yard, or the songs of birds. Of course they can keep a phonograph going all night, make the small hours sleepless with ragtime on a player piano, dance until morning to the ear-bursting din of the jazz band, sleep peacefully thru the clatter of fire apparatus and ambulances, find sweet solace for their tired nerves in the grind and bang of flat-wheeled trolley cars, and the myriad of other noises of the town, not to forget the barking of dear little Pomeranian "Fifi," the thousand-dollar toy, when it yelps for attention at all hours—but such common noises as the crowing and cackling of productive, useful fowl, oh, dear me! such nerve-racking noises must be forbidden under penalty of the law. It is a wonder that such folks have the nerve to eat eggs for breakfast or to dine on chicken.

The ordinance against keeping crowing cocks works a hardship in many cases. It is an act directly in opposition to increased food production and food administrators everywhere ought to see to it that the ban on city poultry keeping is lifted. Here is a case where it works against an earnest beginner who has the makings of an enthusiastic poultry breeder and producer of necessary foodstuffs. There are thousands more like him.

New Haven, Conn., Oct. 28, 1918.
Mr. Editor:

Please tell me if splitting a rooster's tongue will make him stop crowing. If so, kindly tell me how to perform the operation. The man I bought my chickens from in the spring told me when I got a good rooster from the chicks he would split his tongue for me, but he has been drafted, so I am at a loss to know where to have tongue split. Everyone I ask about it laughs at me and says he never heard of it. Does splitting the tongue affect the breeding? I have a trio of White Wyandottes purchased from John S. Martin, Port Dover, Canada, and do not wish to injure the male as a breeder. *I live in the city and am not allowed to keep a rooster that crows.* But think I can get a lot of enjoyment out of mating up my own pens and hatching my own chicks. I have all my chickens leg banded and trap nests installed and wish to carry on line breeding and work for a heavy-laying strain which I hope to produce if I can find some way of keeping the males from crowing.

G. A.

We do not know whether or not splitting the cock's tongue will prevent crowing. The operation is not necessarily cruel or difficult; the free part

MILLS CREEK POULTRY FARM - Eagleville, Ohio
W. J. FORREST, Prop.

of tongue may be quickly slit lengthwise with a sharp knife or scissors. We never tried it. Unless the bird is unduly mutilated it should not interfere with his breeding ability. If he is so cut that it seriously interferes with his eating or causes him much discomfort, it will ruin the bird. If any of our readers know how to prevent a cock from crowing we will be very glad to pass along the information.

It is difficult for us to understand how any human being can get into such a condition that the crowing of the cock becomes an unbearable disturbing factor. We have dozens of cocks crowing on our farm most of the time, we seldom hear them unless we listen for the sound. To us the crow of the cock is both welcome and musical. We like to hear some lusty male stretch his lungs in a long loud call and to hear the answering voices from neighboring flocks. The sound has a beauty all its own.

There is an interesting classical legend about the origin of morning cock crowing which has been handed down by the ancients. Here it is:

Mars, during his amour with Venus, stationed at the door a youth named Alectryon to watch against the approach of the sun. The youthful sentry fell asleep, and Apollo came and discovered the lovers, who were exposed by Vulcan, in each other's arms, before all the gods. Mars was so incensed that he changed Alectryon into a cock, who, still mindful of his neglect, early announces the approach of the sun.

Boost Your Breed.

MR. BREEDER, you are letting slip some of your best opportunities for better business. There are thousands of beginners and near-beginners who are thirsting for just the sort of information you can give. They know about Standardbred poultry by hearsay, largely, but they are interested. They are beginning to read the poultry papers. They are beginning to clamor for more breed articles.

Why don't you, Mr. Breeder, take a little time and write a good instructive article boosting your favorite breed? It will please the beginner and help your business. We will be glad to have breed articles of the right sort and good photos of your fowls and poultry plant. We have asked for such articles many times. There never was a time when they were more needed than now, nor a time when they will be more appreciated by readers who are about to decide on what variety or breed to keep.

Describe your breed, tell how you mate, what you feed and how; about houses and yards, hatching, and any particular equipment which you have originated or perfected. Describe the chicks when hatched, how they should be fed and cared for. Tell what they look like at various stages of growth. Many a beginner, noting the—to him—strange coloring of his chicks, thinks he has been "stung" and that his chicks are not pure bred. He does not know that they are all right and will show Standard color when they get their adult plumage. Explain to him about what percentage of good ones he may expect to raise, tell him about culls and how and when to cull his flock. In short give him the A-B-C of work with your breed. Don't put it off. Sit down and write that breed article today and mail it to us.

Such records uphold the reputation of our Quality Birds.

HOW MANY CAN EQUAL THIS SHOWING?

Not only do our birds win for us, but our birds also won in the hands of our customers at the following shows:

Dallas, Texas; Kenosha, Wis.; Des Moines, Iowa; Denver, Colo.; Columbus, Ohio; Cleveland, Ohio; Spokane, Wash.; Atlanta, Ga.; La Fayette, Ind.; Calgary, Canada; Guelph, Ontario, Canada, and many other shows too numerous to mention.

What we have done for others we can do for you.

Right now we have many youngsters that are positively the best we ever had. They simply cannot be excelled in type and color for the price we ask for them. No matter who the judge is, the wonderful character of color and unparalleled type on our rugged northern bred birds will catch and hold his attention.

Let us furnish you the birds which will spell success for you at your next show, engage them now while our line is complete; also breeders which will prove satisfactory.

If you expect to breed good ones you will find it necessary to have good birds for your foundation. You can depend on anything you buy from us. If you find anything wrong, it's our mistake. Money cheerfully refunded.

Send for our winter sale list describing our stock and prices.

BETTER THAN GREEN FOOD

Just dissolve WACKER'S B-T-G-F TABLETS in the drinking water. The tablets will do more than any green food you can give; your chickens will be in prime condition, and an increased egg production will result. The initials B-T-G-F stand for "Better Than Green Food," a fact you can positively rely on, as there is no green food as good. No meat scraps are necessary and nothing else is needed for the molt when using these tablets. If you are not satisfied after a fair trial, write us and we will return your money. To those who are skeptical, we say, write your own guarantee. **DID YOU EVER TRY OUR ROUP TABLETS?** In time of need Wacker's Roup Tablets will not fail you. All tablets: 200 tablets, 50c; 1,000 tablets, \$2; 5,000 tablets, \$7.50. Sold nowhere else. Practical hints free.

Keeler's Vigorous White Wyandottes

The Aristocrats of the White Wyandotte World

FIRST COCK, CHICAGO

WON 5 FIRSTS AT CHICAGO

For 25 years they have been winning for me and my customers at America's best shows—Chicago, New York, St. Louis, New Orleans, Kansas City, Pittsburgh, Washington, D. C., Denver, etc. In buying White Wyandottes from me you not only receive the benefit of my quarter of a century of experience, but also the careful pedigree breeding back of these birds for many generations. I not only can supply you with winners—birds that will win in any show room, but also birds that will fill the egg basket. My birds lay from 200 to 265 eggs a year, and the prize-winning females are selected from among these layers. The biggest demand for Standardbred poultry the world has ever seen will be the fall and winter of 1919-20, so prepare now for the harvest, but be sure your foundation stock is right.

2000—Birds for Sale—2000
Cocks, hens, cockerels, pullets—females, \$5 to \$35; males, \$5 to \$50; breeding pens, \$25, \$35 and \$50; show pens, \$50, \$75, \$100 and \$150. I have no cheap birds, nothing but the best, so please do not write me for \$2 or \$3 birds. Please state wants clearly.

All stock shipped on approval. Your wisest act before buying stock or eggs is to send for my instructive, illustrated art catalog, giving a full history of my birds.

MAHOGANY RUSSIAN ORLOFFS

NOT a new creation—bred 200 years in Russia, its native country. Quaint in appearance and rich in color of plumage. European standard weights, cock 8 lbs., hen 6 lbs. The Orloff is a tight-feathered, yellow-skinned, yellow-legged fowl, a non-sitter and prolific layer. Foundation stock purchased and imported from the two best breeders in Europe.

DIVERSION POULTRY FARM

FARM: Kissingbower Road

E. A. FRANK, Prop.

CITY OFFICE: Broad St., Augusta, Ga.

DR. WOODS' NOTES AND COMMENT

Christmas.

Blow, bugles of battle, the marches of peace; East, west, north and south let the long quarrel cease; Sing the song of great joy that the angels began, Sing of glory to God and of good-will to man!

—Whittier.

Merry Christmas, everybody! May the coming season of peace on earth, good-will to men, bring happiness and contentment to you and all of yours. In the good New Year that is to come, may success crown your efforts and may prosperity and the "best of luck" be always with you.

According to an old English saying: "As many mince pies as you taste at Christmas, so many happy months will you have." Mr. Hoover, please take the lid off for Christmas tide.

Poultry is good and eggs are the best of food, but hog killing time comes this month. O you sassingers, scrapple, spar'-ribs, pork chops, and cracklin's, to say nothing of ham an' eggs, and liver and bacon. Those milk-fed haws sure do look good and we expect to make good use of everything but the squeal. There is a heap of satisfaction as well as good food in a pair of good growthy pigs, it's a pleasure to watch them eat and grow. Ours have been compounding interest since last spring and no matter what the skim-milk, buttermilk and grain cost, they are worth it.

Labor has been and still is mighty scarce. We have had to be farm manager, editor, farm hand, chore boy, office boy and typewriter, all in one, most of the year. Working hours fourteen 8-hour days per week, but it has been a very interesting and satisfactory season at that. We have been much longer getting into winter quarters than usual, still have much undone that ought to be done, but we have some very excellent poultry and live stock and hope to be able to carry on in good shape during the coming season.

We are pleased to note increasing interest in goose growing and turkey raising on nearby farms. Where suitable range for forage is available, geese and turkeys make a very satisfactory food crop. We need more of them. Readers are beginning to take a lively interest in geese, ducks and turkeys. Won't some of our experienced growers contribute, "for the good of the cause," some instructive articles for beginners on how to successfully breed, feed, and rear these excellent fowls. "Do your bit" for waterfowl and turkey breeders, it will mean better business for you during the coming season.

In Pearson's Magazine for October, Editor Frank Harris has the best article on the American farming situation that we have ever read in any general magazine. He quotes W. J. Spillman, chief of the office of farm management of the United States Department of Agriculture, as authority for the statement that the average "labor income" of the farm family is only \$318.22 and that even the best farms show an average net earning of only \$640.40 per year. He points out that while some farmers have undoubtedly prospered, others have suffered extraordinary losses this past season and cases are cited which prove that four members of a family working 14 hours a day on the farm are not receiving as much pay for all four as the salary of one other member of the family working short hours on a city job. Summing up the evidence presented in answer to the query "Are Farmers Getting Rich?" Mr. Harris says:

"If the American farmers were getting rich, the entire nation ought to unite in a hymn of praise to God that it is so. If he is not prosperous, then it should be the chief business of those who direct our public policies to see that he does prosper. Atlas-like, the farmer carries the world on his shoulders. If he stumble and fall, then all goes with him. The truth is he works harder for less pay than any other class in the community; yet the profiteering on beef and pork and mutton continues while the farmer is half starved."

OWEN FARMS

S. C. Rhode Island Reds White Plymouth Rocks Buff Orpingtons and S. C. White Leghorns

are known all over the world as the best flocks of these varieties.

The wonderful records that have been made by my birds at Madison Square Garden, New York (where 418 Owen Farms birds have won the blue), Boston, Chicago, New York State Fair, Minneapolis, Pittsburgh and the leading shows of the South have never been approached.

Thousands of Owen Farms' birds have won firsts in the hands of customers.

What You Will Find Here:

- | | |
|----------------------------------|--|
| 1. Golden Rule treatment. | 6. Naturally grown birds, on free range with sane feeding. |
| 2. Exceptional value. | 7. Utmost courtesy. |
| 3. Unequaled Standard quality. | 8. Absolutely square dealing. |
| 4. Unexcelled utility qualities. | |
| 5. Perfect health and vigor. | |

Show and Breeding Birds

The past few weeks have been busier on Owen Farms than have been the corresponding weeks of former years. Not only have many star exhibition birds been shipped, but hundreds of lower priced birds have gone. All ordinary thorobred utility males and females have been sold, and only good to fine breeders and fine exhibition birds remain. A few choice cock birds remain on sale and a limited number of choice hens. There are plenty of fine cockerels in each variety and a number of fine pullets.

You will find old or young birds to win your show and breed your winning chicks afterward.

You will find choice, carefully mated trios at \$25, \$35 and \$50 per trio, and pens at \$35, \$50 and \$75.

You will find grand husky cockerels at \$10, \$15 and \$25 each. A limited number of good breeders at \$7.50.

Place your order now, while my flocks are large, and I can select just the birds you need. Remember, your absolute and permanent satisfaction is my first thought. My best customers this year are my customers of former years. When you once try "the Delano Way and receive Delano Treatment, you remain a Permanent Delano Customer."

Write me fully and freely exactly what you wish to accomplish, and my reply will advise you to the best of my ability.

Liberty Bonds and War Savings Stamps are accepted in payment for the birds you need.

The war is over, and poultry will now have its innings. Feed prices will go down and poultry products remain high on account of the great scarcity.

Caudalpin Farm, Convant, N. J.

The following letter from the son of the late I. K. Felch will interest readers who knew "Uncle Isaac" personally:

"Natick, Mass., Oct. 14, 1918.

"My Dear Doctor: I appreciate the kind words you had to say about my father in the American Poultry Journal. I believe he too is thanking you—for I fully believe he knows and sees and now hears.

Very gratefully yours,
A. E. Felch."

We shall all miss the familiar, tall, straight, broad-shouldered figure from the aisles of the big show this winter, the man who was so quick to see, so keen to appreciate, and so quick of wit, with an apt and ready reply for all queries, in spite of the fact that all must address him thru an ear trumpet of large caliber. Tho there must be a vacant chair at the veteran fanciers' meeting at the coming Boston show, the things "Uncle Isaac" stood for and fought for still live, and he lives in the memory of old friends. Many will be glad to feel and believe that he knows, sees and hears.

* * *

Do not close poultry houses too snugly at night. Fresh air is needed at night even more than in the daytime. If certain fronts are used, arrange them so that they will not entirely close the front but leave an open space at the top.

* * *

Ice in water pails may be readily removed by turning the pail upside down and then pouring a little cold water over bottom and sides of pail. Follow this with gentle pressure on bottom of pail and the ice will fall out. Do not bang and batter pails to get rid of ice. Galvanized iron equipment costs money. Save it.

* * *

If water pails and fountains are emptied at night closing-up time, there will be little trouble with ice. In extreme cold weather, when there is plenty of clean snow, snow will often serve better than water for the fowls. We do not like to use warm water. Many cases of frosted wattles, and even frosted combs, can be traced to wetting with the drinking water when cold is severe. Snow in place of drinking water will not affect the egg yield.

* * *

Collect eggs frequently, to avoid chilling and freezing. Do not permit broody hens to occupy the nests. If you do not require their services for early sitters, remove the broodies the first night they are found on the nest. Place them in a slat bottom coop in a comfortable part of house. Water but do not feed. If they are taken in time, three days confinement is usually sufficient and you can have them laying again in from six to ten days. The longer a broody hen clings to the nest after she first shows a desire to spend the night sitting, the longer it will take to break her up and to start her laying again. Broodiness indulged for a week or more may mean that it will take as long to get the fowl laying as if she were permitted to hatch a brood.

* * *

Feed succulent greens and vegetables freely, give each day what they will clean up. If you are seeking best results in egg production do not gorge the birds with wet mash in the morning or permit them to fill up their crops without a reasonable amount of exercise. A hen with a crop full of warm mash is likely to seek a quiet roost and go to sleep again. This loafing on the roost may give you fat fowls but it won't help egg production.

* * *

It is time to overhaul the incubators and brooding equipment and make sure that everything is in readiness for starting the early broods. If new equipment or supplies are needed, orders should be placed early. We still have transportation difficulties and freight is slow. Place orders early to avoid disappointment.

* * *

Don't neglect the show birds when they come home from the winter exhibition. Give them a roomy place by themselves for a few days, where they can rest and be comfortable. Give them a chance to stretch and exercise. Watch them for symptoms of any disease which may have been contracted in the show room or during transportation. Feed them well on a variety of wholesome food and plenty of greens. See that their quarters are well ventilated so that there is abundant fresh air both day and night. Keep them away from the home flock for from ten days to two weeks to make certain that they are not victims of contagious disease.

* * *

Plan to start hatches early the coming season. Baby chicks will be in demand and early pullets will have a ready sale at all ages. Get out a good bunch of early chicks for renewing home flocks.

The Germ-killing Disinfecting White Paint

CARBOLA

A Better and Easier Way

to do your work—a saving of time, labor and money—is yours if you will use this snow white mineral paint combined with a germicide 20 times stronger than pure carbolic acid—a paint and disinfectant in one. It comes in powder form ready to use as soon as mixed with water and can be put on with either a brush or a sprayer. It will not blister, flake or peel. Has the approval of many experiment stations and most carefully conducted poultry, dairy and breeding farms. It is not an experiment and you too will be satisfied if you

Use It Instead of Whitewash

to make your barns, poultry houses, pens, cellars, dairies, etc., cleaner, brighter and free from the germs of infectious disease. Carbola kills lice, mites, fly eggs, etc., but is non-caustic and non-poisonous. Its use makes for better producing flocks and herds and a readier and higher-priced market for their product. Whitewash is disagreeable to prepare, has no germicidal value and flakes, peels and blisters.

Get some Carbola today from your dealer, or if he has none send his name and your order to us.

10 lbs. (10 gals.), \$1 plus postage.

Value of Advertising.

I AM enclosing a large advertisement of the American Tobacco Company, which is appearing in the daily papers and in which both text and illustration advocate the use of more eggs on the family table. This is one of the best advertisements in the interest of poultry culture which I have seen. One line in it says "You know there isn't a better breakfast than two poached eggs on toast—seasoned exactly right." That is good, truthful advertising, and I believe that more of this and less hot air, committees, breed books, market standards, federations, experimental ginks, expert lecturers and advisers—some who ought to be over there or in munition plants—would do the whole industry a lot of good. The Chicago "Con," which I attended a little, will

master the situation if a million words will turn the trick!
Ohio.

F. C. Stier.

More Advertising.

Not long ago I attended a meeting and luncheon of United War Workers in an eastern state, and the conversation at the luncheon table drifted to the high cost of living. It was the general verdict that "food is entirely too high in price and that farmers are getting wealthy since they have acquired the habit of gouging the city dweller for every mouthful of food he eats."

Personally I am not accustomed to speaking in public and I did not feel sufficiently well informed to attempt a speech on the subject, but I was well pleased to find that there was a country woman present equal to the occasion and who, after a few min-

utes earnest conversation with the chairman of the meeting, addressed the large number of women present. As most of these are housekeepers, I believe the majority of them will go home with a clearer idea of food values and what it actually costs to produce food than they have ever had before. Women who have never in their lives gotten out of bed before seven or eight o'clock and many of them not before ten, who have had their luxurious breakfasts served them in bed, and their appetites pampered since childhood, listened attentively and actually applauded the little woman who stood up before them and told them in plain words of the hardships, the long hours, the monotonous, poorly paid work of the farmers' wives. Said one of the women afterward in my hearing, "I am glad I heard this talk for I begin to see the magnitude and importance of the food producer's work—I had thought of him only as many of us used to the slaves, necessary to our comfort and wellbeing, but not having the same instincts and desires as the rest of humanity."

This is the kind of advertising the food producer needs today. Just because a farmer once in a while in some specially favored community makes a hundredth part of what the railroad magnate or the steel magnate or the manager of a great packing concern makes every year, the report goes around that farmers are coining money, and some

Guarantee

I guarantee the Putnam Brooder Heater to give satisfaction or it may be returned to me within 30 days of shipment and the money paid for it will be refunded.

Brooder Complete \$4.96

Cut herewith shows the Putnam Home-Made Brooder—Complete

This Year Save Your Baby Chicks
Either those you hatch yourself or those you buy—and do it at small cost in every way.

← See Sample Brooder at Left

The materials used to make it were one shoe box; one-sixth yard of oil cloth and one Putnam Brooder Heater. The total cost, including Heater, was \$4.96. A 14-year-old boy can build one in an hour with no tools but saw and hammer. This Brooder will accommodate from 35 to 60 chicks and will take better care of them than any Brooder made, no matter how elaborate or expensive. Build one NOW and have it ready for the young chicks when they come. Write for plans for making this Brooder and testimonials from satisfied users. I will send you the plans FREE.

Advantages of the Putnam Home-Made Brooder

Requires filling BUT ONCE A WEEK—no other attention. Patented principle—EFFICIENCY guaranteed. Thousands in use. Every OTHER BROODER must be filled and trimmed SEVEN TIMES a week.

Putnam HOME-MADE BROODER is adapted to any size plant from 25 to 60 chicks in one brooder to any greater number desired; simply use more brooders. Is particularly adapted to needs of small breeder and back-lotter who aims to produce one lot of chicks or a few dozen.

No other brooder on the market is EASIER or more SIMPLE to operate; none uses SO LITTLE OIL per chick; brooder consumes less than a gallon of oil A MONTH. Send for and read the testimonials.

Putnam BROODER HEATER is so constructed that it acts LIKE AN OPEN FIRE PLACE, carrying the foul air out and drawing the fresh air in, thus providing PERFECT VENTILATION AUTOMATICALLY.

Heat is radiated from ABOVE onto the backs of chicks, giving the natural and soothing effect OF THE HEN—without the lice.

Hover is so constructed that chicks FIND EXACT TEMPERATURE THEY LIKE. Adjustable hover takes care of any season from February to July.

Putnam HOME-MADE BROODER CAN BE OPERATED ANYWHERE—in a sunny room in a house, an open shed, or, if a roof be built on it, out of doors; can be CARRIED ANYWHERE by a half-grown boy.

No other brooder is easier to clean and disinfect. Simply lift out hover and heater—brooder can then be emptied of litter and be disinfected.

Brooder Heater is made of brass and galvanized iron—IS PRACTICALLY INDESTRUCTIBLE.

Capacity of Putnam HOME-MADE BROODER IS ELASTIC. When chicks require more exercising space heater and hover can be placed in larger box or other structure. THE BROODER GROWS WITH THE BROOD.

Floor of this brooder is even with the ground and therefore chicks do not have steps or inclines to learn, thus avoiding loss from rain or chilling.

To summarize: At no price, HIGH OR LOW, can a brooder be bought so economical in first cost, also in fuel and labor—so simple and EASY TO OPERATE, so perfectly ventilated, or one that will so surely raise HEALTHY AND VIGOROUS BIRDS.

THE BROODER HEATER

Price only \$4.75, postpaid

HOW TO ORDER: I do not sell the Putnam Home-Made Brooder. I sell the Brooder-Heater only. The price of the Heater is \$4.75 postpaid. With every Brooder-Heater I will send EASILY FOLLOWED DIRECTIONS for building the Home-Made Brooder. You can order direct from this advertisement to save time. Reference, by permission, Editor this Journal.

Made in Sizes 1 to 8 Dozen. Also hatching sizes. Can be used repeatedly. Light weight. Strong Construction. Order from Your Dealer.

DIAMOND BOX MFG. CO., Minneapolis, Minn.

Ill-advised people seem to feel that a farmer should not be permitted to ride in an automobile, much less to own one, when as a matter of fact farmers could not carry on their business today except for their use of motor cars and tractors. It is time that these facts be made known to those whose wealth and comfort is dependent upon the great work which the food producer annually performs. For this reason no opportunity for enlightening people along these lines should be allowed to go by ungrasped. Let us all enlist as advertising agents in the interest of the food producer. Pennsylvania. E. H. Johns.

Partridge Cochins.

Of late years very little space has been given in the poultry journals in the interest of the beautiful Partridge Cochins but in spite of the neglect, this useful breed is still a favorite in many poultry yards, especially among poultrymen capable of judging worth in fowls. Those who have bred them for many years acknowledge them to be one of the best general purpose breeds which we have today. They are wonderful layers of large brown eggs, and if well fed and cared for lay almost the year round. They should be fed very little corn or fattening food, especially in summer. For best results I advocate a ration consisting of oats, barley and wheat, with a mash composed of wheat bran and ground oats moistened with skim-milk or water. I prefer to feed the whole grain in a straw litter.

The next boxes for Cochins should be placed on or very near the floor and the perches should not be more than eighteen inches from the floor. If placed higher, many of the birds would not go on the perches at night, or, if they did, would be liable to injure themselves in jumping down to the floor because of their great weight. A woven fence three or four feet high is sufficient to confine them.

In plumage, the Partridge Cochins are rich and elegant looking, and the dark-shaded plumage is not apt to show every little bit of soil, as lighter-plumaged varieties do when kept in small yards. It requires little fitting to get them ready for the show room. They seldom require washing if their surroundings are kept fairly neat.

The hen is a rich brown, with each feather beautifully penciled with black. The Partridge Cochon cock is unsurpassed in the richness and splendor of his colors. His hackle and saddle are a rich mahogany red on a dark under color with each feather showing a strong, distinct lacing. The broad back and wings are a rich, lustrous brown, the tail a greenish, glossy black, and the breast, thighs and under body black. The general appearance of the cock bird of this variety is broad and massive, with heavy feathering in all sections. They have small, neat combs, bright bay eyes, short tails and rich yellow skin and legs. The back is brown or horn color. The tail is very short and carried low. The heavy feathering gives the neck a short appearance and the head is carried well forward. Cocks weigh from ten to twelve pounds, the hens weighing from seven to ten pounds. Their large size and rapid development make them unsurpassed as a table fowl. As market poultry they often bring an advance over the market price because of their large size and superior flesh. For roasters and capons, they are rivaled only by the Brahmas, while their extreme hardness and quick growth make them one of the best breeds for broilers. At eight weeks they easily weigh two pounds each and bring top prices.

As a table fowl the Partridge Cochon is at its best when matured and properly fattened, usually at a period long after other breeds have passed the soft-meated stage and gone "staggy," when the Cochon cockerel remains soft and tender as a young turkey. Even after they have been used a year or so in the breeding pen, they make choice table meat.

The Partridge Cochons are very gentle and tame and the hens make the best of sitters and mothers. They are strong, robust and free from disease. The vitality of many of the modern breeds has often been seriously impaired by the practice of intensive line-breeding in order to establish some desired characteristic. The Partridge Cochon is one of the oldest breeds and because of this breeds remarkably true to type and color. It is from the Cochins that many of our modern breeds have had their origin. The various Wyandottes, Plymouth Rocks, Rhode Island Reds and Orpingtons are predominated largely by Cochon blood and to this fact they owe much of the size and quality they possess.

Standardbred males mated with Standardbred females of the Partridge Cochons will produce both males and females of Standard quality and color. In breeding, extremes should always be avoided. The closer the parent birds conform to Standard requirements, the better will be the offspring. Most of the best fanciers of today who are breeding this variety are using only a single mating to produce Standard birds of both sexes.

Size should always be maintained by selecting the largest hens as breeders and mating them with males of best shape and color markings. It should always be remembered, however, that free range and liberal feeding during the entire growing period has a great deal to do with increasing the size of the birds. Breeding of carefully selected stock will not insure quality in the offspring, unless due attention is given the birds during growth. The best blood lines back of a bird will not produce quality, unless the bird is generously fed on wholesome grains and greens and is comfortably housed and yarded.

A flock of Partridge Cochons well bred and well cared for in every back-yard would go a long way toward solving the meat problem of today by supplying fresh eggs and chicken for the table every day in the year. I have bred Partridge Cochons for more than twenty years with great success both in the show room and out and feel that I am thus able to judge their worth.

New Jersey. Elmer Niece.

Sprouted Oats Were My Salvation in the Poultry Business.

When I got the chicken fever I had not paid much attention to obtaining winter eggs; in fact I did not care nor know where in to specialize in order to get the most out of my fowls I imagined I would soon possess. I simply wanted to raise chickens.

This was several years ago and since then I, like many others, have had my ups and downs (mostly downs) in this venture.

First, I raised a lot of chickens and sold all I could spare as fries. This would have been all right if I had been able to catch the market always at the right time. Early hatches here in Iowa are not always so easily managed, unless one has on hand the best facilities for taking care of the youngsters.

Then I tried capons and holiday fowls with varied success.

Finally I decided on the production of

Golden Eggs-Get Them!

The old fable tells of a goose that laid golden eggs—now the hens are actually doing it. Egg prices have never been so high. There is a shortage in storage eggs—a correspondingly big demand for fresh-laid eggs. Make your hens and pullets, every one, lay steadily now. Get your share of the golden harvest.

Pratts Poultry Regulator

"makes hens lay." Guaranteed to do it or your money refunded. Make the test at our risk. Learn how well your birds can lay if given the help they deserve. Pratts Poultry Regulator is not a food, not a mere stimulant. It is a tonic and health-builder, which keeps fowls healthy and vigorous, able to stand the strain of every-day laying. Inexpensive, used in small amounts, but it brings results. Get a supply from your dealer today and put your hens into the money-making class. Don't let colds and roup injure your flock and reduce the egg-yield.

Pratts Roup Remedy

will prevent these disorders. Use it occasionally, especially during changes in the weather. If disease has appeared, Pratts Roup Remedy will save the sick birds and protect the rest of the flock.

market eggs which I had no trouble to obtain during the spring and summer months, but, of course, prices at that time were not always satisfactory.

As a last resort to make the most out of my poultry I put all my thoughts and efforts into getting fall and winter eggs. I went about getting them like this:

I set my incubator the first part of March, fed the chicks little but, often, according to the rules laid down in most poultry papers; did not miser with the feed when the youngsters were maturing; placed them in their winter quarters about October 1; put plenty of straw for litter on the floor in which the scratch feed is thrown early in the morning; at noon gave them plenty of sprouted oats, and in the afternoon sometimes whole oats, sometimes milk-moistened mash, and, in extreme cold weather corn.

Last winter I had 200 White Wyandotte hens and pullets (about the same number now) and those gave me from 90 to 120 a day last fall and winter. This was a quantity of eggs I had never received during cold weather.

I want to say right here that in my estimation sprouted oats did more toward producing such nice results than any other one item of the feeding system.

I had the sprouts about 1 to 1½ inch long, so as to retain the feeding value of the oat. The fowls also relish it best at this stage of sprouting, and you get the most value out of the oats, as it is a regular egg-making as well as green feed. With a good sprouter you can manufacture it yourself every day. It must be given to the fowls daily, the same as other feeds, or the hen's egg-making machinery will be thrown out of gear for several days, thereby losing a lot of eggs as well as feed.

With a good sprouter you can depend on a regular supply of crisp, tender egg-making green feed, as you could in no other way. Have tried other green feeds, but with only half the success that I enjoy since feeding sprouted oats.

Waterloo, Iowa. J. L. Dickerson.

Merry Christmas.

In nearly every community there are a few soldiers' families or returned disabled soldiers who are not financially provided for as well as they used to be before as stalwart young fellows they went forth to make the sacrifice for you and I. It will be some little time before these men and their families will again be as independent as they once were, and now is the time when you and I can best show our appreciation of what they have done for us. The season of good-will and gift-giving is at hand, so dress off a prime quality chicken and send it to a returned hero or his family with a Merry Christmas. Or if your neighbor has sent a chicken or a turkey or goose, fresh-laid eggs will not come amiss in spreading Christmas cheer.

Maryland. F. D. Blake.

Says Eggless Egg Products Must Go.

Action has been taken by the state dairy and food commission to stop the sale of various egg substitutes which have been appearing on the market. Among the brands of this preparation under the ban are Egg-zact and Egg-oleo, manufactured by the Sunbeam Products company, Milwaukee, Sa-Van-Egg, Eggette, IXL Egg Saver, Egg-Sub and Eggola.

"We shall take immediate steps to stop the sale of these products, which are pure deception and fraud," said George J. Weigle, Wisconsin dairy and food commissioner, on Saturday. "Analysis of the products show that they contain 80 percent cornstarch and 20 percent skim milk powder. Egg-oleo contains a small percentage of dried eggs, but not enough to prove effective as a leavening agent in baking. The products are artificially colored with coal tar dye. Baking demonstrations which we have prepared prove that a cake baked without any egg is not much worse than one baked with these so-called egg substitutes."

C. J. Kremer, state food inspector, exhibited a number of cakes baked with egg, with the substitutes, and without leavening agent. Those made with the substitute were colorless, flat and heavy, being about one-fourth the size of those baked with egg, and the same size as those baked without leavening agent.

According to Mr. Weigle, other states are also stopping the sale of the substitutes. There are about thirty-two brands on the market.—Milwaukee (Wis.) Sentinel.

An egg a day from each of your hens is not too much to expect *if they are properly fed.* Feed them *right* and they will produce Eggs in *winter* as well as *summer.*

There is no secret about securing Eggs. It is simply a matter of *feeding.* Give your hens food which provides the necessary *nutri-ment* for *egg-making* and *body-building* and they will give you eggs.

More than 118 years of success in poultry feeding has enabled us to produce *Blatchford's "Bar-Nun" Laying Mash* which embodies in the correct proportion all the egg-making elements and ingredients required to enable the hen to *lay an egg a day.*

Blatchford's

"Bar-Nun" Laying Mash

Trade Mark

A scientifically milled, carefully prepared food—a food that makes eggs. Keeps hens in healthy condition. Safeguards them from exhausting the energy required for egg-production as it provides the food elements they would otherwise have to scratch for. Produced to provide poultry raisers with a food that can absolutely be depended upon to assure continuous egg-production 12 months of the year.

Guaranteed Absolutely Free from All Cheap By-Products

We have no by-products or waste materials to get rid of. Therefore you can depend upon it that "Bar-Nun" Laying Mash is *all food.* We *guarantee* it to be free from all cheap by-products or refuse from the manufacture of breakfast or cereal foods or scratch-feed rations.

"Bar-Nun" does not force or fatten—it makes eggs. Ready for feeding —*dry*—just as it comes from the bag. Hens eat it up clean. Get a sack today from your dealer or write to us for further information.

Name

Address

When George Newell discovered that he could Increase Egg Production

100% by the use of artificial light in his poultry houses in the early mornings and evenings of the short, dark days of winter, he opened the way for far greater profits in the poultry business. The only drawback to Mr. Newell's system has been that most poultrymen were not located where they could install electric lights. This deficiency has now been remedied by the

Acorn Uni-Lite

The Light That Shames Electricity

A Portable Three-Hundred-Candle-Power Light which burns 15 hours at one filling—costing only a quarter of a cent per hour for light that in brilliance, whiteness and steadiness puts any electric incandescent light in the shade. It burns common gasoline or kerosene. Is storm-proof, bug, rain, sleet and snow-proof. You can upset it and roll it around without the slightest danger. No odor, no smoke, no wicks to trim.

During the short days of winter it keeps your hens busy to eat enough to last them through the long, cold night—they have nothing left for eggs. Keep one of these lanterns burning in your poultry house early in the morning, and for a while in the evening, and see your egg production jump. Write for special proposition to poultry raisers. **ACORN BRASS MFG. CO., 110 Acorn Bldg., Chicago**

Big Money-making Proposition for Farmers, Stockmen, Poultrymen, Auto Owners, Liverymen, Watchmen and Campers.

MORE LIGHT ON THE SUBJECT.

J. W. Parks Lets the Cat Out of the Bag and Comes Forward As an Inventor.

No, kind reader, the accompanying illustration is not one of Goldberg's cartoons. While the key (A) on Big Ben pulls wire (B), which operates handle (C) and throws in switch (D) according to diagram as in aforesaid cartoons, this is a practical contrivance, and when it operates, the lights go on in whichever of Mr. Parks' pens he wants his Plymouth Rocks

Mr. Parks' alarm clock which turns on the light in his poultry houses.

to get off the roost and begin eating and laying. When George Newell first experimented with artificial light as an aid to greater egg production in winter, and gave the results of his researches to the poultry world in a book entitled "A Revolution in Egg Production," he aroused much ridicule and hilarity. But just as sure as foam rises on beer, so will truth come to the surface, and when you see such practical, hard-headed poultrymen as J. W. Parks putting these ideas into operation and proving their worth, you may rest assured that they are sound. It's as plain as A-B-C.

During the short days of winter a hen has barely time enough to pick up sufficient food to keep her going during the long, cold night, but if her working day is lengthened by the use of artificial light in the morning and evening, her working day is increased sufficiently for her to eat enough to produce more eggs.

The principal handicap has been that poultrymen were not able to secure satisfactory illumination, but about a year ago, Mr. Parks installed an electric light plant and says he would hardly know how to get along without it now. It gives him an opportunity to do most any kind of work at night and helps the women folks by running the washing machine, churn, etc. There have also been many practical oil lights put on the market which are giving excellent service in lighting poultry houses.

We can imagine that Ma Parks raised strenuous objection when she saw that gigantic being erected right there on the door, but imagine that she is placated since seeing the results which Mr. Parks reports.

In a letter dated November 12, he wrote as follows: "In installing the electric light

Yesterlaid Baby Chicks

Buy Yesterlaid Baby Chicks

on the laying record of their ancestors

The first Lady Laymany is dead, but her ability to lay lives on in the blood of her descendants. Abundant constitutional vigor and the inherited power of heavy laying are two distinguishing characters of Yesterlaid Range-Raised Laying-Leghorns—the hens that have made the word Yesterlaid stand for Leghorn Supremacy. This is borne out by the written statement of hundreds of our successful customers, and by the fact that Yesterlaid hens have been purchased by twenty-six state institutions and experiment stations.

Every Yesterlaid breeding pen carries the blood of hens that have laid 443 to 480 eggs in two years. The individuals in these pens are the result of more than a decade of diligent, painstaking study and breeding experience. They are pure line-bred Yesterlaid, they have never been out-crossed with foreign blood. They rank high as Show birds and Breed true generation after generation.

Yesterlaid Baby Chicks are strong, thrifty and quick-growing—three of them can be raised at the cost of two ordinary chickens, and they will lay enough eggs to pay their cost of raising before average pullets begin to lay. On the farm they are master foragers.

Yesterlaid hens are thrift hens for the city back-lot. They stand confinement perfectly and require less care than other hens of heavier breeds. They will not get over-fat, but turn their food into big white profitable eggs.

One Yesterlaid customer, writes: "I have nine Yesterlaid hens. They layed 1993 eggs from November 1st, to November 1st, I did not trap-nest them, but there was one that I am sure layed 260 and another 240. My back lot is only 33ft.x50ft., and I had part of that in garden.

Buy Yesterlaid Baby Chicks directly from this adv. Buy them now. Send your order today to avoid disappointment when you want shipment. Shipments will be sent out in rotation as orders are received—"first come first served." First shipments will be made as near April 1st as weather permits. Live delivery of full count guaranteed.

Yesterlaid baby chicks will be delivered to you post paid, in any quantity above twenty-five at 20 cents each.

Yesterlaid eggs for hatching, guaranteed 100% fertile, in lots of 100 or more are priced 9 cents an egg, by mail or express, carriage charges collect.

plant, we naturally had intended trying out the lengthening-of-the-day plan; however, one of our main thoughts was the advantage of being able to put in longer days for myself and the hired help as well as the chickens. About the time of the year that the days commence to shorten is when the breeders are having their busiest time. Previous to installing the plant we seldom got much work done by the help after it commenced to grow dusk. Now, when we feed supper to chickens about four, the help goes to the workshop and finishes up the day grinding feed, ripping out material for shipping coops or any of the many jobs that can be done by a good supply of light. When it comes to trying out the lengthening of the days on biddies we figured that the lengthening was best done by adding out to the beginning of the day. For awhile I set the alarm a couple of hours earlier than daylight. But then we might just as well stay up, for it's hard for a poultryman to go back to sleep again (especially these war times with the labor shortage) when we had so many little jobs awaiting us. As I generally do most of my office work after supper and sometimes well up into the night, I found that I could not stand having my days lengthened at both ends. That is what drove me to working out the dufunny on the alarm clock.

"We have as a rule been very successful with winter egg production and will freely admit that by lengthening the days the production can be increased, but it takes careful handling of the birds especially during the severest weather, and especially in open-front houses. When you get the birds from the roost a couple of hours before daylight, if you're not careful they will be filled up by that time and then have a tendency to loaf, and as we all know about dawn as a rule is the coldest part of the day, and just when they should be working instead of taking it easy.

"I have been experimenting along another line besides increased laying, which is along the line of developing the youngsters. I have taken three pens of late May-hatched youngsters, and been giving them a couple of hours extra daylight in the morning this fall. It's surprising how they are stretching out, and in some cases not only equaling but passing the youngsters hatched four weeks previous, but without light."

Artificial lighting is a subject which every poultryman should look into. It means an untold increase in wealth to the industry.

Silver Quill Egg Mash

Mash Feed makes eggs. At least as much of this mash should be consumed by laying hens as scratch feed, preferably more. It contains 22 different ingredients, and analyzes 19 per cent protein, 4 per cent fat and 10 per cent fiber.

- No. 51PP921½—100-pound bag. Shipped from CHICAGO. Price.....\$4.55
- No. 51PP5921½—100-pound bag. Shipped from INDIANAPOLIS. Price.....\$4.65
- No. 51PP6921½—100-pound bag. Shipped from COLUMBUS. Price.....\$4.65
- No. 51PP7921½—100-pound bag. Shipped from KANSAS CITY. Price.....\$4.75

Silver Quill Laying Mash

Should be fed in equal quantities with scratch feed and kept before the hens continuously. They will not overeat. This mash analyzes 15 per cent protein, 6 per cent fat and 8 per cent fiber.

- No. 51PP967½—100-pound bag. Shipped from CHICAGO. Price.....\$3.65
- No. 51PP5967½—100-pound bag. Shipped from INDIANAPOLIS. Price.....\$3.65
- No. 51PP6967½—100-pound bag. Shipped from COLUMBUS. Price.....\$3.65
- No. 51PP7967½—100-pound bag. Shipped from KANSAS CITY. Price.....\$3.85

Meat Scraps

Experiments show that animal protein in meat scraps induces greater egg production at less cost.

Silver Quill Meat Scraps analyze 50 per cent protein and 8 per cent fat, and contain the animal protein that is so essential in balancing hens' rations.

- No. 51PP925½—100-pound bag. Shipped from CHICAGO. Price.....\$5.35
- No. 51PP5925½—100-pound bag. Shipped from INDIANAPOLIS. Price.....\$5.40
- No. 51PP6925½—100-pound bag. Shipped from COLUMBUS. Price.....\$5.45
- No. 51PP7925½—100-pound bag. Shipped from KANSAS CITY. Price.....\$5.70

Silver Quill Scratch Feed

Contains Cracked Corn, Wheat, Kaffir Corn, Barley, Oats, Buckwheat and Sunflower Seed. All clean, sweet grains, free from chaff and grit.

- No. 51PP302½—100-pound bag. Shipped from CHICAGO. Price\$3.59
- No. 51PP5902½—100-pound bag. Shipped from INDIANAPOLIS. Price.....\$3.50
- No. 51PP6902½—100-lb. bag. Shipped from COLUMBUS. Price.....\$3.60
- No. 51PP7902½—100-lb. bag. Shipped from KANSAS CITY. Price.....\$3.70

Egg Shell Grit.

So named, because in addition to acting as teeth for the fowl, it supplies lime for making egg shell. It is a bright and sparkling crystal white marble grit.

- No. 51PP960½—100-pound bag. Shipped from CHICAGO. Price..\$1.00
- No. 51PP5960½—100-lb. bag. Shipped from INDIANAPOLIS. Price. 1.00
- No. 51PP6960½—100-lb. bag. Shipped from COLUMBUS. Price.. 1.00
- No. 51PP7960½—100-lb. bag. Shipped from KANSAS CITY. Price. 1.35

Silver Quill Oyster Shells.

Are guaranteed oyster shell. They are ground and dried, not burned, then carefully screened and washed.

- No. 51PP935½—100-lb. bag. Shipped from CHICAGO. Price.....\$1.15
- No. 51PP5935½—100-lb. bag. Shipped from INDIANAPOLIS. Price. 1.15

SOFT-HEAT **MAKES STRONG CHICKS**

Hundreds of poultry raisers say that they get stronger, healthier chicks and more of them thru use of Soft-Heat Incubators—many have succeeded amazingly who never used incubators before.

Amazing Discovery
The Soft-Heat principle in hatching chicks is undoubtedly the **greatest incubator discovery in 50 years.** It is the result of 25 years experience and study—invented by acknowledged experts. Actually gets better results than any hen because it is on the job constantly and maintains exactly the right amount of heat over each and every egg at all times in all weathers, and insure perfect ventilation. Automatic control of heat, moisture and ventilation. Round egg chamber.

Porter Soft-Heat Tubeless Incubator

Is put out on an Iron-Clad guarantee. Saves much time—only three minutes a day to attend to it. One filling of lamp with three quarts of oil, all that is needed. Eggs turn semi-automatically without removing tray. **100 to 600 egg capacity.** One user says: "I never saw such strong, healthy chicks as those hatched with your machine, they were so full of life that they fairly popped from the shell. I lay it all to the wonderful Soft-Heat."

Get Big Free Book
Write us a letter or card today for our big, new, free book that tells all about Soft-Heat, result of 25 years incubator building by originators of center lamp heat, and gives much valuable information on hatching chicks—you won't be obligated in any way.

Horticulture for Poultry Keepers
Conducted by *Thos. F. Rigg, Iowa Falls, Iowa.*

WE HAD the most pleasant and desirable fall weather. We had plenty of time and to spare to put the orchard and garden in perfect condition for winter. So far as I know I have given every tree, vine and shrub just what it needs, and so I can rest easy this winter in the assurance that having done my duty toward these things, they will reward me with a big crop next season.

In answer to several correspondents: There can be no set rule governing the pruning of grape vines. In the pruning of the fruiting grape vine there are many things to be considered—the variety of the grape, the soil, and the kind of care given the vines. Here in the rich soil of the central west we can prune to longer canes than can the grower in many parts of the east. These vines can be overfed so as to make such wood growth that no fruit will set. I try to prune my Concord vines so that each vine will carry 35 to 40 fruit buds. On this basis the Worden should carry about 25 to 30 fruit

buds; the Delaware 18 to 20 fruit buds. Such pruning would be called long pruning. I have found that Niagara is best pruned to 30 to 35 fruit buds. Campbell's Early, Lucile and Moore's Early do best here when pruned to about 30 buds. When to prune is a disputed question among many growers. There is a theory to which many growers lean. It is that when cold weather checks the growth of the vine, the absorption of food by the roots is not stopped and that the vine becomes surcharged with sap so that each bud is given sufficient food to start it in healthy growth the following spring; that if a portion of the vine is cut away immediately after the vine drops its leaves that portion of the vine remaining will receive all the strength which would have gone into the whole vine had it not been pruned; that the buds will start out earlier in the spring and give better sized bunches of fruit. On this theory, the truth of which I doubt, prune the weaker growing vines just as soon as they drop their leaves, leaving the pruning of the strong growing varieties to later

Imperial Prince, White Plymouth Rock grand champion male at Greater Chicago Show, also at Illinois State Show, 1918. Bred and owned by Mrs. Louisa White, Box A, Washington, Ill.

prunings. I have made it a practice to prune all my vines as soon as the leaves have dropped. One reason why I do this is because many of the vines must be covered in the fall. To central west growers my advice is to prune all grape vines as soon as possible after the leaves fall.

* * *

"I am a subscriber and earnest reader of the entire contents of both American Poultry Journal and the American Fruit Grower. I live in the Ohio River valley (bottom land a little too high to overflow) about fifteen miles east of Cincinnati. Soil is a kind of yellow clay and rather poor and run down. I own only one lot on which my house stands, and would like to set out three or four apple trees, one or two plum trees, and a few gooseberry and currant plants. Will appreciate it very much if you will kindly inform me what varieties of trees and plants for home use. Would like one early, one autumn and two winter apple trees. I like the Wealthy and Jonathan apples but do not know whether they would be best for this locality and soil, or not. If it is not too late I would like to get the trees and heel them in this fall. Also will you name a good reliable nursery near here where I can get the trees and plants you advise."

Kentucky. S. H. B.

You will find Liveland Raspberry, Duchess, Wealthy and Jonathan ideal for your location and needs. Omaha, Endicott and America plums will give you an abundance of plums of superior quality. Would advise you to confine your choice of currants to Fay and Diploma. You will want a few Oregon Champion gooseberry bushes and a few grape vines. For a home supply of grapes plant Green Mountain, Eclipse, Moore's Early, Worden, Concord and Niagara. Then you will have grapes from very early until very late.

* * *

"I am offered a ten-acre lot in the Indian Spring Land Company's subdivision in Volusia county, Florida, at fifty dollars per acre. It is close to Briggsville station on the Florida East Coast Railway and seven miles from New Smyrna on the same coast.

"I would like to get a line on that part of Florida, as to soil, temperature, rainfall, etc. I am told \$2,000 a year can be made from ten acres if properly worked."

Vancouver, B. C., Canada. J. C. Stuart.

Anyone who purchases ten acres of ground in Volusia County and counts on making \$2,000 per year net therefrom is going to be disappointed. Volusia County is in neither the vegetable nor the fruit section of Florida. It is too far north for the successful and profitable production of fruit and vegetables. I have been going to Florida for many winters, and time and again I have seen all the state north of Palm Beach laid low by killing frosts. In fact no one ever thinks of that section as a fruit section—except the land men who play the game in the north.

I strongly urge you to make an inspection of Florida before you buy land anywhere in the state. A person with sufficient capital can make good returns from a grapefruit grove and vegetables if the vegetable growing is made secondary to the production of fruit. To do this, land of the right soil, character and located right must be purchased. It is not at all difficult to find this kind of soil. The fact is that the successful profitable grapefruit groves are located in a small area comparatively. You will find that when planting is made much north of Miami, the business is not profitable, because it is almost certain to be ruined by frost. The climate in Volusia County is delightful and rainfall abundant. The soil is mostly sand.

* * *

Just now there are a number of nursery firms flooding this section of the country with literature, telling how apple trees on

Early Spring Chicks Make the MONEY

February or March chicks bring twice the profits of those hatched two or three months later; grow to market size when highest prices for meat prevail; to laying size in time for winter eggs and lay all through the winter.

Because of its special method of construction you can depend on the

Standard RELIABLE Incubator For Successful Cold Weather Hatching

This incubator is noted for its double enclosed heating system, combining hot air and hot water. Copper hot water tank and hot air system extend entire length of egg chamber—maintain even heat over all the eggs in coldest weather, in any altitude. Perfect regulation of heat, automatic ventilation and moisture supply make it practically self-operating.

Substantially built of thoroughly seasoned timber, nicely finished; top and bottom tongued and grooved; double walls thoroughly insulated throughout; roomy chick nursery; double glass doors; strong legs; all metal lamp.

No Wicks to Trim; No Smoke

No Soot No Odor No Gas

To save your chicks after you hatch them you need the Reliable Oil Heated Hover. Burns kerosene with clear blue flame; automatic regulation prevents waste. Keeps chicks warm and dry. Built of galvanized steel in 30-42-52 inch sizes.

Free illustrated catalog gives full information. Write for it at once and get your incubator started early.

LABOR-SAVING DEVICES EMPLOYED ON THE BARRED ROCK FARM OF J. W. PARKS, BOX J, ALTOONA, PA.

(1) Mash mixer. Mixing mash used to be a tiresome and dusty job before we installed the small power mixer that takes care of a bushel of mash in a few minutes. (2) Grinding machine; one of the most profitable of our satisfactory investments. By its use we are always sure of a supply of good mash. (3) Corn sheller. We generally buy enough grain in the fall to do for the season. Last fall we bought corn in the field at \$1.60 and were grinding and feeding corn this summer at that price, while some others were paying as high as \$2.40 per bushel. (4) Electric light plant. We have only had it installed about a year, but would hardly know how to get along without it. Ordinarily poultry work is a daylight job, but we now do most any kind of work at night. It also helps the women folks by running the washing machine, churn, etc. (5) Big Ben. Even the alarm clock has something to do besides keep time. He is harnessed up to one of our home-made contrivances so that he turns the lights on in whatever pens we want to have extra feeding hours while we sleep.

160 Hens 1500 Eggs

As America's foremost poultry expert I predict that eggs are going to retail for a dollar a dozen this winter. Right now the retail price is from 50c to 75c per dozen in some of the large cities. At a dollar a dozen poultry raisers are going to make tremendous egg profits. You, too, can make sure of a big egg yield by feeding your hens a few cents worth of "More Eggs" tonic.

This product has been tried, tested and proven. It is acknowledged the best and most successful egg producer on the market today. Every day that you don't use it means that you are losing money. Don't delay. Start with a few cents worth of "More Eggs" tonic now.

Got 117 Eggs Instead of 3

That's the experience of one poultry raiser who wrote me. A. P. Woodard of St. Cloud, Fla., writes: "I get from 40 to 50 eggs a day now. Before using 'More Eggs' I was getting only 3 or 9 eggs a day." Here are the experiences of a few others of the hundreds who write me:

"160 Hens—125 Dozen Eggs"

E. J. Reefer: Watery, Mo.
I have fed two boxes of More Eggs Tonic to my hens and I think my hens have broken the record for eggs. I have 160 White Leghorns and from March 25 to April 15 I sold 125 dozen eggs.

"15 Hens—310 Eggs"

E. J. Reefer: Turner Falls, Mass.
I used our More Eggs Tonic and from December 1 to February 1, from 15 hens, I got 310 eggs. Your remedies are just what you claim them to be.

"Layed All Winter"

Dear Mr. Reefer: Lockawana, N. Y.
I gave the tablets to my hens and in three weeks they began laying and layed all winter. I never saw anything like them in the world.

"37 Eggs a Day"

E. J. Reefer: Elwood, Indiana
That More Eggs Tonic is simply grand. When I started using it they did not lay at all, now I get 37 eggs a day.

"Increase from 2 to 45 Eggs a Day"

Reefer's Hatchery: Derby, Iowa
Since I began the use of your More Eggs Tonic 2 weeks ago I am getting 45 eggs a day, and before I was only getting 2 or 3 a day.

"Doubles Egg Production"

E. J. Reefer: Paradise, Texas.
I have been using More Eggs Tonic 3 or 4 weeks and must say it is fine. My egg production has been doubled.

"48 Dozen In One Week"

Dear Mr. Reefer: Woodbury, Tenn.
I can't express how much I have been benefited by answering your ads. I've got more eggs than I ever did. I sold 42 1/2 dozen eggs last week, set 4 dozen, ate combs and had 1 1/2 dozen left. From your friend, MRS. LENA McBRON

"Increase From 8 to 36 Eggs a Day"

E. J. Reefer: Shady Bend, Kansas.
I am well pleased with your More Eggs Tonic. I was only getting 8 or 9 eggs, now I am getting 3 dozen a day. Yours truly, Wm. SCHMIDT.

More Eggs Makes Layers Out of Loafers

This is a concentrated tonic, not a food. It consists of every element that goes toward the making of more eggs. A perfect regulator, aids digestion, stimulates egg production and builds firm bones and strong muscles. The foremost authorities in America and poultry raisers from every state endorse Reefer's "More Eggs" Tonic.

Results Guaranteed!

Here is the facsimile of the guarantee of a million dollar bank that "More Eggs" will produce results. This million dollar bank guarantees to refund your money if you are not satisfied. You run no risk. So don't delay. Every day you wait you are losing money.

Order Today

Send a dollar today for a full-sized package of "More Eggs" tonic; or better yet send \$2.25 at extra special discount, and get three packages. Three packages is a full season's supply. Don't put it off. Order now and start your hens making money for you. Remember, you run no risk. A Million Dollar Bank will refund instantly if you are not entirely satisfied. If you don't order your More Eggs now at least mark on the coupon for Mr. Reefer to send you ABSOLUTELY FREE, his valuable poultry book that tells the experience of a man who, himself has made a fortune and is helping others to make money out of the poultry business. "She stands pat" on the pledge!

Madam Ancona — from the Sheppard family — stands pat on the pledge. She is helping thousands of homes to SAVE by laying big white eggs at a comparatively low cost. An alive, virile bird is she — with red blood in her veins, vitality in her system, habit to her credit, a beauty in appearance! She has been brought to the highest type of perfection in the SHEPPARD strain.

She lays—and saves!

One of her holds the world's egg laying record for a single bird—a flock of Anconas brought their owner great credit by taking the world's egg laying record for a flock.

She wins prizes, too!

For ten years Mr. Sheppard has taken her kind to the Madison Square Garden show and has carried home nine out of ten possible first prizes. At national, state and county fairs she and her sisters and brothers cover themselves with glory.

She helps cut home costs!

That is her greatest plea, as she suggests that YOU, by adopting her, will effect an economy in the kitchen — and enjoy your own home-gathered eggs of dew-like freshness. The FREE Ancona book tells all about her. Get your copy now.

H. Cecil Sheppard
Box M-2, Berea, Ohio

President International Ancona Club

Doucin stock will produce fruit the second year from planting. Agents are busy taking orders for such stock. I tried out the Doucin stock several years ago and found it to be too tender for this section. Because this is a matter of much importance and in order to make the warning to people in the mid-west not to buy this stock as strong as possible, I give herewith the opinion of Prof. S. H. Beach of the Iowa Station. I hope all readers of A. E. J. at least will be guided by what Prof. Beach says:

"Replying to your inquiry as to planting in this section of the country McIntosh Red and Famense worked on Doucin stock, will say that we have made several plantings of hardy varieties like Wealthy, Duchess of Oldenburg and Longfield on Doucin stock. The stand has not been satisfactory altho some of the trees are still living after having been planted about ten years. This stock cannot be recommended as reliable in this section of the country. I suppose the trees of the plantings referred to which are now living, may have gotten established on their own roots so that they are no longer dependent upon the more tender Doucin roots for nourishment. I cannot say positively that this is the case because I have not made examination."

* * *

"Can you give me any information in regard to dwarf apple trees? Wish to know which varieties are best, also if the Senator, Mother, Mellon, Chenango, Strawberry, Shenawasse Beauty are good, hardy varieties of apples for southern Wisconsin, near Lake Michigan.

"Do you think it profitable to ship honey bees to this locality in the spring of the year?" Dawson Bros.

Wisconsin.

You will not find dwarf apple trees satisfactory in a commercial way in your locality. In fact no thoroly posted orchardist would plant dwarf apple trees commercially in your locality. However, if you desire to plant such trees, you will find Wealthy, McIntosh Red and Senator best suited to your purpose. For a commercial orchard I would advise you to plant Wealthy, McIntosh Red and Senator. Mother is an apple of splendid quality but comes into bearing late and is not very productive. Mellon is no better if as good as Wealthy. The other varieties you refer to are not hardy enough for your section. Neither are they good commercial varieties. You can ship bees in the spring with perfect safety. Be sure you get them from a yard free from foul brood. Be very careful in buying bees.

* * *

"I am sending you three apples for identification. One of them I suspect is a Baldwin altho the tree was bought for a Stark. While the apples were on the trees I imagined that I could detect a difference between the ones on this tree and the ones on my Baldwin trees, but upon comparing individual specimens they seemed almost identical.

"The green apple was grown on another tree bought for a Stark. This tree bore the youngest of four trees that were set out at the same time and it seems to be a prolific yielder as well as an every year apple. Most of the fruit is of good size, probably one-half being as large as the one I am sending you, and many of them larger.

"The third apple was raised by a friend of mine and is called the Boston apple. There are only a few trees of this variety around here as far as I know, and I wish to find out if possible whether this is the correct name or only a local name for some variety more widely known by some other name. The tree is of a decidedly 'weeping type' with long slender branches reaching nearly to the ground. One characteristic which perhaps you can see in this specimen, is the slight twist to the stem, or rather the portion of the apple to which the stem is attached. If you are familiar with the variety I should like to know something of its history. I hope it reaches you in good condition, for I consider it the most delicious fall apple I have ever eaten, and I intend to graft a few scions into my trees next spring.

"If you can give me any information in regard to these three apples, I shall esteem it a great favor." Massachusetts. Chester L. Hayward.

I feel sure that the apple to which you first refer is a Stark. This apple colors differently in different locations. Sometimes it is all overcast with red, then again it is but little so colored. The specimen you sent in is a very good sample of the Stark.

The large green apple is beyond all question a Northwestern Greening. There can be no question as to this. The third apple looks to me like a Porter, altho it is a little better colored than the average run of Porters. There is no recognized variety by the name of Boston. I was greatly pleased with this apple and

THERMOMETERS NEVER VARY

LOOK for "AEM" on Your Thermometers. You will then

be sure you are buying a skillfully made and absolutely accurate thermometer backed by 54 years thermometer experience. This means that if the incubator or brooder you buy is equipped with the AEM thermometer you will be taking no risk of your hatch being either chilled or cooked to death.

would like to secure a few scions from your tree next spring. I will put them on Wealthy stock.

At this writing Missouri grown Jonathan apples are costing dealers here \$9 per barrel wholesale. Iowa produced about 384,000 barrels of apples this last season and growers made a killing—those who properly cared for their trees and fruit. Iowa grown Grimes Golden were surely gold nuggets this season. Several growers in the southwestern part of the state are now getting from \$6 to \$9 per barrel for this variety.

In answer to Paul C. Polk, Pennsylvania:
1. Inasmuch as I know nothing of the soil conditions on your farm I cannot tell you how much phosphatic fertilizer you should apply per acre. It depends on the condition of your land and the richness of the fertilizer. In applying raw rock phosphate you should always associate it with barn yard manure. This manure will liberate the acid in the rock and make it available. Raw ground bone contains about 22 percent phosphoric acid and 4 percent nitrogen. Owing to the presence of some fat in raw ground bone it is slower in decaying than steamed bone. Steamed bone contains 28 to 30 percent phosphoric acid and about 1 1/2 percent nitrogen. Steamed bone can be ground finer than raw bone and the removal of the fat causes it to decay more rapidly. Tankage contains 7 to 18 percent phosphoric acid. Bone black or animal charcoal contains 32 to 36 percent phosphoric acid. Bone black is used to refine sugar; after use by the refineries it is sold as fertilizer.

2. The Red Cross currant was originated by the late Jacob Moore of New York. Mr. Moore was an horticultural enthusiast but a poor business man. C. A. Green, nurseryman, paid Mr. Moore more than \$7,000 for this currant, and had it not been for this money, Mr. Moore would have been a pauper in his later days.

3. Montgomery County, Arkansas, is located on the upper waters of the Owachita river in the mountainous region of western Arkansas. The general face of the country is much broken. A chain of mountains divides it into two parts. Over half of the country is hilly, and about one-third low land and alluvial. The hill lands are well adapted to fruit growing and the low lands produce good general crops. The water is soft. There are many springs of pure water. Lands in that county are advertised by the lumber company having them for sale as producing 25 to 40 bushels of corn to the acre. Personally I would not even think of looking at farm land that would not produce better than that if I were seeking farm land. I advise you to look elsewhere for a "farm home in the south."

4. The Roanoke valley is a subdivision of the Shenandoah valley of Virginia. It is a beautiful and attractive country. The land is rich, producing wonderful crops of hay, grasses, and all general farm crops. The climate is of the best, the water abundant and pure, and the rainfall about 52 inches per annum. I know of no better place to live in all the United States than the Roanoke valley. It is an ideal fruit country. It is settled largely by northern and western people.

5. Yes, you can buy farms in Vermont at prices which appear very low to a western man. There are some of the best fruit lands the sun ever shone upon up there in Vermont. A young man who puts out an orchard of McIntosh Red and Wealthy in Vermont will have something better than a gold mine in a few years and for a lifetime. Vermont raises the best and for a lifetime. Vermont raises the best and for a lifetime. Vermont raises the best and for a lifetime. Vermont raises the best and for a lifetime. Vermont raises the best and for a lifetime.

6. You have been misinformed regarding conditions in western New York. Good farm and fruit land there commands and is worth as much (I think worth more) as the Iowa and Illinois lands. True, you can buy some land in western New York very cheap, but such is not the most desirable.

7. Yes, fruit production and dairying make a good combination. I am of the opinion that the eastern fruit grower of the future will be also a dairyman.

8. If I were to establish a dairy herd what breed would I choose? Well, I have my favorite breed. However, I would be governed in my selection by conditions. I would choose the breed that was specialized in by the dairymen in the section where I located. By so doing I would be able to replenish my herd as needed more cheaply and better in every way.

9. Your last question is one I cannot answer. I do not know if it would be better for you to give up your position and purchase a farm and engage in fruit growing and dairying. No one can or should decide this all important question for you.

Again I want to urge my readers to place their orders for fruit trees and all needed

Egg Prices Will Be Higher

THE days of cheap eggs are past. Even when wartime standards no longer prevail, prices will still be higher than the old levels.

The patient poultry raiser has come into his own. Skilful handling and above all, careful feeding, will bring him big returns the year 'round.

BADGER LAYING MASH

In these times of high feeding costs, Badger Laying Mash has helped thousands of poultry keepers to turn losses into profits. They recommend it as the most successful mash feed and the most economical, because it produces more eggs and keeps their fowls in top-notch condition.

Badger Laying Mash is an honest, reliable, high quality feed that never varies. Chickens thrive on it and lay on it because it is wholesome and easily digested. It contains a liberal portion of high grade meat scraps combined with sound, clean, sweet grains uniformly mixed. It is ready mixed and can be fed dry in hopper or as a damp, crumbly mash.

Harrysbourg Colony Hover

THE BEST OIL-BURNING HOVER IN AMERICA

Wickless Burner

Plenty of Heat

Automatic Valve

Perfect Ventilation

Uses Common Kerosene Oil

Burns Less Than One Gallon of Oil Per Day

HARRYSBOURG BROODING DEVICES ARE DEPENDABLE. Last spring the Government ordered a sample hover for the Government Farms at Panama, and on September 20 we received its order for twenty more. Constructed for long service, stove has cast metal top, and cast metal rim around the top edge of canopy; HEAVY METAL WICKLESS BURNER, making a perfect blue flame like natural gas, and burning continually the entire season without cleaning.

PLENTY OF HEAT for coldest weather. Absolute control of heat in mild weather.

AUTOMATIC VALVE working like a carbureter.

VENTILATION SYSTEM producing strong, healthy chicks.

MADE IN TWO SIZES. Large 50-inch canopy, capacity 100 to 600 chicks, and small 33-inch

canopy (burning three days on one gallon of oil), capacity 50 to 200 chicks.

SPECIAL OIL-BURNER STOVE. If you wish to change from coal to oil, we furnish you with our special stove which you may use with your coal stove canopy.

nursery stock right now. Prices of all nursery stock are sure to be advanced next spring. Cost of production has greatly advanced and nurserymen must ask more for stock. Don't consider cheap stock at this time.

* * *

In answer to Mrs. C. W. Lambricht, New Mexico: Mericadel grape is one of the Munson creations. Like most of the Munson varieties it is suited to southern planting only. It is a hybrid of America with Delaware. The vine is very vigorous and productive, clusters large, fruit medium and of high quality. It is a very profitable grape in Florida and other southeastern states. I do not consider it suitable for your location. However, you might try a very few vines.

Yes, Senator apple is suited to your state. In fact I think it is perfectly at home in New Mexico. It is a beautiful apple of high quality, tree hardy and very productive. It requires a special system of pruning to do its best. Early Elberta and J. H. Hale peaches would give you the ideal planting. Mellon apple would be better for your planting than Wealthy. I know of no black currant that is as productive as the red sorts. I do not think you would find a five acre planting of black currants profitable. You are too far from the market, altho you might work up a demand for this fruit in New Orleans. I think the Florence crab worth all other crabs put together.

* * *

"I own a small farm of ten acres near Bayard, Columbiana County, Ohio, and wish to set our several cherry, pear, peach and plum trees next spring. What month will be best for setting these trees in this section and also what varieties would you advise me to put out. I want both early and late fruits. I have about 100 bearing fruit trees on this farm. What do you think of the location for raising fruit and poultry? Where would you advise me to purchase the trees?"

Ohio.

E. B. G.

Would make the cherry planting all of Montmorency. By so doing you will be able to get most of the crop. If you made a home orchard planting of early and late kinds, the birds would get most of the fruit. You will find Red Bird, Early Elberta, J. H. Hale and Krummel October peaches the best varieties. Such a planting will give you peaches from early till very late—the best kind of a home supply. Plant Omaha, Gold, Endicott and America plums. Set out the trees in April as early as possible. There are several good nurseries in your state. Of course, I know nothing about the lay or character of the land upon which you will plant these trees. If you can plant them on elevated land all the better—but plant them anyway. You are in a good fruit section. In fact there are mighty few places in all America where a satisfactory home orchard cannot be maintained.

* * *

I am in receipt of three letters wherein the writers take issue with me in my statement regarding the double mating of certain breeds and varieties of fowls. One of these letters is from a gentleman who kindly and ably states his side of the case. The other letters are from fellows of a different kind and were promptly consigned to the waste basket. The gentleman's letter has been duly answered and I hope I shall hear from him again. It is a matter of entire indifference to me what lines of breeding other people pursue, and I am not at this time asking advice as to how I shall breed my favorite fowls.

* * *

I want to thank J. H. Drevenstedt for his kind words and personal reference in a recent issue of the American Fancier. One word of praise from J. H. Drevenstedt is praise indeed.

* * *

I find the following in the report of the annual meeting of the New York Guernsey Cattle Club:

"Charles D. Cleveland, New Jersey, gave a demonstration of the new score card adopted by the American Guernsey Cattle Club."

Heavens! I hope Mr. Cleveland has not become a score card advocate and will insist upon turning back the wheels of progress and use the score card in the New York poultry show.

* * *

The many friends of B. G. Pratt of New York will regret to learn that he met with severe injuries while at work in his apple orchard in Virginia and that he is now confined to his bed at home.

Guaranteed Winners

HUNDREDS of "Aristocrat" Barred Rocks have now grown up into superb, magnificent show birds—ready to step right into the show-room and win out. While the "Aristocrats" have shown wonderful quality in past years, this year they are in actual fact more glorious than ever—so surpassingly beautiful, so truly marvelous in quality all over that you have never seen their equal. This is why I guarantee them so cheerfully, so absolutely as show birds to all exhibitors—anywhere—against any and all competition. You cannot even picture to yourself the great glory of these phenomenal birds this season, for they will be better than you picture them—better even than my catalog shows them.

The "Aristocrats" Have Made a World's Record

by their sensational sweep of victories from ocean to ocean—from the Grand Palace Show of New York to San Francisco; from the foremost shows of Canada down into South America, Australia, and Asia—winning out at these greatest Barred Rock shows of the entire American continent: The National Barred Rock Show (the greatest of all the great ones), Chicago, New York Palace, Guelph, New Orleans, the "Tri-State," the "World's Fair," Cleveland, Texas State, Detroit "Round-Up," Kansas City, Los Angeles, Indianapolis, at one state show after another throught the entire Union, and in many, many hundreds of other large shows. This is simply an indication of what they already have accomplished and

THIS SEASON THEY ARE STILL BETTER

Therefore, if you need Barred Rock show birds for any show (no matter how large, or how small) write me fully and I will furnish you the winning birds. Nothing will create more good business for you than winning out in the show-room over your competitors. **THE "ARISTOCRATS" WILL WIN FOR YOU.** I want you to win. I will help you to win. Simply write me, telling me where and when you wish to win out and depend on me altogether. You will find the "Aristocrats" bringing home the ribbons, the glory and the prizes for you.

I have a wonderful collection of cockerels, pullets, hens, cock birds and pens and can furnish you with Barred Rock winners in any class you wish to fill.

Remember, Holterman is the man who is furnishing to other breeders so many of those powerful winners in the world's foremost shows

 With the New Improved
Eureka Colony Brooder
Best Brooder Stove Proposition
on the Market

This wonderful brooder raises the chicks instead of smothering them. It is absolutely gasproof, can be operated at a cost of only five cents per day, and being self-regulating needs attention only once every 24 or 48 hours (dependent on the weather). The price for 500-capacity is but \$18.50; for 1000, \$22.50. You can make real money selling this brooder—its quality, construction, automatic features and general efficiency impress on sight. Experience is not needed. Send at once and get the rights for your territory. We make the Eureka right and we treat our agents right.

Price is low—discount liberal
James R. Wotherspoon
 240 N. Front Street Philadelphia, Pa.

the best time of year to do it and how should I go about it?"

Michigan. R. Wynn.
 With the right kind of handling these bushes can be transplanted in the fall. It would have been better had you transferred the lilac bush to its new quarters in October or early November. The lilac should be transplanted when dormant. Remove it as early in the spring as possible. Transplant the snow ball at the same time.

One of our most profitable crops this year was the Hubbard squash. Everybody seemed to want them. A crop of squash can be grown at practically no cost.

"I intend to set 75 or 80 apple trees in the spring, of the following varieties—Delicious, McIntosh, King David and a few Golden Delicious. For our climate, do you consider there would be any advantage over trees from a good nursery like Stark Bros. in setting Virginia Crab, growing same for a year and then top-working them to the varieties named above? Are they any more hardy or productive?"

"I notice a nursery company in Des Moines has stock for sale, top-worked on Virginia Crab and also on Wealthy, but at a price almost beyond question for any number of trees.

"I also notice you highly recommend the Senator apple. Is this an early bearing apple and how does it compare with King David for yield and early bearing?"

Illinois. Dr. R. G. Chamberlain.
 The varieties you have selected are all of splendid quality, hardy and productive, and with the exception of Golden Delicious are red—the colored apple demanded by the people. Golden Delicious is a beautiful golden yellow apple of high quality. In my trial grounds the tree has made splendid growth. It went thru last winter (30 degrees below zero) without injury.

I advise you to plant standard trees of the varieties you have named. They are absolutely hardy in your section. Nothing could be gained either in hardiness, growth or fruitfulness by top-working Virginia Crab to Delicious and McIntosh Red. By all means plant standard trees of these sorts. King David is not quite so hardy as Delicious and McIntosh Red, but fully hardy in your locality. Some of my trees have withstood 33 degrees below zero.

Top-working apple trees on harder stock is all right if the proper stocks are united. I have had considerable experience in this work. Not all varieties will properly unite. I placed Senator on Virginia Crab. Senator grew stocky and soon the Senator stock was much stronger and larger than the crab stock. Of course such a poor union caused the trees to split and they were ruined. I have had this experience with several varieties. I have Jonathan, King David, Grimes' Golden, Senator and Iowa Brilliant worked on Hibernial. They make a perfect union. Grimes' Golden worked on Delicious makes the ideal union and tree. Such varieties as you have selected need no such aid to their hardiness.

I was in the experimental orchard at the Iowa Agricultural College grounds a short time ago and Prof. Beach spent several hours among the 3,000 seedling trees. Here we found all sorts of unions, good, bad and fairly good. Prof. Beach prefers the Hibernial as a stock upon which to top-work most other varieties.

I am going to try several varieties on Siberian crab roots, that is roots grafted with the Siberian crab root as the basis. I have an idea that I will get a young bearing tree but do not expect any other advantage in these trees over standard trees. They will all be standard trees in a few years for they will finally get into their own roots.

The Senator is one of the very best of apples. It is a good tree, apple beautiful red and of fine quality. Tree is hardy. It is a winter apple. I advise you to plant a few of this variety.

Almost 1919! May it be a year of health, prosperity and happiness to all readers of the American Poultry Journal, and may the world be released very soon from the chains of war.*

*Just as Mr. Rigg's copy reached Chicago, the chains broke, and the pandemonium of their clanking which came thru our windows testifies to the worldwide joy.—Ed.

ENDORSED, RECOMMENDED AND USED BY AMERICA'S MOST SUCCESSFUL POULTRY RAISERS

Licene Exterminates all Chicken Lice as if by Magic

When such breeders as Mrs. Helen Dow Whitaker, E. B. Thompson, Dr. N. L. Smith, A. C. Hawkins, O. F. Mittendorf, Prof. T. E. Quisenberry, Len Rawnsley, U. R. Fishel, A. A. Carver and thousands of other big breeders that have had years of experience in raising poultry, endorse and use a preparation as the best, it must have exceptional merit, and will do all that is claimed for it

LICENE Makes Hens More Profitable

No hen can lay her best when tormented by lice. Kill the lice and watch the increase in your egg production. John G. Poorman, Tinley Park, Ill., the owner of "Lady Show-you," the \$800 hen, and breeder of the celebrated 200-egg strain, writes:

"Lice is the one great factor in determining success or failure in the poultry business. If exterminating lice means success, and it surely does, LICENE should be given all the credit. I would as soon be without feed as without LICENE, for without either profitable egg farming is not a success."

LICENE Cheapest Lice Killer Known

Price, 60c a Tube, Postpaid Sufficient for 150 to 200 Fowls

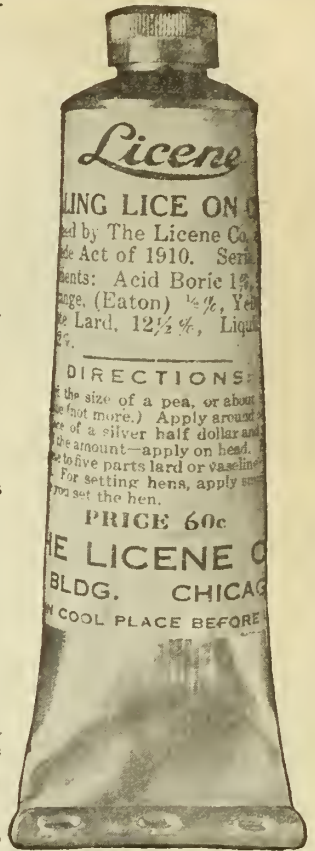

LICENE is applied twice a year, but many report that they have found one application a year sufficient. When you stop and consider that one tube is sufficient for 150 to 200 birds, you must realize that LICENE is cheaper than lice powder and liquid lice killers. It is also more conveniently handled and more easily applied, saving time, labor and money, making LICENE not only the best but cheapest lice exterminator the world has ever known. Put up in collapsible tubes, which prevents waste. Remember LICENE will not injure the birds in any way or destroy fertility of eggs, so with our positive guarantee you take absolutely no risk in giving LICENE a trial.

Positive Satisfaction Guaranteed or Money Back

If Licene does not destroy every louse and "nit" (egg of a louse) or does not clean scaly legs on your chickens, or if applied on sitting hens, and does not prevent head lice on chicks—you are the judge—we will refund your money if you notify us (or our agent) within one month after receiving Licene and no questions will be asked.

The Poultry Doctor FREE This little book is worth its weight in gold to any one raising poultry. Thousands of poultry breeders are following its suggestions with success and profit. It contains 16 different tested and proven formulas of remedies for disease common among fowls. It is invaluable to the beginner and experienced breeder alike. Remember it is absolutely FREE, so just send your name and address for it.

THE LICENE CO., 1500 Pontiac Bldg., CHICAGO, ILL.

The Country Needs Millions of Chickens —You Need the "Successful" Incubator

Hatch Two Chicks, Where You Produced Only One Before

Successful Incubators will do it, and the country needs every chick you can raise. Never have poultry raisers had a bigger chance to help the country and make good profits themselves. Help answer the food problem—raise more chickens—get more eggs—sell more meat. And this year of all years you need the time tried "Successful"—backed with 26 years of experience—the machine used by the biggest money makers in the poultry business. Write for my 1919 offer on

"SUCCESSFUL" Incubators and Brooders

The only incubator I know of guaranteed to be cabinet made. The only hatcher that heats around the colder edges of the body first. Guaranteed to vary not over a fraction of one degree throughout the entire hatch—because of the fact that our own patented lamp and water thermostat regulator are 99.9-10 per cent perfect.

Sold Under the Strongest, Most Liberal Guarantee to Hatch a Chick from Every Hatchable Egg

"Successful" Incubators have been built and sold for twenty-two years. "Successful" Brooders, too, are built too good to compare with others. Raised floor, glass drop top, real hot water heating plant, rain and cold proof. Write for catalog and prices.

J. S. GILCREST, President
Life Member American Poultry Association

Get 50 Per Cent More Eggs
Feed sprouted oats. Change 1 bushel oats into 3 bushels green, tempting, egg-making food with a "SUCCESSFUL" Grain Sprouter. Made in all-steel sections, fire-proof—double steel walls, separate sections. Save one-third on feed cost. Write now for circular and prices.

Poultry Lessons FREE to every buyer of a "Successful" Incubator or Brooder. Famous little booklet, "Proper Care and Feeding of Chicks, Ducks and Turkeys," sent for 10 cents. Big catalog is free. Send for it.

Questions and Answers

Conducted by
Prince T. Woods, M. D.

Questions about poultry are answered in this department free for all readers of American Poultry Journal. Where answers are desired by mail, a stamp for reply is requested. Address all query letters to the managing editor, Dr. Prince T. Woods, Lock Box 4, Silver Lake, Mass.

White in Earlobe of R. I. Red.

Q. I have an S. C. R. I. Red cockerel of good plumage and shape, an excellent bird in all ways, except he has part of both earlobes showing white. The parent stock did not show this defect. How can I correct it and color earlobes red without injury to the cockerel? If it is not colored will it show up in the chicks of his get?

Monticello, Ark. V. F. P.
A. It would be faking to attempt to remove the white from earlobes and if you succeeded in removing it or in coloring the lobes this would not have any influence on the breeding quality of the specimen. Would let the earlobes alone. If he is all right otherwise and from sound parent stock, would breed him to a few selected females. It is not likely that any large percentage of the chicks of his get will show the defect, since his parents were free from it.

eyes, just a puffed-out appearance. The turkeys were raised under common hens. I had 31 but have only ten left. These are all sick and don't grow much. I have treated them without results. My turkey hens have raised another brood and I would like to know if I should kill these sick ones, as I am afraid they might infect the later hatched ones. Is there any cure?

Raymond, S. D. Mrs. E. W. B.
A. The catarrhal colds of your turkeys may possibly be of a contagious character, so would certainly keep them away from the later hatched, healthy stock. If they are stunted and do not grow it may be best to kill the sick birds. If you desire to try treatment, cleanse nostrils and mouth carefully with some preparation like glycothymoline and then apply a little camphorated vaseline to nostrils and roof of mouth.

Feeding Ensilage to Poultry.

Q. Is it safe and all right to feed corn and kafir corn ensilage to poultry? If so, in what manner should it be fed?
Cambridge, Kansas.

C. B. W.
A. Yes, if the ensilage is bright and sweet. Do not feed it if spoiled or moldy. It may be fed plain once a day, what the fowls will clean up promptly, or it may be mixed with the moist mash in proportion of about ten percent.

First Single Comb Ancona cockerel at Madison Square Garden. Owned by H. Cecil Sheppard, Lerca, Cal.

Ancona Information Wanted.

Q. Do Ancona breeders issue any book of information on Anconas and breeding same? Is there an Ancona Club from which I can secure information concerning this breed of fowls?
Dr. C. B. Weagly

Middletown, Md.
A. Write R. W. Van Hoesen, Franklinville, N. Y., secretary of United Ancona Club.

Artificial Incubation of Goose Eggs.

Q. Can goslings be successfully hatched in an incubator and raised in a colony brooder?
J. D. S.

Indianola, Iowa.
A. Goose eggs can be incubator hatched but it requires skill and experience to get good results. Goslings are readily reared in colony brooders and require brooding for a comparatively short time only.

Green Cut Bone.

Q. Would like to know the value of green cut bone for poultry. Is it as good as beef scraps or fish scraps and can it be used in place of these? Is green bone good for growing stock and breeders? Does it have any effect on fertility of eggs.
R.

Wausau, Wis.
A. There are considerable differences of opinion among poultry keepers concerning the value and use of green cut bone. If sound sweet beef bone can be secured at low cost, green cut bone can be used to advantage for laying stock. In limited quantities it is good for breeders and growing stock. If breeding stock are overfed on green bone it may get them out of condition so that fertility of eggs is affected. Cut green bone, when sound and sweet, is an excellent animal food for fowls. It heats and spoils quickly after cutting. In most localities it is difficult to get a regular supply of bone at a sufficiently reasonable price. Bone for poultry feeding should be freshly cut. If a regular supply is obtainable it can be substituted for scraps. Overfeeding on cut bone, or feeding tainted or heated cut bone, may cause indigestion and diarrhoea. Analysis shows following composition: Green bone, water 6.9, ash 24.5, protein 22.3, fat 16.5, calories in 1 ounce 69; beef scraps, water 1.3, ash 8.0, protein 58.0, fat 32.9, calories in 1 ounce 154.

Bowel Trouble.

Q. Several of my hens have bowel trouble, the droppings are watery, colored yellow, then green. The fowls lose appetite, comb becomes dark purple and finally they die, seemingly from weakness. There are about 75 hens in flock, the house is large, sunny open front. They have free range over wheat fields, corn fields and orchard. Clean water vessels every day. Keep grit, oyster shells,

GRAND CHAMPION MALE
(Chicago, January, 1918)

I have some very choice exhibition stock that would win in keen competition. The stock I raised this year meets my best anticipations.

GEO. H. RUDY : : MATTOON, ILL.

Get Winter Eggs

In these winter months eggs are what we are after. Hens in good condition, properly fed and housed will do their duty, and fill the egg basket as they should. Green Food is necessary, but troublesome and expensive. Most birds do not get enough. Give them instead Succulenta in their drinking water.

Succulenta

contains the most important constituents of Green Food, without the parts which are of no benefit. Hens know Greens are good for them. That's why they eat them. Simply dissolve one water in a quart of the bird's drinking water. No labor, no bother. Not a drug, nor a remedy, but a food. Wholesome and harmless. You will see the result in your egg yield. If Succulenta is not entirely satisfactory, your money will be returned without a quibble.

Harvey A. Drew, Vernon, N. J., writes: "I herewith enclose an order for \$5 worth of Succulenta. A pen of 5 pullets that were Succulenta chicks won the December Cup in the National Egg Contest with 113 eggs." He says Succulenta is "a great help in raising chicks." Try Succulenta in your flock.

Succulenta will make your chicks grow and your hens lay. When ordering please give your feed dealer's name.

DAD'S CHRISTMAS PRESENT

The 1919 Model of our well-known "American Bankroll"—a combination Billfold, Coin-purse, Checkbook holder, Card and Photo-case, 3x4 1/4 in. folded, of Fine Black Seal Grain Genuine Leather, postpaid, only **69c** (\$7.45 Per Doz.)

Iron strong, yet wonderfully limp and flexible. We engrave any name in 23-K Gold free (name of city 20c, street number 20c, Fraternal Emblems 25c extra). You'll find place for coins, currency, cards, photos or passes, etc. Also the Memo-Diary, an interesting book of 48 pages, brimful of necessary information, such as First Aid, Presidents of the U. S., Health Information, Dates and Payments due, Addresses and Telephone Numbers, etc.

The American Bankroll is also sold in a very strong Black Morocco Grain Genuine Leather for **\$1.00** (or **\$10.80** Per Doz.)

This is your Sunday Pocketbook. Send postage stamps or money order. If you don't think you have gotten more than your money's worth, we will refund immediately. We have been in business for years. Ask your Bank about us—they know—we sell them. You will be proud to own one of these pocketbooks—the Biggest Show you ever got for your money—everybody wants them. Our 13th annual catalog free with orders for American Bankrolls, or sent alone for 10c postage.

U. S. LEATHER GOODS CO. (Established 1906, Incorporated 1910) Dept. 80-E. 106-8-10 W. Lake St., Chicago

charcoal before them all the time, also a good commercial laying mash. They eat during the day about 8 quarts of thick clabbered milk. At night I feed them two quarts of commercial scratch feed and in morning the same. On floor of house there is always deep wheat straw litter. The dropping boards are thoroly cleaned three times a week, and after cleaning covered with land plaster, so there is never any moisture or odor. House is thoroly cleaned and whitewashed every spring. Am I feeding too much or is it the fault of the damp weather we have had for some time? Would also like to know if a good meat scrap should be kept before them or fed now and then in laying mash.

Langhorne, Pa. A. W. B.
A. You are feeding rather liberally for fowls which are having so much forage. It is probable that they are getting overmuch new wheat and corn from the fields, which, in addition to free use of clabbered milk and laying mash, has put them out of condition. Bowel trouble is probably result of indigestion from overeating. With so much clabbered milk and commercial mash they do not need meat scrap. Would cut down the supply of mash and feed less sour milk for a while. Would also restrain them from ranging in grain fields now that damp weather has molded part of fallen grain.

Chicks Discolored About Vent.

Q. I have about 150 springers that weigh from 5 to 6 pounds each. Killed some of the cockerels last week and found the skin around the rectum was green and they were not marketable. These chickens were never sick and have never had any medicine. What could cause this trouble?
Scranton, Pa.

J. D.
A. We doubt if many of the chickens are so affected. Possibly it is due to injury. Would keep the flock off green range for two weeks and feed largely on corn, then kill and dry pick a few of them. We think you will find them all right.

White Chicks from Blue Andalusians.

Q. Is it possible for Blue Andalusians to breed white chicks? I bought a Blue cock from a breeder and bred him to ten of my Blue hens. Out of 65 hatched I had 20 white chicks. I wrote the breeder about it and he said the cock is from choice stock. I think he is mixed with White Leghorn.
Watson, Ill.

A. D. H.
A. Your Blue Andalusian cock is probably all right and a thorobred. While the Blue Andalusians are one of the oldest and purest of breeds, blue is not a natural color in the plumage of domestic fowl and is a combination of three colors, viz.—black, white and red. Blue Andalusians will throw blue chicks, white or splash white chicks, black chicks, and an occasional sport showing salmon color. Here is what Walter J. Choates had to say on the subject in A. P. J. for March, 1918:

"Blue mated to blue is supposed to produce 50 percent blue chicks, 25 percent black, and 25 percent splash white. A 'splash white' is a white bird having splashes of blue or black feathers interspersed thruout its plumage.

"Three distinct matings—the three matings preferred by our best exhibition fanciers—belong to the category above given of blue mated to blue.

"1. Standard exhibition blue males mated to standard exhibition blue females. Ground color should be clean and lacing distinct in every section of birds so mated. Also in the two following matings.

"2. A male of dark even blue ground color and distinct wide lacing, mated to females of very light blue ground color and narrow lacing.

"3. A male of light even blue ground color and narrow lacing, mated to females of very dark blue ground color and heavy or wide lacing.

"Black mated to splash white is supposed to produce approximately 100 percent blue offspring. This mating is much used and preferred by the breeders of utility Blue Andalusians, but is in some disfavor among many fanciers, because the resulting offspring is apt to lack in evenness of ground color and in uniformity of lacing. The combinations used are:

"1. A splash white male mated to black females.

"2. A black mated to splash white females.

"The breeder should, of course, be careful to select specimens of proper shape or type for his breeding pens, remembering that 'type makes the breed, while color makes the variety.'

"The occasional 'sport' offspring that shows salmon brown, or red, or golden brown, in plumage should not be used in the breeding pen by a novice; and, in fact, the main value of such birds consists in the

variation in color which, when handled properly by an expert breeder, often results in the creation of a new variety."

Origin of Rhode Island Reds.

Q. What varieties of poultry were crossed to produce the S. C. Rhode Island Reds?
Princeton, N. J. G. R.

A. The Rhode Island Reds developed on the farms of Rhode Island. Their ancestry is decidedly mixed and carries the blood of many varieties. The foundation stock was undoubtedly Asiatic combined with both Red Malay and Brown Leghorn, with the admixture of other breeds. Many farms in Rhode Island were, and some still are, owned by sea captains or near relatives of seafaring men. Many fowl were brought in from all parts of the world. Red cocks were the favorites and for many years the farm flocks of Rhode Island were bred to Red males very largely. Naturally Red and Partridge, or similar black on red color, predominated in the farm flocks. That the Red Malay cock of nearly three-quarters of a century ago was a splendid bird of sound red surface color is readily proved. There is still on exhibition in the East India Marine Hall of the Peabody Academy of Science, Salem, Mass., a well preserved specimen of Red Malay cock which was brought from Malay in 1846 by a Captain Wheatland. This specimen shows a well developed pea comb instead of the knotty knob comb which we usually associate with the Malay fowl. The Reds undoubtedly were developed very largely on the farms of Little Compton, Rhode Island, and Westport, Mass. The common Red fowls on these farms had rose combs, single combs and pea combs, with some variations from these types. Both fanciers and commercial egg farmers became interested in these Red fowls, the fanciers created an ideal and bred to it, with the result that we have in both the S. C. and R. C. Reds an American Class fowl of exceptional merit which is as truly American as any biped on this continent and which possesses the characteristics of a thoroughbred. The Rhode Island Red, before the fanciers became interested in the breed, was a good deal like Topsy of Uncle Tom's Cabin—it wasn't born or originated, it "just grew." Among the breeds and varieties known to have contributed to the makeup of the Rhode Island Reds are the Cochin-Chinas or Shanghais, the Chittagongs—both the Gray and the Red, the former having both single and pea combs and the latter showing a good percentage of rose combs—the Red Malay—a large game fowl, sometimes knob combed and sometimes pea combed and undoubtedly showing variations—the Brown Leghorns, and the mixed farm flock. The manner of early development was sixty or more years of outbreeding of farm flocks, kept for egg production, to selected all-red or predominating red cocks. The utility poultry farmers of those early days had faith in the virtues of a red male bird and we owe the R. I. Reds to the fact that they believed that a red male possessed unusual vigor and productivity, and consistently and constantly bred in accordance with that faith. As the "cullud gentleman" at the poultry show said: "W'y, boss, a good chicken's jes' nacherally gotter be red."

When a Pullet Becomes a Hen.

Q. Will you inform me as to what age a cockerel becomes a cock and a pullet a hen? I am desirous of getting some stock and would like to know, as soon as possible, just what I would be getting in ordering cocks or cockerels, or hens or pullets.

Sacramento, Calif. J. L. N.
A. A cockerel is a male fowl less than one year old; when one year old or older he is a cock. Strictly speaking a pullet is a female fowl less than one year old and becomes a hen when twelve months old. In common usage, however, a pullet is spoken of as such until she completes her first year of laying, when she is called a yearling hen. Buying pullets at this season you should get fowls under one year old.

Disappointed in Egg Yield.

Q. I have 50 pullets, March hatched, supposed to come from 960-egg hens; 15 end of April hatched, 15 May hatched, and 10 June hatched. All Leghorns except the 15 May hatched which are R. I. Reds. One of these latter started to lay on October 1st and laid 22 eggs without a stop and then went broody. Four other Reds are laying now. I should have more laying, but some quit and I cannot see the reason.

I feed in the morning wet mash made with milk, shorts, bran, cabbage, potatoes, beef and fish scraps. Use a condition powder in the mash. It takes them until noon to clean it up. I feed it about 9 a. m., as there is always some grain in the litter left from the day before. At noon feed four pounds of heavy oats in the litter and about 4 p. m.

SURPRISING INCUBATOR BARGAIN

ONLY \$6.95
for the famous **Liberty Hatcher**

This wonderful, strongly built, scientifically correct hatcher is the greatest incubator value at any price. Built round with a central heater; no cold corners which mean unhatched eggs. Write me your needs

D. L. WARNER LITTLE YORK, ILL.

feed good wheat screenings, all they will eat. I gather from 6 to 9 eggs daily. (Written Oct. 27.) I think they should do better. They get all the milk they want to drink. Every other day some pullet is starting to lay and the number of eggs does not seem to increase.

Could you make up a balanced ration with the following? I have no corn and it costs \$3.50 per 100 lbs. I believe that hens can lay well without corn, but I see that all the rations have a big percentage of corn. I have on hand the following feeds at prices stated:

Oats	\$0.52	for 39 pounds
Barley65	for 50 pounds
Wheat	1.50	for 100 pounds
Shorts	1.70	for 100 pounds
Bran	1.60	for 100 pounds
Linseed meal	3.00	for 100 pounds
Fish and meat scraps ..	6.95	for 100 pounds

The fowls have all the milk they can drink and are always supplied with grit, oyster shells, charcoal and water.

I raised this summer 115 chickens with the income of 18 hens; scrubs but good layers. All my chickens came up fine. I lost only four small ones out of 119. We ate all the roosters and have 40 pullets left. I invested \$60 in 10 pure bred Leghorns, but they do not seem to be any better than my scrubs—a cross of common Barred Rocks with S. C. Leghorns. In May and June I had a better average than most of the contests.

Before last year I did not pay much attention to breeds, when the cross-breeds made me think that the success came from my White Leghorn cockerel. I became interested, got some poultry papers and figured out the results of all the contests and came to the conclusion that S. C. White Leghorns lay more eggs than any other variety. This is all the more true when hens are kept like the farmer keeps them, without care in winter. In summer the heavy breeds pass a big part of the time sitting. I kept a record of my neighbor's flock, 35 scrubs; they averaged 51 eggs in 12 months. My scrubs average 147 eggs in 12 months. I believe I had better kept them this year for they lay better than my pure bred pullets.

There is no one around here taking any interest in poultry. At the county fair this year I hoped to see a fine display of poultry but there were only two pens, one of English White Leghorns and one of Rhode Island Reds. I stood around half an hour to see how many people would look at them. Vegetables were exhibited on one side and the chicken coops on the other. Not a single person showed interest in the chickens. I bought eggs as high as \$1.50 each and I offered cockerels for \$2 each and was offered 50 cents. These are some North Dakota items. I hope it is not so all over the state.

Oiga, N. Dak. C. M.
A. It is not fair to judge those pure bred pullets on an October try-out. October is a poor month for egg production and particularly so this year.

The information you give indicates that you are feeding your pullets rather heavily for birds that are not established in laying. Pullets will stand forcing rations after they have started egg production, but overfeeding before laying begins may result in the production of internal fat and either retard laying or prevent a good yield. You have been feeding rather too heavily on a wet mash, rich in animal food and containing a large percentage of cooked vegetables. We would not feed more wet mash than they will clean up in half an hour.

We believe you will find your pure bred stock wholly satisfactory if you will give them a fair opportunity to make good; in your desire to succeed with them you have been rather overdoing a good thing in matter of rationing. Give the birds a chance and they will certainly better the record of your scrub flock. Those R. I. Reds started well.

While you can undoubtedly get a good egg yield without corn, we believe that you will more easily arrive at satisfactory results by using some corn in the ration. The price you name is less than we have had to pay since the war began.

Try cutting down the mash to what your flock will eagerly clean up within half an hour after feeding. Give morning and evening feeds of scratch grain in litter, allowing at the rate of approximately two quarts of scratch grain per fifty fowls at each feeding. Do not be governed wholly by measure. Watch your fowls and note their appetites. Keep them well fed but neither overfed nor underfed. They should always be a little keen, but should go to roost with full crops. Mix your scratch grain equal parts of available hard grains and vary the quantity of each from time to time according to the appetites of your flock, giving them the most of whichever grain they exhibit a preference for.

The lack of interest in poultry you report in your section is unusual. We find that very generally thruout the states interest in

NEWTOWN Giant Incubator

Hatches the Most Chicks—
The Best Chicks—
With Least Labor—
And at Lowest Cost—

You cannot ask or get more—should not be satisfied with less. Newtown efficiency and economy insure your success. The Newtown Mechanical Eggs-Turner is a big labor-saver. Where other incubators are used, much time must be spent turning the eggs. The Newtown Mechanical Eggs-Turner has changed this. Take ten seconds to turn the crank and all eggs will be turned better than you can turn them by hand. No eggs are cracked or broken. No "bunching" on trays. If you demand highest efficiency plus economy and certainty, write for complete Newtown catalog "G" today. Please state the size incubator in which you are interested. Remember, it is to your advantage to place your order early.

NEWTOWN Giant Colony Brooder

is the brooder for the chick grower who demands that his chicks shall make rapid, vigorous growth, with least mortality and at lowest cost. It will positively give you the most satisfactory results, as it has thousands of others.

The Newtown Giant Colony Brooder is coal-burning; self-feeding; self-regulating; fully ventilated; portable; strongly built; operates successfully in any suitable building; free from fire risk; easy to care for; RAISES THE CHICKS.

Learn all about this time-saving, profit-producing machine before you add to your brooding equipment. Our Brooder Catalog "C" will show you the way to success. Free for the asking.

NEWTOWN Wickless, Oil-Burning Colony Brooder

Broods Like a Coal Burner

By embodying desirable features of the Newtown Coal-Burning Colony Brooder we have been enabled to build an Oil-Burning Colony Brooder that is simple, safe and durable—a real practical device for large and small plants. It has an Automatic Regulator that controls the flow of oil to the burner and is also fitted with safety adjustments. The Newtown represents the greatest value in Oil-Heated Brooders that has ever been produced.

Write for our Catalog "O" and learn all about this wonderful brooder

SPROUTED OATS—WINTER EGGS

CLOSE-TO-NATURE GRAIN SPROUTERS

The Close-To-Nature vapor bath machines produce the succulent sprouts, the vegetable milk, and the grape sugar that bring the eggs. Cut down the feed bill and run up the egg yield. From one bushel of grain make two to four bushels of the best of egg-producing green feed. Germinate grain in 20 to 30 hours and force growths of an inch or more daily.

We are the originators of the grain sprouter and its largest manufacturers and make three kinds and many sizes from 1/2 bu. to 8 bu.—a few hens to 1,000.

The Double Quick:—the original sprouter. Cypress case outside, galvanized steel grain chamber inside, insulated double walls, for use in zero temperatures, the most efficient and economical sprouter ever put on the market.

The Metal Sectional:—Made of galvanized steel, built in sections. Get what you want now and sections for back-lot flocks; larger base and sections for egg farms.

The Lamless:—For use in furnace and other heated rooms. Trays slide, not stack up. Drip pan has drain tube. The most convenient lamless now advertised.

Get our circulars giving full information on sprouted oats and eggs.
CLOSE-TO-NATURE COMPANY
38 Front Street Colfax, Iowa

Single Comb Rhode Island Reds

Mittendorff Strain. Our strain of Single Comb Reds contains the blood of the best strains of Reds in America, and have size, shape and color, combined with heavy laying qualities. WINNERS at Chicago, Peoria and Quincy. Stock for sale at all times. Satisfaction guaranteed or money refunded.
MITTENDORFF & JOHNSON, 604 Sixth Street LINCOLN, ILLINOIS

Standardbred poultry keeping is good and steadily increasing. You could undoubtedly dispose of your surplus pure breeds, those of breeding quality, by advertising them. Your local market evidently needs a good deal of educational development.

Breeding Young Stock.

Q. I have a cockerel and four pullets hatched from eggs from a pen of eight hens and a cock. Can I safely breed this cockerel to the pullets as foundation stock for both show and utility purposes? They are from a good prize winning strain and are good type birds. O. L. F.

Wakarusa, Ind.
A. As a rule we prefer not to breed a cockerel to pullets except in case of necessity. If the fowls are well matured and the mating well balanced, the results may be good. Provided all the fowls are healthy and vigorous and it is possible to select them so that they are well mated for quality results, it would probably be better to mate the cockerel with six of the hens from original pen and to mate the cock bird with his four pullets and the two remaining hens. If there is a poultry judge near you, it would be wise to have him look over your fowls and mate them up for you.

Sulphur for Chicken-Pox.

Q. Kindly tell me what to do in case of chicken-pox. Have heard that sulphur fed in the mash will cure this disease. A bird sent to a fair broke out with it within a week after his return. I killed him promptly altho he was a valuable bird. I now notice a few small scabs coming on combs of some of my other fowls. Would like to know how to prevent spread of the disease.

Wilson, Va. L. R. W.
A. Use carbolized petrolatum on the pox sores. In the mash use a heaping tablespoonful of flowers of sulphur to the quart of mash mixture. Continue until the pox sores disappear. Usually they will begin to dry up promptly. Clean up the poultry house, burn all old litter and nesting material. Dampness and damp weather favor the spread of this disease. If they are not disposed to eat the mash, give them no other food until they clean it up.

To Keep Rooster from Crowing.

A few days ago I noticed an inquiry in a daily paper by a backlotter how to stop the cock's crow in the small hours of the morning. I know of two safe and simple methods. The first I stumbled onto the second day after my removal to the suburbs. A neighbor had unloaded on me a dozen mongrels of uncertain ages almost before my goods were unpacked. I fixed temporary quarters for them under the back porch, with a roost close to the joists. To my astonishment neither of the two roosters disturbed my slumbers next morning, while both crowed lustily after being at large but a moment. I noticed that to crow the cock must stretch, which he could not do in the cramped quarters under the porch. So I hit upon an idea. When I had them settled in the barn, I nailed a slat over the roost just low enough to keep the rooster from stretching as he would try to crow. This plan is limited, of course, to a small flock, and furthermore to the night time, as fowl leave the roost at daylight. The second and most reliable method to keep your rooster from crowing in the morning is to decapitate him in the evening.

Illinois. E. L.

AN IMPROVED poultry coop which is particularly adapted for use when chickens are being fattened preparatory to being killed for the market, the invention of the late George Collis, has been patented to Theo. Collis Company, of Clinton, Ia. It is a traveling metallic coop, with a series of cages mounted one above the other and supported on cross pieces attached to the corner posts. Feeding troughs extend lengthwise of each of the cages, supported by hooks attached to the corner posts. The sides of the cages are of woven wire, with gates that swing upward to open. Droppings catching pans are slidably supported on supporting strips arranged adjacent the ends of each cage. The arrangement makes the entire structure sanitary and practically indestructible, besides which it can easily be wheeled out. Patent No. 1,276,723.

Fattening Coop, patented by Theo. Collis Company, Clinton, Ia. Patent No. 1,276,723.

An electric incubator, invented by Frank N. Blagen, of Hoquiam, Wash., has an improved arrangement of parts whereby inconvenient and frequent removal of the mercury or cleaning is not required. A balanced lever connected with a second lever which has one of its ends positioned to electrically connect with a cup of mercury. A wire connects the opposite end of the balanced lever with the battery. A wire extends from the battery to a relay, and the relay is connected with the service mains and the resistance wire which is arranged in U-shaped loops over the incubator chamber so as to provide an efficient even heat. As the low voltage spark is in the mercury cup, the mercury does not have to be removed or cleaned off at frequent intervals as with some electric incubators. Patent No. 1,276,317.

Electric Incubator, invented by Frank N. Blagen, Hoquiam, Wash. Patent No. 1,276,317.

An incubator of the center-heated type has been patented to Henry M. Sheer, of Quincy, Ill., the novel feature of which is a tray with spaced strips arranged in successive tiers. The object is to overcome the inclination of the eggs on the sloping tray to roll toward the center, which at hatching time

Incubator, patented by Henry M. Sheer, Quincy, Ill. Patent No. 1,273,679.

The SCHWALGE Sectional INCUBATOR

The incubator of common sense, not of empty phrases. The one and only incubator that stands absolutely in a class by itself, owing to its unique and exclusive features. The Schwalge will fill your present and future needs, as you may start with a 300 or 600-egg machine, and enlarge to a mammoth machine as your business increases. Additional sections easily added in two minutes.

Two types to start with—300-egg size and 600-egg size. All equipped with blue flame vapor oil heater. Clean, reliable, no odor. Each egg chamber containing 150 eggs can be run as a separate unit. The Schwalge is used and endorsed by hundreds of the most successful poultry men.

To appreciate the true value of the Schwalge Sectional Incubator you should send for illustrated catalog, which is free for the asking.

Illustration shows the individual egg chambers of 150-egg capacity each, which can be run as separate units. With this machine you can hatch Chicks, Ducks and Geese, all at the same time, each variety having its own egg chamber.

The Schwalge-Smith Company
Elm Street, Elmhurst, Ill.

makes it difficult for the chicks near the center to get out of the eggs, owing to the pressure of eggs farther up on the tray. Patent No. 1,273,679.

A new incubator regulator, devised by Andrew J. Kile, of Harrisonburg, Va., has a crosshead or bar connected to the thermostat, and to each end of the crosshead are

Incubator Regulator, patented by Andrew J. Kile, Harrisonburg, Virginia. Patent No. 1,276,543.

attached regulating levers connected to dampers for each of two egg chambers. A counterweight carried by one of the levers provides means for balancing the mechanism. Patent No. 1,276,543.

A removable egg tray for incubators, with rotatable rollers for turning the eggs, has been devised by Samuel E. Harpham, of Heartwell, Neb. The various rollers are connected with each other by a cable looped around each roller, the end rollers being provided with cranks by which they may be rotated, thus turning the eggs on the tray. Patent No. 1,276,907.

An egg-tester, devised by Charles C. McCormick, of Aurora, Mo., the contact of the egg with a resilient metal strip extending across the top of the tester and encircling the egg opening, moves the strip down so as

Egg Tester, invented by Charles C. McCormick, Aurora, Mo. Patent No. 1,266,695.

to cause its end to contact with an adjustable contact member to complete an electric circuit and light an incandescent bulb in the circuit whenever an egg is placed on the device. Patent No. 1,266,695.

A chicken beheader, invented by Andrew Carlson, of Mullen, Neb., comprises a fixed bottom blade attached to a suitable frame to be bolted to a post where the device is

to be used, and co-operating with the fixed blade is a swinging or pivoted blade, with a downwardly curved cutting edge, which swings past the lower fixed blade scissors-fashion. The swinging blade is provided with a wooden handle. The device is a convenient substitute for the ax where it is not necessary that the head be left on the poultry. Patent No. 1,271,016.

Chickens Sick?—Use Germozone

In the treatment or prevention of poultry troubles nothing seems to hit the spot with quite the same certainty as Germozone.

Poultry diseases, even colds and roup, almost always start with bowel trouble. Bowel trouble starts mostly from musty or spoiled food. Grain, whole or ground, if it becomes damp and lays around for a week or two is apt to become musty and **musty feed is poison for chickens.**

Even the feed hoppers, infrequently cleaned, are sources of trouble; also excess feed left laying for days in damp litter.

A chicken with bowels in healthy working order resists colds, roup, and other similar troubles. One with bowels bad is easy prey for all kinds of trouble. Even lice bother these more.

Germozone kills or counteracts the musty poison in food. Here it is more than a medicine and it is why thousands find it indispensable as a "two or three times a week, given in the drinking water, preventive." But, better still, if one will give pure water as drink through each day and water containing Germozone as a last drink each night it is a little more trouble, but the ideal preventive treatment.

And, as a remedy for colds, roup, canker, sore head, swelled head, chicken pox, sores, swellings, loss of feathers, etc., Germozone is unexcelled.

Sold most everywhere by druggists, seed stores and dealers handling Lee Poultry Supplies. In tablet form mailed postpaid by us at 75c per package with 5 book poultry library FREE if requested.

GEO. H. LEE COMPANY, Dept. 302, OMAHA, NEB.

THE NEW REVISED EDITION

of the

Standard of Perfection

Now ready, and will be the only recognized authority on all Standard requirements of American-bred Land and Waterfowl until 1923—eight years in service.

Since 1874 the American Poultry Association has issued under copyright, many editions of the Standard, but this issue is, without doubt, the master piece.

It is the one great book most used by judges, fanciers and breeders, and the only recognized authority in awarding prizes in the poultry shows of the United States and Canada.

The new edition contains 112 full-page illustrations of Chickens, Bantams, Ducks, Geese and Turkeys by America's foremost artists.

A new nomenclature indicating each section of all Standard breeds and varieties—male and female.

A glossary of fifteen pages describing and illustrating many technical terms used by poultry breeders.

A complete list of recognized disqualifications for each American Standard-bred breed and variety.

A chapter on cutting for defects. A full and complete Standard description of each and every recognized Standard breed of Land and Waterfowl, giving the Standard requirements in every section, weight, size, color, markings and shape.

No Poultry Breeder Should be Without a Copy

Buy a copy and know the Standard requirements for all American Standard-bred breeds and varieties. Price, cloth, \$2; Sent postpaid.

Brood Your Chicks

Simplex Brooder Stove

30 Days FREE

Use the new 1919 Simplex Brooder Stove on your own hatch for thirty days free. Raise 20 to 50 per cent more chicks at 1-5 the cost, 1-10 the work and 1-4 the operating expense. Small and large broods. Three sizes of stoves. Try our stove under all conditions and if you are not delighted send it back and we will cheerfully refund your money.

Turn Losses Into Profits

This wonderful brooder will raise 50 per cent more of your chicks than you have been able to raise under the old fashion methods. No more deaths from white diarrhoea and poor ventilation. It turns the losses from dead chicks into big profits for you. The Simplex soon pays for itself by the extra money it makes for you. The Simplex Brooder Stove burns kerosene oil, natural or manufactured gas, automatically regulated to insure an even temperature with the least possible attention.

Free Brooder Book

Write today for valuable free brooder book and catalog. It tells how to "increase your profits by decreasing mortality." Tells how to save chicks you have been losing each year through disease and faulty brooding. How to make more money. Also catalog and details of 30 days trial free. No obligations. Write now.

that when selling birds must end, as the certificate goes with the bird. While ribbons were easier to handle they did not mean anything to the party winning same other than that he secured so many ribbons, whereas now with a certificate the bird can only be sold once, as the buyer no doubt will want the certificate, much on the same principle as a buyer of a dog gets his pedigree.

A. P. A. ribbons and gold medals—\$50 Liberty bond, best display in show; \$50 Liberty bond, best display S. C. White Orpingtons; \$50 Liberty bond, best display of pigeons.

The United States Government Poultry Exhibit, consisting of model coops, traps and all modern poultry appliances will be shown, in charge of government experts. They will also show record egg-laying hens and tell how to obtain best results. This exhibit will cover about 3,000 square feet floor space.

Up to the present time the following national meets have decided to show with us: All Orpingtons (except Buffs), United Antona Club, Blue Andalusians. State meets, Rhode Island Red Club and American Plymouth Rock Club. In addition there will be several others who have not yet decided.

Harold Ravnley has been selected to judge the pigeons on exhibition.

J. Leonard Pfeuffer, secretary of the Poultry Exhibition of Pittsburgh, Commonwealth building, will be pleased to send any intending exhibitor a premium list, which will be out December 5.

Thirtieth Garden Show—The Peace Show.

For thirty years our exhibition has been "America's Leading Show"—truly a wonderful record and one that should be topped off this season with the greatest exhibition that the world has ever seen. The dates—January 24 to 28, inclusive—are ideal; they come just before the real breeding season and at the very best time for selling, not only fowls, but incubators, breeders and supplies of all kinds, and just at the best period for taking orders for eggs and chicks. The Christmas rush will be over and express facilities will be ample.

Now that peace has warmed the world into full life and activity and has pointed out the bright future ahead of all poultrymen, the exhibit should be a great, whole-souled outpouring of the enthusiasm of the fanciers of the world. The Garden should be crowded to its very doors with quality in every variety.

I have been urged both to raise the entry fee and to cut out all premium money and make the show a ribbon show. These suggestions will not be carried out, because we believe that our exhibition should be open to all and that the small breeder should be placed on the same footing as the big one. The entry fee will remain at the same figure as in former years. Certain changes will be made in the premiums as indicated in the premium list, but the show will continue to give both money and ribbons.

I ask a special favor this year—that you make your entries early. Help me to get your tags back to you at an early date.

Application for premium lists have been coming in for some time. Many of these are from persons who are merely curious, or who want them for souvenirs. It is necessary, therefore, to say that no premium lists will be sent unless good faith is shown by inclosing stamps.

At the service of intending exhibitors, I am, Charles D. Cleveland, Secretary, Eaton-town, N. J.

Detroit (Mich.) Show.

Under the name of the Detroit State Poultry Show, poultry raisers and fanciers will hold a statewide exhibition at the armory January 27 to February 1, inclusive. By general agreement among the poultrymen there will be none of the smaller shows held this year in Pontiac and other adjacent cities.

The Detroit show will cover all the territory possible and in addition to the exhibition the Michigan State Agricultural College will conduct a school in poultry raising, dressing and marketing, open to all persons attending the exhibition. During the week the National Barred Rock Club, one of the largest poultry organizations in the country, will hold its annual meeting in this city.

Officers selected for the show are as follows: President, Joseph Toynton, Pontiac; first vice-president, William F. Degan; second vice-president, B. D. Collins; secretary, Prof. C. H. Burgess, East Lansing.

The Twenty-fifth Annual Illinois State Show will be held in the new armory at Carbondale, Ill., Jan. 7 to 11, and the outlook for a big show was never better. Inquiries are already coming for catalogs. The Illinois State has not for many years been held in the southern part of Illinois, which was one of the big reasons it was awarded to Carbondale. The features will be free door, free official and marked catalogs. Many breeders are under the impression that

free catalogs means given free to exhibitors, but they are mistaken; we distribute the official and marked catalogs to all who visit the show. The cash prizes are higher than those of any show in the state, and cash specials for best displays in all varieties will again be given. Our judges are the best in the country and are not only hired to judge the different varieties, but to give all information gladly to all who ask. Catalog will be ready Dec. 1. Write to A. D. Smith, Quincy, Ill., for your copy.

Buff Minorca Club.

The International Buff Minorca Club holds its annual at the Great Fanciers' Show, Boston, Mass., Jan. 14 to 18. The following is a list of special premiums offered by the club and its members at this meet: Dr. B. J. Hovestadt and Cort Hincken, Boston, offer a magnificent silver cup for best display, also a grand trophy shield for second best display. The Walhalla Farm, Oscoda, Mich., offers a grand silver cup for the best three hens and three cockerels. Also a setting of eggs from its best matings for best male and best female. E. J. Campbell, Cedarhurst, N. Y., offers \$5 in gold for the exhibitor coming the longest distance. Charles W. Deeds, Dayton, Ohio, offers \$5 in gold for best shaped Minorca in the show. Walter C. Young, Dayton, Ohio, offers \$5 in gold for best colored Minorca in the show. The International Buff Minorca Club offers handsome silk ribbons for best cock, cockerel, hen, pullet, pen and grand sweepstakes for best Buff Minorca in the show. The above specials are open to club members only. Every breeder of Buff Minorcas is requested to enter a few birds, if possible, at this meet, in order to make this the greatest show of Buff Minorcas ever penned in America. If you are not a member of the club send \$1 to the secretary in order to compete for the above specials. Walter C. Young, secretary, R. R. 16, Dayton, Ohio.

We greatly regret to announce that the officers of the Fair of the Carolinas have decided not to hold a fair this fall. This has made it necessary for the Mecklenburg Poultry Club to change the dates of its show again, as the club had arranged to hold its show with this fair. At a meeting of the club held October 29 it was decided to hold the show January 6 to 9. The annual show of the North Carolina Poultry Association will be held in connection with the Mecklenburg Poultry Club show on above dates, and with the two associations pulling together we are assured of the largest exhibition of poultry and pet stock ever seen in this state. New premium lists and all information necessary will be mailed you at an early date. In the meantime, get ready to show at Charlotte, N. C., January 6 to 9. They'll all be here and one good old-fashioned chicken show time is promised everybody. R. L. Simmons, president; S. W. Asbury, secretary.

The American Buff Wyandotte Club offers to its members four handsome ribbons, one for best shaped male, one for best shaped female, one for best colored male, one for best colored female. Club cups will be offered at the national, sectional and state meets. These specials are offered without strings, all that is necessary is to be a member in good standing. It is very essential to state on your entry blank that you are a member. All breeders not members should join the club and compete for these handsome specials. Send \$1 to Andrew C. De Hass, secretary-treasurer, Albany, N. Y., or to your state secretary.

Kansas City Poultry Show, Kansas City, Mo., January 13 to 18. The show has deposited with the National City Bank of

Kansas City \$750 in Liberty bonds to guarantee the prompt payment of all its premiums. For premium list write E. L. Noyes, secretary, Manhattan building, Kansas City, Mo.

The Assiniboia Poultry Association, Winnipeg, Canada, held its first annual show October 3 to 5, and reports a most successful show in every particular. One of the features that proved most popular was the boys' and girls' classes, also the selling class. C. O. Merredew, the secretary, is to be congratulated upon the most efficient manner in which this show was conducted, and all the officers deserve praise for their untiring efforts toward making the show the success it proved to be.

A. H. Studebaker, South Bend, Ind., secretary of the South Bend Poultry and Pet Stock Association, was stricken with influenza the latter part of October, and after an illness of only ten days died Nov. 4. Mr. Studebaker was a son of the late Henry Studebaker, founder of the great Studebaker wagon works at South Bend, Ind. He was a lover of thoroughbred poultry and took great interest in the local poultry association.

Due to the embargo on all shipments of fancy poultry from Dec. 10 to 31, inclusive, the Jefferson County (Wis.) Poultry Association has changed its dates to Jan. 3 to 6. For full particulars write the secretary, Alfred Cory, Fort Atkinson, Wis.

The Waterloo Poultry Association of Waterloo, Iowa, has changed its dates to Dec. 31 to Jan. 5; James A. Tucker, judge. For further information write the secretary, J. S. Leeper, Waterloo, Iowa.

Meeker County Poultry Association will hold its annual show Jan. 13 to 16, at Litchfield, Minn. Most liberal premiums will be offered. Send for premium list to E. J. Sleeter, Litchfield, Minn.

The Williamson County Poultry and Pet Stock Association has changed its dates to December 4 to 8, at Johnston City, Ill.

Better engage them now. New catalog

M. S. BARKER Thorntown, Ind.

FAIR OAKS BARRED ROCKS

We have the birds and want the breeders to realize it. We never had as good a bunch headed for the show room

—and that means a good deal when you consider that last year we had more winners at the National Barred Rock Club and Illinois Centennial Shows than all breeders in the United States combined.

1000—Head of Superior Young Stock for Sale—1000

bred from the above winners and others like them. They will give ground to no competitors this winter, no matter where they come from.

GREAT BARGAINS IN BREEDERS

300 head fine yearling old stock, including our winners, with 40 cock birds in the list. Now is the time to secure your breeders! They are lower in price now than they will be in the spring, and it is much better to put them into their new quarters in the fall, so that they will become acclimated and satisfied by breeding time. The results are much more satisfactory.

Waukegan, Illinois

Poultry House Ventilation; Or, Where Experts Differ.

S. K. Burdin, Toronto, Canada.

HOW is the layman to know whom to follow? One man says, this is the way; another says, no, it is not. Let us study some of the principles involved and how to apply them.

The question of poultry house design, arrangement and ventilation is one of more than ordinary interest to the general public, and especially now when so many are being urged to help in the increased production campaign. It has long been recognized that if this question had been solved beyond the shadow of a doubt, and definite rules and methods of construction and ventilation could be provided for guidance in building our houses, large or small, a great stride would be made toward ultimate success in poultry raising, but unfortunately it has not and this information is yet to be supplied.

It is a common practice for most persons, as soon as they become interested in poultry raising, either from the fancier's or utility standpoint, to subscribe for one or more poultry papers, while some will buy every paper they learn of or see mentioned in the exchanges.

At first the way seems clear to them; the various phases of poultry raising simple, and their course easily discernible. When they finish reading the first few articles on this or that method of housing they know, or think they do, just how to proceed; but soon they observe that the authorities are frequently contradicting each other. Then they begin to realize that their own houses, built as directed in the most childish faith and simplicity, fail to come up to promise. They begin to analyze their own troubles. Have they not read in their favorite paper, by their favorite expert, about this or that style of house and also that no matter what is wrong with a bird, whether it be a case of crop-bound, egg-bound or "hide-bound," if she is placed in one of these sanitariums she will recover promptly and all will be O. K. in a few days. Then conditions change; the weather moderates, the house works better, and everything is again serene.

No sooner does our friend begin to see the rift in the clouds and again get out his slate and pencil and begin to figure up and prepare his "balance sheet" for some few years hence, when his wealth will require a very respectable row of duck eggs preceded by a figure one, three or five, to write down his wealth on the income tax collector's books, when lo! he suddenly comes across something like the following in an equally reliable paper by a renowned expert.

"One would think that after this rigorous winter (1917-18) the advocates of open front poultry houses would be less enthusiastic and flamboyant (some word, that) than they have been in the past. Open front houses are all right in mild climates, but in latitudes where the mercury drops to zero and below, they are out of place."

Then he begins to wonder who is who. He reads again and yet again. No, there can be no mistake about it. These experts are facing each other with swords drawn, each claiming the floor and persisting they

"Golden Rod" Buff Orpingtons

are bred for heavy egg production and exhibition qualities, and their 20 years of winning at the NATIONAL SHOWS and EGG-LAYING CONTEST proves that they are BRED RIGHT. If you have never raised poultry you owe it to yourself, and country, to do so now. If you are just beginning, you naturally want the best; if you are an old breeder, these old linebred trap-nested "GOLDEN RODS" will improve your flock. Remember, we are the oldest, biggest and BEST breeders in the U. S.

At the Illinois State Fair, 1918, we won 1st old pen; 1st young pn; 2nd hen; 2nd pullet; 3rd cock, and the medal for best display. Write your wants.

are right. Now he begins to examine his poultry papers and to look upon the editors and advertisements from a new angle.

As he turns the pages over he stumbles on an advertisement of the very house. What does this mean? Has not one of the editors on another page just been denouncing this very type of house? Another glance and the plot thickens—the paradox is getting tragic. The plans for the house denounced on one page are advertised for sale, and as a premium by the paper, on the next. What do they mean by such contradictory methods? What shall he do? Where shall he go? How shall he build or remodel? Are the blind trying to lead the blind?

Ah, A bright idea strikes him. He will send for bulletins. He does, and alas his last estate is worse than the first. He is told that with a few old boards, a roll of building paper, and a piano box or two and his troubles will be over. Nothing positive, nothing decisive. He is told what is needed in the way of ventilation but left without adequate assistance as to how to secure it.

The Hen.

The hen is a very unusual creature. She has no parallel proportionately among all our domestic pets. When she is in full health and working condition she is a high speed, heavy duty machine. She has the largest and most powerful heart, the largest capacity for storing and assimilating food, and the highest average daily or yearly production.

The normal temperature of our domestic animals, as well as mankind, is about 98 degrees, while that of poultry is from 103 to 107 or higher than any fever patient. Again, when our domestic animals are in normal health they urinate regularly, while poultry, the drinking more in comparison to size, does not. Its high temperature, heavy consumption of food and water, require special provision for exercise and ventilation to promote health and aid digestion. These points are generally overlooked, and they upset all rules and regulations for warmth and ventilation as applied to our homes, barns and stables.

Fresh Air and Oxygen.

Nature's method of keeping the blood pure, vigorous and dancing is simple and effective, if not interfered with.

The function of the heart is to pump the blood through the system, of which the lungs form a part of the circuit. The blood goes out thru arteries and returns by another route—thru the veins. Its function is to build up new tissues and tear down old. Every pulsation of the heart sends a portion of the blood thru the lung cavities where it is brought into contact with the oxygen inhaled with each breath.

The walls of the lungs are so constructed they retain the blood yet allow the oxygen to come into direct contact with it. By this exposure to the oxygen the impurities are consumed or burned up and the blood sent out purified for its next voyage thru the system, when it will again be returned and the process repeated over and over, day after day. The impurities thus removed are thrown off by the lungs in the form of gas or carbon dioxide.

If the air has been used or breathed over it becomes vitiated or devitalized, will not do its work thoroughly, and health suffers accordingly. Fresh pure air in abundance is necessary, therefore, to enable the lungs to do their work efficiently and also to carry away the dampness and impurities (carbon dioxide) thus produced. In this way the system is torn down and rebuilt every seven years.

Open and Cotton Fronts.

During the past decade there has been a constant wrangle between various authorities regarding ventilating methods. These authorities have been divided into two schools—the open front and the cotton front schools. Arguments pro and con are

unimportant. It will serve no good purpose to present them here. It will be necessary, however, to refer to some of their shortcomings as the two methods and ventilation are discussed.

There are three methods of ventilation: Forced ventilation, direct ventilation, and indirect ventilation. As the first is used and applies to public buildings exclusively it will not be discussed.

Direct ventilation is secured by opening a door or window. By this means its efficiency is influenced by size of opening, direction and velocity of wind, and temperature and humidity of the atmosphere.

In the various forms and shapes of open front houses direct ventilation is the means employed. In practice it has been found impossible to use this type without dangers from drafts and storms. To overcome these

PILLING CAPON TOOLS

Double the Weight From the Same Feed

Double the weight and double the price per lb.

So great has been the demand for those practical, ready-to-use caponizing tools that most dealers exhausted their stocks. The fact that the Pilling factory was working 100% on Government orders for surgical instruments prevented us from refilling their shelves.

But next Spring we shall be able to supply dealers who order early. Get your order in now—any poultryman with Pilling caponizing tools and our complete illustrated instructions can make each dollar's worth of feed produce four times as many dollars as with roosters. *Capon Book FREE.*

faults various different sizes and shapes have been employed. Styles of houses that are habitable at all in winter are hot and stuffy in summer, and so low they are difficult and unhandy to work in. On the whole, however, a majority of poultrymen do not like them; they seem brutal and improvident.

The aversion for the open house led to experimenting with various means to overcome the dangers from storms and drafts, and also provide a more convenient house to build and work in. The result of these efforts is the cotton front house, or semi-direct ventilation.

This style of house overcomes to a degree the errors of the open front, but others equally grave have developed.

It has been found impossible to determine the correct amount of cotton to use under various conditions. What is adequate one day is too much or not enough the next. Heat from sun, or cold at night, necessitate constant watching and frequent adjustments. Sudden changes in direction and velocity of wind and storms baffle the wisdom and watchfulness of the attendant. A house that becomes too warm in winter under certain conditions is more dangerous than the one that is too cold. Colds are inevitable.

The solution of ventilating difficulties will never be found in either the open front or cotton front houses. There is absolutely no question, however, but what they are a great improvement over "closed" or "heat-ed" types, and by careful manipulation and tireless vigilance birds can be kept during winter in fairly good shape; but in spring and fall colds are well nigh universal, due to overheating or drafts or both. We must look, therefore, elsewhere or employ some other principle if we would secure better conditions, successfully cope with the sudden changes of 40 to 60 degrees in less than 15 hours, and meet the unexpected shifts in direction and velocity of our storms.

The Problem Solved.

After trying every conceivable combination of ventilation, curtains and openings, without satisfactory results, it was discovered that indirect ventilation secured the desired end. It is not a new principle, but simply a new use and application of an old one.

Let us pause a moment and mention the laws bearing directly upon this new means of purifying the air for our flocks—indirect ventilation.

First: The amount or volume of air passing through a given opening depends upon its velocity.

Second: Heated air expands; becomes lighter and rises.

Third: Cold air contracts; becomes heavier and settles.

Fourth: The normal atmospheric pressure is about 14 lbs. per square inch, at sea level.

Indirect and semi-indirect ventilation makes use of these principles in a simple and efficient way for the elimination of dampness, carbon dioxide, and other impurities from our poultry houses, without any dangers whatever from drafts and sudden changes; securing all the good points of the old houses without any of their dangers and drawbacks. Drafts, dampness and frost-bites are practically unknown.

During the past winter (1917-18) (most severe and trying in 50 years) houses constructed along these lines have given phenomenal results. It places the novice on an equal footing with an expert in house management, and will revolutionize poultry raising and housing.

WITH THE EGG LAYING CONTESTS

Final Report of American Egg-Laying Contest.

The hens in the American Egg-Laying Contest at Leavenworth, Kansas, made an average of 13 1/2 dozen eggs per bird, or a total of 162 eggs each during the past year. Some of these birds scored as high as 95 1/2 points. All were Standard bred. The first prize pen in the breeders' contest was a pen of exhibition Light Sussex from Ohio, No. 48, with a record of 1,039 eggs. The highest pen in the Leghorn contest was pen No. 67 from Washington, with a record of 1,145 eggs. The best individual record ever made in the American contest was made by White Leghorn No. 1101 from Pennsylvania, with a record of 304 eggs. The leading pen of yearling hens, R. I. Whites, No. 35, from Illinois, laid 1,002 eggs.

The best individual record in the yearling hen contest was made by White Rock hen No. 28 from Illinois. She laid 265 eggs, which is quite good for a hen that is now two years old. The highest individual record in the breeders' contest was made by R. I. White hen No. 351 from Illinois, which laid 258 eggs.

The fact that these birds were all Standard bred and averaged 162 eggs per bird, speaks well for American breeders and the progress which they are making along the line of combining Standard qualities with egg production. The eggs laid by these hens sold for approximately \$6 per bird. The feed cost was in the neighborhood of \$2.50 per bird, which left about \$3.20 to cover cost of labor, interest on equipment and profit. If records are kept on your flock you can make more per bird at present prices of feed, eggs and poultry than at any time in the past if the right methods are used. Of this there is no doubt.

Breeders' Contest.

The five leading hens for the year were as follows:

- No. 351—R. I. White, Illinois.....258 eggs
- No. 102—S. C. W. Leghorn, Illinois, 248 eggs
- No. 273—White Orpington, Illinois, 245 eggs
- No. 131—Ancona, Ohio.....236 eggs
- No. 306—S. C. Red, New York.....233 eggs

The five leading pens for the year were as follows:

- No. 48—Light Sussex, Ohio.....1039 eggs
- No. 7—Buff Leghorns, Michigan..1033 eggs

- No. 43—Wh. Wyandottes, Illinois..1005 eggs
- No. 35—R. I. Whites, Illinois.....1002 eggs
- No. 9—Buff Leghorns, Ohio..... 992 eggs

Leghorn Contest.

The five highest hens for the year were as follows:

- No. 1101—White Leghorn, Penn....304 eggs
- No. 674—White Leghorn, Wash....274 eggs
- No. 626—White Leghorn, Illinois...258 eggs
- No. 1015—White Leghorn, Ohio.....251 eggs
- No. 1105—White Leghorn, Penn....248 eggs

The five highest pens for the year were as follows:

- No. 67—White Leghorns, Wash...1145 eggs
- No. 70—White Leghorns, Wash...1137 eggs
- No. 110—White Leghorns, Penn....1133 eggs
- No. 132—White Leghorns, Kansas..1056 eggs
- No. 99—White Leghorns, Ohio.....1030 eggs

Yearling Hen Contest.

The five highest yearling hens for the year were as follows:

- No. 28—White Rock, Illinois.....265 eggs
- No. 351—R. I. White, Illinois.....258 eggs
- No. 341—R. I. White, N. J.....231 eggs
- No. 354—R. I. White, Illinois.....222 eggs
- No. 379—White Wyandotte, Ark....219 eggs

The five highest pens of yearling hens for the year were as follows:

- No. 35—R. I. Whites, Illinois.....1002 eggs
- No. 34—R. I. White, New Jersey... 954 eggs
- No. 69—White Leghorns, Illinois... 905 eggs
- No. 1—White Rocks, Illinois..... 900 eggs
- No. 59—White Leghorns, Missouri.. 884 eggs
- No. 67—White Leghorns, Canada.. 884 eggs

The averages made by the different varieties in the breeders' contest were as follows:

Variety	October Leader	Best Pen for October	Av. Pul. 12 Months	High Layer 12 Mth., Pul.	High Pen 12 Mth., Pen
Black Leghorns	15 eggs	32 eggs	172.1 eggs	212 eggs	960 eggs
Anconas	19 eggs	43 eggs	184.4 eggs	236 eggs	922 eggs
White Rocks	18 eggs	42 eggs	151.6 eggs	207 eggs	833 eggs
Buff Rocks	22 eggs	53 eggs	131.5 eggs	214 eggs	713 eggs
Brown Rocks	24 eggs	67 eggs	167.3 eggs	218 eggs	913 eggs
White Orpingtons	22 eggs	64 eggs	163.1 eggs	245 eggs	975 eggs

Brown Leghorns	16 eggs	39 eggs	192.0 eggs	227 eggs	1033 eggs
Buff Leghorns	22 eggs	46 eggs	178.7 eggs	248 eggs	959 eggs
White Leghorns	21 eggs	41 eggs			

Fourth Arkansas State Egg-Laying Contest.

The following table shows the average production of the different breeds:

Breed	No. of Birds	Av. Produc. Per Bird
Barred Rocks	10	131.4 eggs
White Rocks	15	126.3 eggs
Columbian Rocks	10	145.8 eggs
Partridge Rocks	5	90.0 eggs
Rhode Island Reds	20	134.3 eggs
White Wyandottes	5	144.2 eggs
White Leghorns	25	155.4 eggs
Brown Leghorns	10	135.7 eggs

The following table shows the production of the leading breeds by months and the number of eggs laid by each.

Month	Pen No.	Breed	Eggs
Nov.	12	Barred Rocks	33 eggs
Dec.	6	S. C. White Leghorns	57 eggs
Jan.	1	Barred Rocks	56 eggs
Feb.	10	S. C. R. I. Reds	79 eggs
March	20	Columbian Rocks	120 eggs
April	10	S. C. R. I. Reds	115 eggs
May	20	Columbian Rocks	115 eggs
June	20	Columbian Rocks	99 eggs
July	14	S. C. White Leghorns	109 eggs
Aug.	18	S. C. White Leghorns	105 eggs
Sept.	7	R. C. R. I. Reds	91 eggs
Oct.	20	Columbian Rocks	74 eggs

The following table shows the average production per bird by months:

Month	Average	Month	Average
November	2.63 eggs	May	18.95 eggs
December	4.69 eggs	June	15.23 eggs
January	5.12 eggs	July	15.82 eggs
February	11.13 eggs	August	12.59 eggs
March	19.17 eggs	September	10.48 eggs
April	15.01 eggs	October	6.11 eggs

Breaks Egg Record—Saves Feed

With eggs at 80c to \$1 per dozen, how would you like to have a flock of hens that would equal the record of this great hen, 304 eggs in twelve months? Or, if they would average even 150 to 190 eggs, you could make big money. This wonderful hen just made a record of 304 eggs during the past year in the American Egg-Laying Contest. The balancing of the feed so that the daily ration could be turned into practically the same number of yolks and whites made is possible for her to make one of the world's greatest records in an official egg laying contest.

It is possible for you to turn every yolk into an egg and get a 100 percent egg yield. Every hen must have the proper feed to make as many whites as yolks or it is impossible for her to lay her full number of eggs. Poultry raisers lose millions of dollars each year by feeding grains which produce more yolks than whites, the hens therefore become overfat and egg production is reduced.

This hen was handled according to the methods of Prof. T. E. Quisenberry, Box 206, Leavenworth, Kansas, president of the American Poultry School. His new 16-page bulletin tells how to balance your feed so the hen does not waste a lot of energy and food. He tells you how to feed so as to double your egg yield; how to save on feed; how to grow winter green feed; how to cheapen your feed, and how this 304-

Hen No. 1101, Which Broke the American Laying Contest Record With 304 Eggs in Twelve Months

egg hen was fed so as to manufacture nearly her own weight in eggs every month in the year and still stay in good health. Some suggestions are also given for culling out the drones. Thousands pronounce this the best 16-page bulletin or book ever written on the poultry feeding problem. Many poultrymen can double their winter egg yield by following these directions and on less dollars spent for feed.

If you really need information of this kind you can get a copy of this bulletin absolutely free by writing to Prof. Quisenberry at the above address. Write today while they last.—Adv.

The following table gives the amount of feed, grain and dry mash required by the different breeds to produce one dozen eggs:

Breed	No. of Birds	Feed to Prod. 1 Doz. Eggs
Barred Rocks	10	9.93 lbs.
White Rocks	15	11.25 lbs.
Columbian Rocks	10	8.21 lbs.
Partridge Rocks	5	11.12 lbs.
Rhode Island Reds	20	9.10 lbs.
White Wyandottes	5	8.68 lbs.
White Leghorns	25	7.71 lbs.
Brown Leghorns	10	8.08 lbs.

The number of pounds of grain required to produce one dozen eggs was 5.62 and the number of pounds of dry mash was 3.91, making the total of 9.53 pounds of grain to produce one dozen eggs.

Final Report of the Seventh National Egg Laying Contest.

Pen 36, S. C. White Leghorns, owned by C. J. Labahn, formerly of Lincoln, Missouri, but now located at Benld, Illinois, won the honors for the year with a record of 1,171 eggs to their credit, averaging 234.2 eggs per hen, beating their nearest competitor 46 eggs.

Ninety-three hens, or 31 percent, laid 200 eggs or more during the year. The 300 hens averaged 171.86 eggs each during the year. The high hen, a White Wyandotte, laid 286 eggs, tying the previous high individual record of the 1913-14, or Third Contest. The 300 hens in the sixth or previous year contest, averaged 175.2 eggs per hen per year fed on a perfect egg ration.

The results of this, the seventh contest, prove that hens bred to lay will produce a high average altho fed what necessity compels—the most available ration at hand.

During the life of the contest the hens were fed a war ration consisting principally of corn chops as a grain feed. Each bird consumed 4 1/2 lbs. of corn chops, 5 lbs. of wheat and 42 lbs. of mash, making a total of 87 1/2 lbs. consumed by each bird for the year.

The mash ration used in the contest was as follows:

Shorts	20 lbs.
Bran	20 lbs.
Ground oats	20 lbs.
Corn meal	20 lbs.
Beef scraps	26 lbs.

The birds were fed this mash moistened in the mornings, what they would clean up by noon, and the same mash was kept dry in the hoppers before the birds at all times. The grain was fed principally at night—all that they would clean up.

The wheat used in this contest was of a low grade and could not be used for bread purposes.

The cost of keep per hen was \$2.64 for the year. The gross receipts per hen was \$5.75 per year, leaving a profit over the cost of feed of \$3.11 per hen per year.

The Contest.

Pen 36, S. C. White Leghorns, Missouri, won the \$50 cash and silver cup by laying 1,171 eggs for the year, an average of 234.2 eggs each. Hen 1, Pen 47, White Wyandotte, won the individual prize by laying 286 eggs.

The winning pen in each variety is as follows:

Pen	Eggs
36 S. C. White Leghorns.....	1,171
49 R. I. Whites	1,125

ANOTHER SMASHING VICTORY!!

"Hillview" White Leghorns

in the Missouri Egg-Laying Contest ending Oct. 31, '18, won FIRST HONORS!
in competition with 60 pens, consisting of 20 breeds and varieties

1,171 EGGS in one year is the official record of these wonderful five hens, an average production of 234.2 eggs each. They finished the contest 46 eggs ahead of their nearest competitors and 218 eggs ahead of all other Leghorns entered in the contest. In addition to this, a Hillview hen was crowned Queen of all Leghorns by laying 248 eggs for the year.

To celebrate our big victory we are now starting a special \$5.00-COCKEREL SALE-\$5.00

We are offering 1,000 big sturdy cockerels, bred in pedigree line and rich in the same blood-lines as our laying contest winners, at HALF PRICE, \$5 each. This is a bargain you cannot afford to miss—an opportunity to secure breeding cockerels that will improve the egg-laying qualities and will stamp this character permanently and profitably in your flock. Our repeated winnings at the National Laying competitions (see catalog) back up our claims. Get one or more of these cockerels; write today and order right from this advertisement. One cockerel for \$5, two cockerels \$9.50, three cockerels \$14, four cockerels \$18.50, five cockerels \$22.50. Watch the improvement in the egg yield of your next season's pullets. Sale expires January 15, 1919.

The Best by Actual Test

"Hillview" Leghorns have stood the test of public competition for many years. They come back year after year. In the show-room we have never lost best display. At the National All Leghorn Show, Columbus, Ohio, last year, we won best display and all shape, color and head specials. At Kansas City we have won every ribbon. At St. Louis we have won every ribbon, excepting on cock birds—we did not show any cock birds. We have furnished more of the winning cockerels for Chicago than any other farm in the West during the past six years. We have hundreds of youngsters now ready to win any show, no matter how large or small—great big fellows, with long concave broad backs and saddles, neat head points, pure white and profusely plumaged, and well up on deep-yellow legs. **BIRDS THAT WILL WIN THE BLUE! REAL BREEDERS OF QUALITY.**

Write for our 24-page catalog, including price list. It's free.

Report of the Fifty-second Week of the Seventh Annual International Egg-Laying Contest.

Storrs, Conn., October 31, 1918.

The seventh international egg-laying contest at Storrs ended late Wednesday afternoon when hen No. 982, a White Leghorn from Lakewood, N. J., laid the last egg. The two outstanding features of the competition just ended are the remarkable performance of a pen of birds from Corvallis, Ore., and the individual work done by White Wyandotte hen No. 195 from Bridgeton, R. I. At this point it may be said that during the past five years the poultry department at Storrs has trap-nested over 5,000 hens representing thirty different breeds and varieties from twenty states and including birds from Canada and England. The pen of "Oregons" entered by the Oregon Agricultural College has beaten them all. These ten birds laid 2,352 eggs as compared with the best previous record of 2,265 made two years ago by a pen of White Wyandottes. Connecticut's best birds were Buff Wyandottes entered by H. P. Cloyes of Hartford.

The best individual record has also been broken. During ten years of trap-nesting, 236 eggs has been the best that any one hen could do until this White Wyandotte owned by Obed G. Knight finished up the year with 308 eggs. Besides winning first at Storrs this bird is second best in a class of only four American hens with official records of more than 300 eggs each. The following table shows these four leading layers with their records and where they were made.

White Leghorn, Delaware Contest...314 eggs
White Wyandotte, Storrs Contest...308 eggs
"Oregon," Ore. Agricultural Col....303 eggs
White Rock, Vineland Contest.....301 eggs

In the Barred Rock class hen No. 112 from Palenville, N. Y., was first with a score of 264 eggs. Hen No. 673 from Hollywood, Wash., with a record of 233 eggs was the best White Leghorn for the year. In the Rhode Island Red class hen No. 423 from Southboro, Mass., was first with a yield of 240 eggs.

The grand total for all pens was 158,920 or an average of about 4 1/4 eggs less per hen than was laid in the contest last year. The subjoined table shows the number of birds in each breed, the average annual individual egg yield, and the general average for all varieties engaged in the contest.

130	Barred Rocks	169.0
100	White Wyandottes	168.3
170	R. I. Reds	148.0
430	White Leghorns	162.4
170	Miscellaneous	147.7
1000	Average for all breeds	158.9

The following list shows the twenty best pens in the order of their production and gives their total egg records for the year.

53	Agricultural College, Corvallis, Ore. "Oregons"	2352
20	Obed G. Knight, Bridgeton, R. I. White Wyandottes	2179
68	Hollywood Farm, Hollywood, Wash. White Leghorns	2043

Re-chickening France.

There are few breeders of Standardbred poultry in the United States who have not given some thought to the part that American poultrymen must play in the work of rebuilding the poultry industry in France and Belgium. The work in northern France is now under way.

In June, 1917, a group of ten American women were taken by General Petain into the devastated region of northern France and placed at Blerancourt in the Aisne for the purpose of reinstating the moral as well as the physical welfare of the civilian population, which, since 1914, had suffered under the Germans. These women, under the leadership of Mrs. A. M. Dike and Miss Anne Morgan, were requested to wear the French uniform and were made a part of the 3d Army Corps, later the sixth army. This was the beginning of the work of the American Committee for Devastated France.

More than two hundred villages and several thousand acres of farm land were turned over to the committee. They were asked by the French government to assume responsibility for all relief work among the civilian population in these territories. With the driving back of the Hun, there came an ever increasing stream of French refugees anxious to get back to what little of their homes had been left by the retreating Germans. They were discouraged, helpless people, without food, clothing or tools or materials with which to work. To feed and clothe these people and help them to become self-supporting upon their own farms has been the work of the American Committee for Devastated France.

The leaders of this work early turned to poultry raising as the quickest and best means of aiding the French refugees to become self-supporting and also to contribute to the support of others. Incubators were provided and placed on farms under the control of the committee. Eggs were purchased in southern France and furnished to these farms in the devastated areas. For many months this work of "re-chickening" France has been going on. The success which has attended the work reflects great credit upon the leaders, not only for their foresight in choosing poultry raising as the quickest and best method of meat production but also for their skill in handling the work.

The need for this work is rapidly increas-

ing. In the valley of the Aisne as well as in other large areas of devastated France not a chicken or an egg can be purchased at any price. The native chickens have been entirely destroyed by the retreating Huns. The whole poultry industry must be entirely rebuilt.

The opportunity for the introduction of American varieties of poultry, American incubators and equipment and American methods into this vast area of devastated France is now open to the poultrymen of America.

The greatest need before the committee just now is for the establishment of a central breeding station, stocked with the best breeding stock obtainable, the installation of a mammoth hatchery where chicks in large number may be produced for distribution among the people as they are re-established upon their own farms, and for instruction in American methods. This great need must be met immediately by voluntary contributions from the poultrymen of America. A campaign is now under way to raise a fund of at least \$5,000 for this work.

The American Committee for Devastated France is the logical agency thru which the poultry men of America should work in doing this part in the rebuilding of the poultry industry in devastated France. They are already in the field. They have the recognition and support of the French government, and it is depending upon them for this work. The machinery for carrying on the work both here and in France is established. Every dollar contributed to this fund is effective. Not a penny of it is used for salaries. All overhead expenses are eliminated.

Prof. Milligan C. Kilpatrick, instructor in poultry husbandry at the Ohio State University, has been chosen by the committee to direct this work. He expects to sail donating his services. He expects to sail for France about January 1. It is hoped that sufficient money, breeding stock and equipment will be contributed before that time so that he can proceed at once with the establishment of a central breeding station and hatchery. The greatest need just now is the money. What will you do to help? Has your state poultry association made a contribution.

Herbert H. Knapp, president of the International Baby Chick Association, Shelby, Ohio, is treasurer of this special poultry fund. Send him your contribution today.

New Method Increases Profit

The new, simple Philo System plan gets the most from poultry—provides the ideal conditions for maximum production with less expense than other methods—bigger profits, smaller losses.

Thousands of hens that are producing for their owners barely enough to pay the cost of feed would go into the "200-egg" class of big profit payers with the right care and housing.

A dozen hens in the new Philo System house shown above should pay for themselves, their feed and the cost of the house within a year. It is scientifically designed, combines features that bring best results from the fowls with conveniences that make it a pleasure to care for them. Requires space 6x6 ft. Ideal for city lot.

3 SPECIAL OFFERS

1 CATALOG FREE. Full information and prices "Ready-Built" Houses, Incubators, Brooders and supplies of all kinds.

MORRIS FARM, R 4, BRIDGEPORT, CONN. MY BIRDS WIN CONTESTS and make world's records for eggs

PERSONAL MENTION

E. M. Whitney, manager of Sears-Roebuck's poultry feed department, paid us a visit the other day, and he does not "view with alarm" by any means. Whit is very enthusiastic over the poultry outlook for the coming season, and his many friends will be glad to learn that he is enjoying unqualified success in his present position.

M. S. Barker, the Black Langshan breeder, of Thorntown, Ind., is in line for congratulations, as he was elected state representative at the November 5 contest. We shall expect M. S. to keep his eye peeled for anti-cock-crowing statutes, fat hen embargoes, etc.

Harry Lamson, senior poultryman of United States department of agriculture, passed thru Chicago early in the month in connection with his duties. Mr. Lamson is very much interested in the reports of the effect the government campaign has had on in-

creased production. Poultrymen report sales of from two to four times as much stock this year as compared with the corresponding months last year. Keep up the good work, Harry.

A. A. Berry, of Clarinda, Iowa, was in town renewing old acquaintances this month. Besides operating the largest farm seed concern in the world, Mr. Berry finds time to do an extensive poultry business. For October he reports sales about 100 percent larger than last October.

Way down in San Antonio, New Mexico, C. B. Allaire is doing his best to improve the laying ability of the stock in that vicinity. The demand for pure bred birds is increasing by leaps and bounds in the South, as is proved by the great increase in orders for show birds and utility stock, and Mr. Allaire has a good field for his efforts.

A true fancier is I. H. Murray, 11337 Longwood Drive, Chicago. It does our heart

good to hear him talk about his chickens. Mr. Murray is connected with a large concern at the stock yards and raises thoroughbred poultry as a hobby. He is the originator of Brown Anconas, and no mother's description of her first born has anything on Mr. Murray when he gets to talking about his pets.

The national meet of the American Cornish Club will be held with the Kansas City show, January 13-18, 1919. Premium list now ready.

One of the Ancestors of the Rhode Island Reds.

The above illustration is reproduced from a photo by Dr. P. T. Woods, taken at the museum of the Peabody Academy of Science, East India Marine Hall, Salem, Mass., of a well preserved, mounted specimen of Red Game fowl. This Red Game cock was brought from Malay about the year 1846 by Captain Richard Wheatland and was bred in Salem, Mass., about three years, by George Wheatland, Jr. This cock has a pea comb, yellow legs, plumage which is a rich nearly uniform red throat, with the exception of one wing, which shows white in the primaries. The tail is solid red. Under-color ranges from light to dark slate. This specimen is evidently typical of the Red Malay Game or red Wild Indian Fowl, once so popular with New England seafaring men and which is credited with being one of the progenitors of the red farm fowl of Rhode Island, which later became the Rhode Island Reds.

Here's the Way to Ship Birds

The old-fashioned wooden coops are a source of much loss to poultrymen. They are expensive, and can only be used once or twice. Being heavy they bruise the birds and shoot shipping charges way up. All this despite the trouble taken to nail them up.

ANDREWS EFFICIENCY KOOP & KOOP DE LUXE

are "Koops without a nail"—sturdy coops—coops of long life and great mileage, but so light they cut shipping charges in half.

And they are selling at before-war prices—\$3.00 to \$5.10 a half-dozen for Efficiency Koops, \$5.40 to \$9.90 for Koops De Luxe. Freight prepaid on orders of \$10.00. Address Dept. A

O. B. ANDREWS COMPANY Chattanooga, Tenn.

Secrets of Expert Exhibitors and Easy Lessons in Judging

By FRANK HECK

BOOK that is new in character and the most valuable and interesting production ever published for breeders of exhibition fowls. No other book or similar publication comes within gunshot of it. It is in a class by itself. The time has gone by when a breeder can pick up birds right out of the yards and win with them without special preparation. This is true even in the smaller shows. There are always at least a few hustling, enterprising breeders in nearly every locality who are keenly alive to the financial profit and the honors accruing from winning over all competitors. These breeders use all legitimate methods for putting their birds in show condition.

Faking and Legitimate Preparation Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Consider also the immense advantage you would have in being able to detect such forms of faking as can be discovered in cases where there may possibly be a dishonest exhibitor in the class.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained

You need the book to protect yourself against the dishonest fakir and you need it to put yourself on an equal footing with your honest competitors. It will save you dollars in useless entry fees, and it will show you how to win the coveted prizes and honors which your rivals would otherwise receive. The price of the book is..... **\$2.00** and it is worth the price. Have you ever bought a poultry book on general topics or disclosing some system or so-called secrets, and upon receipt of it had your expectations drop with a dull thud of disappointment? Well! this is not that kind of a book. Don't put off sending your order. You need the book now. Address.....

AMERICAN POULTRY JOURNAL PUB. CO., 523 Plymouth Court, CHICAGO, ILLINOIS

CLASSIFIED ADS.

UNDER this heading ads will be inserted for seven cents per word each month for less than three months, or **six cents per word each insertion for three months or longer.** Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under **classified headings.** No ads accepted at less than an average of 60 cents per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from AMERICAN POULTRY JOURNAL than from any other poultry journal—none excepted. On writing any of these advertisers, mention AMERICAN POULTRY JOURNAL. **All copy for Classified Ads must reach us by the 17th of month preceding the date of issue.**

Just What You Will Need This Winter

This is the FAULTLESS Automatic Feeder

All you have to do is to fill the can of this feeder with wheat, corn, oats or any other kind of feed, either mixed or separate. When the chickens are hungry they pick at the cross bar; this causes some feed to drop to the ground where the chickens can pick it up. No feed spoils or is eaten by rats or sparrows. You can save enough feed in one month to pay for these feeders. Besides the saving of fuel, you save work.

Here Are Our Low Prices

This feeder holds ½ bushel of feed. It is made of heavy rust-proof material. It weighs six pounds packed for shipping. Order by No. 153.

16-quart each \$1.75

THE SIMPLICITY KANT-KLOG POULTRY FEEDER

6-quart size, especially \$1.50 adapted for low coops

Here's the Original "KANT-KLOG" Automatic Poultry Feeder Simply Perfect Perfectly Simple

For six years this Feeder has been on the market, and they have been six years of satisfaction giving.

The Bait Bar operates with a swinging pendulum motion—not rotary. The length of the pendulum can be adjusted so that the device feeds just the proper amount of grain at each movement of the rod. Needs no watching—always works. Nothing to go wrong. No springs or intricate working parts. How does it work? The swinging of the pendulum fills the cup under the hopper (which regulates the quantity of grain fed at one "swing"), and also releases one "load" of grain. This drops off onto the deflector and bounces around in all directions.

This Feeder holds 6 qts. Hopper height, 6½ in. Weight 4 lbs. packed.....\$1.50

SIMPLEX SUPPLY HOUSE, Peterson Bldg., CHICAGO, ILLINOIS

E. B. Thompson's Imperial "Ringlet" Barred Plymouth Rocks

The Imperial "Ringlets"
Are Recognized Throughout the World
as the
Leaders of All Barred Rocks

One of the Great Imperial "Ringlet" Males.
Observe the Wonderful Shape, Color and Barring.

Their record at America's Imperial Show, Madison Square Garden, N. Y., for 30 years stands without parallel.

At the last 1918 Garden Show they won every first prize offered. At the last four shows, 1915, 1916, 1917, 1918, they won 19 first prizes out of 20 offered. First Prize Pullet and Champion Female the last four successive years—every prize and ribbon offered on cockerels, viz: 1st, 2nd, 3rd, 4th, 5th, the last five years in succession and under three different judges—every bird bred on my farm.

**Supreme at
Madison Square Garden
is Supreme Everywhere**

Grand Winning Show Birds
