The first Review by the Queen in Hyde Park was a scene which can as little be forgotten as it could be repeated. The wonderful universality of the thing—the long march amidst crowds innumerable of excited spectators—the vast masses of men in the Park—the gallant bearing of the corps that had come from so far to join in the work of the day—the imposing salute—these were all striking. But more than all these the march past dwells in the memory. Endless seemed the lines of people that we passed in our gradual approach to the saluting-point; then as we grew nearer came a perceptible settling down and bracing up of the regiment into an indescribable and anxious kind of tension, then the sudden striking up of our own well-known air, to the beat of which we seem to fall into an easier, truer step—a glimpse felt rather than seen of a glittering staff and the noblest lady of the land, standing in her carriage, her commanding air of queenly bearing caught, one can hardly tell how, so indistinct and rapid was that stolen glance. And then for a moment or two a sensation as if the whole company was one man, a consciousness that we have gone past like a wall, and then at last a waking up to hear the swelling and falling cheers and clapping of the spectators following us along the whole course of our further march. Simple as the movements of that day were, the display of the volunteer force in the face of the Queen and country was, perhaps, the most imposing scene we ever took part in.

Brighton has recollections of a quite different stamp—a bright morning, an early railway trip, an indescribable holiday crowd, all the shops shut, most of the houses decked with flags and many with fair faces. The movements amid the open downs, spacious and bright and breezy with keen sea air. Then a dusty march back, and a rattling sleepy railway journey home, or, perhaps, if we remain behind, a walk in the densest and most motley crowd that can well come together, and a general air of keeping open-house.

Guildford we recall, not without some uneasy memories of delay and discomfort, but with a more vivid impression of wildly beautiful scenery, rustic spectators, and an unusual sense of remoteness and country life.

Portsmouth, on the other hand, was all town and harbour; bright, busy, and military. Long as the day was to those who went and returned with their regiments, it was yet a great success. No sight could be finer than the Portsmouth review as we saw it, when, moved up to the high ground, we were able to glance back over the whole harbour, with its creeks and waterways, glittering in the sun, covered with active gunboats shooting out puffs of white smoke in regular, constant succession, while the shores were lined by masses of troops, some actively engaged, some held in reserve, and vast crowds of eager spectators crowned every spot that commanded a view of the scene.

Of Windsor we speak less willingly. It is not the beauty of the fine old park, or the brilliancy of the Royal c^ortège and staff, or the few and apparently unmeaning movements which followed the march past, that dwell in the memory. It is our long, weary waiting by the side of the dark, silent river, after we had become aware that the railway had hopelessly broken down. There we remained quite through the dewy hours of a summer's night, tedious and all too long, notwithstanding that it was the shortest of the whole year. That time we shall none of us, methinks, forget; nor the solitary house, and its hospitable inmates, heaven reward them! who toiled so willingly and so long in supplying water to slake what appeared the unquenchable thirst of hundreds of weary men. But if there was little to enjoy, there was much to admire, in the unflinching steadiness of the men, and the gallant constancy of our chief, who stuck to us through the whole, and came up to town with us in that tardy train which, starting soon after dawn had begun to break into clear day, landed us at Waterloo in the bright blaze of the early hours of a summer Sunday morning.

A better means of effacing the unpleasant memories which this review must have left in many minds could hardly have been hit upon than taking us again to Dover. There is an interest about Dover that none of the other spots have had. Gay Brighton, wild Guildford, nautical Portsmouth, each in turn has been a pleasant place to visit, a cheerful holiday sojourn for a day or two to those who have had the time; but at Dover there was something besides all that belongs to the review itself, and in addition to the co-operation of the fleet, the volunteer artillery in the Castle, the strong military force, and the noble space on the heights among which the review was held;—something that seemed to make the place more striking to those who simply came and returned, more interesting to those who stayed a day or two than any other locality.

For in truth Dover is a place that brings us face to face with our English history, from the day when Cæsar landed downwards. The ruins of several ancient buildings; the well-preserved or restored walls of others, here appeal to the eye as well as to the imagination; and if the reader feel himself struck by the beauty or stirred by the dignity of aught that he sees there, let the Rambler remind him, as he takes leave of a brother-volunteer, that these works were done at the time when every man was more or less a soldier as well as a citizen, and that it is incumbent on all citizen soldiers of the present day to emulate in the structures they raise now those noble qualities which we cannot fail to admire in the works of the past.

BLOCK HOUSES.

IN the same manner that the name of 'Pele Towers' has been applied in the north to those towers of defence erected against the sudden incursions of the Scots, so we find the term 'Block House' used in the south of England to describe the small castles or forts built for protection against any surprise in these quarters. But while the Pele Towers in Tynedale belong principally to the Edwardian period, the Block Houses, to which we shall briefly call attention, are exclusively of a much later age; they were in fact for the most part built during the reign of Henry VIII. It appears that they were mainly for the purpose of protecting the Cinque Ports, or

those towns or 'members' attached to them. It is well known that the Cinque Ports originally consisted of Dover, Sandwich, Romney, Hythe, and Hastings; to these Rye and Winchelsea were added by Henry III., and each of these ports had its subordinate towns or 'members.'

Walmer Castle, a member of Sandwich, was built by Henry VIII. in 1539. The place is rendered interesting by the landing of Julius Cæsar in 55 B.C., and the castle as the scene of the death of the Duke of Wellington in 1852. The fort in its original condition consisted of a central round tower, with walls eighteen feet thick, and flanked with four bastions pierced with loop-holes. It will be seen from the plan that it has been much altered in modern times, the ancient system of defence having also been superseded by guns mounted 'en barbette.'

Deal was also a member of Sandwich. The Block House was built by

close to the sea that the waves almost wash its bases at the spring tides, and its situation opposite the Goodwin Sands is singularly wild and desolate. Colonel Hutchinson died here in 1664.

Other Block Houses were built by Henry VIII., at West Cowes, Camber, Fowey Castle, Hurst, Motes-Bulwark, and South Sea, and there are two towers at Hull which partake of precisely the same character as those on the south coast; they are probably of the same period.

The travellers who a few years ago crossed the Channel and visited Havre, cannot fail to have been struck with the remarkable 'Tour de François I^{er},' which stood at the entrance of the harbour, and the similarity between this fort and the English Block Houses. The resemblance was probably owing to its having been erected at the same period and applied to like purposes of defence. It was demolished a few years ago.

Henry VIII. It served as a prison for the Roundhead Colonel, Hutchinson, and in 1648 withstood an attack by the Cavaliers. This fort consists of a central round tower, comprised within six semicircular bastions, each pierced with four loop-holes, and beyond these is a wall of enceinte.

Like those of Deal, Walmer, and Sangate, the Block House of Sandown consists of a central tower surrounded by four bastions, but, unlike its prototypes, remains in nearly its original condition. The fort stands so

PICTURES IN PROGRESS FOR THE ROYAL ACADEMY.

THE time is fast approaching when our painters will have to finish the works which they destine for the forthcoming Exhibition; and the public are curious to learn what is likely to be the character of that Exhibition. From all that we have seen, and all that we have heard, we have no hesitation in saying that it is likely to be up to the usual average, although, from a variety of causes, some of our popular favourites may not be as well represented as could be wished; nor will there be any of those large highly-wrought works which usually attract so great an amount of public observation.

Mr. Millais, owing to his recent severe illness, may possibly not be represented at all; he has been engaged on a subject from Romeo and Juliet, and several portrait pictures, and we hope at least to see some of the latter on the walls of the Academy. Mr. Frith, another great favourite, has confined himself this year to pictures of a smaller size than usual. His two principal works are, a subject from Don Quixote, and 'Nell Gwynn selling Oranges in the Theatre.' All who are acquainted with Mr. Frith's powers of expression and technical ability will be curious to see how he has rendered the features of the fair, frail, but good-natured mistress of the second Charles, and of his witty, handsome, unprincipled courtiers.

Mr. Calderon has painted two pictures, the figures in which are of a larger size than is usual with him. One represents two mediæval lovers seated in a boat, which quietly glides by the shady banks of some still river, the lover (some young poet, we should say) 'sighing out his soul into his lady's eyes.' Mr. Calderon's second picture depicts 'The Vengeance of the Guises,' Madame de Montpensier instigating Jacques Clement to the murder of Henri III., and contains some of this artist's best painting. Mr. Leighton will exhibit several works, to our thinking better than anything he has yet done. His subjects, as in previous years, are classical, and taken from the stories of Icarus, Electra, Phœbus, &c. Mr. E. M. Ward has two works, one of which, 'Martin Luther Studying the Bible,' is life-size, whilst Mrs. Ward, faithful to the domain of history, has selected this year an incident in the life of the Pretender. Mr. Yeames has taken for his principal subject, a Jacobite about to conceal himself in one of those curious hiding-places which still exist in the capacious chimneys of some of our old country mansions. The young gentleman is surrounded by his agitated sisters and mother, and the room in which the scene is laid is specially noticeable for its fidelity to the character of our ancient baronial halls. Mr. G. D. Leslie will be represented by two pictures, 'Cupid's Curse,'

'For this is Cupid's curse,
That they who change old love for new,
Let's hope they change for worse.'

and 'Coelia's Arbour;' the latter the most charming work that this very charming artist has yet produced. Mr. Armitage will contribute three works: 'Hero, with her Beacon,' life-size; a small picture of Christ calling the sons of Zebedee; and a study of an Eastern woman holding a chameleon, in a background of oleanders. Mr. Pettie has chosen for his theme 'The Fall of Wolsey,' as described by Shakespeare. This is the most important effort which Mr. Pettie has yet made; indeed, the rendering of surfaces and textures has been carried by him in this work to such an extent as to make the picture a very miracle of finish. Mr. Orchardson (the other Dromio) has chosen for illustration a very good subject—'The King's Antechamber.' Of course the period is supposed to be mediæval, and we have poet and parasite, sculptor and savant, priest and bravo, the worthy and unworthy, waiting for the royal favour to shine upon them. Mr. Wells, in addition to several first-rate portraits, sends a picture representing his own children, and which is likely to fascinate all the fathers and mothers who see it.

The two new Associates, Messrs. Poynter and Mason, will both be represented; the former by a portrait, a small picture of Andromeda, and a larger work, the return of the Prodigal, all characterised by that surprising technical excellence, remarkable in any English artist, and especially in one so young; Mr. Mason by two works, the subjects taken from that quiet rural life which this artist loves so much and paints so well. In this latter class of subjects we hope to see exhibited a picture by Mr. F. Walker, but as there is some doubt about it being finished we shall defer describing it. Another of our popular younger artists, Mr. H. S. Marks, has not this year been able to finish an important work, but makes up for the want of size in the picture which he sends by superior excellence; indeed, so great is the technical advance which he has made, that one can hardly recognise it as Mr. Marks's handiwork at all: this picture, which represents some mediæval musicians being shown into the gallery where they are to perform, is especially characterised by some charming colour and painting. Mr. J. E. Hodgson has lately visited the north of Africa, and his principal picture for the year shows us an Arab storyteller enchanting his Moorish audience with one of those thrilling tales with which the 'Arabian Nights' has made us familiar. Considering the interest which has been lately shown in these countries and their inhabitants, Mr. Hodgson's work is likely to attract the attention of the public. Mr. Storey, whose 'Shy Pupil' was one of the hits of last year, sends a picture in the same vein of genteel comedy. A beggar—an old soldier—is seen wheedling a shilling out of a pretty young lady by some artful but not undeserved compliment, the picture being in that light, pleasant key to which Mr. Storey is addicted. Mr. Wynfield's principal effort is of a semi-historic character—'The Rich Widow,' 'young,' 'beautiful and a great fortune,' one of those prizes so much sought after by the noble but somewhat scantily endowed courtiers of the Stuart kings. Mr. Prinsep will exhibit several works, of which 'Bacchus and Ariadne' is the principal, and Mr. Marcus Stone will have an important picture, 'The Princess Elizabeth forced to attend the Mass by her sister Mary.' Without alluding to the efforts of other artists—and indeed we have not as yet seen the works of those gentlemen who reside in the country—we have said enough to show that the forthcoming Exhibition will not be deficient in the interest which has attached to most of its predecessors.

MR. SHIELDS' REPORT ON THE NEW LAW COURTS SITE.

THE publication of a 'Report on the New Law Courts and their Approaches, by F. W. Shields, C.E.,' as a parliamentary paper printed by Order of the House of Commons, is in many respects the most startling incident which has yet occurred in the discussion of this question. Mr. Shields is known in Westminster as an engineer whose *spécialité* is metal work, and is the author of a small treatise on 'Iron Girders.' With every possible respect for such occupations, we confess it is very hard indeed to discover how they can constitute any qualification for his selection by Government authority to 'report' on a project which is mainly an architectural one. Mr. Shields himself admits it is so, by the very division of his subject. These are the heads of his Report:—1. Architectural effect afforded by the site. 2. Uniformity of level of its surface. 3. Economy of its acquisition. 4. Its accessibility; or, the convenience of its approaches.

It may well be asked whether the whole of these heads do not lie more naturally within the province of the architect than of the engineer, dealing as they all do with the streets and buildings of a city like London. The choice of a civil engineer to report on such a question points to some 'Theory of Selection' which would puzzle Dr. Darwin himself. It is true, however, that the matter is somewhat cleared up by Mr. Shields in the preface to his Report:—'The Chancellor of the Exchequer, understanding that I have given considerable attention to the question of the New Courts of Justice, and their approaches, will feel much obliged if I will favour him, &c.

The Chancellor of the Exchequer, as everybody knows, is Mr. Lowe, though everybody may not be equally aware of the circumstance that while he was as yet *only* Mr. Lowe, and had not the power of Government patronage in his hands, he bestowed during last session of Parliament the most amiable efforts to procure a Select Committee of the House to decide on the question of amount and compensation due to Mr. Shields as the unrecognised author of the Thames Embankment scheme! There is no reason whatever why Mr. Lowe should not have the most implicit faith in Mr. Shields' capacity for any conceivable work. We should be sorry to cast a doubt as to the propriety of his selection on anything like personal grounds, and, indeed, should not have alluded to the matter at all, if the 'Report' which is now issued to the public with the full prestige of a parliamentary document were really worthy of the notoriety which has been given to it.

Anxious to procure any information or argument on a subject in which we have proved our interest by the space we have given to it lately, we procured Mr. Shields' Report and carefully read it. It is not too much to say that every opinion expressed is, by this time, sufficiently old. Indeed, we need not scruple to observe that the greater part of it which the author devotes to his two first heads—architectural effect and levels—is nothing more than a *réchauffé* of matter which has appeared in these columns during the last month or two. As to 'architectural effect,' it is only natural that an engineer should look outside himself for his opinion; and as to 'levels of sites' there is information of a perfectly reliable kind to be had by anyone who cares to invest a shilling in the Ordnance map.

We must, however, do Mr. Shields justice by noting that his Report *does* contain one original and novel feature which has not yet taken a prominent place in discussions on the subject of the Law Courts' site. The suggestion we refer to is one which might probably be expected in the natural order of

things from one who attaches C.E. to his name. Mr. Shields' 'Report' culminates in a project for a *new railway*; and we are really driven to the conclusion, from a careful study of the document, that there is really nothing besides this which Mr. Shields can safely recommend. Whether the Embankment site is the best on the whole is left for public inference merely: the same may be said of the Carey Street site. Only one thing is certain—a *railway* from South Kensington to the Mansion House is the kernel of the nut which we call the Law Courts' site. A project for a railway from Hampstead Heath to the Crystal Palace would have been quite as pertinent to the real question at issue, as affecting the site whereon the New Law Courts should be erected. It may, however, be some comfort to those who advocate the selection of the Thames Embankment site to find that the engineer who thus reports his view of the two sites to the Government, considers that the adoption of the Carey Street site will involve a scheme for a new metropolitan railway which, on the lowest calculation, must require a greater expenditure than the Law Courts themselves. The Embankment site, of course, cannot incur this disadvantage, since it has the Strand thoroughfare on its northern side, and the direct route of the Metropolitan Railway on its southern face, with the superadded conveniences of river and road communication.

We observe that the latest contribution to the question of the two sites is supplied in a statement published by the 'Metropolitan and Provincial Law Association.' This document indulges in an amusing insinuation as against the advocates of the Embankment site. The Committee of this Association 'fully believe that there are private and venter influences largely at work in this agitation, and that art has less to do with it than is pretended.' It is due to Mr. Shields to state that he has written his Report without any attempt at such innuendoes. The Society which has resorted to them only proves how poor a case they possess on the merits, while the value of the insinuation will be duly appreciated by the public who know thoroughly well by whom and in what quarter the Embankment site was first suggested.

So far the question between the Carey Street and Embankment sites remains exactly where it was before the Report of Mr. Shields or the statement of the Law Association appeared. We shall be glad to note the opinions and arguments of others—and there are many—who have also 'given considerable attention' to the subject, even though their views may not be printed 'by order of the House of Commons.'

ILLUSTRATIONS.

DOVER CASTLE.

THE illustrations which we give this week all refer to Dover and its Castle, and are alluded to in our first article. The illustrations giving the present aspect of THE CONSTABLE'S GATE and THE GENERAL VIEW OF THE CASTLE are from recent photographs. THE VIEW OF THE CASTLE AS IT APPEARED A CENTURY AGO is from an old print. THE INNER BAILEY AND KEEP and THE AVBRANCHES TOWER are given from drawings by the late Rev. T. C. Hartshorne. We also give a careful PLAN OF THE CASTLE AND ITS SURROUNDINGS, upon which the different works can be very readily identified.

MR. RUSKIN.

THE limpid and sparkling play of Mr. Ruskin's eloquence never charmed a crowded audience more completely than in his lecture at University College.* The large theatre was full to the very doors, and, although the student element was perceptibly prevalent on the benches, a pin might have been heard to drop, by any one who was thinking of pins, during almost the whole course of the lecture. The speech of our great non-rhythmal poet glowed with the many coloured hues of his ever-changing fancy, like the pillared spray of some mountain cataract, overarched by a dancing rainbow; as fresh, as graceful, and as unsubstantial. As a glorious instance of word-painting, it would have been impossible to have a richer intellectual treat.

We may pay this tribute to the power of the orator, without forgetting the disappointment which he expressed, and in which many of his audience must have sympathized, that the illustrations with which he had proposed to elucidate his lecture on Greek Legend were absent. None but the most perfect illustrations, as Mr. Ruskin justly felt, would have been worthy of the occasion, and such effects of art he had not had time to procure, nor would he, in the eighty minutes during which his lecture lasted, have had time to display.

Indeed, in the unnecessary apology with which Mr. Ruskin so habitually commences his addresses, is to be noted one of his few defects as a rhetorician. Time, which can be but ill afforded, is wasted in the conventional introduction, and the impression of insincerity, than which nothing can be further from the speaker, is almost unavoidably produced by a long self-deprecatory preface. And, while on the subject, one other main rhetorical aspect of this great word-painter may be referred to, namely, that he 'doth protest too much.' As a rule he so far abuses the artifice by which the speaker represents that which he thinks, to be that which *is*, as to weaken the effect of his great descriptive force. In inference and allusion, indeed, his prodigality is unbounded; but if he more often intimated that some inexplicable paradox were merely the momentary phase of his ever shifting opinion, such solid residuum as remains, when the sparkle of the language has evaporated, would be more perceptible and more precious.

In listening to the eloquent voice, and in watching the beaming and unaffected smile that broke over the face of the speaker as he rendered, in his own felicitous English, some immortal lines of ancient epic, the scene, and the audience, and the hideous dress of the day, seemed thoroughly inappropriate. Looking only at the eye of the orator, and discerning how

much more he longed to say than he dared to say—how much of the written pages before him he left unread—the anxious zeal of a kindred spirit, whose name, but not whose function, is unrecorded, came strongly to the mind. Mr. Ruskin is eminently distinguished for his mode of expressing a classic sentiment in the language of Scripture. He cannot be displeased at the description of his own address which is given in the following words:—‘Then the Priest of Jupiter, which was before their city, brought wine and garlands unto the gates, and would have done sacrifice to the people.’ Like the hierophant of Lystra, moreover, the orator showed a grateful honour to a deity who might be thought especially to favour him: ‘Mercurius, because he was the chief speaker.’

Into that apology for the ancient writings which formed the nucleus of Mr. Ruskin's lecture, it is not for a writer in these pages to enter. With much of paradox it contained, doubtless, much of truth. And those who are familiar with the grimy cloud with which the uncleanly habits sanctified by the influence of the mendicant orders have obscured the fairest scenes in Italy, will find a chord of sympathy in their breasts, that vibrates very sensibly in unison with the orator's key-note. No Italian priest now forbids a suppliant to approach the Divine presence with unwashed hands—as in the instance of that famous sacrifice which was held to inaugurate the supremacy of Rome. But we must enter a protest against the mode in which, not in the commencement but in the course of his lecture, Mr. Ruskin attempted to explain away much of the significance of Grecian legend, and thus tended, far from wittingly, to depreciate the significance and the grandeur of Grecian art.

Nothing could be more lucid than the just definition of what Mr. Ruskin called a myth, but what we prefer to call a fable, parallel, or allegory. The description of an event is given, not as a history, but as the means of conveying to the mind a distinct lesson by the use of imagery, and the introduction of one or more impossible details is made use of by the fabulist, to show that he is not recording, but hinting, truth. Such was the method of one of the greatest and most immortal teachers of antiquity—Esop. Such was the method of a greater Teacher, to whom alone the word immortal is strictly appropriate.

But, after this announcement, Mr. Ruskin glided insensibly into the very discrepant German theory of the myth. He spoke of legends ‘crystallising into form,’ ‘throwing off the caterpillar state,’ and assuming the wings of Psyche.’ In short he threw the weight of his brilliant genius into the scale of that philosophy which would break down history, in order to develop it out of the internal consciousness of individual professors. And what concerns us, such an explosion of the theory of history tends to bury beneath the fragments caused by the concussion, the chief sources of our reverence for the relics and traditions of ancient art.

As to the twofold source from which ancient legend has sprung, we agree to a considerable extent with Mr. Ruskin. But he takes only a part of his theory, and he omits precisely the part which has most value to the artist. He draws far too much, we are convinced, on the theories of writers like Dupuytren (his *L'Origine des Cultes*). That some of the heroes and demi-gods of antiquity were ancient kings and chiefs, seen as they loomed through the golden haze of that poetry which is the native language of the childhood of peoples, no less than of individuals, cannot be denied. That physical phenomena or powers were denoted by other mythologic personages, such as Eolus, and Iris, and Thetis, and the swart smith who forged his thunderbolts in the volcanic glow of Etna, in the long period when Vesuvius had quenched his fire, we freely admit. But it is to a third source that we must attribute the origin of those forms which have chiefly occupied the chisels of the Grecian sculptors—those forms which yet, when unearthed from an entombment of two thousand years, beneath the ruins of ancient Rome, or the volcanic shroud that enwraps Herculaneum, all but breathe in marble and in bronze. The powers, and passions, and frailties of the human mind, were the gods and genii embodied by the artists, and hymned by the poets of Greece.

To represent the lofty virgin daughter of Jupiter, springing from the brain of the king of gods, as the ruler or spirit of the air, at once to ignore the existence of the cloud-compelling wielder of the thunderbolt, and of his sister wife, Héré—the very name is significant—and to render unmeaning the attributes of Minerva!

But we have no space to dwell on the charming subject, or to break another lance with so illustrious an opponent. We appeal from Mr. Ruskin to himself. At the commencement of his lecture, as of his writings, he is wont to assume all the precision of science. He indicates the path on which he bids us to follow him as if with the wand of Ithuriel. The way lies through pleasant valleys and meadows enamelled with flowers, but it leads straight to the temple of Truth. Woe to those who linger on the way! For all false guides is reserved that righteous anger which Mr. Ruskin is so fond of describing as the cardinal virtue of ‘Justice’—so much so indeed as to have varied a very venerable quotation into ‘He was clad with anger as with a cloke.’ We follow in awe and in delight. But our guide stoops to pluck a flower, then he turns for a second, then he leaps into the air and brings down a spray laden with blossom. He stops to load his followers with his many-leaved and fragrant spoil, and then he starts full speed after a glorious and erratic butterfly. We watch the elfin form fading in the distance at a pace we are unable to follow, and we sigh for the loss of the tender and loving guide who has, in his admiration of the last form of beauty that caught his appreciative eye, forgotten his self-imposed task to guide us to the Temple.

PARLIAMENTARY PROCEEDINGS.

Palace-Yard Station.

On Monday, March 22, Mr. LAYARD, First Commissioner of Works, in answer to a question by Mr. Herbert, who asked when the passage leading from Palace Yard to the station of the Metropolitan Railway was to be opened, stated that there had been unfortunately some delay with respect to certain works under the Yard, but he expected that the passage would

be commenced at once, and the architect would endeavour to complete it with as little delay as possible. It would be open in about four months.

District Asylums.

Mr. GOSCHEN, in answer to enquiries by Mr. W. H. Smith, said that the amounts of 56,000*l.* and 44,000*l.*, respectively specified in the returns relating to asylums (Metropolis) as the estimated cost of the structures of the Fever and Small-pox asylums at Stockwell and Homerton, did not include the amounts for furniture or fittings. The original estimate of the Stockwell Asylum had been reduced by 5,600*l.* But, on the other hand, the estimates for furniture and fixtures must, as yet, be regarded as simply provisional. They amounted to about 16,000*l.*, besides a sum of 6,700*l.*, which represented 10 per cent. for possible contingencies. These figures applied to the Stockwell Asylum, and not to the Homerton, of which he had not yet received any estimates beyond the cost of structure given in the return. In reply to a second question, with regard to the number of beds originally proposed, they were as follows, and he might observe that the estimates for the number of beds were those of the managers of the asylums, and not of the Poor Law Board, though the inspector had conferred with the managers. The number of beds at Newington was about 600, at Kensington 700, at Rotherhithe 500, at Poplar 570, and in Central London about 600. These were entirely provisional estimates, with regard to which no decision had at all been taken.

The Cadastral Survey.

On Tuesday, March 23, Mr. Cardwell, in reply to a question by Sir L. Palk, said the Cadastral Survey of the mining districts had been going on in Denbighshire and other counties, but at present it was not decided when that of Devon and Cornwall would be commenced.

Consolidation of the Sanitary Acts.

Mr. BRUCE, in reply to a question by Lord Eustace Cecil, said it was not his intention to introduce during the present session a bill to consolidate the various sanitary Acts, or to reconcile the conflicting clauses in some of them, although he admitted that the subject was well worthy the attention of the Government. He hoped to be able to introduce a short bill to facilitate the union of draining districts.

THE SITE FOR THE LAW COURTS.

ON Monday last a meeting was held in the Rooms of the Society of Arts to discuss the question of the site for the new Law Courts, the Earl of Harrowby in the chair. Among those present were Sir C. Trevelyan, K.C.B., Mr. Street, A.R.A., Mr. J. Young, and many gentlemen who have been associated with the subject. Mr. Thomas Webster, Q.C. commenced the proceedings by a statement advocating the Carey Street site, chiefly on the ground of its proximity to the legal quarter of the Metropolis. The Carey Street site would, he said, lessen the traffic on our great thoroughfares by rendering necessary the adoption of new streets leading east and west from Carey Street; that to the east, to relieve Ludgate Hill and Fleet Street, while that west would relieve the Strand. He suggested subways from Holborn to the Courts, continued to Serjeants'-Inn and the Temple, which would place all the centres of the law in connection with the Temple of Justice. These subways, he urged, could be so made as not to tempt the general traveller to use them. In conclusion, he dwelt upon the great saving of time to be hoped for by the concentration of the Courts.

Sir Charles Trevelyan contrasted the advantage and disadvantages of both sites in detail. He declared that, not only was the north side to be considered, but the south side of the Thames, for he said the southern side contained the suburban residences of a very large portion of those having connection with the law. He pointed out the various existing means of reaching the Embankment site: there were broad roads, omnibuses, a railway, the river, and other facilities; and showed that the outlay necessary to secure the required space between the Strand and the river would not be excessive.

Turning to the question of the best use to make of the already acquired Carey Street site, he urged that Gray's-Inn, Bedford Row, Hatton Garden, and other places on the Holborn site were dead or dying as dwellings for the lawyers, and suggested that those places should be given up for building sites for working-men's houses, which were much wanted, while the professional men there could take up dwellings on the Carey Street site. He also suggested that, as Old Square, Lincoln's-Inn, ought to come down, the Benchers might adapt a part of Somerset House, from which there would be an exodus of Government officials, and so be on an equality with the Templars in respect to the advantage of proximity to the Courts and offices. He declared that by his scheme the cost of site would be only 1,500,000*l.*, as compared with the expenses of the other, which, with its approaches, is likely to cost over 3,000,000*l.* Mr. J. Young supported the Carey Street site. He protested against the delay which would ensue if the questions were again considered, pointing out that the matter had been in hand for many years, and 800,000*l.* had been already expended. Mr. Street spoke on some of the alleged disadvantages of the Carey Street site, as represented by Sir Charles Trevelyan, which he stated did not exist, and added that the alleged advantages of the Embankment in respect of its expansiveness would be found to be overstated. Eventually the discussion was adjourned after the customary vote of thanks to the chairman.

THE HANDY-BOOK OF HOUSE-BUILDING.

CHAPTER I.—LIVING-ROOMS.

(Continued from page 129.)

Once more, to be comfortable, the living-rooms, and indeed every other part of the house, must be free from smells. The smell of cooking is the one most often intrusive; and a most annoying intrusion it is. This annoyance need not be feared if foreseen and sufficiently guarded against by providing proper doors and by care in planning the positions of the

kitchen, corridors, staircases, and above all of the dinner-lift, if there be one. To prevent the danger of noisome smells, it is a good rule that no drain be ever taken under any living-room. No cesspool should be formed within reach of the house. No space under a floor should be left inaccessible, so that if a rat or other animal dies there its carcase cannot be got out. The water used in mixing plaster should not be foul, or the house may smell of it permanently. The greatest and most vigilant care should be taken during the construction of a house that nothing offensive to the smell be left under any floor. The arrangements of the plan should provide, as will be elsewhere shown, for proper ventilation wherever an offensive smell could arise; and, lastly, if gas is introduced, the best workmanship and nothing but iron pipe should be insisted on. A very minute leak of gas (such as injury inflicted by a nail driven into a wall upon lead or zinc pipe may occasion) is not readily recognised by the sense of smell for what it really is, and many a room has been rendered unpleasant and unwholesome for a length of time by a very trifling escape; an unpleasant smell has been noticed, but as it has been very little like the scent of gas in large quantities, it has escaped detection, and consequently has remained unremedied for a long time.

Lastly, to be thoroughly comfortable, rooms, in fact the whole house, must be well appointed. In other words, all the fittings must be good, and such as will not get out of repair.

The bells must all ring; the handles of doors must never come off; the doors themselves must shut close; the shutters and the windows must open and close easily and without noise. If casement windows are used in a country house for access from the living-rooms to the garden, they must be so constructed as perfectly to keep out wind and water at their meeting and at the cill, and they must be so fixed as to remain perfectly steady whether open or closed, when wind is blowing. Blinds must always have a space prepared for them, and be so constructed as to work satisfactorily and easily. The fittings, in short, must all be good, and the joinery of thoroughly well-seasoned materials. This is very simply attained by a little care, a little outlay, and a little common sense to guide both.

The first rule in selecting fittings is to have everything simple. In London or a large town, where skilled help is readily at hand if anything goes wrong, it may be less unsafe to make use of contrivances that are more or less complicated; but in a country situation anything that it is beyond the power of the village blacksmith and the village carpenter to set right, at least temporarily, is out of place—the wisest course being, indeed, to have everything so simple that it hardly can go wrong.

Next to simple fittings, large-sized ones are to be insisted upon—good-sized knobs, shutter bars, window fastenings, taps, pipes, bolts, or locks, most certainly costing more than the smallest sizes, but they are always stronger, and generally better made. It may be a useful hint to all except builders north of the Tweed to add that all descriptions of ironmongery are made of larger sizes and more solid for the Scotch market than for ours: these are consequently the best to obtain.

A more appropriate opportunity for speaking of those fittings unconnected with living-rooms may be found hereafter, but it is right here to note that upon their acting satisfactorily depends much of the comfort of the inmates of those rooms. If we say nothing here of the discomfort felt in the dining-room when the kitchen range is out of order, the smoke jack does not act, or the oven has burnt the pie crust to a cinder; or of the misery in the boudoir when a neighbouring waterpipe has been burst by the frost, or in the drawing-room when the bath overhead has overflowed and spoilt the newly decorated ceiling (a reason, by the by, for never putting a bath-room over a good living-room if it can be helped), it is not because such accidents ought to be ignored, but because these matters belong to parts of the house which do not come into this chapter. Those appointments and fittings, however, which actually pertain to the living-rooms, i.e. the joinery and ironmongery of their doors and windows; the fire-place, with its grate, register chimney-piece, &c.; the bells; the gas fittings and the ventilators, do properly belong to it, and with regard to them we repeat with emphasis that the comfort of the house greatly depends upon their being simple, of ample size, and well made. Upon no part of a dwelling house is it more desirable to spend liberally than upon these appointments; and after all the difference between the cost of providing them in the best way and the cheapest amounts to a most insignificant fraction per cent. of the outlay upon any dwelling house.

BUILT TO SELL.

SIR,—Let me induce you to warn house-buyers to be very careful ere they part with solid sterling gold for new-built airy fabrics which scarce resist a gale of wind—structures which often fall down before completion, but are saddled with long leases, strict repairing covenants, and heavy ground-rents. Since the pulling down of so many City, Westminster, Borough, Clerkenwell, Somers Town, and other ancient buildings, for railway and street improvements, these rotten old materials have been freely used in the suburbs, but are so cleverly concealed by the aid of new facing-bricks, new thin floor-boards, plaster, paint, and showy paper-hangings, as oftentimes to dupe the unwary and incautious purchaser, who, alas! very soon discovers that cracked window-arches, sinking foundations, stopped drains, leaky roofs, shrunk woodwork, shabby floors, falling rotten plaster, rising damp, smoky chimneys, and other minor evils, sadly try his patience and pocket; in short, that in the long run it would be a saving at once to pull down and rebuild properly the vile erection, than to be at a continual expense and worry for unsatisfactory repairs.

I for many years have been almost daily amongst speculative building estates N., S., E., and W., and witness the operations of needy 'duffing builders,' who run up on some of those sites dwellings which, if you view

in carcase the abominable materials combined with the slight, rapid, scamping, and unskilful workmanship, would convince anyone they were meant only 'to let and not to last,' that they were only contract-built edifices by 'slop builders,' certainly not sturdy houses like those which our ancestors were so justly proud of for their weather-tight and durable qualities.

As dilapidations are incessant, no landlord can accept low rents for 'sala houses.' I entreat both tenants and owners to ascertain, with strict care and vigilant enquiry,

1st. That the house is not built on made soil, where the gravel has been dug out and sold.

2nd. That it has deep concrete foundations.

3rd. That all the materials are new, and the bricks sound hard-burnt stocks, well bonded in lime-mortar.

4th. That no iron chimney-bars supporting the arch are absent.

5th. That the drainage is distinct and separate, properly connected with the main sewer.

6th. The strength of joists, quarterings, lintels, rafters, purlins, sills and sill-heads, thickness of doors, floor-boards, shutters, skirtings, shelving, panels—in short, quality and quantity of timber used. It is frightful to see how slightly houses are timbered and scantily nailed.

7th. Whether the grates, locks, ironmongery, blinds, and other fittings are of the very cheapest description, unfit for wear.

8th. That the house has a trap-door fire-escape to roof.

9th. Avoid zinc gutters, cisterns, flats, &c., as zinc is a very temporary affair. Insist upon lead or stone cisterns, &c.

10th. If the parish has not taken the road, have money security for its cost from seller. It may save you 10*l.* to 30*l.*

11th. Find out if it is an estate where any scamping is allowed, to create heavy ground rents and lawyer's leases.

12th. Investigate the title thoroughly. Beware of needy bankrupt or litigious sellers, and improved or increased yearly ground rents.

Lastly. Insist upon a warranty (legally drawn up) with full specifications attached, subject to penalties if false. Have the warranty before deposit or purchase.

In conclusion, let me declare my picture of modern houses might have been presented in much worse colours, as every district surveyor or workman can easily certify, and no doubt many will do so, in reply to this brief epistle on one of the frauds of the day, viz. 'built to sell,' 'to let and not to last' houses.

I am, Sir, your obliged reader,
WM. PERCY TRUEMAN.

NEW BUILDINGS AND RESTORATIONS.

Investigations have been for some time in progress at the eastern end of the south aisle of the choir of Chester Cathedral, Mr. Scott being of opinion that the aisle originally terminated with an apse, and that the foundations in that case might still be discovered. The necessary excavations have now been made, and the casing of the present walls immediately above has been carefully examined; the result being that the actual basement courses of the apse and distinct traces of a conical tower or buttress above it have just been discovered, of the utmost interest in an ecclesiastical point of view. This feature, unique, it is believed, in this country, though not unknown in Normandy and other parts of the Continent, must have been destroyed at the time when the very ugly and now tumble-down chapel at the south-east corner was added to the venerable Lady Chapel, to the great disfigurement and prejudice of that beautiful structure. Mr. Scott will propose to restore this curious apse, and to remove the ruined southern chapel altogether, revealing once again to the eye the beautiful portions of the original Lady Chapel.

The Proposed Harbour and Basin at St. Just.—The provisional order applied for, is thus reported on by the Board of Trade:—The promoters are Messrs. Vivian, Daniell, and others, who apply to be incorporated as 'The St. Just Harbour and Pier Company,' with a capital of 70,000*l.* in 7,000 shares of 10*l.* each, with power to construct a harbour and basin on Pornenven beach, near Cape Cornwall with piers in connection therewith; to borrow 17,500*l.* on mortgage and to levy rates. The estimated cost of the work is 48,000*l.* No objection has been made to the scheme, and the Board of Trade propose to proceed with the order.

The parish Church of Wath, near Doncaster, has been re-opened, after having been closed about fifteen months for a thorough restoration. The organ, a fine instrument built some years ago, has been removed from the west end of the church into a new chamber or chapel, built expressly for its reception, and the fine old gothic arch under which it was before situated has thus been opened. The ceiling has been altogether remodelled in the chancel, and the entire flooring of the edifice lowered in order to bring to view the ancient foundations of the pillars. The old pews have been replaced by comfortable oaken seats, which add much to the internal neatness of the place, whilst the ancient pulpit has been replaced by an elegant carved one of the same pattern as the new seats in the chancel and corresponding with the communion rails. The four tablets of Commandments have been removed, and put over the principal arch between the nave and chancel. The stained glass window, erected by Miss Scholfield, and which used to be at that side where the organ is now situated, has, of course, been removed, and put in at the opposite side of the chancel. In addition to these extensive alterations the church has a much better provision for lighting than formerly, the unsightly pipes being now substituted by elegant brass standards. Altogether when finished the alterations will very materially improve not only the appearance of the place, but the means of convenience and comfort to the parishioners. The cost of the restoration has been 1,800*l.* The architects have been Messrs. Hadfield and Son, of Sheffield.

A Christian Church is to be erected at Nazareth. The estimated cost is 2,000*l.*, and towards that amount 1,820*l.* have been received.

Lowestoft.—Christ Church, Lowestoft, has been opened for Divine service. The edifice is in the Early English style, and consists of nave, aisles, chancel, organ chapel, tower, and spire, with porch and vestry. The tower is placed at the south-east angle of the nave, terminating in a spire, rising to a height of about 80 feet.

Lincoln.—The new church for the combined parishes of St. Peter-in-Eastgate and St. Margaret will, in all probability, be shortly commenced. The cost of the building is estimated at 2,500*l.*, and 2,120*l.* have been already subscribed.

Warrington.—A new church at Warrington, dedicated to St. Ann, has been consecrated by the Bishop of Chester. An endowment has been provided by Mr. W. E. A. Beamont of Orford Hall, who has also given 2,500*l.* of the total cost of 5,200*l.*, the remainder having been contributed by the public.

Webbeath.—The plans of the new church have been prepared. The style is Early English. The plan is simply nave and chancel, with a south porch at the western end, a bell gablet at the intersection of nave and chancel, and a vestry, and organ arch between it and the choir.

Wickham Market.—Efforts are now being made to restore the church, which dates back to the year 1349, and has of late years been falling into decay. The tower, which is octagonal, is surmounted by a leaden spire, rising to a height of 135 ft., and is a conspicuous landmark for seagoing vessels.

Some months since an east window of great beauty was placed by Mrs. Hogg in the church of St. Mary the Virgin, Collaton, near Paignton, in memory of her husband, the founder of the church. Since then the deep and affectionate reverence entertained for his memory has been testified by the addition of two south chancel windows, and of a reredos in Caen stone; the former being the gift of Mr. Hogg's brothers and sisters, and the latter that of several friends. The windows were designed by Mr. J. F. Bentley and Mr. Westlake, and executed by Messrs. Lavers and Barraud. The 'Resurrection' and 'Christ's Charge to St. Peter' are the subjects of the two windows, which are spoken of in terms of high praise. The subject of the sculpture in the reredos is 'The Last Supper,' in alto-relievo, originally treated, but with a faithfulness to the highest traditions of art, especially in the head of our Blessed Lord, worthy of the great Leonardo. In this work the artists have aimed to preserve the unity of the group while giving diversity to the individual characters. The whole was executed by Mr. Piffers with his well known skill. The architectural portions of the reredos, designed, as well as the group, by Mr. Bentley, executed at the works of Mr. Earp, consist of a groined canopy, with panels of Irish green marble, surmounted by the 'Agnus Dei' and the 'Pelican in her Piety.' The wall-arcades (also of Caen stone) on each side of the altar, and returning north and south of the chancel, spring from plinths of yellow Mansfield stone, and contain large panels of polished red Staffordshire alabaster, between which are canopied angels. A cornice of foliage and fruit, elaborately carved, surmounts the whole design.

Rebuilding and Enlargement of Poplar Union Workhouse.

At a special committee meeting of the Poplar Union Board of Guardians, held last Friday morning in the Board-room of the Workhouse, James Barrington, Esq., in the chair, tenders were opened for rebuilding and enlarging Poplar Workhouse. As far back as 1857, Mr. Farnall, Poor Law Inspector of Workhouses, reported this Workhouse to the Poor Law Board as 'inadequate in size, and inefficient in arrangement.' At the present time it is over-crowded by 530 inmates, and for many months the Guardians have been compelled to 'farm out' more than 500 people, who, in addition to the first-mentioned, claimed admission to the House. The greater portion of the old Workhouse is to be demolished and, the Guardians having acquired additional land at the rear, a new House is to be erected capable of accommodating 808 persons. It was originally intended by the Board to provide accommodation for 1,000 able-bodied paupers, and plans were prepared in accordance with this intention, but, upon the drawings being submitted for the Poor Law Board's approval, those gentlemen refused to sanction the carrying of them out; and, suggesting certain modifications which brought the number to be accommodated down to 808, recommended the Poplar Board to prepare fresh drawings, embodying the views of the Poor Law Board. There was considerable dissatisfaction expressed by the Guardians at this, but it was eventually resolved to accept the Upper Board's *dictum*, and the architect, Mr. John W. Morris, of East India Road, Poplar, was instructed to prepare a fresh set of drawings. Having done so, the architect submitted the new plans, and the Poor Law Board immediately approved them. The Local Board then issued invitations to builders to send in tenders for the works. The architect's estimate of the cost of the works, as originally determined upon by the Guardians (*viz.*, for 1,000 paupers) was 47,709*l.*; but the extensive modifications suggested by the Poor Law Board reduced this sum by 12,709*l.*; the estimate, therefore, for the building to accommodate 808 persons stood as 35,000*l.*

There were fifteen tenders for the works sent in, as follow:—

Messrs. Wick, Bangs & Co.	£34,200
Mr. John Kirk	35,996
Mr. Sheffield	33,267
Messrs. Cooper & Callum	34,980
Messrs. Myers & Sons	34,564
Mr. Ancombe	32,300
Messrs. Atherton & Latta	33,855
Mr. Abraham	33,490
Mr. Ennor	34,700
Messrs. Hill, Keddall & Waldron	32,480
Mr. J. F. Watts	36,589
Messrs. Webb & Son	33,263
Mr. Killbey	36,116
Messrs. Scrivener & White	34,854
Mr. Henshaw	34,350

The special meeting having discussed the tenders, and conferred with the

architect in reference thereto, decided to recommend to the Board's consideration the two lowest tenders, namely Mr. Ancombe's and Messrs. Hill, Keddall and Waldron's.

At the ordinary business meeting of the Board, held on Friday afternoon, the Committee's recommendation was read by the Clerk, and a very lengthy and animated discussion ensued. Numerous resolutions, counter-resolutions, and amendments were proposed, some of which were seconded and put to the vote, whilst others could find no supporters and consequently 'fell through.' One proposal advocated the addition of Mr. Sheffield's name to the recommended two on the score that that gentleman was resident in the district and would employ labour from the district; Messrs. Webb's tender was then proposed on the same grounds: a third proposition suggested that the Committee's recommendation should be thrown over, and the fifteen tenders submitted to vote. After more than two hours had thus been spent, Mr. W. Hickson, superintendent of the West India Dock Co., moved, and Mr. J. R. Ravenhill, engineer, seconded, 'That Messrs. Hill, Keddall, and Waldron's tender be accepted, as Mr. Ancombe, whose tender is the lowest, has not complied with the Board's condition in regard to the provision of sureties.' (It appears that Mr. Ancombe had not supplied the addresses of the parties proposed as his sureties.) This resolution was carried by a majority of 6, and Mr. Waldron immediately signed the contract. The Board's seal was then affixed to the contract, and the Guardians proceeded to the general business of the day.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Paris Notes for Connoisseurs.

The first day of the great Delessert sale passed off with all its expected éclat, some of the gems having fetched enormous prices. The first lot consisted of the famous Raphael, the 'Virgin and Child,' of the Orleans Gallery, which was purchased by M. A. André for the Duc d'Anmale, as it was said in the room, for the sum of 150,000 francs (6,000*l.*). Four works by Backhuysen sold for 1,300*l.* Five by N. Berchem for 1,332*l.* Even at these high rates it is said that several works were bought in.

The results of the latter days' sales are more surprising even than those of the first day, and the total proceeds of the whole amount to 1,795,330 francs, over 71,813*l.*, the total number of lots being only 2,180. The second day's sale, consisting of the remainder of the pictures by old masters, brought the largest amount of the four days. The most noticeable cases were the following:—'Sunset,' by Jean Both (called the Italian Both), 720*l.*; 'Two Canalettis,' 540*l.*; 'A Dutch Interior,' by Pierre de Hooge, bought by M. B. Narischkine, for the large sum of 6,000*l.*; 'The Interior Court of a Dutch House,' by the same artist, 1,640*l.*; 'The Dutch Musician,' by A. Van Ostade, bought by M. Say for the sum of 940*l.*; 'Portrait of an Old Woman,' by the same, 860*l.*; 'The Fish Market,' by David Teniers the Younger, fetched more than any other work in the sale, namely, 6,360*l.*; 'An Interior, known as the White Hat,' by the same artist, fetched 444*l.*; two of Gérard Terburg's pictures, 'A Young Woman and a Cavalier,' and 'Tasting,' sold for the comparatively high rates of 1,200*l.* and 1,800*l.* Two landscapes by Wynants, with figures by A. Van de Velde and Lingelbach, sold for 1,340*l.* and 2,040*l.*

The modern pictures sold quite as well in proportion as the ancient; thus, a small and early work by Rosa Bonheur fetched 620*l.*; a fine Bonington, 'François Premier and Marguerite of Navarre,' 1,240*l.*; 'Sainte Cecilia,' by Paul Delaroche, 840*l.*; 'The Old Lacemaker,' by Baron Leys, 720*l.*; Meissonier's 'Chess Players' (1841), 1,080*l.*; and 'The Amateurs' (1843), by the same artist, the large sum of 1,600*l.*; an exquisite flower and fruit piece, by Saint Jean, fetched 660*l.*; a Swiss landscape, by Wickenberg, 480*l.*; Pradier's 'Phryné,' the marble statue which, if our memory does not deceive us, won one of the grand prizes at the Great Exhibition of 1851, sold for 440*l.* The sculptor's fame has waned sadly.

At the sale of the collection of the late M. Breithmeyer, a picture by Prudhon, 'Venus, Cupid, and Hymen,' presented by the painter to his friend Parent, then artist at the Sèvres factory, sold for 180*l.* At the same sale the water-colour drawings and sketches fetched extraordinary prices, the most remarkable items being 'A Sketch of a Turkish Merchant,' by Bida, 19*l.*; 'The Death of Titian,' a pencil sketch by Delaroche, 9*l.*; 'A Sketch of a Scotch Shepherd,' by Gavarni, 9*l.*; 'A Head of St. John,' by Gleyre, 12*l.*; a small water-colour, 'Steps in a Park, with figures of the time of Louis XIII.,' by Isabe, 15*l.*; 'Cromwell's Daughter begging her father to preserve the Portrait of Charles I.,' a sketch by Raffet, 10*l.*; 'The Finding of the Body of Charles the Téméraire, Duke of Burgundy, after the Battle of Nancy,' by the same artist, 13*l.* 10*s.*; and 'The Grand Canal of Venice,' in water colours, by Ziem, 26*l.* 10*s.*

At another sale a sepia sketch by Rosa Bonheur, of 'A Farmer's Horse at the door of an Inn,' sold for the relatively large sum of 27*l.* 10*s.*; at the same sale seven drawings by Ingres, some of them heightened by colour here and there, sold for sums varying from 7*l.* to 15*l.* each; a sketch in red chalk of 'A Young Woman Working,' by Meissonier, for 14*l.* 8*s.*; a drawing by F. Millet, of 'The Interior of a Barn,' 13*l.* 8*s.*; and a Hussar in sepia, by Horace Vernet, for 8*l.*

The rage for ancient *faïences* knows no diminution; there was a sale in Paris on the 8th and 9th instant, at which some Urbino ware fetched remarkable prices. A large dish or plateau attributed to Orazio Fontana with a coat of arms in the centre, surrounded by an arabesque frieze, executed by what is called the process of *bianco sopra bianco*, and having on the broad edge a composition representing the fall of manna in the wilderness, sold for the large sum of 226*l.*; two other dishes fetched over 60*l.* and 60*l.* respectively; a *gourde*, or vase, with two handles, 53*l.*; and a three-lobed fruit stand on pedestal, 188*l.* At the same sale there were several other remarkable objects, as for instance a small Gothic reliquary in carved wood, which sold for 89*l.*; two terra-cotta vases by Clodion,

52l.; a round tazza in Limoges enamel, painted in *grisaille* by Raymond, 1558, sold to M. Stettiner for upwards of 60l.; and another vase in the same style and by the same artist, 1575, sold to the same collector for 68l.; a saltcellar with foot, painted by Pierre Raymond, 35l.; two square enamelled slabs, the painting attributed to Pénicaud, 50l.; and another small square enamel in *grisaille* by Leonard Limousin, 1539, 21l.

The other day a Parisian connoisseur picked up a treasure at a *bric-à-brac* shop in the Rue Eau de Robec at Rouen, an enamel painting in perfect preservation, by Leonard Limousin, which had hung for years on the wall of the staircase of a cooper's house in the town. The work is a portrait on an ultramarine ground, and its archeologic value is greatly increased by the discovery that it represents Michel Nostradamus, the famous, or notorious, doctor and astrologer of Catherine de Medicis and Charles IX. The lucky finder paid 200 francs for the treasure, and immediately sold it to a Paris dealer for 3,000, who is said to have re-sold it for 8,000 francs.

Amateurs of French painting witnessed the dispersion of a very fine collection in Paris on the 22nd instant; the collection includes pictures by many of the first French artists, including Marilhat, Meissomer, Rosa Bonheur, Cabanel, Charlet, Corot, Diaz; five works by Decamps, Prudhon's 'Andromaque,' from the Laperlier collection, four pictures by Diaz, 'Mephistopheles and Faust,' by Eugène Delacroix, three works by Isabey, studies by Ingres and Léopold Robert, three by Giraud, landscape by Th. Rousseau, and two works by Troyens. Also, 'Faust in his Study,' 'Marguerite at her Wheel,' and two other works by Ary Scheffer; with a few pictures by the old masters.

On the 23rd and 24th instant was to be sold the collection of the late well-known dealer M. Moreau-Wolsey of Paris, including works of all schools, and some rare productions of the fifteenth century. Amongst the most remarkable are the famous triptych, by Hans Memling, formerly belonging to the Sforza family; a Lucretia, attributed to Albert Dürer; and a very fine Claude. The collection is in all respects a very remarkable one, and includes amongst other works one by Sir Joshua Reynolds; an English brick-field with sunset, described as a vigorous work.

On the last day of the present month is to be sold, also in Paris, the collection of M. Kractzer, of Mayence, including many works of great importance, principally of the Flemish school. This is the busiest period of the art season, but it will shortly be checked by the dissolution of the Chambers and the coming elections.

Notes from Germany.

In a previous Number we noticed an Art Exhibition, to be held at Wittenberg in Germany, this summer. The building for this purpose has been commenced, and is described as of *u* shape, having a frontage of 500 feet, with three receding wings. The sky line of the front elevation is broken up by the dome of a central hall, seventy feet in diameter, in the middle of which there will be a handsome cast-iron fountain. The two spaces formed by the three wings at back will form open covered courts containing machinery in motion, and the various processes of wood carving, ivory cutting, turning, repoussé work, weaving, bookbinding, &c., will be shown here. The entire available space will amount to 156,000 square feet.

The council of the museum at Stuttgart having advertised for designs for a new building, a number of architects responded to the invitation, and the result is just published. The first prize, of 1,200 florins, was awarded to Messrs. Grossheim & Schwarz, of Berlin; and the second prize, of 800 florins, to Professor Wagner, of the Architectural College at Stuttgart. The latter gentleman had chosen for his motto—'Deficiente pecuniâ deficit omne.'

Mr. Wichmann, the Munich sculptor, has just finished his model of Goethe. The statue will be in bronze, and is to be inaugurated on August 28, that being the 120th anniversary of the poet's birthday. Goethe was born at Frankfurt, on August 28, 1749.

The Archeological Society of Heidelberg has collected sufficient funds to enable it to make a partial restoration of the fine old castle. The part to be first taken in hand is next the chapel, and immediately over the Great 'Tun.

An anonymous benefactor has sent to the municipal authorities of Leipzig the sum of 20,000 dollars (3,000l.), to be expended in the erection of workmen's dwellings.

The Emperor of Austria has lent to the Museum at Vienna a very fine collection of church furniture, of the time of Henry the Lion (1194). The collection includes specimens of Byzantine and Cologne enamel, gold vessels, reliquaries, portable altars and book covers, chiefly taken from the Cathedral of Brunswick and the Church of St. Michael at Luneburg. The Council of the Museum has published a catalogue with illustrations of the principal and most curious of these objects.

The Brandenburg Gate at Berlin.

This gate occupies at Berlin very much the position which the Arc de Triomphe does at Paris, for whilst the latter leads from the Champs Elysées to the Bois, the former leads from the Linden to the Park. Until lately the 'gate' consisted of a double row of six Doric columns, having an entablature over, and surmounted by the Quadriga, which in 1806 was taken to Paris, but was restored to its original position in 1815. From the designs of Professor Strack two wings have now been added, each consisting of four rows of five columns each. These, too, are Doric, but only about half the height, including entablature. The cost of these additions amounted to 35,000 dollars (5,250l.)

New Hotel-de-Ville for Vienna.

Detailed particulars of the terms of the competition for this great work, which is open to architects of all countries, will be found in a supplement of four pages appended to the *Moniteur des Architectes* for December, 1868. Twelve prizes are offered by the municipality, amounting in the aggregate to 2,800l. The designs are to be sent to Vienna so as to reach the Municipal Council of that city not later than September 1, 1869.

Improvements at Dresden.

Dresden is following in the wake of larger cities in its efforts towards

improvements, and the densely populated state of some parts of the town and the increasing number of its inhabitants, besides a constantly fluctuating amount of strangers (of whom the police accounts show there were 104,000 last year), seem to call for some effective measures for additional accommodation. With this view Mr. Löhmman, Engineer in Chief, has laid before the Minister of the Interior a project for rectifying the banks of the river on both sides of the Elbe, by means of embankments, similar to those of the Thames, though on a somewhat smaller scale, and for utilising the space thus gained as sites for public and private buildings. The eastern embankment will commence at the Elyseum and continue to the Marien Kirche, whilst the western will run from the Lamb Battery to the Bridge of Augustus.

Indian Notes.

Art.—Some interesting remains of Greek art have recently been exhumed from the bed of the river Indus, at a village called Rokri, in the Mianwali sub-division of the Banu district. Mr. R. Egerton took the first instalment of these curiosities, in the shape of three beautifully sculptured heads, which are now in the Lahore Central Museum. Mr. Priestly, the Assistant Commissioner of the sub-division, has since exhumed some further remains.

Architecture.—The Government of India has agreed to contribute towards the restoration of the Calcutta Medical College Hospital a sum equivalent to any amount, not exceeding three lakhs of rupees, which may be raised by private subscriptions and the municipality. The hospital was opened in 1852, but the building was severely condemned by the Sanitary Commissioner in 1865-66.

The Governor of Madras has published a minute on the conservation of ancient architectural remains. Lord Napier there shows how unworthy it is of our Government, and unjust to the natives of the country, to permit historical monuments to be obliterated. 'We are now constructing,' he says, 'the Streevagantum Weir with the materials of two grand pagodas. The Mussulmans pulled down the pagodas to build a fort, and the English are pulling down a fort to make an irrigation work. The gods are going to the river. Art will not suffer, and agriculture will gain. The great Brahmical structures, on the other hand, which are still the seats of pilgrimage and worship, possess, either in land revenues or in the offerings of the faithful, sufficient means of restoration and maintenance.' The restoration of Bejanagur, his lordship thinks, would be as impracticable as the restoration of Palmyra, but still something might be done to arrest its decay. The palace of Tirumala, at Madura, Lord Napier would restore to serve as public offices, and he points to Mr. Chisholm as an architect capable of carrying out the work. His lordship very justly criticises the liberal expenditure of the Supreme Government at Delhi and Agra, which had no reference to such practical purposes as are contemplated in the Madras restorations.

Engineering.—The Harbour Committee at Madras have finally closed their proceedings by recommending Colonel Orr's proposal for the straight-line breakwater 6,250 feet long, extending from Messrs. Parry's to the north side of the railway station at Royapooram, and at a parallel distance of 1,200 yards from the shore, in $7\frac{1}{2}$ to 8 fathoms water.

A report is published by the *Rangoon Times*, that the Government of India has sanctioned thirty lakhs of rupees for the construction of a railway from Rangoon to Promé.

A new company is being formed in Calcutta for the reclamation of the salt-water lake, by means of the town sewage. The necessary capital has been estimated at thirty lakhs of rupees, upon which, it is expected, a Government guarantee will be given.

A Committee has recently been formed in Madras for the purpose of enquiring into the mismanagement of the minor irrigation works in that presidency.

The Egyptian Government, in view of much shipping being attracted towards Port Saïd, on the opening of the Suez Canal, has sanctioned the erection of three lighthouses on the Mediterranean, at Cape Burlos, Damietta, and Port Saïd. The defences of Alexandria Harbour are being strengthened by iron-clad gun-boats.

A Runaway Ship.

During the late severe gales a large vessel, called the 'Belle of Lagos,' got adrift in the Mersey. The force of the wind carried her against the Waterloo Dock wall, by which she was so much injured that her crew, alarmed at the critical state of affairs, jumped ashore. The vessel, now left to herself, was driven with great force against the northern bridge connecting the great landing stage with the Prince's Dock wall. Her bowsprit penetrated the outer casing of the bridge, and the rolling of the vessel seriously injured the wrought-iron cross girders which support the roadway, as well as the planking. One of the enormous chains which support the mooring of the stage was snapped asunder. After considerable difficulty, the vessel was towed away, and taken into dock, though in a terribly battered condition.

The Abbey Bells of Bath.

The citizens of Bath are much concerned at an accident which has befallen the fine old tenor bell of the Abbey church (which weighs 38 cwt., and is about five feet in diameter at the base). The bell has long been celebrated for its rich, mellow tones; but soon after the ringers commenced practice on the day of the accident it gave forth an unusual sound, and upon careful examination, a crack, extending seven or eight inches from the bottom, was discovered. The bell in question was originally presented by Lady Hopton in the early part of the 17th century; but was recast in 1700. About seventy years later it was disabled, and to such an extent that it was feared remoulding would be necessary. The crown of the bell was unfortunately broken off, and the bell remained useless for some time. At length Mr. George Clark, a builder of the city, to save expense, undertook to refix the bell. Doubts were entertained as to the efficacy of his plans. Nevertheless, he accomplished his work, and he did it in this way. The crown being severed, holes were bored in the top of the bell, which was then suspended to the beam by iron bands; and so it has worked and remained ever since. There appear to have been originally (namely, in 1622) six bells. But by the assistance of friends and a rate on the city, they amounted to ten in

number in the year 1700. The following quaint inscriptions are on the bells:—

1. Bennet, Esq., Mayor, 1774.
2. Nicholas Beaker, George Clark, Wardens, 1774.
3. When yov Mee ring, I Sweetly sing. A.R. 1770.
4. God prosper the Church of England. A.R. 1770.
5. Prosperity to all our benefactors. A.R. 1770.
6. Pray Ring vs Trv. Wee will praise yov. A.E. 1770.
7. Peace and good neighbourhood. A.R. 1770.
8. James Smith, Samvel Ditcher, Wardens. 1770.
9. Thos. Gibbs, Mayor, Mr. Willim Clement, Minister, Anno Domini, 1770.
10. All yov of Bathe That Hear Mee Sovnd, Thank Lady Hoptons Hvndred Povnd.

ABRA. Rvdhall Cast vs all. 1700.

We may remark that Abraham Rudhall was a noted bellfounder of Gloucester, who brought the art to great perfection before the year 1684. Some of the most famous peals in the West of England were of the Rudhall make; besides many others in different parts of the kingdom.

Mauritius Railways.

The railways in the Mauritius are by no means in a flourishing condition. The sum required to pay the interest on the capital amounts to 60,000*l.*, and the amount to be paid annually as a sinking fund to 18,000*l.*, whilst the total net receipts have only reached 26,000*l.* This leaves an annual sum of 52,000*l.* to be made good by the colony, whose finances at present appear to be in anything but a flourishing condition.

Important Discovery.

The Americans believe they have done away with the process of puddling iron. The famous discovery is already in active operation at the Shoemaker Juniors Works, at Pittsburg. The method consists in taking the melted pig-iron direct from the blast furnace, running it into a kind of large kettle, which will hold about five tons, from whence it is poured in a stream about a foot wide into a circular trough 12 inches wide and 10 inches deep, revolving on a radius of 7 feet or 14 feet diameter. Here it is mixed with pulverised iron ore (oxide of iron). The ore descends from a hopper into the revolving trough, and covers the melted metal as fast as it is poured in. The continuous revolutions of the trough produce alternate thin layers of melted metal and raw ore. When the trough is full, and before the metal is cool, it is broken up into slabs of suitable size for the heating furnace. This process, which consists in incorporating iron oxide with the melted pig-iron, yields, we are assured, malleable iron equal in quality to puddled bars.—*Scientific Review.*

Preparation of Lime.

The use of lime prepared in powder has been for some time extensive in France, and the advantages are considered to be very great. The subject has just been laid before the Paris Academy of Sciences, by M. H. de Villeneuve-Flayosc, and cannot fail to have great interest for the readers of **THE ARCHITECT.**

The success of works executed on the largest scale with this form of lime is regarded as placing the value of the method employed beyond all doubt, and therefore the details were laid before the Academy. The mode of operation was described in the following terms:—1. Slack the lime not by immersion in the minimum dose of water, but, on the contrary, sprinkling upon it all the water it will absorb, and continuing until the powder becomes pasty. 2. Heap up the lime, and let it remain for at least eight days: the longer it is left thus, the more complete will be the disaggregation of the lime. 3. Sift the slacked lime: the recently-formed lumps will be broken up by the sifting, while any old lumps must be broken down by means of exposure to the air, only sprinkling with water.

The powder obtained by this method is thoroughly slacked; it cannot become further disintegrated after being used, but becomes an integral part of the building.

The meshes of the wire sieves used in its preparation should not be more than $\frac{1}{16}$ inch square; for the finest powder being most readily saturated by water, produces the best paste. 4. In order to preserve the lime in the state of powder, it should be kept in loose heaps under a shed, or elsewhere, completely protected from the rain; when compressed in any way, the carbonic acid in the air causes it to cake together: even in barrels there is danger of this effect being produced.

Lime prepared in the manner above described will keep good for years, as proved by experience.

The economy as regards the raw material, the diminution of trouble in the mixing, and the absence of all the inconveniences attending the ordinary slacking of hydraulic lime, have won for the powdered lime the approbation of the engineers and builders of Paris. This preparation of lime favours in an extraordinary manner the execution of great public works abroad; the contractors for the works of the Isthmus of Suez, and the engineers of the Algerian railways, are now regularly supplied with the powdered lime shipped from Marseilles.

Powdered lime promises to be of great value for agricultural purposes, as it contains no lumps of quicklime to lie in the soil, where it is moistened in an irregular manner, and must produce injurious effects.

Ebbw Vale.

It is intended to erect a new school-house at Ebbw Vale, in connection with the English denomination in that town.

New Hospital and Dispensary Competition, Rotherham.

About eighty designs have been prepared and submitted by architects in competition for this building, being answers to an advertisement that has appeared frequently in our pages. Some of the designs have come from a great distance and are very carefully got up. The walls of the Mechanics' Hall, the largest room in Rotherham, will be devoted to their exhibition. A sub-committee will meet on Thursday, to decide on what further steps shall be taken towards selecting the three premiated plans. It is to be hoped that they will see the advisability of calling in the aid of a professional adviser.

The proposed site lies to the south-east of the town, and occupies the summit of some rising ground overlooking Doncaster Gate. A more suitable place for the purpose could scarcely have been chosen, as it is near the town, and windward of the smoky district.

The ground from its contour and elevated position is dry and healthy. Considering the population of Rotherham, it is strange that it has remained for so many years without such a useful institution. At present all pauper cases of any importance have to be taken all the way to Sheffield, and this, too, in a place so liable to wholesale accidents amongst its factories and coal mines.

The new hospital, according to the present scheme, will contain only twenty-six beds. We presume that the committee contemplate future extension.

Statue of Lord Palmerston.

The statue of Lord Palmerston, in bronze, was cast last week by Messrs. Holbrook & Co., Chelsea. The figure is seven feet high, and weighs about one ton five cwt. It is in one casting, not having a single joint in it. To accomplish this, great care and skill were required in making the mould and running the metal. The late statue of Sir Robert Peel, that was placed for a short time in New Palace Yard, has contributed about ten cwt. of its metal to Lord Palmerston's statue.

It is some time since a vote was passed in the House of Commons for a statue of Lord Palmerston, to be erected in New Palace Yard. Several eminent sculptors were invited to send in designs. The committee appointed to select the best chose that of Mr. Woolner, who has undertaken to supply and erect the figure complete on its site. The casting and erection have been sublet to Messrs. Holbrook & Co., who have undertaken to have the figure finished and in place in May next.

The sculptor has represented Lord Palmerston in the act of addressing the House of Commons. One of the chief difficulties in the reproduction of large figures in metal is the necessity of casting them in one piece. If cast in several separate parts, the metal figure has frequently an appearance of stiffness, and often causes the delicacy and freedom of the artist's model to be lost. Great lifting power was required in handling the mould, which was about ten tons, including the metal in the figure.

The Louvre.

Two extra rooms have just been opened in the new Louvre in connection with the Renaissance sculpture galleries; one contains tombs and bas reliefs of the Roman-Christian period and the other reproductions of the great Bruges chimney-piece, and of the tombs of the Dukes of Burgundy, now in the museum of the old Burgundian palace at Dijon. The Burgundian tombs were found in pieces in cellars and crypts several years since, but they are wonderfully perfect and form not merely interesting examples of Burgundian decorative composition, but specimens of the most magnificent sepulchral monuments in the world.

The whole of the Greek, Roman, Renaissance, and modern sculpture galleries have recently been restored, and the two latter much enlarged. The new rooms are at present only open to the public on Tuesdays and Fridays from 12 to 4 o'clock.

Visitors to the Louvre should also enquire for another special room, only open once a week, which contains a superb collection of drawings by the old masters.

Archaeological Discoveries in Italy.

The Marquis de Gualterio, the Minister of the King of Italy, and to whom belongs the honour of inducing Victor Emmanuel to undertake the excavations at Herculaneum, has made a most interesting discovery on his own estates in the environs of Orvieto. He has found a number of specimens of Etruscan pottery of various forms, besides Greco-Roman ware—the latter of the same kind as the famous vase of Cannes, belonging to the Campana collection, and which was sold to a Russian for two thousand pounds. This pottery, which will create quite a sensation in the archaeological world, is remarkable for perfection of workmanship, elegance of form, and purity of design. The decorations of the vases are in composition, *stuc*, and in relief, and the subjects are derived from the Labours of Hercules. The chief specimens are two grand vases and a patera. The latter is intact, and shows great taste and beauty; the figures represent the struggle of Hercules with Nemean lion. The vases are not in such good preservation, but the most important parts have not suffered. One represents Jupiter and Alcmena, the other the combat between Hercules and the Queen of the Amazons. Amongst the relics is a fine vase with handles, decorated with well-modelled heads; it is of Greco-Roman origin.

In addition to these is a specimen which is believed to be unique of its kind. M. Gualterio has yet only found half of this specimen, which is decorated with figures of very good effect. There are two *quadrigæ* or chariots, representing, it is supposed, scenes of the Olympic games, called *fêtes* of Hercules; the other parts of this vase are being sought for with great care.

M. Gualterio has named the sepulchre in which these precious relics were found the Tomb of the Priest of Hercules. The collection has been carried to Florence, where the fortunate discoverer is occupied in classifying, studying, and having them reproduced by photography.

General.

Mr. G. E. Street, B.A., has just received his diploma as Foreign Member of the Royal Academy of the Fine Arts at Vienna. This recognition of the claims and merits of English architecture in the person of one of our most representative architects, if we may be allowed the term, is a matter for congratulation. Mr. Street is one of the men who have helped to form the character of the art of the present day, and his work, though much of it is no doubt open to criticism, is yet always conscientious, and marked by science, learning, and taste. Its peculiarities must be, we should fancy, very strange in the eyes of a Viennese artistic body, and we are the more glad that its undoubted merits are thus recognised.

Mission Church, Waterhouses.—A mission church at Waterhouses, near Durham, has recently been erected from the designs of C. Hodgson Fowler, Esq., architect. The building is a simple parallelogram in plan externally, while internally it is divided into a nave with sanctuary having a vestry on the north side, and a porch for the school children on the south. The whole is under one roof, with the sanctuary marked by a lofty flèche, and buttresses below. The east window is a triplet under an enclosing arch, and the side windows are coupled lancets. The whole building is of fire-brick, with hollow walls, no stone being used except for sills and steps. The accommodation is for 200 in the nave, and the cost 530*l*.

During the morning service on Sunday, at the village church of Herringwell, Suffolk, the edifice was discovered to be on fire. The fire was occasioned by the heat of the iron piping, which ran from a stove through the thatched roof. The church was quite destroyed.

Messrs. Holtbrook & Co. are now preparing to cast, in one piece, a colossal statue of Her Majesty the Queen, from the design of Mr. Wood. It will be 12 feet high from base of pedestal to top of crown, and will be cast in Florentine bronze. When completed it will be sent to Canada.

The Royal Academy wishes it to be made known to artists that the regulation requiring water-colour drawings to be 'framed close, without mounts,' has been rescinded, and that artists are at liberty to frame their drawings as they please. The caution against the use of excessively wide frames still holds good.

The Electric Field Telegraph is to be made use of for directing the movements of the troops at the Dover Volunteer Review on Easter Monday. This application of telegraphy to the conduct of warlike operations is of course not new, but it will be the first time that it has been made use of in the field on the occasion of a Volunteer Review.

The Church of St. James of Wardendown at Dover, now under restoration, contains a remarkable feature in the shape of an aisle on the south side of the nave, but of unusually great width, and at a lower level than the floor of the church. In this curious structure anciently sat the Courts of Chancery and Admiralty.

Tunnelling under the Sea.—A proposal has been made for uniting Ireland and Scotland by means of a railway tunnel. The entrance to the proposed tunnel on the Irish side is to be from a point about midway between Cusheden and Cushendall on the coast of Antrim, and, on the Scotch side, at Glenstrone, from whence it will run through the head of the Mull of Cantyre. The total length of the tunnel under water would be fourteen miles three furlongs, and it is said that the ground through which it would have to be made is exactly suited for tunnelling operations, and the sandstone for lining it can be had in any quantity on the Irish side. It is proposed to construct the tunnel for a single line only, the extreme depth being twenty-one feet, and the clear width at the level of the rails fifteen feet. It is proposed, however, to lay down three lines of rails to accommodate wide and narrow gauge carriages. The gradient at the entrance to the tunnel on the Irish side would be one in sixty for about five miles; it would then fall to one in eighty-two for about half that distance, and to one in seven hundred and seventy-three for about five miles in the centre of the tunnel under the water, rising from that to one in two hundred and seventy-two, then to one in one hundred and thirteen, then to one in sixty for about the same distance as on the Irish side, which continues to the entrance of the tunnel on the Scotch side. The estimated time that would be occupied in completing the tunnel is, allowing for all contingencies, under six years, and the cost under four and a quarter millions. To pay a dividend of five per cent. the weekly earnings must be forty-two pounds per mile, and an estimate is appended to show that the gross earnings would be largely in excess of this amount, and that the mineral resources of the land in the immediate vicinity of the Irish end of the tunnel would be immensely developed.

The Thames at Wapping.—A public meeting was held on Friday evening March 19 at the Turk's Head, Union-stairs, Wapping, to consider the propriety of petitioning Parliament to provide an embankment to prevent the frequent overflowings of the Thames into the property in the district. Mr. W. Creighton, who occupied the chair, in opening the proceedings, said that at present, whenever there was a high tide, the river overflowed, entered the houses, and but a very short time ago the whole of the inhabitants of one street were compelled to remove from their tenements. When the water subsided, the floors and furniture of the inhabitants were coated with mud, which emitted a most disgusting odour. Taking these facts into consideration, he thought it was the duty of the inhabitants of the district to stir in the matter. Mr. Brown, landlord of the Turk's Head, said that he had had his cellar full of water four times in three weeks, and on the last occasion it was full for two days. A boat was then plying for hire along the main street. In Plough Alley, a court directly opposite, the water was 7 ft. deep, and the people living in that court had to sit for about ten hours till it subsided, their beds being saturated, and their furniture floating about in all directions. A number of other statements were then made by sufferers. A Mr. Andrews declared that when the street was last flooded he had to drag a woman in at the first storey of a house in Plough Alley to save her from drowning. Mr. Whitfield, living in the High Street, said he often had three feet of water and mud in his shop. A Mr. Peaman, whose house happens to be slightly below the level, said he had nine feet of water in his house a few weeks ago, and that on this occasion the water was level with the top of the counter of the Dundee Arms, a publichouse on the higher side of the street. A committee having been formed to collect information, the proceedings were adjourned.

The New Central Branch Synagogue.—On Thursday, the 18th inst., just forty years after the dedication of a neighbouring structure to the services of the Jewish religion, the first stone of a building henceforth to be known as the Central Branch Synagogue was laid by Baron Lionel de Rothschild. The site is a piece of ground reaching from Great Portland Street westward to Charlotte Street; and this will be occupied by a

Moresque edifice of stately elevation and ample interior space, the ground area measuring 70 by 60 feet, and the galleries, according to the plans, giving a considerable addition of space. The architect is Mr. N. Solomon Joseph. The cost of the building will be 24,000*l*.

New Window at the Abbey Church, Tewkesbury.—A fine painted window has been inserted in the west end of the church, and is, we understand, intended as a memorial to the late Mr. John Terrett and his sister, Miss Mary Terrett, whose beneficence to the public charities and institutions of the town is well known. The subject of the painting of the window is 'The Adoration of the Magi,' illustrating the text 'They brought unto him gifts of gold, frankincense, and myrrh.' The window has been executed by Messrs. Heaton and Co., of Garrick Street, London.

Earthquake-proof Architecture.—The recent earthquakes on the Pacific coast have necessitated the adoption of some new style of building in that section of the country. Mere brick shells will not stand many heavy land shocks, and the architects of San Francisco are now busy over earthquake-proof plans of architecture. The last severe earthquake in that city cracked a large number of brick walls, which have had to be braced together with iron rods to make them in any way safe. A very little heavier shock would have tumbled them in ruins. The fact that these sensations may come at any time has somewhat shaken the faith of the people in the security of their brick houses. One of the new plans proposed is to build a compact wooden frame structure, and surround it with brick walls. The frame would secure it against falling, and the walls would render it fireproof. A large publishing-house in San Francisco is soon to erect a store upon this plan. Another method proposed is to build thick walls with iron girders inserted in them, and riveted at the angles. There has been considerable discussion among builders on this matter, and a new field is open for the ingenuity of architects. Anybody who will guarantee to put up a house that will stand an ordinary earthquake without damage, whether it be built of wood, stone, iron, paper, or rubber, can make his fortune on the Pacific coast.—*New York Times*.

The Edinburgh Museum.—The Lord Provost of Edinburgh has received intimation to the effect that the Government are prepared to insert in the Estimates for the ensuing year a sum of 10,000*l*. towards the extension of the Museum of Science and Art, on the understanding that the ultimate cost will not exceed 53,335*l*. 17*s*. 2*d*., and also under certain conditions with regard to properties in the neighbourhood of the building.

On Saturday last (March 20) the foundation stone of a new Church was laid at Cheetham Hill. The Architects are Messrs. Paley and Austin, Lancaster. The cost is estimated at 10,000*l*.

It is proposed to raise a monument to the memory of the late Lord Gough. One proposition is that it shall be placed in St. Patrick's Cathedral, Dublin; but another, and the more popular of the two, is that it shall be placed in one of the principal thoroughfares of that city. A large sum will be easily raised for either purpose.

The estimates of the cost of building the new Opera House at Paris amounted to 16 millions of francs. More than double that sum has been already expended, and it is now confessed that the total will come up to 48 millions before the work is completed.

Rome.—The Chevalier Rosa, Imperial director of the excavations on the Palatine, has discovered some remnants of statues in a corridor leading to a staircase which was filled up with rubbish, probably fallen in or thrown in from a *lucernarium* above. The principal piece is a mutilated figure of a child, in basalt, at first supposed to be an infant Hercules, but which seems to have formed part of a group. The torso is very fine, but part of the head and portions of the arms and legs are wanting. This statue seems to be of the Augustine period. The other pieces are four detached heads of statues of merely decorative style, but of which two have been decidedly identified as portraits of Drusus and Agrippina. Photographs of the subjects, with a report of the mode and locality of their discovery, have been forwarded to the Emperor Napoleon.

The Tunnel through Mont Cenis.—Steady progress continues to be made with the works of the great tunnel through Mont Cenis. At the end of last month 9,386 metres had been completed, viz., 5,474 metres at the south end, and 3,912 at the north. The number of metres still to be excavated is 2,835. The opening of the tunnel through its entire length may be expected to take place by the month of July, 1871, or perhaps earlier, owing to the improvements which are constantly taking place in the manner of working.

The Ateliers of mosaic attached to the Vatican at Rome have taken fire, in consequence of the negligence of some of the workmen in leaving rosin and mastic near the stove. The flames soon spread, and destroyed all the beautiful mosaics preparing for St. Paul's and many other churches, which were in an unfinished state. The fire was happily extinguished before reaching the library or museum, but the damage is estimated at 80,000 scudi.

The Sewage of Kingston.—Mr. Rawlinson, the Government Inspector, opened an inquiry on Monday last at Kingston, the corporation of that town having petitioned the Home Secretary for power, under the Sewage Utilisation Act, to acquire about 160 acres of land situate at Ham, facing the river by Teddington Lock, on which to distribute by irrigation the sewage of the borough. The strongest possible opposition has been raised to the scheme by the local boards of Ham, Teddington, and Twickenham, as well as by the Orleans family, and other influential residents in the neighbourhood. So many technical objections were advanced upon the mode of procedure adopted, that the Inspector adjourned the inquiry for some days to consider the questions raised.

MEETINGS OF LEARNED SOCIETIES.

ARCHITECTURAL ASSOCIATION.—Friday, April 2, at 8 P.M. Members' Soirée.

SOCIETY OF ARTS.—Wednesday, March 31, at 8 P.M.

LONDON INSTITUTION.—Thursday, April 1, at 6 P.M. Professor Bentley, on Plin's.

The Architect.

ART AND ARCHITECTURE IN PARLIAMENT.

ASTER has come and gone, the brief Parliamentary holiday is over, and our legislature is about to recommence the work of the Session with little further prospect of break or pause till the advent of the shooting season brings its proceedings to a close. And the present seems an appropriate time to ask the question, Will the arts, the public buildings, the public works, and the art-teaching of the country be in any degree touched upon? will they be helped or hindered, aided or neglected? and shall we, at the close of the Session, be in any respect in a better position than at the present moment?

It is not to be denied that a Government professing and actually practising financial reform is not always, perhaps not often, in a position to make large grants of public money for artistic works. But still we must not forget that it was when Mr. Gladstone himself held the purse-strings that the vote for restoring the Chapter House at Westminster was obtained; and that even an economical Chancellor of the Exchequer has, after all, the spending of a good many millions of money in the year; so if works are a necessity, it may be that the funds will be forthcoming.

But there is a function of Government quite different from the finding of money. Undertakings of all sorts have to be, or at least ought to be, directed, controlled, sanctioned, watched, and governed. The actual fact ordinarily being that they come to Parliament for powers to do something or go somewhere; and having submitted to conditions, without which parliamentary consent could not have been obtained, they secure their powers, and exercise them with a very convenient disregard of the conditions annexed; and that, in fact, little or no control could be or is exercised by that department of the Government with which the undertaking is supposed to have to do.

Still, we have departments, and they have some work to do. There is a First Commissioner of Works, and it is a matter for congratulation that this post is filled by a gentleman and a traveller who has given much attention to matters of fine art and architecture. It is also gratifying that Mr. Layard has shown by his recent appointment of Mr. Fergusson that he is not averse to secure for his department the services and the counsels of an eminent architect.

Whatever chance there may be of doing some good with the Government, we are not aware that there is either more or less chance than there has been of useful action being taken by the House of Commons. That body reflects the prejudices and the deficiencies of the English nation pretty faithfully, and the idea that art is not practical, and that no good can come of it, is pretty deeply rooted in the breast of the average Briton. Still, let us hope for the best, knowing that we are not altogether without members who are alive to the claims of art and artists.

Of the subjects that will claim parliamentary notice, the one most pregnant with importance is probably hardly known even to the majority of those interested in its operation. Lord Elcho, as is well known, has procured the nomination of a committee, containing several well-known and trustworthy names, to consider the question of the Villiers Street viaduct, which, our readers will remember, was examined with some care in a recent number of THE ARCHITECT. Since it appeared that through inattention or by surprise a scheme had received parliamentary sanction which ought really never to have obtained it, nothing was more natural than that the terms of the reference to the committee, in addition to the investigation of what has gone wrong this time, should include a few words as to the possibility of preventing the same sort of thing from happening again; and here, if we mistake not, lies the most important part of the duty of this committee.

Lord Elcho, there can be no doubt, was fully aware what his proposal implied, and we believe that the true solution of the question, how best to regulate public works in the Metropolis for the future, will, as was suggested in the House when the committee was agreed to, be found in the appointment of a small permanent board of advice, to which board should be submitted all schemes affecting the

Metropolis coming before parliamentary committees, and all measures of Her Majesty's Board of Works, or the Metropolitan Board which promise to affect London public works. Such a board ought to consist of men thoroughly conversant with Architecture, Art, Science, and Public Works; that is to say, of professional men of standing. Its members ought in all probability to be paid for this work, and its recommendations ought to have the greatest possible weight with the First Commissioner of Works and with committees of the House.

It would in all probability be desirable that the members of the consulting board thus suggested should be nominated by the leading artistic and technical societies. Thus, the Royal Institute of British Architects, the Institution of Civil Engineers, the Society of Arts, and, perhaps, the Royal Academy, might each, with great propriety, be asked to name one of their own body. That rising and influential society, the Institution of Surveyors, might possibly claim to send an additional member; but if so, we hold that one of the purely art societies, such as the Arundel, or the Graphic, might with almost equal propriety make the same claim; and the one might perhaps be set against the other.

The advisers thus recommended might with great advantage meet weekly, and it is very certain that even if there were no express understanding that all proposed Metropolitan works undertaken or sanctioned by Government should be submitted to them, at least the actual result would be that the plans of such works would come under their eye:—no minister having such a council would willingly take the responsibility of neglecting to take its advice. Had such a body of men existed at the time, it would never have been permitted the railways to span the approach to London Bridge with the hideous girder there visible, or to blot out so much of the fine view of St. Paul's from Fleet Street as is cut away by the ornamented but not ornamental viaduct at that point; nor would it have been left to the action of a single member accidentally made aware of what was going on to prevent such a barbarity as the intended demolition of the pedestal of King Charles's statue at Whitehall—a step which was not only contemplated, but actually arranged for under a former administration.

We sincerely trust that Lord Elcho will secure a hearty recognition from his committee of the importance of establishing permanent and known experts as a kind of Committee of Vigilance to keep the Government well advised; and this being so, we trust that no difference of opinion will arise as to the other branch of the reference to them, but that they will unite in recommending the abandonment of that great blundering eyesore, the viaduct.

The large space still unappropriated at this portion of the Thames Embankment invites the notice of the committee, and we believe that a scheme for the suitable occupation of this site by a large public building such as would receive the support of the present Government will not have to be long sought when the time comes.

The next great question connected with public works, which cannot fail to be early discussed, is that all-important one of the site of the Law Courts. Mr. Gregory has given notice of a motion on the subject, to come on during this month; and if the discussion of the subject in this and other journals, and by the Society of Arts' committee, has produced its due effect on the public mind, there will no doubt be a reference of the whole scheme to a parliamentary committee—possibly to that of Lord Elcho—and legislation in accordance with the opinion arrived at in the course of the inquiry may be expected. We hold it to be of great importance that this subject should be fully and dispassionately considered, and we strongly urge all who have influence to promote that consideration by sending in petitions. All the leading professional societies ought to petition for a full, a complete, and a decisive investigation of the whole question. The legal societies, as well as the architectural ones, are interested in the best possible site being chosen; and the very fact that many able and thoroughly disinterested men have taken up the Embankment site ought to convince even those who most strenuously advocate the Carey Street site that an inquiry will not be out of place.

Lord Redesdale, it is understood, will bring forward a measure in the Lords relative to Artistic Copyright. At present there can be no doubt that both law and practice are very unequal, and the right to reap the fruits either of a scientific invention or a literary work is much better defined and secured than the analogous copyright which an artist, especially if he be an architect, is supposed to possess, but hardly does hold in a tangible form. The subject is a very wide and a difficult one, but there can be no doubt that all these classes of inventors—he who creates a work of art as much as he whose creation

is literary or scientific—deserve to stand on the same footing, whatever that footing may be.

The 'Science and Art Department,' with its large and incomplete undertakings, its extensive museum, and its system of art-education, may or may not provoke a little discussion. Probably not: but there can be no doubt that while a useful, and, let us add, liberal, expenditure of public money has been secured for this department, mainly through the indefatigable exertions and the iron will of Mr. Cole, there are under that department branches which languish as well as branches which flourish.

The art-education of the country is not in the condition in which we should like to see it, and is not sufficiently elevated or sufficiently progressive to render to art, and to our manufactures, all the services which might, we think, fairly be required of it; at least, such is the impression we gather from the actual results whenever we have been able to examine them, and such is the opinion of many impartial judges. If the teaching of art-students be not the very best that can be devised alike as to the methods pursued, the objects studied, and the instructors employed, the work of the department must fail of its results, and we believe that in a considerable number of art-schools there is much room for improvement in one or in all of these respects.

The dispersion throughout the country of specimens of art-workmanship and design, in the various loan-collections cannot fail to do good, and this part of the work of the department is being well done. Perhaps the reformed Parliament could not do a greater service than to supplement this practice by the converse, and remove wholesale the most ambitious of the examples of bad art which so constantly meet the eye in travelling through the country and the metropolis. In London, for instance, we should like to advocate a clean sweep of all the public statues and all the drinking fountains. It is quite true there are one or two statues and one or two fountains not quite without merit, and these might possibly be saved, but it would be an immense boon to be spared the others. In the country, we should like to destroy a majority of the cemetery chapels, and if it were not a kind of demi-semi-treason, to annihilate all the Albert memorials. To make of England in these respects a *tabula rasa*, and then start afresh with good taste and good judgment, is unhappily as impossible as to start our whole railway system afresh, with some definite plan to guide us, and some recognised principles as to competing lines; but both ideas are pleasing fictions enough to contemplate. Wren had such a chance after the fire of London; but his was a solitary opportunity, such as, we trust, will never occur again.

Among matters which we should like to hope might be subjects for legislation, is a subject nearly allied to architecture. We allude to the preservation of ancient monuments, ruins, works of art, and historic remains. Within the last few days two cases have come to light of famous and very ancient remains being entirely destroyed for the sake of stone or lime. Every such monument lost is a national loss, and there can be little doubt that a kind of special protection ought to be extended to such remains as are of great value either to history, archaeology, or architecture. Private enterprise, it is true, does much to replace the care bestowed upon such monuments in other countries by their governments; but private enterprise is fitful and uncertain, and we should like to see the invaluable and decaying memorials of past days safe from the caprice, the neglect, and the wilful dilapidations of ignorant or perverse owners or occupiers.

Other matters will no doubt arise, and will be duly chronicled in our columns as the Parliamentary session goes on; but nothing can be likely to occur of more general importance than Lord Elcho's Committee, taking into account its possible scope, and the latent capacity for useful development possessed by the subject it has to investigate. We are sanguine that good will come out of it, and shall anxiously watch for the fulfilment of our expectations.

OUR RAMBLER

OVER THE HOLBORN VALLEY.

A LITTLE thing will collect a crowd in London—the appearance of two cats on a house top, approaching one another with howls of angry menace, the false step of a cab horse, the mere fact of a person's standing still and looking fixedly in one direction. It was thus, one cold day a week or two since, that a little mob began to agglomerate on the new and sprucely paved island that has recently been thrown up opposite to Hatton Garden.

There was little enough to be seen. Two sturdy navigators, each armed with one of those long narrow pickaxes which are peculiar to the paviors of London, were endeavouring to open an iron door in

the pavement. It was a roughened slab of iron, over which you might have walked a score of times without observing that you trod on anything but the flagging. On inspection, however, you became aware of the presence of a gigantic keyhole. The navvies were unprovided with a key, and when one of them struck the plug intended to guide the pipe of that implement, it vibrated like a harp string. He inserted the end of his pick, and endeavoured to 'prize' up the heavy trap, while his companion stood ready to thrust his own instrument into the aperture as soon as the door began to rise. Then the end of the pick broke short off. The usual variety of spectators halted around. There was the selfish, pushing man, who usually comes to the fore, and makes his way through life chiefly in virtue of his negative qualification—entire absence of delicacy. He is mostly stout and robust, and thrusts himself before his betters, or even tramples on their toes, just because he wants to see what is going on. There was the officious, somewhat anxious man, a lean counterpoise to the other, (who is generally stolidly silent), with his suggestion that a pebble should be put into the crack. There was the satiric, or sneering man, who recommended the unasked counsellor to do the kind office by means of his umbrella. There was the openly jocular person, who improved upon this hint by suggesting the insertion of a finger or a toe. Amid all this friendly counsel, blended with one or two expressions of a rather strong vernacular idiom from the operatives, up came the door. As it was fixed at right angles to the pavement by a convenient catch, it became evident that some one had given a good deal of thoughtful attention even to so simple a subject as a trap door.

For, as the flap rose, a grating took its place. It was not merely a grating under the flap, but there were cams or projections on the hinges, by the movement of which the grating rose to occupy the very space which the solid shutter had previously filled. The matter was simple enough—trivial, indeed, in the original sense of the Latin word—but it deserves notice as an instance of that precaution to which, in a crowded metropolis like London, many a casual passenger may be indebted for safety in limb, if not in life. The fall of two or three inches from the level of the pavement to that which, without this little mechanical arrangement, would have been that of the grating, might have thrown down many a feeble or heedless pedestrian. As it is, the solid door may stand open for purposes of ventilation or of light, and yet no possible inconvenience can be caused to the traffic of the footway.

The door having been raised in this fashion, the grating followed. A man with a lantern descended into the aperture, down a steep, narrow, stone staircase. Two or three persons followed, and our Rambler joined the party.

Reverting for a moment to the group above, who only peeped down when the grating was re-closed over the last who descended, let us recall what else met the eye. We have referred to the commodious 'island,' in the centre of which is a handsome lamp-post. Directly to the north of this point trends the street which runs through the site of the garden of Sir Christopher Hatton, yet commemorated by his name. At an angle of 45 degrees, or thereabouts, dips out towards the New Meat Market, a wide, new, well-paved road, laid out at a regular and practicable gradient of 1 in 45. To the south, Shoe Lane seems to blush, in unwholesome hues, at its naked narrowness. St. Andrew's, Holborn, shows more of its exterior than it has long been accustomed to do, and the demolition of some of the former line of houses shows a building, opposite the church door, that looks as if it must have been erected for a parsonage, in days when green glebe surrounded the churchyard, and when the parson's neat garden was shaded by lofty elms. Such houses are never built in streets, except it be in the picturesque and broken street of a country town.

To the east runs a long, level, open roadway—open as yet, on either side—over which is commanded a noble view of the finest classical building in England, some say in the world; in which, over an interior rather suited for Pagan than for Protestant rite, swells the magic dome of St. Paul's.

In a few years, when the row of stately houses which has already been commenced shall have lined both sides of the level and gently curving thoroughfare, few of those who rattle over its surface will be aware of how much cost and care, and long struggle with all sorts of opposition, has been bestowed on the spot. Probably there is no hill in the world which has been the scene of so much stone-breaking, knee-breaking, and heart-breaking, as Holborn Hill. From the narrow and lofty portal which was adorned by the grim effigy of the Saracen's Head, the Western coaches, half a century ago, used to issue, and after a brief and somewhat perilous descent commence their day's journey by a slow drag up that rise of 1 in 15:—1 in 13 it is said to have been at one part. In no place has the roadmaker been so driven to his wit's end. Pitching of all sorts has been tried there from time to time—small granite sets, fixed so as to give a series of very short steps, like the teeth of an enormous saw, being at one time in favour. Granite, however, soon turned to mud beneath the constant grinding traffic of Holborn Hill, and from twenty to thirty minutes' time was lost by every omnibus that carried its heavy load of passengers from the West-end into the City, or back again, by the slow and painful ascent; albeit the drivers had recourse to the skid, and rattled gaily down to the bottom, arriving in either direction.

What has been designed and is now in course of accomplishment to obviate these evils, is the roadway known as the Holborn Viaduct, and carried on a substructure of brickwork from a point near Hatton

Garden to the top of what was Snow Hill. With this undertaking, which will carry the east and west traffic at a dead level, had necessarily to be combined the means of descending from the level of Holborn to that of Farringdon Street, so as to accommodate the traffic which, coming from the west or east, turns at this point north or south; and though the viaduct is the most conspicuous, and has no doubt been the most important part of the scheme, it could have been of little use apart from the system of new roads, to some of which allusion has already been made.

If you ramble along the narrow footway, which, confined between two hoard fences, leads along the foot of the nearly completed Viaduct, you become more aware of the magnitude of the work than by walking over the level surface. You see arch rising above arch, as the ground rapidly dips. You see the face of the wrought-iron girder bridge, that spans the roadway of Shoe Lane, but allows for the introduction of a new pair of lasts, or of a roadway double the present 14 feet width. You come upon the broad thoroughfare of Farringdon Street, and admire the noble bridge, of which we have a word or two to say. Ascending towards the corner of Newgate Street, you pass a curiously complicated structure, of iron and of brick, by which the subways and the main roadway of the Viaduct are carried over the burrowing channel occupied by the Metropolitan, or the London, Chatham, and Dover Railway. The grim ashlar quoins of Newgate, and two of Sir Christopher Wren's fairy spires, soaring in the distance, close the prospect to the east.

When our Rambler had forsaken the light of day—for on the occasion of his ramble it was clear daylight in London, purchased at the cost of a keen and sleety north wind—he found himself in a place more resembling the crypt of a cathedral than anything else that suggested itself to his mind. A semicircular vault, of six feet radius, springing at some three feet from the floor, gave admission to radiating or converging arches, of similar dimensions, which cut into one another with sharp and well-defined groins. This vestibule, so to speak, lay under the new pavement about the island above described, and one long line of vaulting, which was illumined by jet after jet of gas, as the lantern-bearer sped down its course, ran under the new street down to the Market and the Railway Station.

The line of this wide and lofty archway gave admission, on either side of the Viaduct, to a subway of a different construction, which—forming as it does one of the main features of this carefully-planned work—will be known to the passengers over the completed road only by the negative evidence that they will never see any part of this 1,000 feet of street broken up, after our usual London fashion, for the gratification of the conflicting authorities who reign over gas-pipes and water-supplies, paving and sewerage.

The subway is a passage or channel, some 7 feet wide, along each face of the Viaduct. The level floor is paved with stout York flagging; and iron stanchions, built into the sides, project so as to afford support to the mains of the New River Water Company, the City Gas Company, and the Great Central Gas Company, and to the wires of the Electric Telegraph. The branch pipes for the supply of each house, of the street lamps, and of the hydrants are all readily accessible in this convenient subway, and any leakage or fault in the mains is capable of immediate detection and repair. Ventilation is ensured both by pipes passing up through the lamp-posts and by flues running through the party walls of the houses, terminating, by independent apertures, in the top of the chimney stacks.

Below the level floor of the main length of subway, the ground level dips rapidly, so that a lower storey of subway becomes more and more lofty as we descend toward the Farringdon Street Bridge. This storey also is flagged, but the flags only occupy one side of the width, like the towing path of a canal; while the open sewer which provides for the drainage of the houses that skirt the Viaduct runs down the sharp pitch. This sewer shares with all the London drains the remarkable quality of periodicity in activity. Day after day throughout the week, precise to a quarter of an hour, every London sewer begins to rise at its own proper period—varying according to the more or less humble character of the locality and the habits of the dwellers. As domestic life becomes brisk, and personal ablutions, cleansing of floors and steps, washing of china, and all other family proceedings that terminate in the sink, go briskly forward, the subterranean tide rises, attains its maximum flood, and then declines, differing from the tidal movement of the Thames itself in being diurnal instead of semi-diurnal, and in being fixed in its daily period instead of following the phases of the moon.

Thus, on one visit to the subway, the Rambler found the open sewer to be all but dry; and when he traced it to the spot where it disappeared in darkness, he heard the rapid, sullen, mysterious rush of the subterranean waters of the Fleet. This was about 2 p.m. On a former visit, about 11 a.m., the little stream was in full activity—a dark brown current, not offensive to the nostrils (it is when sewage is stagnant that it begins to putrefy), running very briskly down its channel, and leaping in its descent to the great Cloaca beneath with a dash that drowned the hoarser murmurs of the imprisoned and polluted stream.

Down pipes from the street gullies into this lateral sewer drain the upper roadway, and a swinging flap allows everything that can enter the orifice at top to fall freely into the sewer. The impetus acquired by a brick-bat, for instance, in its descent, throws open this simple trap, and the obstacle, if not swept away at once by the flow, can be readily removed by the inspector.

Our Rambler dwelt with the more interest upon this portion of the works from the sense of the great care and wise forethought bestowed upon the structure. Expense, and what is worse than expense, constant worry and stoppage of traffic, will be obviated by works which must always remain concealed from the great mass of those who derive daily benefit from the skill which designed them.

The lighting of this subway is due to an American inventor, whose glazed lights Mr. Haywood found in use in the pavements of New York. Hyatt's patent illuminators are iron plates, seven feet by three feet in area, full of small globular lenses or pieces of glass. They form an almost unperceived portion of the pavement, are as durable as the flags themselves, and, placed thirty-five feet apart, give a full illumination to the upper subway.

Thus far the Rambler has endeavoured to give an idea of the general structure of the Viaduct. The three bridges which form a part of it remain to be described. It is also to be borne in mind that between the subways lies a range of commodious vaults, accessible by a central roadway or 'jack arch,' into which carts can enter from the intersecting streets at the level of the original surface of the ground.

The railway is crossed by a substantial brick arch. But as the rise of this structure would interfere with the course of the subway, a wrought iron trunk of an ingenious construction (which it would occupy too much time here to describe) is carried on either side of the central road, and the several mains are laid side by side through this chamber, instead of being vertically disposed as through the remainder of the subway.

The thirty feet span crossed by the wrought iron girders of the Shoe Lane bridge, does not call for any especial notice; but the three-arched bridge, of granite and cast iron, that spans Farringdon Street, will be one of the most notable, and, indeed, one of the finest, engineering works in London.

The central arch of this bridge supports a platform, eighty feet on the square span, or ninety-six feet measured on the skew, the angle at which the upper and the under street cross being such as to allow of the introduction of the hexagonal form for the piers and quoins of the abutments, with great success. Below, the width over-arched is sixty-six feet from centre to centre of the piers, giving a total skew span in these arches of 117 feet.

Twelve piers of polished red granite support the girders of the central arch, and the smaller ones which spring over the footways. The pedestals of these piers are fine hexagonal blocks of grey Cornish granite. On each of them stands a moulded base of black Guernsey granite. The red columns, seven feet six inches high, are sunk with a double curve on each hexagonal face, the effect being to give at once richness of detail and an increased idea of solidity to the piers. A capital of grey granite will be ornamented by a foliation in bronze; and a low blocking piece of the same polished red stone (from the Ross of Mull) as the body of the squat column, completes this beautiful part of the structure. For the foundation of these piers the engineer had to go down about thirty feet to the London clay, sinking a trench long enough to take the whole of the six piers on either side, which was filled in with six feet of Portland cement concrete, on which was brickwork composed of hard paviers. The bricks generally used for fine work are made from the gault, at Barham, and the backing consists of Medway stocks—very rough, but very hard.

The girders which spring from these piers, and which will act as true arches, are unusually sharp and beautiful castings, from Woodside Foundry. The rise of the central arch is about $\frac{1}{2}$ of the span. The foliated spandrels are cast so as to give strength to the girder, circular apertures being left for the insertion of the merely ornamental work. The City arms, and the pious dragons, which, as if in denial of all their mythical kindred, are ever appealing for celestial guidance in the legend *Domine dirige nos*, have been cast in circular pierced medallions; and the rough and ready expedient of running three saw kerfs through the circular rim of the casting when red hot has allowed of cooling without any fracture or distortion.

A very interesting feature of this bridge is, that each rib consists of a pair of castings. The subject is one which has occupied much thought. It is not altogether a new application of material; for in point of fact, the hollow box girder, which is now rarely used, is somewhat similar in principle. Mr. Fowler has made use of coupled wrought girders in the bridge over the Thames at Battersea, but in the enlargement of that bridge single girders have been employed, and much greater freedom from vibration may be remarked on this part of the bridge, although the headway sacrificed is less than on the older portion. It may be justly objected to Mr. Haywood's plan that the second vertical web is a weight of iron that does not add to structural strength. On the other hand each casting is more manageable, and is likely to be more sound, than one of nearly double the weight, and the pictorial effect promises to be very superior. A complex but well-considered structure of cross girders and corrugated plates supports the roadway over the main arches, and will form a remarkable and entirely novel soffit. Of the 800 tons of iron which compose the bridge, some 600 are now on the ground, and the opening of the Viaduct depends on the completion of this portion of the work.

Four towers, or sheltered staircases, one at each corner of the abutments, give access from the pathway below to that above. The design of these buildings, so novel to London, the decoration of the doorways and windows, the foliated iron work of the gates, all evince

a union of the skill of the engineer with that of the architect, of which the city of London may be justly proud.

On the piers of the parapet, over the granitic columns, will be placed statues of London worthies. Fitz Alwyn, the first historic Mayor;—the sturdy Walworth, whose dagger, loyally bestowed upon Wat Tyler, still gleams in the City arms (according to some legends—others make it the sword of St. Paul); the semi-fabulous Whittington, the host of three kings, with a grateful remembrance of the cat that proved to him a veritable puss in boots, and Sir Hugh Middleton, are to look down on the two crossing currents of the mighty traffic that will flow by, but no longer choke, this long-obstructed site—menacing the heedless youth who is on his downward course to sink into the dangerous classes, and encouraging the industrious apprentice with the best lesson of history, the success of the patient toil of the worthies of the past.

It is not the function of the 'Rambler' to pay compliments. It is certainly neither his wish nor his habit to pay indiscriminate or exaggerated compliments. But he has rambled over many fine works, and many noble buildings, since he stood by the side of Robert Stephenson on the footboard of the first locomotive that ever blew its whistle south of Lancashire. In the several qualities of magnitude and imposing proportion, of peril and difficulty overcome, and of architectural excellence and ornament, many works more remarkable than the Holborn Valley Viaduct recur to the memory. The gigantic (and hideous) girders that cross the skew roadway at London Bridge, the large iron bridges at Battersea, the foundations of several of the recent River Bridges, the Thames Tunnel, portions of the Metropolitan Railway, the turrets and pinnacles that pierce the sky at Westminster, each may deserve the place of honour in some particular respect.

But for the painstaking application of the resources of modern skill to augment the permanent comfort of the inhabitants of London, whether the hundreds who will be affected as residents, or the millions who will be served as passengers; for study, of which the results will never be exposed to daylight; and for the happy combination of wise and large structural economy, the function of the engineer, with pictorial beauty and architectural excellence, the Holborn Valley Viaduct ranks second to no work which the Metropolis can boast as the production of the present century.

MODERN MÆDIÆVALISM.

WE saw the other day, in a shop-window, a photograph of some gentleman of the present day, the 'author of' something or other, attired in the precise costume of John Milton. He looked very queer. We could not reconcile him at all to our notion of a person of the latter part of the 19th century. And this set us thinking. If the costume of two centuries back appear so opposed to our modern notions, how can we expect to make the architecture of a still more remote past fit in to anything like a natural place in our system of life? If we may not dress as people did in the middle ages, or print like them, or speak like them, or write or fight like them, why should we build like them? It will be answered, Because their mode of building was better and handsomer than ours. Admitted. But so was the architecture of Egypt and Greece; so was that of India and of the Arab caliphs. If there be an irreconcilable difference between the ways of thought and the whole system of life, as these existed in the middle ages, and as they exist at the present day, how can the architecture of the one age be employed without untruthfulness, without a manifest shock to all our feelings, in the other? Compare with each other groups of things which were made in any one of the whole-hearted art-periods, be they books or pictures, columns or arches, swords or breastplates, doors or windows, and you will find that they all came from the same workshop, and have, so to speak, the same maker's name on them; however different in purpose or in form, there is a secret and indefinable harmony which links them all together and makes them one. They are like objects seen under the same daylight, and which the sun harmonises; while the grouping together of the arts of different ages is as if each object in a picture were seen from a different point of view, had a different intensity of light, and a different angle of shadow.

During a period which has now extended over three hundred years, civilisation has been drifting away from the system of art as it was practised in the middle ages. We have adopted the Roman type in preference to the black letter, the running Italian hand instead of the cramped vertical manuscript of the fifteenth and earlier centuries; our Saxon speech has become ampler and more balanced, largely influenced by Roman models; our furniture and our houses, if not classical, are at least of a modern type which has no affinity for mediæval art. How, then, can we roll back the whole tide of our civilisation, or make one of the arts to flow in a dry bed from which all the others have departed?

We think this question as to whether we should build archaically, in a style which died a natural death, at an advanced age, three or four hundred years ago—but which some amongst us wish to resuscitate, rejuvenate, and make beautiful for ever—is one that, to any rational mind unwarping by the exclusive study and contemplation of models possessing many fascinations, is solved when it is fairly stated. Amongst the many lessons which we may learn from the study of the great works of our forefathers, let us not overlook this one—that all true art is faithful to the feelings, the wants, the knowledge, and the life of its own day.

The Exhibition of Paintings in connection with the Bristol Fine Arts Academy is one of the largest and best they have held. Some of the pictures are of a very high order, and the entire display is calculated to interest and delight.

ENGLAND IN 1669:

A RETROSPECTIVE REVIEW OF THE TRAVELS OF COSMO III

PART I.

TWO hundred years ago there was as much unhappiness in the Grand Duke's Palace in Florence as could possibly be found in the humblest house in the City. Cosmo, the eldest son of the Grand Duke (whose marriage also was unhappy), was married, in 1661, to a daughter of the Duke of Orleans, who had grown up with the expectation of one day becoming Queen of France; but when this hope was overthrown by the marriage of Louis XIV., she was compelled to accept the Prince of Florence. 'What is marriage foredo but a hell, an age of discord and continual strife?' and of the truth of Shakespeare's observation this case was an illustration. All kinds of charges, from robbery downwards, were made against the princess, who would seem to have been excited to madness; and, although judgment is usually given against her, on the other hand, her husband appears to have had little that was lovable, and she may have been as much sinned against as sinning. The Grand Duke exercised control over his daughter-in-law as well as his son, and, whenever he was about to place new restrictions on her liberty, to save Cosmo from the 'scenes' that followed he usually sent him away from Florence, and thus he was able to travel through a great part of Europe. On one occasion, when a longer absence than usual was thought necessary, it was arranged that the prince should visit Spain, Portugal, England, Holland, &c. There was to be a record kept of all that occurred, and drawings made on the spot of different places. For this purpose a number of *savans* were attached to the suite, amongst whom were an architect and an artist; and the secretary and chronicler was Lorenzo Magalotti, who, to judge from the variety of works he has written, must have been an universal genius, or, as Newton styled him, 'a magazine of good taste.' Scattered through the huge volume that resulted there are several notices of the English buildings of that time, which we have culled, in the hope that some of our readers may be interested in them.

On March 19, 1669, the prince and his suite sailed from Corunna for England in the good ship called the Portland. Owing to the uncertainty of the soundings, the over-zeal of the captain, the inexperience of the pilot, and an ill-regulated timopiece, the British Channel was mistaken for St. George's, and instead of in England, the travellers were landed at Kinsale, in Ireland. At that time the famous Act of Settlement had been lately made law, and the inhabitants of Kinsale, the greater part of whom were English, were settling down after the turmoil of the previous years. Their houses are described as being of mean construction and appearance, with very little decoration, and for the most part low; some built of stone and slated, but others of mud and lime, which did not last long in the climate; glass was used in the windows, and, as was the case in High and Low Germany, there were no shutters. But what kind of houses had the unfortunate native inhabitants, who somehow appear at all times to be out of the reach of Acts of Settlement of any kind? There are few antiquarian questions so easily answered, for, as Moore says, two thousand years have passed in vain over the habitation of the Irish peasant. The prince took the precaution to have them 'reconnoitred' before he went near them, and the hovels he saw must have been as bare and full of wretchedness as those that are to-day found in many parts of the country. The dwellers were living like wild beasts, sleeping on short mats on the ground, treated as slaves, feeding chiefly on fish and cockles, and seldom tasting bread. They were allowed to retain but one-fourth of the produce of the land, the remainder being required by the landlord. The amazing fertility of Munster is described at some length, but the wise political economy of the day is seen in the circumstance, that, however it might abound, no wheat was allowed to be exported without a license. The chief part of the currency was in Spanish pieces. After remaining in Kinsale for two days, they again sailed, but this time they were obliged to put into St. Mary's, one of the Scilly Isles. More wrecks are said to have happened here than in all the other seas of Europe put together, but it is also said that in case none of the crews escaped, the vessels became the property of the governor. The houses in St. Mary's are described as being built of excellent materials, low, and a few slated. Most of them had for covering nothing but a mat spread over the rafters, drawn tightly all round and fixed to the walls, and which lasted only a year. After a couple of days they left St. Mary's, and this time they were fortunate in reaching England, and landed at Plymouth on April 1 (N.S.).

Although Plymouth was, it is said, in the sixteenth century, a mere fishing village, in 1669 it was reckoned amongst the best towns in England, having between twelve and fifteen thousand inhabitants. (In 1861 it had 62,599.) The life of the place was navigation, lead and tin being the principal exports, so that, as the greater part of the men lived at sea, women and boys only were to be seen. 'The buildings are antique, according to the English fashion, lofty and narrow, with pointed roofs, and the fronts may be seen through, owing to the magnitude of the glass windows in the different stories.' The prince remained in Plymouth four days, when he left, accompanied by Colonel Gascoyne and Major Andrews, whom the King sent to make all the arrangements for accommodation along the road to London. After passing through a country partly desert and partly cultivated with wheat and oats, the fields being surrounded with hedges and dry walls, they reached Oakhampton (which is said to be of little account, the houses being built of earth and stone, thatched with straw), and remained there one night. The next day they journeyed to Exeter; the country as they passed having fields surrounded with trees,* meadows of the most beautiful verdure, gentlemen's seats, and small villages; the houses built of mud mixed up with short straw and chips of slate, and thickly thatched. Exeter is said to be intersected almost in the middle by a very large and straight street, full of rich shops, the houses of the same

* It is not easy to see why, with such descriptions occurring, Macaulay should say: 'In the drawings of English landscapes made in that age for the Grand Duke Cosmo scarce a hedgerow is to be seen, and numerous tracts, now rich with cultivation, appear as bare as Salisbury Plain.'

form as elsewhere. The Cathedral is a very considerable edifice, but it deserves praise from its size, and from having the exterior faced with stone. The façade is ornamented with different figures, in high and low relief, representing saints of the Old and New Testaments, many of them having been injured in Cromwell's time. The church is long, and divided into three naves, the arches low and resting on round pillars; over these are galleries running almost around the whole church. It is lighted by large windows, in which are represented the figures of the saints. Around the church are the tombs and marble monuments of the ancient Catholic bishops, whose statues have been defaced by the Independents.' The beautiful throne of black oak was mistaken by the Italians for a marble tabernacle, which had been converted into a bishop's chair; and they were amused at seeing the bishop's wife and children, 'no less than nine in number,' standing under the tabernacle in a wooden enclosure. Exeter has been long famous for its sacred music, and the fine-eared Italians did not fail to note the exquisite tone of the organ, and the singing, 'in a chant similar to the Gregorian,' and which was so good on account of the high salaries that were paid the choristers. It was only a year or two before they came that any system was attempted towards keeping the roads in repair, so it is not surprising to find that after the travellers left Exeter they were inconvenienced by wet and muddy roads. Their next stage was Axminster, in which they found nothing noteworthy, except that the church bells were well tuned, and that cloth-making occupied the inhabitants, for it was not until 1755 that Thomas Whitty produced the first carpet there. Up to this the prince stopped at public inns (although many houses on the way were hospitably placed at his disposal), as it was his intention to travel incognito, which is to be regretted, as otherwise we should have had more pictures of the English houses of the time; but, after leaving Axminster, he was induced to accept an invitation from Lord Paulett to Hinton St. George. The house is described by them as an ancient irregular building, of a noble appearance, and spacious, the outside being faced with a kind of porous stone. They were keen-eyed enough to observe a difference between the garden here and those usually found in England, for while the latter consisted of grass plots with walks between, made perfectly level by rolling them with 'a stone cylinder, through the axis of which a lever of iron is passed, whose ends being brought forward and united together in form of a triangle serve to move it backwards and forwards,'—Lord Paulett's garden was a meadow divided into several compartments of brickwork, which were filled with flowers. In the parish church (which was 'an ordinary building') the most noteworthy monument was that to Lord Paulett's father, which was in good style, of coloured stone partly gilt, with an urn supported by two satyrs. They stopped next at Dorchester, and, accompanied by many of the townspeople, went to view the Roman remains. The camp they considered to have been originally a hillock, around which the tiers were cut, rather than formed of earth brought there for the purpose. Dorchester, for some reason or other, was thought but little of by them. It is said to be not large, nor surrounded with walls, nor a place of much trade, nor handsome, so that the county deserved a more suitable capital. Cattle abounded so, that in a circuit of three miles, forty thousand oxen and sheep were reckoned. When they left Dorchester for Salisbury, it was thought prudent to have them escorted by a number of the mounted militia, as protection against robbers, from which the district was not free. On their way an invitation to Wilton was received by Cosmo, from Lord Pembroke, which was but in part accepted, as he would only agree to dine there next day, and in the morning his lordship came to conduct him. On their way Stonehenge was visited; this is described as 'a celebrated piece of antiquity, supposed to be a sepulchre or a trophy, consisting of very large stones, some thirty feet or more in height and ten in breadth, placed on one another in three rows, in such a manner that the connection amongst them is not discernible.' The old British legends of its origin are given: that it was erected by Merlin, the famous mathematician, at the desire of Ambrosius Aurelianus, in memory of the defeat which the Britons suffered here through the perfidy of the ancient Saxons and their king Hengist, or by his brother Uther, to give more celebrity to the tomb of the same Ambrosius; and that it was in place of the ancient Sabean, which is more than a mile distant; but strange to say, no notice is taken of Inigo Jones's theory, that it was a Roman work, although it is the one in which the travellers might be thought most interested. From Stonehenge they went to Wilton. As not one of the houses out of London that were visited by the prince possesses more interesting associations, a fuller description than is in the book would be desirable. One would have liked to discover what impression a house so famous, and on which Holbein, Solomon, De Caus, and Inigo Jones were employed, made on foreigners. His Highness walked about the glorious grounds, saw Inigo Jones's bridge over the Nadder,* the grotto rough-cast with pumice-stone and cockle shells, fountains playing in different ways, the maze park, and the rooms newly built, 'as well for pleasure as for the convenience of a foundry,' and then in the evening returned to Salisbury. Afterwards he visited a house where a number of ladies were assembled, and heard two of them sing an English air, 'very indifferently—the fault either of the music or of the singers.' The houses in Salisbury are said to be like those of the other cities in materials and structure. As for the Cathedral, 'although its architecture is Gothic throughout, yet it is magnificent and sumptuous, and it is rightly considered one of the most beautiful temples in England,' and as far as it goes their description is not incorrect:—'At one end in the stone façade there are three doors (besides others at the sides); these correspond both in situation and proportion with the three aisles within, which are divided from each other by quadrangular stone pillars; these serve as a support to other similar pillars placed against each angle, and made equally of Irish marble, called Kilkenny marble (?), not unlike the granite of Spain. These being equidistant from the two sides of the church respectively, leave an open space for the middle aisle (which is 214 paces long), and for the two smaller aisles on each side. Arches rest upon these pillars, supporting a noble gallery, divided by small but numerous pillars of the same Irish marble (?), which running round encircles all the interior of the building; and between it and

the roof, which is very light and airy, are the windows, which give abundant light to the whole edifice. Where the two smaller aisles terminate, and the church is divided by a transept of the same breadth and takes the form of a cross, four large arches are raised upon four lofty pilasters, which not only support the roof (from this place to the altar painted *al-fresco* with representations of different saints), but serve as a basis to the belfry, which, rising from the roof, continues for half its height in a quadrangular form, and terminates in a spire. In front of the principal aisle, when you have passed where the transepts branch out, the choir occupies a part of the greater aisle, and is separated from the rest of the church by a wall which runs round it as far as where the altar is placed; this yet retains some paintings, in which the name of God is written in Hebrew character.' Nor is the old saying omitted, that the doors correspond in number with the months of the year, the windows with the days, and the pillars with the hours. From Salisbury the prince journeyed to Basingstoke, which is described as a wretched place, the greater part of the buildings being of wood, 'so that the gratification of his curiosity did not compensate for the fatigue of walking even a few paces.' The next stage was to Egham, from which, on the way to Brentford, they visited Sion House, 'the villa of the Earl of Northumberland, and which was formerly a monastery of nuns of St. Bridget.' 'It is now converted into a spacious and commodious palace, having a great many rooms on a floor, after the Italian manner, and numerous galleries. The outside is entirely of flint stone, but yet without any superfluity of ornament. Within the circuit of the exterior walls is enclosed a very large meadow, which serves as a court; parterres and pleasure grounds, after the English manner, are not wanting, and extend as far as the Thames, which has the appearance of a canal running through the gardens. The building is new, and not yet finished; on the roof there is a very fine walk, covered with plates of lead.' At Brentford ('a very large village, through which the Thames formerly ran') a crowd had assembled to see the prince, and many people were permitted to do so in the dining-room of the inn. A number of court officials were sent to meet him, and he was offered as a residence in London Old Somerset House, but he declined it, as he was determined throughout his travels to preserve his incognito. After a few hours' stay in Brentford, they journeyed to London; 'the whole tract of seven miles being truly delicious from the abundance of well-built villas and country houses, which are seen in every direction.' Along the road, crowds were waiting to see him pass, and at about two hours before sunset, on April 15, his Highness arrived at Earl St. Alban's house, which had been prepared for him.*

LIMEHOUSE-BASIN IMPROVEMENTS.

THE development of the coal traffic during the past few years has been so great in the Limehouse Basin of the Regent's Canal Company, that the accommodation was found inadequate for the increasing demand for space; and, consequently, the Company determined to apply to Parliament for powers to acquire the requisite land and make the necessary extensions and alterations, which being granted, the works were commenced in May, 1867, from the designs and under the directions of their engineer, Mr. E. Thomas, the contract being carried out by the Company themselves, with a very extensive plant and staff, under the immediate superintendence of their resident engineer, Mr. J. Blackebourn.

The new works consist of a ship entrance lock 350 feet long and 60 feet wide, divided into two compartments by means of three pairs of wrought-iron gates; enlargement of the existing basin by taking in about 1½ acres of ground near the present barge lock, and building a very massive quay wall; the construction of about 200 feet of quay wall on the river face; and, running at nearly right angles with this, a timber jetty about 45 feet long.

The method of keeping out the water during the construction of the new lock was by means of a coffer-dam, well strutted from behind, and composed of two rows of piles puddled between.

The lock is being built of brickwork in cement, with stone dressings and granite quoins. There are fourteen discharging culverts, placed at an angle of about 45°, and six emptying sluices.

The lock gates are of the ordinary type in wrought iron, with a skin of plate on the inner side and only half way up on the outer side; the lower portion of the gates being made watertight to enable them to be floated at any time when required.

The thoroughfare across the existing lock will be diverted by means of a new road, which will be carried over the ship-entrance lock by a wrought iron swing bridge. This bridge will be raised upon its pivot a few inches to enable it to clear the road, and will be manipulated by hydraulic power, as will also the opening and shutting of the lock gates.

The whole of the ironwork and hydraulic machinery is being provided by Sir W. Armstrong & Co., of Elswick Works.

The three coal drops now working in the basin will be removed, and replaced by fine new coal jetties, fitted with every modern appliance to facilitate the unloading of vessels, and thus enable them to leave the docks by the next tide.

The estimated cost of these works was 200,000*l.*, and it is expected they will be completed in time for opening in May. We may add that the progress of the works is so far advanced that we see no reason why this should not be accomplished.

The whole of the work is being executed with the very best material and workmanship, reflecting great credit upon the engineer in chief, Mr. Thomas, and the resident engineer, Mr. J. Blackebourn.

* On the road he passed our old friend Samuel Pepys, who went specially to meet him:—'April 5th, 1669, O.S.—So we left other good things that would keep till night, for a collation, and with much content took coach again, and went five or six miles towards Brentford, where the Prince of Tuscany, who comes into England only to spend money and see our country, comes into the town to-day, and is much expected; and we met him, but the coach passing by space, we could not see much of him, but he seems a very jolly and good comely man.' Six days afterwards, Pepys had a better view of him: 'Easter Day, and going out of the chapel (St. James's), I did see the Prince of Tuscany come out, a comely, black, fat man, in a mourning suit, and my wife and I did see him this afternoon through a window in the chapel.' There are a couple of other notices of him in the Diary.

* How little the English peasantry know of topography! When Carlyle and Emerson visited Wilton, the gardener was unable to tell them the name of this river.

CONDITIONS OF CONTRACT.

(Concluded from page 132.)

IT must not be forgotten that some contractors—in fact all builders—occasionally act direct for the client without the intervention of an architect, and often to their own pecuniary advantage; and they justify this by the simplicity of the relations thus subsisting between employer and employed, and the frequent desirability of direct communication between them. We understand the fallacy as to the supposed saving of the costs of proper design and superintendence. But there is a recommendation in the mere simplicity which is wanting in the proposed complications if lawyers are required to commence, and arbitrators to proceed with the work. If Mr. A., wanting to erect a house, goes to Mr. B. to build it for him—setting aside all questions of art—there is but the necessity, as at first would appear, to arrange the kind of building and the terms, as in any other simple business transaction. But the contractor himself can hardly get on without plans, even if the employer is satisfied without first seeing them; so he engages a designer of some kind, and thus the architect sinks to the position of a mere draughtsman, and as employed by him, becomes either the clerk or tool of the builder. To this point many firms have lowered the architect, and we may add ourselves also, for even such important works as churches, and other large buildings, have been 'got out,' as the phrase is, in the office; and whole ranges of important streets, squares, terraces, as well as city buildings and offices, have been 'got out' in the same way, with what architectural effect we will not now inquire. Yet what would be thought of a combination of architects not to include in their invitations to tender for works, firms who aspire to be architects and builders together, and obtain the profits of both, examining and pricing their own bills? While the present taste, or want of it, lasts, perhaps these simple arrangements may exist unchallenged, but there are signs of a demand for buildings properly designed and superintended on behalf of those who purchase or intend to inhabit them. This of course will lead to a more extended application of the third-party arrangement, the architect being called in to design the building, advise the client, and arrange with the contractor.

In all cases at present, the client gives himself up to his adviser by the mere terms of the conditions; and the contractor, on this account, is called upon to do the same, and to accept his verbal interpretation of written and well-understood documents, because of the mutual relationship, the middle position, occupied by the architect, and the confidence reposed in his judgment by both parties.

His sole arbitration is submitted to because, having reduced the client's wishes to a definite shape, and to a form available for the contractor, he alone can give any authoritative declaration as to what is meant or intended by the drawings made, and conditions drawn up by himself—the effect of which is as well, if not better known (as it now appears) to the contractor as to himself, and therefore not blindly accepted. The architect cannot be a mere advocate for his client against his own judgment, nor can the client insist on his being so, for he has not the necessary technical information; nor can the contractor fairly object to the architect assuming to know his own mind as expressed in the documents, where such may not be perfectly clear. Where any attempt is made by a contractor to ascertain what he undertakes to perform, it is seldom that he cannot secure himself from any loss, or see his way to obtain such profits as he chooses to require for his services; and if the client expects to get more than a fair amount of work for his money, or to have his works carried out at an unremunerative price, who has to explain the matter to him but the architect? Should the client unjustly object to any work or materials, who has to resist him and become for a time the builder's advocate, but the architect? Should time be exceeded, who has to say whether cause can be properly alleged for delay, and how much allowance must be made for unavoidable causes, but the architect, notwithstanding his client may be suffering severely for want of the works being concluded, and may be desirous to impose the penalties provided? Again, as to payments. Who has to see that the contractors do not suffer from delay on the part of his client as far as he can prevent it by giving his certificate, but the very same architect to whom the client looks to be certified what he has to pay and when to pay it? To urge that the architect cannot do this fairly is to ignore common everyday facts, and to make difficulties where none occur.

Yet it is against this sole arbitration—arising out of the middle position assumed by the architect—that the great objections are raised; and, indeed, this seems to be the head and front of the offence. The printed memorandum of the General Builders' Association—a body having its headquarters in Birmingham, but extending northwards to Dundee and southwards to Exeter—has addressed the members of Architectural Societies and the Architects of Great Britain as to four special points, of which the arbitration clause is the most important. The Metropolitan Builders' Society confine their attention chiefly to this matter, and suggest a form of arbitration clause which they would like to see adopted. It is briefly as follows:—'All questions between the client—or the architect on his behalf—and the contractor as to the (1) *proper performance*, the (2) *quantity* or the (3) *quality* of (4) *works* and (5) *materials* or their (6) *prices*, or as to (7) *alterations* of all kinds (including money additions or deductions for same), or as to (8) *time of payment* or (9) otherwise, (omitting apparently time of carrying on or finishing the works, except this be covered by the words 'or otherwise,' again repeated with the addition of 'in any way relating to the premises') shall be referred to the award and arbitration of——'

This blank, one would ordinarily suppose should be filled by the name of the architect designing and superintending the works; for who in the world but he could be supposed to be able so fairly to exercise this power and discretion for both parties alike—who could so thoroughly understand the whole matter in hand—who possess so much the confidence of both sides? Who, in fact, does really now in every contract bear these heavy responsibilities but *the architect*? Yet the builders want some other architect, to be called 'arbitrator,' to be put in his place; one who has perhaps never heard of the work before, and is so perfectly uninformed and unbiassed, that he must necessarily delay the work when anything is submitted

to him in order to inform himself thereon, and must devote further time and attention in hearing evidence, as well as run up a bill of costs. One who, moreover, may be as liable to failings and partialities as the original architect—in fact, who in another case may be *the architect* himself, and subject to some one else as arbitrator.

Now does it not strike these builders that such a demand as this is a serious charge against the fairness, the honesty, uprightness, and common sense (in one word) of architects generally, yet putting a most humorous confidence in the unknown blank architect, who, however fit to direct other men's works, and explain the intent and meaning of other people's drawings as arbitrator, is not capable of so acting fairly with regard to his own?

And would it not strike any architect that there is something strange in such a sudden demand for him to surrender at discretion his position of director of his own works and agent for his own client, when hitherto he has probably never found any individual contractor urge any objection against his so acting? While, as to the client, would he not imagine some deadly feud had arisen between architects and contractors, preventing their mutual understanding, and jeopardising his interests; and would he not be alarmed at being thus forced to stand the chances of having to pay the costs of an additional architect whenever this feud should break out into open war, or even mere skirmishing take place between them?

In fact, it would seem as if contractors were endeavouring to drive architects out of the field altogether, if they will not consent to neutralise the contract and leave all kinds of doors open for an attack upon the pocket of the client.

We say it would seem—for we are persuaded this is not the 'intent and meaning' of the general body of builders, nor the wish of most of them, that such an inference should be drawn from their printed papers. Yet men of upright character, and with well-grounded reputations for even-handed justice as well as shrewd common sense, have put their hands to this demand for architects to stultify themselves—give up their professional status, and hand over their clients to lawyers, arbitrators, and surveyors, without retaining the power to do more than put in a word or a drawing as evidence of their intentions of humbly submitting to another's decision; feeling, perhaps, that they also may aspire to the honour of being nominated by a contractor as arbitrator at some future time. We have no hesitation in saying this clause will not work—simply because no architect will adopt it, and no client will be foolish enough to allow him to do so.

Having thus disposed of the sweeping arbitration clause, as above described, let us say that some matters may very fairly be the subject of arbitration; and a clause embodying such would scarcely be objected to, because in practice it rarely happens that an architect does not himself suggest an appeal, informally, to some arbitrator—be he another architect or surveyor—if any difference, not even a dispute, but any common settlement of account is necessary, though this may not be part of, or according to, the formal terms of the contract. The measurement and pricing, for instance, of extras or omissions, is generally handed over to the surveyor who took out the quantities; and if there be any doubt as to quality of materials—though it is seldom that there is room for doubt in this matter—the question may be referred to an independent party who is supposed to be a good judge—perhaps even another builder. Again, as to time, few architects but admit a strike clause and a form permitting an extension of time for unavoidable delays, though it is a new thing to require 'lock-outs' to be included in such a phrase, they being avoidable and the result of the action of contractors themselves. Still, without a formal clause, no architect would object to consider such a case if the lock-out were justifiable, it being one of those matters of general policy affecting the whole building interest, and not merely the class of contractors. An arbitration clause should thus embrace merely the reference of value and quantities of extra or omitted work, and payment in case the certificates be not issued in due course. We think few, if any other matters, are fit subjects of arbitration, but that *the one* architect's decision, as heretofore, should be final, binding, and conclusive in all respects.

If it be necessary to provide by a special clause that the architect shall give his certificates—especially the final one—at the time named in the contract, or state to an arbitrator in writing the reasons why he cannot feel that he is justified in doing so, (the works not being complete or not being perfect, &c.), and if some protection is required to the contractor owing to a defect in the legal remedy only just discovered by builders, and only just made known to architects, by all means let it be devised; or if there is any preferable way, free from objection, of nominating surveyors in taking out quantities for competition tenders, by all means let it be adopted; but surely these are very small matters of detail compared with the vital question as to whether an architect is to be either an arbitrator or only a draughtsman, and so the very meaning of the word 'architect' changed. When we learn that a large band of contractors have bound themselves each not to take any contract which another has refused because of its containing—so-called—'unequitable conditions;' (and what these are considered to be we learn from the foregoing suggested arbitration clause), 'unless the committee of the Builders' Society should decide that the conditions objected to may be reasonably adopted'—we are astonished at the spread upwards of the principles of trade unionism, and wonder what the penalty is intended to be if the temptation of a good contract should be too great for one of the Society builders to resist. We shall next look for advertisements from non-society contractors, free contract associations, and co-operative arrangements for executing building contracts. To most London contractors, however, any idea of this kind is quite foreign, and they have no wish to take upon themselves more responsibilities than at present; while they doubtless feel the advantage, and appreciate the assistance, we have before alluded to, as received from the architect.

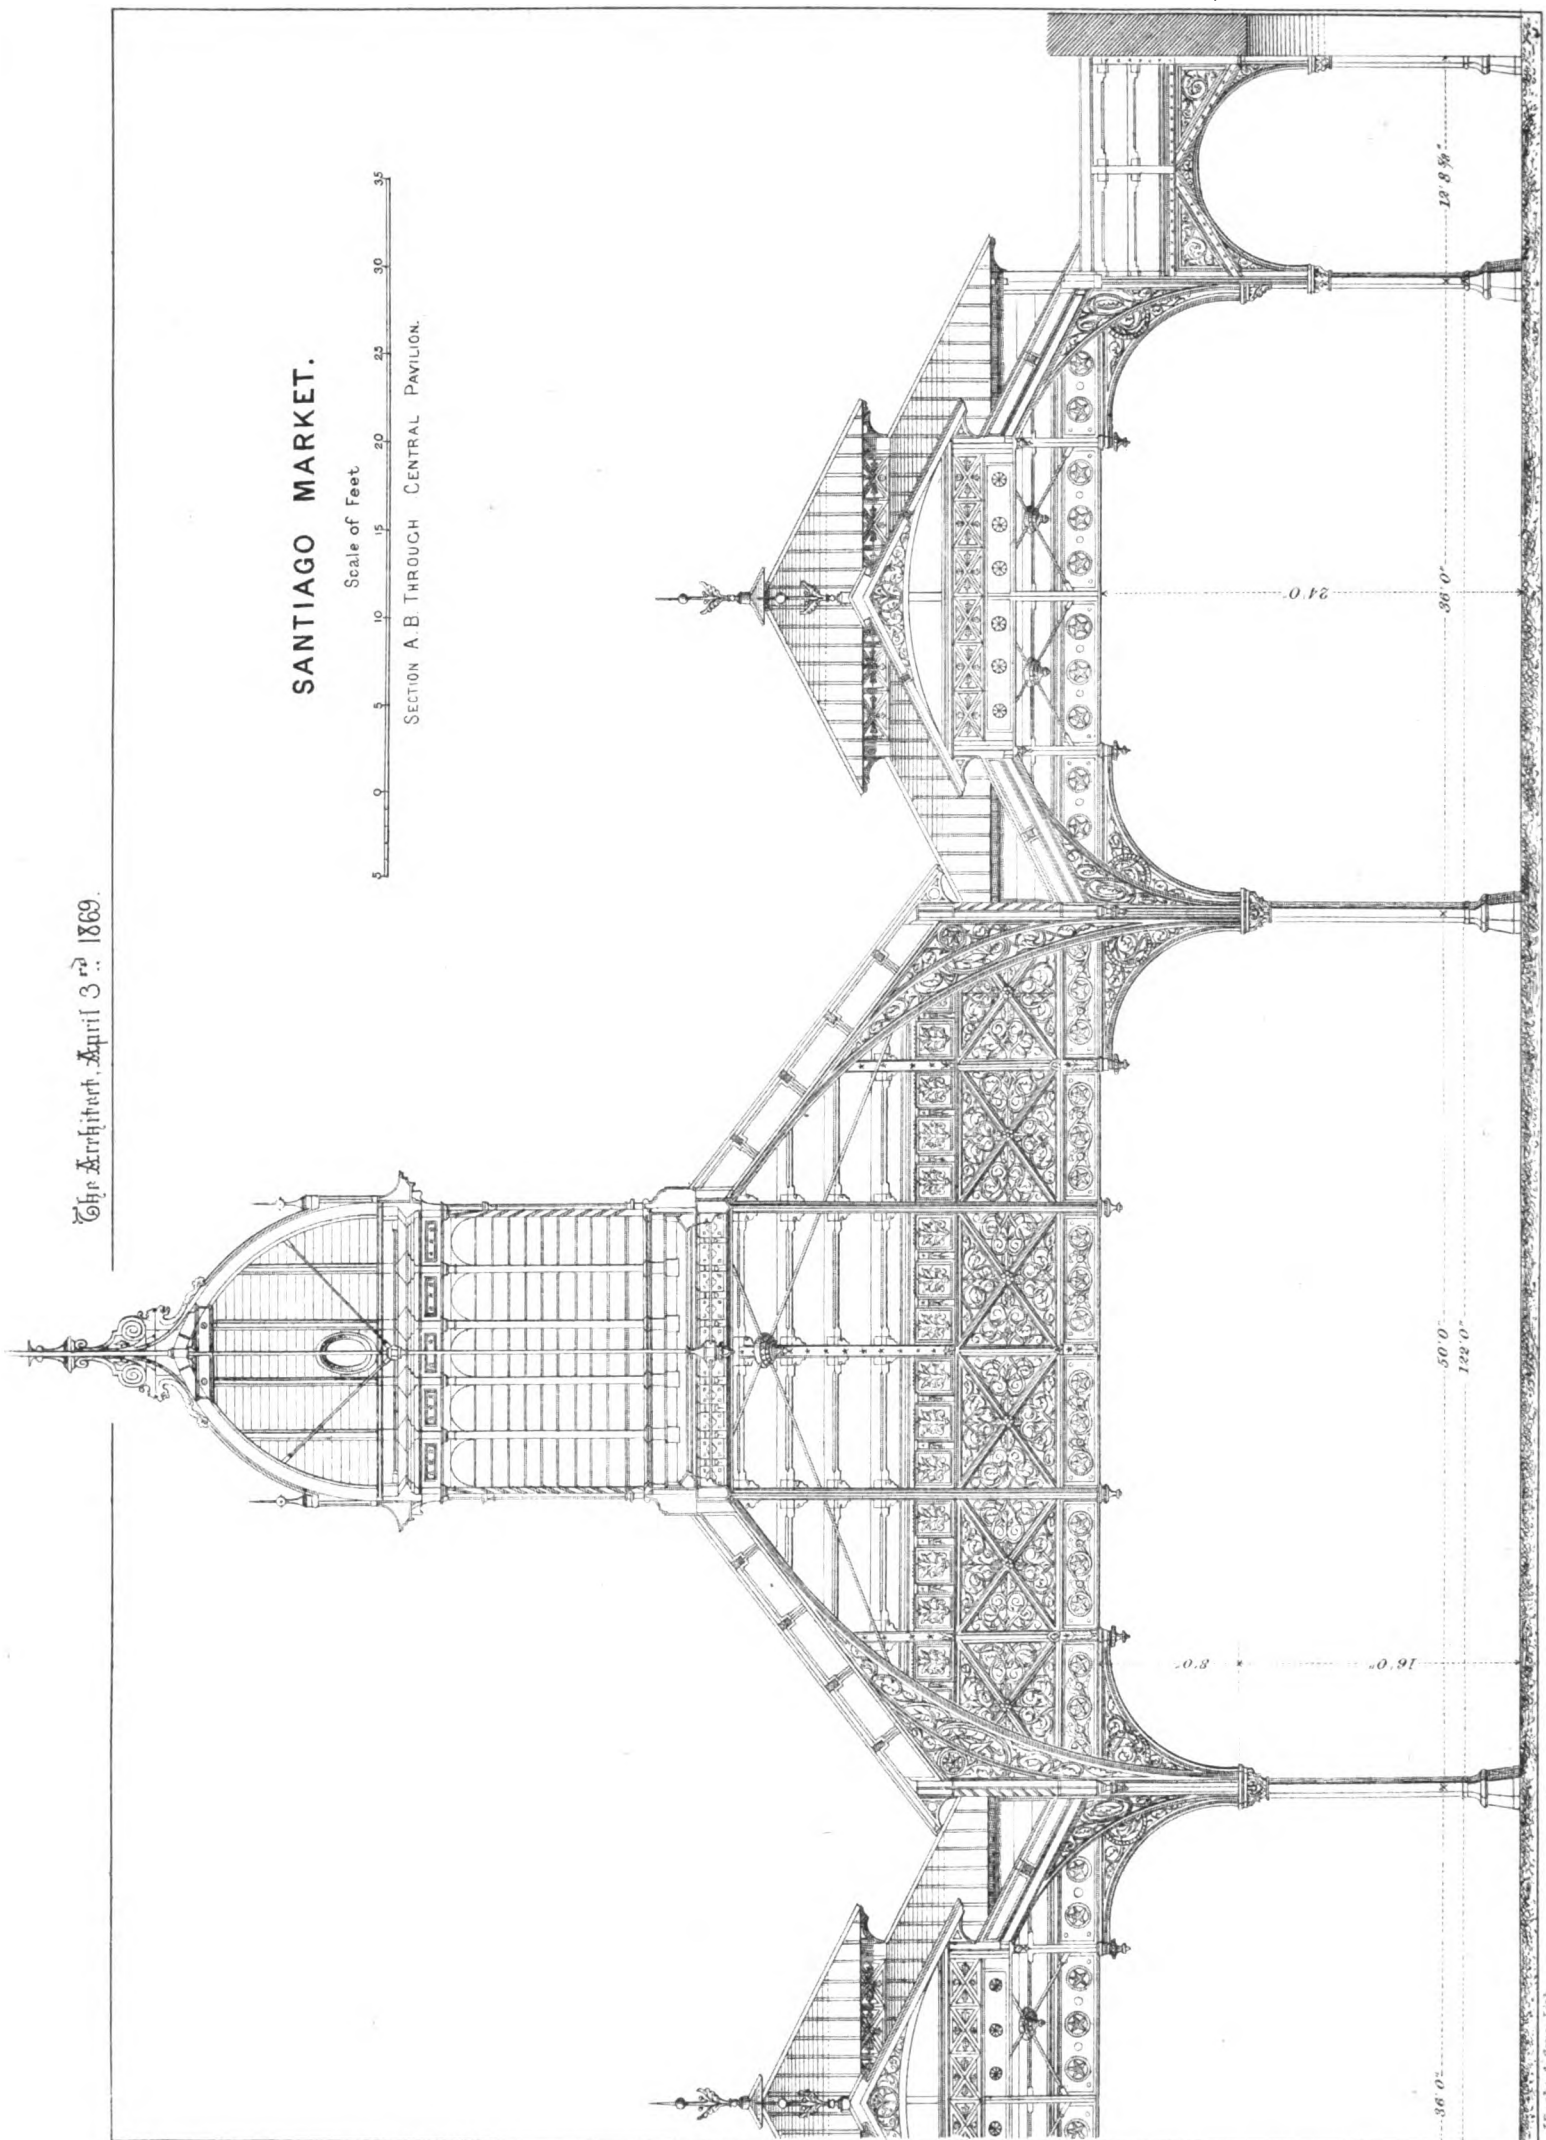

It must not be forgotten that no duty of an architect comes before that which he owes to his art; and in designing a building he must see that the science of his art is properly carried out, if he would deserve the reputation he desires. And, thus, whether his client is careless of the matter or no, whether the builder is one anxious to do his work well or otherwise—whether the matter lead to trouble, anxiety, or expense—it is the architect's first duty to do well, from a professional

point of view, what he has undertaken. Even if his client and builder agree on adopting, or the builder persuade the client he can adopt, a mode of construction which the architect's better knowledge tells him is wrong, dangerous or improper, it is the duty of the architect to explain the matter, and if it be insisted on, refuse to bear any part of the responsibility in carrying it out. And as in art his prerogative is undisputed, so in the science of construction, as well as the form and method of execution. The time and manner of payment may in certain cases even be eliminated from this view of the question, for this is no part of his duty relating to his position as an artist—a designer of art building, and a superintendent of its execution by the hands of workmen. These workmen are perhaps employed for the time being by a capitalist called a contractor, under certain conditions, to suit the special case; or, perhaps, employed by the client himself, and paid day wages for day work. The latter is the oldest and simplest form; is not unknown in the present day; and, if much additional complication is attempted in the contract and quantity system, will be again generally resorted to, and probably prove a saving as well to the pocket as to the peace of mind both of architect and client. In this way, at any rate, expenditure will be ascertained at the time of progress in the works, and payments must be provided for in sufficient time for a client to see the state of the case before he is absolutely ruined by a large bill for additional works, or his mind made uneasy by the mere expectation of such demands and the uncertainty as to his architect being able to shield him from them.

ILLUSTRATIONS.

THE EVANGELISTIC BEASTS.

THERE is hardly any portion of Christian Iconography upon which more might be written than that relating to the evangelistic animals. In the first place, the author would have to enter into the biblical portion of the subject, showing how the manifestation in the burning bush, as seen by Moses, was succeeded by the more majestic one of Isaiah (Isai. vi.), and the culmination in the rapt vision of Ezekiel, and how this again differed from that seen by St. John. Then would follow a most interesting branch of the subject, and one which is only just beginning to be worked out, viz., the influence of surrounding objects upon the sacred writers. Thus we know that both the Ark and the Golden Calf were derived from the Egyptians, and a French author has lately called attention to the resemblance between the Ninevite sculptures and the visions of the prophets of the Captivity.

Then would follow the various interpretations given to these animals at different times: how the Jews believe them to represent the four archangels or four great prophets, but how the Christian church has, at least from the second century, persistently considered them to mean the four evangelists. The artistic history would show how the great visions of Ezekiel and St. John have been interpreted into sculpture and painting; the variety of types and the date of their adoption. Lastly, there would be the political history of the evangelistic symbols—showing what nations and what guilds took them for patrons, and how they were emblazoned on the banners, sculptured on the buildings, and even engraved upon the cannon. The lion of St. Mark had nearly as glorious a career as the Roman eagle itself.

If we examine the visions of Ezekiel and St. John we find one very notable difference. The prophet describes four living creatures which had the likeness of a man; each creature had four heads, viz., the face of a man and the face of a lion on the right side, and the face of an ox on the left side, and we are likewise told that they had the face of an eagle. They had each four wings, and their legs* were straight legs; the sole of their feet was as the sole of a calf's foot, and they had the hand of a man under their wings on their four sides. They were also in close connection with certain wheels which intersected each other at right angles, the strakes or rings being full of eyes. The evangelist, on the contrary, describes four beasts as being in the midst of the throne and round about the throne. These beasts were full of eyes before and behind; the first beast being like a lion, the second like a calf, the third had a face as a man, and the fourth was like a flying eagle. We are further told that they had each six wings, and that they were full of eyes within.

These two visions have given rise to two distinct ways of representing the same subject. That of Ezekiel has produced what is called the Tetramorph. This, in Greek art, assumes the form of a human being with the four heads (*i.e.* that of the man, the lion, the eagle, and the ox), and six wings. The feet, which are human, stand on two winged wheels. In Western art, it becomes an animal with the four different heads and four different feet.

St. John's vision has, however, been that generally adopted; and although we occasionally find the evangelists taking the form of human bodies with animal heads or animals with six wings, the great number of ancient examples simply exhibit the man, eagle, lion and ox with two wings only. These winged animals for the most part hold books representing the gospels. In art later they have scrolls inscribed either with their names or with the commencement of their respective writings.

In Mediæval works they are thus placed—

The angel,
The eagle,
The lion,
The ox,

or if they occupy the corners of a rectangle, say a monumental brass, they are arranged in strict order of heraldic precedence, thus:—

The angel. The eagle.
The lion. The ox.

The reason is that the angel and the eagle are naturally more spiritual than the lion and the ox, which are only beasts. Again each symbolises one of the acts of our Lord, as expressed in the following lines which Didron ('Manuel d'Iconographie,' p. 307) quotes from a book of the gospels given to the Sainte Chapelle at Par's by Charles V. in 1379, but which are doubtless of far earlier date.

Quatuor hæc dominum signant animalia Christum :
Est Homo nascendo, vitulusque sacer moriendo,
Et Leo surgendo, caelos Aquilaque petendo ;
Nec minus hos scribas animalia et ipsa figurant.

Further information will be found in Didron's 'Manuel d'Iconographie chrétienne' (Paris, Imprimerie royale, 1845), p. 241–307; and Mrs. Jameson's 'Sacred and Legendary Art' (London, Longmans, 1866), p. 132. The latter work contains woodcuts of the sundry ways in which the evangelistic beasts have been represented from time to time.

The annexed lithograph is a representation of the evangelistic symbols as they are about to be carved around the rose window of Cork Cathedral. They always formed a part of the design, being represented on the original drawings, but that they are to be carved is due to the liberality of the Freemasons of that city. The craft took a very conspicuous part in the ceremony of laying the foundation stone some years back, and, at the suggestion of the late Dean of Cork (the present Bishop of Peterborough), whom the craft has the honour of enrolling among its members, their gift took the form of these pieces of sculpture, a worthy present from the Freemasons of a city which boasts of the No. 1 Lodge of Ireland, and of the affiliation of the Hon. Mrs. Aldworth.

At present only the half-sized models are executed, but the carving will very shortly be commenced. When in stone, the animals will be fully real size. The process of modelling was thus:—The architect, in the first instance, made sketches to a half-inch scale. The models were then partially executed by Mr. Nicholls, of Lambeth, under the superintendence of the architect. Then both sculptor and architect repaired to the British Museum to see how the Ninevites treated similar subjects, and the figures were finally finished from the information thus obtained.

It is true that this is a very troublesome process both for the sculptor and for the architect; but the art of sculpture in connection with architecture has been so forgotten that it is only by such painful processes as those described that we can obtain work which, when executed, we should not wish to see altered. Of course, it is not denied that there are plenty of sculptors who can copy nature more or less correctly; but far higher qualities are demanded when it becomes a question of arranging the lines of the figures with due regard to the lines of the building; and when it also becomes a question of properly filling up a certain space, and, above all, of making those modifications of nature which are imperatively demanded in such work. Thus the eyelids and other details have often to be exaggerated, and the outline, if the subject is a bas-relief, be cut square and not rounded off, or occasionally it must be strengthened with an incised line, or some parts of the drapery must be undercut or the reverse. Now, Mr. Nicholls has attended to all these points, and, although at present we have only the half-sized models from which to judge, there is every probability of the real work turning out a success and a credit to the donors.

If there could be a Mr. Nicholls in every cathedral city, and if architects would only give up their notches, chamfers, vegetation, and hideous brick polychromy, and spend the money on sculpture, and give sketches for it, there might then be a chance of an improvement in our art, which there will never be until such men as Mr. Nicholls and Mr. Holiday or Mr. Marks are called in to every important building in the same manner as the upholsterer and grainer.

W. BURGESS.

NEW MARKET FOR SANTIAGO.

THIS iron building, the contract for which has been very recently let, is designed to occupy the centre of a quadrangle already surrounded by a one-storied building appropriated for butchers' stalls; and the work being executed in this country is limited to the roof and the columns and girders which carry it, together with a certain proportion of fittings.

The material employed both for constructive and decorative purposes is almost entirely cast iron—wrought iron being used for little else than the bolts and tie rods. The timber used is confined to boarding under the zinc covering of the dome, and pitch pine for purlins. This material was employed in preference to iron purlins, as giving better means of fixing the roof covering. As will be seen from the drawings, a considerable amount of ornamental effect has been aimed at and secured.

The mode adopted for covering the space was to erect nine separate roofs at varying heights, in addition to a low corridor roof next the butchers' stalls, the central one being the highest, and surmounted by a small dome.

* On Ezekiel's vision, see 'Newcome's Ezekiel.' London, Tegg. 1868.

The angles are occupied by four roofs of a less height, but still forming features. These, like the central one, are hipped each way, and the five pavilions thus formed will have their louvred faces well exposed to the air. Four oblong spaces, one adjoining each side of the quadrangle, remain. These are roofed at a lower level again; and the system thus completed and treated as shown on our illustrations may be expected to give rise to very picturesque effects.

The general roof covering is 'galvanised Italian corrugated iron,' a material differing from ordinary corrugated iron in having wide plain faces, with the corrugations some inches apart. This iron is to be No. 18 B. W. G., and before galvanizing and corrugating is to weigh 30 oz. to the foot super; and this material is to be employed without boarding or rafters to carry it being considered necessary. There is no inner skin or ceiling, and a ventilator to allow the escape of heated air is formed at the apex of each pavilion and at the ridges of the intervening roofs. The gutters are all trough gutters of large

size, as much as 1 foot 6 inches across, and the water from all the roofs will be conveyed to the outer ranges of columns, which will act as down pipes.

The castings have been arranged in short lengths for packing, and the ornamental castings are to be mostly, if not entirely, cast separate from the structural pieces. The very necessary precaution has been taken of providing for the erecting complete in this country of a very large portion of the structure, each separate casting being numbered and marked, and a sufficient proportion of duplicates of every piece being provided to guard against contingencies.

Almost the whole structure will be bolted together, and a specially ingenious contrivance has been arranged for holding together the ends of the girders on the tops of the caps, so as to give almost perfect continuity to the lines of girders from end to end. The very considerable amount of fitting and fixing to be provided for may be judged of from the fact that the number of bolts amounts to 34,288, and the number

PLAN OF THE NEW MARKET FOR SANTIAGO.

of holes to be punched to 77,472. As a specimen of the general care with which the whole is specified and arranged for, and as a good example of the precautions which it is wise to take in the matter of testing iron work, we append the following extracts from the specification:—

Testing Quality of Iron.—Cast Iron.—When the castings for bed plates, columns, girders or rafters, are being run, three test bars shall be cast from each day's melting for this work, and from such ladle-full as the inspector shall direct; each bar is to have marks cast upon it indicating the date of the melting, and the three bars of each set must be numbered 1, 2, and 3, consecutively. One of the test bars will be broken in the presence of the engineer's inspector, the second is to be sent to London, the third is to be held as reserve at the disposal of the engineer. The test bars are to be cast 3' 6" long, 2" deep, and 1" thick, and care is to be had to preserve the dimensions as accurately as possible. The test bar being placed on bearings 3 feet apart, is to sustain, without breaking, a weight of 30 cwt., applied in the middle, and with that weight shall not deflect more than $\frac{1}{8}$ of an inch. If the bar does not satisfy these tests, the castings run from the same meltings will be rejected, unless some flaw in the test bar itself shall be discovered at the place of fracture. If the test bar shall fail to satisfy the above conditions, and it shall be judged by the engineer that such failure appears due to a flaw in the test bar itself, then the third bar above mentioned shall be tested in like manner, and the result shall be accepted as conclusive. The test bar shall be accurately gauged, and if the section is found to exceed the dimensions above given, viz. 2" by 1", the minimum breaking weight will be increased in proportion, viz. directly as the square of the depth, and directly as the breadth; on the other hand, if the dimensions fall short of those prescribed, a corresponding diminution will be made. A machine must be provided for accurately determining the deflection and measuring the breaking load by dead weight, to the satisfaction of the engineer, as also a gauge for determining the dimensions of the bar. The second sample test bar is to be sent, at the contractor's expense, to the testing works of Mr. Kirkaldy, the Grove, Southwark, London, and is there to be tested in such manner as may be decided by the engineer, at the sole expense of the manufacturer. The bars are to be sent up weekly by rail, carefully packed.

Testing Wrought Iron.—Such sample pieces of the wrought-iron bars used for bolts, nuts, and tie rods, as the engineer may select, are to be tested by being bent cold through

an angle of at least 120 degrees; if any crack, or commencement of a crack, or rupture of the fibres, appears on the convex side of the bend of any one sample piece so treated, the lot of bars represented by that sample is to be rejected. As to the selection of the samples, the bulk of materials offered by the contractor is to be divided into such lots as the engineer may deem expedient, and one sample is to be selected from each by him and considered as representative of the lot from which it has been taken. All girders or such of them as the engineer may designate to be tested before leaving the premises of the contractor, and at his expense, in the presence of the engineer or his inspector, to the extent of one-third of their breaking strain; and should the engineer decide that any girder exhibits too great deflection, or appears otherwise faulty, it is at once to be broken up in the presence of the inspector, as are all other rejected castings, and is to be replaced by a fresh casting, which is also to be similarly treated.

The contractors for the whole work are Messrs. Laidlow & Sons, of London and Glasgow; the engineer, Mr. Edward Woods; and the joint architects, Mr. T. W. Goodman and Mr. Driver. The representative in this country of the Santiago municipality is Mr. Garland.

Canal between the Bay of Biscay and the Mediterranean.—The project of establishing through the valley of the Gironne (France) a canal for large navigation, to connect the ocean to the Mediterranean, has been often mooted, but there is now a new plan for this undertaking, under the auspices of M. Staal de Magnoucourt. The proposed canal will admit not only merchant ships of the heaviest tonnage, but also men-of-war and Transatlantic steamers. It is proposed to establish a port in the Gironde, just below Bordeaux, and another on the Mediterranean. The cost of the scheme is estimated at 442 millions of francs, and the cutting of the canal would occupy six years. This plan, if carried out, will materially shorten the navigable communication between England, the North of Europe, and India, for it will in fact be a continuation of the Suez Canal.

THE GREAT PYRAMID.

To the Editor of THE ARCHITECT.

SIR,—The 'note' on my letter in your last issue contains a re-assertion, in a more deliberate form, of what I pointed out to be simply contrary to the fact; and that re-assertion is sought to be strengthened by a quotation, not from my letter, but from Professor Smyth's private letter to me, of which I sent you a copy. I must, therefore, ask you, in simple justice to the Professor and to the facts, to publish the whole of his letter; so that your readers may judge how far true it is (in the sense of his being 'content to determine that matter of real geodesic importance' by any such means) 'that the measurement of the side of the Pyramid to which the Professor gave the *place of honour* was made by a *tape*;' and that they may judge whether 'with the reasons for this we have little concern.' The value of this 'place of honour' as estimated by the Professor himself will then be apparent. Professor Smyth's letter is in answer to the two categorical questions which I put to him, after reading the charge made against him in THE ARCHITECT of February 6:—

1. Did you yourself (apart from Inglis) attempt a measurement of the side of the Pyramid?

2. If so, did you make the measurement with a *tape*?

I have the honour to be, &c.,

Royal Observatory, Edinburgh, February 9, 1869.

DEAR SIR,—Modifying your first question, thus—Did you, yourself (apart from Inglis), attempt a measurement of the length of a side of the Pyramid's base *from socket to socket* (these being the only recognisable accurate terminations of such a base line)? My answer to this is briefly, No!

Your second question, therefore, falls to the ground. But I may add that I would have been horrified at the idea of making the final measurement of any important base line with merely a *tape*. I have not had any opportunity yet of showing how I would like to make a good measure of the Pyramid's correct and socket-defined base.

The modification of your first question is necessary, because I did make *angular measurements for the azimuth* of two sides successively of the Pyramid's base, *as defined by the sockets*, with an alt-azimuth instrument; and, again, I did, several months before Mr. Inglis opened up any of the sockets, make some excessively rude, tentative, length-measures (with a string) on all four sides of the Pyramid's base, merely to test whether it was more probably square than violently oblong, like the Chaldean temples. The object of these measures being so simple, I was content that my then measuring means were so rude, because there was no definite termination; only indistinct, large dilapidations of masonry at each corner of the base, and no corner could 'see' another, by reason of the hills of rubbish between, and I looked on my effort only as a temporary approximation—just a *first shot*.

Such rude length-measures at that early part of my visit were quite enough to disprove the reputed oblong figure of the Great Pyramid's base, but not enough either to settle that the base of ancient days was an accurate square, or to state the length of the ancient sides for any accurate purposes. When, therefore, Mr. Inglis opened up, just at the end of my visit to the Pyramid, all the four sockets, and they did give definite corner points (whether absolutely the right ones is a matter to be still tested by further monumental evidence as yet not excavated), and when he measured linearly between these sockets, I at once gave his linear measures the place of honour *as compared with mine, made long before, and when there was nothing defined to make the measurement between or upon*. But I did not, and I do not, think that Mr. Inglis's linear measures made by *tape* were anything like so accurate as pyramid base-line measures should be, or that we should rest content with them. I regard them only as *shot No. 2*; and *shot No. 3*, by whomsoever delivered, should be something so much more accurate, that *No. 2* should be no more mentioned in its presence than I consent to my *No. 1* being mentioned in presence of Inglis's *No. 2*. And I remain, &c.,

(Signed) C. PIAZZI SMYTH.

NOTE.—We are indebted to the courtesy of our correspondent for enabling us to insert the above conclusive testimony to the justice of the remarks which excited his displeasure. We may return to the subject of ancient linear dimensions, the only part of the case which has any interest, except of the most strictly private nature.

NEW BUILDINGS AND RESTORATIONS.

The General Council in St. Peter's.—The Holy Father visited on the 6th ult. the works now in progress in the transept. His Holiness was accompanied by the four architects of the church, and by other officials. Some modifications have been made in the original plan. There will be fourteen rows of stalls, arranged *en amphithéâtre*. Each Bishop will have a desk before him. To prevent the dispersion of sound which would be caused by the great elevation of the roof of the transept, a thick curtain will be suspended above the assembly, stretching from one cornice to the other. The arcades, which form a communication between the transept and the two chapels adjoining it, will be entirely closed. The interior surface of the enclosure through which the Prelates will enter the transept will be adorned with portraits of all the Popes who have held Œcumenical Councils.

The New Wesleyan Schools at Wolstanton.—Following the erection

of their handsome new chapel in 1866, the Wesleyan body have now completed their original plan of providing new schools. The schools are in strict architectural keeping with the Gothic chapel, and have been erected from the plans of Mr. T. Roberts, of Trentham. The contractor for the building was Mr. W. Sutton, of Newcastle. The premises are situated at the rear of the chapel, and are lofty and commodious, containing a large room 70 feet by 60, and capable of accommodating between 300 and 400 children. The building will also contain an infant school, several class rooms, and a room for the school library. The total cost of the schools, including the land (70*l.* 10*s.* 6*d.*), and the heating, furniture, &c., will amount to about 1,080*l.*

The Gladstone Testimonial.—The Premier having expressed a wish that the Liverpool testimonial to himself, raised chiefly by the pence of working men, should be devoted to a convalescent hospital, the foundation-stone will shortly be laid by Mrs. Gladstone.

A Colossal Concert-room is about to be built in Paris. It is to contain 5,000, and the orchestra 1,000. Monster concerts, *à la mode de Londres*, are to be the entertainments, and the idea is to give the finest works of the great masters by the best artistes, and yet keep the price within range of every class. The cost of the building is to be 200,000*l.*, and half that sum is already subscribed.

A New House of Commons.—The Report of the Select Committee on the House of Commons arrangements is published. The commissioners have decided that an enlarged House of Commons is required, and that no enlargement of the present House is desirable. They propose to take down the present dining-rooms, and to construct a new House on the present site of the dining-rooms and Common Courts. The present House would then be used as a lobby, and accommodations of all kinds would be increased. The New House would hold 669 members and 330 strangers, whereas the present House accommodates 428 members and 268 strangers. The form recommended for the new House is that of a square, with the corners cut off. The proposed floor is to be solid, and the ceiling to be of glass in the centre, with sloping sides of wood. In the construction of the plans great attention has been paid to acoustical conditions.

Laying the Foundation-stone of St. John's Church, Holmside.—The ceremony of laying the foundation-stone of this church took place recently at the village of Burnhope, in the parish of Holmside. A large number of people assembled to witness the ceremony. The trowel was presented to Mrs. Earle McGowan by the architect. Mrs. McGowan, after acknowledging the compliment, declared the stone to be duly laid in the name of the Father, Son, and Holy Ghost. A bottle was placed in a cavity in the stone, containing a number of coins, a copy of THE ARCHITECT and Daily Journal, and other documents, and a scroll containing the following inscription: 'This, the Foundation-stone of the Church of St. John, Holmside, was laid by Mrs. Earle McGowan, March 17th, 1869. Rev. Earle McGowan, M.A., Vicar. T. C. Ebdy, M.R.I.B.A., Architect.'

Worcester Cathedral Restoration.—The scaffolding round the tower has now been entirely removed. The restoration of this portion of the cathedral has been undertaken at the sole expense of the Earl of Dudley, and is now complete, and the statuary has been fixed. The niches in the north porch have also been filled with statuary, and the whole of the exterior decorations have been finished. The restoration of the interior is proceeding slowly. The magnificent reredos, erected at the cost of the Dean (Dr. Peel), from the design of Mr. Scott, has been completed, with the exception of the wrought metal work, intended to be placed within the open arches on each side of the five niches forming the centre of the composition. The general design of this reredos is similar to other works of the same kind designed by Mr. Scott, especially that of Lichfield; but at Worcester single figures of large size, representing our Blessed Lord and the four Evangelists, take the place of small sculptured groups or emblems: these figures are extremely effective, being distinguishable at a considerable distance—a point often lost sight of in designing this important feature of a church. The reredos is mainly constructed of alabaster, with shafts of coloured marbles and granite, and inlays of *lapis lazuli*, gold, mosaic, malachite, cornelian, spar, and other rich materials. Figures of angels occur between the larger gables, behind which are other angels playing on instruments of music. A profusion of delicate carving in the shape of crockets, crestings, capitals, finials, has been lavished upon the work. The arches are richly moulded, and rising from the centre is a lofty canopy resting upon four shafts of *verde antique*. The screens and other fittings of the choir cannot be proceeded with until a large addition has been made to the restoration fund; but the great hour-bell—an instalment of the new peal—is now in the nave ready to be raised to the tower. It has been founded by Messrs. Taylor, of Loughborough.

The Runcorn Viaduct, which is the principal work upon the new route from Liverpool to London, and is just opened for traffic, is about a mile and a half in length, including the approaches, which consist of viaducts of blue Staffordshire brick, 65 arches on the Lancashire side, and 32 on the Cheshire side. The main portion of the work consists of the wrought-iron open lattice girder bridge over the Mersey. It consists of three openings, each 305 ft. wide. The girders rest upon piers of Bramley-Fall stone, for which a foundation upon the rock was readily met with. The lattice sides, including the girder, are about 30 ft. deep, and the great structure presents, at a short distance, a very imposing and graceful appearance. There is 75 ft. of headway for the navigation at highwater spring tides. In October last a footway alongside the bridge was opened to the public, and has been found a great convenience as a substitute for the ferry. Express-trains from London to Liverpool will be now able to complete the run in a trifle over four hours, the distance being a little over 200 miles. There will be no stoppage on the way, the water supply being scooped up by the tender from tanks placed between the rails in the neighbourhood of Rugby. The Runcorn works are highly creditable to Mr. Baker, engineer, and to the directors of the London and North-Western Railway Company, for whom they have been executed.

NOTES ON NOVELTIES.

Potts's Ventilating Cornice.

This patented invention, which we have carefully examined in model and also in actual use, appears to us to have claims that are unusually strong upon the attention of the public. We say this on account of the very great importance of the object proposed, and which is nothing less than a self-acting and efficient system of ventilation easily applicable to the rooms of dwelling-houses as well as to larger apartments, and on account of the great simplicity and apparent suitability of the means employed for attaining that object. Mr. Potts's invention has less that is absolutely new than the majority of the 'novelties' that come before our notice, but it has the recommendation that it proceeds on principles long known, recognised, and successfully used, and that it carries the application of those principles one step further than it has hitherto gone, and assumes a form readily applicable to new or existing rooms, not excessive in cost, and not merely slightly, but even suggestive of novel, though simple effects of a decorative character.

Without going through the whole history of inventions available for ventilation of the rooms of dwelling-houses, we may appeal to the experience of almost everyone engaged in building to corroborate us when we say that the only useful and simple apparatus readily purchasable and easily applicable is Arnott's valve, which lets out hot air into the chimney flue, and the Sheringham valve, which lets in cold air from outside; while the only other appliance in ordinary use is perforated zinc fixed over openings intended to admit or emit air to or from the room as the case may be. These appliances are all somewhat unsightly, and all in their application liable sometimes to produce discomfort; but they are simple, often effectual, and much used.

We will now describe how Mr. Potts's cornice combines something of the working of all the three. He constructs the cornice of any ordinary room in metal, using by preference zinc, and he separates the hollow space at the back of this cornice by a horizontal division into two chambers or channels—thus forming a channel behind the lower or 'bed' mouldings, which runs continuously round the walls, and a second behind the upper mouldings similarly continuous, and having the ceiling for its upper surface. The extreme upper and the extreme lower mouldings are perforated, and the lower channel being made to communicate with the outer air by a suitable opening, while the upper channel communicates either with the smoke flue or with a separate ventilating outlet flue, carried up alongside of the smoke-flue, the whole is complete. Those of our readers who are at all versed in the science of ventilation will readily understand that the layer of air at the very top of the room, which is the most vitiated portion of the air when a room is in use, especially if lights be also burning, may be expected to be constantly sucked in at the perforations in the topmost mouldings, into the extracting channel, and so drawn off by the flue; while a corresponding volume of fresh air will enter through the lower channel to supply its place, and as far as we have been able to satisfy ourselves of the facts of the case in actual practice this result is satisfactorily attained.

We have already stated that this invention is not entirely new, and some of our readers familiar with the subject may remember that the Society of Arts' medal has been given to a scheme for ventilation having many features similar to those of this plan, but which has been little used in actual building; but we believe that the introduction of two channels—one below the other—is an entirely novel feature, and sufficient to alter the whole character of the contrivance, while Mr. Potts's invention has this additional and very great merit, that it is practically applicable to existing rooms of the most ornamental as well as the plainest character. And we do not see why some modification of the plan might not be made available for hospital ventilation.

There are but few details to add: it may be right to mention that the inventor has succeeded in giving to the outer face of his zinc a surface upon which distemper or lime-white can be applied just as it can upon ordinary plasterer's work. The perforations can be, and in fact in all the specimens we have seen have been, arranged so as to produce a very effective and decidedly novel architectural decoration. It is easy to apply this cornice to rooms where a cornice at present exists, if only the circumstances permit of the ventilating cornice being sufficiently large to include the original cornice within it, and leave space enough between the two for the air channels. The new cornice could be combined with plaster, or carton-pierre, or papier maché enrichments; or a cornice, partly in plaster and partly in perforated zinc, could be used, though not without difficulty. Architects' own profiles can be worked, but not, it is clear, so simply and cheaply as where plaster cornices are used: where, however, considerable lengths of one profile are required, this objection will not be serious, and to that large class of building undertakings for which good selected patterns suffice, this invention is easily applicable. The mouldings, which are procurable in moderate lengths, and of which various sections are obtainable, require some care in mitring and fixing; but the fixing is simple enough: and on this ground they recommend themselves as worth a trial wherever a ventilator has to be introduced. Care should of course be taken that the sectional area of the hollow parts of the cornice and of the openings for inlet and outlet are large enough for the work they have to perform, and we may add that, to spread the current, the perforations of the part of the cornice immediately opposite the inlet are omitted.

No doubt difficulties will arise in the application to actual practice of even such a simple expedient as the one we have described, but we believe that many of them have been already disposed of, and that no obstacles remain such as are likely to prevent the successful application of this invention, if it can be supplied and fixed at prices which do not compare unfavourably with plaster cornices girt for girt, and the net prices quoted to us are very near those now charged for plaster cornices of similar character.

Potts's Patent Moulding for Hanging Pictures.

This invention, which may or may not be used in connection with the perforated cornice already described, consists of a hollow moulding, formed in strong metal, fixed all round the room by the help of strong holdfasts, from which it can be detached at will. The hooks from which the pictures

hang are suspended from the interior of this moulding, within which they run easily, in place of being carried outside as on the ordinary brass rod. The invention is ingenious, and its simpler forms can be put up, we are informed, at much less cost than the brass rods ordinarily employed for the same purpose. It appears to be secure and appropriate to, and not difficult to fix, and may be made to work in with the ordinary cornice of any room.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Pictures by Raphael.

The long gallery at South Kensington in which, greatly to their advantage, the Cartoons of Raphael are at present lodged, has for some time been used as what may be familiarly termed a 'Raphael Room'; that is, as a locality in which may be assembled all objects illustrating or referring to the career of the great painter. Copies of several pilasters of the celebrated 'Loggie,' reduced copies of the equally renowned 'Stanze,' a monochrome copy of Raphael's latest work, the Transfiguration, and a tapestry after the Charge to Peter, are among the principal objects of interest. Lately, however, there have been hung on each side of the entrance two pictures, each of which claims to be a veritable work of the master. On such occasions pretenders (and be it observed that this word does not imply an unfavourable judgment, nor indeed any opinion whatever) must expect to be severely criticised, and to have their credentials strictly examined. Perhaps, however, the first and best step is to examine the internal evidence of genuineness, as documentary evidence of the most irreproachable character will scarcely establish a belief, and will assuredly fail to excite an interest, in works of inferior merit. In the present instances there can happily be no doubt on this essential point. Even those who doubt the authenticity (and it is always a *safe card* to doubt) of the paintings which, to use an Italian phrase, 'wish to be Raphael's,' can scarcely deny their great beauty of execution. On the composition nothing need be said, the one being a *replica* of the well-known Madonna in the Louvre, the other a *replica* of the celebrated 'Cardellino' in the Tribune at Florence. The first-named is the property of the South Kensington Museum, and forms part of the magnificent bequest of the Rev. Chauncy Hare Townshend, which comprises many other paintings, drawings, engravings, books of fine art, coins, and a valuable collection of precious stones. The Cardellino picture belongs to George Verity, Esq., of Southwoods, Thirsk, and possesses a curious and apparently unchallengeable pedigree, which we propose to give in our next number, for the satisfaction of those who may require written authority to justify their admiration.

Notes for Connoisseurs.

At the sale of the collection of M. Jules Boilly in Paris last week a pen and ink drawing by Murillo, Saint Theresa in ecstasy before the infant Jesus, was purchased, for the Louvre, for the large sum of 66*l.* 8*s.*; a drawing by Clouet (called Janet), Portrait of Diana of Poitiers, fetched 42*l.*; an original pen and ink sketch which Gérard used for his portrait of Madame Récamier, 16 guineas; Géricault's first idea of his picture of the Wreck of the Medusa, pen and ink, 12*l.* 8*s.*; Pen and ink sketch for portrait of Napoleon when First Consul, by Ingres, 30*l.* 8*s.*; Claude's first idea, pen washed in with sepia, one of his great pictures, known as the Great Bridge, 17*l.* 12*s.*; a Bacchanal sketch in sepia by N. Poussin, 66*l.*, and a small pen and ink sketch of Pan and Syrinx, by the same, 13*l.* 4*s.*; and a study for the decoration of a vessel, in alto-relievo, by Pierre Puget, 43*l.* 4*s.*

At another sale in Paris, two small works by Ary Scheffer, sketches or replicas of his famous Faust in his Study, and Margaret at her Wheel, sold for 30*l.*; three small works by Decamps also sold well—A Pool surrounded by Rocks in the Forest of Fontainebleau, 126*l.*; a Landscape with figures of Tobias and the Angel, 166*l.*; Sportsman in the Marshes, 160*l.*; The First Day in the Plain of St. Denis, 180*l.*; and a single figure of an Old Sportsman, 96*l.* The following also deserve notice—Fox-hunting by A. do Dreux, 320*l.*; Mephistophiles appearing to Faust, Eugène Delacroix, 304*l.*; Diaz, a group of Gipsies, 67*l.* 4*s.*, and a scene in the Forest of Fontainebleau, 68*l.*; Robert-Fleury, Luther taking the Oath at the University in presence of the Elector of Saxony, 120*l.*; Géricault, A Scene of the Deluge, 400*l.*; Ingres, a Study for St. Peter, 80*l.*; Leys, Religious Service in the time of Luther, 292*l.*; Marilhat, a Mosque on the Nile, sunset, 256*l.*; and an Avenue of Palm trees, by the same, 102*l.*; Prud'hon, Andromache, 286*l.*; Troyon, A Horse at the Door of a Farrier's Shop, a small work, 56*l.*; and another small work, view of Saint Cloud, 72*l.* 16*s.*; Rosa Bonheur, Cattle, 188*l.*; and a Shepherd of the Landes with his flock, 176*l.*, both small works; Ziem, Marine view in Holland, 60*l.* 16*s.*

Amongst old works, a picture representing the History of Troy, attributed to Memling, was sold at the Paris mart to M. Rutter, for 600*l.*

A mistake occurred last week in the Notes on the Delessert sale, the number of lots being printed as 2,180 instead of 213.

Architectural Prize-Competition at the Ecole des Beaux-Arts, Paris.

The pupils of the Architectural section who have passed the preparatory trial with success commenced their competitive labours for the Prix de Rome on the 22nd ult., and will not terminate them until August 4; the candidates accepted this year are ten in number.

The names of the Architects in whose ateliers these candidates for the honour of the Roman studentship have studied are as follows. One is announced as having studied under both M. Guénépin and M. Questel, and two as pupils of these same gentlemen separately; three as pupils of MM. Libas and Ginain, two of MM. Pacard and Vaudoyer, one of M. Laisné, and one of M. Coqart. The academic standing of the above architects is as follows:—M. Guénépin won the Prix de Rome in 1837, and was decorated with the cross of the Legion of Honour in 1843; M. Questel obtained his first medal in 1846, a medal of the first class in 1855, and is an officer of

the Legion of Honour: M. Libas's name is not in the official list of decorated architects or medallists: M. Ginain obtained the Prix de Rome in 1852: M. Pacard's name is not in the official list: M. Vaudoyer won the Prix de Rome in 1826, is a first class medallist, a member of the Institute, and an officer of the Legion of Honour: M. Laisné obtained a second class medal in 1852, and the cross in 1864: M. Coquart won the Prix de Rome in 1858, and a medal in 1865. It may be added that two of the above named architects were placed on the list for the Architectural jury of the coming Salon, but only one of them, M. Vaudoyer, was elected. There is no doubt that many an architect who has obtained no honours may be a very good teacher, and a truly practical one might chance to make a much better master than a theorist covered with honours; but those who support the academic system against, or in preference to, that of articulated pupils must of course, to be consistent, look for masters who have themselves reaped the laurels. While on this subject, it may be remarked that it is a constant complaint amongst French architects themselves that the arts of designing and of constructing buildings are almost divorced; it was the want of practical education in France that gave rise to the new independent School of Architecture which has been noticed in the columns of THE ARCHITECT (page 138), and there is no doubt that this school promises to inculcate good sound principles in the minds of its pupils, but it cannot teach the ways of the shop, the management of workmen, or the business of life.

The Brussels Exhibition of Paintings.

The annual Exhibition of the Brussels Society of Arts will this year be held in the buildings of the Botanical Gardens. The first day of exhibition, usually July 1, is this year postponed to the 25th of that month, and the gallery will remain open until the last day of September. The President for the year is M. Anspach, the Burgomaster of Brussels, and the Vice-President is M. Cuyllits, President of the Society for Encouragement of Art at Antwerp.

Notes from Germany.

The Arch-diocese of Cologne has just despatched its present to the Pope on the occasion of the 50th anniversary of his ordination as priest. It consists of a well-executed painting in oils of the 'Dom' of Cologne, as it will appear when finished, by Professor Conrad, of Dusseldorf. It is mounted in a handsomely carved and gilded frame, designed by M. Conrad, bearing shields and Gothic foliage. The top middle shield bears the Papal arms, the shields at the four corners the arms of the dioceses of Cologne, Trèves, Münster, and Paderborn, whilst along the bottom of the frame runs a scroll with the words, 'Sanctissimo Patri Pio Nono summo Pontifici per decem lustra Sacerdoti grato pique animo filii dioecesis et civitatis Sanctæ Coloniensis Romanæ Ecclesiæ fidelis filiae.'

The stained glass for the great west window of Cologne Cathedral is being prepared by Messrs. Milde & Achelius, of Lubeck, and is said to be nearly ready for fixing. Of the 18 great pictures, 14 are quite finished and 4 nearly so; after which the smaller spaces in the tracery will be taken in hand, so that the window will be complete by Easter 1870. The following subjects, forming part of this work, are now on view at the Public Library in Lubeck:—The daughter of Herod with head of John the Baptist, the Pharisee and the Publican in the Temple, Moses descending the Mount, and Abraham's Sacrifice.

The Committee appointed to examine the competitive plans for the Berlin Cathedral have advanced in their labours so far as to have thrown out twenty-two designs out of the fifty-two which have been sent in. That a Gothic cathedral would be out of place in a city like Berlin is admitted by every member of the Committee, even by those who are considered 'Goths' *par excellence*. Their decision is looked forward to with much interest by the Prussian public.

The rage for limited liability companies seems to have migrated from London to Vienna, where, among many other schemes, several companies have lately been started for building purposes. Notably, there is the 'Building Bank,' with a capital of thirty million florins (three millions sterling), and the 'Vienna Building Society,' which has been created for the purpose of erecting groups of houses, widening and lengthening certain streets, and providing dwellings for the labouring classes. Several architects—amongst them Schmidt, Fellner, Hasenauer, and others—are members of the Boards, and much good in every sense, both practically and æsthetically, is expected from these new combinations. Berlin is only watching the issue of these companies, in order, if desirable, to follow the example thus set by Vienna.

A valuable painting, executed on wood, and attributed to Hans Memling (it can be traced as having existed at Bruges as far back as the year 1477), has just been bought at a sale at the Hôtel Drouet, Paris, by Mr. Rutter, for the South Kensington Museum. The subject is the History of Troy, from its foundation to its destruction, and the treatment is said to be amusingly quaint. The price for which it was knocked down to Mr. Rutter was 15,200 francs (608*l.*)

Spain.

The Cathedral of Burgos, which had remained closed since the assassination of the burgomaster, was consecrated afresh during Passion week, and is now open daily for service as before. The Theatre de la Libertad at Malaga has been burnt to the ground; the conflagration spread so rapidly that the building was in flames simultaneously from end to end. There was no loss of life.

M. Calamatta.

Milan journals report the death of M. Calamatta, a celebrated engraver, chiefly known for the excellent manner in which he reproduced the works of Raphael. The harmony of tone and the firmness of his touch, tempered withal by softness and delicacy, accorded well with the qualities of the master whom he loved to copy. Calamatta was born at Civita Vecchia in 1802; after studying in Rome under Marchetti and Giangiacomo, he went to France, where he remained until the dream of his life, that of a United Italy, had become a reality. He was a Commander of the Order of Saints Maurice and Lazarus, and at the time of his death Professor of Engraving at the Milan Fine Arts Academy.

Ship Canal through the Isthmus of Corinth.

We are informed from Athens that the Greek Government had granted to a company of foreign capitalists a concession to cut a ship canal through the Isthmus of Corinth. This is no new idea, it having been proposed to the Austrian Lloyd's more than twenty years ago, but the difficulties were then considered insurmountable, and the negotiations at that time set on foot with the Greek Government fell through. The present concessionists have the advantage of benefiting from the experience gained on the Suez Canal—by the way, not the first time the Greeks have learnt from the Egyptians—and are sanguine of success.

Failure in the Iron Manufacture.

The failure is announced of Messrs. Brotherhood, the well-known engineers of Chippenham. The liabilities are said to be 160,000*l.*, and the stoppage of the works is a heavy blow to the whole neighbourhood, as it has thrown a large number of men out of employment.

General.

Mr. G. Gilbert Scott, R.A., has recently received a diploma as Honorary Member of the Imperial and Royal Academy of Vienna. We are glad that this Academy has done itself the honour to recognise in this manner the services of an artist to whom the Gothic revival is largely indebted.

The contract for the erection of a new lighthouse and lighthouse-keeper's residence at Souter Point, near Sunderland, has been let to Mr. Todd, builder, of South Shields, for 8,000*l.*

Works for constructing a railway round Brussels are being urged forward with great activity, and are expected to be terminated by the end of the present year.

A Methodist Cathedral.—The magnificent memorial church which has been erected at Washington by the Methodists of the United States was opened on the 1st day of February. The erection of the structure was in contemplation some sixteen years ago, but the struggle between the North and South occurred, and the work was necessarily delayed. Towards the cost of the enterprise nearly two hundred thousand dollars have been contributed, but the building when fully completed—and this completion involves the introduction of a chime of bells—will have cost a quarter of a million of dollars.

A new town-hall is to be built at Bradford, at a cost of over 50,000*l.*

Twelve gigantic columns of granite intended for the façade of the church of St. Paul at Rome are approaching their completion at the quarries of Bavono, Lago Maggiore.

The pinnacle of Totnes Church, Devon, was blown down during the late gale. The débris fell through the roof; but although several narrow escapes are reported, no lives were lost.

A few days since some fragments of ancient sculpture were dug up close to the cathedral at Bayeux. One figure is supposed to represent the god *Mên*, an Asiatic divinity of Phœnician origin.

The Royal Academy Exhibition of this year is likely to be marked by the appearance of one of our best-known painters in water colours in a new character. Mr. Birket Foster is now in the far west of Cornwall, and earnestly occupied in preparing a landscape of considerable size, in oil, of a coast scene. A second picture of similar character, and wrought in like method of the above, is already far advanced.

The Collection of Historical Portraits, the property of Mr. John Webb, of Grafton Street, London, and consisting chiefly of distinguished French personages from the time of François I. to that of Louis XVI., also some Sèvres porcelain, &c., have been disposed of by auction, the proceeds amounting to more than 4,600*l.*

The New Pier at Morecambe, which is 900 feet long, has just been opened to the public. Its total cost will be nearly 10,000*l.* The approach to the pier is nearly opposite to the Mechanics' Institution, and it is said to be one of the most handsome structures of the kind in England. After the chairman of the Company had formally declared the pier open, Mr. H. C. McCrea, of Halifax, chairman of the Blackpool Pier Company, and one of the directors of this, addressed the assembly, pointing out the advantages which had resulted to Blackpool from the opening of the pier there. He saw no reason why Morecambe should not be similarly successful. The Blackpool Company had realised a dividend of 12½ per cent.

The Works for the construction of the New North Bridge at Halifax have been commenced with vigour. The buildings known as Tillotson's Buildings, at the south end of the old bridge, are nearly demolished, and the foundations for the piers are being put in. The first stone of this important work will be formally laid on Wednesday, 14th inst.

A Stained-Glass Window has just been placed in Lichfield Cathedral. The chief features are six large figures in the six divisions of the window, representing St. Michael, St. Joseph, the Virgin and Child, and in the three others the Magi. At the extreme top of the window is the representation of the Holy Trinity, and underneath the Blessed Virgin and St. Simeon and Child. Beneath the six large figures above referred to are six separate Scriptural subjects, viz. the Annunciation, the Angel appearing to Joseph, the Nativity, Kings Journeying, Kings before Herod, and the Flight into Egypt, the other portions of the window being filled with exquisite designs of a floral and architectural character.

Singular Discovery of One of Ruysdael's Pictures at Windsor.—Mr. Putnam, of High Street, Eton, recently purchased for a small sum an old picture from a furniture dealer in Windsor. Upon cleaning and examining the painting, it was discovered to be a genuine Ruysdael. The subject is a woodland scene, with cottage ruins and a brook, and several figures. It is a gem of art, and has a number of the painter's private marks as well as his signature. Jacob Ruysdael painted in the seventeenth century, and the value of this picture, which has been examined by a number of connoisseurs, is set at several hundred guineas.

The Leamington Local Board have accepted an offer made by the Earl of Warwick to take the whole of the sewage of the town for a term of thirty years, and dispose of it by irrigation on his lordship's estate, at a distance of from two to three miles south of Leamington. The local board are to lay down the requisite mains, construct the necessary works, and pump the sewage to a given point on the estate, and in return his lordship will pay the board 450*l.* annually for the sewage. The arrangement will come into operation on March 25, 1870, by which time Lord Warwick will be prepared to dispose of the sewage on his estate.

A Lock-out is threatened at Bradford in the building trade. The master builders having given notice to their workpeople that, on and after May 3, 7*½*d. per hour shall be the ordinary pay of skilled workmen, that the rules against the machine and quarry-worked stone shall be rescinded, and that all disputes henceforth shall be settled by conciliation or arbitration, the Masons' Society have expressed their determination not to accept the proposition of the masters, which they regard as inimical to their interests. If no arrangement to avert such a result can be effected within the coming month, a lock-out is inevitable.

On Tuesday last the first stone of a new suburban village which is about to be built at Loughborough Park, Brixton, by the Suburban Village Company (Limited), was laid by Lord Shaftesbury. This company was started in July 1866 to supply a want to which at that time public opinion was much directed—namely, good and cheap dwellings for the working classes, thousands of whom had been, or were about to be, deprived of their houses, either by the metropolitan lines of railway or by the course of other large works and public improvements. The leasehold of the Loughborough Park estate, for a period of ninety-nine years, was purchased from the Ecclesiastical Commissioners on very reasonable terms, and this has been laid out in plots for dwellings. The whole extent of ground thus acquired is about twenty-six acres. It has been carefully planned out into six main streets, each house having its garden in the rear. The houses, which are designed by Mr. Pite, the architect, are to be built in ornamental brick, and will contain six, eight, or ten rooms, exactly as the shareholder and intending occupier may wish. The rules of the society are so framed that anyone can purchase his house at once on payment of the amount down, or in one or two years, or he may spread over his payments in the form of rent for seven, fourteen, or twenty-one years. Thus, if a shareholder selects a number, one house, the price of which is 200*l.*, and pays for it by yearly instalments in 21 years, he would have to pay 19*l.* a year and 21 years' ground rent at 3*l.* 5*s.* a year, so that at the end of the 21 years he would have paid 470*l.* for a 200*l.* house. But, on the other hand, it must be recollected that at the end of his twenty-one years the house becomes absolutely his own property, and that for the same description of house elsewhere he would have to pay at least one-third more rent, and at the end of his twenty-one years have no more title to the property than on the first day he entered on its occupancy. After the stone was laid, Lord Shaftesbury, in a few earnest remarks, dwelt upon these advantages, and above all upon the enormous benefits which must accrue to the working men from having clean, well-ventilated, and wholesome dwellings, instead of being huddled together as they now were in crowded sties, the very atmosphere of which so depressed the vital system that drinking and all its hideous train of vices were almost forced upon the poor. He avoided expressing any opinion as to the financial results of the company, but did not conceal his admiration of the good work they had begun, and earnestly hoped that it would be as successful to them as it must in any case be beneficial to the working men who would tenant the houses. He believed in the goodness of the scheme, as he believed in the excellency of most of the efforts which were now fortunately being made for the benefit of the artisan and mechanic, and all the upper class of handicraftsmen, and he thought the day was not far distant when as classes they could be pointed to as models of frugality, temperance, and industry. The Hon. Arthur Kinnaird also addressed a few words to those who had come to witness the laying of the stone, after which the proceedings, which were very brief, terminated.

There are three projects before the public for crossing the Straits of Dover. Mr. Hawkshaw has for a long time past been engaged in preparing plans and making soundings for a tunnel. Eminent French engineers favour the proposal of one of their number, who has suggested the construction of a bridge. Another proposal is for the construction of an enormous raft on which trains of railway carriages shall be carried across from one railway to another. According to the *Railway News* a fourth scheme has now been proposed. The designer, Mr. Purkis, proposes that an iron tube for a railway shall be laid across from the English to the French coast, and be supported at a depth of about 50 feet below the surface of the water by iron stanchions or tressels, the feet of which will rest upon the bed of the straits. The tube is to be in its outside diameter 23 feet 6 inches, and with a view of giving it sufficient strength to resist the pressure of the weight of water, to sustain the weight of the trains between the points of support, and to allow for the decay caused by the action of the water, the tube is to be of cast iron 8 inches in thickness, being nearly twice the thickness of the armour-plates of the *Warrior* ironclad. The length of the tube between each pair of legs or supports is to be 300 feet, and the weight of each of these sections is to be 3,000 tons. Each of these lengths of 300 feet is to be made up of 8 segments of 37 feet 6 inches, and those are to be firmly bolted together by means of 100 steel bolts passing through the internal flanges of each length of tube. Ask the bold engineer how these segments are to be put together in the water, and he explains the matter in the most practical manner. Each segment will be made water-tight by a bulkhead, and will be lowered until it is brought into exact position with the portion previously fixed, and when made fast by the bolts the near bulkhead will be removed, and the workmen will pass on to the next section. The stanchions which will have to carry the tube are made, as it may be supposed, of enormous strength. They will vary in length according to the depth of the water. The largest will be 106 feet in length; it will be formed hollow, tapering from each end to the middle, where it will be 7 feet 2 inches in diameter, the

ends being 5 feet 8 inches in diameter. They will be cast in three pieces, and bolted together by cast-steel bolts on inside flanges. The weight of each of these legs or stanchions will be 454 tons. In order to give them a sure foothold at the bottom of the sea, they will be fastened by bolts to discs of metal 25 feet in diameter, and weighing 85 tons. To prevent any lateral motion, the feet of these stanchions will be held together by tension bars 100 feet long, and weighing 60 tons, and a similar tension bar, though of less length, will connect and hold the stanchion at the upper extremity. The bolts that are to hold and keep the stanchions apart weigh not less than 4½ tons each. The transverse strength of the tube when completed has been satisfactorily ascertained to be 27,034 tons, and if loaded in the middle it would safely carry 2,000 tons weight. In order to sink the tube, each section of 300 feet will be loaded with 433 tons of rails, air and water tubes, and of 1,800 tons of ballast or shingle, each segment as it is lowered being provided with its due share of dead weight, to ensure the necessary displacement of water. The pressure of the flow of the tides will be equal to 450 lb. on every square foot of the cross sectional area, but the stanchions are calculated to be of sufficient strength to resist any movement from this cause. The ventilation of the tube is to be provided by stationary steam power at one of the entrances to the tube, which will force a sufficiency of air through a channel constructed along the inner roof of the tube to a point about midway of its entire length, where it will be discharged and force itself along the tube to either end, providing at the same time a perfect system of ventilation. The draining of the tube is duly provided for; the water will be collected in the lower part of the tube, and as the locomotives pass through they will take up the water in a trough, in the same manner as the engines are supplied on the London and North-Western Railway while travelling. The casting of the various portions of the work is to be done in a dock to be formed on the coast, and the various portions, as they are cast, are to be floated by letting in water, and taken out to sea by pontoons, to which they will be attached by suitable chains. The cost of this work is set down at from ten to fifteen millions.

Discovery of a Tumulus near Penrith.—A discovery of a very interesting character to archaeologists has been made on the farm of Moorhouses, near to Penrith, which will likely form the subject of an important and interesting investigation at the next meeting of the Archaeological Society. It appears that on Wednesday last ploughmen were engaged at work in a field on the farm at Moorhouses, and in order to facilitate the progress of the plough several large stones had to be removed. Under one of these stones the ploughman discovered a large urn turned upside down and protected from the surface by a large stone supported by three perpendicular stones placed in the form of a triangle. The man thought he had discovered a treasure, and on lifting the urn he found to his disappointment that it only contained a quantity of bones and ashes instead of the great prize that was expected. In his simple ignorance he threw the urn, which was perfect, aside and it broke. The urn was made of clay, and was ornamented around the exterior, and when the broken pieces are fitted into each other, a good idea may be formed of its original dimensions. It is computed to have been about a foot in height, and about nine inches in diameter at the top. It was filled with charred bones nearly to the top, and from the ashes amongst them it was evident that many of them had crumbled to dust. Many of the bones are of a very curious form, but many of the small pieces can be fitted into each other, such as the jaw and parts of the skull, in such a way as to leave no doubt of their being the remains of a human being. There are also a few small teeth, and from the formation of the under jaw it is conjectured from its small size to have been that of a female. Be that as it may, however, there they are, and a very interesting collection for the examination and the study of those who are interested in such matters. The whole might have been lost sight of altogether and been ploughed into the soil again had the circumstance not fortunately reached the ears of Mr. Valance Stalker, of Penrith, who takes a deep interest in archaeology, and he at once proceeded to the place and secured what to him was a much greater treasure than it was to the ploughman. The urn and bones are now in his possession, and he shows them with pleasure to any one who wishes to inspect this curious relic of the past.

The Breach in the Bank of the Ouse, near King's Lynn, which threatened to renew the disastrous inundations of 1862, has, it is stated, been effectually secured. The danger, which was very great, appears to have been met with much promptness, and the measures taken to prevent further mischief are reported by telegraph to have been successful.

Trouville.—Messrs. Herries & Co., and Messrs. Roberts, Lubbock, & Co., have notified that they will receive subscriptions for an issue of 400,000*l.* seven per cent. mortgage bonds on the *Trouville Association* (Limited), secured by a property at Trouville, the well-known French Brighton on the Normandy coast, which it is proposed to enlarge and generally develop by the erection of houses and the disposal of building lots. The debentures are to be of 10*l.* each, redeemable in about seven years, with a bonus of 20 per cent., and a share in any surplus profits that may be realised.

Paris Workmen.—Bertall, in a comic page of the Paris 'Illustration,' gives the following advice apropos of the present difficulty of disposing of the large number of workmen who have been attracted to the Metropolis by the Haussmann mania, and who are now likely to be thrown out of employ, if the proposed stoppage of the public works is really carried out. 'For all these men,' he says, 'only one thing can be done. You must carry all the soil of the Champ de Mars to the Buttes Montmartre, and then carry all the soil now on the Buttes Montmartre to the Champ de Mars. This is a simple way out of the difficulty, and can injure no one!'

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Monday, April 5, at 8 P.M.
 INSTITUTION OF CIVIL ENGINEERS.—Tuesday, April 6, at 8 P.M.
 SOCIETY OF ARTS.—Wednesday, April 7, at 8 P.M.
 ASSOCIATED ARTS INSTITUTE.—Saturday, April 3, at 8.15 P.M.

The Architect.

TO OUR READERS.

WE have great pleasure in announcing to our Subscribers and Friends, and the Public, that the success which has attended THE ARCHITECT through the three months during which it has been established has been so marked, and the consequent pressure of business so great, that it has become absolutely necessary to take separate premises without further delay.

These have been secured in the south side of the Strand, a little east of Somerset House; and, as soon as the necessary preliminaries have been completed, the publishing and editorial offices of THE ARCHITECT will both be transferred to that address, where the excellent facilities offered by a roomy and well-arranged place of business will assist us materially in carrying on the affairs of the Journal.

The actual transfer of our offices to this their permanent position will be made known as soon as it has taken place: in the mean time we cannot allow this opportunity to pass without expressing our grateful thanks to the public whose support we have so largely received, and to the very many Architects, Artists, and other friends who have assisted us by their contributions, suggestions, and information.

This public support and private assistance has come from so many quarters—in very many instances having been proffered unsought—that we cannot but feel that, in the establishment of this Journal, we have supplied a public want. It will be our endeavour to continue THE ARCHITECT as we have begun it; and not merely so, but to make constant advances, to supply more and more completely the needs of our readers as they become known to us, and to keep up with the progress which the Arts of Construction are daily making.

It has been the good fortune of this Journal to make its start at a time when great and perceptible changes are beginning to make their presence felt. If we are to prognosticate the future from the history of the past, the remainder of this century is likely to witness an astonishing advance in the Art of Architecture, the Science of Engineering, and the Practice of Building. To point the way, to chronicle the progress made in any department of human activity, to help by every means available the pioneers of wholesome reforms, is peculiarly the privilege of the technical and professional press; and THE ARCHITECT trusts that its services may not be found less valuable to Art, Architecture, Civil Engineering, and Building, than those which have been rendered by other periodicals, identified with their respective interests, to Law or Medicine, Manufactures or Agriculture, to Music or to Literature.

ARCHITECTURE IN MANCHESTER.

A STRANGER passing through Manchester will not be qualified to discourse on all the architectural doings of the city and neighbourhood; but he will in even a cursory glance be struck with the magnitude and merit of some of the edifices progressing or recently completed.

Messrs. Mills and Murgatroyd have made "a clean sweep" of two large stone edifices—the Railway Terminus in London Road, and Newall's Buildings in Market Street—erecting in lieu of the former work of Messrs. Blyth and Carpenter, a large stone building of astylar Italian design. There was little of monumental character in the building it replaces: there is, if anything, less in the new one, a want very likely attributable to the exigencies of the site. The structure looks in front like a large Manchester warehouse—no mean work to compare it with—but, looking at it as a railway terminus or screen to an up and down line, one can scarce refrain from wishing its designers could have adopted as their model the façade of the Great Northern Terminus* at King's Cross, without its ugliness. Mr.

* Since penning these remarks, we are concerned to see that workmen are now engaged in removing, at an immense expense, the vast laminated timber trusses of this fine terminus. Whether owing to inherent mal-construction, or to the use of the material in so exposed a position, we cannot say; but they have failed altogether. The absence of tie rods and complicated features gave an appropriate simplicity to the form of this vast roof; but for constructive purposes its design seems to have been too simple unfortunately.

Cubitt's terminus has, despite its absence of architectonic or 'architecturesque' treatment, a bold monumental air, vastly expressive of what it is—the fag-end of a couple of gigantic highways.

Newall's Buildings, the other large edifice, has been entirely taken down, and its site been absorbed by the Royal Exchange, now erecting by the same architects. The space enclosed presents only a vast hoarding and system of scaffolding for masonry; but this 'old' building demands a few words 'in memoriam.' It was erected only thirty-five years ago by a rich grocer of the then 'town of Manchester,' at a cost of some 30,000*l.*; and was a very monster of architectural composition, in which cast iron pillars, Greek colonnades, heavy stone attics and pediments, domes, weather-vanes and windows, severally strove for pre-eminence. It was a sort of Woolston Hall, that had grown up in Market Street 'spontaneous,' as Mr. Mark Tapley would say: and it is gone from among us; without, for aught we know, a single drawing to show what it was—a fact to be grieved at in a political, if not an architectural sense; for Newall's Buildings was not without its history. It was, if we mistake not, the headquarters from first to last of the now historic doings of the Anti-Corn Law League. *Sic transit*—and in a brief thirty-five years.

The site of the new Town Hall is now cleared and enclosed with a hoarding, but as yet nothing can be seen of the building: its design is, however, well known to the general public, which is more than can be said of the design for the New Exchange. The two edifices will have good sites, at the confluence of some four or five important thoroughfares, but neither of them so good as that possessed by the Royal Infirmary—an edifice of very ordinary character, or rather of very extraordinary absence of character.

Hard by the site of Mr. Waterhouse's new building we came upon a new bank just erected by Mr. George Truefitt, for the firm of Brooks & Co., old clients of the architect's, who seem to have given him *carte blanche* for his pencil. It is a stone edifice of free Gothic character, with a profusion of floral carving and wrought metal-work, admirably executed. This bank may be considered Mr. Truefitt's *chef-d'œuvre*. Its design is, like all his works, very original and masterly. Looking at this bank, and at some other commercial buildings that may now be seen in Manchester and Liverpool, such as Mr. Walters' bank in Mosley Street, Manchester, and Compton House in Church Street, Liverpool, one can hardly suppress the obvious inquiry—'When will a London banker or merchant commission an architect to raise in our metropolis such a building as either of these structures?' Is it the leasehold tenure of ground in London, or its want of stone, or of money, or of taste? Somehow, all that the London architect 'of the period' has at his command is the manipulation of party-coloured streaks and voussoirs of brickwork, sickening to contemplate, all over the metropolis; giving scope indeed for *ingenuity* in the 'high art' of—'making a silk purse out of a sow's ear,' but little beyond it. It needs small reflection to perceive that a walk of art which restricts the efforts of our architects to courses of brickwork—

Black bricks and white bricks,
Yellow, red, and gray,
Mingle, mingle, mingle:
You that mingle may—

three inches, six inches, nine inches, &c. at a stroke, is likely to signally cripple the fine-art power of our architects. It is 'a style' we should much like to see the last of. In Liverpool we only came upon one sample of it by an architect, and that, it must be owned, a very good one—a convent of Sisters of Mercy on Mount Pleasant: evidently the work of a master, unknown to us. Peradventure it is the work of some London architect, 'to the manner born,' for in Liverpool the stone is too plentiful, and the bricks fortunately are too coarse and mono-chromous, to encourage its architects to emulate Southwark Street in the Borough, and many other places we could—and won't—name.

To return, however, to Manchester. Messrs. Joseph Hansom & Son are erecting a very large conventual church for the Jesuits in Oxford Street. The foundations, carried up with a liberal use of vast inverted arches, and little, if any, concrete, indicate the plan pretty clearly. Nave, lateral aisles, chapels, and apsidal sanctuary, with, in front towards the street, a spacious narthex, extending across the church. This feature is to be carried high above the church roofs by way of an oblong tower of tripartite form, crowned with a central lantern some 320 feet in height. The design is exceedingly striking and original.

Alderley in Cheshire is (as Richmond to London) quite an offshoot of Manchester, whose rich men's country mansions, dotted about the village, are well worth a visit from the architectural tourist. It has

had for some time a large Decorated church, by Mr. Crowther, of Manchester; and, till lately, it was the opprobrium of this towerless edifice that the Wesleyan Methodists had contrived to raise hard by it a tower and spire (with public clock, &c.) some 115 feet high. We observed, however, on passing the station, that the Church of England has asserted its old supremacy by adding (doubtless from Mr. Crowther's designs) a magnificent steeple to the church. It consists of a very lofty and massive tower and spire, with the low bell-chamber so peculiar to, and so frequently found in, old English examples. The design, though chaste, as are all this gentleman's works, is by no means wanting in originality, however much it may be in quaintness and oddity, now so over-prized. Mr. Crowther is not the only English architect versed in old English ecclesiastic architecture; but he has the unfortunately rare merit of adhering to his first love, to the exclusion of Gallicanisms and other exotic fancies. There is, nevertheless, no feebleness or servile copyism in his many excellent works in and around Manchester, St. Alban's, St. Mary's, Moss Side, &c.

In street architecture (or rather in architectural streets) Manchester is unquestionably inferior to Liverpool; but there are not many towns in England whose 'architecture' streets will vie with the upper half of King Street, Manchester, with its handsome bank and insurance offices; to say nothing of the old Town Hall, not, we trust, to be taken down or altered for many long years to come. Its design is somewhat too eclectic to be classed with pure Greek; but it is nevertheless, even shorn of its crowning sculpture (much to the discredit of the Corporation), one of the most dignified and majestic classic edifices in England. We have in London a good copy of the Erechtheum example of the Ionic Order in Mr. Inwood's St. Pancras Church; but no edifice of Greek architecture that in merit of composition will compare, small though it is, with the old Town Hall in Manchester, by Francis Goodwin. Thus much it may be well to say; or, as the edifice is to be now appropriated for 'town's offices,' we may one day hear of its being put into the hands of some enthusiastic Sir Wykeham de Waynflete, to be 're-cast' down to the latest recipe of some new ecclesiastical society.

OUR RAMBLER

IN AND ABOUT THE HOUSES OF PARLIAMENT.

TO say that the English people have witnessed a remarkable revival in all intellectual work, during the last quarter of a century mainly, is only to state a fact, the results of which are before our eyes every day. Take literature for example, and it will be seen how changed its tone as a teacher, and how increased its activity as an occupation has become since the beginning of the century! The very same conditions of progress have been fulfilling themselves in the arts which every civilised people practise. In olden times learning and the instinct for art were the gifts of the few, while the enjoyment of them was mainly the heritage of the rich. It has happily, however, been the distinction of our own age to popularise art as we have popularised literature. The students of the one and the amateurs of the other now number their hundreds as against units in former times not long past. The result—we may, indeed, call it the penalty—is that the colossal genius is now an almost impossible growth where so many enter the arena of fame, and when, consequently, the spirit of competition confines the chances of distinction to those who work in smaller spheres. So it is that while we have no Shakspeare in poetry or Addison in prose, no Reynolds in painting or Flaxman in sculpture, we have now those arts of intellect—if we may so term them—more widely spread, with a result which permeates the mass of the people with increased sources of cultivation and refinement.

Our own special art of Architecture, the mother of the fine arts, being more technical because less imitative, had certainly fallen lower than any of its kindred at the beginning of this century. It is not too much to say that thirty or forty years ago architecture in this country was at its lowest ebb. Little, if any public interest was devoted to it. County surveyors were its most distinguished professors, while churchwardens and vestrymen were its most conspicuous patrons. Our own native styles struggling hard for an existence from the Elizabethan down through the Jacobean style, and into the time of Queen Anne, finally succumbed under the importation of Italian fashions. It is true that the individual genius of two or three men, such as Wren and Inigo Jones, had given a kind of vitality to styles which never fitted to either our feelings or our habits. Subsequently, such architects as Chambers, Gibbs, and Vanbrugh, only intensified the anomaly by working in more academic methods. As there was no inherent English spirit in the style they practised to admit of development, the natural result followed when such men as these died out. There was nothing left but mere dry as dust, rule and compass work, for the would-be-student, and it is not surprising, therefore, that the art fell into incompetent and unfeeling hands.

These, and many other such reflections, possibly tedious but not the less true, filled the mind of the Rambler the other day as he

wandered about and through Sir Charles Barry's great work at Westminster. In the Houses of Parliament we possess the first great protest against the de-nationalised styles bequeathed to us by the eighteenth century. Regarded in this light (and in any other its character as an historical work of art will be lost to us), it is truly a glorious effort at reaction. The more it is looked at, the more wonder will be excited by the completeness and the art of its conception; the more we examine into it, the more we must be struck by the thoroughness of its detail. Nothing is left which craves for apology or extenuation; rare praise one may think for the largest and most important work of modern architecture.

Why should the Rambler betake himself to a subject which has so little of novelty or freshness about it as the Houses of Parliament, a work with which we are all tolerably familiar? is a question which we can imagine will arise in the minds of many of our readers. Our justification is simple enough. Not only is there every year new and interesting architectural matter to be discovered in and about the Palace of Westminster, but the building itself, even as Sir Charles Barry left it, can never become old or stale to this generation at least. It is, so to speak, the initial letter of that chapter in our architectural history which the age has been composing. True, we may entertain varying and conflicting predilections as to the style or period of art on which it is based; but this optimist, or rather archæological kind of criticism is rapidly and happily dying out. We take a work now for what it is, and not for what it resembles. We never think of quarrelling with a man's words so long as we appreciate his meaning and admire his sentiment. In the design of the Houses of Parliament it may be that the words are the words of the fifteenth century, but the voice is the voice of our own time. That must be admitted on a fair view of so great a work; for though amateur critics outside and amateur M.P.s inside the Houses may carp at the gargoyles and crockets, at the so-called 'useless' ornament (as if ornament were ever intended to be useful), and stinted light, yet the work as a whole will remain as a monument of our time, equally worthy of the mind which conceived and of the people who produced it.

It is in this latter respect that the Houses of Parliament, as an architectural work, does England an honour which few would have prophesied for it at its first inception. It has cost altogether more, much more, than was ever intended to be expended on it. But we who inherit so noble a monument of our time should be only too proud, one would think, to recognise the genius and the spirit which have raised a work so sumptuous, visibly embodying, as it does, the history of the greatest political Constitution which the world has yet seen. Great nations in all ages have reared grand works. Princes offer sumptuous presents, not on considerations of mere utility, but out of the respect they owe to their own rank and wealth. So it should be even with our 'shop-keeping' nation. The Houses of Parliament might possibly have been reared so as to answer all the practical uses of the Legislature of the realm if its design had been modelled on the type of a city warehouse. But who is there in that case, who would not, even half-a-century hence, regard such work as a mere monument of meanness in an age which had thrown up all sense of historical dignity or respect for its own prestige? We judge, instinctively, of the old nations of the world, not by the records we possess of their habits of life and thought so much as by the works which they have left us. These are the veritable and visible emblems of their power and state, and remain to impress us even in the last stages of their decay.

The Rambler avows a thorough repugnance to this modern spirit of Utilitarianism in art. 'Give us only what we want' is the prevailing cry which modern English wisdom utters aloud in our streets. We, on our part, choose rather to encourage, so far as we can, that more generous and patriotic spirit in public works which not only pays regard to bare necessities, but to the verdict which posterity will form of us by the material records we leave.

Ten or twenty years before the Houses of Parliament were designed such a work as we now possess would have been quite impossible in the then condition of architecture and its subsidiary arts in this country. We mention these subsidiary arts because the employment of them in Barry's masterpiece initiated to a great extent a new era in modern architecture. Previously the architect rarely, if ever, shaped his conceptions for any higher artistic work than his specification would cover. Without derogating from the merits of Sir Charles Barry as the veritable architect of the Palace of Westminster, it is only due to the genius and memory of the late Prince Consort to say, that he constantly regarded, and as Chairman of the Fine Arts Commission (an organisation believed to have been created at his suggestion) zealously endeavoured to promote the employment of the arts of painting and sculpture as necessary accessories to a building of such imperial character. So it is that we find in 'the Houses' some of the most worthy specimens of modern art in painting and sculpture, contributing to the effect of the architectural design. In sculpture we have works from the hands of such men as Gibson and Foley; and if the work of the former is hardly up to the mark to which some of his other productions have raised his reputation, it is at least not unworthy of it. The statue of the architect himself is in our estimation equal to any work which even Mr. Foley has produced. Under the head of sculpture one may point the visitor, though almost unnecessarily, to the statues in St. Stephen's Hall. Up to this moment there is no finer collection of modern British sculpture to be seen than is contained in this apartment. The subjects of the statues

which fill the bays are as varied as the authors of them, and yet it would be a very invidious task to select the most excellent. Why is it, we may ask, in parenthesis, that the same sculptors cannot display equal talent when they are commissioned for statues in our streets and squares?

In respect of the painter's art, the Houses present us with specimens of the most polyglot character. Artists of various schools in regard of style, but all of high repute, have contributed to the decoration of the architecture; not in works framed and glazed in true drawing-room fashion, but such as are designed to their allotted spaces in the building, and executed by processes which are intended for architectural effect.

On this point, however, the Rambler must offer a word of remonstrance and complaint in view of the failure which has followed the work of the fresco painters whose works adorn or, rather, were intended to adorn the interior of the palace. If there is much to admire in the art displayed as to design, there is much to be deprecated in the *science* of the painter as to his processes. Some, nay many of the frescoes at Westminster are already reduced to a state of dilapidation which reflects sadly on the reputation of modern work. In nearly every corridor and lobby we see pictures which a few years ago were perfect in their surface as any canvas-painting, now presenting figures without heads or extremities, unless we accept as such the bare outline revealed to us on patches of wall-plaster, where elaborate paintings of heads and hands were once visible. It is surely due to the reputation of the Fine Arts Commission who presided over such works as these, that some steps should be taken to discover by any and every process of inquiry why it is that the works of our leading painters executed in a perfectly dry and well-ventilated building should thus have 'gone to the wall' in the most literal sense of that phrase. It is hard to discover an excuse for such results happening to works executed under such ambitious auspices. If one may argue from what has already taken place to what may yet occur, we do not venture too far in saying that the most of the frescoes in the Houses will be wholly invisible to another generation, unless some judicious measures are adopted, not only to arrest the ravages which are already visible on many of the paintings, but to prevent a repetition of them. We observe with some satisfaction that precautionary steps have already been taken to arrest the decay of the frescoes in the corridor between the two chambers. The surfaces of some of the pictures have been glazed, and it may be admitted that the effect of the expedient in no way interferes with the artist's work. The glass being inserted on the same wall-plane as the windows above, the frescoes seem to be, in all hours of *daylight* at least, quite free from glare and reflection. Indeed the glazing is much less noticed than it would be on most of the pictures one sees in public or private galleries.

What is to become of the two famous works of Maclise in the Royal Gallery, is a question which may well excite apprehension when one sees the decay which is gradually going on in smaller and drier apartments. The Royal Gallery is about the largest room in the building, and never seems to be of even temperature. It is also one of the least occupied spaces as regards use, and anyone must see that the damp atmosphere which collects in it—say during a winter night—must inevitably destroy the wall paintings in it, whatever the pigment or the medium which the artist has employed. While speaking of this apartment, we cannot help noticing the change which has been made in the quality or treatment of the coloured glass in the upper range of windows. Formerly the glass in these windows was very richly coloured, but we understand that Mr. Maclise required the removal of it in order that the effect of his two great frescoes might not be so seriously interfered with. Mr. Edward Barry, the present architect of the 'Houses,' has shown no less discretion than good taste in substituting the new windows, which are almost *grisaille* in their character. He has only done what, as we happen to think, his father would have thoroughly approved if he had lived to see those frescoes completed. No higher compliment can be paid to the work as we now see it.

The Royal Gallery is undoubtedly the *pièce de résistance* for the visitors who weekly file through the different chambers of the House of Parliament. It is not only the largest apartment in the building, but it contains, as we have already noted, the two great pictures by Maclise, embodying subjects which every English mind is pardonably gratified in contemplating—'The Meeting of Wellington and Blücher after the Victory of Waterloo,' and 'The Death of Nelson at Trafalgar.' Within the last few months the attractions of this noble chamber have been greatly enhanced. Not only has the whole of the architectural detail been gracefully emphasised in coloured decoration by the skill of Mr. Crace, working under the guidance of Mr. Edward Barry, but the art of the sculptor, hitherto 'conspicuous by its absence,' has been employed to assist the general effect and give historical interest to the architecture.

The eight niches which flank the four openings in the Gallery are now filled, or are about to be filled, with full-sized statues representing the Sovereigns who reigned over the more warlike periods of English history. The statues which we see placed at present are those of Alfred the Great, William the Conqueror, Richard I. (Cœur-de-Lion), and Edward III. It is only doing bare justice to the sculptor, Mr. J. Birnie Philip we believe, to say that his statues, whether in respect of portraiture or in architectural treatment, are equal to any artistic work which the building contains. Indeed, the

Rambler, if he felt disposed to indulge in mere eulogy, might go much farther in speaking of them, but he prefers to ask his readers to see and judge for themselves.

These statues are distinguished by a novelty of treatment which does great credit to the architect. At first sight it may appear a bold expedient to gild the entire surface of figures exceeding the life size. The effect, however, in the apartment we are speaking of is eminently successful. Every part of the chamber is worked up in colour, and the more elaborate detail is brought out by gilding. Placing bare stone statues in niches whose architectural forms are richly decorated, would have had no other effect than to give a ghostly and essentially mean appearance to works of sculpture which are meant to represent some of the most illustrious personages in our national history. As we see them at present, they are not only true to their full intention as historical statues, but form, as they undoubtedly ought, the most sumptuous features of the Gallery they occupy.

The Rambler has already occupied his allotted space here; and is yet only too conscious that he has advanced little farther than the threshold of his subject. To a great extent the original work of the Houses of Parliament is new to our readers of to-day, while the last few years have seen much in the way of art-work produced 'in and about' the Palace, which not only deserves but demands notice of a more or less critical kind in these pages. We shall be glad, therefore, to continue our ramble in these precincts on another occasion.

CONTEMPORARY ART ON THE CONTINENT.

Exhibition of French and Flemish Pictures—Sixteenth Season.

CONTEMPORARY art on the Continent is no longer the unexplored field which ten or fifteen years back incited the research of adventurous connoisseurs and collectors. The eye of exhibition-goers in London has become used to foreign modes of artistic expression, and some few among French and Flemish painters, such as the Bonheurs, Gérôme, Frère, Scheffer, are, through their works, as familiar as Landseer, Millais, or Faed. The annual Exhibition, now open for the sixteenth time in Pall Mall, has done much to slacken the bands of prejudice and widen the range of art sympathy amongst us; and the effect of increased acquaintance with modern Continental schools becomes year by year more obvious, not only in the more thorough character of art criticism, but in the work of English painters. In some directions, indeed, it is to be feared that study of foreign styles may lead to mere imitation, or to mannered affectation; yet, in the long run, there can be no doubt that such study will be of service to English art.

Our own school has its strength and its weakness, and precisely where we are weak our Continental neighbours are strong. For example, no one can walk round the gallery in Pall Mall without marking, in the works there hung, the supremacy of treatment over motive, of art style over mere prettiness of fancy. Let the subject be a lady at her toilet, or a beggar in his rags, a child at play, or a general on the battle-field, the power and charm of the work lie in a certain mastery of the situation, in force of intention, studied composition, and deliberate use of means to an end, rather than in nobility of thought or range of imagination. It is just this clearness of artistic articulation which our English painters seem to lack. It may be that higher moral teaching, and purer aspirations, struggle for expression upon the walls of our exhibitions but find place within the galleries of modern foreign schools; yet, for want of precision and power in the language of art, the lesson becomes unintelligible, the thought incoherent.

In thus drawing comparison between English and Continental schools, we must be understood to include in the latter French, Flemish, and Dutch schools only. The best contemporary art of Germany is, unfortunately, and despite international exhibitions, as yet too little known in this country, even by artists, to influence art or furnish basis for popular criticism. If Mr. Wallis, or some equally enterprising caterer for the art-loving public, should find space in future exhibitions for works by first class German painters, he will do further good service to the cause of art in England. So long as the so-called spiritual art of modern Germany, the landscape school of Düsseldorf, the realistic school of Munich, headed by Carl Piloty, the vigorous naturalism of Knaus and others, so long as these phases of modern art are ignored in London exhibitions we cannot lay claim to thorough acquaintance with Continental schools, and the German saying points significantly to our prejudice and ignorance: 'Sind auch Leute über die Berge!'

This divergence from the especial subject of discourse must be forgiven, and our text recalled to mind, namely, the Foreign Exhibition now open in Pall Mall. No better comment upon the observations with which we commenced could be found than in this Gallery. The absence of 'high art,' in the most lax use of the term, is remarkable; even the idyllic classicism, in which French artists reign supreme, is this year unrepresented. The greater number of figure pictures rise in motive no higher than elegant or rustic genre—sentiment of the boudoir or romance of the cottage. Two pictures, however, attract alike by freshness of subject, though antagonistic in every other quality; on the one hand, 'The Birth of Venus,' by Cabanel; on the other, 'School for Vengeance,' by Alma Tadema. The first is a nude of enchanting loveliness, which, if it startle English eyes, yet bewitches into unwilling admiration. The second is a clever episode in early French history, repellent in hard realism and unflinching purpose. As it is intended now to indicate only the leading features of the Gallery, detailed criticism of these pronounced works, as of others also, must be deferred to a future opportunity. Two masterpieces, by Meissonier, 'Napoleon I., 1814,' and 'Les Bons Amis,' add weight to the Exhibition, thanks to the favour of their owners, Her Majesty the Queen and John Ruskin, Esq.. That technical perfection and that large manner independent

of mere scale which belong to Meissonier's style find full expression in these two gems, but are too well known to need comment. In passing, we may note how the harmonies struck upon a golden key in 'Les bons Amis' show the mellower for juxtaposition with the cool, steel-like quality of the 'Napoleon.' The one example of Edouard Frère in the Gallery is almost submerged by the wave of little rival pictures in the same style. Duverger, Aufray, Goupil, Azmar, Dargelas, J. Marés, and others, follow Frère at more or less distance. Among these Aufray seems to maintain most individual character, though resembling Frère in completeness of conception, tenderness, simplicity, even mode of execution and tone of colour.

One work by Gérôme shows that clever French master not in full power, albeit great enough to dwarf his companions. Madame Browne has a careful study of 'A Seminarist.' By Landelle also there is a single figure—a female 'Fellah'—in quality more hard and flat than usual, though in composing line severely graceful. The brilliant phase of boudoir studies or *tableaux de toilettes* is sufficiently represented by De Jonghe, Toulmouche, Willems, each a master of distance and harmonious play of colour. By J. Israëls, G. Brion, and C. Bischof, are important rustic subjects, which will claim further comment. Mr. Wallis has also secured a work by the famous Belgian Wilkie, J. B. Madou. Pictures by A. Glaise, F. Heilbuth, G. Koller, and Breton, also deserve notice.

In landscape and animal painting the Exhibition is strong. Perhaps A. Schreyer has never shown to better advantage than in two studies from Valaquin of horses at halt or in full tear along a sweep of rough road; for pluck and vigour of drawing and execution these are beyond praise. With the landscapes of poetic beauty by Corat, and of prosaic power by the late M. Rousseau, with the pleasant pastorals of Auguste and Peyrol Bonheur and the calm seas of P. J. Clays, we must close this enumeration of the leading works of the Gallery. Later a selection for closer criticism may be made from the pictures here only indicated by name. A. D. A.

THE CAUSE OF COLLIERY EXPLOSIONS.

THE last day of 1868 was painfully signalised by the announcement of one of those terrible colliery explosions which have of late been so disastrously frequent. 1869 is hardly three months old before it witnesses another!

The appetite for horror which a certain portion of the press does its best to stimulate and to indulge is called into full activity on occasions of overwhelming calamity. It is not our purpose to enter into the details which, on all these occasions, present for the most part a terrible monotony. It is rather our wish to inquire what light can be thrown on the subject of such explosions, than to dwell on the more harrowing, but less instructive, part of the subject.

It may not unnaturally be thought that events of this nature throw no slight reproach on the science of the day. To say this is, in other words, to blame scientific men. While, with regard to some of those sources of danger which have ever been considered as beyond human control, we have ceased to hold that helpless opinion—when, for instance, in the matter of marine storms, we have organised the means of giving such warning of their approach from the opposite shores of the Atlantic as to enable the mercantile navy in every port of our coasts to look for timely shelter—how is it that we seem to remain powerless in the presence of the fearful activity of the fire-damp?

Such a view, however, would be unjust. Science has done much to protect the collier. There is no danger so terrible as that to which the coal miner is exposed. There is no danger against which science has provided so simple, so certain, and so elegant a protection.

No phenomenon of nature, with the exception of the active eruption of a volcano, can be compared to an explosion of fire-damp. Neither the thunderbolt, nor the hurricane, nor the whirlwind, brings such overwhelming ruin. The *feu d'enfer* of modern sieges, the rain of bullets, the shattering fury of the bomb-shell, are rapidly destructive of life. But the inflammation of the fire-damp is instantaneous. The first announcement of the fact is the rush of a river of fire that precedes the sound of the explosion. The slaughter is limited only by the number of the workmen in the colliery in which it occurs.

But there is one invariable condition precedent to this frightful calamity—it must be occasioned by the hand of man. It is not, we need not say, so occasioned intentionally; but it is undoubted that the fire-damp only explodes on coming into contact with flame, and that flame is borne by the hand of a miner.

A century ago this was as well known to be the case as at present. Certain mines were known to be so productive of fiery gas that all attempts to work them were given up. In others ventilation was relied on for assuring a comparative safety. In others the incredible expedient was adopted of sending a man, wrapped in thick leather or woollen clothes, with a mask on his face and a hood on his head, to explode the gas in the mine, in order to render the workings accessible when it should have been consumed.

The originator of the steam engine, himself reared on the bank of a coal mine, was the first to offer to his fellow workmen the protection of science. A co-inventor in point of time, there can be little doubt, with George Stephenson was Sir Humphry Davy, himself a man sprung from the ranks of labour. The safety lamp, whether the 'Geordie' or the 'Davy,' was, and is, what its name imports, a reliable protection for the miner.

The practical objection was raised to the use of the safety lamp that the wire gauze, which protects the flame, stifles the light. This, no doubt, is felt as a great drawback by the miner. Darkness presses upon him in his solitary work. To remedy the evil, he has often been met, groping through the galleries of a coal pit, with

safety lamp in one hand and—a LIGHTED CANDLE IN THE OTHER. Again, it has often been found to be the case that a miner would bore a hole in the guard of his lamp—for the convenience of LIGHTING HIS PIPE.

It is not necessary for a safety lamp to be a sort of dark lantern. Admirable combinations of glass and of wire gauze have been invented, and are made use of in the Belgian mines. The danger of fracturing the glass by a blow may be guarded against with tolerable certitude. But the question still remains of the danger of a crack in the glass, if the interior of the lamp should become filled with ignited gas. It is probably for this reason that, in France as well as in England, the wire gauze lamp is still principally used. There is an electric lamp, that of Messrs. Dumas and Benoit, the light of which is displayed in a closed tube, which appears to unite the two requisites of good illumination and absolute security.

It is well known that the rate of the production, or rather of the escape, of inflammable gas, depends very much on the barometric pressure of the atmosphere. The less the height of the mercurial column, the greater is the outpour of fire-damp. Sudden changes of atmospheric pressure, such as have been recently tested, produce the greatest discharge of gas. To the admirable indications of barometric change that are afforded by the best forms of the instruments well known to science, have been added special inventions for the use of the coal miner. One of these contained a collapsible globe or vessel, delicately sensitive to the pressure of the air around it, which, when a certain tenuity was obtained, gave warning by disengaging a ball, or sounding a whistle.

But the fact remains that, do what we will to warn and to protect him, we have not yet obtained the honest, enlightened, thoughtful aid of the miner in taking care of himself. It can hardly be denied that every colliery explosion arises from the neglect or the foolhardiness of some individual miner. He lives in danger enough to appal any unaccustomed man, until he almost ceases to believe in its existence. If the safety-lamps are not locked by means of a key kept out of the possession of the miner, he will often open them out of mere bravado, or to see how a feeble jet of fire-damp will burn! A visitor to a foreign colliery relates the alarm which he experienced when the engineer, who was conducting him over the workings, unscrewed his lamp to show him the phenomena of combustion, when the air was partially vitiated with fire-damp. The opportunity thus afforded of observing the flame, varying from a red to a bluish tinge, and the occasional small detonations, did not reconcile the stranger to the *sang-froid* of his conductor. After a fatal explosion in a coal-mine at Merthyr Tydvil, where 62 WORKMEN were killed or wounded, ONLY 61 LAMPS were to be found. Whether it were the case that one of the sufferers had entered the galleries with a candle, or that he had opened his lamp (to light his pipe), which was then blown to pieces by the explosion, the fact is equally instructive.

By that wise dictum of the English law which defines the slaughter of any one, without malice prepense, in consequence of any act in itself unlawful, as murder, there can be little doubt that every death occurring by colliery explosion ranks under the category of that crime. Masters and overlookers may do their best—there is no doubt that in the majority of cases, perhaps in all, they *do* their best—all precautions are ineffectual, so long as there is one foolhardy, selfish, or negligent miner under ground. One safeguard alone is to be relied on: the thorough education, moral as well as intellectual, of the miner.

Those who are familiar with the working classes are well aware of a certain disinclination, often evinced, in many trades and callings, to adopt any improvement which renders the pursuit of that calling less dangerous, or even less certainly fatal. The divers long resisted the introduction of a method of attaching the dress to the helmet that removed the chief peril of their occupation. If a diver, accoutred with the helmet that was first used, stumbled and fell, under water, he was drowned. To meet this peril the dress was screwed tightly to a plate descending from the helmet, and the wearer was then safe even if he lay full length at the bottom of the sea. The Whitstable divers long refused to adopt this improvement. The opposition of the Sheffield grinders, a set of men whom the irritation caused by the particles of metal, thrown off by the wheel, invariably brought to the grave by the age of forty, to magnetic guards and other inventions, the adoption of which would have removed the cause of this early mortality, is well known. There can be little doubt that the idea is very prevalent among many classes of workmen that the dangers of their trade make it all the better for them. Such dangers keep out competitors. Familiarised to perils which may never be actually realised until the moment when a fatal blow is struck, men are wont to regard them as useful bugbears to keep off outsiders, and they resent any attempt to make their calling perfectly safe as an injury to the trade.

That this is the case with the colliers we do not assert. That it is the case, or has been the case, in many trades, no competent witness can deny. That the unconscious influence of such a principle may often be mischievously active is highly probable: one thing, however, is certain, where there is no open flame there can be no explosion. Where every miner has his safety lamp, uses that lamp in accordance with rules, and never, either by match, or ill use of lamp, or any illegal means of kindling his pipe, applies fire to the treacherous gas, that gas cannot explode. Let those, then, who care for the lives of the men, and for the property of the masters, cease to blame science for calamity; and turn their attention to the adequate education of every human unit, on whose prudence the life of scores depends; and

for the results of whose breach of orders it is no compensation to his fellow sufferers that he has paid the penalty with his own.

We purposely omit any discussion as to the asserted cause of the Wigan explosion. If it should prove to be the case, as has been stated, that blasting was resorted to in a seam of coal known to be fiery, it is not by the scientific press that such a procedure should be dealt with. There will, no doubt, be a proper legal investigation on this subject.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE recommendation of the Council of this Institute that the Royal Gold Medal for 1868-69 should, with Her Majesty's sanction, be awarded to Professor Lepsius, the eminent archaeologist and art-littérateur of Berlin, was unanimously adopted by the general meeting on Monday last. It would, indeed, have been difficult to select any *savant* more fitted or the honour which in due course of routine, must be this year conferred upon 'a foreigner not being a professional architect.' The stupendous literary and artistic work 'Denkmäler aus Aegypten und Aethiopien,' in twelve volumes of elephant folio size, which Professor Lepsius published in 1849, in itself sufficient to establish an European reputation for any antiquary, was the result of a scientific expedition sent to Egypt and Ethiopia under his direction in 1842. The volumes contain more than 800 plates, illustrating every monument of the countries which had been hitherto unpublished or incorrectly delineated. A copy of this work was presented to the Institute by the King of Prussia in 1852.

The Institute medals and prizes annually offered to competitors in the field of architectural design and illustration were awarded in accordance with the recommendation of the Council as follows:

The Soane Medallion with 50*l.*, subject to the usual conditions of Continental study (modified in this case and for the future), to Mr. H. L. Florence, for his design for a Club House. Mr. Beresford Hope's prize of 10*l.* to Mr. E. J. Roche, for his design for a Gothic Theatre. The Institute silver medal with 5*l.* 5*s.* to Mr. T. C. Wilberfoss for two sets of measured and perspective drawings illustrative of Hatfield Hall and St. Peter's Church, Winttringham. In the same competition medals of merit were awarded to Mr. T. E. Williams for measured drawings of the Abbey, Dore; to Mr. E. B. Ferrey for measured drawings of South Wingfield Manor House; and to Mr. W. Howes for measured drawings of St. Mary Overy Church, London. Mr. A. S. Bird carried off the Student's Prize in books for his design of a gateway to a court-yard. In the literary competitions, the Institute Medal was awarded to Mr. H. D. Shepard for his 'Essay on the Revival of Italian Art,' and a medal of merit was awarded to Mr. T. A. Britton for a voluminous treatise on Timber; while the special essay prize of 10*l.*, placed at the disposal of the Council by Mr. T. Southall, of Worcester, was gained by Mr. E. Locke, for his essay on Bricks and Terra Cotta. This concludes a list of prizes which, taking into due consideration the prescribed conditions attached to them, were on the whole, we think, fairly well deserved by all the successful competitors. Without entering on a detailed description of the drawings which have been on view for some days, and will remain at the Institute for a short time longer, we may especially mention those of Messrs. T. C. Wilberfoss, and E. B. Ferrey, as indicative of great industry and careful study. Mr. Florence's design may be open to objection from those who have no great *penchant* for the modern French school, but the drawings are at least free from common-place faults, and considered as drawings they are admirable.

The award of medals and prizes was followed, we understand, by a discussion on the subject of the Voluntary Architectural Examination, concerning which some useful resolutions of the Council, elsewhere given, were adopted. The object of these resolutions is to rescue the Examination scheme from an untimely end. It is no secret that of late years, from some cause or another, it has failed to attract the younger members of the profession, and in 1869 not a single candidate has presented himself. There must be some cause for this apathy, and we think that the Council has rightly guessed it. We can readily understand that there are many professional men who ignore the merits of the Examination scheme *in toto*. The strength of their argument probably lies in the fact that an architect is an artist as well as a man of science and a man of business. You may test his knowledge of art, but you cannot test his taste; for the simple reason that there is no recognised standard nowadays—if indeed there ever was—by which to measure it. Nor can it be assumed, even by the warmest friends of the scheme, that the Examination would be a perfect test for any qualifications. A man's natural disposition—his habits and method of work, his capacity for cramming or the reverse—and a hundred other considerations, may no doubt be urged as reasons why such a test must always remain to some extent empirical. But the same may be said of most examinations, and meanwhile it must not be forgotten that the Voluntary Architectural Examination as a scheme has been approved and established. The present question therefore is, not whether the Examination would be beneficial to the practice of architecture as a profession, but whether, being established, it should be carried out in such a manner as to secure a permanent advantage to those who pass it. Now, what have 'passed candidates' hitherto had to show for their pains? Absolutely nothing. Diplomas, medals, certificates have all been suggested in turn, and have, up to this time, been severally rejected by the Institute as a body. That these forms of acknowledgment might in some cases be open to objection we can readily conceive; but surely to no greater extent than the recognition of any professional status similarly testified.

We trust, therefore, now that the necessity of a 'formal acknowledgment' to passed candidates has been admitted by a general meeting of the Institute, it will lead to the establishment of something in the character of a certificate which may satisfy the natural ambition of those who compete for the honour, without giving offence to any elder members of the profession, who may foresee dangers, and perhaps with some reason, in the award of a diploma.

Such an arrangement, together with some other privileges proposed to be

accorded to passed candidates, will no doubt act as an incentive to younger members of the profession to present themselves for examination next year, and tend to revive general interest in a scheme which, after all the care bestowed on its organisation, scarcely deserves to sink into oblivion.

The next ordinary general meeting of the Institute will be held on Monday, April 19, when a memoir of the late A. Ashpitel, F.S.A., Fellow, will be read by Mr. Wyatt Papworth, Fellow.

The presentation of the Royal medal and of the Institute medals and prizes will take place on the same evening.

VOLUNTARY ARCHITECTURAL EXAMINATION.

IT will be highly satisfactory to those interested in the welfare of these Examinations, to know that at the last meeting of the Royal Institute of British Architects the following Resolutions were passed:—

1. That passing the Voluntary Examination ought to be followed by advantages such as will promote the advancement in life and in the profession of the Student.
2. That each Candidate who passes the Examination should receive a formal acknowledgment of his having passed.
3. That passed Students in the Class of Proficiency should become, *ipso facto*, Students of the Institute, without further payment, for as many years as they have paid guineas.
4. That the names of Candidates who have passed in the Class of Distinction be notified to the Board of Examiners for District Surveyorship Certificates, when such Candidates present themselves for Examination before that Board.
5. That it be referred to the Council to determine a form of acknowledgment under Resolution No. 1.

PARLIAMENTARY PROCEEDINGS.

Ancient Monuments.

On Friday, April 2, Sir H. VERNEX asked the First Commissioner of Works to consider whether measures could be adopted to place the ancient monuments now existing in the country under the protection of some authority which may prevent their destruction.

Mr. LAYARD: The subject of my hon. friend's question is one of considerable importance. Not only have many Royal and other interesting historical monuments in our cathedrals and churches been removed from their original places, injured, or suffered to fall into decay, but monuments of great national as well as archaeological value have been irreparably injured and even wantonly destroyed. This state of things is not creditable to the country. In France and elsewhere measures have been taken by the Government to preserve and maintain such monuments, as forming part of the property of the nation. Since I have held the office which I have now the honour to fill, my attention has been seriously directed to this matter. There are, as my hon. friend well knows, great difficulties in dealing with it in this country, especially those connected with what might be considered as interference with private rights and property—for instance, as in the case of the destruction, only recently, of a highly curious and interesting ancient monument in Cornwall, an act of vandalism which, if what I have read in the newspapers be true, one would have scarcely thought possible in these days. After fully considering the subject, I have thought it advisable to turn my attention, in the first place, to Royal and other historical sepulchral monuments, some of which have been injured, removed, opened, and otherwise interfered with even of late years. The first step is to obtain a list of such monuments as it might be desirable to place under public protection. With this view I addressed a short time ago a letter to the Society of Antiquaries, requesting their assistance in preparing such a list. My request has been met in the most cordial spirit by the distinguished President of the Society, Lord Stanhope, and by its members. They have taken steps which, I trust, will enable me to obtain such a list as will permit me to submit to the House some proposal for the protection of these monuments which may meet with its approval, or, at any rate, to invite its views and opinion upon the subject. If I find it possible to effect the object I have in view with regard to sepulchral monuments in our cathedrals and churches, I would endeavour to ascertain whether some means might not be found to extend the same protection to other monuments of national and historical interest and importance.

The New House of Commons.

On Tuesday, the 6th instant, the report of last year's Select Committee on the House of Commons' arrangements was brought under the notice of the House by its Chairman, Mr. HEADLAM, who drew an amusing picture of the insufficiencies of the present Chamber and the devices to which members resorted for procuring seats on an important occasion. In a succinct narrative of the history of the Committee, he examined the various plans submitted to it, concluding decidedly for Mr. Barry's proposal to build a new House on the space occupied by the Dining-room and the Commons' Court. This could be done for 120,000*l.*, and would give accommodation for 560 members instead of just over 300. The present Chamber would be restored to its original condition, and would be used as a lobby or anteroom. He ended by moving—'That this House, agreeing in substance with the report of the Select Committee of the year 1868 concerning House of Commons' arrangements, recommends the same for the consideration of Her Majesty's Government.'

Mr. W. COWPER, Lord J. MANNERS, and Mr. BERESFORD HOPE joined in condemning as utterly futile any attempt to tinker up the present House and in praising Mr. Barry's plan, but Lord J. MANNERS thought that any alterations should be something more than a mere departmental affair, and should be carried on in concert with the Lords. Mr. TITE also took the

same view, and gave a kind of professional opinion that the present House could not be advantageously altered, and that there was no reason for supposing that Mr. Barry's estimate need be exceeded.

Colonel FRENCH objected strongly to the removal of the Dining-room to the ground-floor, which would be necessary if Mr. Barry's plan were accepted, and urged the Government not to pledge itself to an expenditure which, judging from former experience, could not be less than 600,000*l*.

Lord BURY moved to omit from the resolution the words committing the House to an approval of Mr. Barry's plan.

Mr. HUNT, in opposition to the motion, avowed that he was not dissatisfied with the present House, which accommodated all the members who usually attended on ordinary occasions, and possessed admirable acoustic qualities.

Lord ERCHO traced many of the inconveniences complained of to the disorderly habit which had recently sprung up of members retaining seats before prayers, by hats and, what he called, 'devotional dogskins.' But the difficulty at present experienced in getting seats was abnormal, and, like Mr. Hunt, he thought that no new building ought to be commenced until further experiments had been tried on the present House.

Mr. V. HARCOURT having supported, and Mr. DODSON having opposed the motion,

Mr. LAYARD denied that this was a question for the Government rather than for the House. Speaking for himself, he held that either the present House must be left as it now stood or a new House must be built on the site indicated. He believed that the present inconveniences must go on increasing, and sooner or later Mr. Barry's plan would be adopted.

Mr. WALTER agreed with those who thought the present House unworthy of the country.

Mr. GLADSTONE emphatically asserted that this was a matter on which the Government ought to be guided by the House. But it was a matter on which the House could not at present express an opinion; for the 240 new members ought to be allowed the benefit of some experience before deciding. In the present impossibility of coming to a decided opinion, he asked Mr. Headlam to withdraw his motion, and it was accordingly withdrawn.

ILLUSTRATIONS.

POSSINGWORTH MANOR.

THIS building, of which we gave an exterior view in our number for January 9, and of which we now present an interior sketch, showing the general effect of the Drawing-room or principal Saloon, has been erected for Mr. Louis Huth at Possingworth, a few miles from Uckfield, in Sussex, and is an attempt to combine a reproduction of many of the leading features in the plan of a mediæval or Tudor house with the requirements essential to a modern residence. One marked variation from the common *planning* of former days consists in the facilities provided for carriage access to the hall-door across the quadrangle, or courtyard, enabling visitors to be set down at the great porch. This is one of the principal and most effective features of the building, and one in which the aim of the architect has met with a worthy response at the hands of the mason and the carver. This porch, forming the principal entrance, leads at once into the great hall, 50 feet by 20 feet, and 40 feet to the underside of the ridge of the open-timbered roof. From this hall—in which we only note, in passing, the grand staircase, entirely of oak, with a profusion of rich carving beautifully executed; the noble stone chimney-piece; the stained glass, by Lavers & Barraud, representing the months and seasons, and other kindred subjects; the minstrels' gallery, &c., each of them worthy of attentive study and separate notice—we gain access, through a lobby and a corridor vaulted in stone, with pierced pendentives and fan tracery, to the drawing-room, a fine room 45 feet by 30 feet, exclusive of two bays, each 17 feet by 7 feet 6 inches. The oak panelling and screenwork in this room, together with the ceiling, shown in the illustration, have received very careful study and elaborate treatment at the hands of the architect. The execution well realises the design.

The dining-room, 38 feet by 22 feet 6 inches and 16 feet high, is entered immediately from the hall; and has a ceiling, similar in style, but different in treatment from that in the drawing-room. The great buffet or sideboard in oak, and the elaborate chimney-piece in Mansfield Woodhouse stone—both executed, as was indeed every enrichment throughout the building, from full size working drawings by the architect—furnish excellent samples of the perfection to which the best skilled labour of the nineteenth century in England may attain when adequately guided and encouraged.

The library, or morning-room, 25 feet by 22 feet, lies between the dining-room and drawing-room, and from it access is gained, by a picturesque and boldly treated flight of steps, to the terraces on the south front.

On the west side of the quadrangle is a cloister, leading to Mr. Huth's business room, 43 feet by 20 feet, exclusive of bays, and fitted with strong rooms, &c.

To the west of the building, in the space between Mr. Huth's room and the corridor north of the drawing-room, we find the picture gallery, 60 feet long by 23 feet wide and 22 feet high. The ceiling is formed of longitudinal and transverse moulded oak beams carried on corbel heads, excellently carved by Phyffers, the interspaces being filled with panels of open ironwork carrying the inner glass ceiling of the gallery. The rich cornice and cove of this gallery were executed in fibrous plaster by Messrs. Jackson, of Rathbone Place.

A triple-arched doorway on the west side leads at once into a conservatory of about 60 feet by 25, formed mainly of glass and iron.

The kitchen (with an open-timbered roof) and offices, forming the entire east wing of the building, are most complete, and fitted with every modern requirement, principally executed, together with the iron-work of the conservatory, by Potter, of South Molton Street. The various bed-rooms, dressing-rooms, bath-rooms, &c., &c., are situated on the first floor, with other bed-rooms over. All the principal ground-floor rooms and one of the first-floor rooms are completely wainscoted in oak, and all the guests' bed-chambers are completely fitted in oak also. Under the drawing-room, in a portion of the basement, which from the fall of the site is quite above ground, is a billiard-room; and the rest of the basement is devoted to extensive callarage, china-rooms, stores, &c.

At some distance to the east of the house is the extensive group of stable buildings, with coach-houses, clock-tower, stables, loose boxes, carpenters' shops, laundry, and all the etceteras of a great establishment.

Throughout the interior of this mansion a considerable degree of richness has been aimed at; the intention having been to adapt it to the adequate display of the beautiful collection of high-class 'art treasures' which it was destined to receive. The decoration of the building falls far beneath them both in elaboration and value; and the architect's aim, in fact, was concentrated on so scheming his internal structure as to make it subservient to the right framing or setting of these very gems of art.

The building, with its surroundings, is a real triumph of art over nature; and they who, but a comparatively short time since, saw the site a somewhat desolate tract of agricultural land, overgrown with rough underwood, and with little to recommend it beyond its sporting attractions, would scarcely credit the marvellous metamorphosis which a large and judicious outlay in the way of planting, formation of terraces, execution of a large lake with islands, bridge, &c., has produced, by changing a bald and cheerless waste into a tasteful and ever-pleasing landscape.

The builder, to whom the highest praise is due for the thoroughly conscientious and substantial way in which he realised the architect's designs in every branch, was Mr. Alexander Cheale, of Uckfield; the indefatigable clerk of works, Mr. Richard Winter; the very successful landscape gardening was designed and superintended by Mr. Marnock, of London; the hydraulic engineers were Messrs. Easton & Amos; the ironwork, and heating throughout, were by Messrs. Potter & Son; the carving was principally executed by Messrs. Halliday Brothers, who also modelled the ceilings.

The cost of the building, including the stables, three lodges, garden buildings, gardener's residence, entrance gates, farm buildings, &c., was somewhat in excess of 60,000*l*; and the whole was erected from the designs, and under the superintendence, of Sir Digby Wyatt, and, considering all that has been effected, within an unusually short space of time.

M. LAMEIRE'S DECORATIONS.

THE accompanying illustration is copied from a portion of M. Lameire's magnificent design for a church decorated throughout with paintings, and which he entitles 'Catholicon.'

The drawings, now at South Kensington Museum, being framed and glazed, it is impossible to trace from them; but, allowing for this obstacle and for the necessity of translating a coloured subject into lines of one colour, it is hoped that the lithograph may give a fair idea of the original. The band of ornament along the top, treated in somewhat questionable taste, is formed of two ribands, orange on one side and blue on the other, folded backwards and forwards. Charlemagne's mantle is yellow, with ornaments of a slightly different shade; his inner robe is grey; the saddle cover green, with yellow pattern; and the horse a purple black. Charles Martel's robe is red.

REVIEWS.

ITALIAN SCULPTORS: Being a History of Sculpture in Northern, Southern, and Eastern Italy. By CHARLES C. PERKINS. London: Longmans & Co. 1868.

In 1864 Mr. Perkins published two volumes upon the Tuscan Sculptors. To those volumes the present work is a sequel, and with them it forms a most complete and valuable history of Italian sculpture. Considered separately, and as a work upon fine art, 'Italian Sculptors' is necessarily of inferior interest to the volumes which preceded it. All the greater and better known artists of Italy—Ghiberti, the Pisani, Donatello, della Robbia, Michael Angelo, Benvenuto Cellini, and Gian Bologna—had already found a place among the masters of the Tuscan schools; and in his last volume Mr. Perkins has lain under the disadvantage of having to deal with the lives and works of second-rate men only. But, apart from fine art considerations, we see no falling off in interest. The plan adopted embraces all kinds of decorative sculpture, and to the student of the art in its relation to architecture few works could be of greater value. Pre-Revival sculpture—which is almost exclusively architectural—is treated of at length, and the pages devoted to early works in the less known districts of Apulia and the south will be found especially interesting. Antiquarian subjects are by no means handled with antiquarian dryness, but historical and legendary matter is so introduced as to render these parts most delightful reading, as will be seen from the following extract upon the symbolism of mediæval carvers.

'Frequently incorrect in their ideas about the nature and properties of animals, they did not seek to separate the true from the false, since, as St. Augustine remarks, "The all-important object for us is to consider the

VISION OF A CHURCH (BY MON C. LEMEIRE)
 APOCALYPSE OF ST JOHN.

signification of a fact, and not to discuss its authenticity." This habit of looking for a symbol in every created thing led to a system of mystical zoology contained in the "Physiologus" or "Bestiary," a work which explains the now forgotten meaning of many of the strange forms carved about the façades of mediæval churches. The first sentence in the version of the "Bestiary" made by Peter of Picardy clearly sets forth the object for which it was composed. "Here commences the book which is called 'Bestiary,' because it speaks of the nature of beasts; for God created all the creatures upon earth for man, and that he may in them find an example of faith and a source of belief." One or two examples will give the reader an idea of the way in which the different animals are described in view of man's instruction. "When the hunter has seized the young tiger cubs, and is pursued by the tiger, he places a mirror in the path of the furious animal, who on perceiving himself in it is so charmed by the spectacle of his own beauty, that he gives up the chase and forgets his loss. The hunter is the devil, the cub is the soul which he wishes to steal away, and the mirror the temptations of the world put in a man's way to absorb and divert his attention from matters connected with the welfare of his soul."

In the scheme laid down by Mr. Perkins, each important city and district in Northern, Southern, and Eastern Italy has its separate art history. Apulia appears to be peculiarly rich in remains of the 11th and 12th centuries, in the porches, bronze gates, and marble pulpits of its churches. As might be expected from the political history of the country, the style of these works shows in a curious manner the mixture of Byzantine, Saracenic, and Norman influences. The Neapolitan district has also its elaborately sculptured pulpits of early workmanship, and its monumental works of the Gothic period are important, more especially the Angovino series in the Church of Santa Chiara; but among a profusion of later examples there is little of real moment, and its most noted native sculptor, Merliano, is entitled to no very high rank as an artist.

To the casual observer it might appear that, among cities, none had been so fertile in sculptors as Rome. Such, however, is not the case. In classical times Rome was crowded with works of art, but they were either brought from Etruria or Greece, or executed on the spot by foreign artists. In Christian times all the great Tuscan masters worked there during some portion of their lives; but, although a continuous line of workers in marble can be traced in Rome back to the classical period, she has produced few native sculptors of merit if we except the Cosmati—a family by whom the arts of mosaic working and sculpture were united, and who flourished in the twelfth and thirteenth centuries—and Paolo Romano. In speaking of the sculpture of Lombardy, Mr. Perkins finds it necessary to make some incidental mention of the style of architecture developed in that province, and which is most commonly known as Lombardic. To this name he objects as an absolute misnomer, and prefers the less generally received one of Comacine. He urges that the Lombards, like their predecessors the Goths, neither brought with them nor acquired any art whatever, but merely employed such native workmen as they found in the conquered provinces. Of the Comacini, to whom, according to Mr. Perkins, the style is really owing, we shall quote his account. It will at least be interesting to such of our readers as belong to the Masonic Brotherhood.

For twenty years after Alboinus and his followers overran the plains of Lombardy, the Isoletta Comacina (an island in the Lake of Como), which held out against their power under Francione, an Imperial partisan, contained numbers of fugitives from all parts of Italy, amongst whom were many skilled artisans known as the Maestri Comacini, a name afterwards changed to that of "Casari" or "Casarii"—builders of houses. After they had submitted to the invaders, their college or guild was favoured by the Lombard kings; its members were enfranchised, made citizens, and allowed certain important privileges, such as that of making contracts, which were not, however, conceded to their assistants. There is no evidence that the Lombard kings did anything to protect arts, commerce, or industry, before the reign of King Rotari, but these important objects are aimed at in his laws, which contain official enactments for the protection of the Maestri Comacini, whose free jurisdiction was recognised by the name of Free Masons' (A.D. 636-652).

In the buildings erected by this brotherhood for their Lombard masters are numerous carvings; some of these are obviously by Byzantine artists, others—rude and ill-cut imitations of classical forms—are precisely what the Comacini themselves might have been expected to produce; but there is a third class showing that interlacing of ornament and fantastic animals common to the Celtic and Scandinavian races, in which, notwithstanding his former argument, Mr. Perkins is obliged to confess the influence of Northern tradition. In the twelfth century Milan shows a curious instance of sculpture used for the purpose of satire. After the victory of Legnano, in which the Milanese revenged themselves on Frederic Barbarossa, to show their hatred and contempt for the Emperor, 'they caused two portrait bas-reliefs of himself and his wife, the Empress Beatrice, to be set up on the Porta Romana, one of which is a hideous caricature, and the other too grossly obscene for description.' In the thirteenth and fourteenth centuries both sculpture and architecture in Milan were well-nigh engrossed by a single family of artists, the Campionesi. Their works are numerous, but they seem to have made little progress till about 1320, when a Tuscan sculptor, the well-known scholar of Andrea Pisano—Balduccio—was invited by Azzo Visconti to Milan. Several of the Campionesi became his scholars, and under the Tuscan influence art rapidly improved. In 1386 Galeazzo Visconti founded the Duomo at Milan, and ten years later the Certosa at Pavia, as thank-offerings for the success of his schemes of usurpation; and from that time the two buildings became the great fields in which all the chief masters of the Lombard school exercised their powers. Both are remarkable proofs of how much may be achieved by the members of a school working in concert, but the Certosa far exceeds the Duomo in artistic merit and completeness. Among the artists employed on these buildings before the Revival, various members of the Campionesi family, the Grassi, and Jacopino da Tradate are prominent; later the brothers Mantegazza and Omodeo. Perhaps of all the sculptors and architects of the Lombard school Omodeo was the greatest. His life was an eventful one, and is full of melancholy interest. We can only mention one other of the many Lombard masters of note—

Agostino Busti (called Bambaja), three of whose reliefs, from the unfinished monument of Gaston de Foix, are in the South Kensington Museum, and show the perfection of masterly handling of material.

The tendency of Venetian art has always been in the direction of colour rather than of form, and its early sculpture will not demand special notice till we come to the decorations of the Ducal Palace. These form so remarkable an example of the systematic and intelligent application of sculpture to the purposes of architecture that we must allow Mr. Perkins to describe them:—

'It was not simply with the intent of beautifying the walls of the edifice that the sculptor carved all these groups, and capitals, and ornaments. He had as definite a purpose as the architect who divided it into spacious halls and chambers proper for the reception of the great bodies of the State, and for the residence of its chief magistrate. It was to convey lessons of importance to governors and governed; to reflect as in a mirror the habits of life and guiding influences of the nation; in short, to make the palace stand in the midst of Venice as an image of the political state, faith, and occupations of the Venetians, and thus give it a physiognomy so national that it would appear to have been born of the place. The task was difficult: let us see how far he accomplished it.

'At each angle of the two façades, whose junction forms the apex of a triangle, stands the statue of an archangel, to show the trust of the Venetians in Divine protection, whether they were upon the sea or upon the land, at war or at peace. Raphael the patron of travellers with his staff in his hand, at the end looking towards the sea; Michael the warrior and avenger holding his sword, at the angle above the Piazzetta; and Gabriel the peacemaker bearing the lily, at the corner next St. Mark's. Under each of the archangels is a group of figures in alto-relief. The drunkenness of Noah, under the statue of Raphael, is an admonition against that vice, and a warning against filial impiety, happily contrasted with filial piety by the young Tobias, who sits at the feet of Raphael holding in his hand the fish whose liver is to cure his father's blindness. The group of Adam and Eve in the act of plucking the forbidden fruit, below the statue of Michael who was sent to drive them out of their forfeited Paradise, warns against disobedience; lastly the Judgment of Solomon below the statue of Gabriel speaks more particularly to the magistrates of their duty towards the people.

'We now come to the carved capitals of the thirty-six columns upon which the edifice rests. They too have for the most part their separate as well as their connected meaning, though the sculptor apparently allowed himself here and there a certain freedom of invention. They represent the conditions of man, the animals and plants needful for his existence and comfort, the planets which preside over his destiny from the cradle to the grave, and the winds which purify the air and propel his ships across the sea. The capitals beginning at the Raphael end of the façade are sculptured with figures of children; heads of young knights and warriors; birds; emperors (among whom are Titus and Trajan); women's heads; virtues and vices symbolically represented; wise men, such as Solomon, Aristotle, and Pythagoras; the planets Saturn, Jupiter, Mars, and Venus; the patron saints of sculptors, each working upon a capital, a cornice, or a figure; the trades, such as those of the lapidary, the carpenter, the husbandman, the blacksmith; the seasons with their varying occupations; the ages of man represented by the infant, the schoolboy, the warrior, the student, and the old man leaning upon his crutch and dead upon his bed; the courtship and marriage of a young man and woman, who are again represented with their child, first an infant, then a youth, beside whose death-bed they are weeping and praying. Last of all we come to the column of Justice, which stands below the Judgment of Solomon and the statue of Gabriel. Its capital, which is the finest of the series, is covered with the richest leaf-work, growing upwards from its base and drooping in graceful volutes, between which are inserted figures of Justice seated upon two lions, the law-givers Aristotle, Solon, Numa, and Moses, and an admirable group of the Emperor Trajan reining in his horse to listen to the widow's prayer for vengeance upon the murderer of her son.'

The general plan and partial execution of these sculptures is attributed by Mr. Perkins to Filippo Calendario. If this be correct, the teacher profited little by the lessons he taught. Calendario was hanged from the balcony of the palace in the year 1355, for his share in the conspiracy of Marino Faliero. Of the Renaissance sculptors at Venice, Leopardi and Verocchio are remarkable as having together produced 'the noblest equestrian statue of modern times'—that of Bartolomeo Coleoni. In the 16th century, when the 'Baroque' style prevailed—'when architects declared war against the straight line, and erased logic in construction from their system, and sculptors twisted the limbs of their statuettes into the most impossible positions, hollowed out the folds of their draperies like chance furrows in broken rocks, and aimed altogether at novelty for novelty's sake'—the great Tuscan, Sansavino, for forty years misdirected all matters in architecture and sculpture at Venice. He was succeeded in the dictatorship of taste by his pupil Vittoria, whose great powers, viciously applied, completed the ruin of art.

At Bologna the chief interest attaches to the one Italian female sculptor of mark, Properzia de' Rossi, whose generally received romantic history Mr. Perkins sets himself mercilessly to demolish.

Even in this slight manner it would be impossible for us to touch separately on the histories of all the Italian schools; but a few words will indicate their general progress. Previous to the 13th century, although antique remains must have been everywhere abundant, they appear to have been wholly disregarded by the sculptors, who elected rather to follow the ugly, stiff, and elongated forms of the Byzantine school. But from that time the influence of those remains is apparent. Italy never frankly accepted the Gothic style; it was a thing foreign to her climate and her sympathies; she was slow to receive it, used it only with much modification, and soon threw it aside; and when, in the 13th century, Nicola Pisano laid the foundation of the great Tuscan school, although to a certain extent he adopted Gothic architectural forms, he based the composition and modelling of his figures on the antique. The superiority of the Tuscans was soon acknowledged and their teaching followed throughout Italy; con-

sequently we find everywhere a freer treatment of the human form, and, even in strictly architectural sculpture, little of that subjection to Gothic principles which is to be observed in contemporary work in Northern Europe. From the time of the Pisani the history of Italian sculpture may almost be said to be included in that of the Tuscan school. In the development of the art the Tuscan masters took the lead; in the later Gothic and Renaissance their works were its chief glory; and in the 'Baroque' their great powers, misapplied, hastened its decline.

After the extracts we have given, it is almost needless to say that Mr. Perkins writes in a style which would make interesting a far less attractive subject than that with which he has to deal. The volume is profusely illustrated by etchings and woodcuts; the former, by the author himself, are very carefully and lovingly executed. We miss the useful chronological tables which followed the chapters in 'Tuscan Sculptors;' but beyond this, in the luxuries of a copious index and in marginal and foot notes, Mr. Perkins gives us everything we could desire.

SITE OF THE NEW LAW COURTS.

At a Meeting of the Social Science Association at the Society of Arts, on Tuesday evening, the adjourned discussion on the rival sites of Carey Street and the Thames Embankment was resumed.

LORD ELCHO, who was to have taken the chair, was detained at the House of Commons, and Mr. ROBERT STEWART, Q.C., presided in his absence.

SIR CHARLES TREVELYAN read a letter from Mr. T. W. Green, Q.C., who was unable to attend, expressing strong views in favour of the Embankment site. He also read a letter from Mr. H. A. Hunt, who took the same view of the subject.

Mr. WM. GOLDSMITH, who had moved the adjournment of the debate, resumed the discussion, and advocated the Carey Street site, notwithstanding all the arguments used by Sir Chas. Trevelyan, whose principal argument seemed to be that the Embankment site would best serve towards the ornamentation of the metropolis; and he did not think such an important matter ought to be decided by that standard. One great objection to the Embankment site was, that it would not be capable of future enlargement, like the Carey Street site. It was urged, in opposition to the point as to future extension, that the tendency of the present age was towards decentralisation; but if so, why were they going to concentrate the Law Courts? The fact was, that the law business of the country was daily increasing. The Embankment site might well be filled up by other buildings than the Law Courts. The Carey Street site would involve less expense in the alteration of streets than the Embankment site, and many of the proposals of Sir C. Trevelyan with regard to Lincoln's Inn and Gray's Inn would take perhaps a generation for their completion. Upon the question, therefore, of expense, time, place, and area, the Carey Street site was the superior one. The importance given to the fact of a railway station being made upon the Embankment was much over-rated, and he believed journeys in London could be performed as quickly on foot as by the rail.

Mr. O'HARA referred to the precedent of the Law Courts in Paris and Dublin, both being on the Embankment of the rivers in those cities, and thought that, as it was impossible to get the Law Lords, the Parliamentary Committee, and the Judicial Committee of the Privy Council to meet in the new Palace of Justice, it might be advisable to place the latter on the Embankment, as near as possible to Westminster.

Dr. SMITH supported the Embankment site, but regretted that the Courts were only about to be commenced, when the law business of the metropolis was beginning to diminish, as legal statistics would prove. As to the convenience of the profession, it was well known that they would follow the courts wherever they were placed, and the accommodation for them in and around Lincoln's Inn was known not to be very good. The Embankment site would give easy access both for the Temple and City practitioners, and the Carey Street site would be quite as valuable for other purposes.

Mr. SHIELDS, who has reported to the Government on this question, referred in detail to his various proposals. The Embankment site afforded one opportunity for architectural display, but only one; because, to make another on a level thirty feet higher would spoil the effect of the building. A perfect site, in his opinion, would be in the centre of a circle embracing the chambers of the legal profession; and this condition he thought would be satisfied by the Carey Street site, which would also afford better opportunities for architectural display than the Embankment site. The architectural view of the question, however, was not so important as that of business convenience. If the Carey Street site were adopted, it would afford a good opportunity for prolonging Piccadilly through Long Acre and Carey Street into Cheapside; and under that road a railway might be made without interfering with much property, or inconveniencing the tradesmen or the traffic.

Mr. VENABLES spoke in favour of the Embankment site, and argued against Mr. Shields's proposals, on the ground that they would involve an expenditure of three millions of money, which no one was prepared to find.

Mr. ROSS advised Mr. Street not to embarrass himself with the question of roads. The agitation for central Law Courts had been going on for years, and now they had got power to build them it was too bad that any delay should occur. Upon this ground, although the Embankment site had certain merits, he advocated that the buildings should be erected on the Carey Street site.

Mr. WEST deprecated any vacillation upon this question, and also urged that the Courts should be built on the Carey Street site as soon as possible.

Mr. THWAITES, speaking with a knowledge of the property which would be required for the Embankment site, said it was of such a nature that all parties would go in for very considerable compensation.

Mr. STREET, the architect, spoke not only in favour of the Carey Street site, but of the arrangements involved in his plan of the building.

SIR C. TREVELYAN replied to many of the arguments which had been used against the Embankment site, and dwelt at length upon the architectural and other advantages which its adoption would afford.

Mr. T. WEBSTER, Q.C., the author of the paper upon which the discussion had arisen, replied to the remarks which had been made generally, and urged that no improvement could be made upon the Carey Street site, which he had at first advocated.

The CHAIRMAN said that the meeting would now be in a position to vote upon the question, but it was not usual for the Society to take divisions.

In addition to the above discussion three meetings have been held by the Special Committee, invited by the Society of Arts to consider this subject, and *The Times* has published two powerful letters (one the 31st March, and a second on the 1st April) advocating the Embankment site.

IMPROVED DWELLINGS FOR THE INDUSTRIAL CLASSES.

BY THOMAS CHATFIELD CLARKE.

Read at the Ordinary General Meeting of the Institution of Surveyors, April 5, 1869.

Mr. JOHN CLUTTON, President, in the Chair.

At the formation of the Institution of Surveyors, the question was asked, whether in its range was to be included all those matters connected, with building not mainly artistic; and the answer being in the affirmative no apology need be presented for the introduction of a subject so deeply interesting, professionally, morally, and socially.

So much, however, has been said and written in connection with this subject, that it would be difficult to lay down any new principles which should guide its development; but it may not be uninteresting to give a 'résumé' of the work actually done up to the present time in the metropolis, and to strengthen the hands of those whose care it has been to act on sound principles.

Before commencing the sketch I propose to give of the various societies in operation, I will, in brief, give my view of the first principles which should guide undertakings of this kind:—

1st. That there should be economy in the outlay consistently with due regard to durability and health, combined with great simplicity in all details.

2nd. That, financially, any scheme should be based upon such a fair percentage, in proportion to the outlay, as might be reasonably considered an inducement to others to follow the example set.

3rd. That the classes for whom you are to provide dwellings should be carefully suited as to locality and means in the different districts of the metropolis:

4th. That freedom from restraint or interference with the privacy and self-respect of the occupants should be carefully studied.

To the professional man many other questions must suggest themselves, of great interest and importance—such as the nature and plan of the structures to be inhabited; the desirability or not of erecting very high blocks of buildings; the possibility of adapting present structures, with sanitary and other appliances, when substantially built, thereby saving much outlay; the desirability of restricting or not the amount of accommodation below that usually considered essential; and the question of all others the most difficult—viz., will it be ever possible to succeed in being able to build dwellings which can be made fairly remunerative and yet applicable to the humblest classes of our citizens? Before passing on, I should like to offer a few remarks on each of these points, and to suggest a few thoughts in relation to them.

With respect to the nature and plan of the structures, it cannot be doubted that experience has proved the undesirability of erecting buildings on a large scale for single men, or for purposes of laundries and the like, with any hope of their being fairly remunerative, and that the buildings should be confined to such as are either of the block or cottage character. In like manner, it cannot be doubted, I think, that in the plans of the various buildings an avoidance of tortuous staircases and passages, of rooms with many angles and many doors, and too much glass, are all requisites; also that the staircases should have direct access to the outer air; that the passages should not have room-doors opening opposite to one another, nor, indeed, should there be passages at all, if possible; that all the appliances should be iron and stone, of the simplest but yet most effective character—such as the flushing of closets, sinks, and the like; and that, though the finish should be of the plainest kind, those additions which tend to make the dwelling comfortable in the eyes of its occupants should not be wholly wanting; and for this purpose cheap papers, of a glazed character, that would stand washing, would be of great service (with simple polished or varnished woodwork), the coating of the walls being as non-absorbent as possible—of course not being unmindful of the necessity for simple methods of ventilation.

With respect to the erection of very high blocks of buildings, I am doubtful whether, on a large scale, they are desirable; for it is evident that, unless placed in a street or square of very great width, the lower floors must be in a *well*, besides the possibility of great loss of life in an alarm of fire should the staircase be not readily accessible, or not prove wholly impervious to the effects of fire in the lower storeys. Doubtless the motive urging the erection of very high blocks of buildings is apparent, that you thereby reduce the ground-rent proportionately over the buildings; but in doing so you add somewhat to the thickness of your walls, and give to your buildings a character which to many forms an objection.

Taking the next point, viz., the possibility of adapting present structures for the purposes of dwellings for the industrial classes, I have always been desirous that this mode should be tried on an extended scale; for wherever tried on a small scale, with a proper choice of property, it has proved remunerative.

It has this advantage, that house property is taken on long repairing leases, often out of the hands of middlemen who oppress the poor, and at

no large outlay of capital a large amount of good may be done by adapting the same, and no very great liabilities incurred.

As to the remaining point, viz., the advisability of restricting the amount of accommodation with the view of keeping the rent within the means of the *humblest class*, I am not sanguine, with the present cost of land and buildings, that this can ever be done; and I fear those interested in this movement must be content to provide for a class somewhat above the lowest, hoping thereby to improve ultimately the nature and amount of the accommodation for the humblest.

After the brief notice I have given of the principles that should guide, in my judgment, the operations of such Associations, I now proceed to give a summary of the results of the working of the various agencies in the metropolis for this object that I have been able to gain information upon; giving approximately the capital expended, the nett dividend divisible, the number of persons accommodated, and statistics as regards the health of the inmates as far as I can ascertain the same. I also give some particulars of the rents obtained for single and sets of rooms.

One point in connection with these results I would strongly press on the consideration of those interested in this question—viz., the recent great increase in the taxation of these buildings, and the heavy incubus it is on the poor, or in reduction of dividends on these undertakings. Sir S. WATERLOW has recently made a statement relative to the Company in which he has taken so leading and earnest a part, by which it appears that by the recent change in the law an increase of 37½ per cent. has been chargeable in respect of the rates on the Company's property.

In the order I have proposed to myself, I desire first to refer to the work of The Metropolitan Association for Improving the Dwellings of the Industrious Classes, as being the Association that, on a charter involving much preliminary expense and with many restrictions, has proceeded in such a careful manner with various tentative experiments as to entitle the managers of such Association to much praise.

It is satisfactory to learn, from the clear and detailed accounts presented by this Association, that several of their larger buildings are earning, after the payment of every expense, more than 5 per cent., and one of their largest blocks 6 per cent.

The statement of general results is as follows, to Midsummer 1868:—

Paying on a capital of about 100,000*l.*, exclusive of loans and advances, and provincial branches, this Association was enabled to divide at the rate of 4 per cent. last Midsummer, though having earned nearly 5 per cent., accommodating a population of 3,342 persons at that date, and with the favourable rate of mortality of 14 per 1,000, the average rentals per room being, I estimate, from 2*s.* to 2*s.* 6*d.* per week.

Ranking next in interest, perhaps, is 'The Improved Industrial Dwellings Company,' from the spirited way in which, in a short space of time, so many blocks of buildings have been raised in various parts of the metropolis, on plans peculiar in their conception and original in the class of material used in their construction.

This Company are going to avail themselves largely of the power to borrow from the Government at 4 per cent., to assist their undertaking, though the advantages likely to accrue from so doing have been lessened considerably by the great expense hitherto incurred in obtaining such loans.

With a productive capital, by the last Report, of about 90,000*l.*, this Company is enabled to pay 5 per cent., accommodating a population now of about 2,900 persons, but shortly hoping to increase that number, by their buildings projected, to 3,890 persons. No statistics of the health of the inmates have been kept, but, from some partial observations in one locality, they have been very favourable. The average rentals derivable are from 2*s.* 3*d.* to 2*s.* 6*d.* nearly per week per room.

(To be continued.)

THE LAW COURTS.

To the Editor of THE ARCHITECT.

SIR,—Perhaps you will think that the accompanying letter to my address from Mr. J. P. O'Hara might with advantage be published in the present state of the discussion on the subject of the Law Courts. It contains interesting information relative to the experience of the Irish Bar, and suggests for consideration how far the habits of English lawyers might with advantage be modified in the same direction. Mr. Street's plans include commodious Consultation Rooms and Library for the Bar.

I have the honour to be, &c.,
C. E. TREVELYAN.

March 5, 1869.

To Sir Charles E. Trevelyan, K.C.B.

SIR,—As a member of the legal profession in both England and Ireland (being an Irish barrister since 1856, and a student now of Gray's Inn), I beg to thank you for your most felicitous idea of erecting the Law Courts on the Thames Embankment. Permit me to offer a few observations suggested to me by the state of the legal world in Dublin. The Courts there are at least a mile from the residence (in which is always the office) of any barrister, yet, so far from this being an inconvenience, it is the reverse. It offers a change of air (which a mile in or from town sometimes can confer better than ten in the country), and also compels some slight daily exercise to be resorted to by professional men. Being of politico-economic principles, I do not approve of any direct or indirect compulsion in respect of anything whatsoever not required by the necessities of the State. I only mean that the supposed inconvenience of courts being distant

from chambers is, in the case of barristers, no real inconvenience, especially as those in brisk practice may survey their notes in cabs, if they do not like walking to court or wasting time on exercise. A barrister in Dublin has no chambers but his residence; because the vast library in the Four Courts supplies him with a place where he can peruse his briefs, and at the same time be within call. A porter is stationed at the door for the express purpose of calling barristers when wanted by anyone. The library in the new London Courts will, of course, serve this very same purpose. This takes the brunt off the objection as to the courts being distant from chambers.

The conveyancing and special pleading bars, indeed, will still hold chambers. But these members of the profession rarely go to court. They stand in the same relation to the advocate that the civilian did in the time of Cicero to the forensic orator.

Now, as to the attorneys. As a concentration of courts will bring the bar together, so, for that very same cause, it will lead an attorney in search of a counsel to go to court to look for him rather than to his private chambers or residence. Let us distinguish between the different classes of attorneys. The City attorneys will always remain in the City. They have chambers there, not for legal, but trade purposes; not for being in contact with the bar, but with the public. Until the City tide ebb to Charing Cross, and Macaulay's traveller arrives from New Zealand, the City attorneys will remain where they are. As no one suggests that the Courts should be built in the City, the City attorneys, therefore, may be eliminated from the present inquiry. Next comes the central square mile about Lincoln's Inn Fields. But, surely, the attorneys there are not zoophytes. They can move on a proper cause for motion. They can easily, as accessory, follow their principal, Lincoln's Inn, whithersoever that withered and grotesque structure goes. Now, surely, Sir, there is nothing in the size or architectural beauties of Lincoln's Inn that ought to affect the consideration of the public on this point for one moment. The only advantage Lincoln's Inn has is the adjacent square, which freshens the air. But there is much greater reason, as to that head, for preferring the Embankment.

The particular object I have had in view in offering these observations is to suggest that, as a concentration of jurisdictions is the primary purpose of the scheme on foot, the Embankment between Hungerford and Westminster is the proper site for the Courts—otherwise, there will be no concentration. The head will be detached from the inferior members—a consideration which in future will be more important than ever, owing to the probable decentralization of judicatures, with a proportionate increase of appeals to the ultimate court. The Law Lords and the House of Lords will never consent to the trial of causes before them elsewhere than at St. Stephen's. Therefore, upon this ground, as also in the interest of the parliamentary bar, as also because the profession would thus be constantly in contact with the Legislature, I respectfully suggest that the site I have referred to is the natural site for the Courts. Finally, owing to the greater prevalence of westerly winds than of those from other points of the compass, the air at the West End is exceedingly good. Therefore, as likely to spend most of my remaining days in the New Law Courts, I implore you, for the sake of the health of the profession, to seek to give us above all things good air. This can be had at Westminster; to some slight extent at the Temple, but not at all at the Strand.

I cannot appreciate the effrontery (for such it is) with which any body of lawyers can pretend that the Carey Street site is superior in any respect to any part of the Embankment. When it was proposed many years ago to prohibit intramural interments, the clergy of London took alarm, and a venerable archdeacon actually charged the clergy of his archdeaconry on the subject, pointing out the advantages of intramural interment. 'There are laws of death,' said the good archdeacon, 'as there are laws of life,' &c. The *Times* suggested the key to this nonsense. Fees were in question. It is greatly to be feared that some similar undercurrent is working in the recesses of the legal consciousness of those members of the profession who refuse to stir, though offered such very eligible accommodation and pure air.

Wherever the New Courts are erected, thither will the legal eagles resort. Why, then, should the antiquated legal settlements centering on Holborn at all affect the consideration of this subject? Unfit for habitation, they have nothing whatever but antiquity to recommend them. But, at all events, a library, club-room, refreshment room, and a suite of consultation rooms in the new palace of law would leave little to be desired by the forensic barrister in respect of chambers. All married barristers (and the profession do not boast asceticism) live, as a rule, a considerable distance from chambers, and many ten or twelve miles from town. These, in the morning, instead of repairing to chambers, would go to court at once. There, in the hall, library, or club-room, they could see their clients. This is the universal rule in Dublin. The court would thus be a forum in the classic sense.

A very considerable portion of the profession have an interest in retaining the Courts at Westminster. But, however, as I consider the question of chambers and vested interests therein altogether subservient to the primary one of concentration and of air, I make no account of these more than of their City brethren. The former will find inconvenience in one class of legal duties keeping them in attendance on parliamentary committees or appeals, and another requiring them to be a mile off, but this would be worse if the Courts were placed on the Carey Street site, which has not the advantage of a railway. If they are placed on the Embankment site, barristers in attendance at Westminster may, with the help of the Metropolitan Railway, be in their place in court in five minutes after they are summoned by telegraph.

With respect to room anywhere, it cannot give you, sided by the Chancellor of the Exchequer, any trouble. If you buy fresh land, you can sell what you have. Approaches, too, for the same reason, need not be considered.

The Embankment will probably not lessen the traffic in the Strand to the extent supposed. The quays in Paris and Dublin are comparatively deserted; while the lines of street parallel thereto are crowded. These analogies are not to be lost sight of. There is only one row of houses, it is to be remembered, fronting each side of a quay, consequently there can

be only one half the natural flow of customers to other streets. So much so is this the case, that, the road being comparatively clear of vehicles, the drivers of carts, &c., in Dublin, drive faster there than elsewhere, and, I must confess, make more noise. You may make any public use of this letter.

I have the honour to be, Sir, your obedient servant,
Gray's Inn, March 27, 1869. JOHN P. O'HARA.

NEW BUILDINGS AND RESTORATIONS.

The Academy of Music, Vienna.—The new Conservatoire or Academy of Music, now in course of construction behind the Würtemberg Palace, under the superintendence of the celebrated architect Hansen, will, when completed, contain the finest concert-room in the world, with two thousand stalls, and gallery room for eight hundred auditors, and the great hall will be convertible at a few hours' notice into a ballroom by the application of an ingenious but simple process for sinking the whole of its stalls, &c., under its flooring. Besides enormous double galleries, there will be fifty-two large boxes, including the Imperial box. All the offices, wardrobes, *fumoirs*, &c., are on the ground floor, spacious, commodious, and easy of approach. On the right and left of the entrance portals, two wide flights of stone steps lead upwards to the greater and lesser halls, both on the first floor and occupying the remaining height of the building; they are connected by a broad corridor, so that they may be made available at once on extraordinary occasions, such as monster balls. For the Imperial family a special entrance and marble staircase is constructed on the eastern side of the edifice. The decorations of the larger hall will be red and gold; its ceiling will be covered by frescoes emblematic of the divine art; and three colossal statues—Winged Poetry, supported by Gay and Mournful Music—will ornament the *Loggia Principale*. Busts of all the principal composers will be ranged in niches, and marble genii will bear on their shoulders the pillars dividing one box from the other. The frescoes, by Eisenmenger, will represent Apollo and the Nine Muses; Orpheus, the original 'Wandering Minstrel,' in the different phases of his musical expedition; Arion and Sea Nymphs, '*solus zonis*,' and other groups of appropriate figures. The proposed expenditure will amount to eighty thousand pounds, and more than half of the sum has been raised by voluntary subscription.

The New Station of the North-Eastern Railway in Leeds.—The new station is a few yards to the south of the Wellington Station and parallel with it, and it is at this portion of the works where the most remarkable features of the whole undertaking are to be met with. Of the hundreds of thousands who pass through the Wellington Station, probably comparatively few are aware that the building has for a foundation a number of arches, through which flow the murky, slimy waters of the Aire. To construct the new station at the requisite level and give ample field for the wonderful reticulation of lines and points, a preliminary and greater work had to be accomplished, in the erection of an extensive series of arches, through which, during floods, the waters roll and foam with a tremendous roar. These arches cover no less than seven and a half acres, and it is said that in their construction no fewer than eighteen millions of bricks were used, and in the course of their erection difficulties of no ordinary character presented themselves. In one case the foundation of one of the pillars had to be inserted at the base of a chimney forty feet in height connected with the engine shed of the Midland Company, and that was accomplished without a single strain upon the chimney. Obstacles of a similar character were also successfully overcome. The canal basin lock is spanned by a magnificent girder bridge, which, it is said, has cost 10,000*l.* It is formed of eight enormous wrought-iron girders, each weighing about 70 tons, the span being 85 feet clear, and the width of the whole about 200 feet. For this bridge the contractors were Messrs. Panton and Sons, of Sunderland, who also supplied the girders for the rest of the iron bridges, with the exception of that in Neville Street. The iron of which was by Messrs. Butler and Pitts, of Stanningley. When the workmen were engaged on the arches and road in the immediate neighbourhood of the lock, they discovered, buried eight feet below the surface, a quantity of piles of oak, four feet apart, the intervals being filled in with stone. It is not improbable that they played some part in the construction of the navigation, but the antiquarians of the neighbourhood offer no satisfactory explanation. The ford—in the immediate neighbourhood of which was the Waterloo swimming bath before the commencement of the railway works—is spanned for about 250 feet with seven straight massive arches of solid ashlar, the arches extending down stream for about 200 feet. The danger from floods is reduced to a minimum by the walls of the 'jack' arches being constructed on the skew in the direction of the stream, so that the least possible resistance may be offered to a heavy current.

The arches already described form in reality the foundation of the station-buildings, which are of an equally extensive character. The site is in form very peculiar, but the architect, Mr. Thomas Prosser, has adapted the structure to its position with considerable ingenuity, though it must be admitted that it will receive admiration more on the score of utility than on that of appearance. The entrance to the station is approached under the covered carriage way at the east end of the Wellington Station. In arrangement the buildings may be said to bear some resemblance to the letter Y, the stem and right spur being formed of two wedge-shaped blocks with rounded angles, and the left spur representing the ticket offices. The latter are of an oval form, are 75 feet in length, and have a central passage 14 feet wide, the block on the right being occupied as parcels offices, and that on the left as booking offices, the booking clerks of each company being accommodated in the same building, though in different compartments. These offices stand at the entrance to the station, and the arrangement is such that the traffic will be greatly facilitated. Diverging to the right on reaching the platforms, the whole of which are 25 feet in width, is the 'dock' of the London and North-Western Company, the platforms surrounding which have a total length of 630 feet, of which 302 are covered in. To the North-Eastern main line there is a covered platform 513 feet in length, the total length being 940 feet. Separating this main line from the London and North-Western 'dock' is

one of the wedge-shaped blocks 130 feet in length. In addition to the refreshment rooms there are on the ground floor lavatories and other conveniences. The upper storey will be occupied by the superintendents of the lines and in various other ways. The smaller block, or right spur of the 'Y,' is 96 feet in length. In its accommodation is provided for the joint station master, the assistant station master, two telegraph offices, &c. On the Wellington Street side of this building is a siding for the North-Eastern traffic, and outside the southern wall of the station, which is 508 feet long, are two lines for the use of the goods trains. The roof, which is constructed of glass and iron—the contractors being Messrs. Butler and Pitts, of Stanningley—is supported by a series of iron pillars with perforated spandrels. Peculiar and irregular in shape, it may be described as having a sort of double-pitch; it is very lofty, being about sixty feet high; the greatest span of the roof of the London and North-Western dock is 92 feet, and of that over the main line 68 feet. This portion of the works has been carried out under the immediate superintendence of Mr. Wm. Brown, the contractors for the station buildings being Messrs. George Thompson and Co., who have also executed the whole of the arches, and the rest of the line, with the exception of the iron bridges.

Her Majesty's Theatre.—The contract between the Earl of Dudley and Messrs. Trollope was signed May 28, 1868, and the further contracts for the decorations and the stage were entered into at the beginning of the present year. Messrs. Trollope were bound under heavy penalties to complete the whole by the end of last month, and very confident predictions were made that the works would not be accomplished, and that Messrs. Trollope would be probably ruined by the penalties that would be enforced against them; but in the unprecedented short time of ten months everything has been completed, and the building in a condition to be handed over to the lessees, with whom it now rests to take measures for opening the theatre.

Louth.—Church Restoration.—We are glad to learn that the restoration of the Parish Church now in progress embraces the pulling down and the rebuilding of the north porch, one of the most modern, but most completely incongruous portions of the edifice. Both in style and material it was altogether unworthy of its connection with such a noble building as this much admired church. It is now levelled with the ground. It is sincerely to be hoped that the architect, Mr. Jas. Fowler, will in its place raise a porch of such a character that it will be an ornament to the rest of the edifice.

Opening of a New Presbyterian Church at Darlington.—A new English Presbyterian Church has been opened in Northgate, Darlington. The building, which is a handsome edifice in the Early Gothic style, will involve a total outlay of about 2,700*l.* The church is built of stone, and has a spire. A stained glass window faces the main thoroughfare. The building is calculated to hold 550 worshippers. It is divided into nave and aisles by iron columns. The architect is Mr. J. Ross, of Darlington.

The Parish Church of Icombe, in the diocese of Bath and Wells, is about to undergo restoration.

A New Pier has just been opened at Clevedon. The Engineers are Messrs. Ward & Grover. Our contemporary, *Engineering*, gives the following technical description of the works:—'The contractors for the whole of the pier are the Hamilton's Windsor Ironworks Company Limited, of Liverpool, who have recently completed successfully a very large similar work at Colon, in Panama. The contractor for the masonry and approaches is Mr. Ambrose Oliver, of Hitcham, Bucks. The general dimensions of the structure are as follows:—Length of approaches, 180ft.; length of the pier (in 8 spans of 100ft. each), 800ft.; length of the pier-head, 42ft.—making a total length of over 1,000ft., and giving a minimum depth at extreme low water spring tides of 6 feet at the pier-head, which is therefore always accessible. The approaches are generally 25 feet wide, and are executed in first-class masonry, the footings of which are let into steps cut out of the solid rock. Powerful moorings, or holding-down bolts, which are carried through this work at an angle of 45 degrees, serve to secure the main girders from moving from their bearings. The pier itself is composed of eight 100ft. spans, consisting of two continuous wrought-iron girders 3ft. 6in. deep, which serve partly to form the parapet. On the top of each girder there is a continuous seat, the back of which is made up of tight boarding. The deck is of 3in. planking, machine planed and closed jointed, laid lengthwise, and cambered in the centre 3 inches, so as to give the effect of the long and pleasing perspective of a flush deck on board ship. The main girders are supported by double cantilevers, so that they could be divided in two in their centres without danger. These cantilevers are composed of Barlow rails, bottom upwards, bent, and having flat plates riveted on their backs, the distance or spandrel pieces being a combination of T irons and plates. The main longitudinal girders are kept apart by rolled joists 9 in. deep, 16 ft. 6 in. long, and about 20 ft. 6 in. from each other. Between these again runs a system of diagonal bracing below the deck, the idea being to make the whole superstructure one deep lattice girder laid upon its side. The piles, which in the deepest point reach the height of 65 ft. above ground—which, added to an average of 15 ft. in the ground, makes them as much as 80 ft. long—are composed each of two Barlow rails riveted back to back. They are placed at a rake of 1 in 10 both ways; and at the top the pair on each side are brought into intimate union by means of a wrought-iron plate passing between them. The two united rails are bent over, and form an arch of considerable stability. The piles are kept in position by a complete system of diagonal bracing and distant pieces or struts. That part of the pile which enters the mud is made of 5-inch solid wrought-iron stems, at the end of which comes a 2 ft. 3 in. cast-iron screw. These are carried down to the rock. Where the rock is on the surface, the piles are secured to it. One important and very advantageous arrangement of the piles appears to be that they are so combined and connected as to form in themselves a powerful girder, which would not only resist any tendency to buckling but would be effectual, probably, in withstanding the shocks of wreckage or of an average-sized vessel itself. The pier-head on plan measures 42 ft. by 50 ft.; is in itself a formidable structure, being 65 ft. high, and is built of eighteen piles, each made of two Barlow rails, riveted back to back. At vertical intervals of

every 10 ft. come five lower landing decks or stages. These are made of open boarding, laid upon a strong framework of rolled iron joists and girders, which serve as distance-pieces between the piles. Horizontally, diagonally, or cross-diagonally, runs a complete rigging of wrought-iron rods as bracing, and in the centre up the entire staircase are to be carried the stairs, which are wide and ample, and of which there will be five pairs. Around the entire wrought-iron framework runs a vertical casing of 1 in. timber fender-piles, about 2ft. 6in. apart, which are intended to distribute the shocks of vessels discharging. The pier-head is doubtless sufficient for the purposes of a landing-stage, for which it seems to be designed; but if it is to be used as an attraction for promenaders, as a resort for the residents and visitors of the pretty little town of Clevedon, as a place where the band may play on summer evenings, to the delight of "congregated thousands," then we fear its deck area of 50 feet by 42 feet less the stair opening will be found too small. It should have had another row of piles on each side, which would have increased it to 76 feet by 42 feet. Even then there would not have been too much space, after deducting all the obstructions of band-houses, pollards, masts, ropes, signal-huts, &c., and the numerous necessary adjuncts to a work of this character. In all other respects the work seems well adapted for its situation. The large spans are right in view of the difficulty of the foundations. The openings are pleasingly formed by the elliptical arch. Advantage has been taken of the important combined principles of "continuity" and "double cantilevers." The piles, though long, are clustered, and we know that union is strength. Although the use of the Barlow rail as a pile is not altogether new, it has, we believe, never been employed in England before for a work of equal importance. It remains to be stated that the quantities of wrought iron used are nearly 350 tons, and of cast iron under seven tons.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Royal Archæological Institute.

The annual meeting of the Royal Archæological Institute of Great Britain and Ireland will be held in 1869 at Bury St. Edmund's—a town rich in objects of archæological interest. The Marquis of Bristol will be the President for the year, and the three sections of Antiquities, Architecture, and History will have for their chairmen the Bishop of Oxford, Mr. A. J. B. Beresford Hope, M.P., and the Venerable Lord A. Hervey. The meeting will probably commence in the third week of July, but the precise date has not yet been fixed.

The Bath Bells.

We hear that the accident which has happened to the tenor bell of the Abbey peal—noticed by us in a late number—is to be repaired by re-casting. A subscription is to be opened to defray the expense, which will only amount to the moderate sum of 120*l.*

Harbour and Coast Works Ordered in France.

An Imperial decree, which has just been promulgated, orders that the works in course of execution for the construction of a port in the small bay of Porstrein at Brest shall be modified according to the plans and advice of the general Council of the Ponts et Chaussées and Mixed Commission of Public Works, the effect of which is to increase the estimates for the work from 640,000*l.* to 930,000*l.* Another decree orders the execution of the necessary works for the formation of a port at Berre on the lake of that name near Cette; the cost of this work is estimated at 6,800*l.*, of which the Department and the Commune are to pay 1,700*l.*, and the State the remainder. By a third decree, works estimated at 9,800*l.* are ordered to be executed for the improvement of the bay of Herbaudière, in the isle of Noirmoutier in La Vendée.

Method of clearing the Paris Sewers of Mud and Gravel.

In the sewers which have a fall of not more than about three feet in the mile, the accumulations of gravel and mud cause a great deal of trouble, and the following are the methods employed to prevent the choking of the collectors: in the larger sewers, boats are used for the cleansing, and in those not exceeding four feet in width, small trucks running on rails; in each case a hatch is fastened to the head of the vehicle and can be lowered to any required depth; the effect of this is to interrupt the flow of the waters, which then rush impetuously by the sides and through openings made for the purpose in the hatch; this is found to answer well in certain cases, but in some parts banks of deposit are formed, extending two hundred yards or more, and recourse is had to positive manual labour, and the mud and gravel are swept out to the mouth of the great collector, at Asnières.

The method adopted for cleansing the great sewer syphon of the Alma is ingenious; the tubes are one metre in diameter, and a wooden ball, nearly nine tenths the size of the tube, is introduced; the consequence is that the sewage water rushes with great violence below the ball and exerts a powerful scouring action.

It is not out of place to add, that the length of the sewers of Paris is rather more than 312 miles, and as the streets measure more than 400 miles it results that there are 128 miles of street still unprovided with sewers.

The Paris Annual Exhibition of Works of Art and Popular Election.

The works sent in for exhibition at the coming *Salon*, which opens, as usual, on May 1, amount to the extraordinary number of 6,375, of which 5,570 are oil paintings, drawings, &c., and 805 sculpture, engravings, and architectural drawings. This is, we believe, the largest number ever received, and there is a sufficient number of important works, known in art circles, to show that the *Salon* of 1869 promises to be above the general average in interest.

The juries that are intrusted with the reception or rejection, and the hanging of the pictures, as well as with the award of all the medals, with the

exception of the two great medals of honour to be given in the sections of Painting and Sculpture, have just been elected. Two thirds of each jury are elected by the votes of all the artists in its own section who have had one or more works received at former exhibitions, and who have sent in anything for exhibition this year—a very broad franchise, as will be admitted. This mode of election has been adopted now for three or four years without alteration, except that artists absent from Paris are allowed to vote by letter. On the present occasion about eight hundred voted, and the result will show whether popular election and a low standard have any connection. The following are the names of the elected jurors, placed according to the number of votes they obtained:—

Section of Painting and Drawing.—MM. Gérôme, Baudry, Pils, Bonnat, Bida, Gleyre, Fromentin, Comte, J. A. Breton, C. F. Daubigny, J. N. Robert-Fleury, and Cabanel.

Section of Sculpture and Medal Engraving.—MM. Barye, Guillaume, Perraud, Soitoux, Dumont, Paul Dubois, Cabet, and Carpeaux.

Section of Architecture.—MM. Duc, P. F. H. Labrousse, Duban, Vaudoyer, Viollet-Leduc, and Ballu.

Section of Engraving and Lithography.—MM. Lalanne, Mouilleron, Jacquemart, Boetzel, Gaucherel, Henriquel-Dupont.

There are undoubtedly several names of artists of the highest rank missing from the above lists, but some of these decline to serve, while others reside constantly at great distances from Paris, and several out of France: the mode of election is therefore to be judged of by the standing of the artists elected, and not by the missing names. Almost all the candidates who are members of the Institute or Professors in the Ecole des Beaux-Arts have been elected. The rest of the jurors are appointed by the Government, that is to say, by the Minister of the Beaux-Arts, and consist principally of eminent art critics and connoisseurs; they are as follows:—*In Painting, &c.*—MM. Alfred Arago, Cottier, Vicomte Delaborde, Théophile Gautier, Lacaze, Comte de Lesay-Marnésia. *In Sculpture, &c.*—MM. J. A. Barre, Michaux, P. de Saint-Victor, Eudoxe Soulié. *In Architecture*—MM. Beswillwald, Albert Lenoir, and Du Sommerard. *In Engraving and Lithography*—MM. A. de Beaumont, Charles Blanc, Eudoxe Marcille.

It is pleasant to be able to add that while under the old system, when the jurors were appointed by the Academy of the Beaux-Arts, the complaints of partiality were constant, there has scarcely been a whisper of discontent since the new mode of election has been in operation.

Notes for Connoisseurs.

At the sale of the collection of Kraetzer of Mayence which took place in Paris, on March 31, there were some remarkable works of the Dutch school, of which the following were amongst the most prominent: David de Heem, Flowers and Insects, 180*l.*; Wilhelm Kobell, the Auberge, 113*l.*; Weenix, Game and Sporting Implements, 200*l.*; and the Tinker, by the same, 60*l.*; Philip Wouvermans, Marine-piece, 56*l.*; and a landscape by Jean Wynants, with figures by Lingelbach, 126*l.* 8*s.*

Sales are coming thick and fast as the season advances. A good collection of pictures belonging to the late M. Alphonse Ondry, including works by the best Flemish, Dutch, and Spanish artists, is to be sold in Paris on the 16th and 17th of the present month of April. A very fine collection of objects of Oriental art and curiosities, made by the late Alfred de Rougemont, is announced to be sold on the 14th instant and five following days; this collection includes arms, bronzes, enamels of various kinds, jewellery, and porcelain.

On the 20th inst. and four following days the collection of the late Baron Albert de Hirsch, of Vienna, is to be sold in Paris. It consists principally of antique and modern cameos and intaglios, silver-work of the fourteenth and seventeenth centuries, Venetian glass, carvings in ivory and wood, carved furniture, and Gothic coffers, bronzes, &c.

The well-known collection of furniture of the fourteenth to eighteenth century, clocks from the time of Henri II., bronzes, ironwork, arms, &c., belonging to the late M. Bigillon, of Grenoble, is to be sold in that town on the 14th to 30th inst.

But one of the finest private collections of objects of *virtu* is that of the late M. Edouard Fould, which is being sold in Paris this week and attracts all the connoisseurs to the auction mart.

Leonardo da Vinci.

The 'History of Leonardo da Vinci,' on which M. Arsène Houssaye has been engaged for years, has just been published.

General.

At a late Meeting of the Common Council, held at Guildhall, Mr. Alderman Causton gave notice of his intention to move at the next court that a statue in commemoration of the late Prince Consort be erected by the Corporation, at a cost not exceeding 3,000 guineas, as the City of London Memorial of his late Royal Highness.

The opening of the Wedgwood Institution at Burslem is now definitely fixed for Wednesday, the 21st inst., when an art exhibition, including a most extensive display of Wedgwood Ware selected from the best collections, will be opened by the Right Hon. the Earl de Grey and Ripon.

The works of the railway between Athens and the Piræus are now nearly completed, and will be opened for traffic in a few days.

The Building Trade at Bradford.—There is every probability of the lock-out of stonemasons at Bradford on May 1, all attempts thus far to prevent such a result having failed. The master-builders insist on the masons accepting payment by the hour, abolishing their rules relating to machine and quarry worked stones, and submitting all disputes to settlement by arbitration. The notice served on the workmen by their employers specifies that 7½*d.* per hour shall be the ordinary rate for skilled workmen; that the rules against machine and quarry worked stone shall be abolished; that all disputes shall be settled by conciliation or arbitration, courts to be

formed for this purpose; that, upon six days' notice, the masters are prepared to publicly meet the men, select arbitrators, and mutually appoint an umpire; and that these alterations are required to come into force on May 3, 1869, or upon such other day as the new or altered rules shall come into force. Mr. M. Shepherd, Secretary of the Bradford Lodge of Masons, has replied that it was unanimously resolved, at a general meeting held on February 10, to carry out the following resolutions:—'1. That this meeting is of opinion that the notice of the master-builders of Bradford would be injurious to our society, and pledges itself to resist it with all its power. 2. That this meeting considers that the present rate of wages and hours of labour are nothing in excess of the demands of the working mason, and pledges itself to maintain them in their entirety.' The conflict thus seems inevitable, and this cannot occur without inflicting injury on artisans in the other branches of the building trade, and arresting the progress of the building trade in the district.

Stained Glass Windows in St. Michael's Church, Alnwick.—Four additional memorial windows (to the memory of the late Algernon, fourth Duke of Northumberland) have been placed in St. Michael's Church, Alnwick—one in the western end, and the other in the chancel. The first window on the east represents, on the lower panel, the Epiphany, the shepherds on one side, and the wise men on the other; and on the upper panel, the baptism of St. John. The second window has on the lower panel the Last Supper; on the upper the Crucifixion, with the Virgin Mary, Mary Magdalene, and 'the other Mary' on one side, and Joseph of Arimathea, &c., on the other. In the tracery above are angels bearing shields, with the crown of thorns, &c., on them; and in the quatre-foil the arms of the Duke. The third window has on the lower panel the Resurrection, with on one side the three Maries, and on the other Peter and John; on the upper panel is represented the Ascension, with the eleven apostles on either side and angels above, as in the central window. The west window illustrates the *Te Deum*. On the lower panel is St. Michael, with the Church Universal on one side, the martyrs on the other side. On the upper part is Christ as 'the King of Glory,' and on either side the apostles and prophets. Above are Cherubim and Seraphim, with crowns in their hands, and with scrolls, singing 'Sanctus,' &c. The windows are 13ft. high by 6ft. 3in. in breadth; the lower panels are 4ft. 6in. by 1ft. 9in.

Architectural Remains in Java.—Few Englishmen are aware of the number and beauty of the architectural remains in Java. They have never been popularly illustrated or described, and it will therefore take most pious by surprise to learn that they far surpass those of Central America, perhaps even those of India.—*The Malay Archipelago.* By A. R. Wallace.

Mr. Hardwick, the architect of Lincoln's Inn Hall and Library, has, after long and honourable service in his profession and the Royal Academy, determined to surrender his seat as R.A.

New Dock Works.—The first stone of the new works for the extension of Portsmouth Dockyard has been laid. A block of Portland stone, weighing some five tons, was fixed at one end of a vast excavation, which will form one of four docks that will stand on the south side of the new repairing basin included in the general plan of the extension works. A silver trowel, together with a square, plumb-line, &c., were handed to Mrs. Wellesley, who performed the duties of master mason, and declared the stone well and truly laid. A few words were then spoken by Rear-Admiral Wellesley, and a great engineering work was formally commenced.

Sewage Irrigation.—On Monday the Leamington Local Board held a special meeting to consider an offer received from the Earl of Warwick, to take the whole of the sewage of the town for a term of thirty years, and dispose of it by irrigation on his Lordship's estate, two or three miles south of Leamington. The local board are to lay down the requisite mains, construct the necessary works, and pump the sewage to a given point on the estate, and in return his Lordship will pay the board 450*l.* annually for the sewage. The terms proposed by his Lordship were unanimously approved of by the board, and the offer was accepted, and will come into operation on March 25, 1870, by which time Lord Warwick will be prepared to dispose of the sewage on his estate.

Messrs. Macfarlane & Co. are about to remove the well-known business so long carried on by them as architectural ironfounders, sanitary engineers, and art workers, at the Saracen Foundry, Glasgow, into the country immediately outside the city. Contracts have been entered into for the erection of new works at Possil Park, formerly the property of the late Sir Archibald Alison, Bart., Sheriff of Lanarkshire. The property has been divided off by feuing, accommodating about thirty tenements of double houses, in addition to Messrs. Macfarlane & Co.'s new works. These works are to be connected with the Helensburgh line of the North British Railway system. The line is to be adapted to suit the convenience of any persons who may feu ground for public works. It is expected that not less than 40,000*l.* or 50,000*l.* will be expended by Messrs. Macfarlane & Co. on these new works. Messrs. Boucher & Causland are the architects, and Messrs. Copeland & Foulis are the engineers.

Metropolitan Board of Works.—The report of the Metropolitan Board of Works for the year 1867-8 has been published. The Board conclude their report with a complaint of the inadequacy to the growing requirements of the metropolis of the funds placed at their disposal. They express a hope that the attention of the Legislature will shortly be directed to the important question of readjusting the taxation between the owners and occupiers of property in the metropolis, and then ultimately the requisite revenue will be placed at the disposal of the Board, without the necessity for imposing additional burdens on those who are already so heavily taxed. The total amount of the cash balances on March 26, 1867, was 414,671*l.* 12*s.* 3*d.*, and the total receipts during the year 1866-7 amounted to 2,600,684*l.* 18*s.* 2*d.* The expenditure during the year was 2,595,896*l.* 12*s.* 1*d.*, and the cash balances on March 25, 1868, amounted to 419,659*l.* 18*s.* 4*d.*, the balanced total being 3,015,356*l.* 10*s.* 5*d.* Of the 8,563,000*l.* the Board had from time to time borrowed in various ways, 1,659,833*l.* had been paid. The total indebtedness of the Board was, therefore, 6,903,366*l.*

The Angel Hotel, Oxford.—This once famous hotel, as well as the adjoining property, is in course of demolition, preparatory to the whole of the ground, having a considerable frontage to High Street, and extending in the rear to Merton Street, being cleared to make way for the new Schools about to be erected by the University. Some interesting historical events are connected with this hotel. In ancient times the site was occupied by a building as a place for the reception of clerks, though an inn, which bore the title of the Saracen's Head. We are told by no less an authority than Anthony Wood, that 'the first coffee-house in Oxford was opened in 1650 by Jacob, a Jew, at the Angel, in St. Peter-in-the-East, and there it was by some, who delighted in novelty, drank.' Dr. Johnson generally took up his quarters at the Angel in his occasional visits to Oxford, and Boswell tells us that when he accompanied the great lexicographer to Oxford in 1776, 'we put up at the Angel Inn, and passed the evening by ourselves in easy and familiar conversation.' When Queen Adelaide paid a three days' visit to Oxford, in October, 1835, she occupied apartments at the Angel, where she held a levee and drawing-room. In the old coaching days the Angel was in the zenith of its popularity, and was the favoured house of resort of the wealthy and dignified among the aristocracy, as well as the most eminent in literature and science, who from time to time visited the University. But, since the introduction of the railway system, the fortune of the establishment has gradually declined, and a few years ago it was purchased by the University, since which time it has been entirely closed. In a few weeks it will be entirely razed to the ground, and no long time will elapse before the site is occupied by a structure, the architectural features of which will compare in beauty and magnitude with those that already adorn the High Street. Plans for the new Schools have been prepared by Mr. Deane, the architect of the University Museum.

The bronze statue of Lord Palmerston, for which a grant was voted by Parliament, will be placed in New Palace Yard in May next. The figure is seven feet high. Lord Palmerston is represented in the act of addressing the House of Commons.

QUESTIONS.

Letting Contracts.

DEAR SIR,—Lately there has come under my notice a case of a contract being settled, which has caused a great deal of dispute and argument, whether or not it was decided properly; and as there are two parties, who are perfectly convinced that they are both right—the one, of course, won't give in to the other—perhaps some of your readers will be able to give me some information on the subject, the particulars of which are as follows, viz. :—

An acting committee, having received from the architect plans and specifications for a dwelling-house which they purposed erecting, an advertisement was duly inserted in a newspaper, requesting offers, of which they received several. Putting aside the mason work, as it was settled beyond dispute, I now come to the point upon which I desire the information. One of the contracts was rendered as follows:—I hereby make offer to do the joiner, plumber, slater, and plaster work for the lump sum of 363*l.* 10*s.* sterling, viz. :—

Joiner work	£259 10 0
Plumber, Slater, and Plaster work	104 0 0
Amounting in all to	£363 10 0

All the other offerers were separately, and upon taking them jointly the amount stood as follows, viz. :—

	Lowest separate offers.
Joiner work	£258 19 6
Plumber „	35 10 0
Slater „	37 15 0
Plaster „	31 12 0
	£363 16 6

A portion of the committee claimed the joiner work for this contract, being lower than the other by 10*s.* 6*d.*, although there is a difference of 6*s.* 6*d.* in favour of the first-mentioned contract. The plea put forward was—that the joiner had nothing to do with the plumber, slater, or plaster work; but there was nothing in the specification either in favour or against a lump offer.

How ought this to have been settled; and who ought to have got the contract?

Your insertion of the above will oblige

Yours, &c.,

March 22, 1869.

A CONSTANT READER OF YOUR PAPER.

The Strength of Arches.

Could you or some of your readers give me a correct rule for calculating the strength of brick and stone arches of segmental, semicircular, and semi-elliptic form?

These arches are underground, at various depths, and the angle of inclination is known, also the pressure required to crush the material of which the arches are composed.

Your insertion of this in your next number will oblige, Yours &c.,

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

- ARCHITECTURAL ASSOCIATION.—On Friday, April 16, at 7.30, Mr. T. H. Watson on 'Monumental Sculpture.'
- INSTITUTION OF CIVIL ENGINEERS.—On Tuesday, April 13, at 8 P.M.
- ASSOCIATED ARTS INSTITUTE.—On Saturday, April 17, at 8.15 P.M., Exhibition of Sketches.
- SOCIETY OF ARTS.—On Wednesday, April 14, at 8 P.M., Mr. E. M. Underdown on 'Spain.' On Monday, April 12, at 8 P.M., John Anderson, Esq., on 'Applied Mechanics,' Central Lecture. On Wednesday, April 21, Mr. T. Roger Smith on 'The Duties of the Architect.'
- ROYAL INSTITUTION.—On Tuesday, April 13, at 3 P.M., 'Stellar Astronomy,' by Prof. Grant. On Thursday, April 15, at 8 P.M., 'Light,' by Prof. Tyndall. On Friday, April 16, at 8 P.M., 'Cryptogamic Forests of the Coal Period,' by W. Carruthers, Esq. On Saturday, April 17, at 3 P.M., 'Origin of Land Surfaces,' by A. Geikie, Esq.

The Architect.

JOSIAH WEDGWOOD.

IN the entire range of English industrial biography, there is no name we would rather select as a representative or type of the English manufacturer than JOSIAH WEDGWOOD. There are other men who had to contend with greater difficulties, who from a lower state raised themselves to a higher position, and some who may have done the State more service than he did; but taking it all in all, there is prob-

ably no life in which more of the characteristics are to be found of that race of manufacturers which may be said to be the hands of mankind, and with whose labours the world is filled. If another De Foe were to arise, and write a Supplement to the *Complete English Tradesman* under the title of the *Complete English Manufacturer* (the great Daniel would have called it the *Complete Artist*), he could not find a more fitting illustration of the subject than Wedgwood. And this holds true, although we are obliged to admit, in spite of connoisseurs, virtuosi, and a great part of Staffordshire, that there was nothing very heroic in his character, and that the trade he followed was not so important as that of his friend Matthew Bolton the partner of Watt, or of his contemporary Richard Arkwright, or as Robert's or Fairbairn's, or many others in our day. For in Wedgwood we have the example of a man who, after receiving the scanty education of a dame-school, joined a trade which retained much of its primitive rudeness; who taught himself whatever knowledge in any way belonged to it, and was thus able, not only to extend the applicability of his trade, but to do much towards raising it to the rank of a fine art; whose cheapest and most common work had such qualities as to be capable of being distinguished from that of other makers—while some of his work is thought to be so beautiful that now even fragments of it are considered precious; who was in many ways a good citizen, and who managed his business with such prudence that, notwithstanding experiments and studies and long illnesses, he was able to make it profitable.

The key to his character is, we think, found in one of the letters in Miss Meteyard's admirable *Life of Wedgwood*, in which he says that he hopes to make his work as profitable to the purse as it was delightful to the mind. The motive forces which influenced him were an intense love for his trade—or perhaps we ought to say his art—and a desire to be wealthy. Both these forces might be said to be always in operation; but looking at his life as a whole, neither obtained the ascendancy. He could smash a vase if he was not satisfied with the symmetry of its contour, although it was certain to find a purchaser, and would give up manufacturing any article, he said, rather than degrade it; but he could at the same time twist and turn old patterns rather than pay a few shillings to an artist for a fresh design. He was delighted to find his work the talk of the town, as the Russian service was, but was not desirous of orders of a similar kind where the profit he thought was not commensurate with the fame. He was always on the look-out for new applications of pottery, yet neither enthusiasm or desire to extend his trade ever induced him to carry on an unprofitable branch of manufacture, as the late Herbert Minton did with his encaustic tiles. Whatever may be the value of Wedgwood's life, or the lessons to be drawn from it, it must be owned there is little in it to call forth our sympathy, as, luckily for himself perhaps, he was not numbered amongst the brave men who have to struggle with misfortune, and upon whom, as the school-books tell us, even the gods look down with compassion. 'In the reproof of Chance lies the true proof of men,' but somehow everything was so well arranged about the works at Burslem and Etruria, that Chance had few opportunities of approaching the boundaries. Wedgwood was an inventor, but we have in his life none of those incidents which make the history of inventions as absorbing as a romance. He never was obliged, like Palissy, to make experiments by feeding the fire with his furniture, and never felt the awful depression that so often nearly overwhelmed James Watt; nor was he compelled to turn his wife out of doors for interfering with his models, like Arkwright.

From the day when, a young man, Wedgwood opened the Ivy House Works, his road to fortune seemed as straight as a

rule could make it. But if he was successful, it was not by chance, but by hard continuous work and prudence. External circumstances have often much to do with the prosperity or reverses of most men, but in Wedgwood's case everything he gained was plainly the consequence of a certain amount of exertion. It would not be easy to find anyone who answers more fully to the wise man's idea of a 'Workmaster that laboureth night and day.' Pottery seems to have been always in his mind. If he was travelling, he stopped at all the great houses along the road to examine the collections of china; in London his leisure moments were devoted to ransacking old book-shops for engravings to copy from; the most appropriate subject he could suggest for a painting was Belshazzar's Feast, because it would admit of the introduction of a number of vases; in his family picture he has one of his vases beside him—nay, shortly before his death, he had one of the latest made in his works brought to him to examine.

The variety of work manufactured by Wedgwood seems almost incredible when all things are taken into consideration. No private establishment, and we doubt if any state pottery, had at that time a catalogue approaching his in the number of its articles. In the catalogue for 1788 of the ornamental portion of Wedgwood's stock, there are cameos, intaglios, bas-reliefs, tablets; portraits of kings, or of illustrious persons of Asia, Egypt, Greece, Rome, France, and England; Roman-history medals; busts of illustrious Romans, emperors, empresses, kings, popes; busts and statuettes resembling bronze; antique vases, lamps, candelabra; painted Etruscan vases, besides such things as tea-services, flower-pots, &c. We have not enumerated the varieties of the foregoing; there are, for instance, more than a thousand different cameos, and Wedgwood did not exaggerate the beauty of some of them when he described them as being 'too good for common show.' If it is borne in mind that the materials of which these were composed might be said to have been discovered, if not invented, by Wedgwood, and that when he began as a potter the most experienced could hardly have credited the possibility of such things being made in such a style, some idea may be formed of the extent of Wedgwood's services, and why Staffordshire now honours his memory. It is remarkable how all his efforts were directed towards the one object of making pottery beautiful. He was a friend of Brindley, the great engineer, and took interest in everything he did, and his partner Bentley was a promoter of drainage works; but Wedgwood never seemed able to make his art available in their operations. In all that class of work with which Lambeth is associated, and which is so important to architects and engineers, Wedgwood would, we imagine, find little that was attractive. But, on the other hand, he was impelled by a kind of artistic instinct towards refining the materials of which pottery was made and adorning it. When he was merely an apprentice he began his improvement of materials. Knife-handles were then sometimes made in imitation of the more valuable minerals, and young Wedgwood, by a new process, was able to make them like porphyry. Some years afterwards, when he was a partner with Whieldon, he introduced a green glaze that was long famous, and which was applicable, not only to ordinary pottery, but to the fancy pottery of the time. It was, however, when he had established a business for himself that Wedgwood's greatest endeavours were made towards improving pottery. He first tried to improve the cream-coloured ware that was largely made in the district, and he set about it with a zeal that not even Palissy surpassed. Night and day he was in the workshops. He had to make experiments with various clays, to alter the methods of working and to endure many failures, before he succeeded in obtaining the proper ingredients. This was the cream-coloured ware that, after it had been for some time popular, was seen by the Queen, who ordered services of it, when it became known as 'Queen's-ware.' The next material he introduced was a terra cotta of a conglomerate character that was never thought much of; then the black unglazed 'basalts,' one of his best discoveries, which was used largely for vases, busts, and medallions, as it could be made hard enough to emit sparks when struck with a steel, and polished to any extent; then followed different coloured materials more or less resembling it; then a biscuit suited for chemical vessels; and lastly, the beautiful 'jasper,' of which the name can give no idea; his finest material, which, in addition to being as hard as the basalts, was capable of being thoroughly coloured in part, leaving the remainder white, by which it was applicable beyond any other porcelain or earthenware body for the manufacture of cameos or reliefs. He also discovered a jasper dip by which a coating was given to things formed of other materials. Wedgwood never attempted the manufacture of true porcelain. Some specimens

of clay were brought from China and placed in his hands for experiment, which he imagined were of a kind sufficient to make the porcelain without other materials, and desired that a search should be made in England for the clay, but he never appeared much interested in the matter, and allowed it to drop. It would be interesting if we could ascertain the steps taken by Wedgwood in endeavouring to obtain these materials. There is no art or manufacture in which so many improvements have been the result of accidental discovery as pottery. Were any of Wedgwood's obtained in the same way? He was always experimenting, but when he discovered—say the black basalt—was he in search of a material with certain definite properties like it, or merely after a better material than was in use, and in the course of his experiments hit upon the basalt? The 'jasper,' we know, was not so fine at first, but was many years improving. However much such information may be desired, it can never be obtained. The old potters were singularly secretive, adopting extraordinary precautions to conceal their operations, and Wedgwood, differing from them in so many things, was as close as any of them, measuring out materials in secret rooms, and keeping all memoranda referring to his processes in cypher.

It is for his efforts in making pottery an 'art manufacture,' that Wedgwood is probably most likely to be best remembered. Every improvement he made in the material seemed to him to demand a corresponding improvement in the form or embellishment of his work, although the latter was for long not so much under his control as the former. In his early years as a manufacturer it was the custom to send a great portion of the ware from Staffordshire to Liverpool to receive the pattern. This was done by what was then called Saddler's process, which consists in first taking an impression from a copper plate, on prepared paper, and then making use of the paper to print the pattern on the ware. As the printers supplied the designs, it is easy to understand how seldom they would alter them, and consequently how little variety would be found, and that one manufacturer's work resembled another's, at least as far as the patterns were concerned. The potters in general were indifferent to this: as long as some pattern was on their ware they were satisfied, but Wedgwood thought otherwise. He was at the expense of supplying patterns for his own work, but he soon found that the plates engraved from them were used for all indifferently, and he was obliged to keep up a continual supply of new patterns as the only way to secure a distinctive appearance for his ware. He took great pains in selecting patterns, and he used to have some difficulty in making the engravers merely copy them (they were generally engravings of a simple character), instead of attempting to 'improve' them. But when he was fortunate in discovering a material like the 'black basalt,' capable of being formed into vases of any form, he had the good taste to perceive that some other than this method of decoration with its Jemmy and Jessamy figures and absurd landscapes, would be alone appropriate. It is not easy to imagine the impediments that lay before him when, a hundred years back, Wedgwood endeavoured to introduce a better style of industrial art than had been previously adopted. He had command over materials that were at least of equal excellence with those used by the ancient potters, but no mixture of clays or improvement in lathes or ovens could supply the place of decorators. If Wedgwood wanted a history of pottery, with memoirs from authentic sources of Talos the son of Perdix, sister to Dædalus, Coræbus of Athens, Dibutades of Sicyon and other members of his craft, his friend Griffiths, who was for a time Goldsmith's lord and master, would have no difficulty in supplying him with 'eminent hands' for the purpose. But the case was different with designers. Those who had been trained in potteries were hardly suited for work which was to be unlike any that had previously been produced in England; and as the separation between industrial art and so-called fine art was probably broader than it is at present, there was little chance of his finding assistants amongst the young artists of the day, for one of them would hardly feel flattered by an offer of an engagement to become a pottery designer, who had been recommended by Reynolds to always aim at the *gusto grande*. Whatever may be the defects of Wedgwood's work, especially its poverty as regards original design, allowance must be made for the scarcity of designers that existed when he began what he called ornamental manufactures. It denotes no small courage that, under such circumstances, he should have thought of imitating the finest pottery of antiquity. He had a large amount of that talent for organisation which is usually one of the most prominent characteristics of our great manufacturers and contractors, and on this he would have relied, we imagine, to carry him through more difficult work, even if the available assistance had been less useful. He took some designers who had been employed by silversmiths, and some whose sole experience was in the namby-pamby ornament adopted in other potteries. Then he sought for patterns to imitate. Hamilton had published some engravings of his vases, copies of which were lent to Wedgwood; so was De Caylus' book, which became to him a mine of wealth; vases were borrowed, and he purchased every print, cast, or copy of a gem he met with and thought would be of any use. It is somewhat curious, but it indicates method in what he did, that for his best work he should learn towards sculptors rather than painters for assistance; he never seems to have taken much trouble to obtain drawings or sketches by painters (those he obtained from some aristocratic lady amateurs are hardly worth considering), but he was anxious to possess sculptors' work. In this way he was able to

make an extensive collection, but the misfortune resulted that he appeared to think that the realm of art was comprised in his portfolios and cabinets, or at least as much of it as was required for all his purposes. With the help of such patterns, Wedgwood's power of organisation was so great and his taste so fine that he was able to produce pottery that in every way surpassed all that was previously made in England. Some of his works were copies of ancient examples, and in such cases the only question is if they were accurately copied. And there is no doubt that whether it is a bust, a vase, or a gem, Wedgwood preserved, as far as it was possible, all the spirit and grace of the originals. His principal works are his vases, and in general they are not so much exact copies, as made up of 'bits' taken from different sources, varied by the introduction now and then of original design. In this lies the great defect of Wedgwood's work. There is marvellous manipulation, every part is finished with the utmost care, but there is in general a want of that unity and consistency which should characterise every work of art—a result that must follow whenever ornament is taken piecemeal instead of being worked out as a whole. We doubt if one of the vases was ever shadowed forth in any designer's imagination that Wedgwood paid wages to before it was turned into shape; this or that part might have been, but some other designer, ancient or modern, had part in it too. The extent to which this vamping has been carried may be seen even in a small collection. The ornament that is round the foot of one vase may be found round the neck of the adjoining one; in others it is merely reversed, again it will be combined with something else; a flower will be repeated with the addition of two leaves, or with merely a little ornament on a leaf; scrolls that in one place spring from something, will afterwards be found isolated; groups that surround one vase continuously will, on another, be broken up into detached figures, and so on. It is almost painful to see the extent of mechanical copying without any attempt being made at alteration. There is a little oval ornament on some of the vases over which wreaths pass—we should be afraid to mention the number of instances in which we have met with it, varying in size, but never having the slightest deviation in the shape or the number of the leaves that radiate on it. We have a curious illustration in one of his letters of the way in which Wedgwood used to get up ornament for his work. Flaxman modelled three of the Heavenly Muses at half a guinea a muse, not a very extravagant price when the subjects are considered. Some time afterwards he received an order for the remaining six. But one day Wedgwood was looking over his 'bas-relief goddesses,' in order to make new ones out of them, and it struck him that if he was able to create goddesses in this way, there ought to be no difficulty with muses. So he wrote in haste to his partner, announcing his discovery, and directing that the order to Flaxman be countermanded, as by his plan the models could be produced at half Flaxman's prices, by which means thirty shillings would be saved to the firm. Very thrifty, no doubt, and very tradesmanlike, but what value can ornament have that is manufactured in such a way? And the workmanship of all kinds of Wedgwood-ware is of such excellence that no artist that ever lived ought to feel any loss of dignity in co-operating with the potters. The extent of Wedgwood's supervision may be recognised in the care with which even the tiniest cameo for a button is made. Some of the ornament is so delicate, that it resembles more the work of the lace-maker than the potter. No engraving can give a sufficient notion of the delicacy—it may give the form and size, but it cannot alone impress upon anyone the extent to which a workman can make clay subject to him. The French have a saying that the English have two left hands: it must have little point for anyone who has seen some of Wedgwood's tablets and cameos. What a pity it is that, after all, so much of his best work should be nothing more than beautiful patchwork!

Better would it have been for English industrial art if we had the rough force and vitality of the early French and Italian pottery, where strength and nature make amends for art, than the cold correctness of Wedgwood's classical copies; better if we had the unity of design that is found in pottery made by some half-savage Indian than the elegant extracts which constitute the staple ornament of some of the vases that are most prized by connoisseurs. For wherever there is a principle, there is a possibility of growth, of art being extended and developed, of the relations between master and pupil, of traditions being handed down; but are any of these things compatible with the Wedgwood system of ornamentation? No improvement can be traced in his vases, because he could cut and clip as well in one year as in another. Take away the few things really designed by Flaxman and one or two other artists, and no difference can be discovered by which we can tell Hackwood's or Pingo's work from Mrs. Landres', or one designer's from another's. If everything was done by machinery, there could not be a more complete absence of that individuality which is one of the most essential elements of all true art manufacture. And of all branches of pottery, in none has there been so little improvement of late years as in Wedgwood ware, for the simple reason that while a pseudo-classical style of ornament is adopted, no improvement is possible. A copy from a plaster figure made in the eighteenth century may be as correct as one made in the nineteenth, and while we see the results of extended art education more plainly perhaps in some kinds of pottery than in any other kind of manufacture, a vase or a tablet of Wedgwood ware will have the same classical or childish subjects, neither better nor worse represented than they would have been in our

grandfathers' days. As long as antique subjects are held to be the most congenial decoration of the ware, it is never likely to be otherwise. It is seldom, we know, that a sculptor in any country is capable of the mental feat of giving us a statue or a relief that has any classical property except the title, but no ordinary designer receiving only ordinary wages could possibly project himself some dozen times every year into the past, so as to be able to tell heroic stories, or represent grave-gowned processions properly; the only thing he can do is to allow his imagination and invention to lie dormant and copy. There is no finer material in any trade available to the artist, and it is possible to make it the auxiliary to other branches of art manufacture; but as long as it seems herey to introduce figures or ornament that have no precedent in the works of the man who discovered the material, as far as genuine art is concerned, it may be said to be lost. We would say, therefore, in conclusion, to all students in the Art classes of the Institute that bears Wedgwood's name, as well as to those who may employ them, remember that a pottery designer's room ought to be a studio rather than a repository; that Englishmen are capable of creating as well as of importing forms that are beautiful; and that, while they honour Wedgwood's memory, they ought not to forget that his and their art is capable of greater extension than even he imagined.

NOTES FROM ABROAD.

(FROM A CORRESPONDENT.)

Florence, March 20, 1869.

DEAR MR. EDITOR,—As you have expressed a wish to receive such notes on architecture and its concomitant arts as I may make during my rambles on the continent, I proceed to carry out your desire, and do so with the more pleasure, as I know that amongst professional people, as in society generally, the last gossip is always welcome, and the latest impressions of our friends and acquaintances always listened to with pleasure. We at once feel our importance: we are Captain Grotes, who roam with criticising eye from one town to another; we feel disposed to say to the unwitting foreign public 'Beware! a chiel's amang' ye taking notes, and faith, he'll prent them.' I fear they would care little about that; and yet they deserve lecturing as well as any people, even on matters of art, though in their self-sufficiency they hardly think so. Even Paris might listen and learn; but 'twere vain to tell them what we believe to be decidedly true, that although the Emperor found Paris *quasi* brick, and will leave it *quasi* marble, yet the Renaissance of the Empire will never command the admiration of future generations of artists, and not even that of the educated during the present age. It is poor, inert, and pitifully monotonous; one is oppressed with the idea that Baron Haussmann, besides his other numerous and arduous duties, designed all the houses himself. This has always been to us a serious drawback to our profession, viz. that none but an educated architect can properly appreciate the works of the great masters, and that we address ourselves only to the initiated. The great public is utterly incapable of appreciating the delicacies and beauties of a refined style of architecture, such as that of Greece; and indeed for the matter of that, we question if there are a dozen living architects who feel its wonderful superiority in point of refinement to any architectural style ever produced. But to return to our 'moutons' at Paris, where 'moutons' are scarce, but 'loups' and 'reynards' abound. We must not leave the imperial city without one word about its last great ornamental work, the new Opera-house. Most of your readers, perhaps, will have seen it outside, and for those who have not I will just state that it is a large, fine, florid piece of work, toned down to look interesting, and coloured on the façade between the columns in a sickly style; and that, to my mind, it bears about the same relation to pure, healthy architecture as the *Dame aux Camelias* does to Sophia Western. Paris has, indeed, been Haussmannised; that is to say, as those lively people express it, you go to sleep in one street at night and wake up in another in the morning. But let us give the Baron his due; like a well-known autocrat in the south-west of London, he knows how to carry his point, so bears all opponents down; he has survived the last great combined attack of the Opposition, and has wound it up with a *bon mot* on the leader. 'Ce pauvre petit Thiers,' said the Baron, 'what a fuss he makes! yet he spent millions on the fortifications of Paris, which are of no use, whilst I at least build houses that people can live in.' But let us away from Paris with its painted architecture and painted people to the more decorous and dull precincts of Orleans, celebrated for its maid, its plums, and its great cathedral; if any of your readers desire to know more about Haussmann and his works, are they not written at length in the 'Paris Nouveau Illustré,' especially the No. 15, which can be got at any foreign bookseller's, and which contains an interesting *résumé* of all the Baron's doings, which I strongly recommend to your notice, and require you to thank me for not turning into a valuable article on the subject, as I believe is the fashion now-a-days with *littérateurs*? And now for Orleans. Big as the cathedral is, I am almost afraid that Bishop Dupanloup is the most interesting thing in it—when he is there; but it is large and imposing, with much carved work, and it seems like self-conceit to tell people, when they admire it—as you must, when they admire Milan also—that it is bad architecture. If they admire it, it *must* be good,

so your objection is regarded as mere professional pedantry. Yet it is a fact, that to appreciate and know what is good architecture is the result of education, entirely and wholly; there is no heaven-born sense in this matter, though there is greater capacity in some than in others to find it out. But if the cathedral is uninteresting, not so is the town itself, and there are some few late Gothic and Renaissance domestic buildings which are very picturesque and good; amongst which I would especially mention the *soi-disant* houses of Agnes Sorel and Diana of Poitiers—though that either of these notorieties of old had anything to do with them seems more than doubtful. The best building, however, is the old Town Hall, now used as the museum, the contents of which are very interesting; some of the Roman bronze antiquities found in the neighbourhood being, indeed, quite unique in their way.

The Museum at Orleans, full as it is of works of artistic and historic interest, puts us in mind how much has yet to be done both in England and France to render such collections as useful as they ought to be to the public. I would suggest that it is not enough to gather together such objects, and leave them to speak for themselves—the place being often supplied only with the briefest of catalogues, and often with no catalogue at all. These museums require, moreover, an extended scope; they should be industrial as well as artistic and archaeological, be furnished with full descriptive catalogues, sold at the lowest possible price, and should be open to the public every evening. Such museums in England may indeed be said to be absolutely useless to the local working public, for, at the only times they could possibly visit them, they are closed. South Kensington furnishes us with a good model on a grand scale; but I would rather see less centralization and more local institutions of the same class. From Orleans we proceeded to see the fine cathedral and stained glass of Bourges, and that splendid example of a mediæval citizen's dwelling, the house of Jaques Cœur. It is needless to dilate upon the charms and merits of the first-named; the complaint against all twelfth century glass is the same—it entirely darkens the place where it is used; though in itself wonderful for colour and effect. Of Jaques Cœur's house, so thoroughly characteristic of fifteenth century work, I cannot speak too highly as picturesque architecture. It could hardly be done now, yet there it seems quite appropriate that the owner and his wife should be sculptured leaning out of window on each side of the entrance way to welcome all comers. And it should be remembered that Jaques was not a mere merchant, but also Minister of Finance to Charles VII. Every part of the building is good, and the great round tower at the back, with stone newel staircase abutting on it, wonderfully picturesque. The architect has also cleverly introduced the *fleur de lys* in the tracery of the principal window; and the quatrefoils of the balustrade, as well as other parts of the building, contain a heart (cœur) and scallop shell, no doubt part of the owner's armorial bearings.

Our next halting-place was Nevers; where, besides the cathedral, which contains many striking points, especially a very beautifully sculptured south porch, I meet with a noble example of a grand seigneur's palace—that of the Dukes of Nevers, built in the fifteenth century. It is a really noble building, and has been very fairly restored. It is now used as the law courts, and contains also a museum, in which is arranged a very full and interesting series of the Nevers earthenware manufacture, commencing with the earliest imitations of Italian majolica. But I must hasten on past Lyons with its new streets and squares following in the wake of Paris; accompanying the windings of the arrowy Rhone—to my mind, a more picturesque river than the Rhine; past Avignon, with its frowning Acropolis of church, and pope's palace, and finely-macchicolated walls; past Arles a city almost as Roman as Rome itself, to Marseilles, the old Phœnician Massilia, and which yet has nothing, not a trace of Phœnicia left in it, to mark the path of those ancient carriers of the ocean. But we have come some time since to the conviction that the Phœnicians were traders and nothing more. They made neither settlements nor colonies, probably only what we used to term 'factories,' at the ports where they traded. Neither in their own country, nor in Candia, Crete, Sicily, Carthage, or Marseilles, are any important traces to be found of Phœnician life; and as to England, where they undoubtedly traded for tin, probably also bringing with them most of the bronze weapons and ornaments which are dug up so often in early British graves, the only thing, after careful search, which we have been able to find, which tells of their presence, is a solitary small bronze bull, incised with the sun and moon, which I believe is to be found engraved in one of the volumes of the 'Archæologia,' and which probably belonged to some Eastern sailor, who may have worn it as a talisman. Marseilles is now, with its narrow crowded streets in the old town, its port full of the shipping of all nations, its rocky coast and islands, and forts, and noisy, many-coloured population, one of the most picturesque cities in Europe. True it is noisy and dirty, but we always leave it with regret. There is a fine new Exchange, and very fine and very dear hotels; and Notre Dame de la Garde, made spick and span new, on the hill, where all the storm-saved mariners hang up their votive offerings—and curious enough many of them are; and the old cathedral, pulled down to make way for a very pretentious semi-Romanesque new cathedral, which I doubt not is a fine work; but, to my mind, no French architect has yet been inspired with the true spirit of mediæval art: there is something petty about all they do; it is finicking, and wants that boldness and simplicity and sense of strength which is so eminently characteristic of the best works of

the men of old. From hence to Toulon, where there is a new theatre, very orthodox in style, i. e. Roman, but not effective. There is nothing to detain the architect here, after he has seen Pierre Puget's caryatides at the Town Hall, but they are not good, strained and exaggerated; there are better examples by him or of his school at Marseilles. One thing, however, we did particularly remark at Toulon, and that is the principal street or boulevard (is not that our *bulwark*?), which is laid out in three parts—a central avenue of brick squares intersected with stonework and lined with trees about 20 feet apart, and a road on each side of that, with pavement and shops: it makes a delightful walk, and dates from about the time of Louis XV., I should say. The rail now lands us at Monaco, one of the most picturesquely-situated castellated towns we have ever seen; but Nature here reigns supreme, though there is another monarch on the plain beneath, Mr. Le Blanc, who pays the worthy Prince of Monaco 8,000*l.* a year for permission to hold his gambling saturnalia at the Casino, on which, and on the grounds, we are told he has spent some 40,000*l.* This is a blot on the Prince's escutcheon he would do well to wipe speedily away. Monaco of ancient fame, even in the fabulous times of Hercules, is wretchedly degraded by this intrusion of mammon worship in its worst form.

Mentone and San Remo, with their palm trees and cactuses, are passed rapidly by; they have no architecture, and are perhaps the very dearest places on this beautiful coast; so we step into the diligence, and are kept in a constant state of delight at the splendid scenery of the Cornice road till we arrive at the first really Italian town of any note, Albenga. Now who, amongst your architectural readers, ever heard probably of Albenga? and yet, let us assure you, it well deserves a visit. It is a perfect picture on a small scale of a fortified town of the thirteenth or fourteenth century; a mixture of what Genoa and Bologna were in their earlier days. Only imagine! this town of some 5,000 inhabitants was of sufficient importance as a republic to be sought by Carthage in its palmy days as an ally! It must have retained its importance even to Mediæval times, for it was the ally also of Genoa up to the eighteenth century, when it was finally incorporated with that republic. Its streets are narrower even than those of Genoa, and its high brick towers, two of which bear the classic names of Malespina and of Guelph, are more numerous in proportion to its size than those of Bologna, probably like what Florence was before the jealous populace demanded the reduction of its seigniorial towers. Most of the streets can hardly be above 12 feet wide, and the houses are connected by arches which form ties throughout them, rendering them of great strength. The walls still remain with an inner way of similar arched buildings; nothing can be imagined more stern looking, dreary, and unhealthy. What a life must the citizens have led! What tales does it tell of party jealousy, insecurity, and isolated privacy! To appreciate the blessings of modern life you should visit Albenga. The cathedral of unknown age has been sadly modernised, but still in its façade remain some very curious early tokens of its architecture. The Baptistery is beyond conception old, and seems to be some 8 or 7 feet below the present level of the ground, which, according to the usual computation in such matters, would lead us to ascribe it to the fourth or fifth century of our era; it contains some most interesting early remains in mosaic and sculpture. The tower of the cathedral is a remarkably fine piece of brickwork, and is a good example of architecture in the eleventh or twelfth century. Albenga is still the *capo-luogo* of the district, but its glory is fled, and the wild winds resounding through its deserted streets seem to speak of its present decay and of its future fall.

Wonderfully beautiful as the road, skirting the Mediterranean, is, from here to Savona, there is little or nothing to interest the architect. Nor does Savona itself present much for our notice beyond its houses, but the portals of these deserve particular attention. They are of the early Genoese style. The main body of the house is painted with various architectural and allegorical devices, and there is little architecture or sculpture except upon the doors; these are usually of black or dark coloured marble, of very good effect, with pilasters at each side, or the architrave carried round the opening. These are richly carved with arabesques, or, more properly speaking, with grotesques—a curious mixture of antique and modern subjects, ancient arms and armour combined with cannon and trophies of modern weapons. Above the angles of the door are usually to be seen two heads of the Cæsars, and in the centre, where there is no appropriate sculpture, a circle enclosing the cabalistic letters I. H. S. frequently occurs; the staircases are about five or six feet wide, with marble columns and balusters, and the doors are all plated with iron, thickly studded with large headed nails; the knockers being invariably somewhat oval, fixed upon ornamental plates. Religious subjects abound on the architraves, and the entire sculpture is always well, carefully, and yet boldly executed. The principal doors are to be found in the Via Guardia Superiore, and in the Via degli Orefici (Goldsmiths' Street), where a few of the craft still are to be found, but which is now mainly dedicated to the sale of poultry and fruit—'To such base-uses may we come at last.' Like Toulon, Savona boasts of a new theatre, the two most notable features of which are—that amongst ornaments on the façade are a statue of Chiabrera, one of Italy's greatest lyric poets, a native of Savona, and a clock, from which it seems that some importance is attached to time punctuality in the theatrical amusements of the place. From Savona the rail once more takes us comfortably on to Genoa; and as we may now be fairly said to be on Italian ground, where architecture holds a prominent place,

we propose to commence our next series of notes, which we trust will be rather of a more strictly architectural character, from this most ancient busy and noisy city, the metropolis of Liguria.

W.

PICTURES SENT IN TO THE ROYAL ACADEMY.

IN a recent number we laid before our readers a short statement of the principal pictures intended for the forthcoming Exhibition of the Royal Academy, and we now add some further particulars respecting other works which have been sent in. The public will be gratified by learning that the department of Landscape will be well represented. The veteran Creswick heads the list with four contributions. Mr. Vicat Cole, whose works have lately attracted so much attention, will exhibit two pictures generally considered the best he has yet painted. Mr. Peter Graham, whose very clever picture of a 'Spate in the Highlands' first brought him into notice at the Royal Academy, has this year sent two very admirable pictures, decidedly finer than anything he has yet attempted; and Messrs. Leader, Moore, and other popular favourites will be well represented. In addition to the above, one or two leading French landscape painters have sent contributions which will give us an opportunity of comparing the respective aims and achievements of the two schools. Sir Edwin Landseer, we are happy to learn, will after all be represented, and that by a picture which, if we may trust the report of the privileged few who have been permitted to see it, equals, if not transcends, anything which he has yet done. It represents a combat between eagles and swans on the bosom of some inland lake. Several foreign artists have forwarded pictures to the Exhibition this year. Mdlle. Rosa Bonheur sends two; Edouard Frère two; and the same number have been sent by that rising Belgian artist, M. Alma Tadema; one, a party of Roman patricians witnessing a species of war dance of gladiators previous to the combats of the arena; the other, a classical *virtuoso* displaying to his admiring friends some choice specimen of metallic sculpture. So that we may repeat our statement that the forthcoming show will certainly equal in interest, if not surpass, any previous Exhibition that we can remember.

DRAWINGS SENT IN TO THE FORTHCOMING ARCHITECTURAL EXHIBITION.

THE Annual Exhibition of the Architectural Exhibition Society will open to the public at 9, Conduit Street—the Architectural Galleries—the first week in May. We understand that in addition to the usual amount of drawings sent in, will be exhibited an i. l. resting collection of water-colour drawings by the late Rev. J. and Petit, made by him during various tours in England, Scotland, Ireland, France, Italy, Spain, and the Holy Land, &c.—numbering some 300 in all. Amongst other contributors are, Mr. Blomfield, who sends a drawing of his Basilica church at Oxford; Mr. Seddon, who, amongst other drawings and sketches, will exhibit two drawings of the large parish church of St. Nicholas at Yarmouth, now in course of restoration under his superintendence; Messrs. Godwin and Criap, who send their last design for the new Assize Courts at Bristol, and a view of Glenbegh Towers, Killarney.

Mr. Lamb will be represented by a drawing of a Memorial Church in Clarksdown, and Mr. Ewan Christian by a view of a house at Combe End, and a new church at Folkestone, lately erected by him. Messrs. Blackmore and Withers, Johnson, J. W. Fowler, &c., will contribute various competitive designs for churches; and Messrs. Fowler, G. C. Clarke, Walford and Evill, Chamberlain, &c., sketches and drawings of mansions and villas lately erected. Mr. Phipps will exhibit a drawing of the decoration for the new Gaiety Theatre, together with Mr. Marks's cartoons for the lunette and proscenium frieze for the same building; and Mr. Robert W. Edis a small study for new premises in Oxford Street, proposed to be built principally in terra cotta. Mr. Robson sends the Municipal Buildings in Liverpool, and Messrs. Adams, Corson, Kempson, and others will send drawings and photographs of various works lately erected in the provinces; and Mr. Emerson forwards from Bombay drawings of various works in progress, &c. Beyond these there will be a good collection of sketches of ancient work by Messrs. T. H. Watson, R. Phéné Spiers, A. Darbyshire, J. Foster, &c., so that we may fairly hope to see an average collection of drawings, although we are sorry not to hear of more drawings from the senior members of the profession.

LONDON AND PARIS.

[SECOND ARTICLE.]

THE Parks of London are, perhaps, the next features of prominence which call for notice. In these we certainly possess a great advantage over our neighbours, for the Champs Elysées, which in summer soon becomes a dusty desert, is the only great open space running into the centre of the city which at all corresponds with the chain of parks extending from Kensington to Charing Cross. But, on the other hand, the eastern part of Paris is far more open than is the east of London; and there is not that perceptible difference between east and west that there is with us—the east for the poor, and the west for the rich.

The Square du Temple and the little gardens on the Boulevard Richard Lenoir are as well kept as the gardens in the Champs Elysées; and the Parc Monceaux and the Buttes Chaumont are certainly quite unrivalled.

The Place du Châtelet, again, is charming. There is a prevailing taste amongst our French neighbours, making the most of an opportunity, which puts us utterly to shame; and yet London is not deficient in opportunities of a similar nature. The dismal yard on the north side of Westminster Abbey might be planted with trees, as has been done behind Notre Dame, adding immensely to the effect and apparent size of the building. There are several squares and open places which might be turned to account, and laid out for the benefit of the people, instead of being reserved for cats and broken bottles. No doubt the residents at the West End would object to have their squares interfered with, as they are, in fact, private gardens supported by the surrounding inhabitants, and the Parks being so near, the people have no need of other open places; but eastward the case is quite different. If we take Finsbury Circus for a centre, there is not a park or open playground within two miles in any direction, and yet this part of London teems with poor children, to whom the open space and the sight of flowers and a pleasant garden, such as that in Park Lane, would be a wonderful boon; tending also to civilise and refine the poor, and bringing decency and order into their midst, where now there is nothing but squalor and filth.

The inhabitants of such places as Red Lion Square, Charter House Square, Finsbury Square and Circus, could not, we should suppose, object to the care of their very shabby squares being taken off their hands by Government and turned into such pleasant places as we see in Paris. And if a few persons did object, the People should gain the day. Lincoln's Inn Fields is another open space, nearly useless, and yet what a charming little park it might be made! There are, too, the dismal grass plots before the British Museum. Compare these wretched and forlorn-looking places with the cheerful and well-laid out gardens round the Louvre, where happy children play to their hearts' content, without in the least disturbing the visitors to the Museums.

It appears to us that this subject is one which may well be recommended to the new Liberal Government.

In comparing London and Paris, we must not pass over the two chief places of the respective capitals, Trafalgar Square and the Place de la Concorde, although the subject is so worn to death that we almost feel it absurd to mention it.

The Place de la Concorde is certainly very fine, but extremely flat, and wants definition; neither the Tuileries Gardens nor the Champs Elysées form any decided boundary. The Corps Législatif is a low and tame-looking building, and the side towards the Madeleine is the only architecturally commanding view to be obtained, by no means equal to the view from Trafalgar Square down to the Palace of Westminster. And if we stand in the centre and take the view up or down the grand avenue, the Place itself is lost in the Champs Elysées or the gardens of the Tuileries.

The site of Trafalgar Square being on so decided a slope is much superior. A very little would make this dismal desert of asphalt into certainly one of the noblest squares in Europe.

As we have been before speaking of the natural grouping of buildings which still remains to us in London, but has been almost destroyed in Paris, we will merely name a few views, which in our opinion are very fine, and are to be equalled by our neighbours.

There is the view of St. Paul's as we approach it either from Fleet Street or Holborn; the Victoria Tower from Waterloo Place; the Abbey from the front of Marlborough House; and several others nearly as fine.

The transition from groups of buildings and public places to streets and houses is easy, but the two subjects are so intimately connected and intermingled that it is somewhat difficult to keep them at all distinct. And there are in London, as yet, but few new streets to put in comparison with the ever-increasing number in Paris; while there are many collateral circumstances, such as restrictions imposed by the legislature and various exigencies of locality and custom, which must of necessity exercise considerable influence on the laying-out of a street, and the designing of the houses in it, and with all of these it is hardly possible we can be acquainted.

Uniformity is, as the lawyers express it, of the essence of a French street, wherever it may be built—Paris, Rouen, Marseilles, or Algiers, all display the same rows of balconies, renaissance, rococo, or semi-Greek details and identity of general design, without much consideration of climate or other local influences.

If we take any new street in Paris—it really matters very little in what quarter of the town—we shall find it to be a repetition of its neighbours. The houses are almost alike, with the exception, as we have before said, of a little variety in detail, or a balcony more or less.

Unquestionably, as a *coup d'œil*, there is a grandeur in the lofty houses and regular lines which is at first impressive, but the more we look the less we find to look at. There is nothing to induce us to go down the street to admire this or that building; having arrived at the end, we look back, and see precisely the same vista as before, and, on looking to the right or left, we see interminable avenues, all resembling the one we have passed through. If we start from the Hospital of Lariboisière and walk down the Boulevards Magenta and Prince Eugène to the Place du Trône, we shall pass between more than three miles of houses almost identical in general design from end to end—the monotony could hardly be exceeded.

The Rue Lafayette is nearly as bad.

The Rue de Rivoli is certainly far superior, because it is not all new. It owes little enough, as we have before said, to the new buildings at its western extremity. It is impossible that a city such as Venice or Nuremberg could have been formed on such a model.

M. César Daly ('Architecture privée au XIX^e siècle') gives the following reasons for this uniformity:—'Whilst the "hôtel privé" demands a character of individuality, showing that it is a special construction, intended to form a lasting residence for its inhabitants, the "maison à loyer," destined for every one—that is to say, for a multitude of inhabitants, changing from day to day, as the necessities of work, position, or fortune demand, inhabited from basement to attic by tenants of classes socially different, strangers one to another—does not admit of any marked originality of treatment. Neither the exterior, nor the internal arrangements, can

show character, but must correspond as well as possible with the tastes and necessities of the great mass of the population.'

There is, no doubt, a great deal of truth in M. Daly's remarks, but we may place ourselves in much the same position. The new streets, or rather the streets of new houses, in the City of London are built to fulfil nearly the same requirements as are those of Paris. They are composed of buildings, used, almost without exception, as shops on the ground floor, and offices above, let to various tenants. They have each been built by some large firm for its own use, or partly to let; and this must be the case with many of the French houses, which cannot all be constructed merely as speculations. During the wholesale demolitions perpetually going on in Paris, numbers of large firms must have been dislodged, and compelled to build for themselves fresh quarters, and yet the prevailing type of domestic architecture is always maintained. We need scarcely point to the different appearance between a Paris and a City street; the one all monotony, the other all variety. It may be argued that an office and dwelling-house are *not* the same, but (unless we restrict our comparison exclusively to private residences) for all external purposes of design they are. They are all houses. We are subjected to building regulations as are our neighbours, but do not seem to find it necessary to carry a cornice for half a mile or more in an unbroken line; nor to make every building a repetition of its neighbour. In fact, none of our main thoroughfares can be accused of monotony. Victoria Street, at its western extremity, is most open to this accusation, and a sad failure it is. Anything more depressing than the row of huge smoke-grimed barracks cannot be imagined, and unfortunately the new houses on the north side of the street repeat the roofless sky-line of their opposite neighbours.

If we take any of the new streets in the City, the buildings with which it is lined are, as it were, the embodiment of the great banks, insurance offices, or large firms which occupy them, as, for example, Throgmorton Street, Lombard Street, or Cannon Street, or if we go westward we find large shops, clubs, or mansions, still bearing more or less of individual character about them.

Some of the buildings are, no doubt, very remarkable specimens of architecture, to which it would be impossible to point with any degree of satisfaction, but in most cases they fulfil their purpose, and show that they do so. The French have certainly a 'style.' We have not. Strand Music Halls, slices of Greek temples, all styles and no style at all, succeed each other in endless variety, and new and startling developments of the Victorian seem growing in Southwark Street with alarming rapidity: indeed this street would appear to be the trial-ground for the New Style we so often hear about.

In comparing our ordinary streets—those lined with houses in the 'vernacular' style—with those of Paris, the French have unquestionably the advantage over our stucco terraces, although very many of their houses owe quite as much to the fine material of which they are built as they do to the goodness of the design, and much is due to their always honestly showing their roofs. The eye is satisfied with the sky-line of the building, although in most cases nothing more than a very commonplace mansard, with scarcely any design about it; but nevertheless it is a good honest roof, and pleasant to see. We shall probably before very long have a good opportunity of comparing a roofed and roofless building in Parliament Street—the Duke of Buccleuch's on the one hand, with its lofty and prominent chimneys, roofs, and dormers, and the New Home Office, which will be no doubt like the Foreign Office, a great roofless box, with miserable little chimneys fearing to show themselves, possibly because they are not classical; but on that score the tower should certainly be suppressed—it would be hard indeed to say what style that belonged to. We should have hoped that so great and able a champion of the Gothic revival as is the architect of this building would not have adopted the expedient of hiding the roof, even to please Lord Palmerston. Why not have a good cornice and low roof, as in the purest Italian style, in which useless parapets are not found necessary?

We may, however, point with great pleasure to the new buildings on the Marquis of Westminster's estates, very preferable, as we think, to much of the street architecture of Paris. The roofs and chimneys are in many cases very striking, and there is a reasonable diversity between the various blocks of buildings, without any straining after effects of variety, although they must certainly be accused of imitating the effect of large public buildings instead of blocks of houses.

One of the most remarkable features of the newest houses in the chief quarter of Paris is, that they are decidedly worse in design than those built some time ago. Many of the older houses are excellent specimens of street architecture; but the perpetual call for new streets has evidently exhausted the architects, and they have at last come back to the old cut and dried arrangement of an order running through two stories and a little bit of entablature squeezed in between the windows, the cornice serving for the inevitable continuous balcony, which seems a *sine quâ non* in all French houses. There are numbers of new houses treated thus to be found round the New Opera, on the Place St.-Michel, and at various other points.

But, as a set off to all this, what a grand solidity there is in almost all the French buildings, whether public or private, compared to anything we find at home! Stucco is unknown. Stone, brick, and iron construction are the rule. Not only the floors of most of the new houses are of fire-proof construction, but in many cases the steeper portions of the mansard roofs are also formed with iron rafters filled in with concrete. The vast sub-structures of the New Opera House, and the new buildings of the Tuileries and Louvre, are quite unparalleled in any of our public works. One has but to walk through the sculpture galleries of the Louvre, more particularly the new entrance from the Place Napoléon III. and the new staircase, all groined in stone and built with the most magnificent solidity, to feel the extremely flimsy construction of such a building as the South Kensington Museum; not even the British Museum can at all compare with it. Nevertheless it is impossible in many respects to defend the new buildings of the Louvre erected by the present Emperor. Everything has been sacrificed to uniformity, so that the north and south sides of the Place Napoléon III. may exactly correspond. Although it has been always intended that one portion should be used as a picture gallery, and the other for various pur-

poses, still windows have been made only to be stopped up, and a pretence that the building is two or three storeys high all round, when in fact the north side has nearly all its grand windows divided horizontally by floors across the middle, and the south side has no floors at all. A grand *coup d'œil* is not so difficult to attain when such architectural questions as these are entirely ignored. It is not true architecture; indeed, it is very probable that a more magnificent or gigantic sham does not exist in Europe than this great pile. The whole side of the building towards the Rue Rivoli, new and old, is all a sham of the same sort. And again, anything more ridiculous than the Mairie in the Place du Louvre, with a portico to match St.-Germain-l'Auxerrois (a sham St.-Germain), can scarcely be imagined. We have the consolation that our wretched stucco shams will soon fall down, from their poverty of construction, but it will take centuries to overthrow such buildings as we have mentioned.

When, however, we come to look into matters of detail, we find our neighbours far ahead of us. We have before remarked that they take advantage of every opportunity for some little display of taste, planting here and there a few trees, or placing a little fountain and plot of grass at a vacant corner. Even their arrangement of a shop-window shows an innate love of beauty and elegance, which amongst the mass of our population is absolutely wanting.

The thing may be ever so elegant, and the British public actually do not seem aware that it is beautiful at all. A hideous or an elegant lamp-post is a lamp-post, and there it ends, otherwise how could the Signal Lamp-post at the bottom of Parliament Street be tolerated for a moment? A worse thing was never seen, and yet it seems to have passed almost unchallenged. The shape of the lamp and utter vulgarity of the capital which supports it are perfectly monstrous; the shaft can only be compared to a huge screw-jack that has wound its way up from the sewers. The pedestal suggests the Gothic (?) of sixty years ago. Nearly all the other lamps in London—indeed, we may pretty safely say in England—are as bad, and yet the Paris lamps are very ornamental, and also give a far better light than ours.

If we turn to larger things, we find a refinement and delicacy in the architectural mouldings, and a grace and beauty in the carving, which we seek for almost in vain in this country.

Whether in stone, wood, or ironwork, in ordinary houses or in the richer quarters, although there are many things not very pure in style, there is not that lamentable vulgarity which we so perpetually see on this side of the Channel. We may attribute this partly to the fine climate which the French enjoy, permitting delicate detail to be well seen, which with us would be almost obliterated; but this does not excuse vulgarity. The truth is that men run in herds much like sheep; even the man who thinks himself most original is influenced far more than he may be willing to imagine by his predecessors and surroundings, and those who do not aim at originality are of course influenced to a much greater extent. A French artist and workman sees daily refinement of detail about him, and naturally moves in the same groove; an Englishman sees, alas! very different things.

The English iron-founder who sees the lamp in Parliament Street, and the French one who sees those in the Place du Palais Royal, must have very different ideas as to what he should imitate. And to refer to larger things, how different is the detail of the iron columns in almost any French railway station from the miserable things at the Victoria or London Bridge Stations, or indeed almost anywhere else in England?

What must a Yorkshireman's idea of an iron column be when such things are provided for him to look at as those in the Winter Garden at the Leeds Exhibition, where art might have been expected?

Or, to turn to stone-work, what clumsy detail, ill-shaped balusters, and coarse heavy pediments we find in the Junior Carlton Clubhouse, numbers of the City banks, and other buildings, which we shall not see in Paris!

If we turn our attention to the shops, what a difference there is between the internal fittings of those in Paris and those which we consider even our best! The French display a vast amount of fertility of invention in the decorations of the ceilings, show-cases, and walls—indeed, we may truly say that there is more taste visible in an average French shop than in an English drawing-room. It is quite a treat to walk through the Boulevard des Italiens or the Rue de la Paix when the shops are lit up, in order to examine the ingenuity with which such small apartments, as many of them are, are so tastefully arranged and richly and variously decorated.

And these decorations are, of course, not produced by artists of note, but by ordinary house decorators, and any little novelty is thoroughly appreciated by their public.

As a specimen of English ingenuity, we were lately struck by a wonderful effort at shop-decoration, in the 'Gothic taste,' just finished in the Buckingham Palace Road, near the Victoria Station—one of the newest developments, indeed, let us hope, the last in this style. It is to glorify a grocer's shop that this effort has been made. There is a Gothic window all over little nobs and bosses, and within is a sort of bookcase, with flaming pillars and adornments, holding rows of tea-canisters, which are all painted vermilion, with an enormous chevron on each canister in gold or some light colour. The effect at night must be seen to be appreciated. The chandeliers, too, are 'Gothic,' with little twists and brass balls stuck on in every part but the right one. The artist (?) of the Parliament Street lamp-post must surely have been here. We feel very little hesitation in saying that such an exhibition is not to be found in Paris.

The little kiosks, again, for selling newspapers, are many of them very ornamental; and so are the pretty little sheds on the Champs-Élysées for the omnibus passengers, very different to the ugly things on the landing stages for the new Embankment. Compare the elegant preparations made by a Frenchman for a public fête with the clumsy attempt of an Englishman. However, we might go on comparing for ever. Let us hope for improvement.

Proposed New Police Station at Wath.—It is proposed that the sum of 500*l.* be granted out of the police rates for erecting a police station at Wath, for the division of Halikeld (Yorkshire), on a site to be given to the Riding by the Marquis of Ailesbury.

IMPROVED DWELLINGS FOR THE INDUSTRIAL CLASSES.

BY THOMAS CHATFIELD CLARKE.

Read at the Ordinary General Meeting of the Institution of Surveyors, April 5, 1869.

Mr. JOHN CLUTTON, President, in the Chair.

(Concluded from page 193.)

The munificent and repeated gifts of Mr. PRABODY next claim some notice: indeed, such an amount as the total of 350,000*l.* put in trust for this object must impress every one as an unexampled instance of a generous and highminded man seeking in what way his great wealth can be devoted for the permanent good of the community of which he is not even a country-man.

In reviewing the action of the trustees hitherto, it is difficult to go into much detail as to the results, inasmuch as the accounts presented annually to the public are so meagre in character, no revenue account being published, and no analysis being given of the interests obtained on distinct blocks of building. It is much to be wished that the trustees would consider the advisability of furnishing more detailed accounts, as great interest is felt in the matter, and it might serve to remove from the public mind by explanations false results, possibly otherwise arrived at.

As to the scale and substantial character of the buildings, there cannot be a question, that their large and airy secluded playgrounds, laundries, and other conveniences, all must add very much to the comfort and convenience of the dwellers therein; but, judging by the recent letter of the secretary to the trust, it is a source of regret that it has been hitherto impossible to realise a larger rate of interest than 2½ per cent.—'a sum,' as he justly says, 'much too small to induce those actuated even partially by a view to investment, to follow the same example.'

The capital hitherto expended has been about 150,000*l.* with a total population of 1,971 persons, the rents demanded being at the rate of 2*s.* 6*d.* for one room, 4*s.* for two rooms, and 5*s.* for three rooms. The health statistics show a mortality of about 15 to 16 per 1,000.

The average wages of the working-men in these buildings are stated to be about 21*s.* per week, and occupants are as carefully selected as possible to avoid a class who could pay higher rents.

The buildings erected by the Corporation of London in Farringdon Road next claim notice, as a large and spirited undertaking, which sets a good example to like corporations.

These buildings are on the model (with some modifications) of those erected by The 'Improved Industrial Dwellings Company,' with the addition of shops on the ground-floor.

The outlay on this property has been about 54,000*l.*, showing, on the average of three years, a clear nett receipt of rather over 4 per cent., beyond which there is a portion of the site not yet utilised.

The population in these buildings amounts to 872 persons in 168 tenements, and the average number of deaths is at the rate of 22 per 1,000, showing only a difference of 1 per 1,000 over the whole of the metropolis; but, as compared with a small property not far off, this shows a very favourable result; there the death-rate is 31 per thousand.

The Society for Improving the Condition of the Labouring Classes claims to rank with The Metropolitan Association as setting up models for imitation, and as having led this movement. This Society, at the present moment, is not extending its operations, and does not consider itself committed to any continued series of erections. Its properties are various in character, several being occupied by single men and women, and it has also a public washhouse, which occasions the Society considerable expense and loss; it has also adapted existing houses with every needful comfort, which yield, the Report states, a fair average balance.

It is almost to be regretted, I think, that the mode of conducting the operations of this Society does not seem to provide a clear balance to accumulate for the extension of their operations, or a sinking-fund to redeem the leaseholds, as is the case with other societies, and the expenses seem large; but this Society is working with a large amount of borrowed capital, obtained as to a considerable proportion at 5 per cent.; several of the blocks of buildings show in the accounts a considerable surplus of from 4 to 5 per cent., after deducting the charges upon same.

The capital account, not including a freehold property at Hull, shows an expenditure of about 37,000*l.*, an entire population of from 1,600 to 1,700 persons, and a death-rate of 15·5 per thousand.

Miss COURTS, whose name is so universally respected for her long and generous interest in the welfare of the poor in the metropolis, has also aided this movement by the erection, in Columbia Square, Shoreditch, of a large pile of buildings, giving every facility for healthy living, and on a scale superior to others as to external decoration.

The outlay upon this undertaking has been in land and building about 45,000*l.*, the gross rents amount to about 1,840*l.* per annum, and the deductions upon the same to about one-third, yielding, therefore, according to Mr. Darbshire's Report, about 2½ per cent. per annum.

There are 189 tenements, let, I am informed, at very moderate rents, which Miss COURTS will not permit to be raised, and commencing at 2*s.* per week. The number of inhabitants is about 716. These buildings have the advantage of laundries, drying-rooms, baths, and other conveniences, and are much valued in the poor neighbourhood in which they are placed.

Mr. GRUBS has also erected a large pile of buildings, on the scale of those erected for the trustees of the Peabody Fund, in Rochester Row, Westminster, and it is a gratifying fact, that after a large outlay in buying up the leases of old properties, so good a result comparatively should be derived; but here, also, taxation presses heavily on the success of the scheme in a financial point of view, the taxes, rates, gas, superintendence, and repairs amounting to about ⅓ of the gross rental derivable.

These buildings consist of 166 tenements, housing about 650 persons, at rents varying from 2*s.* 3*d.* for a single room to 5*s.* for a 3-roomed tenement.

The total outlay has been about 32,000*l.*, and a nett dividend derived of something over 3 per cent.; the death rate averaging for two years: 9 in 1,000.

Sir SYDNEY WATERLOW, with great boldness, before initiating the company with which his name is connected, experimented in this matter in the erection of a block of buildings called 'Langbourne Buildings,' at a cost of nearly 8,000*l.*, containing 78 tenements, with about 390 inmates, and these (partly on account of the less cost of building when they were erected) yield, after deducting all expenses, and providing for repairs, a nett result of over 9 per cent.; and these figures are obtained after a trial of five years.

The Right Honourable RUSSELL GURNEY, M.P., has also made a most interesting experiment in his own neighbourhood, which has a special value that not only does it locate the poor near to their work, but combines the element of retaining poor families in the neighbourhood adjacent to their richer brethren, in whom they may justly take a special interest.

The outlay was 2,500*l.*, giving accommodation for ten sets of dwellings, and from fifty to sixty persons; the rentals being 7*s.* 6*d.* for three rooms with conveniences attached, and yielding a full 5 per cent. on the outlay.

These buildings are constructed on the same design, and with similar material to those carried out by the Improved Industrial Dwellings Company.

Before closing this Paper there are other associations for this object in the metropolis which it is right to refer to: among others, the Marylebone Association for Improving the Dwellings of the Industrial Classes, and the Highgate Dwellings Improvement Company. With respect to the former, I am hardly able to present many particulars, but with a capital of about 27,000*l.*, spread over six properties, doubtless a considerable work is being effected. The dividend on the ordinary shares last declared was at the rate of 4 per cent., and 4½ per cent. on the preferential stock of the company.

With respect to the Highgate Dwellings Improvement Company, built also on similar plans to the Improved Industrial Dwellings Company, it provides on a total capital of about 6,000*l.*, though the expenditure of the same is not fully defined, for ninety-six rooms, and the company have been enabled to pay a dividend of 5 per cent. on rentals varying from 2*s.* to 2*s.* 3*d.* per room per week, and for two and three rooms in a somewhat less proportion.

In giving this sketch, I ought not to omit some other kindred societies and persons who have worked out schemes of the kind, and amongst others the Strand Buildings Company, the Central London Dwellings Improvement Company, the London Labourers' Dwelling Society, the Rev. Mr. Burgess, Mr. G. Barker, Mr. J. H. Harlowe, the Rev. Thos. Ainsworth, Mr. John Newson, and Mr. Hilliard may be mentioned; nor ought the labours of the late Prince Consort in this direction to be omitted, as tending probably more than any other person, by his high position and his pure and disinterested motives, to have infused energy and excited inquiry in many minds that might otherwise have been directed into other channels. Of the results of some of the above operations, it may be briefly noted that the Strand Buildings Company, on an expenditure of 5,000*l.*, pays 4½ per cent.; the Central London Dwellings Improvement Company pays 3 per cent. on a capital expended of about 10,000*l.* The London Labourers' Dwelling Society pays 5 per cent. on about 30,000*l.*, spent chiefly in renovating old buildings; and that of the Private Owners, Mr. Hilliard receives from 6 to 7 per cent. on an outlay of about 14,000*l.*, and Mr. Newson is reported to have received a nett 6½ per cent. on an outlay of 13,000*l.*, or thereabouts.

I am aware in this Paper I omit altogether any notice of cottage dwellings, both suburban and agricultural; but I should like to mention the Metropolitan Association have an interesting experiment in suburban dwellings at Penge. I trust some other Member of the Institution may be found willing and more able than myself to deal with this question. It is by no means second in interest and importance to the subject considered in this Paper; it also abounds with similar problems as to the difficulty of providing adequate accommodation for the humblest classes, at fairly remunerative rates.

With respect to the general results obtained from this Paper, I trust they may be looked at as on the whole encouraging. With a total sum expended in the metropolis of about 650,000*l.*,* housing approximately from 15,000 to 16,000 persons at moderate rents, giving an average return of 4½ per cent. on fifteen ascertained returns, with a death rate, in a great proportion of reported cases, much below the average rate of mortality in the metropolis, and considerably below the rate in the poorer districts taken singly, and with a rate of interest derivable not varying much from that receivable for freehold property elsewhere, I trust we may look to the future with hope.

In our varied relations as professional men, we may do much to help this work; and though of course we do and must acknowledge that no material and social progress can supply the place of higher influences, we can and do, I hope, recognise that the one should go hand in hand with the other, and I trust, as a body, we may ever be found taking a deep interest in such questions.

A discussion ensued, in which Sir Sidney H. Waterlow, Messrs. H. A. Hunt, F. Vigers, C. Gatliffe, H. A. Darbishire, J. B. Denton, and others took part.

The meeting then adjourned till Monday, April 19, when a paper will be read by Mr. W. Menzies, on the 'Sanitary Treatment of the Refuse of Towns, and the Utilization of Sewage.'

[NOTE.—The author of this Paper desires to express his warm thanks to those who have furnished him with statistical information.]

* Not taking into account the 200,000*l.* further given by Mr. Peabody, not yet expended.

The Operative Stonemasons in the employment of the principal masters in Manchester struck work on the 10th inst. They refuse to be paid by the hour, and they claim a reduction of time from 54½ to 48½ hours per week.

SETTING OUR SOLDIERS TO WORK.

AS will be seen from our Parliamentary Report, the question of the employment of our soldiery on civil and military works has been mooted in the House, and the War Secretary has gone so far as to express a hope that this subject may receive the favourable consideration of the Commander-in-Chief. We trust we shall not be accused of being unpatriotic or protectionist, or averse to progress, when we avow that we do not share in Mr. Cardwell's wish.

The soldier is entirely free from all the risks and uncertainties of the life of the civilian. Everything is provided for him at the country's expense. He is paid by those who desire to live in peace and safety to fight for them, and to hold himself in constant readiness to do this whenever called upon. For the sake of being able to command his entire services the other members of the community tax themselves heavily. They provide him with necessaries while on active service, and they provide for him—what too many of them are unable to secure for themselves—a provision for old age when active service is over. This being the position of the soldier in this country, it is easy to see that an injustice of a serious kind would be committed were his services as an artizan brought into competition with those of tax-payers who have no daily pay, no quarters, no clothing, and no pension, beyond what they can provide for themselves by the sweat of their brow.

There is, no doubt, another aspect of the question. If the expense of a standing army can be in any way *lightened*, as it might be, by the judicious development of the militia system, so that men in England may be, as they are in Prussia, at once soldiers and engaged in civil life—liable to perform some military duty, and paid in respect of that duty only—well and good. Such soldiers need not cease to be operatives in their own trades; but it is not now a question of any such arrangement as this. The proposal now mooted would not diminish our taxation or lighten our financial burdens, but it would introduce the labour of men who could afford to work for a shilling a day, in competition with the work of men who cannot afford to work for less than five or six—the very men who pay taxes in order that their competitors may be free to do something else. Professional men have sometimes had occasion to feel keenly when Government has placed secular works in the hands of Engineer officers drawing pay, in lieu of Civil Architects living by their work; and now it is proposed to carry the same system further.

There is another objection to the proposal on a ground which the most enthusiastic reformer cannot fail to appreciate. It would lead to no economy in the works in hand. The labour of soldiers working under military regulations, however well organised and however cheaply paid, though it might drive out of the field that of artizans under a foreman, would be a very inefficient substitute, and progress would be slower, consumption of material more wasteful, and superintendence more costly to such an extent as precludes the idea that solid advantage could be reaped by the public.

The true mode of utilising the labour of our soldiery lies, in all probability—and will lie for long to come—in the employment of their spare time in constructing earthworks for the protection of our vulnerable places, and in training them to use the spade in entrenching themselves when in active service. There can be little doubt that pits and mounds will, for the future, replace all masonry fortifications, and that the army which can use the spade most adroitly stands an excellent chance of having the best of it in any future campaign.

REVIEWS.

GREEK ART BEFORE PERICLES.*

M. BEULÉ, with admirable reticence, has condensed into one modest octavo materials and arguments which a less conscientious writer would have distended over interminable volumes. M. Beulé is an enthusiast, but he is also an earnest and patient student; he writes fluently, but thinks deeply; and if he indulge in an occasional crotchet, who can blame him? He has claim to a hearing, by virtue of services rendered to art and archaeology, and by right of official position; he possesses, moreover, the merit of meeting difference of opinion with courteous liberality. To give a thorough criticism of the work now before us, would require more space than lies at our command: we may only endeavour to indicate, as succinctly as possible with justice, what are the contents of the book, in the hope that our readers will seek further for themselves.

M. Beulé begins, as in duty bound, at the beginning, and refers us to the Oriental parentage of Greek art, to elements and applications in the architecture of Egypt and of Asia which, later, were resolved into the Doric and Ionic orders. The living power of Greek genius clothed the dry bones of Eastern art with beauty, and infused into dead forms the spirit of life, and thus emerged into light and developed into perfection that wondrous creation which we call 'Greek Art.' To the Greek belongs the glory of having invented European art. The epoch from which our author dates the distinct spring of Greek art, properly so called, is the sixth century before Christ, during the period of Pisistratus, and prior to the era of Pericles. Greece had then calmed down into comparative tranquillity; borders became defined, and everywhere a young society felt its way upward to freer, nobler life. The Tyrants occupied their conquered subjects, and signalised their rule, by the erection of grand monuments; rival peoples strove for mastery in the arts of peace.

First of birth among the arts is architecture; with the first order in Greek architecture M. Beulé commences his treatise. He finds the Doric temples, in mass and in detail, own their parentage to imitation of constructions in wood. Wherever were trees, he argues, there men first built of wood; wherever the Hellenes migrated or dwelt they found forests, therefore of wood they first constructed their habitations and temples. The Etruscans—a branch of the Greek race—built the entablature and

* L'Histoire de l'Art grec avant Pericles. Par M. Beulé, Secrétaire perpétuel de l'Académie des Beaux-Arts. Didier et Cie., Paris.

summit of their temples of wood, even in the time of Augustus. Pausanias bears witness to the existence of a wooden column near the temple of Jupiter on Olympus; Greek colonists at Metapontum showed a temple of Juno with columns of twisted vine stems. Again, Pausanias speaks of a wooden temple dedicated to Neptune at Mantinea. Moreover, fires were of frequent occurrence in early Greek temples, indicating their construction of combustible material. M. Beulé brings in the Lycian tombs to aid his argument, combating, by the way, Sir Charles Fellows' theory of their Ionic origin, and finally sums up satisfactorily:—'It is not Art itself which has presided over the construction of these tombs so much as a principle—the principle of Doric art, that is, imitation of wood.'

Well put is the definition of the principle of beauty in Greek architecture; 'Its essence, its inherent genius, is proportion.' Thus, 'the temple is a being which lives, capable of development or diminution.' Again, 'the temple then was a being subject to the laws which govern human nature; on finding one only of its parts, we may divine what were the dimensions, the style, the proportions, of its other parts.' We may add that the author proves himself a very Owen among archaeologists, with rival power of inductive reconstruction! 'The ancients exalted form before all things, we elevate thought, and thus,' says M. Beulé, 'is the spirit of modern and of ancient art opposed. We seek ever something new, they turned their eyes backward, and held faithfully to great traditions, seeking to develop, not change. Thanks to this fidelity to tradition, we can trace the progress of Greek art in the monuments left to us; and especially of the Doric order, the constitutive type of all orders, can it be said, that it relates its own history with a sequence which will astonish no one.' On inference from the scale of proportion, then, M. Beulé conducts his investigations, assigns dates, and christens styles, aided by the corroborating witness of form, more especially form of the capital, 'the most characteristic and noteworthy amongst the forms of Doric temples.' In sequence to certain interesting observations on the absence of local influence on Greek art, time rather than place is assigned as our guide throughout the monuments which in detail our author describes.

We have not space to follow M. Beulé in his separate dissertations on the Doric temples of Corinth, Delphi, and Syracuse; the ruins at Selinus; the temple of Jupiter at Agrigentum; the temples of Paestum, Metapontum, Crotona, Assus, Samos, Siphos, Træzen, Sparta; the monuments of Pisistratides, and the temple of Ægina. The author's general plan we may indicate in few words. First, he gives an historical sketch, drawn from tradition and written testimony, supplemented, in a manner more or less satisfactory, by his own lively imagination; secondly, he is at pains to discover to what divinity the temple under review was dedicated, and is unhappy until this point is settled to his liking. Then he proceeds to business, furnishes dimensions, proportions, details of construction, with patient, discriminating exactness, and in a clear and manly style unfolds his inferences. Finally, with a transition always happily turned, often eloquent, he bids adieu to the present, and turns to the next subject. '*Le roi est mort. Vive le roi!*' Additional zest is given to M. Beulé's descriptions and evidence by the fact that he speaks from personal inspection of the ruins, with the exception only of the temples of Paestum and Metapontum, which are described on authority of the Duc de Luyne.

A short chapter is devoted to the Ionic order, which M. Beulé unhesitatingly places as successive to the Doric, not contemporary. Perhaps his decision may be helped by the fact that he enters lovingly into the theory which finds in the Doric and Ionic orders symbols of the two sexes: he may remember that woman came second in creation! 'In our time of eclecticism, runs the argument, we enjoy all styles because we are indifferent to all; but with a people primitive, creative, earnest, these styles succeed each other. As society grew more cultivated, luxurious, feminine in delicacy of sentiment, architecture followed the general impulse, and 'the Ionic order arose to satisfy the new needs of society.' So scanty are Ionic monuments prior to the fifth century, that our author cannot find matter for more than twenty pages, at close of which he turns to a subject on which he has put forth all his strength, viz. the Polychrome of the Greeks.

It must be confessed that M. Beulé has handled this vexed topic with a master hand; rich in material and vigorous in style, the chapter devoted to Polychrome is perhaps the best portion of the whole book. The writer states frankly the views of the partisans of absolute polychrome, partial polychrome, and no colour at all. He himself inclines to believe that the three systems, whether as applied to architecture or sculpture, were successive. The polychrome of the archaic period he finds in harmony with the spirit of the architecture—austere, melancholy, solemn—and he holds the style adopted to have been, in the general, the emphasis by colour of the lines of construction. Though an enthusiast for polychrome, M. Beulé sifts evidence soberly; he deprecates the violence done to truth by those fanatic partisans who, gathering material for argument regardless of the laws of time and place, heap all together into the balance, and point triumphantly as the counter-weight kicks the beam. It is not until the end of his chapter that he allows his feelings vent. Then, after a brilliant picture of the Greek temple, glorious in all the splendour of colour and material, he bids degenerate moderns cease to scoff at their masters, and learn rather to imitate methods miscalled barbaric. 'If,' he cries, 'one day we recover the taste for painted buildings, we shall not deserve the name of barbarians; rather shall we have regained an inheritance we had renounced, a beauty which we had lost.'

Another fruitful subject for learned discussion and disagreement has been the mode of lighting their temples followed by the Greeks. M. Beulé adopts somewhat of a compromise. It is true he puts aside that hypothesis of Mr. Fergusson, which presupposes a number of small windows in the roof, because it involves 'complications unsuited to Greek genius;' but he admits the occasional existence of the hypæthron, also of the roof wholly closed. His favour is reserved, however, for the theory of an opening or interruption in the roof, through which might fall 'the beautiful perpendicular light that we seek for our grand buildings and museums,' and which might be covered, as occasion required, by drapery, or even by glass, set in movable framework. For M. Beulé's ingenious application of historical evidence to this theory, we must refer our readers to the book itself.

We have not space to enter fully into the second portion of the volume, which is devoted to Sculpture. It is careful, yet seems to imply less thorough knowledge than marks the first division. The gradual rise of sculpture into a distinct art, the circumstances which fostered its development, its mythical origin with Dædalus, aptly named the St. Luke of ancient art—of all this and much more M. Beulé writes pleasantly. He traces with care the history of the primitive masters of Samos and Chios, of the Cretan masters of Sicyon, and gives sketches—rapid, yet detailed—of the Doric schools of Corinth, Sicyon, Argos, and Sparta, allotting a separate chapter to the works of Canachus of Sicyon, and to Ageladas of Argos, whose glory it was to have formed the stars of the age of Pericles—Myron, Polycletes, and Phidias. The ancient school of Attica M. Beulé finds representative of the ideal as opposed to the realistic in treatment, and characterised by a certain Oriental immobility. The school of Ægina, on the contrary, may be considered realistic as opposed to idealistic, and, *par excellence*, the school of anatomy in Greek sculpture. Very enthusiastic does our author become over the Ægean marbles now at Munich; in these he finds a simple grandeur, an heroic truth, a grace that comes of strength, a type 'truly sculptural'—in fine, qualities 'solid, precise, geometric,' beside which even 'the ideal beauty of the works of Phidias seems to grow uncertain and enervated.' That the Ægean school was essentially Doric, M. Beulé maintains, and considers that the distinctive title of 'Ægean style' arose simply from the fact that Ægina, as rival city to Ionic Athens, was chosen by the Dorians to be their representative.

With this argument M. Beulé somewhat abruptly closes his treatise. Though the work is not exhaustive, and though it seems, here and there, to ignore the result of recent labours in the same field, it is undoubtedly full of valuable information and brilliant suggestion. At a future time, perhaps, the author may supplement any omissions, and, we hope, may devote some space to the light which is thrown by discoveries in fictile art, in coins and gems, upon the history of Greek art, even 'before Pericles.' ILLUSTRATIONS.

THE WEDGWOOD MEMORIAL INSTITUTE.

THIS building is announced to be opened on the 21st inst. by the Earl de Grey and Ripon, the Lord President of the Council. The foundation-stone was laid by the present Premier, and there could have been no greater honour bestowed on the memory of Josiah Wedgwood, than was paid by Mr. Gladstone, when he read, on that occasion, an elaborate *written* address on the character and career of the great potter, which was subsequently published.*

The building is erected in Wedgwood's native town, and is intended to serve the purposes of a Free Library and Reading Room on the ground floor, while the upper floors are designed for a School of Art and Science. It is so disposed, as to plan, that it can be extended hereafter, if local necessities require it, for the educational uses of the town and neighbourhood. For the present the accommodation is presumed to be sufficiently ample.

The first floor, for the purposes of a school of art, comprises a museum or exhibition room, elementary class rooms, ladies' class room, and painting room. A modelling room and a master's room are also provided; a chemical class room is placed on a second floor. All these apartments are top-lighted; the roof is carried on cast iron girders, semicircular on the soffit, and the building generally is fire-proof in its construction. The ground floors are carried on brick arches, and the first and second floors are formed in Dennett's patent concrete, carried, in the larger spaces, on rolled iron girders.

The architectural treatment of the building will no doubt carry some interest with most readers from the fact that it is composed almost entirely of the clay material, from its simplest masses of brick-work up to the more elaborate detail which composes the external design.

The idea of erecting a building of a purely ceramic character, as the memorial of Wedgwood—'the father of the English potteries'—was first initiated by Mr. Beresford-Hope, M.P. I have striven to realise that conception as worthily and completely as the present resources of architectural pottery will admit of. But it must be said here that any attempt in that direction would have been of a very partial and limited character, if the authorities at South Kensington had not come forward to subsidise the scheme of ceramic treatment by employing and paying the modelling work which was necessary to embody the design in the clay material. Under this arrangement two 'national scholars'—Mr. Rowland Morris and Mr. Robert Wright—were selected from the Potteries Schools of Art, and the whole of the terra-cotta details requiring modelled treatment have passed through their hands, the different varieties of ornamental detail having been executed by them from the architect's designs. The more sculptural and figure subjects were entrusted to Mr. Morris. There is unusual variety observable in the designs of the ornament; the bands which are introduced midway in the piers of the ground floor windows are very varied, and bear the monograms of the different names of persons who have been concerned in the erection of the building. The impost course and the archivolt of these windows are also designed on various *motifs*, though it is only possible to produce, by way of illustration, on the sheet of details given herewith, one or two of the varieties which the building exhibits as it stands.

SPECIMENS OF WEDGWOOD WORK

REPRODUCED BY PERMISSION OF MISS METEYARD AND MESSRS. HURST AND BLACKETT.

Between the ground and first floor a deep band or frieze runs the entire length of the building, composed of panels corresponding to the bays given by the windows; these represent the different processes of the modern manufacture of pottery, from its first stages in the raw material to those of its finished productions. It is to be noted in regard to this frieze that, in common with all the sculptural portions of the design, the work, as placed in the building, is that of the modeller himself, and is, in this respect, an original terra-cotta work, similar to the treatment we are familiar with in the sixteenth century Italian art in the same material. It deserves also to be noted that the whole of the terra-cotta work, whether it appears as sculpture or foliated ornament, is purely and essentially constructive as part of the building. None of it is veneering, but the work it performs is as necessary to the stability of the structure as that of the bricks which compose the walls.

A reference to the elevation of the building will discover a difficulty in the way of the architect which most professional readers will readily appreciate. The whole of the exterior, above the ground-floor windows, is a blank, dead wall, the first-floor being lighted from the roof. Whether this difficulty has been successfully grappled with or not is, of course, a matter of fair criticism. The first floor is treated as an arcade, formed by coupled columns in dark buff terra-cotta, and the successive bays are occupied by sculptured representations of the months of the year, modelled in red terra-cotta clay and framed in the same material, with an architectural design which recalls the treatment, in similar conditions, of the North Italian sculptors. Over these panels, and occupying the tympani of the arcade, are inserted representations of the Signs of the Zodiac, corresponding to the month panels; these are executed in Venetian mosaic on a gold ground, by Salviati.

The greater portion of the terra-cotta detail of the building has been most faithfully produced by Messrs. Blanchard & Co., while the sculptural frieze of 'process panels' has been manufactured by Mr. Blashfield, of Stamford, to whose credit it may be stated that these pieces, weighing many hundredweights each, have been fired and fixed in their places without flaw or accident.

The general contractor for the works was Mr. Alfred Barlow, of Stoke-upon-Trent. Mr. Mathews, of Manchester, acted as Clerk of the Works, during the erection of the building.

ROBERT EDGAR.

EXAMPLES OF WEDGWOOD WARE

WE are indebted to the courtesy of Miss Metgard and Messrs. Hurst & Blackett for the opportunity of reproducing illustrations of a few characteristic specimens of Wedgwood's work.

The sheet of illustrations of Wedgwood's work includes the following:—

- 1.—Gold Bronze Pitcher-shaped Vase. Bohn Collection.
- 2.—Bust of Wedgwood, by Fontana. Presented to the Wedgwood Memorial Institute by Joseph Meyer, F.S.A., Liverpool.
- 3 & 7.—Cup and Saucer, in Blue and White Jasper. From Bohn Collection. Blue ground and white ornaments.
- 4.—Barberini, or Portland Vase.
- 5.—Vase. Blue and White Jasper. Meyer Collection. Showing Apollo and the Nine Muses, wreaths, and musical instruments.
- 6.—Group. From the Portland Vase.

THE EVANGELICAL BEASTS.

To the Editor of THE ARCHITECT.

SIR,—In his very interesting article upon this subject in your last number, Mr. Burges points out what were the symbolical beasts mentioned in the Old and New Testament, how certain animals mentioned in the Prophecies are supposed to represent certain kingdoms, and how, from the second century at least, the Christian Church has represented the Evangelists by the angel, eagle, lion, and ox, without, however, explaining *why* the Evangelists were so represented. A bit of monkish Latin, copied many years ago into the title-page of my Greek Testament, answers this question, and with your permission I here transcribe it:—

Hoc MATTHÆUS agens hominum generaliter implet;
MARCUS ut alta fremit vox per deserta leonis;
Jura sacerdotis LUCAS tenet ore jurenci;
More volans aquilæ celeris petit astra JOANNES.

If these lines are old, they were probably not known to the author of those quoted by Mr. Burges from Didron (*Quatuor hæc Dominum, &c.*). The latter seem to have been written by a monk who, finding upon the cover or title-page of a New Testament pictures of the Evangelical beasts, tried to account for them, in rather a lame way, as symbolising the acts of our Lord. In so doing he (very naturally) mistook a mediæval angel for a *homo*, and an ox for a *vitulus*.

ALFRED STRONG.

VOLUNTARY ARCHITECTURAL EXAMINATIONS.

SIR,—An extract, that I have lately seen, taken from the Report of the sub-committee formed for the management of these intended examinations

and presented to the Royal Institute of British Architects on the subject, has re-opened an old wound that time and silence had nearly healed.

Will you kindly relieve me of part of my griefs by allowing me to whisper them into your sympathetic ear? To state my case in the shortest form, I am one of those deluded victims who passed the Voluntary Examinations during the first stage of the movement. You may, perhaps, from this, guess the burden of my complaint.

About the year 1861 the walls of the Institute rang with the eloquent and enthusiastic speeches of its leading members on the benefits that would accrue to the profession, and especially to the individuals who should prove successful in passing through the ordeal, by the young architects flocking to these examinations. Visions of the practice of architecture being placed under the protective restrictions that surround the Church, Medicine, and the Law, to prevent quacks from entering those professions, were presented to us in vivid colours. The funeral oration of that amphibious creature the architect-builder or ambitious joiner, the vampires of our profession, was delivered with feeling; and those who should dare to trespass on the hallowed domains of architecture, without the licence of the Institute in their pockets, were threatened with punishments little short of penal servitude for life. In fine the Architectural Cummings prophesied a professional millennium.

Our mentors echoed those sentiments, and urged us on to valiant deeds.

No wonder that some of the most enthusiastic amongst us succumbed to these bright allurements. Fired with a holy zeal for the welfare of the profession, many of us burned the midnight gas with a vengeance, and coached up subjects, some of which I had scarcely more than heard of before. The printed 'Regulations, &c.' reached me, and have been of little or no service to me since.

At the first examinations that were held, the attendance was very fair; and many came, as the list of the successful shows, from Bristol, Belfast, Manchester, and other distant places, to break a lance in honour of architecture; of the whole number about a third only returned as victors.

Three days were spent in the rooms of the Institute, working hard against time, and then succeeded an awful fortnight of suspense (it seemed to be double that length of time), when sleep was scarcely possible on account of mental anxiety as to the result of the examination, which I then ignorantly thought would influence for good or evil my whole future career.

After waiting some time for the expected reward of my labours, and not receiving any, I, for one, wrote to ask what tangible acknowledgment of my success the Institute proposed to give me, and received in reply a letter stating that, after mature consideration, the Institute had decided not to give any regular certificate, as an improper use might be made of such documents; but that the fact of having passed, and being on the books of the Institute, was thought to be a sufficient return for our labours. What a set of scamps they must take us to be! It has been found safe to entrust all the other learned professions with degrees and diplomas, but we are to be numbered amongst the dangerous classes.

It is only petty jealousy of the 'young blood' and red tapeism, which is as rampant amongst the old fogies of the Institute as in the War Office itself, that could have submitted us to such an insult. With the exception, therefore, of being graciously allowed to pay the examination fees and heavy travelling expenses, I have as yet received no return for the hard work and hard cash expended on the venture, unless, indeed, I include the mental anxiety before described and the satirical inquiries of friends as to what good has come from my exertions.

The result of this short-sighted policy on the part of the Institute was soon apparent, as the number of candidates for these barren honours soon dwindled, and, according to the Report above referred to, has this year expired. In this emergency the Committee begin to look the matter fairly in the face, and propose holding out such inducements as would, if adopted at the beginning, have saved the Institute the ignominy of failure, and this important movement the consequent damaging effects.

From the experience that I have had in the matter, and from frequent conversations with professionals and others on the subject, I have reason to think that it would not be too much to ask of the Institute that they should not only give each candidate, when he passes either class of the examinations, a certificate, engrossed perhaps on vellum, to that effect; but that they should also constitute him, *ipso facto*, an associate of their body, at reduced entrance fee and yearly subscription; and, in case he should think fit to present himself as a candidate for the district surveyorship appointments, credit him with proficiency in those subjects that were included in the architectural curriculum.

I venture to say that had the above course been pursued from the first, the present committee, instead of complaining of the total absence of applications, would have to state that the accommodation at their command was insufficient for the crowd of candidates. Government and the public would by this time be prepared to place architecture on the same footing as the other professions that I have named, and in the position that it at present holds in many places on the Continent.

The discussions held by the 'Association' showed distinctly the prevailing opinion of the juniors on the subject, and these with the letters received from the successful candidates at the request of the examiners will prevent the Institute from pleading ignorance of what was really required from them.

It is not to be expected that young men who have long office hours to keep will voluntarily impose upon themselves the additional labour of preparing for such a trial, especially when they run the risk and disgrace of failure, when they will receive no prize or acknowledgment, even if they be so fortunate as to pass.

It may not yet be too late to retrieve the errors of the past, and the timely concession just announced on the part of the Institute may do much, even now, to recall the interest in the subject that it had at one time aroused. As my Father Confessor I thank you for your patient hearing, and will not impose on you the seal of confession, as I am anxious to hear what other unfortunates have to say on this great question.

Yours obediently,

A VICTIM.

CHURCH RESTORATION.

SIR,—I venture to appeal to you and to your readers for advice in the following case; and may I add that I shall be rejoiced if my letter calls forth any material assistance also?—but that by the way.

Braunton, North Devon, is an agricultural village, of large population, and of great antiquity. To the church I would direct attention. Restoration has not yet reached it, as this seems to stop short at the estimates. The funds required are beyond the powers of the district.

The church consists of nave, with north transept, and tower, with spire opposite, and three projecting porches. The chancel and chantry beside it are similar in most respects, and form a twin projection eastward.

The internal width of the nave is 34 feet, and the roof, which was once open to the ridge, is now coved, in large plaster compartments divided by drab-coloured oak beams, at the intersection of which are some very fine bosses.

The seats are of carved oak, of great solidity, antiquity, and boldness of workmanship. They are divided into four compartments by the passages in the nave, which run west and east, and north and south also. There should be a passage by each of the walls, but west of the north and south doors; this has been blocked by very ugly and trumpery deal pews, also painted the favourite drab. A similar enormity has been perpetrated in the passage east of the south-eastern group of seats.

In these instances some carving has been cut away, to admit these modern fixtures, or for the comfort of the seat-holders.

I have mentioned these matters to show that restoration is needed, and that Braunton Church is a deserving object for the attention of all who can feel grateful that any such fine old woodwork still exists *in situ*. Although the Restoration fund is languishing, money is to be spent, I hear, upon a condemned gallery at the east end of the nave, which tops the beautiful chancel screen, but is in no way to be confounded with a rood lof, for it runs the whole width of the church, blocking up most of the chancel arch. The seats in it are raised behind each other, with their backs towards the altar.

The fall of plaster and whitewash and the noise of footsteps are far from edifying to those who sit underneath; and the rest of the congregation, whom the occupants of this gallery, mostly impudent boys, face and overlook, have other complaints against it.

It is to be repaired because the ancestors of the parishioners used to sit there. I would ask all those who have been accustomed to deal with galleries, can this one be got rid of instead?

If the gallery at the west of the nave which is approached from the churchyard were removed, and that in the north transept also approached from the outside, and the gallery in the tower archway, as well as this east gallery, which are both approached from the belfry stairs, the number of seats would be so far reduced that it is doubtful whether the church would contain all who would wish to come at once. The number of persons who use the seats these galleries contain would not, I fear, be considered with the question of their removal. Seats are seats, no matter how disagreeable it is to get at them, sit in them, or hear and see anything when in them more edifying than giggling and winking, or nutshells and orange-peel.

We want the least evil, not the less of two, and restoration such as architects treat us to is more often conciliatory than conscientious. Until an architect is independent of parson and people, we shall always trace their prejudices in buildings new, or newly done up. That those who use the building and pay for it ought to know what they want, is one thing; that the architect ought to be the best judge as to what kind of building is good for the intended purpose is another. I will not pretend to reconcile them, for the case of Braunton Church seems to make it impossible to do so.

I feel sure that any solution of these difficulties will be gladly considered by the Restoration Committee. Their difficulty is not with the architect, but with the parishioners, among whom I was born, and therefore beg to subscribe myself your faithful servant,

BRAUNTONIAN.

ST. THOMAS'S HOSPITAL.

I read in your issue for March 6, with very great interest, the remarks of your 'Rambler' on the new St. Thomas's Hospital, but was rather disappointed to find that the fact of 'Gibbs's fireplace lintels' being used by the architect, Mr. Curry, in all the fireplace openings of this building, was not stated. Perhaps you will kindly notice this in one of your forthcoming numbers, and oblige

Your obedient servant,
JOHN GIBBS.

Liverpool.

PARLIAMENTARY PROCEEDINGS.**Military Labour.**

On Monday, April 12, Mr. HANBURY-TRACY rose to call attention to the waste of public money which arises from adhering to the system of employing civilian labour on the construction and repair of works and buildings connected with the War Department, when experience gained at Woolwich, Dover, Parkhurst, and the Aldershot and Curragh Camps shows conclusively that soldier labour can be used with the greatest benefit to the service; and to move—That, in the opinion of this House, an authorised organisation should be adopted for extending the system of 'military labour to military works' to all stations of Her Majesty's army. He remarked that an army would become efficient in proportion to the extent to which structural duties were combined with the ordinary routine. A great many military men had not yet clearly made up their minds what a really efficient army should be, but it was generally agreed, he believed, that a considerable time must elapse before we could place our forces on a par with the principal armies of the Continent. Historical students were aware that centuries ago the Romans were accustomed to exercise their troops, not only in the use of arms, but also in intrenching camps, and in other works likely to be useful to the army. More recently Napoleon declared at St. Helena that if his troops were properly trained they could, under a good general, fight as well with spades as with muskets. In America, again, only the other day, the greatest advantage was derived from having a large number

of artificers in the ranks. Lord Grey, in his evidence before the Recruiting Commission, stated this very clearly. His Lordship said:—'I would on no account take away any part of the time that was necessary for making the soldier perfect in his military drill, and I would especially require a complete knowledge of the use of his weapons, but I am told that Americans have found that the system of drill is capable of very great simplification, and that they have discovered that the efficiency of their army depends to a very great degree upon the skill of the men, not only in the use of weapons, but in the use of tools. The efficiency of the American army was increased to a degree that it was difficult to describe by the skill of those volunteer soldiers, many of whom were drawn from the western parts of America, and who had the ready habits of settlers in applying all the resources they could find to their own advantage; that the efficiency of those men in that respect was one of the great sources of strength of the American army, that it was found in that contest that entrenchments could be erected in a wonderfully short space of time by skilled men, and they had the power not only of making earthworks, but of rapidly constructing railways, and laying down electric telegraphs, and making all the arrangements for the communication with the army and carrying on all the work necessary for its advantage. Some of our own officers tell me that there was very much indeed for them to learn from what they saw actually done in the course of that contest in America.'—The motion was eventually withdrawn.

The Central Military Prison.

On the same day Colonel NORTH also asked whether any steps had been taken to carry out the recommendation of the Royal Commission on Military Punishments, suggesting the establishment of a central military prison.

Mr. CARDWELL said that one of the questions which came before him on taking office was the first report of the Commission upon this subject, and he had been very desirous of putting into the Estimates of the present year a sum of money for the purpose of carrying into effect the recommendation as to the central prison. Upon consultation, however, with Colonel Henderson and his hon. friend the member for Truro, who was a member of the Commission, he came to the conclusion that it would be premature to do so, not from the slightest unwillingness to give effect to the report of the Commission, but for these reasons:—In their first report the Commissioners recommended many alterations in the mode of punishment which would diminish the number of imprisonments; substituting fines, for example, for drunkenness, which was the fertile mother of all imprisonment. It was thus highly probable that the number of imprisonments might be diminished. Then the contemplated reduction in the number of men might lead to the disappearance of the most frequent inhabitants of the military prisons. And, lastly, he thought it better to wait until the final report of the Commission had been presented, together with the evidence, so that Parliament might be fully informed upon the whole subject.

The Crypt under St. Stephen's Chapel.

On Tuesday, April 13, Mr. LAYARD, in answer to questions, stated that the crypt was ready, but that, if divine service was to be established in it, it would be necessary for the House to provide an endowment for the incumbent.

The Public Offices.

On the same day, Mr. LAYARD said that it was the intention of the Government to introduce a Bill this session for the acquisition of the property recommended to be purchased by the Treasury Commission for the concentration of the public offices.

Metropolitan District Railway Bill.

On Tuesday, April 13, Lord ELCHO moved that it be an instruction to the committee on the Metropolitan District Railway Bill to inquire and report whether any and what provision would be made by the railway company in constructing their line from Westminster to Cannon Street, with a view to prevent injury to adjacent buildings from the vibration caused by the passage of trains. The Bill in question, he said, empowered the company to construct a line along the Thames Embankment, which it was hoped would be turned to account as one of the finest sites in the metropolis for the erection of public buildings, and the House would, he thought, be loth to see anything done which would cause danger to those buildings when erected, a danger which was to be apprehended from the vibration caused by the running of the railway. When the Metropolitan District line was being constructed in the immediate vicinity of Westminster Abbey, the Dean and Chapter of Westminster were apprehensive of injury to the Abbey from that cause, and forced the railway company to take the precaution of using a quantity of teak, which acted as a non-conductor to vibration. Again, when it was sought to construct a railway tunnel under the Observatory at Greenwich, the Astronomer-Royal made a representation to the Admiralty on the subject, because of the risk to the building which would be likely to be occasioned, and the South-Eastern Company were obliged to take another line. In the case, also, of the underground line along Oxford Street from the Marble Arch, the Vestries protested against a work which they were led to believe would be injurious to the houses on the line, and it was put a stop to.—Mr. Gilpin said the objection raised to railways on the score of the vibration which they caused he could say, from his own experience, might be brought against the ordinary traffic in the streets.—Motion withdrawn.

LEGAL.

Court of Bankruptcy, Basinghall Street.—April 12.
(Before Mr. Commissioner BACON.)

IN RE T. G. A. PALMER.

The bankrupt, Thomas George Adams Palmer, of 7 Sackville Street, Piccadilly, and formerly of Cawnpore, India, ironfounder and contractor, applied to pass his examination and for an order of discharge. He came before the Court on his own petition, and from his preliminary statement

it appeared that until the end of the year 1866 he carried on business in India, when, owing to depreciation of securities and commercial losses, he was compelled to suspend payment. Many meetings of his creditors were held, and ultimately he was required to execute two assignments for the benefit of his creditors. By the deeds, which were prepared by the committee of the creditors, he conveyed all his property, moveable and immoveable (except his wearing apparel), to Cecil Stephenson, Samuel Bird, and another, for the benefit of his creditors. He left India in 1867, and came to England, where he had been sued by one of the non-assenting creditors, Alfred Preston. He had no funds to contest the validity of the deeds in England. He had given up all his property for the benefit of his creditors, and he was compelled to seek the protection of this Court. The accounts filed by the bankrupt returned debts of 154,980*l.*, with assets, consisting of property surrendered to the trustees, 298,000*l.*

Mr. R. T. Latley, a creditor, in person opposed, and contended that the bankrupt, having given up his property to trustees in India, might properly seek his discharge there, and he had no right to petition this Court.

From the bankrupt's evidence, it appeared that he made a post-nuptial settlement either in 1858 or 1859. The settlement comprised some houses and some land in Oude. The trustees were in India, and so was the property. He was pressed in India. He submitted all the accounts to his creditors, and then made deeds of assignment. The year before the assignment he expended 1,200*l.*

The Court held that no valid objection had been shown to the discharge, which was accordingly granted.

Middlesex Sessions.—April 12.

Francis Thomas Chittell surrendered to his bail to answer an indictment for stealing a number of deals, the property of M'Clymont & Co. The prosecutors are builders of the Redcliffe estate at West Brompton, and the prisoner is a lighterman; he was in charge of a barge laden with deals belonging to the prosecutors, to be delivered at Lindsey Wharf, Chelsea. The prisoner employed several boys, according to the evidence for the prosecution, to assist him in unloading the barge, and paid them by giving them some of the deals. Other deals were also missed, the whole number short being 43. For the defence it was shown that the prisoner had not employed the boys, but had tried to keep them off the barge, and also that one of the carmen employed by the prisoner to carry the deals from Lindsey Wharf to the prosecutor's works had failed to deliver one load (about 43 deals), and had since absconded.—The jury returned a verdict of 'Not guilty.'

NOTES ON NOVELTIES.

Indian Punkahs.

A new punkah-pulling machine has recently been invented by Lieutenant Turnbull, of the 6th Royals, which, it is hoped, will enable the punkah coolies to be in a great measure dispensed with in India. The mechanism of this contrivance is of great simplicity, and its perfect noiselessness is said to be one of its chief recommendations—the faint ripple of the linen punkah being heard amid the complete silence of the wheels that move it to and fro. A deadweight turning a horizontal shaft gives the desired motion to a slender flywheel with four spokes; a slight jerk of the punkah being caused at each revolution by the plan of making one spoke heavier, at the end next the nave, than any of the other three. This peculiar action imitates with admirable nicety of effect the movement of the wrist when the punkah is worked by an attendant. There are 12,000 revolutions of the fly-wheel, and consequently as many forward pulls of the fan, in eight hours; and this statement will exemplify the great saving of manual labour which the machine accomplishes.

Ransome's Patent Concrete Stone.

Much has been already written and said relative to the uses to which Ransome's Patent Concrete Stone is applicable for building or decorative purposes; and probably most of our readers are already, to a certain extent, acquainted with the material, which is now to be seen in many of our more recent public buildings. To the engineer this invention has already repeatedly proved its usefulness, not only as a building material, but extensively for the beds of steam-engines, and even of steam-hammers; its solidity and toughness being such that it perfectly endures the percussive action to which it is subjected in the latter case. To the architect also it is valuable, as enabling him to produce with exactness his mouldings, cornices, capitals, plinths, and other parts of a building where repetition is required. Nor is it by any means necessary that the stone should bear upon its face the appearance of having been made in a mould, for it is as capable of being dressed with the chisel after induration as any natural stone taken from the quarries, while this additional advantage is claimed for the material by its manufacturer, that it possesses a perfect homogeneity of structure, such as can scarcely be relied upon in any blocks of the natural freestones.

Although the original idea embodied in the present process occurred to Mr. Ransome's mind so long back as the year 1844, it was not till the year 1866 that the principles now carried out in the manufacture were arrived at. About that time it occurred to Mr. Ransome that if a compound silicate of lime could be formed in the surface-pores of natural stones, it would tend very much to their preservation from decay, and experiments subsequently proved the correctness of those views. Taking advantage of the experience thus obtained, it next occurred to him that by the adoption of a somewhat similar process applied to sand, or pulverised stone, and by forming a compound silicate of lime, artificial stone might be formed by means of a cementing agent not only possessing perfect insolubility, but which would also effectually envelope, and firmly bind together, the several particles of which the stone was composed. After numerous experiments, designed to reduce this principle to practice, he found that the application of a solution of chloride of calcium (or lime dissolved in muriatic acid) to a mixture of sand with silicate of soda (consisting of flint stones dissolved, under pressure, in caustic soda) formed almost instantaneously, by double

decomposition, an insoluble silicate of lime, and a soluble salt of chloride of sodium, or common salt, which latter substance is easily removed by subsequent washings.

Since the year 1863, when a joint-stock company was formed for the manufacture of artificial stone upon Mr. Frederick Ransome's patents, many improvements have been introduced into the process, gradually and steadily leading towards a high standard of perfection. Recently a great improvement has been introduced in the manufacture, ensuring uniformity, and removing uncertainty from the operations. This has been effected by the use of air-pumps, whereby a complete exhaustion is effected in the pores of the mass, and its perfect saturation by chloride of calcium is the more easily obtained. At the works of the Company, at East Greenwich, there are now exhaust-vessels from which pipes are conducted in every direction, so that, by means of flexible connections, all kinds of work can, at all points, be brought into communication with the exhaust-chamber. According to this process, which is the combined invention of Mr. Frederick Ransome, Mr. Henry Bessemer—so well known as the inventor of the Bessemer process for manufacturing steel—and Mr. Ernest Ransome, son of the original patentee, the stone is saturated by immersing the mass in a solution of chloride of calcium, when, by connecting it by means of the flexible pipes before alluded to, the solution is drawn through by exhausting the air from the mass. After a suitable time, water may also be drawn through the stone in the same manner, in order to remove from it any salts which remain in a soluble state. A current of air, either hot or cold, or even artificially deprived of its moisture, may then be drawn through the stone for the purpose of displacing the moisture, and drying the stone. By this process the principle of manufacturing artificial stone is enabled to be brought more generally into use, and materials, otherwise unsuited for the purpose, may now be successfully employed. Besides this, also, the above means may be employed for the subsequent saturation of the mass with waterproofing or colouring compounds.

In addition to building or decorative purposes, this same process has been made applicable by the inventor to the manufacture of grindstones, which have already achieved a notoriety for their uniformity of texture and extraordinary cutting properties. Filters are also manufactured, by the same process, of any dimensions. And the proved capabilities of the artificial stone to resist the action of the strongest acids, make it an invaluable acquisition for chemical works. The Patent Concrete Stone has now achieved a great position for itself, and is being largely employed both in this country and abroad. Amongst other buildings where it has already been employed may be mentioned the new India Offices, in Westminster, and it has been extensively used for cornices and dressings for several large warehouses in the City of London. It is also being largely introduced in the more ornamental portions of St. Thomas's Hospital. An important fountain, made entirely of the patent stone, has recently been erected in the Public Gardens at Hong Kong. It has been largely introduced in the Nawab's Palace at Moorshedabad, Bengal; it is being used in connection with the works for the improvement of the navigation of the Godavery; the Indian Government has recently established a manufactory on a large scale at Bombay; and Mr. Ransome is now engaged in preparing plans and estimates for erecting works for the manufacture of this material for the municipal authorities at Madras. Among some of the more recent novelties in connection with this stone, may be mentioned the manufacture of ashlar facings, which are so constructed that projections in rear bond firmly in with the brickwork backing. Hollow building blocks are also formed of the same materials, and so constructed with tongues and grooves that they dovetail, as it were, into one another, forming at once a very light but extremely strong building.

The applicability of Mr. Ransome's invention does not, however, stop at the manufacture of stone; it is also applicable to the preservation of natural stones from decay, and for the protection from damp and climatic influences of bricks, stucco, and cement. Space will not admit of our giving a lengthened account of the processes employed for this latter purpose. Suffice it here to state that besides the silicate process, the Patent Concrete Stone Company are in possession of a second, known as Ransome's combined process, which is in some cases preferred to the former. Amongst other buildings to which this has been applied may be specially noticed the Chapter House, Westminster, portions of Canterbury Cathedral, and the new Midland Railway Terminus at St. Pancras.

Flooring Tiles and Slabs made from Slate Refuse.

The immense accumulation of refuse in the slate quarries has induced M. Sébille to convert it into paving tiles and other useful articles; the slate, with a certain proportion of river-sand and pitch, all reduced to powder, is heated by steam, then poured into moulds of the form of the tiles or slabs required, and afterwards submitted to hydraulic pressure amounting to 170 kilogrammes on the square centimètre. The tiles are then cooled in water, and the upper surfaces ground smooth if required. The density of these slate tiles varies between 2.2 and 2.5; they are unaffected by acid or alkaline solutions, and they will bear a temperature of about 160° Fahrenheit without suffering.

These composition slabs and tiles are not only economical, but they possess far more power of resistance than ordinary stone. M. Michelot, who has made a series of experiments with them, says that their resistance is not less than 325 kilogrammes per square centimètre, or, in round numbers, about 2 tons to the square inch.

NEW BUILDINGS AND RESTORATIONS.

A new Presbyterian Church is to be erected in the Camden Road, London. It is intended to accommodate 720 persons, and is to cost 8,000*l.*

New Church at Holloway.—A new church is about to be erected for the district around and including the Seven Sisters' station of the Great Northern Railway. The Bishop of London's Fund has voted 2,000*l.* towards the scheme, 1,000*l.* for a site and a second 1,000*l.* towards building.

We understand that Mr. G. G. Scott, R. A., is about to erect a church at Highclere, for the Right Hon. the Earl of Carnarvon.

The attendants at Miles Street Chapel, Vauxhall (United Methodist Free Church), are arranging for the commencement of a new chapel to meet the growing wants of the church and congregation.

New Chapel and School-room at Soham.—Services have been held at Soham, Ely Circuit, in connection with the laying of the memorial stones. The cost of the building will be about 620*l*.

The Vicar of Mirfield has laid the foundation stone of a new parish church. The structure, which is to supersede the present edifice, will be a very handsome one, and is to cost between 12,000*l*. and 15,000*l*.

St. Chad's, Kirkley.—The Earl of Sefton has laid the foundation-stone of the new church at St. Chad's, Kirkley. It is to cost 10,000*l*., and he provides the funds.

Great Renovations are taking place at Worsley Hall, the seat of the Earl of Ellesmere, for the entertainment of the Prince of Wales on the occasion of his visit to that district.

The Restoration of St. John's Church at Wolverhampton.—The committee for this purpose have accepted the tender of Messrs. Higham, builders, of Wolverhampton, to do the main work of restoration for 1,201*l*. 3*s*. 9*d*. Other works are contemplated at a cost of 400*l*.

The New Town Hall at Stone.—At a committee meeting held at the Crown Hotel, on Wednesday, March 31, twelve tenders for the erection of this building were opened. That of Mr. John White, builder, of Nottingham, for 2,130*l*., was accepted. The building, after the plans of Mr. F. Bakewell, architect, of Nottingham, will be immediately commenced, and it is expected that it will be handed over to the trustees by the 1st September next.

The New Dumfries Infirmary.—The plans of the new Infirmary, prepared by Mr. Starforth and selected by the building committee, have been submitted to Mrs. Laurie, of Maxwelltown, who has returned them with an expression of approval. Working plans and specifications are being proceeded with by the architect, who anticipates that tenders can be procured from competent tradesmen to carry out his plans for the sum of 10,000*l*. Should this be done, Mr. Starforth will, subject to the approval of a general meeting of governors, be entitled to the prize of 50*l*. offered for a selected plan.

The Tower Subway is under the superintendence of Mr. Peter W. Barlow, jun., C.E.; the contractor being Mr. J. H. Greathead; the shafts are being sunk by Mr. Thomas Tilley, of 2, Bond Court, Walbrook, London. The castings for these shafts and the tunnel, which are all made in segmental rings firmly bolted together, as also the manufacture of the shield, are entrusted to the firm of Messrs. Bells, Goodman, & Co., of the Walker Engine Works and Foundry, Newcastle-upon-Tyne, and 25, Walbrook, London. It is expected to be opened to the public before the commencement of the year 1870.

The New Grammar School at Doncaster has just been opened. It has been erected on a valuable plot of building land given by W. H. Forman, Esq., of Sippbrook House, Dorking, who, in addition to his munificent gift of the land, presented a donation of 1000*l*. towards the building fund. The school is built from designs of Mr. George Gilbert Scott, R.A., and stands boldly out a long way back from the road, upon a fine terrace raised nearly four feet above the general level of the ground in front. The school is approached by a massive flight of stone steps, in the centre of this terrace. In style the building is of the Decorated or Middle Pointed period, and has open cloisters on the ground plan, which give a very handsome effect to the front elevation. These cloisters furnish a covered playground of 68*ft*. long, and 35*ft*. 9*in*. wide. There is also on this ground level a library 11*ft*. 6*in*. by 35*ft*. 9*in*., and staircase to the school-room and offices. The upper floor is occupied along the whole front of the building by the school-room—a large hall of good proportions and considerable ornamentation. It is 82*ft*. long, by 35*ft*. 9*in*. wide, and 42*ft*. high. The roof is massive and beautiful—being a fine specimen of the open king-and-queen post roof, with moulded hammer beams, and circular wall braces and ribs, forming the principal rafters, which spring from great stone corbels and form grand trefoil-headed spans. There is an immense amount of work about the roof, and, except the common rafters, which are square, the whole is handsomely moulded. The timber used is Baltic fir, and is stained. On the upper floor, at the back, there are also a class-room 26*ft*. by 14*ft*., and a master's room 14*ft*. by 12*ft*. 6*in*. Above the master's room and the staircase, and at the west and entrance end of the school, is erected a gallery, which extends right across the room, leaving the roof open to the end of the building. The school-room is heated by hot-water pipes, and lighted by plain gas-pendants hung from the end of each hammer beam of the roof. Throughout, the fittings are substantial and complete.

Viewed from the playground in front, or from the high road beyond, the new school has a fine and imposing effect. Below, rising just above the terrace, are the five pointed arches forming the open front to the cloisters, flanked on each side by a window—the library and staircase windows. Above these are moulded string-courses, and then seven large, handsome, three-light windows, divided by transoms heads, giving six lights to each window. The mouldings of the windows are deep and massive. Over the window heads is a moulded corbel tabling, and projecting eaves of the roof, which is of very high pitch and covered with Broseley tiles. At the west corner there is an ornamental smoke turret carried a little higher than the ridge of the roof. The upper part of the turret is of Ashlar stone, with traceried shallow niches, terminating in a short spire, surmounted with a gilt vane. In the spire part are eight trefoil apertures for the escape of the smoke from the warming apparatus. The ends of the building contain small pointed windows in the lower part, and two large six-light windows, of rich and elegant design, above. Over these are quatrefoil louvres, acting as ventilators through the roof—this important matter of ventilation being amply provided for throughout the building. The total cost of the building has been about 6,000*l*.

The Proposed Gymnasium at Ashford.—A meeting has just been held at the Public Rooms to forward this project, and the necessary committee appointed. The gymnasium will cost 43*l*.; reading and dressing rooms, 97*l*.; drill shed, 39*l*. The proprietor of the premises (Mr. J. S. Burra) was present, and showed a desire to meet the views of the promoters.

Marlow (Bucks) Bridge.—At the Bucks Easter Sessions, the County Surveyor reported that 'the deal planking of this bridge, which was put down in the year 1860, at considerable cost, has become decayed from dry-rot, and has been consequently replaced. The committee think that the deal platform should be restored or repaired, and that the layer of felt and asphalt, which was placed between the upper platform, constructed of deal, and the lower one, which is constructed of oak, should be discontinued.' If the whole of the deal platform should be found defective, it will involve an outlay of from 250*l*. to 300*l*.

A Wesleyan 'High Church.'—The Metropolitan Memorial Methodist Church recently erected in Washington (U.S.), at a cost of 50,000*l*., is in the Gothic style of architecture, and is built in two storeys—the ground-floor being used for Sunday-school purposes, and the upper as the chapel proper. There is to be a tower and spire 240 feet in height, to contain a peal of bells. In the chapel all the windows are filled with stained glass illustrative of the life of the Rev. John Wesley, and of various leading Wesleyan ministers, whilst those in the schoolroom beneath are devoted to incidents in the Life of Our Lord. The panels of the pulpit, or platform, are of olive-wood from the Garden of Gethsemane, and are carved into crosses, with the sacred monogram and the symbolical ivy-plant. The keystone of the arch to the recess in which the pulpit is placed is of stone from Solomon's Temple, and upon it is carved, in Hebrew, the name of God.

The Contract Work at Chester Cathedral, under the direction of Mr. G. G. Scott, R.A., has been let to Mr. John Thompson of Peterborough. Mr. Thompson has executed the work at Hereford and Ripon Cathedral, under Mr. Scott, and is building the new University of Glasgow under the same architect.

The Parish Church of Pontefract was reopened last week. The cost of the alterations is 2,000*l*., including a new chancel, which has been added at the expense of the Earl of Harewood, the lay rector.

The Bristol Cathedral Nave Restoration had its first anniversary a few days since, by the holding of divine service in the cathedral.

Sedgefield Asylum.—New Wing.—The new wing being erected at the Durham county asylum for the accommodation of 200 additional patients will soon be ready for occupation.

Shildon Police Station, Durham.—The plans of this police station have been approved, and tenders will be at once advertised for and the works commenced. The estimated cost is 400*l*.

Stanhope Police Station, Durham.—The plans for the proposed additions to this station have been approved. The estimated cost of the work is—450*l*. for superintendent's house, stable, and gig-house, and 50*l*. for improvements to police-court. The Clerk of the Peace is instructed to take the necessary steps with the trustees of the present town hall and police building at Stanhope, to enable the county architect to proceed with the new building as early as possible.

The First British School in Breconshire was opened on Easter Monday. For years this portion of the county has been destitute of the means of education to children of the neighbourhood.

New Chapel at Syke.—A small chapel (belonging to the United Methodist Free Connexion) has been erected at Syke, in the Rochdale Circuit, at a cost of upwards of 1,200*l*.

The 'Corner-Stone of an edifice at Sheffield, to contain 'thirty-six almshouses for the accommodation and subsistence of forty-eight aged and indigent persons,' has just been laid with some ceremony. For the erection and endowment of these almshouses Mark Firth, Esq., has appropriated 26,000*l*., 'as an expression of gratitude to Almighty God for His favouring providence, and as a means of benefiting so many of the aged and indigent of his native town as may be deemed eligible for the charity, and as the charity itself may be able to support.'

The Chancel of the Parish Church of Olney is about to be restored at the expense of the Right Hon. the Earl of Dartmouth. Mr. G. G. Scott, R.A., has made a survey and report. The estimate of Mr. Tait, of Melton Mowbray, has been accepted.

Mechanics' Institute, Durham.—A few years ago the committee of this institute expressed a desire to have the present building enlarged, to meet the wants of the members. Plans were prepared, the extra ground was given by the President, Earl Durham, and several liberal contributions were made by the local gentry. A year has elapsed, and, up to a few evenings ago, the whole matter was left in abeyance. We are glad, however, to report that an effort is about to be made to raise the remainder of the required money in the shortest possible period.

The Stockton Water Scheme.—A meeting of the Parliamentary Committee of the Stockton Corporation was held last week, when it was resolved to recommend the Council to withdraw from the further prosecution of the water scheme, on the ground of the difficulties presented on the question of compensation to the millowners and others.

A New Protestant Church is to be erected at Sulina, Turkey, at the Sulina mouth of the river Danube, in connection with the works of the European Commission of the Danube.

It is in contemplation to restore and enlarge the church of St. Peter, at Mansfield.

The Parish Church at Shadoxhurst, after some extensive repairs costing 600*l*., has been reopened. The builders are Messrs. Bourns and Blackman, of Woodchurch; Mr. Gordon M. Hills, of the Adelphi, is the architect.

ITEMS OF NEWS

FROM OUR
SPECIAL CORRESPONDENTS AND OTHERS.

Opening of the Wedgwood Memorial Institute at Burslem.

This interesting ceremony is announced for Wednesday, April 21, and will be performed by Earl de Grey and Ripon.

His Lordship is expected to reach Burslem between one and two o'clock. On his arrival he will be received at the Town Hall, where an address from the local governing body will be presented to him. He will then be escorted to the Wedgwood Institute, where, after walking through and so formally opening the Exhibition, he will preside at the luncheon in the Lecture Theatre.

The Exhibition itself is expected to be one of real and possibly remarkable merit. The collection of oil paintings and water-colours will be admirable. The pottery collection will contain examples of every stage from the earliest period up to Wedgwood, and a large display of the works of Wedgwood himself; and besides this there will be a miscellaneous collection of artistic productions, chiefly contributed from South Kensington.

Memorial Statue to the Late Prince Albert.

We understand that the matter of the Memorial Statue of the late Prince Albert, to be erected in the City of London, is shortly to be brought before the Common Council.

The New Guildhall, &c., at Plymouth.

As our readers are aware, a public competition has been instituted in the case of this intended structure. According to the programme issued, the building is to consist of a Guildhall, with Law Courts, a Police Court and Station, with Council and Committee Rooms; and Offices for the Town Clerk, Treasurer, Surveyor, &c., &c., at an intended outlay of some 25,000*l.*

The drawings required for the purpose are pretty numerous; and will, for so comprehensive a building, involve no ordinary degree of skill and application on the part of competitors. Still, the printed instructions run coolly as follows:—

'Competitors must look solely to the premiums for their remuneration; as the Town Council will not engage to employ any of the architects whose plans may be accepted.' (!)

We are sorry to see a clause such as this in connection with what should be an important competition. The premiums offered are three in number, amounting altogether to 225*l.*, which sum falls short of the professional value of one good set of plans, sections, elevations, and a general specification and estimate; to say nothing of (or rather for) 'a perspective view, 34 inches by 23 inches.' Let us suppose twenty designs sent in: their mere cost 'out of pocket,' leaving nothing for their authors, will most likely exceed twice the amount of all the premiums added together; so that what the competing architects are to gain by entering into such a competition is not very clear. Thus much we feel impelled to say, in the interests of the profession. If the Town Council are wise, they will withdraw their objectionable clause; and, instead of offering a premium for the first, second, and third best design, they will offer for the best design *the customary commission only*, and reserve their 100*l.*, 75*l.*, and 50*l.* premiums for the unlucky authors of the second, third, and fourth designs. The time allowed for the preparation of the designs (July 14) might, we think, be with prudence extended.

Notes from Germany.

Professor Wilhelm Camphausen, of Düsseldorf, is engaged upon a large historical picture, being a commission of Prince Alexander of Prussia. The subject is the meeting of the Crown Prince and Prince Frederick Charles on the heights of Chlum on the evening of the battle of Sadowa. The positions chosen are said to be well rendered and full of life and vigour, whilst every figure upon the canvas is a portrait.

Mr. C. Puscher in the last number of Dingler's (German) 'Polytechnic Journal' describes a very simple means to retard the process of hardening of plaster of Paris, which for many purposes takes place far too quickly. To the burnt and pulverised gypsum he adds from 2 to 4 per cent. of the root of the yew tree, very finely powdered, and kneads the whole into a plastic paste by the addition of 40 per cent. of water. The gypsum in this state is of the consistence of stiff clay, and, commencing to harden in about an hour, remains sufficiently tough to admit of cutting, boring, turning, or filing without breaking. By adding 8 instead of 4 per cent. of yew tree root, the hardening may be postponed still further and the mass is rendered much tougher. As the brittleness of hardened plaster of Paris has hitherto prevented its being used in many ways, it is probable that this simple invention will be found a welcome hint to the decorative artist.

'Judicious Restoration' in Belgium.

The Belgian Minister of the Interior has just issued a circular to the governors of provinces relative to the native monuments of the Middle Ages, which at each fresh restoration are exposed to suffer more or less alterations of style. 'The interest of the Art,' he says, 'and the maintenance of traditions require that the Government should prevent, by all the means at its disposal, any alteration in style during the execution of such necessary works as the ancient monuments of the country may in future stand in need of. To this end the greatest possible number of authentic fragments of ancient national Architecture should be collected, so as always to be able, at the time of the restoration of any edifice, to preserve the peculiarities and character of its original style and period.' In order the more effectually to attain this object he thinks that it will suffice to oblige all contractors, about to undertake works of this nature, to have casts taken (at their own cost and by a skilful workman) of all such objects as the competent authority, which shall be appointed, shall require; such casts to be carefully and neatly made prior to the restoration being commenced. The casts, he advises, shall be made by means of gelatine, which permits as many as four good casts being taken from an impression made on the spot. These four copies he orders to be disposed of in the following manner: one

to be retained by the State, the second to be sent to the museum of the town or province, the third the builder will keep himself, whilst the fourth goes to the artist who took the impression, and who is at liberty to produce further copies for sale as models or for other purposes. The order closes by requesting the Provincial Governors to issue the necessary instructions to Communal Administrations that this clause be inserted in future specifications of works coming within their jurisdiction, and to see that such clause be properly carried out.

Notes for Connoisseurs.

The sale of M. Edouard Fould's collection has created even more interest than was expected; the pictures and drawings formed a small part of the whole, but they were mostly choice, and fetched great prices. A drawing by Bida, Maronite Preaching in Lebanon, 186*l.*; Decamps, Samson Engaged with the Philistines, formerly belonging to the Duchess d'Orléans, 600*l.*; this picture cost M. Fould about 36*l.* more than it sold for; * Gerôme, Rembrandt at Work Etching a Plate, a charming picture quite out of this artist's line, exhibited five or six years ago, 600*l.*; Marithat, Courtyard of a Mosque, 364*l.*; Meissonnier, Visit to the Atelier, 568*z.*; iem, View of Venice at Sunset, from the De Morny collection, 300*l.*; Lancret, a Group around a Fountain, a picture sold at the Earl of Pembroke's sale for 1,400*l.*, fetched the enormous sum of 2,520*l.*, a high price for such a whistle; Pater, a Party in a Park, which sold at the same nobleman's sale for 1,360*l.*, high enough in all conscience, 2,080*l.*; A. Ostade, Dutch Interior, from the De Morny collection, 230*l.*; Weenix, Dead Game, 380*l.*; and Womverman, The Stag at Bay, from the Elysée collection, 808*l.*

At the sale of a private collection in Paris last week, a Seapiece, by Backuysen, The Coming Storm, from the King of Bavaria's collection, fetched 204*l.*; Portrait of a Burgomaster with his Dame, by F. Bol, 304*l.*; The Geographer, by Gerard Dow, a well-known work, 212*l.*; Van der Meer, a Concert by Three Persons in a Dutch Room, from the Van Leyden gallery, 204*l.*; a well-known little picture, by Velasquez, The Infanta Maria Theresa, from the collection of Louis Philippe, 33*l.* 12*s.*, a small price for anything by this artist nowadays; a Van de Velde, Landscape with Animals, 284*l.*; and two works by Vetter, The Compliment and the Reception, 236*l.* and 272*l.*

Twenty water-colour and other drawings, by M. V. Pollet, were sold the other day here in Paris, and fetched the relatively large sum of 945*l.* 4*s.*

On the 27th of the present month of April are announced for sale, three pieces of the famous so-called Henri II. ware, so dear to amateurs; and two remarkable specimens of Bernard Palissy ware; the subject of one being Temperance, the other bearing the cyphers of Henri II. and Catherine de Medicis, both famous examples.

Those who are curious to know the condition of industry and art in the North of France would do well to pay a visit to Beauvais, one of the famous seats of the tapestry and carpet manufacture, in the month of June, when there is to be a large exhibition, artistic and archæological as well as industrial. The nearness of Beauvais to Calais and Boulogne is an extra inducement.

Compensations Awarded to Tenants in Paris.

The following is the account of the indemnities awarded by the expropriation jury to four tenants of a house in the Rue de la Bourse, about to be abolished for the formation of the new Rue Réaumur, which will form a straight line from the Bourse to the new Opera House:—

	Francs.
A restaurateur	90,000
A café keeper	80,000
A hairdresser	17,000
A glove maker	18,000
	£8,200 = 205,000

All the tenants of condemned houses do not certainly hold leases, and thus obtain indemnities, but the greater portion in the best neighbourhoods, and especially in the great commercial streets, hold their apartments on lease, and the total amount of indemnities paid to tenants, to say nothing of landlords, is enormous.

Austrian Railways.

The total length of railways now in working order in Austria, including the Italian system, amounts to 1,228 miles, of which 624 miles are on German soil, 351 in Hungary, and 253 in Italy. In course of construction are 299 miles, of which 159 are in Austria proper, 121 in Hungary, and 19 in Moldavia. Concessions have lately been obtained for 530 miles more. This will make a total of 2,057 miles of railway. The railways of Great Britain and Ireland amount to 2,144 miles.

Abyssinian Relics.

Great interest has been excited by the exhibition in the window of Messrs. Elkington & Co., of Liverpool, of a unique specimen of art manufacture, in the shape of a coffee tray, which was 'looted' at Magdala, and is believed to have belonged to the late King Theodore. It was brought to Liverpool by an officer of the Transport Corps, by whom it was presented to Mr. Eberlé, of the Alexandra Hotel. The tray is a very fine specimen of workmanship, and is 25 inches in diameter. The centre ornamentation is somewhat in the Byzantine. The centre panel is framed by concentric circles, each one being varied in design, showing great taste in the regular arrangement of ornamental scrolls *en suite* with the centre panel. The outer border is raised and very simply fluted. It is difficult to assign an epoch or country to this rare work of art, but with other specimens of the goldsmith's art from Abyssinia to guide us, we may—with some degree of plausibility—attribute its production to native talent. However, judging from the method of its production, which is technically styled *flat chasing*—a favourite manner of working with the Arabs—it may, with equal safety, be attributed to the latter. The metal of which this 'Theodore tray' is composed is copper, most skilfully and effectively overlaid with gold.

* Decamps' works have lately obtained such large prices that this result is curious; the cause of it is a very unpleasant one, namely, that so many forged imitations have been made that connoisseurs and dealers have become suspicious.

General.

Technical Instruction.—The Committee of Council on Education, on December 21, 1867, passed an important minute for the encouragement of scientific instruction. In accordance therewith, it is proposed to graft on to the science and art instruction already imparted at the Training College for Schoolmasters, Culham, Oxon, such higher branches as are required for fitting persons to be teachers of technical schools throughout the country. Classes were opened on February 1, in all branches of practical drawing, mathematics, mechanics, hydraulics, electricity, chemistry, geology, applied sciences, &c., to prepare students for the examination in May next, when several exhibitions of 10*l.* each (to meet those offered by the Committee of Council) will be offered for competition. After May next, a separate department will be opened for carrying on students mainly in those branches of study which will render them efficient teachers of technical instruction. All further information will be afforded, and all suggestions from Chambers of Commerce, local committees, &c. received, by the Rev. James Ridgway, M.A., F.S.A., Principal of the College.

Metropolitan Board of Works.—At the weekly meeting held on the 9th inst. eleven tenders were received for the construction of sewers, subway vaults, and paving the foot and carriage way between the west end of New Earl Street and the Mansion House. That of Messrs. J. Mowlem & Co.—19,750*l.*—which was the lowest, was accepted. The highest tender was 24,100*l.* The Works and General Purposes Committee have reconsidered the memorial from inhabitants of Vintry Ward, praying the board, in laying out Mansion House Street, to leave the plot of land adjoining the south side of the church of St. Mary Aldermanbury unbuild upon, and they see no reason to depart from the recommendation which they previously made.

A Series of sketches, drawings, and pictures, the property of Mr. John Ruskin, have been sold this week by Messrs. Christie, Manson, & Woods, at their rooms, in King Street, including the celebrated picture of the Slave Ship, by J. M. W. Turner, R.A.; forty beautiful drawings and sketches, illustrating the different periods of the same great master's work; two fine examples of Copley Fielding; four fine works of W. Hunt; and specimens of D. Cox, Duverger, and J. Brett.

M. Costa, the eminent musician, received the honour of knighthood on Wednesday last.

Petitions in favour of the removal of the site of the Law Courts to the Thames Embankment have been lying for signature at the Westminster and other stations of the Metropolitan Railway.

Metropolitan Street Tramways.—The committee have agreed that a case for the promoters of the bill has been established only so far as regards the construction of the southern line, less the loop between Hercules Buildings and Westminster Bridge. 2. That some limitation must be placed on the proposed monopoly. 3. That, after a period to be fixed, the street authorities are to have the power of purchasing the tramways. 4. That the power of the police to regulate the traffic shall be reserved. 5. That the bye-laws shall be subject to the approval of the Home Office. Witnesses have been called to prove the preamble of Bill No. 2, called the Pimlico, Peckham, and Greenwich Tramway Bill, who said that the Pimlico portion of the Bill had been abandoned, and that the line would commence near the railway station in Kennington Lane.

The Government will probably not take legislative action upon the Report of the Trades Union Commissioners. The main features of the proposed Bill on the subject are the repeal of the Combination Acts, and the protection of trade funds under the provisions of the Friendly Societies Acts. While permitting workmen and employers to organise themselves and make rules with respect to the persons by whom, or the mode in which, any particular work shall be done—or with respect to any terms and conditions under which it shall be carried on—the Bill provides that no association shall be formed or maintained for the commission of any offence against the common law. Conditions are also stipulated for the registration of rules and bye-laws, and the furnishing of annual accounts to the Registrar of Friendly Societies.

A full-length Portrait of the Archbishop of Canterbury (Dr. Tait) has been presented by a number of laymen to Dr. Jackson, Bishop of London, to be placed in Fulham Palace.

Manses for Foreign Missionaries.—The scheme originated by the Free Church of Scotland for providing manses or dwellings for the foreign missionaries continues to progress, and it contemplates the raising of 50,000*l.* The Established Church of Scotland has started a similar movement since Dr. Norman Macleod's return from India, but the sum to be raised in this case is only about half that contemplated by the Free Church.

Church Building.—The fifth annual report of the board of management of the Bishop of London's Fund, just issued, contains some interesting information respecting the working of this movement. There have been seventy mission districts in connection with the Fund since 1863. In eighteen of these the permanent church has been already built, in five the church is building, while four districts, though they have not churches, have still been endowed by the Ecclesiastical Commissioners as Peel districts. In seventeen districts, local church-building committees have been formed to raise funds to meet the large grants made towards this object by the committee of the Fund. In order to provide for the mission districts, and for those populations that, having been displaced by metropolitan improvements, are rapidly settling down in thinly inhabited suburbs, the committee has secured or contracted for a large number of sites for churches, schools, and parsonages. Many of these sites are occupied by their respective building works, while in several cases sites have yet to be secured.

Our Sewage.—At the present moment the question of sewage irrigation versus the manufacture of artificial sewage manure is being vigorously discussed at Kingston-on-Thames.

The New Station at West Brompton, on the Metropolitan District Railway, was opened for passenger traffic on the 12th instant.

At the National Gallery the six rooms hitherto allotted to the national collection are supplemented by the five rooms formerly devoted to the annual exhibitions of the Academy, forming altogether a gallery opening out from end to end of the long edifice in Trafalgar Square.

Locomotion is all very good, but are we to have our houses shaken to pieces by subterranean trains? That very important question Lord Ebleho has put to the House of Commons with reference to the proposed extension of the Metropolitan lines, and the subject demands most serious consideration. What is to be done? We must have Metropolitan railways, but possibly we may have to employ, as Mr. Hawkshaw suggests, a different kind of engine.

At an early hour on Wednesday morning the premises of Mr. Wilson, furniture dealer, High Street, Camden Town, were partly destroyed by fire.

The Extensive Block of Buildings occupied as seed and hop warehouses in Kentish Buildings, High Street, Southwark, tenanted by several firms connected with the Hop Exchange, were destroyed by fire on Monday night. Several of the adjacent houses are much injured. The loss is estimated at 30,000*l.*

The Family Mansion of Mr. J. Grimes, of Balham, was destroyed by fire on the 12th instant. The inmates were rescued.—The Junior Carlton Club also caught fire about the same time. There was little to burn except the building itself, as most of the furniture had been removed to the new club-house, just erected in Pall Mall.

The Hunting Catastrophe in Yorkshire.—Instead of a pyramid or obelisk, a North Riding-magistrate has put forth a proposal for a memorial bridge across the Ure. The cost will be great, but the funds are thought easy of reach.

The Flour Mill of Mr. C. S. Dickinson, on Brayford Wharf, Lincoln, is no more, it having caught fire on Tuesday last. A great portion of the mill was new, and the building was filled with machinery on the best and most approved principles. The fire is supposed to have been caused by the overheating of a stove.

The New Church in course of erection on Southernhay, Exeter, belonging to the Independents, was destroyed by fire on Monday last. The building was nearly finished, and while the men were engaged varnishing the roof, flames burst from it at the west end near the tower. The fire rapidly extended to the other end of the roof, which became one mass of flames. The roof fell in with a great crash, and the woodwork inside, including the large galleries, was burnt up speedily.

Fall of a Bridge.—On Monday last an accident happened at Saltburn-by-the-Sea, causing the death of three workmen, through the falling of a bridge. Messrs. Hopkins, Gilkes, & Co., of Middlesborough, are building an iron bridge of 700 feet in length across the famous glen along which the Skelton beck runs at Saltburn-by-the-Sea, for Mr. J. T. Wharton, of Skelton Castle. A strong force of workmen was employed fixing a pair of girders upon two of the piers (which are eight feet in height, reaching about 130 feet from the ground), when suddenly one of the girders slipped from its holding, and struck against the other pier, smashing the two girders and one of the piers absolutely into fragments. Upon the pier which was broken were the three deceased.

QUESTIONS.

The Cost of Contract Deeds.

To the Editor of THE ARCHITECT.

SIR,—Having been a subscriber to your paper from its commencement, may I beg through its columns a reply to the following?

What is the understood and acknowledged rule amongst architects and builders as to who pays for preparing the *Deed of Contract*—the contractor or the contractee, as for the latter's security only is it in the majority of cases drawn up?

I have been led to ask this question from the fact of having been called upon to pay upwards of ten guineas solicitor's charges for drawing up a contract where the total amount involved was under 1,100*l.*; and upon demurring to such a charge, being told it is always the rule in this part of the country for builders to bear the cost of drawing up the contract. Though in this case the solicitor was employed solely by the contractor, and there was no understanding of any kind as to who was to pay the solicitor.

An early reply will much oblige yours obediently, SOUTH WALES.

Fitch Girders.

SIR,—Will you please allow me to ask through your columns what the best proportions are for a fitch girder of 20 feet span, and to carry a load in centre of ten tons? I should like to have the best practical formula for working the same out, giving thickness or proportion of the iron fitch to the timber on each side the fitch plate.

Yours respectfully,

J. BRED.

39, King William Street, April 14, 1869.

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—On Monday, April 19, at 8 P.M., Wyatt Papworth:—'A Notice of the Professional and Literary Works of the late Arthur Ashpitel, F.S.A., Fellow.'

INSTITUTION OF CIVIL ENGINEERS.—On Tuesday, April 20, at 8 P.M.—1. Adjourned Discussion upon Mr. Kirkham's Paper: 'Standards of Comparison for Testing the Illuminating Power of Coal Gas.' 2. Mr. William Sheldford, M. Inst. C.E., 'On the Outfalls of the River Humber.'

ARCHITECTURAL ASSOCIATION.—On Friday, April 30, at 7.30, Mr. G. H. Birch, on 'The Domestic Architecture of London from the Sixteenth to Eighteenth Centuries.'

ASSOCIATED ARTS INSTITUTE.—On Saturday, April 17, at 8.15 P.M., Exhibition of Sketches.—Subjects: 'The Tempest,' Act III., and 'Found.' Discussion—Question: 'Is Competition a desirable Feature in Art Training?'

SOCIETY OF ARTS.—On Monday, April 19, at 8 P.M., John Anderson, Esq., C.E., on 'Applied Mechanics in Relation to Natural Properties of Materials.'

The Architect.

THE EMBANKMENT SITE FOR THE LAW COURTS.

E learn, with the greatest satisfaction, from Mr. Lowe's speech on Tuesday, that Her Majesty's Government has formed, and has by his mouth pronounced, the most decided opinion possible in favour of that site for the Law Courts which has been uniformly and steadily advocated in the pages of *THE ARCHITECT*—the Thames Embankment.

After a six hours' debate, the House adjourned the question for a month, but there can be little doubt, had a division been taken on Mr. Gregory's motion, what the decision would have been; while no shadow of a doubt as to the intentions of the Government was allowed to remain. Nothing could possibly be more uncompromising than the declaration made by Mr. Lowe, with the concurrence and in the presence of Mr. Gladstone and Mr. Layard, that the Government proposed to adopt the Embankment site. It is true the whole proposal as advocated in these pages is not taken up by the Government. Mr. Lowe accepts the frontage to the Embankment, but declines to touch the Strand. But this is simply because he also intends to contract the whole scheme, and to erect a smaller building than at present contemplated; and, therefore, as this building will only require a site of some six acres, the Government adopts that which is the essence of our proposal,—a frontage to the Thames, but they intend not to come further towards the Strand than the line of Howard Street.

We feel that the country is to be congratulated on this great success. We, and those with whom we have laboured, have had in many respects an uphill battle to fight; but the victory of good common sense over strong professional prejudice has been complete; and a most unexpected surprize accompanied it. The advocates and authors of the Carey Street site have suffered that kind of discomfiture which befel the Spanish Armada—they are wrecked and brought to nothing by a superior and irresistible force. *THE COURTS OF JUSTICE COMMISSION* is to be *DISSOLVED*; not, of course, on account of its selection of Carey Street, but on account of its extravagance, and the extent to which it has pushed what Mr. Lowe termed 'a frenzy for concentration,' and indeed because, in the opinion of Government, it has now discharged all the functions it was created to perform. The advocates of the Carey Street site, if they have heart left to continue the contest, will now have to make good their case, not before a tribunal of legal men—none the less professionally biased that they are the heads of the legal profession—but before the Government itself, while the funds to be expended will be furnished from the Imperial treasury.

This in a few words is the result, but the course of proceedings in the House did not for hours give the least clue to the prospect of so startling a solution.

There were three notices of motion on the paper—Mr. Gregory's, advocating a reconsideration of the site with a view to occupying the Embankment; Sir Roundell Palmer's, negating this resolution, and substituting one to the effect that the additional land, if wanted, was to be bought adjacent to Carey Street; and Mr. Tite's, to the effect that a site for additional buildings should be acquired on the Embankment, and two distinct buildings should be erected.

Mr. Gregory began at five o'clock, and spoke for an hour. His arguments were the same with which the readers of this journal have been made familiar, and were based on the same facts. In one conspicuous instance, he quoted verbatim one of our attempts to put the kernel of the matter before our readers, and said that the struggle was 'Lincoln's Inn against All England.' Mr. Gregory wisely gave great prominence to the financial part of the advantages obtainable if the Embankment site were secured, and though his figures and estimates were attacked in every kind of way, they came out of the ordeal triumphantly, proving, in fact, to be below rather than above the real amounts as stated from official sources by Mr. Lowe. This part of the case caught the ear of the House, and was not forgotten through the entire evening.

Sir Roundell Palmer, who occupied fully a second hour, exhausted

all the arts of the advocate in his warm and, we had almost said, uncandid support of the Carey Street site; and yet, though the full House which had listened patiently to Mr. Gregory remained to hear out his long and painfully elaborated account of what would best suit the lawyers, he seemed to rouse little sympathy in his audience; and his concluding passages, in which he ridiculed the proposals of his opponents as 'the visionary dreams of dilettanti gentlemen' possessed of the 'demon of good taste,' well merited the severe rebuke administered by Mr. Lowe when he rose to speak.

For three more hours the debate was prolonged without much being added to the exhaustive speeches of the two leaders. Lord Bury and Mr. Locke spoke, and spoke well, in favour of the Embankment. Lord Bury's brief, emphatic, and pointed speech was especially a happy contribution to the debate. Mr. Beresford Hope supported the occupation of both sites, as proposed by Mr. Tite. After this Mr. Denman, and following him a succession of other speakers, advocated the legal side of the matter, and displayed that pertinacity in stating and restating what they did understand, and that easy and airy inaccuracy in handling what they did not understand, which seem inseparable from the eloquence of gentlemen of the long robe.

It was positively refreshing when some way on in the debate Mr. Tite rose, and in a few short, pithy, hearty sentences, greeted with a kind of rousing fire of cheering by the members, brought back the attention of the House from the details of legal convenience to the practical bearings of the question.

Lord John Manners, in the course of a long, not to say wearisome speech, contributed to the Carey Street advocates the remarkable argument that the buildings, if placed on the Embankment, would have so very bad a foundation to stand upon, that their cost would be raised by no less a sum than half a million! It was in reply to him that Mr. Locke made the short speech we have already noticed, and by that time the attendance had rapidly risen, and the House, which the lawyer's speeches and the dinner-time hour had emptied, had become tolerably full.

When Mr. Locke sat down, Mr. Lowe rose, and began in a style which at once showed that serious business was in hand. He told the House that the whole matter of the New Law Courts had already engaged his most serious attention, and that he had already had to take upon himself heavy responsibility in respect of them.

He then explained that a statement had been laid before him very soon after he first took office, making out a total outlay, past and prospective, of 3,350,000*l.*, which Mr. Lowe considered might really mean 4,000,000*l.*, accompanying an application that 600,000*l.* of that sum might be advanced by Government to buy extra land. Then, reading the clauses of an Act which, with unusual measures of precaution, limited the outlay to one and a half million, he said, 'it seemed to me as if the ground had given way under my feet when we compared the two statements.'

To the proposal to advance this money Mr. Lowe said 'NO;' and he drew a humorous and perhaps overcharged picture of the excessive agglomeration of department upon department which had led to the vast increase of the proposed structure with which this increased estimate corresponded. Showing next that there was not really an available separate fund out of which to build the Courts, but that the money must in effect come out of the public purse, Mr. Lowe concluded by making the startling proposal that the Commission, which he considered had done its work, should be relieved of its power, Government undertaking the whole matter. Mr. Lowe went on to state clearly what the Government, if empowered to act, would do. It would adopt a site on the Embankment with Howard Street as its northern boundary, would build thereon a building of moderate size, and would take its time about selling the Carey Street property. We regret to add that the right hon. gentleman contributed as a suggestion of his own the notion that the elevation of Inigo Jones's design for Whitehall should be adopted for the façade of the new structure!

The not unnatural complaint of Mr. Henley (who moved an adjournment), that the House was taken by surprise, elicited a short explanation from the Premier. The adjournment seemed to be eagerly accepted both by him and by the First Commissioner of Works (Mr. Layard), and it is understood that a month hence, when the subject comes on once more for discussion, the Government is to bring forward its definite proposal.

So ended this debate, which was carried on in a way that cannot be considered as other than creditable to the good sense and judgment of the House. We believe the public advantage will be in the end served by the alteration now proposed, though loss of time is inevitable. We

believe, too, that the time will come when, either in consequence of required extension of the Law Courts, or to meet some other public want, that part of our proposals which had reference to widening the Strand, and rectifying its line of frontage, must be carried out, though it may perhaps not be in this generation. Of one thing there can be no doubt; the decision of Government to throw the weight of its enormous influence into the scale, will render certain the adoption of the proper site for this great public building. This will of course influence largely the decision to be taken as to the western part of the Embankment, and makes it reasonable now to hope that this great opportunity will be worthily employed, and that the northern bank of the Thames will be formed into an architectural feature unparalleled in Europe.

OUR RAMBLER

IN AND ABOUT THE HOUSES OF PARLIAMENT.

[SECOND ARTICLE.]

THE Rambler left off his first notice of Sir Charles Barry's masterpiece with a reference to the Royal Gallery, where much new work, chiefly of a decorative character, has been recently carried out under his son, the present architect of the Palace. Leaving this fine apartment to proceed northward, or along the interior, one is more than ever struck with the absurd scale of the marble group by Gibson, which fills the whole view in passing from the Royal Gallery to the Throne Room. This room is small and *petite* in its parts, as compared with the chamber one has just left, and the figures of the Queen and attendant Virtues are colossal, out of all proportion, while the incongruity of the effect is only intensified by the white colour of the marble.

Will Mr. Edward Barry give ear to our petition, when we pray, in common with many other critics, that this group may be removed to the end of Westminster Hall? Placed under the great south window in that noble chamber, and crowning the flight of steps by which Sir Charles joined the Hall of Rufus to the Parliament House of Victoria, this work of Gibson would not only have justice done to it as a fine sculptural group, but the exigencies of scale and proportion would there be amply satisfied, while the historical proprieties of the place would be brought into harmony.

The Throne Room itself, denuded of this heavy marble group, would assume its proper effect. It is one of the most elegant apartments in the building. The very interesting and excellently-scaled portrait-figures of the sovereigns of England, painted by Mr. Burchett (the present head-master of the schools at South Kensington), give a highly decorative effect to the room. They form a kind of pannelled frieze, which holds its own as against many more recent and more ambitious efforts in mural decoration.

Of the House of Lords it is unnecessary to speak. The Rambler has seen some of the more conspicuous among the legislative chambers of Europe, but none to compare with that at Westminster, which seems thoroughly to embody, in its general design and detailed decoration, the historical traditions of an old nation. We should judge, from some remarks made incidentally in the late discussion on the new House of Commons, that the day is not far distant when some reconstruction of the Peers' Chamber must be made for the accommodation of the Commons, who may have occasion or desire to visit the Upper House. The present 'bar,' to which Her Majesty's 'faithful Commons' are bi-annually summoned, is most literally named, for it resembles nothing so much as a prisoner's dock or a witness-box in any of our law courts.

The Rambler in the House of Lords could not suppress a hope that Mr. Barry may adopt the same happy treatment of the figures which occupy the niches between the windows, which has been applied to those in the Royal Gallery. The gilding of the statues would not only give a more sumptuous appearance to the chamber, which the present dark mass renders somewhat dingy and sombre, but would give a prominence to the figures themselves, which, both in their subject and treatment, they fully deserve. Their dark bronze effect, as they show at present, places them at great disadvantage between large surfaces of brilliantly-coloured glass.

The House of Commons, in its more sober character, seems to develop some of the spirit of the old sumptuary laws, when compared with the gorgeous chamber which has been allotted to what may be classed as the patrician element in the Constitution. The distinction, however, is not one which can offend the average English instinct, for it is most truly said that 'John Bull loves a lord;' and the superior style in which the peers are housed at Westminster only expresses that national affection for the lordly character.

Apart from criticism of this kind, the House of Commons is, in the Rambler's estimation, the more perfect of the two Chambers in an architectural aspect. It appears, however, to possess the fatal blot of very insufficient accommodation for the 658 members who have a right to seats in it. Nothing can be more absurd than to visit this defect on the architect, for it seems he only obeyed his clients in shaping the dimensions of the House. Barry is not the only architect who has been made the scapegoat of mistaken instructions. If his son and successor is to be engaged in the reconstruction of another and larger House, we hope he will follow, as religiously as possible,

the general design and architectural character of the present one, even down to details. We mean detail of design, not of arrangement; for we should be sorry to see, in a new and more commodious House, such scanty accommodation for the outer world as the present Stranger's Gallery affords. We should still more regret the perpetuation of the 'Ladies' Cage,' which, when filled, is dreadfully suggestive of the Zoological Gardens. We say this, of course, with all respect for its fair occupants, whom, indeed, it is impossible to distinguish there as human beings, not to say as ladies. It is no slight reflection on the gallantry—nay, the civilisation of the nation—that we should confine the fair visitors to the House of Parliament within the bars of an unlit cage. Parliament means a place for talk, and it is surely penalty enough to condemn the gentle sex to *silence*, without superadding the deprivation of sight and sound. It may be that the present arrangement was resorted to from a somewhat exclusive consideration for the feelings of susceptible members, whose effusions may be apt to become disturbed by too prominent a display of the fair element of creation. Such an idea speaks badly for our modern gallantry, as compared with those chivalric times when men were moved to their highest deeds of prowess by the presence of fair women. In sober truth, the arrangement of the 'Ladies' Gallery' in the present House is much more suggestive of Oriental than of Western civilisation.

Leaving the 'Houses' proper, we find our way downwards to the Crypt or St. Stephen's Chapel. The restoration of this historical fragment as an integral part of the Houses of Parliament is as creditable to the architect who has controlled it, as it is to the 'powers that be' who commissioned it. The only element of difficulty attending a work so complete and admirable is the speculation as to its probable future use. There will be small credit due to the religious and churchman-like feeling of our legislators if they allow so beautiful a chapel to become a mere 'fancy' work for the delectation of Saturday visitors to the Palace.

Coming outside, and into New Palace Yard, the Rambler was naturally attracted to the new works which Mr. Edward Barry has designed in this quarter. The arcade recently built as a convenience for communication from the Embankment to the Palace—chiefly intended, we presume, for City members of the House—is certainly not a work which can be honestly praised. It has nothing to do but to carry itself, and yet its scale and masses of material are more Egyptian than Gothic. It is difficult to understand why such Cyclopean proportions were resorted to for a mere passage, while the result is such as to dwarf the façade which runs from the Clock Tower on the east side of New Palace Yard. A structure composed entirely of metal and glass could have been erected with as much regard to architectural style; and by proper design adapted to the material much of the unfavourable criticism which one hears on the work as it stands, might have been prevented.

The new boundary railing, in metal chiefly, which defines New Palace Yard, is also a fair subject for criticism, and has already been referred to in these pages. The stone piers which occur at intervals in the length of the high and cleverly designed metal railing are a mistake from first to last, and nowhere look more absurd than at the entrances, where they jumble together at points at which, in the case of a stone construction, they would have been most obvious and appropriate. If the same treatment which has been adopted for the lamp pillars on the space westward, adjoining St. Margaret's Church, had been adopted here, the effect of the railing round New Palace Yard would have been consistent as to material and much more agreeable as to design.

There is more serious criticism to be made on this arrangement of solid stone piers in street railings. A more aggravated form of the same evil is to be found at Charing Cross Station, where foot passengers in the Strand are hourly placed in peril of their lives by the impossibility of seeing the cabs or carriages which necessarily come pretty rapidly down the slope from the station to the Strand. As if stone piers were not obstructive enough to sight, small houses have been built at either gateway. It is not difficult to foresee serious and fatal accidents resulting from this treatment of carriage-ways in our public thoroughfares.

The statues which fill the niches in the stone arcade which extends from the Clock Tower to the Commons' Entrance, are not such as one can speak of with unmixed admiration, though their author, Mr. Armstead, is admitted to be a sculptor of original, not to say daring ability. His work has the recommendation that it is never common-place; but in that very quality lies the danger of its failure. The reader will judge for himself (apart from any criticism which the Rambler might be disposed to offer) what actual value should be placed on this series of figures representing grand historical personages.

Within the precincts we are speaking of, another statue, and by Marochetti, was placed, intended to represent the late Sir Robert Peel. It made its appearance in New Palace Yard, in a place of honour, at the very entrance to the precincts of the Legislature; and before the outside public had had time to see it, it was condemned to removal and oblivion; nay, to total destruction; for we learn that it has been in great part melted up to supply the material for Mr. Woolner's new statue of Lord Palmerston! 'Peel est mort! vive Palmerston!' will be the cry which must be expected to salute the coming statue of the late popular Premier. And yet, if rumour be true, the same kind of treatment, in a sculptural sense, which in-

curred the dismissal of Peel, has been adopted in the design of the statue of Palmerston. The figure of Peel, as far as head and features may be considered, was probably true enough as to artistic portraiture; for the rest of it, we all saw that it was conceived and modelled on a pattern which the artists of Saville Row must have envied. Coat and trousers were represented in the most unexceptionable cut, while the boots of the period were tenderly imitated. What was the result of all this 'naturalistic treatment'? Every man who passed this 'realistic' figure during a wet and stormy day—a condition of climate not very uncommon with us—naturally felt that the figure of Sir Robert Peel should at least have had a hat upon his head. The sculptor, however, evidently did not dare to venture so far as that. So, in the absence of that necessary appendage for personal comfort, the conscientious display of superfine broadcloth only suggested ideas of bronchitis or rheumatic fever to every passer-by, who, it may be supposed, or hoped, was much more seasonably costumed. There was no real *art* in such sculptural treatment as this, and the popular instinct rapidly discovered it. Hence the consignment of the figure to the melting-pot without protest or discussion. Some useful inference may be drawn on this point by a reference to the statue of George Canning, which stands not far distant from the position which that of Peel occupied. A conventional, as opposed to a 'realistic' treatment of the subject, was employed in that case. There was no attempt at tailoring, and so the statue remains as a worthy memorial of an historical personage, which is not a whit the less real in its true meaning, as a public statue, because its author ignored all consideration of coat and trousers. This is a subject to be laid to heart by the apostles of that 'naturalistic' school of sculptors whose 'initial force' is so highly lauded by friendly critics in these days, and whose works, ignoring the intrinsic beauty of simple *drapery*, apart from fashion, threaten to bring our public statues into a phase of caricature from which the boldest of living celebrities would shrink if he could possibly foresee his living presentment modelled into the 'realistic' mould which marked the departed statue of Sir Robert Peel.

From New Palace Yard and its accessories the Rambler crosses over the road to the newly formed enclosures, supplanting the begrimed and stunted efforts at vegetation which were called trees formerly on that spot. Mr. Barry and the Office of Works have laid the public under a debt of gratitude for the improvements which have been effected in this locality. The fine, healthy-looking, open space now railed round by way of affording convenient thoroughfare, is an appropriate adjunct to the more imperial conveniences which have been demanded by the Houses of Parliament on the other side of the way. The new enclosures are evidently designed to receive flowers, and generally to be rendered pretty and ornamental—qualities which are rare enough in the external aspect of our cities in these utilitarian times. If the spaces now railed round north of St. Margaret's Church are to be looked on as a sort of flower-garden, the design of the iron work becomes very natural and good; as a mere railing it has a novelty of effect which scarcely recommends it.

To recur to the 'Houses' themselves, one cannot but regret that the equestrian statue of Cœur-de-Lion in Old Palace Yard was ever placed in such proximity to the building. The scale of the one is so utterly out of all proportion to the other, that Sir Charles Barry's work is reduced by Marochetti's to the appearance of a one-storeyed building. Of the sculptor's work, *per se*, one cannot speak too highly. It has a very noble character, and it is one of the few equestrian groups we know in which the historical personage looks rather the master than the servant of the horse. In the case of the ever-to-be-remembered statue of 'The Duke' at Hyde Park Corner, the figure has much more the character of a groom—cocked-hat notwithstanding—than of 'the hero of a hundred fights.'

Wandering 'in and about' the Houses of Parliament, the Rambler could not help asking himself whether the public, so called, ever dream of the work, intellectual and physical, which the architect of such a building must accomplish before even a single brick is laid. Such a query raises a matter on which the popular mind is, not only profoundly, but cruelly ignorant. The mere fact that Sir Charles Barry produced, from his own hand, more than one hundred different drawings, *to scale*, for the Clock Tower alone, should give our non-professional readers some conception of the enormous expenditure of mental and physical life which is entailed by the design and supervision of such a building as the Houses of Parliament.

OPENING OF THE WEDGWOOD MEMORIAL INSTITUTION, BURSLEM.

THIS building, which was illustrated in our last number, was opened on Wednesday by Earl de Grey and Ripon, with much *éclat*. An Exhibition of works of art, deposited on loan by various private contributors and the South Kensington Museum, has been established in the building, and the ceremony of Wednesday consisted in a public presentation of addresses and the formal opening of this Exhibition, followed by a luncheon in the building.

The day was fine, and a large concourse of visitors was assembled, while the greatest interest was evidently taken in the proceedings by the inhabitants of the town.

The address, and Earl de Grey's reply, touched upon the subject of primary education as essential to form the foundation of all good

training in art schools, and the same subject was more than once referred to in the very interesting speeches at the luncheon. Mr. Adderley and Mr. Cole both spoke excellently well; and a long and interesting speech by Mr. Smiles was listened to with marked attention. The other speakers included Sir E. M. Buller, Mr. Melly, Colonel Roden, Mr. W. S. Allen, the architect of the building (Mr. Edgar), the chief bailiff (Mr. Hulme), Mr. Davis, Mr. Davenport, Mr. C. M. Campbell, Mr. Wedgwood, the indefatigable Secretary (Mr. Woodall), and Mr. Roger Smith. But the speech of the morning was, of course, that of Earl de Grey, who spoke at some length, and with an earnestness, force, and judgment which well became his position as a member of the Government and as chairman of the meeting.

The building has been so recently illustrated in our columns that we shall not need to attempt any criticism or description of its original and effective exterior. Of the interior it may suffice to say that it appears excellently contrived and well-built, and that the unusually good lighting of the pictures and other works of art was referred to in the very highest terms of praise by Earl de Grey and others.

Of the Exhibition itself we can speak with great satisfaction. As was to be expected, a large and very choice collection of Wedgwood-ware forms a prominent feature in it. Seldom, if ever, has a more copious series of illustrations of the best work of our greatest potter been brought together; and a small selection of other specimens of ancient and modern pottery, including some fine Worcester, is also exhibited. A display of metal work (including the famous treasure of Petrossa) and of various other branches of art workmanship has also been got together, to which South Kensington has contributed largely. As there is, in addition, a good though small collection of oil paintings (including a fine Gainsborough), and another of water colours, it will be seen that this Exhibition is very complete, and speaks much for the energy and diligence of those who have got the various objects together. It is proposed to keep the Exhibition open three months, and at its close the regular work of a school of art will be commenced in the building. We heartily wish it success.

ARCHITECTURAL DRAWINGS AT THE INSTITUTE OF PAINTERS IN WATER-COLOURS.

THE annual Exhibition of this Society, formerly known as the New Water-Colour Society, opened this week in Pall Mall. This exhibition is always of interest to architects and lovers of architecture, because it is the one selected by several painters who habitually choose architectural subjects for their pictures.

Want of space compels us to postpone all examination in detail of the works of this class exhibited here this year. We must content ourselves with remarking generally, that while grand architectural subjects are fewer in number than they have been, there are yet enough exhibited to make the gallery well worth a visit to any architect. The veteran Louis Haghe heads the list with a fine interior of St. George's Chapel, Windsor, and sends some other subjects, which, though less ambitious, are hardly so successful. Carl Werner exhibits several subjects, the one most likely to attract being an Egyptian moonlight scene; though for powerful rendering of architecture this picture falls behind another effort of the same artist, in which the entrance to a mosque is given with all the force of nature. A fine view, also by Carl Werner, of the 'Castle of Chillon,' several sketches by Skinner, Prout, and contributions by Deane, Cattermole, and one or two other artists, who understand and care for buildings, enrich this exhibition, even if regarded solely from an architectural point of view.

BELLEK PORCELAIN.

THE eighteenth century was the great period for the establishment of schools of Ceramic art. Not that the actual progress then made was more marked than that which has distinguished the manufactures of our own country, as well as of France, since 1851; but the characteristic of the modern advance has been development rather than originality. As the three famous divisions of Grecian ware mark a long course of connected labour rather than a series of distinct efforts, so the beautiful productions of Minton and of Copeland are more instinct with talent than with genius. But in the last century manufactures were reared by Royal care, and systematic efforts were made, in different kingdoms of Europe, to establish these national sources of wealth. The Dresden manufacture dates from 1706 for the soft ware, and from 1715 for hard porcelain. The Capo di Monte manufactory was established by Charles III. (Don Carlos), in 1730. The soft Sèvres porcelain was first manufactured in 1740, and the hard, or true porcelain, in 1769. The factory of Buen Retiro, near Madrid, owes its origin to the same prince who endowed Naples with the factory of Capo di Monte, and dates from 1759. The great English potter Wedgwood, about the same period, did as much for the Ceramic art in England as was effected by either of its Royal patrons on the Continent in their own dominions, and originated as distinct and admirable an order of *faïence* as that of any earlier artist. Nor should we omit to refer to the various schools of old English china, the productions of which are well known to *amateurs* as the work of Chelsea, Derby, Plymouth, Bristol, Rockingham, New Hall, Worcester, and Colebrook Dale.

As we retrace the history of the potter's art, we find the impress of original genius to be more and more decided. Bernard Palissy, who

covered his dishes and plates with reptiles, fish, and crustacea that almost counterfeited nature, died in 1589. Madame de Hangest, under whose auspices the ware made in her Château of Oiron, near Thouars, known as the 'Henri Deux faïence,' became famous, died in 1537. Luca della Robbia, the inventor of that embossed and enamelled ware known by the name of his family, died in 1481. Maestro Giorgio, the most celebrated manufacturer of the iridescent majolica, known as the ruby lusted ware (the secret of which died with him), lived between 1470 and 1552. Thus in pottery, as in so many other branches of human art, history records the advance of general excellence, accompanied by the increasing variety of individual or creative genius.

A regard to these considerations leads the lover of art to welcome with the greater heartiness such a phenomenon as the establishment of a new school among ourselves; and no lover of England, whatever be his nationality, can fail to experience the utmost satisfaction at the announcement that it is in that portion of the British Isles to which we look with the greatest anxiety that this new school has been established. The Belleek Pottery, to the productions of which we now call attention, is situated on the confines of Donegal and Fermanagh, in the vicinity of Lough Erne.

It was during a stroll through the South Kensington Museum that the eye of the writer fell on one or two specimens of earthenware altogether unlike any other articles in the long ceramic series exhibited in that place. They stood modestly apart in one of the cases of the portion of the building devoted to the loan collections; and it was only by an investigation of the written labels that one arrived at the conclusion that the graceful specimens were products of the skill and taste of the Ireland of to-day. The first impression produced on the mind was, that some very fine shells of the nautilus, or some congeneric mollusc, had been mounted in china. Then it became clear that the brilliant iridescence of the ware was the work, not of Nature, but of the art which had caught from Nature one of her most inimitable perfections.

In chemistry, indeed, we rather guide and control, than attempt to imitate, the productions of nature. We produce a natural effect by following, as closely as possible, the procedure of the great Artificer. To cause an iridescent lustre by any mechanical process would be pure imitation, although even this has to some extent been effected by machine engraving on steel. But to compound and burn in such a flux as that which coats the Belleek porcelain with an indestructible nacre, is only to call in the aid of Nature herself to simulate some of her most delicate works.

The material employed in the Belleek porcelain is a fine white felspathic local earth, almost identical with the basis of the ware of China itself. On the borders of large granitic formations, the several elements and constituents of this ancient rock are often to be found in a state of disintegration. Delicate variations, which it is hard for the chemist to detect, make all the difference in the adaptability of the various forms of what we generally term felspar for the work of the potter. In this case it happens that slightly dissimilar productions are found in such close proximity, and in such rich abundance, that the most famous wares of the East and of the West may be closely reproduced at Belleek, while, at the same time, a class of porcelain has been perfected which is peculiar and unique.

This Irish porcelain is of a pure creamy white. The surface is either that of the finest biscuit, or that of mother-of-pearl. The two methods of finish, that with and that without the iridescent gloss, may be combined, and that with the happiest effect. Figures in biscuit may project from an enamelled background; or lusted forms may be relieved on dead white. Gilding is readily introduced with more or less profusion.

The artists employed at Belleek have rather followed those of the old Plymouth china than any other masters of their craft. Shells and sprays of coral are reproduced with a fidelity to nature that is almost magical; the peculiar lustre of the ware giving a truthfulness to the representations of these natural objects such as has never before been attained by the Ceramic art.

The Belleek designer has the further merit of having laid under contribution, as affording models, a branch of the great Fauna of our planet which has hitherto been unaccountably neglected. Shells and corals have been long seized upon by the artist, both as affording a material for camei and other ornaments, and as yielding graceful forms for the imitations of the modeller. But the novelty of the Belleek designs is, that they are taken from among the Radiate animals. It is only necessary to reflect on the enormous variety of forms which this great province of Zoology comprehends, and the wonderfully fantastic and yet symmetric figures into which some of the echinadae and asteriadae run, as it were, *into flower*, to see that an endless store of beautiful forms is here offered to the artist. A few only, and these extremely well selected, have as yet been reproduced in porcelain, but the capabilities of the field are inexhaustible.

One point of critical value should be insisted on. The only inferiority we have as yet observed in the Belleek ware arises from a neglect or ignorance of a very simple canon of art. Few things are more certain to preclude a work of art from receiving permanent admiration than CONFUSION OF SCALES. In sculpture this is eminently the case; and the Belleek ware almost pretends to the dignity of sculpture. Neglect or confusion of scales is a sure mark of the decadence of art. We have a well-known instance in the inexplicable confusion of the elements of the group known as the *Toro Farnese*—a piece of sculpture of which the workmanship is as wonderful as the design is perplexing and faulty. We have an approach to the same fault in the Laocoon. In some of the Belleek articles we have this fault in its most rampant form. A dolphin, or a triton, or a naereid, very gracefully modelled, as a single figure, is represented as supporting the shell of a sea urchin, or some well-known univalve, rather larger than itself! The effect may be very well for the uneducated eye; but when once pointed out, it is shocking and inexcusable. We insist on it with the more urgency because, unless it is at once admitted and abandoned, it will prevent the attainment of that permanent degree of merit and of excellence which, in almost every other respect, this beautiful earthenware may justly claim.

The only articles which, with the exception of this grave sin against the laws of design, are other than admirable, are one or two very poor statuettes,

in which the hands and feet are out of all proportion. On the other hand purely conventional forms, such as Greek vases, or simple natural forms, such as shells and corals, are rendered with a truth and beauty deserving of the highest encomium. It is only the guidance of the eye and of the rules of the sculptor that is required in order to enable this new Irish ware to take a very proud position among the ceramic products of our own or of any other country or age.

Specimens of the same ware may be seen at Messrs. Mortlock's, in Oxford Street. Dessert and tea services have been ordered by Her Majesty the Queen and by H.R.H. the Prince of Wales. The Belleek ware only needs to be known in order to become highly popular.

TURNER'S LANDSCAPES.

THE interest still felt in Turner's art has been tested during the past week by the sale of a portion of Mr. Ruskin's collection of sketches at Christie's, together with one finished drawing belonging to another property; and the day after, by the sale of Mr. Dillon's collection, including many of his very finest drawings. It has often been a matter of speculation in late years whether the high prices which Turner's works have at different times reached in public sales would be maintained if a large number of them were to be again exposed to competition. The answer has now been given. Of thirty-nine mere sketches thus sold, the average price was nearly 40*l.*; a finished drawing of the early period went for 350*l.*, and the well-known 'Lucerne' for 980*l.*—prices which works of the same class, scale, and finish have perhaps never reached before. Mr. Ruskin's property was certainly sold at a great advantage, being accompanied by critical descriptions from the owner; and the prices did, in most cases, follow the guidance thus provided for purchasers. In the whole number of pictures which have been visible at Messrs. Christie and Manson's there are some which call for special notice, and suggest reflections which we shall attempt to make as brief as possible.

We wish to ask, is the admiration indicated by the prices paid for Turner's water-colours honestly felt by most of those who profess it? We ask this especially with reference to the works of the so-called 'middle' and 'later' periods. If the world really enjoys these works, the ordinary motives of human action will set many of our younger artists at work to imitate them. What cannot be denied, but stares every one in the face who considers them, is that they show extraordinary ability, a profound knowledge both of nature and art, and an imagination of the highest order. These things are past question for every one who is competent to judge in such a matter. It is no less evident, however, that they are the results of a bold experiment, or rather of a series of bold experiments, in pictorial art. As Mr. Ruskin has abundantly shown, they depart from all precedents in several respects, but in none more than this, that they set aside all the conventional limits prescribed by traditional systems of light and shade and of colour.

The gradations of light and the modulations of colour being infinite in nature, and contrasted with each other for the most part by indistinguishable refinements, this great artist set himself to reflect that infinite delicacy by a directly corresponding treatment. So many square inches of surface being given on which to picture the coloured surface presented to the eye, he represents the highest light by passages of white or bright yellow, and modulates downwards from that, following as faithfully as possible the subtle changes of nature, and purposely disregarding the consideration that on this scheme it will be impossible to display the contrasts which the luminousness of light produces in nature. By the conventional system of treatment, on the contrary, this contrast is broadly expressed. The painter knows that his light falls far short in brilliancy of that which it imitates. But he recognises the aim of setting before us that which is, after all, the main impression made by the varieties of light on a coloured surface—viz. that of a contrast in masses between light and shade. With this view, he must, at any rate, reach the shade, and to do this it is necessary to neglect many of the slighter modifications which fill the interval. The inferior limit of the scale at his disposal is the same as that which nature employs—absolute black, corresponding to the absence of all light-rays, if that were possible, from any portion of the coloured surface seen by the eye. But in the superior limit nature has—not a relative, but an absolute superiority, which extends downwards in a diminishing ratio—the luminousness of open-air light being unapproachable by any pigment. As an illustration of these remarks, we would compare the magnificent drawing of 'Norham Castle,' painted before Turner had begun these revolutionary experiments, with—to take one example among many—the sketch 'On the Rhine,' No. 24 of Mr. Ruskin's set. The former has two centres of grave and intense light—the glowing west and the lake's responsive surface traversed and environed by shadowed masses over which the mystery of their presence moves with calm swiftness of retreat. The sketch, 'On the Rhine,' was an attempt, it is true, at something very different, but it was an attempt at something which could not be attained adequately for the purposes of enjoyment. Where the light falls, the landscape is of a singularly bright pea-green, with shadows of brick red. The shadowed part is in the same key of red, and the sky—the really luminous portion of every view—is dingy by comparison with the gaudy lines of earth. Here is conventionality, though of another kind from that which is rejected. Shadows are never brick-red to the eye, unless on a scarlet surface; but it is true that they must be so represented if your highest light happens to be a bright green, and you refuse to miss even the slightest step in modulating downwards. If it should be objected that the 'Norham Castle' gives an evening effect, and the sketch one of full daylight, the finished drawing of the Lake of Brienz might stand instead of the former; though it appears to us less excellent in work. We cannot think that the ordinary picture-buyer would hesitate between the older conventional system of treatment and this strange later manner of Turner, which is unlike anything in art before or since. Nothing but the eloquence and insight of a true enthusiast as well as profound critic could have interpreted those dark sayings to the ordinary sense.—*Pall Mall Gazette.*

OPENING OF FREEMASONS' HALL.

THE NEW FREEMASONS' HALL, in Great Queen Street, Lincoln's Inn Fields, was, on the 15th inst., the scene of a very imposing ceremony—that of the dedication to the Order of Ancient, Free, and Accepted Masons of England of the new grand hall and offices. The hall is a fine building, and presented a gorgeous sight when opened for the first time in 'Grand Lodge.' None except full Master Masons, in craft attire, were allowed to be present, and the Grand Master, when seated on his throne, was surrounded by upwards of a thousand officers of lodges from all parts of the United Kingdom. The addresses relative to the building were heard, and then a choir chanted selections from the chapters of Solomon's dedication of the Temple, 'I have built thee a house to dwell in,' &c. The dedication in solemn form was then proceeded with, according to ancient rites, with corn, wine, and oil, and the Grand Master proclaimed the building to be dedicated to pure Ancient Masonry. The Grand Chaplain (the Rev. Robert J. Simpson) delivered an oration upon the Order; an anthem was chanted by the choir; and the Grand Lodge procession having re-formed, the distinguished column left the Hall in the same order in which it had entered. The Architect of the Hall, and the whole of the buildings connected therewith, is Mr. F. P. Cockerell.

THE STRIKES IN THE BUILDING TRADES.

THE masons of Manchester are still on strike, and, as a consequence, many bricklayers have had to be discharged. All the important new buildings are suspended, and large numbers of joiners and men employed in the other branches of the trade will necessarily have to be discharged if the strike continues. The masons of Coventry are now on strike, and notices have been given in twenty-six other towns, which, it is expected, will lead to similar results. The end of the month of May will probably witness more strikes in the building trades than ever have been known at one time before, the chief point of dispute being a determination on the part of the employers to pay the men by the hour. This system has been acted on in London for some years, but has been resisted in the provinces, the men preferring to be paid by the day, which every now and then has been shortened, until an attempt is now being made to make the working time forty-eight and a-half hours for the six days, only a few minutes over an average of eight hours a day in summer, and of course still less in winter. The towns in which notices have been given include Bolton, Bradford, Halifax, Liverpool, Leeds, and York. Most of the notices expire on May 1 and 3, with the exception of that of Liverpool, which expires on the 22nd of that month.

An attempt is to be made to settle the dispute in the Manchester building trade by arbitration, and Mr. Rupert Kettle has consented to act with the endeavour to bring about an arrangement. All agitation on either side is to cease pending the inquiry.

PARLIAMENTARY PROCEEDINGS.

Kensington Sick Asylum District.

On April 15, Mr. J. TALBOT asked the President of the Poor-law Board whether it was his intention to recommend the dissolution of the Kensington Sick Asylum District; and, if not, how soon it was likely that the plans for that asylum, which were submitted to the Poor-law Board for their approval in December last, would be approved.—Mr. GOSCHEN replied that the Board had no power to dissolve a sick fund district, but such powers were asked for in the Bill introduced for the amendment of the Metropolitan Poor Act of 1867. With regard to the plans for the Kensington Asylum, a site had been offered for 15,000*l.*, and a further expenditure for drainage, enclosure walls, and so forth. It had been represented to him that that expense might be saved by utilising the land at present belonging to the Kensington and St. Margaret's, and St. John's, Westminster, boards of guardians, and the delay had been occasioned in the endeavour to secure their co-operation with that object.

Waterloo and Whitehall Railway.

On Friday, April 16, Mr. GREGORY asked the President of the Board of Trade whether his attention had been called to the piling in the river Thames between the Charing Cross Railway and Westminster bridges; and whether he could state when it would be removed, or who was responsible for the continuance of it.—Mr. BAIGT replied: I believe that no Government department has at present any power to deal with the obstruction. The piles are connected with the works of the Waterloo and Whitehall Railway, and the time permitted to that company has been extended to July, 1870. Until that time no one can legally interfere with the piles; but after that date it will be in the power of the Board of Trade and the Conservators of the Thames to take steps for their removal.

The Metropolitan Railway Bill.

In the House of Commons, on April 16, there was a short debate on the Metropolitan Railway Bill. Mr. Sheridan succeeded by a majority of eight (175 to 167) in carrying a clause repealing the exemption in the Act of last year, and compelling the company to provide smoking carriages in each train, but this decision has been since reversed.

Durham County Courts.

On April 16, Mr. HENDERSON asked the Secretary to the Treasury if he was aware that 2,000*l.* was paid two years ago for a site on which to erect suitable offices for the county courts in the city of Durham, and that the present premises did not contain the requisite accommodation for transacting the business of the district, and if he would state when the erection of the new offices was likely to commence.—Mr. AYTON was sorry to say that he was aware of the facts mentioned by the hon. member, which rendered it necessary for him to introduce an item into the Estimates for the

present year. The buildings would be entered on as soon as the money was voted, and they would take some time to construct.—On the 17th inst., in reply to a question, Mr. AYTON stated that a sum of 2,000*l.* will appear in the miscellaneous estimates for the erection of the said offices.

Irish Monuments.

On Tuesday, April 20, Mr. AGAR-ELLIS asked the First Commissioner of Works whether Ireland would be included in any measure he might bring in for protection of ancient monuments, as indicated in his answer to the hon. member for Buckingham on April 2.—Mr. LAYARD said the Commissioner of Works had no control or jurisdiction in Ireland. The monuments there were under the Treasury. He was aware that there were many important and interesting historical works in Ireland, and he should be very glad if anything were done for their preservation. He had received many communications from Ireland on the subject, and particularly one from Lord Talbot of Malahide, who offered in the kindest way to be of what assistance he could in preserving those monuments. But he must repeat that the question did not rest with him.

The Site of the New Law Courts.

On Tuesday, April 20, Mr. GREGORY having presented a petition signed by 7460 persons in favour of placing the new Courts of Justice upon the Thames Embankment, moved, 'That in the opinion of the House it is desirable to reconsider the question of Carey Street as the site of the new Law Courts, inasmuch as the Thames Embankment between the Temple and Somerset House now offers many advantages for the erection of such buildings.' The petition presented had been signed by 560 members of the learned professions, by 131 gentlemen, by 591 clerks, by 733 persons of the building profession, and by 2840 tradesmen. Petitions in favour of the Embankment site had also been presented by the Middle Temple and by the Inner Temple in their corporate capacity, while the benchers of Lincoln's Inn had not presented any petition in favour of their site. This was the best reply to all the audacious paragraphs and assertions which had been inserted in pamphlets and sent round to hon. members. The gentlemen of Lincoln's Inn said that both branches of the legal profession were nearly unanimous in favour of the Carey Street site, and that as the funds were supplied chiefly by suitors, it was unreasonable that the site should be changed in opposition to the wishes and interests of the suitors. The real truth was that the opposition to the change of site originated, not with the mass of the legal profession, but with the Lincoln's Inn solicitors. That was the whole story. He wished to remind the House that the motion he brought forward pledged the House to reconsider this subject, and served to express this opinion, that the Thames Embankment presented great qualities and advantages as the site for the New Palace of Justice. He did not advocate any committee or Royal commission whatever. He thought they had information sufficient, and he was content to leave the matter in the hands of the Government. The structure of his motion offered no impediment to those gentlemen who thought that a portion of the Law Courts should be on the Carey Street site, and a portion on the Thames Embankment. That was advocated with great force by his hon. friend the member for Bath (Mr. Tite), and he believed his hon. friend the member for Cambridge University (Mr. Beresford-Hope) was of the same opinion, as he advocated a high sky line, and lofty towers carrying the eye along the Strand. These advantages might all be realised if the House accepted his resolution. The Court of Probate and the Register Court would require a large building with lofty towers, and they might be placed in the exact position which his hon. friend required. Great stress had been laid on the subject of concentration, and he agreed in the importance that was attached to it; but they must remember that contiguity would answer all the purposes of concentration, and that the fact of the courts being separated by the breadth of the Strand, with a sub-way connecting them to pass through which would be the work of seconds, not of minutes, would not militate against the scheme of the commission instituted by Sir G. Lewis. For himself, he preferred such a scheme to that great building which the commission contemplated, that terrible pile which weighed upon the imagination like a nightmare. No doubt they would now be told that they had no right to re-open the question. But he contended that the Government had already advanced considerable sums of money on the site, and they were bound to see that it was laid out to the best public advantage. By the Act of 1865, constituting the commission for building the courts, it was provided that the compulsory powers contained in the Act should not be exercised till a certificate was given that the whole cost should not exceed 1,500,000*l.* Of this sum, 1,000,000*l.* was to be advanced from the suitors' fund, and 500,000*l.* from the Government. But that estimate had proved greatly below the mark. The certificate was given, but fresh demands were constantly made. He did not blame those who were originally responsible for this estimate, for new offices had since been added. But he reminded the house that Parliament had already been called upon to sanction an additional vote of 700,000*l.*, and that was only the beginning of the expense. The Thames Embankment had never been considered when the present site was determined on. There were only Westminster, Lincoln's Inn, and the present site in competition; and he was bound to say that of these three sites, the selection actually made was the right one. With regard to the expense there could not be a doubt that the country would reap the benefit of an enormous saving by the adoption of the Embankment site. The money already expended on the Carey-street site taken along with the costs was very nearly 850,000*l.*, while the additional sum required was 700,000*l.*—thus making 1,550,000*l.* as the cost of the site alone before a single brick was put into the ground. But then there were the approaches. It was agreed on all hands to be necessary that the Law Institute must be removed. Mr. Street, the architect, was of that opinion, and he put down the expense at 100,000*l.* Then, on the north-west end of Carey Street there was the King's College Hospital, which dominated the site, and so close was it that Mr. Street had actually been obliged to cut off an angle of his own plan in order to effect a separation between them. Everybody knew that, sooner or later, the hospital must be removed. However, he would not estimate that—he would leave it *in futuro*, though he felt satisfied that for the purposes of air and light

the hospital would require to be removed. But then he came to matters that were absolutely necessary—to the fresh approaches that would be required for the Law Courts. Mr. Street had made a carefully prepared report on the subject, accompanied with plans, and he made new approaches part and parcel of his scheme. He stated that while the greater portion of the persons attending the courts would come from the Strand, the judges or those who held high station connected with the courts would probably come from the west, or would enter the building from the north-west by Carey-Street, so that it was essential, in his opinion, that important alterations should be made in the roads on the north-west agreeing with the site. Mr. Street accordingly laid down four such roads, and the expense of them he estimated at nothing less than a million. But he had not touched the approaches from the City side, though a portion of the business and of those who attended the courts would come from the City. Mr. Street had now modified his views and given it as his opinion that the existing approaches would be enough for the present, but he (Mr. Gregory) would pin him down to that one word in his report, that these alterations were 'essential.' As an additional authority he might cite the opinion which had been published as a parliamentary paper, given by Mr. Shields, the civil engineer. There was much in Mr. Shields' paper of a speculative character with which he did not agree, but he was emphatic in his opinion that the great defect of the Carey Street site was its want of leading thoroughfares on the north-west side, and he proposed a new street which would lead from Carey Street by Lincoln's Inn Fields to Farringdon Street and St. Paul's. Mr. Shields put the expense of the approaches from the east at 600,000*l.* Now, the *résumé* of the whole was—for the Carey Street site, without a brick being put upon it, there had already been expended 850,000*l.*, and there was required 700,000*l.* The Law Institution would cost 100,000*l.*, the approaches from the west would cost 1,000,000*l.*, and the approaches from the east 600,000*l.*, or altogether 3,250,000*l.*, as the total cost of the Carey Street site. On the other hand, if they took the Thames Embankment they knew that the cost of the site would be 1,500,000*l.* The houses on the Strand side would no doubt be costly, but the houses towards the river side were of an inferior description, and would be had cheap. In fact, nobody estimated the cost above that amount. So that the question here was the difference between 1,500,000*l.* and 3,250,000*l.*, making a difference of 1,750,000*l.* for the Chancellor of the Exchequer. As to the approaches, they had got all that required to be constructed already. They had the great thoroughfare of the Strand. They had the Embankment itself; the river steamers, and the railways running all round London. But then it was alleged that if they were now to reseat the land which had been acquired at so much cost, they could only do it at a loss of 500,000*l.* This was an absurd exaggeration. A gentleman, whose name he would have no objection to communicate to his hon. friends on the opposite side in private, told him only yesterday that he was prepared at the instant to give proofs to the Government of the most satisfactory character that a company would be ready to take the Carey Street site off their hands at the price paid for the land irrespective of the law costs and the drainage. Yes, but the gentleman said that if this resolution in favour of the Thames Embankment passed, such would be the value of the Carey Street site that it would be a gain rather than a loss to the Government. Therefore he denied the allegation that Government would lose a shilling. In fact, the Corporation of the Law Institution stated that the rise in the price of land in the neighbourhood was such that the value of their ground had been raised to the extent of 50,000*l.* He now came to the question of convenience—the convenience of the lawyers and the convenience of what were called the suitors, who were in reality the public. It was said that the Thames Embankment would be inconvenient to the lawyers. That might be so, but the inconvenience was infinitesimal. There would be a subway under the Strand which would enable the lawyers to pass to and fro with sufficient expedition. In the petition it was alleged that the lawyers would be obliged to change their chambers, owing to the distance of the Embankment site from the places where they were located. But he had tested the amount of inconvenience by walking from Lincoln's Inn to the Embankment site, and had accomplished the distance by the present circuitous route round by Carey Street, crossing the Strand, in four minutes and twenty seconds. He had no doubt that when the subway was made, the time occupied by traversing the distance would be reduced to three minutes. It was said that at present the lawyers paid 12,000 visits a-day to the Law Courts, and that if they were placed 50 yards from the crossing of the Strand, they would have to go an additional 600,000 yards, and then it was said, only conceive what an additional amount of shoe-leather there will be, and what an expense will fall on the suitors. In a letter written by Mr. Whitmore, the treasurer of the Temple, he showed that the suitors would gain so far as regarded shoe-leather, and that great convenience would be derived by the distant solicitors from the construction of chambers and offices on the Carey Street site, and that such employment of the site would be highly profitable. If the Carey Street site were devoted to chambers, counsel would be within easy call, and in three minutes they could be with their clients in the law courts. That was the view of Mr. Webster, the great champion of the Carey Street site, who admitted that any one who had experienced the great obstructions in the eastern and western arteries of the metropolis must be convinced that the nuisance which now existed would be increased when the new courts were placed on the Carey Street site, and he stated that Carey Street must be extended to Farringdon Street on the east and to Covent Garden on the west. Mr. Webster stated that the Strand, and Fleet Street, and Holborn, might be relieved by subways under the Strand near St. Clement's Church, under Fleet Street, under Chancery Lane near the Rolls Court, under Serjeants' Inn, and under Holborn near Gray's Inn. Now, if the Carey Street site should be selected, the whole district would be converted into a kind of rabbit warren. He now came to the question of the convenience of suitors. Lawyers seemed to think that suitors were made for attorneys. Now, who were the suitors? Why, they were all suitors, and consequently the convenience of the suitors was the convenience of the public generally. Another important point was the necessity of some direct communication north and south. This could be obtained by means of a street from Little Turn-

stile in Lincoln's Inn Fields, running down to the Strand. There was another objection, that although the Embankment might be large enough for the courts, it did not admit of expansion, and that more room might hereafter be required. The real answer to that was that the whole tendency of law reform at present was not to expansion, but to contraction, as was shown by the report of the Judicature Commission presented to Parliament a few days ago. Another objection to the Carey Street site was that for the next seven or eight years the Strand and Fleet Street would be blocked up by the conveyance of materials, whereas all the materials for the Embankment site could be conveyed by water. To show that the Embankment site presented greater advantages than the Carey Street site he would refer to the opinion of Mr. Barry, who said, that as regarded the Law Courts, there could be no question that a great central building, flanked by the Temple on one side and by Somerset House on the other, was the only satisfactory way of settling the question. He believed that the proposed change of plan would not involve a single month's delay, and he sincerely trusted that the House would adopt the resolution which he had proposed.

Sir R. PALMER rose to move the following amendment to the motion:— 'To leave out all the words after "desirable" in order to add the words "to proceed as soon as possible with the erection of the new Law Courts, and the offices connected therewith, upon the site appropriated for that purpose by the Act 28th and 29th Vict. c. 49; and that if additional land be necessary for the proper erection of such courts and offices, such additional land ought to be acquired in immediate proximity to that site."' The Thames Embankment site was not a new question before the house. Before it was made or laid out—before any determination was come to about it—the site was brought forward and considered on its merits as a suggested site for these buildings, and at that time, when there had not arisen this inflated structure of architectural fancies, it was rejected by the house on its merits at the instance of the then Government, to which belonged almost every member of the present Government. Parliament was then of opinion that the Carey Street site was better than the Thames Embankment site on grounds of public convenience, and for the purpose for which the building was intended. The subject of the concentration of the Law Courts was first agitated by the solicitors so far back as the year 1832, and through their exertions a committee of inquiry was appointed in 1840, and made its report in 1842. A royal commission, presided over by Sir George Cornwall Lewis, was appointed on the subject in 1858, and made its report in 1860, recommending the Carey Street site. It was true that at the time that commission reported, the Thames Embankment was not in existence. The Act for making the Embankment was not passed until 1862, but Parliament did not legislate upon the report of the Law Courts Commission till 1865, so that both sites were then before the house, and Parliament was able to make an unprejudiced choice. He felt much regret and disappointment at the success which had attended the efforts made to induce those who lived in the Temple, and to whom, in point of local convenience, the Embankment site and the Carey Street site would be much the same, to separate from the rest of their profession on this question, and to support the Embankment site. He felt the more regret because that was not the way in which they were dealt with when the question of a site in Lincoln's-inn-fields was under consideration. At that time the Lincoln's-inn-fields site would have been more convenient to the Chancery practitioners than the Carey Street site, but for the sake of general convenience and the proximity of the courts to all classes of practitioners in the law, it was thought wrong to choose a site more remote from the Temple, even though it would have been more convenient to other members of the profession from its proximity to Lincoln's-inn. The legislation which had taken place upon the question had been proposed entirely upon practical grounds. It was necessary, for the sake of economy of time and the despatch of business, to bring the courts into the best centre of the legal business and population, and that could only be effected by putting the courts in such a position as they had been most fortunate to find in the Carey Street site, midway between the Temple and Lincoln's-inn, and not so far from either as to make access to the courts irreconcilable with access to the chambers of barristers, and conveniently accessible, without the constant crossing of great thoroughfares, to the great body of the general practitioners of the law. When the courts sat at Westminster the business of suitors in the preparation of pleadings and other work, which had to be transacted at Lincoln's Inn or the Temple, was often delayed for weeks or months because of the delays occasioned to barristers in waiting at the courts for cases which did not come on, and that was especially the case with juniors who had large business in chambers. Of course the clients had to pay for all those delays, which formed one not inconsiderable source of the delays complained of in Chancery. The Carey Street site had been supported by such hard-working members of the commission, who thoroughly understood the question, as the right hon. member for South Hampshire (Mr. W. Cowper), the present Lord Chancellor, and the First Lord of the Admiralty; and he believed their opinions were still the same as his own. That site was also supported by one whose authority must command some weight with hon. gentlemen opposite—he meant Lord Cairns, who, while sitting in this House as Sir Hugh Cairns, spoke on the subject on March 30, 1865. He (Sir R. Palmer) was at a loss to understand what new elements they had now to determine upon in this question which did not exist then. What was the opinion of the solicitors upon the point? They were nearly unanimous in favour of the Carey Street site, and the Incorporated Law Society had passed a resolution, with perfect unanimity or the nearest approach to it, declaring that the Carey Street site was obviously the best, and that it combined so many advantages possessed by no other site that no one competent to form an opinion upon the subject could for a moment think of proposing any other. It was true that at present a considerably larger expenditure was proposed for the Carey Street site than that which was originally contemplated by Parliament. But as the bill passed through the House two things were done which resulted in the enlargement of the scheme: one was that on the part of the Temple especially it was insisted that it was desirable the Government should not retain in their own hands the exclusive control over the execution of the work; but that on account of the immense importance of making it as well adapted as possible to the

administration of justice, a commission should be appointed to confer with the Treasury and to advise them with respect to the plan of the building to be erected, and the best mode of carrying it into effect. Moreover a clause was inserted during the passage of the bill through Parliament which provided not only that those courts and offices which it was originally proposed to concentrate should be erected, but that it should be competent to the Treasury and to the commissioners to consider whether other buildings might not, with public advantage, be added, and also what approaches it might be expedient to make. There was, however, no reason to suppose that if there had been no enlargement of the original design the estimate of the expenditure would have been exceeded. Sir R. Palmer concluded by an explanation of how the commissioners proposed to provide for the additional outlay on the Carey Street scheme, by ridiculing the sanguine hopes and statements of his opponents, and contemning the great cost of the new site; urging that in the recent publication of Mr. Street's views in the discussion at the Society of Arts, it was clearly proved that the figures of Sir C. Trevelyan were not accurate and could not be made the basis of his conclusions. Mr. Shields, an engineer, had reported on the approaches and the two sites, and he said that the Carey Street site would cost much less than a building on the Thames Embankment, and he, too, regarded the figures of Sir C. Trevelyan as inaccurate. He would not pursue the matter further, for it was enough for him to say that, in the opinion of the architect, the level of the Carey Street site was much the best when considered with reference to public convenience. The courts, if erected on the Carey Street site, would be surrounded by buildings worthy of the neighbourhood. As to the Law Institution and King's College Hospital, there would be no necessity for their removal. In his opinion and belief the original reasons for preferring the Carey Street site remained in full force. The hon. and learned member concluded by moving his amendment.

Mr. G. DENMAN seconded the amendment.

Mr. B. HOPKINS admitted that the Carey Street site had great practical advantages, for it stood well elevated, and a large building upon it would be as much above the water as St. Paul's. At the same time the advantages of having a building on the great roadway alongside the Thames were equally undeniable. The question had been treated too much as one between partisans. They must bear in mind that they had the certainty of having a grand building upon a very good site in Carey Street, and that the Embankment was considerably lower than Carey Street, and would cost more for foundations. The house ought to be informed of the views of the Government on the subject. Whatever the result might be, he hoped the Carey Street site would not be abandoned to speculative builders.

Lord BURY said, though he confessed to small acquaintance with the details of architecture, he thought that some who were not lawyers might be permitted to give an opinion on this question. Speaking as a ratepayer of the metropolis, and looking at the question in an economical point of view, he confessed to a predilection in favour of the Thames Embankment site. It had a broad roadway, with good approaches, and a river frontage, which would secure them plenty of air and light. A building on such a site would be seen to the best advantage, and the inhabitants of it would not be in any degree removed from the haunts of legal men. But what did they find on the other side of the Strand? There they found a large space of land that had been cleared, and that another space of considerable size would still be required; while the public buildings already adjacent to the site would block up the new courts, and it would be difficult under any circumstances adequately to develop their architectural proportions. In the matter of approach the Carey Street site was open to the gravest objections; to get at it you must penetrate through some of the densest slums of London, come from what quarter you might, unless indeed a new arterial communication was to be opened, at an unknown cost. In the Embankment a great arterial communication east and west already existed; for the Carey Street site it would have to be made, and to be made at the expense of the ratepayers of London. As one of that body he thought this was a very serious matter. No doubt, as the hon. and learned member for Richmond had said, the expense of constructing such an outward communication ought not to be put upon the Carey Street site; but that very argument told in favour of the Embankment. The Metropolitan Railway would soon be running along it, and he had seen a scheme for constructing a railway right through the centre of London from Cromwell Road straight to the Law Courts. In regard to the comparative artistic merits of the two sites, he admitted that Carey Street did offer great architectural opportunities, provided that free means of access were to be opened up to it. But if that part of the undertaking was to be left *in nubibus*—left to chance—to be done some day or other—then he maintained that after the Law Courts had been erected on the Carey Street site, nobody would be able to see them. Some of the arrangements connected with that site were really ridiculous. According to the proposed method the *coup d'œil* would be this—barristers, in their gowns and wigs, would be seen approaching the courts from all quarters; suddenly they would disappear from sight and be working their way through the burrows or tunnels leading to the court. It would be still more ludicrous to see a venerable and learned judge, full of years and honours, and arrayed in the garb of office, being hoisted up, body and bones, to his place of justice. But if any of them should object to such an undignified and uncomfortable method of transportation, he would have to walk up 70 or 80 steps, and not only would he have to do this, but all the suitors and barristers to the end of time would have daily to do the same. Surely such an inconvenience ought, if in any way possible, to be avoided, and it could be avoided by building the courts on the Embankment level. As to the argument that the question had been settled and ought not to be re-opened, he replied that it had been decided in the absence of a most material witness. When Sir G. C. Lewis made his report, the Thames Embankment did not exist, or certainly its claims would at least have been taken into consideration. The Carey Street scheme, moreover, was by no means in a completed form. The original plans had been rejected, the original estimate had been exceeded, the money spent, or to be spent, upon it amounted to 1,500,000*l.*, and he believed that the cost of the Embankment site would compare very favourably with that expense.

Mr. G. DENMAN said that he objected to the motion because it would involve a waste of money, a waste of time, uncertainty as to the result, inconvenience to the profession, and expense to the suitors. If the Courts of Law were raised on the Carey Street site, they would be within two or three minutes' walk of the chambers of almost all barristers in practice, whether they were in Lincoln's Inn or in either of the Temples, and within a very short time there were sure to be either subways or covered passages leading from the inns to the courts, so that barristers could pass to and fro in all weathers without inconvenience. Barristers were now compelled to waste hours upon hours in court waiting for their cases to come on, a loss of time full of inconvenience to themselves, and of expense to their clients, but which would be entirely obviated if their chambers were close to the courts. They would then be summoned within a few minutes of the time when their attendance was necessary, and in the meanwhile they could be doing work in their chambers. But place the courts on the Embankment, and half of these advantages were sacrificed. Lincoln's Inn would be isolated; barristers having chambers there would find it a walk of seven or eight minutes across an open and crowded thoroughfare, before they could reach the new courts; and however trifling a matter a few minutes more or less might appear to the hon. member for Galway, every lawyer knew that they constantly made all the difference in the world, and might be the occasion of a cause being postponed for weeks. To solicitors the superior convenience of the Carey Street site was equally beyond dispute. It by no means followed that if the courts were not built on the Embankment, the space must be occupied by poor and mean edifices. It could and ought to be secured by the Government and reserved for important public buildings worthy of the position, and he quite felt, with the hon. member for Cambridge University, that it would be highly desirable if the House was informed what the plans of the Government in that respect were. As to questions of beauty and effect, he thought the arguments on each side might be used as a set-off one against another. But there was one thing of which there could be no doubt—that where the great mass of the legal profession was gathered together, there the new courts should be placed. It would be an extravagant waste of time and money to throw the whole question back indefinitely, and plunge the profession into its old state of doubts and difficulties. He understood the building might now be completed in the course of the next two or three years, and he hoped the house would not agree to the question being postponed any longer.

Mr. G. GREGORY said he would not have obtruded himself upon the house if it had not been for the allusion made by the hon. member who introduced the motion to that branch of the legal profession to which he belonged. The hon. member intimated that the opposition to the Embankment site originated with the solicitors of Lincoln's Inn. Now, he denied that. No doubt those solicitors did object, but it was only in common with the other members of their profession. The opposition originated with the Law Institution, of which 2,000 solicitors were members, and it originated there because they had devoted much time and labour to the question, and in the Carey Street site they thought they saw an end to their labours, while this Embankment site tended to dissipate the expectation. His hon. friends who preceded him had left him little to say, and he rather tendered himself as a witness than appeared as an advocate. The hon. member for Richmond had referred to a pamphlet giving some details as to the cost of the new site. He knew the author of that pamphlet, and he could certify that the figures were correct, for they had been tested by two or three eminent surveyors. Then, if they did abandon the Carey Street site, it was estimated that the Government would lose 500,000*l.* He thought too much had been said on the subject of approaches. They did not want grand approaches to courts of law. If they opened the Turnstile out of Holborn, and widened the corners of some of the streets leading from Long-acre to Carey Street, they would give all that was wanted. He did not know that it was desirable to make the courts very convenient for the public to attend. If they provided a large space for their attendance, they were apt to indulge in expressions which disturbed the course of justice. Much had been said of the necessity of employing lifts for the judges, but in fact the average rise would not be more than 18 feet, while on the Embankment site the fall of the ground was 30 feet between the Strand and the Embankment. He entreated the house to settle this question at once and for ever. It had too long been made the subject of discussion. Even if the new courts were commenced at once, there were many in his profession who could not hope to do business in them, but they wished to leave them to their successors as buildings where justice could be administered with something of the decency, not to say the dignity, that was due to the administration of the law.

Mr. W. COWPER said that nothing had occurred to alter his opinion that the Carey Street site was the most convenient and economical, and afforded the best opportunity for grand architectural effect. The 800,000*l.* which had already been spent was a matter of account and not of estimate. With regard to the demand for 700,000*l.*, that demand was not absolutely required for the erection of buildings, but it was considered that it might be required for light, and air, and approaches, and ultimate extension. The estimate of the cost of the Embankment rested on no responsible authority, and was open to great doubt. He believed that if the site in Carey Street were to be sold in the ordinary way, the 800,000*l.* which had been paid for it would not be realised, and Mr. Pownall estimated that the loss would be 500,000*l.* He did not believe that the money would be recouped by the erection of buildings for barristers and solicitors, for he did not think they would be inclined to leave their present places of business. With respect to the expenditure on the sites, there must be a large expenditure on the Embankment which would not be necessary on the Carey Street site. The Carey Street site was a level surface, but the Embankment had a slope of from 30 to 32 feet. That would involve the building of a basement like that at Somerset House. It was well known that the foundations on the banks of the river were bad, and that in erecting buildings it was necessary to go to a greater depth than in any other part of the metropolis. It would be necessary for the purpose of avoiding vibration from the railway to carry the foundations of the building below the railway level—probably down to a depth of forty feet. The additional expense that would be thus caused

had been estimated at 500,000*l.* Then there was the question of approaches. The two sites varied very little with respect to approaches. The Strand was common to both. On the Embankment side there would be a roadway. On the Carey Street side there was Holborn. An enormous preponderance of the legal profession came from the north and not from the south, and of the ordinary public who came to the Strand, the large majority also came from the north. Supposing the law courts to be erected on the Carey Street site, there would be an easy communication through Norfolk or Essex Streets from the Embankment and the Underground Railway. On the other hand, there would be the access from Holborn, and an improved communication might be made by breaking through the Turnstile. With respect to quiet, the advantage was entirely in favour of Carey Street, for on the north side there was no great thoroughfare for vehicles. On the score of economy and convenience, he considered the Carey Street site highly preferable, for so far as the convenience of the legal profession was concerned, the courts would be in the heart of their places of business. On these grounds he opposed the motion of the hon. member for Galway.

Mr. TRICE, advertent to the fact that the estimate for the Carey Street site had been doubled, said that the area which the Commissioners began with was, if he recollected rightly, 376,000 feet, or about seven and a half acres, and now they asked for 276,000 feet more, to make ways around it. With regard to the Embankment site, every one was enamoured of the wonderful work which had been done, and filled with a desire to make the Embankment worthy of the metropolis. If things, however, remained as they were, there was danger that instead of an ornament, they should have a disgrace. Owing to the original provisions of the Bill, the Metropolitan Board had no power whatever to take an atom of the dirty, unsightly streets that ran down from the Strand to the Embankment. But there was a small portion of ground between Essex Street and Arundel Street which might be put to very good use. If he was asked to vote for one site as against another, he should hesitate before voting against the Thames Embankment. He would not venture to put his experience against that of the lawyers as to which site was the more convenient and better for them. But he would ask, how was it that a large number of eminent lawyers who practised in the City had contrived for so long a time to get from one Court to another? The question of Lincoln's Inn and the lawyers' chambers adjacent, that so much had been made of, appeared to him a very small matter. With regard to the estimates, he was not going to say a word, after the reproaches which had been addressed to him the other night. But when they saw that lawyers had the making of the estimates, and it was suggested that what had begun at a million might possibly become 3,200,000*l.*, he thought architects need not be very much ashamed of themselves. He had only suggested doubling the estimate, and that was very natural and very usual. But looking at the matter as a man of business, it appeared to him that the building itself, from its enormous size, was a mistake. Last session he was of opinion that if they were to divide the building it would be possible to get rid of the difficulty as to the two architects, one of whom, Mr. Edward Barry, he could not but think had been very ill-treated. If they could separate the building into two portions—one might be larger than the other,—they might have it in their power to do some justice to a man whom they had treated with some injustice. He had a great regard for both architects, and had been always on excellent terms with them; but putting the architects out of the question, he believed that the proposed building might be divided properly and economically. It was perfectly well known to the Metropolitan Board that if they should not have the inclined road between Hungerford and Waterloo bridges, they must have some communication from the Strand with the Thames Embankment; and the only other alternative was Essex Street. Now, at the bottom of Essex Street would be found a very convenient piece of ground for a handsome building which might be used for the storage of wills, and leading lawyers had told him that it would be desirable to take such a building out of the crowded streets. Such a building would lend to the Embankment a certain amount of ornament, even if Carey Street was retained as the site for the main building.

Lord J. MANNERS said that up to this time he had not heard the slightest indication of the suggestion of the hon. member for Bath for a separation of the courts, and so far as his experience went he did not think the hon. member for Bath's suggestions would find favour with the legal profession. The hon. gentleman assumed that the cost of the Carey Street site would be 1,550,000*l.*, to which he added 100,000*l.* for the purchase of the Law Institution, 1,000,000*l.* for the necessary approaches, as suggested by Mr. Street, who, however, now expressed his dissent from that estimate, and then 1,600,000*l.* for the road proposed by Mr. Shields, which made so enormous a total that he really distrusted the power of his memory to retain it. But Mr. Shields' road was entirely repudiated by Mr. Street, the architect of the building, and, even if that road was required, it would be for the general improvement, embellishment, and convenience of the whole metropolis, and the estimate for the Carey Street site ought not to be saddled with it. The item of 1,600,000*l.* ought therefore to be entirely left out of consideration. The item for King's College Hospital and the approaches, 1,000,000*l.*, was a very large one, but neither Mr. Street nor the commission proposed to purchase King's College Hospital.

Mr. GEORGE said he had not included the purchase of the hospital. His item was 1,500,000*l.* altogether, for the approaches, from east and west.

Lord J. MANNERS said he was so overwhelmed by the hon. gentleman's figures that it was no wonder he had understated them. The item of 1,500,000*l.* for approaches was not wanted for the law courts, and it was in the highest degree unfair to saddle the Carey Street site with it. His hon. friend also saddled that site with 100,000*l.* for the purchase of the Law Institution, but that was a comparatively small item, which he would not raise much question about. But the two large items which he objected to have saddled upon the Carey Street site amounted to 3,100,000*l.* The three and a half acres of land required for the approaches to the Carey Street site, &c., would cost 685,000*l.*, or, in round numbers, 700,000*l.*; but an acre of that would not be required, and could be resold, so that the total net cost would be 418,000*l.* By that extent no doubt the cost of the Carey Street site would have to be increased, and as the site had already cost in round numbers 800,000*l.*, the total would be 1,218,000*l.* Now,

what was the expenditure for the Thames Embankment site? The hon. member for Bath spoke derisively of lawyers making estimates for the purchase of land; but it was a remarkable fact that the estimate for the Thames Embankment site was made by the same gentleman who made the estimate for the Carey Street site. The Thames Embankment site alone was estimated at 1,500,000*l.*, without anything for approaches or anything else, so that there was an excess on the site alone of 282,000*l.* Those who advocated the embankment site did so not on the ground of convenience of suitors, solicitors, barristers, or judges, but on what they called æsthetic grounds, as a great metropolitan improvement. But if that were the real reason for the change, it could not be supposed that such a gigantic building as the law courts was to be could be put up side by side with Somerset House, while Somerset House was left as it now stood, with its dumpy dome and narrow windows. Somerset House would be dwarfed and killed by the law courts, unless a great change were made in its façade and summit. He asked the house to view the question in a practical spirit, and not allow itself to be led away by architectural dreams of what might or might not happen. His object was to carry out, if possible, those works that had been sanctioned by his predecessor in office. In the present instance he thought it would be a most unfortunate event if the government were to reverse the decision of their predecessors for the last eleven years, and by their vote that night plunge this great question into confusion and architectural and financial chaos.

Mr. J. LOCKE believed that all the legal arguments used that evening came from the Lincoln's Inn side of the question. It appeared from the figures relating to both sites that the Carey Street site, if the building were completed upon it, would cost more than if the edifice were raised upon the Thames Embankment. Supposing that the question were now raised for the first time, and that they were offered those two sites only for a building of the kind, on which would they prefer the law courts to be built? He did not think that they would hesitate long before they decided in favour of the Thames Embankment. For æsthetic purposes there was no doubt but that the embankment was preferable to Carey Street, while, as to convenience, he contended that the advantage was on the side of the Thames Embankment.

The CHANCELLOR of the EXCHEQUER could have forgiven his hon. and learned friend what he had said if he had only found in him one redeeming virtue—that was to say, if he could have gathered from his speech he had the slightest regard for the British taxpayer. That was the point with which he (the Chancellor of the Exchequer) was particularly concerned. The noble lord opposite had called his attention to the subject in a very marked manner; but that was not necessary, because, when he had first come into office, one of the earliest documents presented to him was an account to the 21st of July last, stating that the actual outlay on the undertaking down to that date was 785,000*l.*, that additional land was proposed to be purchased for 668,000*l.*, that the cost of the buildings and architect's commission would be 1,650,000*l.*, that the furniture and the contingencies would amount to 147,000*l.*; making a total of 3,250,000*l.* Besides, there was a further sum of 108,000*l.* for the expenses of the royal commission, in which was included 27,000*l.* to the Messrs. Field and Co., for commissions, disbursements, and taxed costs; making altogether a sum of 3,358,000*l.* He had then been immediately referred to two documents which authorised or seemed to authorise that enormous expenditure, namely, two acts of parliament passed in the year 1865. One of those acts fixed the expenditure at 1,500,000*l.*, both for the building and the site, while the other contained a very remarkable provision to the effect that no notice should be given of an intention to purchase property under the act until the commissioners and the Treasury stated that they were satisfied that that sum was sufficient for all the purposes contemplated by the measure. On reading those documents, it seemed to him as if the ground had given way under his feet. He next referred to the debates which had preceded the passing of those acts, and he found that his hon. and learned friend who at present urged them not to stop at any expenditure, delivered an excellent speech, in which, after remarking that the cost of the site and the building would be 1,500,000*l.*, said that was, no doubt, a considerable sum of money, but that the house would think it well and economically spent if they could obtain for it so important a public benefit as the proposed building. On the second reading of the bill his hon. and learned friend returned to the charge, and stated that it would be the constant care of the Treasury so to watch the undertaking as to prevent extravagant expenditure. His hon. and learned friend also said he did not think the estimate would be exceeded; and yet the estimate at present reached 3,250,000*l.* That was enough to frighten any one after reading these acts and speeches. By the act of parliament the Treasury and the commissioners should concur in sanctioning any further expenditure, and when he was asked to agree to a further outlay of 660,000*l.*, he said "No." He then went to the commissioners and read to them that section which had appeared to him so startling; and he told them he felt it his duty to stop all expenditure until the pleasure of the house could be taken. He should next state what he considered to be the position in which they were then placed. The estimate, which, as he had already stated, was 3,350,000*l.*, was not a final one; it was, he believed, what was called a "sketch" estimate, and it would be unfair to the architect to hold him bound by it. It should be further stated that there were certain other lands, called he believed "Cook's block," which must be purchased; and there remained, besides, the question of approaches to the building. Those approaches had been treated as if they were optional; but that was not the case. The Strand was called the great artery of London, but he denied that was an approach to anything. There were persons who wished to witness the proceedings of the courts of justice, and it was impossible that the courts could discharge the purposes for which they were to be erected without having good access. It was not unreasonable if they went to this immense expense that they should provide for the safety of the people. There were to be something like 60 steps from the street to this building, and, upon the occasion of some great trial, on the verdict being given, the people would pour out into the Strand, and accidents would probably result. Now the Metropolitan Board was not at this moment rich,

Mr. Archibert, April 24th 1869.

and even if it were they could not force it to make the approaches, and they could not go on without them. He thought that as the estimate was not a final or conclusive one, and as these approaches must be made, it was not at all unreasonable to say that they would do well if they got out of it for 4,000,000*l.* He, as being charged with the finances of the country, protested against such extravagance, because he held it to be unnecessary. The estimate of 1,600,000*l.* was a reasonable one, and his hon. and learned friend the member for Richmond, instead of asking them to multiply it by three, should rather endeavour to make us retrace our steps. He put this question as one of economy, and in that light he entreated the house to consider it. It was the money of the taxpayers of the country with which they were dealing. Now, why was it that this sum had grown up to 3,350,000*l.*, with the certainty that it would go beyond that? Simply for this reason, that instead of being content to include in the building the concentration of the law courts and the offices necessary for the administration of justice, they had desired to construct a great Tower of Babel, which would be full of noise and confusion, and contain many offices which would not be necessary there at all. In fact it would be the very paradise of thieves and pickpockets. Why, because they concentrated the courts, should they desire the office of the accountant-general to be taken to the same building, or that all the wills that have ever been made in this country should be taken from where they were and piled up in the new building? It would be an extreme disadvantage, to have all these crowded together in the same building, for they would not facilitate, but rather impede the administration of justice. This being so, he earnestly pressed upon the house to retrace their steps, and to go back to the more sober and wiser views of four years ago. He now came to another point. A great deal had been said about the public having little or nothing to pay for this matter; that the whole thing was to be paid for by a tax on suitors, excepting some 200,000*l.* that the government was to advance. He was bound to tell the house that no fallacy could be greater than that. In the Court of Chancery there was a surplus of 7,700*l.*; in the superior courts of law, 16,000*l.* surplus. But this was in rapid course of diminution in consequence of the act of last session giving extended jurisdiction to the county courts. In the Court of Bankruptcy there was a considerable sum, which was also in a fair way of extinction by the abolitions and compensations which must follow from the best intentioned Bankruptcy Bill. Then there was in the Court of Probate a deficiency of 7,300*l.*; in the High Court of Admiralty a deficiency of 4,000*l.*; and in the Land Registry Court of 4,600*l.* So that the whole state of the case was that the expenditure in these courts exceeded the fees by 52,000*l.* a year. The account rendered last July, by the commissioners, of their ways and means, showed a charge of 3,350,000*l.* 1,000,000*l.* of Chancery stock had been sold, and realised 900,000*l.*, and that sum was expended and done with. Then the government granted 200,000*l.* in consideration of the buildings vacated by concentrating the offices, and they proposed to sell out of Chancery 201,000*l.* of stock; but that was part of those funds which yielded that surplus of 7,000*l.*, and when they had sold that sum they would have diminished the receipts of the Court of Chancery. The consequence would be that he would have to provide out of the general taxation of the country 7,000*l.* a year to supply the deficiency. The next item was bankruptcy, 271,000*l.*; but that again was part of the assets, the income of which went to keep down the expenditure of the country, and if they took that away he should lose the income of that also. The same thing would occur with respect to 177,000*l.* unclaimed dividends; that would also increase the expenditure by diminishing the revenue. There was a tax to be imposed upon the probate of wills and administrations which was estimated to produce 46,000*l.*; but that was clearly an Imperial tax, and if anybody ought to put it on, it was him. That item must therefore clearly be struck off. What resulted from all this? The commissioners said they expected the government to lend them a sum of 1,395,000*l.* for the purpose of making up this 3,350,000*l.*, and that was to be redeemed by an annuity of fifty years at four per cent. But the annuity was to be paid mainly by the tax on probates, so that it would in fact come out of the general revenue of the country. Under these circumstances he had suspended the purchase of this 660,000*l.* worth of land and stopped all operations that he could, awaiting the pleasure of the house, and it remained to see what that pleasure was. He had no difficulty in suggesting what he should like to see done, and that was, that with every respect to the Royal commission, he thought that they should be relieved from any further duties, they having really performed all their functions, and that the whole matter should be remitted to the Treasury and himself to do what the Act of Parliament contemplated. He had the strongest objection to the proceedings recommended by the hon. and learned member for Richmond. The building proposed was altogether outrageous for the purposes intended. In justice to the commissioners, he might state that what they had done had been done legally. But he believed that the second act, which empowered the commissioners to alter and enlarge the plan, was passed at the end of the session, and was unknown to the great mass of those who had consented to the prior act. He earnestly hoped that the house would not go on with this enormous building—that they would reconsider the question altogether, and come down to the modest estimate with which they started. What they wanted was air, light, quiet, and accessibility, but those things are not to be obtained in the Carey Street site. His hon. and learned friend had argued rather loftily when he assumed that because a number of legal gentlemen chose to encamp themselves in one of the worst and lowest parts of London, they were bound to follow them. Besides the two alternatives alluded to, he thought there was a third. The cost of Sir C. Trevelyan's plan would, he believed, be something like 2,000,000*l.*, and he hoped they would not consent to it. The other alternative by which he thought the object desired could be obtained—and he did not speak without authority, because it was approved of by competent persons—was this. There is a street called Howard Street, which runs midway between the Embankment and the Strand. Above that street there was property of considerable value, which consisted of good houses in Norfolk, Arundel, Essex, and Surrey Streets. Below this the property is of very inferior value. He believed that the piece of land, amounting to about six acres, could be bought for 600,000*l.* He was also advised that on that

piece of land a building might be erected capable of containing all the courts of justice and all the ancillary offices, and that at a cost of 1,000,000*l.* So that for 1,600,000*l.* a site might be obtained with the buildings necessary for the administration of justice. Without much expense the building might be extremely ornamental. Standing below the buildings of the Strand, it will not require an ornamental frontage on that side, while on the Thames side it might be made very ornamental. He believed that the plan of Inigo Jones for the magnificent palace of Charles I., with a grand quadrangle occupying the space between the river and the Horse Guards, was, with the elevations, still preserved. He had put that forward merely as his personal idea, whether or not Inigo Jones's elevation might not be here reproduced; but he earnestly entreated the house to give a fair and impartial consideration to the scheme he had suggested. He had only done his duty in endeavouring to prevent the house drifting into an enormous expenditure. With regard to the Carey Street site, if they only had a little patience, he had no doubt they would be able to dispose of it without much loss. They had far better stop short in their career of extravagance than go on throwing good money after bad.

Mr. HENLEY wished that the fresh issue raised by the right hon. gentleman had been brought forward earlier in the evening. He begged to move that the debate be adjourned.

Mr. CRAWFORD seconded the motion.

Mr. GLADSTONE denied that the Government had taken any steps for forcing the house to a premature division on the question. He quite approved of the proposition of the right hon. gentleman (Mr. Henley) that the debate should be adjourned. The speeches of the hon. member (Mr. Gregory) and of his hon. and learned friend (Sir Roundell Palmer) had occupied attention till nearly half-past seven, and if his right hon. friend had risen at that time to state the views of the Government he would have defeated his own purpose. He waited, therefore, till the house was reasonably full, so that the views of the Government might be fairly placed before them. Whatever blame there might be, was not due solely to his right hon. friend the Chancellor of the Exchequer, but must be shared by his colleagues.

Sir R. PALMER wished to address a few words to the house, because he thought his right hon. friend the Chancellor of the Exchequer had rather unintentionally put him in a false position with the house as to some of his observations. The Chancellor of the Exchequer had put the case as if he (Sir R. Palmer) wished to launch the house into a great expense. His motion left it to the Government to say whether they would accept the scheme propounded by the commission, and he did not propose that the house should be called on at once to pay for more land, but that if they were necessary, more lands should be bought in the proximity of the Carey Street site. He had stated distinctly that it was for the Government to determine whether or not they would accept the plan, whether they would incur that enlarged expenditure, and whether they would raise money by the means proposed. He did not take upon himself to anticipate the determination of the Government, or to urge upon them a particular plan.

Lord J. MANNERS thought the adjournment ought to be merely a formal one. The plan of the Chancellor of the Exchequer was one that it was utterly impossible to discuss that night with the view of arriving at a legitimate conclusion. The Chancellor of the Exchequer having recommended that the commission should be abrogated, and that the whole thing should be taken in hand by the Government, this should be a formal adjournment, and he hoped that the Government would submit a scheme which would enable the house to arrive at a sound decision upon the subject.

Mr. GREGORY had no objection to offer to the adjournment of the debate. He should like to hear, as soon as possible, what course the Government intended to pursue.

The CHANCELLOR of the EXCHEQUER quite accepted the proposition of the noble lord, that the responsibility of the matter should be thrown on the Government.

The debate was adjourned till that day month.

ILLUSTRATIONS.

SOUTH ESK RIVER BRIDGE.

THIS Bridge is to carry the Launceston and Western Railway, Tasmania. From the drawings it will be seen that it consists of two main girders, continuous, with cross girders 14 feet apart, and longitudinal rail bearers, all on the lattice principle. If the railway has as much traffic as the main girders could sustain, the Launceston and Western shareholders will have little cause to grumble. As we have taken some pains to make our illustrations working drawings, not only by showing every detail, but by the rather unusual method of giving all necessary dimensions as well, the construction of the bridge is, we imagine, evident, and requires little additional explanation. In the manufacture of wrought iron bridges, the most important thing to be considered is the character of the riveting. All the rivet holes in this bridge are to be drilled—a practice that ought to be universally adopted, but at all events in cases like the present, where large rivets are intended to be used. The bridge is braced by horizontal angle-irons and bars underneath, and by angle-irons at every second bay overhead. The arrangement of the bed-plates on the abutments appears to be original. It may not be easy to manage castings of such a size and form in making, but when complete the arrangement ought to allow of the bridge expanding or contracting without injury of any kind.

Mr. Doyne was one of the first engineers in this country to point out the advantages, in certain circumstances, of lattice girders for bridges. In 1851, in conjunction with Professor Blood, he prepared a paper for the Institution of Civil Engineers, which the late Robert

Stephenson thought so valuable, that he said it left little or nothing to be written on the subject. It was illustrated, not only in the ordinary way, by diagrams, but also in a way that ought to be more often practised, by a model which indicated the strains produced by weights placed in any position on it; and in this way sensibly demonstrated the accuracy of calculations based on formulæ derived from mathematical reasoning. Some of the results may be worth repeating on this occasion. As regards the strains that have to be resisted by the top and bottom members or booms of a girder, and consequently the amount of material that ought to be given to them, there is no practical difference between a girder having plate sides and one with lattice sides. In a plate girder, if the load is uniformly distributed, the horizontal strain may be said to increase from the supports towards the centre in a proportion like the ordinates of a parabola. In the lattice girder this increase is rather by sudden increments, depending on the closeness of the points of connection of the lattices with the booms; but a parabolic curve would still be the truest average representation of the strains. Consequently, in all kinds of girders the area of the flanges of both booms ought to increase from the abutments towards the centre. With the load in centre the horizontal strains will be, of course, as the ordinates of two converging lines. As regards the lattices, when the load is uniformly distributed, the strains in the diagonals increase in the reverse way, that is, from the centre of the beam towards the ends, and, consequently, their areas ought to increase in the same direction, care being taken in cases like a railway bridge that the lattices should be able to resist the strain produced by the greatest load that could be placed at one point. If the load was to be stationary at the centre, uniform strength in the lattices would be sufficient, but it is hardly necessary to say that in such cases the weight of the beam itself produces the same effects as a uniformly distributed load of equal weight. These conclusions are now familiar to all; it would not be easy probably to find any engineer of eminence maintain the superiority in general of the plate over the lattice girder, and certainly more large beams are built of lattice work than plate. But it used to be different. Mr. Fairbairn, we think, somewhere calls the lattice or trellis girder 'an imperfect double flanged beam,' and Robert Stephenson said, 'in comparing the strength of a flanged beam having a solid vertical side, with that of a beam having a trellis side, it would be found that the strength of the former would be as the square of the depth, whereas the strength of the latter would be simply as the depth.'

We are indebted for the use of the drawings to Mr. G. Willoughby Hemans, Member of the Council of the Institution of Civil Engineers, the representative engineer of the railway company in London, under whose direction the bridge is being constructed by Messrs. De Bergue & Co.

N.B.—A third plate, illustrating the detail of this bridge, has been prepared, and will be given in our next.

'TILE PAINTINGS,' BY MESSRS. W. B. SIMPSON & CO.

AMONG the variety of pottery productions which have been applied to architecture, we have seen none more interesting in an artistic sense, or more likely to prove valuable to our professional readers, than these tile paintings—or, as the manufacturers prefer to call them, 'art tiles,' as distinguished from those produced by mere mechanical processes; for it is a special feature of these tiles, that they are the direct and actual work of the artist who designs and paints them. Our readers might suppose, from the monochrome quality of the illustration, that the resources as to colour are very limited. The contrary, however, is the fact, for the painter on these tiles has at his command a palette quite as extensive as any canvas painting can exhibit. The colours being, of course, ceramic in quality, are much more brilliant in their effect when glazed. This glazed texture is not at all essential to these tiles, as we have seen some varieties, also hand-painted, which are perfectly flat, the colours being laid on and fired without glaze.

On first inspection of the effect produced by the designs we have examined at Messrs. Simpson's premises, we were afraid that their sumptuousness could only be purchased at very high prices, but the figure quoted to us proved that this class of work is quite within the average means which an architect may have at his disposal.

Another feature in this attractive branch of manufacture is the ease and certainty with which architects and designers generally can have their designs produced in imperishable quality. The material of the tiles themselves is, of course, of a fire-proof kind—a consideration of growing importance at present. The painted decoration, being fired in the kiln, can be easily cleaned, and is not liable to that amount of wear which implies repairs.

We may only add that any of our readers can see specimens of these painted tiles at Messrs. Simpson's, West Strand; and if they are sufficiently interested to follow up such work, they will there find specimens of the simplest diaper treatment, as well as of the more elaborate and higher figure designs.

The Trustees of the Proposed Roman Catholic Cathedral have been compelled to abandon the idea of occupying a site in Victoria Street which they had thought would suit them, and are understood to be looking out for vacant ground elsewhere.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ON Monday evening last, the presentation of the Royal Medal and of the Institute medals and prizes took place at No. 9, Conduit Street. The President, W. Tite, M.P., read a letter from Major-General Sir Thomas Biddulph, K.C.B., communicating Her Majesty's approval that the Royal Medal should be conferred on Professor Lepsius. That eminent author and antiquarian was unfortunately prevented, by his official engagements at the University of Berlin, from attending the ceremony in person, but the Baron Schmiddhals, Secretary to the Prussian Embassy, had kindly consented to receive the medal on behalf of his illustrious fellow-countryman, and attended the meeting for this purpose.

The President in a short but appropriate speech alluded to the original establishment of the Royal Medal, as well as to the high attainments and special qualifications which distinguished Professor Lepsius as a *savant* and Egyptian archaeologist, and had led to his being selected by the Institute for the honour in question.

Baron Schmiddhals in reply thanked Mr. Tite for the complimentary manner in which he had referred to Prussia and her encouragement of art, expressed his full appreciation of the honour which had been conferred upon Professor Lepsius, for whose talents he entertained the greatest personal respect, and receiving the medal at the hands of the President, promised that it should be forwarded to its owner in due course.

The President then presented the Institute medals and prizes for 1868-9 to the successful competitors as follows:—

To Mr. Henry L. Florence, the Soane medallion.
 To Mr. Edward J. Roche, Mr. Beresford Hope's prize of 10*l.* 10*s.*
 To Mr. Thomas C. Wilberfoss, the Institute medal with 5*l.* 5*s.*
 To Messrs. Edmund B. Ferrey, Thomas E. Williams, and William Howes, medals of merit in the same competition.
 To Mr. Andrew S. Bird, the Student's Book Prize.
 To Mr. Henry D. Shepard, the Institute (Essay) Medal.
 To Mr. Thomas A. Britton, a medal of merit in the same competition; and
 To Mr. Edward Locke, the special Essay Prize of 10*l.*
 Messrs. Edward J. Roche and Thomas E. Williams were accidentally prevented from receiving their prizes in person.

The President addressed each of the candidates individually, congratulating them on their success, and recommending them to persevere in their professional studies with the same zeal which had gained them their present honours.

This portion of the business for the evening having been brought to a conclusion, Mr. Wyatt Papworth, Fellow, read a very interesting 'Notice of the Professional and Literary Works of the late Arthur Ashpitel, F.S.A., Fellow,' to which the President added a few remarks. This memoir will shortly be published in the Transactions of the Institute.

Previously to the presentation of the medals, the following gentlemen were balloted for and declared to be duly elected members of the Institute:—

	ARTHUR ALLOM (Associate).
	ROBERT R. BANKS (Associate).
	WILLIAM G. BARTLETT (Associate).
	CHARLES L. EASTLAKE, Assist. Sec.
As Fellows.	AUGUSTUS FREER (Associate).
	ROBERT KEMBLE (Associate).
	SYDNEY WILLIAMS LEE (Associate).
	ROWLAND PLUMBE (Associate).
	CHARLES O. BLABER.
	WILLIAM PAIN.
As Associates	ELIJAH HOOLE.
	GEO. SCAMMELL, JUN.

Before the meeting broke up it was announced by the Hon. Sec. that the following Paper would be read before the Society of Arts on Wednesday, April 28:—"On the Duties of the Architect with reference to the Arrangement and Structure of a Building," by T. Roger Smith, F.R.I.B.A., when Sir M. Digby Wyatt had promised to take the chair.

THE RESTORATION OF GRANTHAM CHURCH.

THIS church has just been re-opened after a thorough restoration. The following brief notice of the building, from the pen of Mr. Gilbert Scott, has appeared in one of the Local Journals:—

The church at Grantham is undoubtedly one of the finest in Lincolnshire, famed as that county is for the beauty of its churches. Its great pride is its magnificent steeple, and its most striking peculiarity is the circumstance, that vast as are its dimensions, its plan (with the trifling exceptions of the porches and the vestry) is a simple parallelogram; four straight walls being its boundaries, and not even the tower forming a projection beyond them. It seems, however, to have attained this remarkable simplicity by a complex series of changes. Its oldest portions are of the latter half of the twelfth century, at which period it seems to have been of the usual form of plain churches, being a nave with narrow aisles, and clerestory, and a simple unaisled chancel. A century later, however, it was greatly enlarged on all sides, excepting the east. The narrow aisles were removed, and aisles equal in width to the nave were substituted. Its length was increased to the westward and the present vast tower commenced, the new aisles being carried on athwart it and terminated within a fine western façade. The clerestory was done away with; the Norman side arches were replaced with lofty pointed arcades; the aisle walls were made as high as what had been the clerestory of the older nave, and the whole covered by three high-pitched and equal roofs. The chancel continued unaisled excepting a single bay on the north side where the nave ran on and formed a chapel. The north side then erected is one of the noblest specimens of its style, agreeing in character, and no doubt in date, with the "Angel Choir" at Lincoln, and having a

series of noble windows with what is known as "geometrical" tracery. The north doorway of the aisle (since covered by a porch) is a most beautiful feature. The next important alteration was the addition of an aisle to the south side of the chancel. This, with the crypt below it, was probably built about the middle of the fourteenth century. At the same time, the two eastern arches of the nave were widened and increased in height, and a stone rood-screen and loft like that of a cathedral were added. The loft was approached by two staircases of stone in connection with the chancel piers. The evidences of these staircases still remain, and the foundations of the stone screen were found during the recent works. A century later, again, the northern aisle of the chancel was added, thus completing the parallelogram which characterises the plan of the church. The south porch is of the thirteenth, and the north porch of the fourteenth century, and a sepulchral chapel (now used as a vestry) was at a much later period added on the north side of the chancel. The steeple is too well known to need description. It may, however, be interesting to remark the curious parallelism, and perhaps rivalry, evinced by the architectural histories (as gathered from the structures themselves) of the churches of Grantham and Newark. Both (so far as the existing remains testify) were commenced late in the twelfth century; both had clerestory and narrow aisles; both had towers added to the west ends in the succeeding century; and both had the narrow aisle and clerestory replaced by wide aisles and great high pitched roofs. In both, too, the wide aisles were carried on to a western façade. In the two churches, however, these transformations were not contemporaneous, but alternating, each apparently striving to go ahead of its neighbour. The raising of the tower at Newark in the fourteenth century, from its less lofty Early English form, was no doubt in emulation of the noble steeple just finished at Grantham; and, finally, the Newark people sought to leave their Lincolnshire rivals behind, by adding clerestories to the entire church far above the levels of the older ones which had been displaced. The church at Grantham had sadly deteriorated from its ancient beauty, especially in the interior. Its roofs had from time to time been all replaced and lowered, and were of heterogeneous forms and design. No vestige remained of the ancient fittings. The church was divided into two parts by a glazed partition, and its eastern portion galleried to the very eyes, and filled with high pews, while the whole of the interior stonework had been clogged with plaster and whitewash, and its surface either concealed or damaged. The works at present effected have been directed especially to remedying these evils. The entire church has been re-roofed to a suitable pitch with massive and handsome oak roof covered throughout with lead. The galleries and pews have been removed; the whole length of the interior has been again opened out; the chancel has been filled up with oak stalls; the organ has been reconstructed, and placed by the side of the chancel for the convenience of the choir; the stonework has been cleaned and repaired, and the whole interior refloored. The nave is not as yet fitted with permanent seats, but is for the present furnished with chairs. There being no chancel arch, and the piers which mark the junction of the nave and chancel being rendered at once unsightly and interesting from their being fragments of the staircases to the ancient rood loft, it has been thought best to place at this point a handsome oak screen of light and elegant design, which will both mark the division of nave and chancel, and will conceal the unsightliness of the mutilated pews, while it allows them to remain as objects of interest to the antiquary and landmarks in the history of the church. The new roofs vary in some degree in design according to the date of the parts which they cover. Those of the chancel and its aisles are the richest in decoration, and the latest in detail, while those of the nave and its aisles are of a continuous arched form and of severe and uniform character. It is most gratifying to witness the manner in which the noble character of an ancient church re-asserts itself from the simple removal of obstructions and disfigurements, and the restoration of the parts which have perished or lost their original form. An interior at once so noble or so simple as that of Grantham church can indeed scarcely be found.

THE EXTENSION OF POPLAR WORKHOUSE.

THE foundation-stone of the building to be erected in extension of the Poplar Union Workhouse was formally laid by James Barringer, Esq., Chairman of the Board of Guardians, a few days since. A procession, headed by a brass band, proceeded from the Town Hall to the site, at the rear of the present workhouse. A marquee had been erected; and on reaching the platform, the Guardians' Clerk handed to Mr. Barringer the records and scroll, some coins of the realm, newspapers, &c., which were deposited in the cavity under the foundation-stone. Mr. Morris, the architect of the building, handed the silver trowel, and the Chairman having operated therewith in the customary style, the company adjourned to a luncheon at the Brunswick Hotel, Blackwall. The inscription upon the stone is as follows:—'This stone was laid by James Barringer, Esq., Chairman of Poplar Union Board of Guardians, on the 14th of April, 1869. John Warrington Morris, Architect; Messrs. Hill, Keddall, and Waldron, Builders.—April 14, 1869.'

The additions and alterations are, according to the drawings, of a somewhat extensive character, embodying the demolition of a portion of the old Workhouse, and the erection of additional buildings, sufficient to extend the accommodation of the Workhouse to 808 able-bodied persons. The plans are upon the double-pavilion principle, and in their practical application will provide accommodation to the following extent:—Able-bodied men, to be resident in east pavilion, 240; able-bodied women, to be accommodated in west pavilion, 240; females to be accommodated in adapted wards of present house, 100; girls in present house, 30; probationers (males), 15; probationers (females), 15; in new sick wards, 12 males and 12 females; lying-in cases, 16; lunatics, 8; girls in dormitories, 30; male and female children in dormitories, 50; the remaining accommodation to be allotted to casuals, and to the admittance of special cases. A chapel is to be erected, capable of seating 300 persons, and there are to be 20

grinding-mills, two labour yards, oakum rooms, &c. The contract sum for the works is 32,480*l.*, payable in sums of not less than 1,000*l.* at a time, at the rate of 75 per cent. upon the actual work done. The architect receives a payment of 4 per cent. upon the total outlay. The Guardians intend borrowing the sum of 40,000*l.* to meet the payments to the contractors, and the work is expected to be completed in about eighteen months.

Mr. B. Webster has been elected Clerk of the Works.

LEGAL.

STANTON V. THE LOCAL BOARD OF GAINSBOROUGH.

This case was tried at Lincoln before Mr. Justice Hayes, when a verdict was found for the plaintiff, damages 180*l.*, leave being reserved to the defendant to move to enter the verdict. In the Court of Exchequer, on Friday, April 16, Mr. Field, Q.C., moved accordingly. It appeared that some new pavement was in the course of being laid down in the streets of Gainsborough by a person employed by the Board for that purpose. Some portion of new was laid and much of the old remained, and there was in consequence an inequality of surface. The plaintiff, Charlotte Stanton, was walking along the pavement and was tripped up and thrown with great force to the ground. It was contended for the defendants that the independent contractor was responsible for the negligence. The Court granted a rule.

BUCK V. WIGMORE.

On the 16th, in the Court of Queen's Bench, an action was brought against Mr. Wigmore, contractor, for an accident alleged to have happened by the carelessness of his servants in leaving some boards lying about on the highway. The case was tried at great length at the last assizes, before Mr. Brown, Q.C., as Commissioner, and resulted in a verdict for the plaintiff. Mr. M. Chambers, Q.C., moved for a new trial, on the ground that the verdict was against evidence.—Rule nisi.

PEARSON V. PLUCKNET AND OTHERS.

This was an action (in the Court of Common Pleas on the 16th inst.) to recover damages against the defendants, who are builders, for personal injuries suffered by the plaintiff. The plaintiff, it appeared, was a watchman at Haydon Square goods station of the London and North-Western Railway Company, and the defendants were employed as contractors by the railway company to repair some buildings over the gateway into the station. On January 28 last the defendants' workmen left a heavy plank resting on the top of the gates, and when the plaintiff shut the gates in the evening this plank fell upon him, and inflicted the injuries complained of. At the trial before Mr. Justice Keating at the Guildhall, it was objected by the defendants that there was no evidence that the plank had been left on the top of the gates negligently; and, further, that the defendants' workmen were the servants of the company, and that as the plaintiff himself was in the same service, he could not recover for injuries caused to him by their negligence, and the plaintiff was nonsuited.—Mr. Serjeant Parry now moved for and obtained a rule nisi to set aside the nonsuit, and for a new trial.

HEATH V. BUCKNALL AND CO.

In the case of Heath v. Bucknall & Co., decided by the Master of the Rolls on Friday, 16th inst., the plaintiff sought by an injunction to restrain the defendants, who are cork merchants of Crutched Friars, from obstructing certain ancient lights in a new building erected by plaintiff. Mr. Southgate, Q.C., and Mr. Bagshawe were counsel for the plaintiff; Sir Roundell Palmer, Q.C., Mr. Jessel, Q.C., and Mr. Rodwell representing the defendants. The case was argued just before the Easter holidays, when on the part of the plaintiff it was shown that before the recent alterations in Crutched Friars and the neighbourhood, he possessed premises in which there were four ancient lights. Upon the re-building of the house some larger windows were placed in the position of the old ones, but the contention was, that the plaintiff having enjoyed these ancient lights for a time, he did not lose the right to them when the house was pulled down. This being the case, the defendants, whose new house overlooked and was overlooked by that of the plaintiff, were clearly in the wrong when they proceeded to obstruct the new windows, even supposing a greater area had been taken up in their position in the new house than was the case in the old one. Plaintiff's counsel produced some photographs of the position of the premises, and called the attention of the Master of the Rolls to the inconvenience experienced by the plaintiff through the course adopted by the defendants. On the part of the defendants it was argued that no real wrong had been inflicted upon the plaintiff, whose new windows were not similar in position to those in the old building. In fact, the plaintiff himself had proceeded to alter the character of the ancient lights in the old building, and therefore he was not in a position to come to the Court of Equity for relief now.—The Master of the Rolls said: The question involved in this case opens in some measure a most important and new point for the consideration of the Court. In my opinion, indeed, it raises an entirely new question as to the construction of the law governing ancient lights. Shortly stated, it may be put thus:—Whether a man who has an easement over the land of his neighbour in the shape of access of light and air for twenty years to a small window may, under that right, build a large and entirely new structure overlooking his neighbour's land, and thereby acquire a perfectly new and distinct easement over it, which his neighbour cannot prevent when he cannot block up the other light without also injuring the light in the little pane of glass which admitted the light before the new building was erected. Certainly, before the decision in 'Tapling v. Jones' (13 Weekly Reporter, 617) by the House of Lords, it was never conceived in equity that a person could possess such a right; but we are bound by the judgment of the House of Lords, in which I must say I fully agree. Again, Vice-Chancellor Kindersley, in the case of 'The Carriers' Company v. Corbett' (2 Drewry and Smale, 355), thus deals with the subject of ancient lights:—'Where a house having ancient lights is pulled down and rebuilt, and the question arises whether the character of the ancient lights which belonged to the windows of the old house attaches to those of the new house, it appears to

me that the principle to be applied to the solution of the question is, to inquire whether the new windows would impose upon the servient tenement, either an additional servitude to that to which it was subjected when the old house existed, or a different servitude from that which previously existed. I think the view taken by Vice-Chancellor Kindersley is the correct view of the law of the case, and 'Tapping v. Jones' does not overrule the doctrine, which appears to me to be founded on immutable principles of equity. 'Tapping v. Jones' decides this—that no alteration of the ancient light will justify the owner of the servient tenement in obstructing it; but whether the obstruction of that light is a matter to be estimated in damages or restrained by injunction is, I conceive, a totally different matter. It may no doubt be laid down as a general axiom, that where a man possesses a right to light and air over the property of another, the obstruction of which is punishable at law in the shape of damages, a Court of Equity will by an injunction prevent the obstruction; but when the owner of the ancient light so deals with it as to alter its character, and converts it into a totally different easement over his neighbour's land, and one which prevents him from enjoying his property as he might have done at any time before the ancient light was so altered, then I am of opinion that the owner of the servient tenement is not debarred from the enjoyment of his land as theretofore, but that if in asserting such enjoyment he unavoidably interferes with the ancient light of the owner of the dominant tenement, then the only compensation that owner can obtain is in the shape of damages, and he is not entitled by the insidious use of his own property to deprive a neighbour of a portion of that neighbour's property. He is still entitled to compensation for the obstruction of the light and air which he formerly enjoyed; but by his own act he has deprived himself of the right to call for the aid of a court of equity to assist him. These are my opinions, and I certainly think it advisable that the point should be settled. There are, however, two rooms containing windows in the plaintiff's new building, to which the considerations I have stated do not apply. These rooms were each 10 feet 3 inches by 10 feet 8 inches, and they were used, it was said, as rooms in which writing was to be done; but I do not think they could be used by their situation for any such purpose. They were 26 feet from the defendants' building also, and in my opinion the diminution of light is not sufficient to induce me to interfere so far as regards them. The bill will be dismissed; but I shall give leave to the plaintiff to bring such action for damages as he may be advised.

To the Editor of THE ARCHITECT.

Church Benches.

SIR.—There are many small annoyances to which we are subjected from childhood, which from custom come to be borne without much protest.

Among these, I think, I may reckon the weekly onslaught on hats which takes place at church, either from our own feet or those of our neighbours. I sometimes fancy there must be a conspiracy between the guild of hatters and some tremendously conservative old fairy, who hate change and improvement, to keep us in a state of serfdom to a conventionality which, were it told of a nation wearing turbans, would much astonish us.

Some attempts were made in the time of square pews to provide accommodation for hats, in the shape of wrought-iron ornamental standards, painted and gilt, and many of them of no mean design; but these were luxuries chiefly confined to parish dignitaries. At the same time, we also find the walls of aisles and galleries furnished with pegs on which to hang our silks and beavers; but though I object to plain whitewashed walls in a church, and daresay the light and shade on hats may be a fine study in sciography, I do not think intermittent rows of them between the windows, or even on the window sills, are the most appropriate wall decoration. Still the general alternative is not a pleasant one, of putting the hat under the seat, whence it comes after service kicked, scratched, and covered with dust or mud.

I have, in one or two places, seen slips like the runners of drawers fixed under the seat, in which the rim of the hat is to run; but hats are not all of the same size—mine being small has slipped out, and come to grief. Again, these are seldom in number sufficient for every member of the congregation to have one, and in that case you are sure to find that the nearest one to you is in front of a lady.

These lucubrations, as Addison would have called them, set me thinking whether a simple contrivance could not be found which would lessen the evil in some degree.

I have adopted the method shown in the accompanying diagram in three churches, built or altered by me, and I believe it has satisfactorily answered the purpose. Bench ends 17 inches or 18 inches wide, space between 16 inches, seats 14 inches, are about the minimum dimensions, I think, for comfortable seats.

The raking boarding underneath the seats, on which is fixed a nail or peg in front of each person, is a support to the seat, rendering a less number of standards necessary. It provides hat room out of footway, yet allows space for the feet of the person in front, when kneeling, and place for a moderately-sized hassock for the one behind.

Such is my method. Others may have adopted a similar or better plan, for all I know; but I think these hints, if you choose to publish them, may, if they produce no better result, cause some folks to have one wound less in their hats on a Monday morning.

I am, Sir, yours faithfully,
27, Great James Street, Bedford Row.

GEORGE ROW CLARKE.

Josiah Wedgwood.

SIR.—In the excellent, and in most respects discriminative, notice of Josiah Wedgwood which appeared in your issue of April 17, I observe one or two passages which, I think, convey very erroneous impressions as to the great potter's labours, and the spirit in which he worked. One is to this effect:—'It is remarkable how all his efforts were directed toward the one object of making pottery beautiful.' Surely if Wedgwood had one object in view beyond another, it was the rendering his wares perfectly adapted to their use. I need hardly point out how his teapots are so balanced that the lid does not tumble off till the long axis of the pot is absolutely vertical; how no drop hangs to the spout of pot, jug, or ewer; how his plates are so fitted into one another that, though they be piled up by scores, the superincumbent pressure never breaks those below, although made of thin earthenware; how the handles of his pitchers and jugs were so placed that the fluid is delivered without effort by the spout, and never over the sides of the mouth; how his plates had rims for salt and mustard, so contrived that these did not mix with the gravy; and how his cups did not slip about in the saucers. These, and a hundred other little characteristics of his articles, show that he had a keener eye for purpose than any previous or subsequent potter.

Also far more remarkable than his love of the beautiful was his desire to apply pottery to purposes hitherto unattempted. His invention of the pyrometer and of the fountain inkstand are two cases out of many of considerable inventive powers, quite independent of love of beauty.

Another erroneous observation is that 'Wedgwood never attempted the manufacture of porcelain.' Tea and coffee services are not rare, made in very fine porcelain, and especially services with British birds and garden flowers painted on them.

Another observation to which I object is that 'neither his enthusiasm nor his desire to extend his trade ever induced him to carry on an unprofitable branch of manufacture.' Now I never heard it doubted that the production of busts and cameos, and especially the portrait series, involved a very heavy loss; indeed, no one could look over the trial models and moulds of these (as I have done) without being convinced that the outlay was very great, and the returns *nil*. He delighted in that kind of work, and pursued it as a recreation. The history of the Portland Vase, too, is a protest against such a statement.

I entirely agree with most of what your contributor states as to Wedgwood's love of the pseudo-classical, the patchy nature of much of his work, and the false taste of a good deal; his little appreciation of high art, and (considering his love of the beautiful) his unaccountable neglect of such artists as Flaxman; but I am surprised to find no allusion made to Wedgwood's efforts to introduce natural objects, especially plants, insects, shells, and birds, effectively and artistically into his cheapest as well as into his more expensive household wares. Like so many self-educated men, Wedgwood's was a very incomplete and often incoherent character. A keen tradesman and a clever adapter, with a wonderful eye for colour, form, and purpose, he never aspired to be a true artist, nor to cultivate art from a higher motive than a desire to please. Hence his commonest pieces, no less than his rarest, whilst gratifying the love of what is beautiful to the eye, and perfect as regards manipulation, fail altogether to elevate the taste, or to suggest the idea that their maker's artistic conceptions were either of a very high natural or cultivated order.

Kew, April 21, 1869.

J. D. HOOKER.

Is a Supply of Good Air possible in Large Cities?

SIR.—As you did me the honour of inserting in last week's 'ARCHITECT' my letter to Sir Charles Trevelyan with respect to the question, 'What is the best site for the New Law Courts?' perhaps you will favour me with a little space when treating of a matter of still more general interest. I do not propose to trespass much upon your columns; since, indeed, my proposition would not be accepted, after any amount of disputation on my part, by those who would deny that the merits of my suggestion were self-evident.

Mr. Ruskin some ten years ago, I think, recommended the adoption of the Gothic style of architecture by builders generally, no matter whether the contemplated structure was to be a public building or a row of private houses. This proposal did not meet with much attention, simply because mere ornament (so far as it can be dissociated from utility) never can very largely attract the sympathies of any great number of persons. I am now going to propose, through the medium of your Journal, the general adoption of a species of *façade* which will be not only much more beautiful than anything proposed by Mr. Ruskin, but which, besides costing little, can actually bring pure air to the door of every inhabitant in every city in the world. This 'towns' improvement' is nothing more or less than the general planting of ivy and other similar plants in the fronts of buildings of every description, particularly in the case of private and non-trading streets. But there is really no physical difficulty in the way of rearing such plants, or shrubs shall I call them? even in the most active thoroughfares. Did the

Government exert itself to have this urban reform adopted, there is not the slightest ground for doubting that towns would become equally as healthy as the country.

It is unnecessary for me to proceed to prove that the vital properties of our atmosphere are derived from plants and vegetable life, and, to some slight extent, from the waters of the ocean. The want of good air, then, in cities is owing to our forgetfulness of the primary and natural sources whence good air is derived. I used to hear a tradition, when my experience was yet unripe, that the venison which tasted so deliciously in the City taverns was really reared in cellars underground in the Minories. If my suggestion, however, be adopted, we may fairly look for a *rus in urbe* in respects more important than the production of venison—and that is, in the preservation of health and the prolongation of human life.

Finding a large portion of the legal profession in favour of the Carey Street site for the Law Courts, I began to consider whether there could be any remedy for the pestilent air which must be breathed in courts erected in so unhealthy a district. I know not whether my suggestion, much less the history of its development in my own consciousness, may be interesting to your readers. But I have been led to consider the general question of air in cities; and, I think, certainly nothing can be said against my views on the point, except, perhaps, that very important effects could not be expected to ensue from the adoption of so simple and inexpensive a plan.

Hoping that you will excuse my thus trespassing on your columns,

I have the honour to be, Sir,

Your very obedient servant,

Gray's Inn, April 15, 1869.

JOHN P. O'HARA.

NEW BUILDINGS AND RESTORATIONS.

The Bengal High Court.—This building, which is now in course of erection, consists of a rectangular parallelogram, covering nearly three acres of ground. It has three storeys, and is 88 feet high from the road to the parapet. The large central tower is 36 feet square, and 230 feet in height. The interior quadrangle has vaulted cloisters, or corridors, all round on the two lower storeys, whilst on the third storey the corridors are on two sides only. There are six large carriage entrances. The two court rooms will be much larger, when completed, than the House of Commons or the House of Lords. The rooms on the ground floor are set apart for clerks' offices, principally natives, and the heavy records of the courts. The tower above the ground floor will be used as the depository for wills and other valuable records. On the first floor there are in all seven courts of law, with retiring rooms for the judges, a judges' library, a bar library, with consultation room and retiring rooms, attorneys' rooms, native pleaders' rooms, petty jury rooms, a private office for the registrar, and a room for the Chief Justice's clerk, with a number of bath rooms and other subsidiary conveniences. There are chambers also which will be let to barristers.

A New Post-Office for Rochester and Chatham is decided on.

At Sunderland the foundation-stone of a new United Presbyterian church has been laid for the congregation of the Rev. Mr. Angus. It is to be seated for about 900, and to cost 3,500*l.*, exclusive of the site.

The New Assembly Room, Hyde (I. of W.).—This Assembly Room, and the approaches thereto, have been completed, with the exception of a little painting and a few minor matters.

St. Michael's Church, Dumfries.—It has just been proposed, in the Dumfries Town Council, that the plans for reseating St. Michael's Church be reproduced and reconsidered. The Clerk hoped that the Council, for the sake of consistency, would not entertain any such proposal, and explained that the plans had not only been submitted to the heritors, but they had been before the Presbytery and were approved of.

Salisbury Cathedral.—It has been decided to proceed with the restoration of the Lady Chapel of this Cathedral forthwith.

The Railway Station at Winchester has been considerably increased in size, and more accommodation in the waiting rooms has been accorded.

Congregational Chapel (I. of Wight).—On the 14th this place of worship was opened by an afternoon service, after which a public tea was given at the Foresters' Hall, which was crowded to excess.

Union Church, Hanwell, has just been opened. The style is Geometrical Gothic of the period of Edward VI. C. Jones, Esq., of Ealing, the architect; Messrs. Gibson Bros., builders.

The Foundation-stone of a new place of worship has been laid by Lord Grosvenor for St. Barnabas district, Pimlico; and a new church has been opened at Matlock Bath, for the poor of the parish. The seats are to be free.

At the late Meeting of the Florence Land and Public Works Company, the report stated that works to the extent of 172,740*l.* have been completed and paid for, yielding a satisfactory profit; while with regard to the building land in the possession of the company, consisting of about seventeen English acres in the city, various operations have already been carried out calculated to lead to a good return. A proposal to issue 50,000*l.* in 6 per cent. obligations at the price of 80, redeemable at par by annual drawings within ten years, was agreed to.

The Central Pacific Railway Works, to protect the line from the heavy falls of snow to be expected in certain sections, consist of a shed-covering, twenty-two miles in length. This shed is sixteen feet in width, and sixteen feet in height, not including the pitch of the roof. The sides are enclosed, and were it not that daylight penetrates through the interstices, the whole would be like a huge tunnel. The building is braced together in a peculiar manner, and is, in addition, firmly bolted to the rocks near the face of a cliff. Where snow-slides are to be feared, an extension of the roof has been carried to the cliffs, so that falling masses shall pass over the building, and lodge upon the other side.

The Church on Southernhay, Exeter, belonging to the Independents, lately destroyed by fire, was being erected by Messrs. Bragg and Dyer, of Paignton. The foundation-stone was laid in June last by Mr. Alfred Rooker, of Plymouth.

Grove Road Chapel, Victoria Park, was built for the Baptist denomination, and was a very ecclesiastical Gothic building, without school-rooms or sufficient vestry accommodation. It has now been sold, and another place of worship will shortly be erected, the congregation holding possession of the present structure until November.

The Presbyterian congregation of Dr. Roberts at Carlton Hill, St. John's Wood, have commenced to build a new place of worship for themselves. It is to have a spire, and to be seated for 570 on the ground floor.

Canton, Cardiff.—The foundation-stone of a new chapel has been laid at Canton, Cardiff. The cost, including several class-rooms, is estimated at 2,600*l.*

Chesterfield is to have a new chapel, the foundation-stone having been just laid. The building belongs to the United Methodist Free Church, and is intended to seat 850 persons, at a cost of 2,500*l.*

Bethesda Chapel, Lynn.—The corner-stone of new schools in connection with this place of worship has been laid by J. Brough, Esq. The building is estimated to cost 470*l.*

The New Church for the United Presbyterian body, in Lower Abbey Street, Dublin, was opened a few days since. The cost will be 4,800*l.* Mr. William Fogerty, architect; Messrs. Crowe, builders.

The New Offices of the Royal Insurance Company in Dame Street, Dublin, erected from the designs of Mr. W. G. Murray, have been finished and handed over by the contractor, Mr. John Nolan, of Meredyth Place.

New Chancel and Alterations.—On Sunday the new chancel and additions to the church of St. James (Roman Catholic), Marsh Lane, Bootle, near Liverpool, were solemnly consecrated. There are choristers' stalls of pitch pine, and an altar of marble and alabaster. A quaint and massive arch opens into the nave of the older church, and the roof is of curved and moulded coupled rafters. The work has been executed by Mr. Ray, builder, of Liverpool, from the designs of the architects, Messrs. M. E. Hadfield and Son, of Sheffield.

Hertford.—St. Andrew's Church is to be rebuilt. The chancel and transepts alone will cost 2,223*l.*

Dorking.—The new aisle on the south side of St. Paul's Church has been recently completed. It is in the Early Decorated English Style. The church was built in 1857 at the sole cost of the late Mr. J. H. Labouchere, who also added an aisle on the north side about five years since.

Manchester.—The foundation-stone has been laid of a church in the Waterloo Road, Cheetham, dedicated to St. John the Evangelist. The church, the site and structure of which are to cost 10,000*l.*, is to be built and endowed at the cost of Mr. Lewis Loyd, of Monk's Orchard, Surrey. The style will be Early Gothic of the thirteenth century. The tower will rise to a height of 130 feet.

Pelton (Durham) church has received the addition of a new scuth porch, through the liberality of a parishioner. It is in the Early English style.

The foundation-stone of a new bridge over the valley of the river Hebble, at Halifax, was laid with much ceremony a short while since. The new bridge, which is to be of iron, with two spans of 160 feet, is to be built by the corporation of the town at a cost of 21,000*l.*

Macclesfield Militia Barracks.—At the last Knutsford Quarter Sessions, Mr. J. U. Gaskell moved for a grant out of the county stock, not exceeding the sum of 250*l.*, for the purpose of repairs and alterations of the Macclesfield Militia Barracks. The grant was allowed, together with an additional amount for fixtures.

The New Asylum at Caterham.—The ceremony of laying the foundation-stone of the new asylum at Caterham, one of the buildings to be erected under the Metropolitan Asylums District Act, 1867, for the accommodation of the imbecile or infirm poor of London, took place on Saturday. In the cavity of the stone a vase of coins was deposited, and also a list of the managers, a copy of the Act of Parliament, &c.

The New Dead Meat Market at Smithfield.—It is stated that a portion of the iron work in the New Dead Meat Market is defective, and that the works lately in progress have been stopped, pending the results of an inquiry.

New Blackfriars Bridge is to be opened in July next, a month in which the inauguration of the Holborn Viaduct is likewise promised.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Notes for Connoisseurs.

Seldom, perhaps never, have valuable collections of world-wide celebrity been brought to the hammer in Paris in such rapid succession as those the fate of most of which we have noticed in these pages. The auction of the Soult collection began the series, and then followed those of Pourtales, De Morny, San Donato, Delessert, and now we have to mention yet another no less important—namely, that of M. Ed. Fould, who breaks up his establishment in order to live in the 'sunny south.' The sale lasted four days, and included, (1st day) the pictures, (2nd day) plate, (3rd day) cameos and antique jewellery, &c., and (4th day) snuff and bonbon boxes, of which there were no less than sixty-eight, and lastly, a small but costly series of Limoges enamels (including an oval *plaque* 16" x 12", by Jean Courtois), statues, china, bronzes, &c. We will content ourselves by noticing the chief

pictures only, although the catalogue contained but fifteen, which together fetched 251,850 francs, or rather over 10,000*l.* The highest bid, amounting to 63,000 francs, was for a *Laocret*; the next highest was 52,000 francs for a *Pater*; both sylvan scenes, formerly in Lord Pembroke's collection, and now bought by the Marquis of Hertford. A third picture caused much lively bidding, partly for its own sake, partly from the fact that it has successively belonged to the Duchess of Orleans and Prince Demidoff. This was a 'Samson amongst the Philistines,' by Decamps, and was bought by M. Bischoffsheim, the well-known Brussels banker, for 40,500 francs. A *Wouvermann*, 6' 2" x 4' 4", realised 20,000 francs (to Count Tolstoy); a Meissonnier 14,200 francs; and 'Poultry' by Hondecoeter and by Jean Weenix were both bought by Mr. Rutter, for the South Kensington Museum, for 14,200 francs.

The Institute Gold Medal.

It may be interesting to our readers to see a list of some of the principal published works of Professor C. R. Lepsius, to whom Her Majesty's Gold Medal was presented last Monday. We give them chronologically arranged:—

- Lepsius, C. R. *Das Todtenbuch der Aegypter nach dem hieroglyphischen Papyrus in Turin.* Leipzig. 4to. 1842.
- *Reise des Prof. Lepsius von Theben nach der Halbinsel des Sinai vom 4. März bis zum 14. April 1845.* Berlin. 8vo. 1846.
- *A Tour from Thebes to the Peninsula of Sinai, &c.* Translated from the German by C. H. Cottrell. London. 8vo. 1846.
- *Die Chronologie der Aegypter. Einleitung und erster Theil; Kritik der Quellen.* Berlin. 4to. 1849.
- *Denkmäler aus Aegypten und Aethiopien.* 12 vols. Plates. Fol. Berlin, 1849–59. [This is the only work of Lepsius in the library of the Institute.]
- *Discoveries in Egypt, Ethiopia, and the Peninsula of Sinai (1842-45), during the Mission sent out by His Majesty Frederick William IV. of Prussia.* London. 8vo. 1852.
- *Letters from Egypt, Ethiopia, and the Peninsula of Sinai.* Translated by Leonora and Joanna B. Horner. London. 8vo. 1853.
- *The XXII Egyptian Royal Dynasty, with some Remarks on the XXVI. and other Dynasties of the New Kingdom.* Translated by Wm. Bell. London. 8vo. 1859.
- *Älteste Texte des Todtenbuchs nach Sarkophagen des altägyptischen Reichs im Berliner Museum.* Berlin. 4to. 1867.

Indian Railways.

From the financial statement by Sir Richard Temple, before the Legislative Council of the Governor-General of India, it appears that during the past official year the gross traffic receipts of Indian Railways were so much less than had been expected, as to entail upon the Government the payment of nearly half-a-million (as guaranteed interest on railway capital, less net traffic receipts) more than had been estimated for at the commencement of the year. Notwithstanding this temporary drawback, for temporary it will most probably prove, it is satisfactory to find that the half million of gross receipts, which the Indian railways returned in 1860, has now grown to near six millions, and the quarter of a million of net receipts, for the same period, to between two and three millions; thus clearly proving the appreciation in which those lines of railway are held by the natives; the traffic during the past year having amounted to some three millions of tons of goods, and about sixteen millions of passengers. On the 77 millions of capital raised for the construction of railways in India, there accrued during the past year 3½ millions of interest due to the shareholders under guarantee from the Indian Exchequer. The gross traffic earnings of the year on the 4,000 miles of railway opened in India amounted to 5½ millions paid into the Imperial treasuries, which sum was, however, reduced by exchange to 5¼ millions. The working expenses, amounting to 3 millions, left 2¼ millions of net traffic receipts, which latter sum being deducted from the 3½ millions of guaranteed interest, leaves a sum of 1¼ millions debit to the finances of the Indian Government for the year 1868-69. It is expected that, as the construction of railways in India will be going on probably at the rate of 3 or 4 millions annually for some years to come, this item of 1¼ millions for guaranteed interest will not presently decrease, but that it may increase to 1½ millions.

The net traffic earnings for the current year will, it is anticipated, be sufficient to return the following rates of interest on paid up capital, namely on the East Indian Railway 4½ per cent., on the Great Indian Peninsula 3 per cent., on the Madras Railway 3 per cent., and on the other lines from 1 to 2 per cent.

Piercing the Isthmus of Corinth.

With regard to the project of cutting through the Isthmus of Corinth, it is thought at Athens that the present moment is peculiarly apropos, in as much as the powerful machinery employed upon the Suez Canal may soon be had very cheap, and plenty of workmen will be out of employ and glad of this new 'job.' A glance at the map of the Mediterranean will show how important such a canal would become for the commerce of the French, Italian, and Austrian harbours with Smyrna, Constantinople, and the Black Sea. The harbours at either end would not require any great outlay, whilst the Canal itself would only be 3½ English miles in length. The chief difficulty will be to cut through a hill of chalkstone, a mile wide at its narrowest point, and 250 feet above the level of the sea. It is calculated that a channel 150 feet wide and 40 feet deep will require the removal of about 12 million cubic yards of earth and rock. There can be no doubt that a canal would be of far greater real utility to the Greeks than an ironclad fleet wherewith to drive the Turkish fleet from the Archipelago.

The Right Use of Works of Art.

The Louvre, with all its recent additions, and including the continuation of the great gallery by the side of the river, now nearly ready, possesses no less than 142 rooms and galleries for the exhibition of works of art and antiquities; yet so immense is the collection belonging to this grand national museum that hundreds of pictures remain in the store rooms for want of wall space to hang them. This is not surprising when we learn

from a report by the Comte de Nieuwerkerke, superintendent of the Beaux-Arts, that during the last fifteen years 45,000 pictures, statues, and antiquities have been added to the store.

The Government has wisely determined that the surplus treasures of the Louvre, whatever be their value, shall no longer be hidden away in store rooms, but made subservient to the purposes of art education and the cultivation of the public taste. The Louvre can scarcely be enlarged, and besides, many of the works in question would be little more than duplicates in effect, as works by nearly all the masters are to be found on the walls; the palaces are well stocked with works of art; and it has been resolved that those pictures and other productions of art which are not required in the great Paris gallery, shall be distributed amongst the churches and museums of those towns which have shown a desire to encourage art by the establishment or the retention of their local galleries, by exhibitions and other means.

With the view of carrying out this judicious arrangement, lists are now being prepared by the conservators of the galleries of the Louvre of such works as may be spared from that collection, and these lists are to be revised by a special commission consisting of twelve members, with Count de Nieuwerkerke as president. The members of this commission represent the chief bodies in the state and the Academy of the Beaux-Arts, the members being M. Chaix d'Est Ange, senator; M. Mérimée, senator and member of the French Academy; M. A. Le Roux, vice-president, and Comte Welles de la Valette, member of the Corps Législatif; the Vicomte de Rougé, of the Council of State; with five artists, namely, MM. Cabanel, Gérôme, Gatteaux, Guillaume and Cavelier, and the Vicomte Henri Delaborde, conservator of the Print-room in the Bibliothèque Impériale, all members of the Académie des Beaux-Arts. When this commission has decided on the works to be dispersed, the Senate will be asked to grant the Government permission to dispose of this portion of the property of the Crown, and many a provincial gallery will receive a welcome addition to its stores.

A Sketch of the Seine and the Marne in Old Times.

M. Alphand, engineer of the Bois de Boulogne and all the public gardens and promenades of Paris, has made a series of researches respecting the early condition of the Seine, and has arrived at the conclusion that it was formerly a mightier river than the Mississippi.

Deposits of river-sand and shells have been found on the heights around Paris, at Charonne and the Barrière d'Italie, amongst others. Between these two points the stratum of sand is about four miles wide, and the Seine, it is assumed, must have covered this entire space. It covered the plain of Vincennes, where many sand-pits are now being worked which formed part of the ancient bed of the river, especially near the village of Montreuil, famous for peaches. These sands abound in remains of extinct animals—elephas primigenius, rhinoceros etruscus, hippopotamus major, cervus elephas, bison europæus, &c.

The Seine is now curvod in a most fantastic manner, and divided in many places into several channels; but it appears in old times to have flowed straight through Paris, and to have been nearly twenty miles wide at that part where it flowed over what is now called the Plains of St. Denis, that great desolate tract of land seen behind Montmartre.

At present the course of the Seine from Paris to Rouen is 152 miles, and from Rouen to Havre 76 miles—in all 228 miles; but in ancient times its course was direct, and did not exceed 142 miles in total length. At high-water, the maximum outflow must, according to M. Alphand, have been 60,000 tons per second, or twenty-four times that of the present river.

In consequence of the increase in the incline of its bed—the fall is now between six and seven inches per mile, on the average—the rapidity of the Seine became so great that the level was gradually lowered, the windings of the river were produced, little by little, and the banks left as they are at present.

In constructing the aqueduct for bringing the waters of the Dhuis to Paris, the sand deposits in the valley of the Marne, which are at an altitude of rather less than 180 feet, were carefully examined, and the inference is that this river also was of immense size. Those who saw the valley of the Marne, as we did three years since, during the inundations, might form some idea of what that now modest stream was in the olden times; for many miles by the side of the railway, and over a vast country on the confines of the forest of Fontainebleau, the waters lay in broad sheets over the valley, factories and buildings of all kinds stood several feet deep in water, all appearance of hedges, walls, or fences was obliterated, and the whole crop of new-mown hay, mingled with uprooted trees, floated on the surface of the turbulent flood.

English Honorary Members of the Royal Academy of Vienna.

There appears to be some uncertainty as to what English artists have been honoured with diplomas appointing them Honorary Members of the Royal Academy of Vienna; but with regard to architects we can, speaking on good authority, state that in addition to Mr. Gilbert Scott and Mr. Street, whose names we have already announced as thus recognised, the distinction has also been conferred on Mr. Waterhouse, Mr. E. M. Barry, and the veteran Professor Donaldson.

America.

An evidence of the improved industrial and financial condition of the South is afforded by the vast amount of building and property improvements going on in New Orleans and its suburbs. What is remarkable, there has never before been a time when buildings could be erected at so little cost in that city. All building material which is produced in the South may be now obtained for the same—if not lower—prices in greenbacks than before the war in gold. Every article, however, that comes from the North is fully up to the gold standard, and has always been so. In consequence of the cheapness of lumber, &c., parties who have never before considered themselves able to build, are now erecting residences of their own. This is certainly a fortunate state of things for the residents of the Crescent City.

Abyssinian Goldsmith's Work.

The Abyssinian war, however satisfactory in many respects, was eminently disappointing as regards literature, architecture, or in short any of the humanising arts. From the mysterious land of Prester John one could not help expecting, or at all events hoping, that some traces of royal and ecclesiastical dignity might be found worthy of its mythic mediæval fame, nor could the veracious narratives of Bruce and later travellers entirely destroy these hopes. The unerring evidence of photography soon gave a rude shock to any such anticipations by showing us churches which resembled badly-constructed barns or haystacks, and gospels whose illustrations could not pass muster for the heading of a Seven Dials ballad. At length, after the capture of Magdala, the arrival of the royal insignia of Theodore dispelled all illusions that might still linger as to possibilities of barbaric pearl and gold yet to be found. A royal robe of coarse and gaudy silk and gold, of European make, a seal which honestly announced itself as the work of a well-known London house, and a cap of red velvet and gold thread which might have issued from the property-room of a transpentine theatre—these were all which betokened the royal state of the terrible monarch. It seemed, indeed, that the Abyssinians had attained to that condition of pure reason sighed after in Pope's 'Martinus Scriblerus,' and could conceive of abstract power unaccompanied by outward symbols, even of a Lord Mayor without fur and chain. A late arrival at the South Kensington Museum tends, however, to show that the eaters of live beefsteaks are not altogether transcendental or unaffected by outward pomp. The actual royal diadem of Abyssinia, or what may fairly be presumed to be such, was taken at Magdala, and having been transferred by the Secretary of State for India to the authorities of the South Kensington Museum, is now to be seen among the other objects brought from Abyssinia. The shape of this somewhat cumbersome head-dress much resembles that of a cupola: the material is silver-gilt filigree, of the same character as an armet, a coffee cup-holder, and other objects in the same case, and which travellers in Nubia and more Southern provinces will at once recognise as a special manufacture of those districts. That the work of the crown is somewhat more clumsy than that of these smaller specimens is not perhaps unsatisfactory evidence of its genuineness as pointing to a more remote date, when their artists may have been less technically skilful than at present. Round the base are some ornamental pieces of similar work set with what may be garnets and emeralds; but look, at any rate, through the glass, suspiciously like pastes. A small painting of a cherub's head under crystal—its companion seems missing—is interesting even in its rude colouring. On the upper part of the dome are four plates, of silver gilt, showing the figures of the Evangelists with their respective emblems, drawn in the same feeble style as characterises all the religious figures on the crosses from that country. These ornaments, and the cherubs' heads above-mentioned, are, however, not without significance as typifying the union of king and priest in one person common in many ancient nations, and may, perhaps, be the sole surviving feature of the mythic priest-king of mediæval legend. A somewhat ludicrous effect is produced by a plain silver tube, which, issuing from the top of the crown, appears intended to act as a ventilator. Its real office was doubtless that of a plume-case or socket, as is shown by a screw which descends internally, and which, instead of being cut in the thickness of the metal, as with us, is formed by a thin silver wire applied with great skill to its surface. Would not the effect of the crown as really worn be rendered more obvious by the insertion of a plume? We offer this suggestion. Altogether this may be safely pronounced the most interesting of the spoils which that singularly barren and savage territory has yet rendered to our researches.

Ceylon Railway.

The working of this line of railway seems calculated to prove very successful from a financial point of view; the receipts on the 75 miles opened having amounted, in October last, to 48*l.* 13*s.* 8*d.* per mile, a sum considerably in excess of the earnings of any Indian line of railway.

Interesting Discovery.

Some remains of Greek art have recently been exhumed from the bed of the river Indus near a village called Rokri, in the Bunnoo district. Three beautifully sculptured heads which were found among them have been presented to the Lahore Museum.

General.

Surveyorship of Liverpool.—With regard to the lately announced withdrawal of Mr. Robson's resignation, a correspondent informs us that some modifications in the duties of the office have been proposed, and are under consideration, but that the whole subject has been referred to the Finance Committee of the Corporation.

Berkhamstead Industrial Exhibition.—It is proposed that another Industrial Exhibition of local manufacture and works of art be held in connection with the Berkhamstead Mechanics' Institute in 1870.

Yarmouth Castle.—This ancient castle, built in the reign of Henry VIII., and repaired in 1855, is now completely dismantled.

Antiquarian.—Excavations were carried out lately at Pompeii, in the presence of the Prince and Princess of Piedmont. Senator Professor Fiorelli caused the earth to be removed which covered some houses. There was found in one of them a bronze seal, the length and thickness of a finger, with the name of its owner: 'Pantera, son of Capus and of the Flamianian tribe.' They also found a wooden casket, encircled by bands of bronze with graceful decorations; amongst others six heads of the same metal and of fine workmanship; the wood was almost entirely consumed by the damp,

excepting parts near the hinges. They also discovered a brazier in smooth bronze, objects in glass (most of them in pieces), and a woman's necklace in blue glass. These objects indicate that their owner enjoyed a certain position of ease. They did not present any remarkable appearance.—*Athenæum.*

The Caverns at Guildford.—Through the exertions of Mr. Macdonald (late Corporal Macdonald, Royal Engineers) the remarkable caverns at Guildford have been to some extent cleared of the débris with which they were found encumbered. The passages leading to the different subterranean chambers can now be traversed with ease, and inspection made under conditions more favourable to the formation of a right judgment as to the real object and use of excavations which have elicited so many conflicting opinions. The work of clearance has not yet proceeded far enough to admit of an examination of the floors. When these are reached, it is expected that discoveries will be made which will place beyond dispute the purposes to which the chambers were originally applied. A safe place of access is being formed for the public, and, if the necessary consent can be obtained from the owners of the soil, in all probability the caverns will be opened for the inspection of the curious during the coming summer.

Discovery of an Ancient Saltpit at Weymouth.—The ravages made by the sea on the shore at Smallmouth have lately brought to light what is evidently one of the salt pans or *salinæ* in use by ancients for the manufacture of salt. It is a circular trough, six or seven feet in diameter, formed of well puddled clay. It has two openings lined with slabs of Kimmeridge shale to a thickness of about two inches, one of these channels being covered by a slab of similar material. The outer edge of the basin sloped for about two feet until it reached the level of the ground. About fifty yards distant was uncovered some masonry, apparently of Saxon construction, but unfortunately it was destroyed almost as soon as discovered and the stones carried away. Portions of British-Roman pottery were also found near, and some perforated stones, which are supposed to have been worn as charms. The mention of salterns or salt pans occurs frequently in the early history of Weymouth, and it is on record that King Athelstan, in remorse for the murder of his brother, granted to the Abbey of Milton 'all the water within the shore of Weymouth, and half the stream of Weymouth out at sea, twelve acres in support of the wear and its officer, and three theynes, and a *saltern* by the wear.' The locality indicated is probably the neighbourhood of Wyke, and if so, it is possible that the relic lately unearthed formed part of King Athelstan's grant. Many an antiquarian 'air-castle' has been built on a far less tangible foundation.

Foreign Trade of Belgium.—The principal (the enumerated) exports from Belgium in the year 1868 show an increase in value of 7 per cent. over the year 1867, and the principal imports an increase of 12 per cent. There were exported in the year 1868 3,758,622 tons of coal, or at least very nearly that quantity, the tonneau being 40 lbs. less than our ton; 3,611,721 tons to France; both quantities are larger than those of 1867, but not so large as those of 1866. Belgium imported in 1868 the unusual quantity of 396,281,584 kilogrammes (of 2·20 lbs. each) of iron ore and flings; but the export of iron ore and flings exceeded 136 million kilogrammes. The iron exports of Belgium in 1868 comprised 70,550,802 kilogrammes of rails (chiefly to Russia), 14,412,891 kilogrammes sheets, and 70,615,781 kilogrammes of other kinds of iron, including wire, a large proportion of these exports going to France; 10,611,895 kilogrammes of nails, and 6,357,206 kilogrammes of other iron wares, the import of iron wares into Belgium (not including anchors and nails) amounting to 1,810,301 kilogrammes. Belgium exported also in 1868 arms of the value of 14,871,527 francs, chiefly to France; 39,234,996 kilogrammes of window glass (17 millions to the United Kingdom), and plate glass of the value of 1,832,104 francs; 17,689,358 kilogrammes of machines and machinery, the quantity in 1867 being less than 11 millions, and the import of machines and machinery in 1868 amounting to 4,230,014 kilogrammes, of which 2,727,555 kilogrammes were from the United Kingdom, our import of machines and machinery from Belgium amounting to 714,713 kilogrammes. The export of zinc, unwrought, from Belgium amounted to nearly 34 million kilogrammes in 1868. Of paper Belgium exported 11,766,110 kilogrammes, of which 7,337,861 went to the United Kingdom; the import of paper into Belgium was less than 800,000 kilogrammes. Belgium imported 3,144,665 kilogrammes of rags, and exported 4,234,626 kilogrammes. Belgium exported 13,581,263 kilogrammes of refined sugar of all kinds, and 27,076,634 kilogrammes of raw beetroot sugar; and imported 17,967,926 kilogrammes of raw sugar of all kinds, chiefly from Cuba and Java, and 1,184,449 kilogrammes of refined sugar. Of textile manufactures the accounts show an export of cotton tissues amounting to 2,357,605 kilogrammes, and an import of 889,037 kilogrammes, besides tulle, lace, &c., an export of 3,396,054 kilogrammes of tissues of flax, hemp, and jute. The year's import of corn and flour exceeded 250 million kilogrammes; of raw cotton sixteen million kilogrammes; of rice 32,246,201 kilogrammes; of salt, unrefined, 50,523,656 kilogrammes; of coffee, 23,627,808 kilogrammes; of tobacco, unmanufactured, 7,532,624 kilogrammes; of petroleum, 38,199,468 kilogrammes refined, and 4,680,509 kilogrammes raw. The import of woollen manufactures of all kinds was of the value of 17,306,810 francs, and the export of woollen cloths amounted to 1,845,457 kilogrammes.

The New Building Act.—It is probable that no attempt will be made at present to obtain a new Metropolitan Building Act.

The Ingham Testimonial Infirmary.—Dean Waddington has given 300*l.* towards the erection of this infirmary in South Shields.

Discovery of Old Scottish Coins.—An important discovery of old Scottish coins was recently made in a field near Prestonpans. There were in all 114 coins, chiefly silver, dating from the reign of James III. to that of Mary. The coins were lying in a heap, as if they had been originally in a bag. Among them was a gold noble of the time of Mary. One of the silver pieces had been struck in commemoration of Mary's marriage with the Dauphin of France. It is dated 1558; and in addition to the monogram 'F.M.' with the heraldic emblems of France and Scotland, there is

the following Latin legend on the reverse—'Jam non sunt duo sed una caro.' One of the silver coins, bearing the date 1558, is said to be almost as perfect in its stamping as on the day when it left the Scottish mint. A number of the coins have been deposited in the Edinburgh Antiquarian Museum. Carberry Hill, the scene of Mary's surrender, is in the neighbourhood of the place where the discovery was made.

Science and Art in Ireland.—The Report of the Commission on the Science and Art department in Ireland has been issued. The object is to bring into harmonious action all existing institutions in Ireland receiving State grants for science and art. The commissioners do not recommend the formation of a separate department for Ireland, but they think it desirable that there should be a General Industrial and Fine Arts Museum in Dublin.

The Danish Church, in Wellclose Square, between the Tower and Whitechapel, is levelled to the ground and carted away. The edifice, which somewhat resembled the parish church of Kensington, was built in the reign of William III., for the use and benefit of the Danish seamen. Inside it, at the south-eastern corner, stood a Royal throne pew, intended for the use of any of the reigning house of Denmark. The reredos over the Communion table was surmounted by the Royal Crown of Denmark and the emblem of the Christian faith; and among the other contents of the church was a heavy but handsome oak pulpit, ornamented with carved wreaths of flowers and statuettes of the Apostles.

Local Art Union of Liverpool.—The Local Art Union of Liverpool is now established. It has been specially authorised by the Lords of the Privy Council for Trade; it is under the patronage of the three members for the borough; and it has at its back a committee composed of leading members of the Town Council and other prominent townsmen. Works of art for the first distribution, to the value of over 1,200*l.*, have been selected from the exhibition and studio collections of Mr. Norbury. The collection includes Mr. Norbury's great picture of 'Caractacus leaving Britain a Prisoner,' and 'The Return of St. John and Mary, the Mother of Christ, from the Crucifixion.'

Sale of Property in Gloucester.—Some house property belonging to the late Mr. R. Carter was sold by Messrs. Bruton and Knowles at the Spread Eagle Hotel a few days since. A freehold twelve-quarter malthouse and premises in St. John's Lane was bought by Mr. Long for 300*l.* The residence No. 18 Brunswick Square was sold to Mr. Wingate for 480*l.* Four residences in Hill Field Parade, held under the Charity Trustees by a lease of which seventeen years are unexpired, and subject to an annual payment of 20*l.*, were sold to Mr. C. Carter for 950*l.*

Messrs. Christie & Manson will sell on Tuesday, May 4, at their rooms, Mr. Barlow's very choice collection of Wedgwood ware. This collection includes many fine samples engraved in Miss Meteyard's 'Life of Wedgwood,' and the sale of it presents an opportunity not often offered to connoisseurs.

On April 16, a portion of a large hall of a warehouse, situated between King's Head Court and Bartlett's Buildings, Holborn, fell with a crash. The workmen escaped without injury.

Indian Architecture.—For many years past there lay unnoticed in the stables of Fife House a mass of old Indian marbles, which had been brought over from Madras, hardly any one knew either when or why. They were broken and uncomely; and if any man had the wit to push inquiries as to what they were and whence they came, he was told they were fragments of an Indian temple of which scarcely anybody in London had ever heard the name. If the inquirer went yet further, he might—or might not—have learnt that these broken stones had been found, a good many years ago, lying on the wharf at Madras, exposed to the wind and rain, and that, after much writing of letters, they had been shipped for England, where they had been tumbled out on the yard of Fife House. To ask how they came to be lying on the wharf at Madras was like going back to the Deluge; yet when curiosity pushed its way backwards, these stones were traced to Mr. Walter Elliot, who, when acting as commissioner at Guntoor, twenty-four years ago, had employed his leisure in grubbing along the green slopes and mounds on the river Kistna, after the fashion then being set by Botta and Layard on the Tigris. Elliot had met with much success in his labours, having unearthed a city and recovered an ancient temple, the details of which were of exceeding richness and importance. Nay, he had actually forwarded his wealth of examples to Madras, in the hope of their reaching London, and making his name immortal. But—alas, for human hopes!—Elliot was no writer. He could not tell his story in a way to arrest the public eye. Amravati was not a Biblical city; and, unlike the Tigris, the river Kistna had a foreign sound. The temple which he had found was called a *tope*, the name and office of which were alike unfamiliar to the English mind. The temple was Buddhistic; and, as Gotama Buddha is not mentioned in the Scriptures, the stones of which his temple had been built in Amravati could not serve to illustrate the form and site of Solomon's temple in Jerusalem. The stones were at length sent to our India Museum in this country; and when Mr. Cole was laying out plans for our share in the French Exhibition, he proposed to Mr. Fergusson, as the chief authority on Indian architecture, that some casts and models of old Indian temples should be prepared under that gentleman's eye. Mr. Fergusson, who fell in with the suggestion, set to work; meaning at first to confine the display mainly to photographic studies of Brahminical and Buddhistic works, backed by four or five casts from the curious and beautiful marbles which had long been shown in the old Indian Museum in Leadenhall Street. The pieces of stone were now picked up and set in order. The separate slabs were copied. Soon these gentlemen began to find that they had more in hand than a mass of stones. The pieces fitted to each other. It was possible to build them up; and as the pile grew higher, it took a wondrous and comely shape. In fact, the old Buddhistic *tope*, under these skilful hands, came back, as it were, to life. But this recovery of an ancient Buddhistic temple is far from being all that we have gained. The recovery is that of an original record; and we

have not only got possession of this record, but of its secret. The *tope* is a religious edifice, and the stones of which it is built are covered with figures—figures of men, animals, trees, and reptiles. They are especially covered with trees and reptiles; that is to say, with figures which appear to be symbols of trees and reptiles. When it was resolved to issue copies of the Amravati marbles, Mr. Fergusson suggested the addition of some specimens of the yet more ancient *tope* of Sanchi, of which there happened to be a capital series of drawings, made by Colonel Maisy, of the Bengal Army, in the India Museum. The *Tope* of Sanchi dates from the first century of our era; that of Amravati from the fourth. This additional proposal was accepted by Sir Stafford; and the consequence is, that we have an excellent account, with specimens, of Buddhistic architecture in India nearly coeval with the Temple of Herod and with the earliest Christian edifices in Byzantium.—Abridged from the *Journal of the Society of Arts*, April 9.

A General Building for the Scientific Societies.—Among the societies inadequately accommodated are the Linnæan, Geographical, Asiatic, Microscopical, Meteorological, Ethnological, Philological, Numismatic, Entomological, Chemical, Botanical, Geologists', Statistical, Syro-Egyptian, Chronological, &c., and the Medical societies. Application has been made to the Government fruitlessly from time to time by some of the societies, and help is still looked for from that quarter. If accommodation cannot be got from Government in some existing building, the favourite schemes now contemplate getting a plot of land and building a common house in some central situation. For this purpose a meeting will be shortly held.

The Devonshire Bridges.—At the late meeting of the County Justices the Clerk of the Peace read the following report of the Bridge Committee:—The Committee report that at Eggesford Bridge the wing wall has been washed away on the upstream side by the floods, and considerable incursions have been made in the banks of the watercourse on the same side, and at no distant period the floods will in all probability further widen this watercourse, so that the road will be endangered if precautionary measures are not adopted: a further extension of the stone pitching or pavement on the down-stream side is also necessary. The Earl of Portsmouth has offered very liberally to contribute towards the expense of the work.

Civil and Mechanical Engineers' Society.—On Saturday last, the members of this Society visited the St. Thomas's Hospital, and the Lambeth Section of the Thames Embankment works, by permission of Mr. Henry Curry and Mr. Bazalgette, this being the first visit of the season. Amongst the gentlemen present were Mr. B. Haughton, President; G. E. Eachus, Past President; Messrs. J. B. Walton, G. W. Usill, and R. M. Bancroft, members of council; and many other gentlemen. Amongst several things seen and worth recording, a sample of the Portland cement used on the Thames Embankment works was broken in presence of the members of the Society, showing a tensile strength of 603 lbs. per square inch of section, but most of the trials give a still greater average. It is worthy of remark that the older the cement the greater is the strength.

Street Dangers.—A correspondent in the *Times* calls the attention of the City surveyors to the dangerous condition of the house at the north-east corner of Chatham Place, just abutting on the footway and roadway of the temporary bridge at Blackfriars. He says:—'It is really impossible to exaggerate the imminence of the peril to those who pass near it. In spite of all supports, it is sinking fast, and the vibration of the traffic that passes will continue to sink it every day till the impending ruin comes crash into the road, overwhelming all beneath it.'

QUESTIONS AND ANSWERS.

The Tottenham High Cross.

To the Editor of THE ARCHITECT.

SIR,—Is the Tottenham High Cross one of the crosses erected in memory of Queen Eleanor, such as the Waltham and Charing crosses?

T. E. B.

The Cost of Contract Deeds.

In reply to 'South Wales's' question—'What is the understood and acknowledged rule among architects and builders as to who pays for preparing the deed of contract?' I beg to state that the rule in my experience of about thirty years has been:—If there was no mention made of a contract in the specification, the proprietor pays the cost, as it is presumed to be entirely for his own further security. If mention has been made in the specification of a contract, without stating in what proportions the deed shall be paid by the respective parties, the expense shall be paid one-half by each. It appears to me too bad in a proprietor, first to order a deed of contract for a small job of 1,100*l.*, and then request his tradesman to be at the expense of it. The sum charged also appears excessive.

Contracts follow much the same manner as payment of schedules of measurement.

I am, &c.,

April 20, 1869.

NORTH BRITAIN.

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

ROYAL ARCHAEOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.—The next Monthly Meeting of this Society will be held on May 7, at 4 P.M.

THE ARCHITECTURAL ASSOCIATION.—April 30, at 7:30 P.M., G. H. Birch, Esq., on 'The Domestic Architecture of London from the Sixteenth to Eighteenth Centuries.'

ASSOCIATED ARTS INSTITUTE.—May 1, at 8:15 P.M., Montgomerie Ranking, Esq., on 'The Renaissance Influence as Traced in the Elizabethan Dramatists.'

SOCIETY FOR THE ENCOURAGEMENT OF ARTS, MANUFACTURES, AND COMMERCE.—April 28, at 8 P.M., by T. Roger Smith, 'On the Duties of the Architect with Reference to the Arrangement and Structure of a Building.' Sir Digby Wyatt will preside.

THE INSTITUTION OF SURVEYORS.—May 3, adjourned Discussion on 'The Sanitary Treatment of the Refuse of Towns, and the Utilisation of Sewage,' by William Menzies, member, at 8 P.M.; and a paper will be read by Mr. W. Hope, 'On the Distribution and Utilisation of Sewage.'

INSTITUTION OF CIVIL ENGINEERS.—Tuesday, April 27, at 8 P.M., 'On the Outfall of the River Humber.' By Mr. William Shelford, M. Inst. C.E.

The Architect.

THE ROYAL ACADEMY.

By EDWARD W. GODWIN, F.S.A.

THE YEAR 1869 will be a marked one, it may be a *very* marked one, in the history of the Royal Academy. Just 100 years have passed since George Rex—more out of consideration, we should imagine, for his friend Chambers, the surveyor, than for any feeling or regard for art—approved of the plan for a Royal Academy, a sketch of which Chambers drew up in the short days

of the close of the year 1768. It may perhaps be as well to remind our readers that the 'Instrument' which George R. issued from St. James's, December 10, 1768, provided amongst other things—

1. That the Society should consist of forty members only (observe the word only!). They were to be artists by profession—that is to say, painters, sculptors, or architects.

2. The object of the Society was to promote the arts of design by an annual exhibition, and by schools of design.

Since the foundation, sundry changes have taken place in the constitution of the Academy. First in importance was the institution of the class of Associates on December 11, 1769. At starting, this class was limited to twenty. It has lately been extended to an unlimited number. As every one knows, it is from this class the Royal Academicians are recruited. In 1853 engravers were admitted to all the privileges of members, but their number was limited to two. In 1862 it was provided that there should be an honorary retired class of Academicians, or Art-pensioners, and that the seat of the Academician thus retiring should be filled up in the usual way. Last of all, there are five honorary members who do nothing. Now it is clear from the foregoing that there is no mystic charm about the number forty. The 'forty only' of the original Instrument has twice received accessions—first, by the liberal extension of Academy privileges to engravers; and, second, by the creation of the class of retired Academicians. Of this number, therefore, it can be no sacrilege to speak plainly. Emphatically, then, the essential defect in the Academy is its narrow limits. For even if we include the two engravers, and allow the largest possible number for retired Academicians (say forty-two), there would not be sufficient room for those who are full worthy of the Academical recognition for which they so anxiously work. It surely needs neither argument nor statistics to show that what was worthily representative of art in 1769, must be utterly inadequate to the conditions of 1869. Break down the narrow limits, and everything else follows. Your young artists will be more likely to work honestly for Art's sake; your schools will be more hopeful; more work and less talk will be the result; good art will be found to be its own reward; discontent and disappointment will only mean bad work, and the day of narrow distinctions will be a thing of the past.

It would be Utopian to imagine that any wholesale reform can be effected all at once. One very important step has already been taken in widening the class of Associates (the A.R.A.'s) from twenty to an indefinite number, so as to identify all the good workers with the Royal Academy. To use Mr. Redgrave's words, 'it renders the Associateship a substantive honour, and not necessarily a step to the higher membership.' Or as Mr. Blaine puts it, 'according as art expanded and population increased, so it would be open to men to be elected Associates.' Which is much the same as Mr. Ruskin's panacea, viz., to give the title A.R.A. as M.A. is given in our 'universities, without any limitation of number.' The practical outcome of this liberal extension has hitherto been *nil*. *We have still but twenty Associates*, and it becomes a question whether the recommendation of the Royal Commissioners, that the number of the Associates 'should be increased at once to fifty,' would not have been a wiser course, considering the ultra-conservative policy of the Academy. To increase the number of Academicians to fifty, and to have not less than double that number of Associates, who should be members of the Corporate body, and who should, jointly with the Academicians, constitute the General Assembly, would be a noble and enduring monument in commemoration of the centenary of the Royal Academy. The next

reform presents itself so clearly that it is a question whether it should not have taken precedence. 'Honorary members' should cease to be. There can be no such thing as 'honorary' in the empire of Art. The whole thing is a frivolous and vexatious intrusion upon the original intention of the founders. It finds no place in the Instrument of December 10, 1768, for it was not until 1784 that the list of the five Do-nothings* was complete; nor is the admission of lay or non-professional members into the Academy—no matter how active they might be—desirable. The lay element, as it is called, whether composed of Do-nothings or Busybodies, is equally out of place within the walls of a real working Academy of Arts. The negation of Do-nothing is perhaps on the whole to be preferred to the unwholesome excitement which would be inevitable on the introduction of the amateur element and the troublesome talkativeness of Dilettantism. But although it may be bad policy to fuse the amateur with the professional, or combine the Dilettante with the Bread-winner, it by no means follows that there is no alteration required. The Instrument to which reference has more than once been made states that the Academicians 'shall all of them be artists by profession at the time of their admission, that is to say, painters, sculptors, or architects.' At first the full number of the Academy was not filled up. The original number of R.A.'s was only thirty-six: of these there were five architects and four sculptors. The painters at starting were thus numerically three times as strong as the two other sister arts put together. But architects were in the proportion of about one-seventh the whole number. When the forty was made up, we find it composed of 29 painters, 6 sculptors, and 5 architects, architecture being thus reduced to one-eighth of the whole number. During the 90 years following the first election, there were admitted into the Academy 194 Associates, of which 16, or less than a twelfth, were architects. From the 194 Associates, 120 have been raised to the full rank of R.A.; of these 12, or one-tenth, were architects. Again, between 1841 and 1861 inclusive, 44 artists were elected Associates, 3 only were architects. During the same period there were 31 elections to full membership, and 4 of these were architects. Now it is confessed that the principle which has guided the relative numbers in the Academy is the very narrow one of the income which the Academy has derived from its exhibitions. The painters tell us that it is their *pictures*, and these alone, which draw the visitors—the architectural drawings and the sculpture are as nothing; that as the shillings are drawn by the moveable art (easel pictures), so the honours must go to the men who provide these easel works. This is in effect to say that the Royal Academy is nothing more than an exhibition. Architecture never did and never can be represented upon the walls of an exhibition. It can be symbolically set forth by means of certain drawings. But these drawings have no more right to be considered architecture than have those bits of pasteboard called 'keys' (which painters sometimes use to explain their works) to be considered paintings. The country's annual progress in easel painting may be seen in the summer months on the walls of the Academy, and similar exhibitions. But to see the progress of English architecture we must look on rather wider walls than those at Burlington Gardens. If the value of art to a nation depend upon the number of shilling sightseers it can attract, architecture is valueless. Few architects could be found to raise their voices against the narrow limits of the wall space hitherto allotted them at Academy exhibitions. Indeed, if they were turned out of the Exhibition altogether, there would be little or no injustice. The injustice consists in this—that whilst the works of the painter and sculptor are seen and examined, the *works*, not the drawings, of the architect are, comparatively speaking, ignored, because, unfortunately, they cannot be put in gilt frames nor placed on pedestals. An architect's drawings are to the public little more than cabalistic signs. What non-professional man ever yet understood a 'section,' or that mysterious compound 'half plan looking up, half plan looking down?' It is no doubt possible to produce a *picture* of an architectural work by giving a commission to some young painter; but, after all, it is the young painter, not the architect, whose work we see upon the Exhibition wall. What we all want is a real practical union and sympathy between the sister arts. Every one is in agreement thus far. The question is, can this be done by the present machinery, or must some new plan be adopted? If it were true, as some affect to believe, that one man has been, and could be, at once architect, painter, sculptor, there would be no difficulty about the matter. An architect would then depict his works with the pencil of a Roberts or a Turner, and get praised for his painting, even if his building were

* The Bishop of Oxford is an honorary member. He says grace at the annual dinners, and may, therefore, be excepted.

never seen, or not worth seeing. Life is much too short for this sort of thing. Architects, too, have a fancy for believing in such men as Ictinus and Callicrates, even though Lord Elgin did not happen to import their columns and mouldings with the sculpture which was so gloriously subordinated to, and decorative of them; whilst the Mediæval exception of Giotto's one tower and the Renaissance exception of Michael Angelo are after all *exceptions*, and such as in my mind could not have discouraged contemporary architects. But, though the union in one man of the practice of the three arts may be regarded as generally impracticable, it is much to be desired that there should be more sympathy between the several practitioners—less marked division and more dovetailing. Painters are unquestionably woefully ignorant of architecture. Sculptors know nothing about it, and very few architects can draw their own perspectives, fewer still their own decoration even in little. These shortcomings ought not to be. We must all be set to work if the Academy would be a living working institution in our midst; the question how? is not for THE ARCHITECT to decide. That is essentially an Academy's business. This much, however, may be said: no advance will be made by glorifying exhibitions at the expense of schools, nor will the brotherhood or sisterhood of art be strengthened by electing only three architects in forty-four elections. It is, indeed, worthy of consideration whether it would not be better to establish two Academies. Drop the cognate term 'Arts' altogether, leave the present body to further the arts of painting and engraving, and found a new Academy for Architecture and Sculpture: the same titles and privileges which the present Academy enjoys to be extended to the new body. Waiving, however, for the present, this possible semi-diseestablishment, another reform, that of the schools, is one which demands notice, and cannot long be evaded. It was generally admitted that one of the greatest evils connected with the old lodgings in Trafalgar Square was the want of space, which obliged the Academy to close the schools during a great portion of the year. Another evil, not so generally admitted, was the appearance of these school-rooms, and in this last respect the Academy has gained little or no advantage in the new building. This is much to be deplored, although no doubt capable of remedy. The question of the *general* teaching of the schools is scarcely within the province of this Journal. As far as architecture is concerned, there is no school. It is true we have a professor, who is required to deliver six lectures per annum at the rate of 10*l.* per lecture, and that is really the beginning and the end of all the Academy does 'to promote the honour and interest' of architecture. 'The reason we have never had a school of architecture' (to use Mr. P. Hardwick's words) 'has been the want of accommodation in the building.' It is devoutly to be wished that that has been the only reason. If it has been, of course we shall find three separate schools in the new building; that for architecture provided with a few trifles, in addition to the lecturer at 60*l.* per annum.

THE NEW SITE OF THE LAW COURTS.

THOUGH we all knew that Mr. Lowe is a dexterous and able man, possessing above all other qualities an antipathy to everything like compromise, yet few could have been prepared for that new phase of the Law Courts site question which his speech on Mr. Gregory's motion contrived to bring about. It came entirely in the nature of a surprise, and to Mr. Lowe himself it must have been a matter of the greatest amusement to listen to the speeches of those who preceded him in the debate, when he knew how completely he was about to put them to rout. A powerful member of a powerful ministry, commanding an unprecedented majority for all Government purposes, he could safely afford to pour contempt on all that had gone before, and proceed to sketch a project for a new treatment of the Law Courts which had an audacity about it that can only be accounted for by Mr. Lowe's own temperament in the first place, and the strength of his position in the next.

It should be some comfort to Sir Roundell Palmer that the 'demon of good taste' which he set himself to exorcise during the debate, has evidently had little to do with the decision of the Government as to site and building. If it were otherwise, Mr. Lowe would hardly have been selected as the spokesman on the occasion. The Chancellor of the Exchequer's having assumed for the nonce the office of the First Commissioner, points to the conclusion that economical rather than æsthetic considerations have mainly influenced the Government in their decision on this question. No one can blame them for trying to realise the project as cheaply, so long as there is any apparent effort to carry out the work as worthily, as possible. There can be no dispute as to Mr. Lowe's position when he states that he will give us a more economical building between Howard Street and the Embankment than we could have

had on Carey Street, or on the full site of Sir Charles Trevelyan's plan. But the public must bear in mind that the economy in this case is of that sort which means making a cheaper bargain by purchasing a smaller article. For it is quite obvious that the full programme of requirements laid down in the green-book of the Commissioners is much beyond the capacity of the site which the Government have determined on. It is probable that the Probate and Registration departments will find habitation on other ground, some portion of Carey Street site probably, and that the actual building will be confined to the Law Courts proper, with their accessory offices. We have Mr. Layard's authority for believing that Mr. Street, who is engaged on the revised plan, is able to provide all these within the new boundaries.

So far the new project goes forward auspiciously enough, and we can only trust now that no effort will be spared on all hands to bring it to a speedy maturity. The advocates of the Embankment site have conclusively proved that not only popular but legislative opinion is on their side, as against that class arrogance which could take no higher point of view for a work of this magnitude than mere professional convenience.

If we congratulate Sir Charles Trevelyan on the complete success of what is practically his own conception, it will be admitted that in these pages we have a consistent right to proffer such acknowledgment. THE ARCHITECT, from the first inception of the Embankment site, has steadily kept to it in perfect good faith, and endeavoured—as we have reason to believe with effect—to impress on popular opinion the substantial advantages which that site would secure, both in respect of public taste and public convenience.

We infer, with no little satisfaction, from Mr. Layard's short statement on Tuesday evening, that the only feature of Mr. Lowe's scheme, as sketched in his speech of April 20, which excited discontent, we might even say derision, out of doors, is now practically abandoned. For if Mr. Street is engaged, as the First Commissioner informs us, in remodelling his plans to fit the new ground, it is of course out of the question that the Inigo Jones treatment of the building can be any longer entertained. Indeed, we should doubt very much if the Government ever *did* entertain it, and rather incline to a belief that the notion of 'using up' the old design for Whitehall Palace never occurred to Mr. Lowe himself till he was far on in his speech, and was then only produced as another shaft out of his economical quiver. To borrow a *piece* from a design of a palace for the building of our New Law Courts would have been as poor a compliment to Inigo Jones as the proposal was insulting to modern architects, who have not fallen so low in the practice of their art in these days that they cannot produce a contemporary building for us, perfectly suited to all our requirements, and expressive of our time as a historical monument. Much as we need contemporary style in our architecture, to have revived a seventeenth century design, conceived for the uses of Charles I., would have been at once the greatest of all our anachronisms. That the words could be the words of Inigo Jones and the voice the voice of Street, is a suggestion which can only be regarded as ludicrous, either within or without the profession. On the other hand, to have made this change of site from one side of the Strand to the other an occasion for changing the architect, who had already matured his plans, would have been a piece of *mala fides* which would hardly add to the reputation of any Government. We feel sure that it will give satisfaction to the public as well as to the profession to know, that there is no intention to interfere with Mr. Street in the prosecution of his great work.

For the sake of much needed improvements we should be glad to see the Law Courts' building taken up to the Strand. Its position, however, as proposed, will secure counterbalancing advantages in the matters of quietness and purer air. At all events, those who so obstinately held out for Carey Street have put it out of their power to complain that there is to be no Strand frontage, for in their scheme, though the building was necessarily brought down to the Strand line, yet the floors were placed so high that access from that thoroughfare would have been a continual tax on physical exertion. It is no secret, however, that these difficulties in the Carey Street plan were regarded by its leading supporters with great complacency, inasmuch as they had been specially devised 'to keep the public as much as possible out of the building.'

MASONS AND FREEMASONS.

SIDE by side in those columns of our Journal which chronicled the general news of last week, our readers found two announcements, the juxtaposition of which startles the eye and provokes a moment's inquiry. The Free and Accepted Masons of Great Britain have just reopened Freemasons' Hall. The working stone-masons in several important towns of the north of England have just struck for wages. In old times there would have been the closest relationship between the two events; in modern days it appears as if this relationship had entirely ceased; and we are roused to inquiry whether the masons who meet to enjoy each other's society in Great Queen Street cannot do something to serve their brother masons who are meeting in Lancashire to try conclusions with their employers.

Modern mind seems bent on running in a direction that is each year eading its tone and temper, its habits of thought and its modes of

action further and further away from their ancient channels. Our manners, our thoughts, our words, and our ways, exhibit the greatest possible diversity, so much so that they might at first sight seem to be too varied and contradictory for the possession of one single bond of union or feature of kinship to be possible. And yet there does exist at least one feature common to the whole. All our doings and sayings and writings are alike essentially *Modern*.

We believe indeed, not without reason, that between the ancient and the modern mind, between England of the present century and any civilised community of any past time, there exists a far wider chasm than separates the ancients of different ages from each other; and yet amid this sea of change, this ebb and flow of restless activity, some institutions stand out like beacons which suggest a time when there was far more calm and quiet than now, and a period when work could be done of a sort not now possible, although perhaps not yet quite needless.

The proudest, most ancient, and most venerable of these institutions of a past age are to be found lingering in this Conservative country, and here show a vitality hardly visible elsewhere. The basis of our administration of justice—trial by jury—dates from the time of Alfred; our ancient families came in with the Conquest; our rights are secured by Magna Charta; and our lands stand surveyed in Domesday Book.

Remarkable among all institutions, and with claims to a far earlier origin than any we have named, stands the craft of the Freemason; and if antiquity goes for anything in the esteem of the present day, the ancient origin and the uninterrupted maintenance of freemasonry ought to give it a title to respect. Could not a society at once so ancient, so widespread, and so legitimate, resume with great advantage its ancient function of protecting and fostering those who build? At such a juncture as this, when a calm, dispassionate investigation of matters in dispute requires to be undertaken by some one, it would appear singularly fitting for Masonry and Freemasonry to coalesce once more.

Influential and noble names, large funds, vast numbers of members, and a loyal observance of the obligations under which the members place themselves, distinguish the Freemasons of the present day to a degree probably seldom surpassed; but the name no longer implies that connection with the craft of the builder which once lay at the root of the whole. There was a time when every man who wrought in stone, be he master builder or ordinary stone dresser, was a free and accepted mason, and his conduct as a mason lay under the control of the body to which he belonged; but the modern temper has long since subverted all this, and the modern Freemason is no more obliged to be familiar with stone, or carving, or building, than a citizen of London, if he be a member of the Ancient and Worshipful Company of Skinners, is obliged to handle stinking hides, or if he be of the Grocers' or the Fishmongers' Companies is required to post himself up in the price of sugar and the taste of treacle, or to be an authority as to *uncooked* turbot and salmon.

Any organisation which brings men together and makes them friends and fellow-helpers is of the greatest possible good, and long may freemasonry continue to render men brothers, who, without it, would have remained strangers, perhaps enemies; but nothing more requires the aid of such brotherly forbearance and mutual help than a handicraft like that of the builder, and we cannot but deplore at such a juncture as this, that the connection between this guild and the trade is quite lost, and inquire with some anxiety whether no possibility exists of so reviving it that the interests of both workmen and masters may be served, and the country be spared a renewal of a serious trade dispute.

None will be more pleased than ourselves to find that these questions can be in any sense answered in the affirmative. We fear, however, that there can be no ground to hope for any influence from Freemasonry as at present existing, unless a great effort is put forth. The craft, as far as its power over the artizans who work in stone or the builders who employ them, has been popularly held to be practically dead. Freemasons may or may not be stone-masons; most of them are not; and it is clear that the modern ways which have changed so much have effected a complete divorce between this most ancient and venerable guild and the regulations of what is perhaps the noblest, as it is the earliest, of all the handicrafts practised on the face of the earth.

Whither then has the stone-mason betaken himself for solace, protection, organisation, instruction? do he and his employers and directors all pull together as of yore? or has any modern influence been set to work to produce fresh results? We need not pause long for a reply. The mason is no longer bound to the master mason by any tie like the ancient brotherhood; he has fled to his trades-union, and looks for no higher association there than with other craftsmen of his own order, and no more intimate fellowship with them than combination to keep up the rate of wages. The master mason has grown into a professional man—an architect—and congregates with his professional brethren at his institute or his local society, and between them has arisen a middle man—the builder. He makes common cause, against what he is induced to consider as the common enemy, with his brother builders, and he discusses and talks over some matters with his friends from his point of view, which the operatives look at no less exclusively from theirs, and the architects care little to look at at all.

Class interests and feelings have always been strong since this world

was a world, but they seem never before to have had the minute subdivisions or the force which modern society has imparted. Formerly all in the same conveyance were fellow-travellers; now we go railroad fashion—first-class, second-class, third-class. Once all in the same venture were partners; now—still railroad fashion—there are directors, and shareholders, and debenture-holders. Formerly progress was tolerably equitable, but it was slow, for the roads were rough; now—railroad fashion once more—the road is smooth and slippery, the pace is express, and from time to time we have a cruelly desperate collision.

And is it really true that the trades union is the only living representative of the masonic lodge of the past, so far as connection with the well-being of stone-masons is concerned? Is George Potter—we beg his pardon, Mr. Marshall Potter—virtually the Grand Master of England? We long to hear not merely the indignant repudiation of so odious a comparison which will rise to the lips of many a Mason, but proof of some step being taken to restore to this venerable and dignified fraternity some of its ancient functions.

We cannot sufficiently urge the expediency of some interference in order to avoid the waste and misery of a great strike, and we regret to learn that attempts to remit the matter in dispute to arbitration are likely to prove a failure. Such interference, indeed, can only successfully come from a body capable, either by ancient prescription or by more recently acquired authority, of speaking with something like weight. The body of Freemasons certainly have the first-named title to respect; they may easily, if they please, regain the second. The laws of supply and demand are probably all that their most ardent supporters claim for them; they are no doubt universal, and perhaps irresistible; but all human laws require administering; and it can hardly be contended that these principles of political economy, that system of 'elaborately organised selfishness,' as a clever writer has termed it, are so perfect and self-acting as to be entirely independent of the agency which sets them in motion. Certain it is that ruined manufacturers on the one hand, and starving families on the other; trade driven away, and foreign competition successful at our own doors, speak of some little hitch in the application to practice (in the iron trade, for example) of the law of supply and demand, as recently worked out or rather fought out between employers and their societies on the one hand, and operatives and their unions on the other.

What is wanted is, no doubt, some disinterested and impartial interference on the part of some person or body of persons capable of making the men see their masters' side of trade questions as well as their own; and of making the masters, on the other hand, look at the same things in the light in which the men see them.

No worse method could in fact be thought of than that the operatives should all assemble themselves together and talk over their trade, and their desires and notions respecting it, without a single person among them able to indicate, or willing to check, such misapprehensions as always rise from the very essence of a one-sided view of anything; while their employers are engaged at the same time, either in their own individual minds, or associated together as societies, in turning the same matter over in an equally one-sided manner. Neither of them can thus succeed in grasping *the whole question*, and they find themselves obliged to fight it out, trusting very much to chance or endurance for a settlement of a disagreement which might easily and certainly have been otherwise decided had reason and patience and something of forbearance come into play.

Nothing can be more certain than that in every question of right and wrong, and in every question of value, there exists an absolute truth, and one only; and that in any question of expediency there exists a course which has a greater number of advantages, and a smaller number of disadvantages, than any other possible course. Now, all trade disputes are questions either as to what is right and wrong; what is the true value of something; or what is the best course to take out of two or more; and the grounds of such disputes, while they could not always be made clear to any outsider, would, generally speaking, be so thoroughly grasped by any person or body of men belonging to the trade, and to both sides of it, that what was really right and proper could in each case be found out and indicated with great certainty.

This is the basis upon which councils of arbitration or conciliation are being organised in many of our manufacturing towns, and nothing can be sounder in principle; and what we advocate is that such measures should be taken as would bring to bear on the settlement of the internal differences of the building trade, the great influence and high character still enjoyed by those who have the ancient right to perform this function—the Freemasons. We cannot but think that if they spoke, they would be listened to with respect on both sides. We know that their ranks embrace many operative masons, many contractors, and not a few architects; and we respectfully but decidedly urge upon those who direct the action of the Masonic body, that no greater service could be rendered to the community at large than such a wise, liberal, and effectual interference as should both settle the present disagreement, and for the future render strikes and lock-outs unnecessary in the building trade.

What we advocate, in fact, is such a measure as might cause these weapons of offence to be abandoned entirely, as altogether too clumsy, too cruel, and too costly in their operation for the enlightened and modern civilisation of the nineteenth century.

THE PRIVATE VIEW OF THE ROYAL ACADEMY EXHIBITION.

TO-DAY (Saturday) the rooms of the Royal Academy are to be opened for the private view of the present Exhibition, and we propose briefly to summarise their contents, deferring for the present all criticism on them, or on the general arrangements of the Academy. And, first, whatever disappointments there may be in connection with the present Exhibition, none is likely to arise from its general character. We ventured to surmise that it would be equal to the usual average; but we have now no hesitation in affirming it to be beyond that average. And this we attribute mainly to the fact that our artists generally, and more especially our younger painters, have improved in their work. Something also is due to the presence of several excellent examples of foreign artists, and the whole effect is heightened by the improved appearance of the new rooms, with their marble doorways, lofty walls, and parquet floors. We wish that the original proposition to hang all the pictures separately could have been carried into effect: but it was found that in spite of the increased space which the new galleries afford, the demand had also increased, some thousand pictures more than usual having been submitted to the Council. One thing will give great satisfaction—all the accepted pictures have this year been hung, and so we have not the pain of hearing that perhaps a couple of hundred works deemed worthy of being placed have been left out from want of room.

Leaving the vestibule, and entering the first room according to the catalogue, the pictures which principally catch the eye are Mr. Hodgson's clever picture of an 'Arab Storyteller and his Audience,'—a careful expression of Eastern, or rather Southern life; Mr. Watts's 'Deluge,' with its long rolls of yellowish-grey sea, and the two pictures which flank it; Mr. Stowe's well-arranged picture of the 'Princess Elizabeth compelled to attend the Mass by her Sister Mary;' and several first-rate landscapes, among which we would especially enumerate the works of Messrs. Vicat Cole, Oakes, Graham, and Henry Moore. Passing to the second room, we find Mr. Calderon's impressive picture of the 'Duchess of Montpensier and Jacques Clement,' Mr. Millais' lovely little picture of the 'Gambler's Wife,' Mr. Faed's 'Street Arab,' Mr. Frith's delineation of the way in which young people manage one of the most important questions of their lives, Mr. Wynfield's 'Rich Widow,' Mr. Orchardson's 'Antechamber,' Mr. Storey's 'Old Soldier,' and several other works bearing the honoured names of Messrs. Archer, Crowe, Sandys, &c.; and notably a very fine landscape by Peter Graham, and the charming portrait picture of his three children by Mr. H. T. Wells. And this brings us to the third room, the big room, where the plan has been followed of hanging the most important pictures of the members. And what a collection it is! Sir Edwin's large picture of the 'Eagles and Swans,' one of the pictures of the year; the President's charming little portrait picture; Mr. Millais' portrait of Miss Lehmann, one of the pictures for all time; Mr. Calderon's 'Lovers'; Mr. Elmore's beautifully coloured scene from 'Katherine and Petruccio'; and a host of others, of which, some painted by Messrs. Leighton, Yeames, Armitage, Leslie, &c., we have already given our readers some little description. Here also are to be found several of the foreign works, Mdlle. Rosa Bonheur's clever picture, the landscapes of Messrs. Daubigny, Corot, &c., and one of M. Alma Tadema's very characteristic works.

As it is not the object of the writer of these notes to criticise, it would be simply tedious to give a mere categorical description of all the good things here; suffice it to say that, in addition to those works which we have described in previous numbers, there are several other very interesting contributions, such, for instance, as Mr. Walker's picture, which we are very happy to see, though it gives evidence of that want of time which very nearly prevented its appearance; two pictures by Mr. Albert Moore, in his clever but somewhat archaic style, and a large pretentious picture by the younger Richmond. Throughout the rooms are to be found several first-rate landscapes; indeed the landscape element is very strong this year, so much so, that were it not for the equality in most of the works in this class, we might have found at last the new man to represent this specialty in the ranks of the Academy. One of the most interesting features in the Exhibition is the series of sketches made in the East by Mr. Goodall, and which are to be found in the lecture-room, where also the engravings are hung. To those who have not already seen Mr. Goodall's studies, they will be a treat in themselves. There is a small room devoted to water-colours, where, among other fine drawings, is a large figure by Mr. Calderon of an Eastern Fruit-seller, two little gems by Millais, some clever landscapes by Henry Duncan, &c., and a surprising sketch by M. Fortuni, that rising young Spaniard from whom, if all that is told be true, we are to expect so much. Of the architectural drawings we shall not at present speak. In addition to the room specially devoted to Sculpture, the Rotunda and Vestibule are also filled with works of that class, the most noticeable amongst which are the colossal statue of Her Majesty, by Mr. Weekes (who, by the way, as a really fine figure of Charles II.), and a notable piece of French sculpture, 'The Young Hannibal contending with an Eagle.'

The course which has been pursued in the hanging this year is one on which we must say a few words: it is that of hanging together the works of titled and untitled. With the exception, perhaps, of the large room, there are no demarcations—all are hung equally, and Academicians and outsiders are in loving proximity. Such a course,

we need not add, is much more likely to tend to the improvement of the artist and the edification of the public than the old system of separation; and as this is one of the advantages which the increased space affords, we trust it will never in future be neglected. On the whole we may pronounce the Exhibition a great success, and such cannot fail to be the impression of the Royal and distinguished visitors who will throng the rooms to-day. One could have wished that the opening could have been made under the most august auspices, and that the interesting ceremonial originally projected had been carried into effect, so as to have given a more national character to this, the opening of the hundred and first exhibition of the Royal Academy in its new home.

EXHIBITION OF FRENCH AND FLEMISH PICTURES.

[SECOND NOTICE.]

WE have in a previous number given a sketch of the general contents of this gallery, and now propose to dwell with greater detail on a few works which, out of the two hundred and ten exhibited, stand distinct through superior merit. Immediately upon entering the room the eye is caught by a couple of pictures, pendant in subject and position; namely, two piquant scenes from Beaumarchais' *Figaro*, by J. Caraud. The incidents are well chosen: Cherubino, the pretty page, on his knees before the languid Countess, is attired in a woman's cap by Suzanne, on one side; on the other, Count Almaviva, disturbed in an interview, opens the door amid the dismay of the Countess, only to discover Suzanne in attitude of comic deprecation. Author and illustrator are well matched; the pictures are cleverly composed after the type of stage situations; the action is pointed, and tells the story neatly; the colour is gay as a French damask; the execution smooth, but not feeble. Altogether, the wit of the dramatist and art of the painter merit equal rank in their respective departments.

No stronger contrast to these brilliant tableaux could be found than the sober scene of 'Family Worship, Alsace,' by G. Brion, which hangs between them. Both subject and treatment are sombre; a family of earnest, hard-featured Alsatians are grouped before the old grandfather, who reads aloud the morning lecture, the expression of his weather-beaten face and upraised hand emphasising the solemn lesson. Here is no attraction of bright colour or winning form; the profile of the woman, who leans gracefully over the child at her knee to listen more intently, is the nearest approach to beauty in the picture. The draperies are mostly black, and cumbrously swathed about the figure after local fashion, and the group is relieved against a background of grey wall skirted with green wood. The execution is in parts somewhat scratchy, and the composition rather lacks focus; but for right intention, conscientious study of character, and thoughtful purpose, this is a picture of high order, and is the best work by Brion that we have yet seen. Another picture, which gains interest from national character and costume, is a 'Lovers' Quarrel,' by Bisschop of the Hague. To our mind, this little work possesses greater artistic quality than more ambitious productions from the same hand. Bisschop has certain technical methods for obtaining brilliancy, such as floating colour within an interval of a hard outline to produce the effect of reflected light, opposing strong darks against cool backgrounds, loading on bright colours at points of focus, and so on. These technicalities are merely means to an end, interesting as peculiarities of language which mark a writer's style. The motive of this 'Lovers' Quarrel' is prettily conceived; the youth sinks dejectedly back in his chair in the shadowed part of the room, while round the sharp angle of the wall, facing us in profile, stands beneath full light at her prayer-desk the maiden, sorrowful but unyielding. Her face is reflected in a mirror behind her, and the sweet expression of the face and pensive droop of the head are given with exquisite tenderness. We cannot help surmising that the cause of quarrel is some point of conscience, in which this clear-browed maiden follows her scruples at the expense of her heart and her lover. Solidity has been somewhat sacrificed to keep the picture brilliant in harmony; yet the contrast of the grey walls, lined half way up by cool blueish tiles, with the rich browns, blacks, and crimson of the figures, was worth gaining at the cost of surface texture. A work by the Dutch artist, Israëls, occupies the post of honour at the head of the room. The canvas strikes us as too large for the subject, or else a certain baldness is produced by the uninteresting monotony of the background. The title, 'Les premiers pas qui coûtent,' is apropos of the efforts of a tiny child to toddle from the side of its mother into the outstretched arms of the father, who crouches to receive it, while a wise magpie, evidently a friend of the family, looks on approvingly from the wall. The picture is full of sunshine, which blazes on the face of the comely young mother, and lights up the enclosure of poor-looking dwellings; yet, in spite of harmonious colour, of vigorous reality, and of tenderness in rendering the incident, there is a disagreeably sordid look about the picture, a suggestion of unkempt, unwashed poverty, that clogs both the act and the sentiment. The small interior, called 'Waiting,' has greater charm of traditional quietude and mellow chiaroscuro, and is more carefully painted. A single figure of a peasant girl with solemn eyes, pausing at her labour in the hay-field amid hazy glow of light, by Jules Breton,

completes the group of high-class rustic subjects. Notable in each and all is the absence of that sentimental poverty and simpering humility which have long been held indispensable to refined treatment of such topics in English art. The earnest pathos of Mr. Faed's best works, the poetic truth of Mr. Mason's 'Evening Hymn,' are as yet exceptions to the accepted standard of English rustic genre.

Madame Browne has met with a good subject in the 'Seminarist,' and handled it with a master hand. The modelling of the face, the subtle play about the sensitive brow, the tremulous eyebrows, curved drooping lids, and full wistful mouth, are studied with keen reading of character and a free touch responsively intelligent. F. Hailbuth, who has this year taken to portraiture, might learn from Henriette Browne to distinguish vigour from coarseness, and character from exaggeration. This artist is more at home when he paints 'Watteau' sketching from the top of a wall garlanded with brambles and flowers. This is a pretty freak of fancy, reminding one of the decorations of a French fan, slight in execution, charming in colour. A neighbouring mediæval version of 'Faust's first sight of Marguerite,' by Koller, would be more interesting did it show greater genius and less imitation of the styles of Baron Leys and W. F. Pauwels. Alma Tadema, pupil of Leys, is, on the contrary, no servile copyist of his master. 'School for Vengeance' is not a favourable example of this eccentric artist, yet as a carefully studied page of history the picture is suggestive and powerful. There is cutting satire in this contrast between the peaceful convent cloister, the simple monks, and the sacred symbols of a religion of love, with the stately French queen, nursing vindictive dreams as she watches her sturdy youngsters learn to wield the weapons with which she will one day bid them avenge a father's murder.

As to the technical merits of Cabanel's 'Venus' critics seem disagreed; as to the claims of this thoroughly French version of Aphrodite to be considered high art in any sense there is little doubt. A sensuous, soulless type of female beauty is this rosy creature born of sunlight and foam, rocking on the waves of a lustrous sea; lovely as she is, our picture galleries will not gain if such as she become the fashion.

We have not reserved adequate space for notice of the landscapes, which are, on the whole, well chosen. Lambinet has been better seen in the same rooms before; yet a bit, 'On the Seine,' is an exquisite transcript of a river nook—cool, green, and quiet. Two landscapes by Corot emphasise a recently-heard remark from one of our greatest figure painters—that landscape art is only valuable in as far as it suggests thought. The style of Corot is pre-eminently suggestive; his aim seems to be not to reproduce nature, but to create in the mind a certain mood. To this end composition, gradation of tone, and harmony of line, are minutely studied; detail is merged in suggestive haze; solids become filmy, atmosphere a dream. The result may be wide of tangible truth—it is at any rate poetic. By the side of Corot, Th. Rousseau seems additionally prosaic. We can perceive knowledge, power, conscientious study in the works of this artist of 'International' celebrity; but find them, nevertheless, entirely unpleasant. The gem of the landscapes is, to our mind, a little work by J. Maris, entitled 'Eventide;' unpretentious as the picture is, it possesses high artistic quality in management of light and shade, in composition, and in silvery tone of colour. The best marine subject is from the pencil of F. Clays, who has already won laurels in England. The 'Calm Weather' now exhibited is a first-rate example of the artist, and could not well be surpassed in the rendering of smooth, limpid water, which throws off light and yields tremulous reflections.

We have already transgressed our limits, and must now close our notice of the Gallery, though we cannot pretend to have given an exhaustive criticism of its contents. We hope that the success which appears to attend the Exhibition may encourage further and wider efforts in the same direction.

A. D. A.

EXHIBITION OF THE SOCIETY OF PAINTERS IN WATER COLOURS.

THE Old Society's Exhibition this year is, to our thinking, not quite up to the usual average. This may be owing partly to the circumstance that some of the members have been working, we hear, for the Royal Academy, and partly to the absence of Mr. F. Walker, whose pictures were always the crowning glory of these exhibitions. Nevertheless, there are many works of more than average excellence, which we shall briefly enumerate, and if we do not mention those of all the members, it is either because they do not differ from, or surpass, their usual standard, or because they fall rather short of the mark. Following the order of the catalogue, the first picture which struck us was (No. 10), 'View from the Corsini Garden at Rome,' Arthur Glennie: very sunligthy and agreeable, though somewhat conventional in the handling. For Mr. Gilbert's little picture, 'The Iris' (No. 11), we cannot say much, nor indeed do we think that Mr. Gilbert is equal to himself this year. Of course there is all the usual dexterity of composition and handling, and delicate charm of colour. But we miss any special feeling or intention in these drawings; they possess only the characteristics which we are quite prepared to expect from Mr. Gilbert's

hand. To our thinking, the best is the 'Lear and Cordelia' (121), where the colour is certainly very beautiful, particularly in the man on horseback and in the painting of the king's robes; the 'Joan of Arc contemplating the Dead Bodies of the Talbots' also contains some fine passages, though we think Mr. Gilbert is wrong in giving the female form to the armour of the heroine. Mr. F. W. Topham's 'Pastoral' (12) is his best drawing here, and is a very fine thing—the composition being especially good. It is some time since Mr. Topham exhibited anything to equal this; and we can speak favourably of two other of his works, 'The Skylark' (83), and 'The Eve of the Festa' (151).

Mr. Jackson's 'Twilight' (15) has something about it which pleases, and we may say the same of Mr. Fripp's 'Scene in the Forest of Glenorchy' (16). Mr. Burton exhibits only one drawing, 'Cassandra Fedele' (20), and that is marked 'unfinished,' under which circumstance it would be unfair to make any criticism; we will only venture to hope that when Mr. Burton comes to work upon it again, he will pay a little more attention to the drawing of the lady's throat, and carry out in the upper portion of the light drapery the same delicate colour and quality realised in the lower, and so complete successfully a very promising work. We would draw attention, in passing, to Mr. Whittaker's 'Mountain Lake, near Capel Curig' (24), and Mr. Callow's 'Dumoon on the Clyde' (28), both of which will repay investigation—the latter being especially remarkable for its faithful, simple aspect. Mr. Duncan's simple drawing (No. 26), 'St. Abb's Head,' though clever, like all this artist's work, is spoilt by a certain woolliness of texture. Mr. Burne Jones exhibits five works, which are more or less distinguished by all the beauty of colours and badness of drawing for which Mr. Jones is famous. His best work of the year—and indeed one of the best things he has ever done—is 'The Wine of Circe' (197): very weird and magical does it look, the serpent-like form of the enchantress stooping to pour some noxious draught into the wine vase; the mystic forms of the accessories, the dreamy weary sunflowers (beautifully felt and drawn), and the stealthy look of the dark panther-like animals who are watching their mistress, combine to form one of the most impressive and imaginative works we have seen. The colour, too, is exquisite, the play upon yellow and gray, from the extreme glowing amber of Circe's dress, through the flowers and golden touches, to the delicate yellow of the hangings, and back from the ineffable tint of the sky through the tones of the marble and the chair to the blue black of the animals—a perfect scale of harmony. We wish we could speak as highly of all Mr. Jones's work. 'The Autumn and Spring' (184 and 207) are charming in colour and very decorative; but surely this of 'St. George' (33), setting aside the beauty of the colour, is a poor realisation of the legend. The knight looks anything but valiant; if he has any bones in his body they must be very small and out of joint, and he looks quite incapable of sustained muscular exertion: a very sorry champion, but fortunately pitted against a still more sorry dragon—formidable, we should think, not even to a child; and so the knight seems to think, from the deliberate and elegant way he is planting his weapon into the throat which the obliging monster holds open to receive his death-stroke. Mr. Jones's remaining work, 'A Lament,' is still worse, not being even thoroughly good in colour. Mr. Dodgson's two best drawings are 'The Timber Waggon' (37), and 'Words at Evening' (148), having a real unconventional feeling for nature about them very refreshing to see; and Mr. F. Powell's 'Ben Nevis' is worthy of commendation, with its poetically-expressed gleam of sunshine on the side of the mountain, whose summit is gloomed and lost in rolling wreaths of mist. Mr. Nash's architectural drawings are falling off, and have not the merit of being faithful to the originals; in his 'Drawing-Room, Haddon Hall' (138), the beautiful proportions of the room itself are missed, and the drawing of the window and the curve of the chimney-piece are specially untrue. Mr. Birket Foster's 'The Meet' (75) is his principal work, and one of the finest and most important things he has ever exhibited. The composition is fine—the arrangement of the trees and the group of children to the left of the picture being remarkably good; so also is the treatment of the hounds, a moving mass of heads and tails, and the action of the huntmen. If we could find a fault, it is in the colour of the clouds, which are somewhat greenish. The whole forms a very fine work—one of the best here—and justifies us in the hope that Mr. Foster will yet do things far beyond what he has hitherto attempted. Mr. Carl Haag exhibits three pictures:—(No. 78) 'My Dragoman,' very clever, but a little unnatural in effect; 'The Acropolis of Athens,' &c. (148), very good indeed; and a large drawing of the High Priest of a Samaritan community reading the Pentateuch (131), in which the figure of the man is somewhat short, but otherwise well done; the execution throughout is capital, and the painting of the copy of the Law which the priest is holding is a marvel of finish and dexterity. Mr. T. Danby exhibits one or two drawings characterised by that same soft misty sunlight effect for which he is specially distinguished. (No. 100) 'In Charterhouse, "Founder's Tomb"' is one of three studies from the same locality exhibited by Mr. F. Smallfield, all of which are remarkable for fidelity, cleverness of execution, and beauty of colour and effect—noticeably so is the 'Pensioners' Hall' (158), where the exact relation of tones, the delicate gradation of the light, and the beautiful colour of the whites and grays and browns, combine to make one of the most pleasing and fascinating studies we have ever seen. Mr. G. P. Boyce (in our opinion one of our best water-colour artists) exhibi-

bits several drawings, all more or less remarkable for his intense fidelity and power of rendering the delicate evanescent colours of nature. That Mr. Boyce is deficient in composition and invention there can be no doubt, but can anything be more lovely than the floods of light and atmosphere in this drawing, 'The Skirts of Smithfield' (117), or in that (287), 'Shillingford on the Thames?' Observe also in the drawing of 'Bridewell Precincts at Nightfall' (224) how precisely correct are the different tones of brick and stone, sky and grass, and what charming colour they all possess. A little study of a head, 'Pensosa d'Altrui' (280), is not so good, and we think Mr. Boyce ought to be careful how he departs from the domain of landscape. Quite another style of work, but almost as fine, is that of Mr. A. W. Hunt's 'Loch Corniak' (155), an earnest, impressive rendering of that lone weird lake in the land of Skye. Mr. T. R. Lamont has again selected one of the ballads of his country for his subject this year, 'Glasgerion' (170)—a well-composed, well-painted picture, in which, if we have to find any fault, it is to object to a certain mildewed look about the shadows—a failing to which this artist is subject. Mr. A. P. Newton's work is all good, but his 'Shades of Evening' (189) is much more than good—a lovely thing, full of exquisite passages. Mr. J. D. Watson exhibits three drawings, one large one, 'Carrying in the Peacock' (161), a group of girls in mediæval costume carrying in the dish of the feast. Somehow we do not quite like this picture; why should the heads be all so ugly—all excepting, perhaps, the first, a young woman with a very large development of bust? The treatment is very thorough, and there is much beautiful work in the draperies and accessories, but the whole thing is more remarkable for talent than for feeling. We much prefer 'The Smithy' (27), or even the 'Family Pew' (243). Mr. Walker's absence from this year's show is a great loss; his place is occupied but not filled by Mr. G. J. Pinwell, a very rising artist, first brought into notice at the Dudley Gallery, and to whose many clever and striking works the only drawback is a certain resemblance to those of Mr. Walker. There is, however, quite enough of original stuff in Mr. Pinwell to encourage the opinion that he will become one of our most distinguished figure draughtsmen, as anyone who examines these careful little pictures may see. One is 'A Seat in St. James's Park' (297), the weakest of the three, but full of character and expression. The other two are taken from Browning's 'Pied Piper of Hamelin'—the 'Piper charming the Rats' and the 'Piper charming the Children.' In the former, the skurrying of the rats, steeple-chasing over all obstacles to follow the magic notes, is wonderfully given. Both pictures are, perhaps, slightly deficient in line and composition, but thoroughly well-drawn, and carried to a degree of finish almost unprecedented in the history of water-colour. Mr. Holman Hunt has two small works, neither very good; perhaps the best is the 'Cathedral at Salerno' (263), which is strong in colour, and in some places good in execution.

The above are the principal or more striking pictures of the Exhibition. Want of space prevents us from enumerating the works of Messrs. Brittain, Willis, Basil, Bradley, and others, all of which, however, will be found to repay inspection, and to conduce towards that pleasure which the shows of the Old Water Colour Society are always calculated to afford.

THE NATIONAL GALLERY AND THE NEW MICHAEL ANGELO.

HOW much the value—not the commercial, but the æsthetic, value of pictures depends on the builders of picture galleries may be realised by any visitor to the unburdened National Gallery. True, it is only space which has been gained, but what a gain it has been! The familiar rooms hitherto devoted to the annual exhibitions of the Royal Academy have been now placed at the service of the national collection. The walls are no longer painfully crowded. The greatest works in the possession of the nation are no longer piled on one another, like the emanations of rival bill-stickers. The sense of relief and pleasure experienced in walking through the unbroken series of rooms, notwithstanding all their imperfections, is wonderful.

We have not space for more than a few lines, but we cannot pass in silence the appearance of that wonderful composition, the exhibition of which is the main feature of the re-opening of the National Gallery. Boldly, and without any note of interrogation, it is labelled as the work of Michael Angelo. We should like to hear what can be said as to its pedigree.

One powerful and unanswerable argument is often open to the defenders of the authenticity of some fiercely questioned work of literature or of art. It is called a forgery. It may be hard to prove its authenticity by direct evidence; but—WHO FORGED IT? It is on the silence that responds to this question, and on the consideration that a forger must have been a more extraordinary person than the reputed author, that the estimate of some of the most venerable authorships in the world mainly rests.

Now in the group of six figures, representing the Entombment of Christ, to which we refer, while there is much that is unlike any thing with which we are familiar from the hand of Michael Angelo, there is much as to which the question, who else could have drawn it? seems to be unanswerable. Who but the great sculptor of the Medicean Chapel could have drawn the foreshortened right leg of St. John, or his wonderfully modelled neck and left shoulder? Who else would have thrown the weight of the corpse so heavily upon the two leaning supporters? Who else would have represented the wonderful rigidity and death-contortion of the nude limbs of Him who is borne to the sepulchre?

The group appears to represent the entombment by the hands of Peter and John, with the aid of the three Marys. One of the latter shares with the younger apostle the sacred burden, which they bear between them by means of a linen bandage. John is clothed in red, the full colour contrasting very forcibly with the pallor of his burden. On the crest of his long, curling, Francia-coloured hair, a small line of bright colour shows how the painter intended to light up a natural glory from the rays of the declining sun. The anxious, agonized look of the young man is no less striking than the tender, loving, almost maternal care evinced in the look and attitude of Peter, who supports the upper part of the figure of Christ. The head of this apostle presents the known conventional features, and is magnificent. Of the head of the Saviour, that subject which even Leonardo feared to draw, it can only be said that it is almost impossible to escape a sort of inexplicable fascination in regarding it.

The mouths of the females are very peculiar. In the one who bears the corpse, and leans outward to counterpoise the weight, the pinched lip combines with the attitude to express physical effort. In the seated Mary, which is the least finished, the most damaged figure of the group, the same action of the lips seems intended to denote mental suffering.

There remains the remark that the stamp of countenance can be referred to no Italian provincial physiognomy with which we are acquainted. The head of St. John is of a type not absolutely foreign to the north of Italy, but the women would almost seem to be Flemings. The profile, expression, and outlined head-dress, of the Mary who shares the burden, are all harmonious with this nationality, more closely than with any other European type that we can recall. The painting is one of the utmost value and of the highest interest. We trust that the attention now called to it will prove the means of eliciting some direct proof of its actual paternity.

ILLUSTRATIONS.

M. LAMEIRE'S DECORATIONS.

WE give this week a second portion of the decorations designed by M. Lameire and exhibited at South Kensington. With a third illustration of this series, which is now in preparation, we propose to give a fuller notice of this remarkable work.

This illustration, like the one given in our number for April 10, has been lithographed by Mr. E. J. Tarver. Another name by accident appeared on the first plate, and we gladly take this opportunity of correcting the error.

CLOISTERS, AIX-LA-CHAPELLE.

THIS picturesque example of early architecture is lithographed from a pencil sketch made in 1864 by Mr. T. H. Watson. Some of the most curious of the details are illustrated, as well as the general effect of the mural arcade.

SOUTH ESK RIVER BRIDGE.

THIS work was fully described in our last number. The sheet of details given this week completes our illustrations of it.

STREET ARCHITECTURE IN CARLISLE.

IN the *Carlisle Journal* of the 23rd ultimo 'An Architect' thus writes:—

'Lest it might be inferred by the public (from certain expressions used at the Carlisle Corporation meeting held in the previous week) that the few members of the architectural profession in Carlisle were responsible for the appearance of the whole of the buildings erected in this city, I have to state (and I believe the gentlemen on the Board of Health will bear me out in the fact), that of the many plans of proposed buildings which come before them weekly, not one in twenty is planned by an architect, and that if the building is of sufficient importance to require such professional skill, a total stranger is often consulted. It is, therefore, slightly unjust to allow a few gentlemen to be blamed for a stated general fault or defect in a matter with which they have nearly nothing whatever to do.

'If there be a defect, the blame rests with the Corporation, or other proprietors of building ground, or their agents, in not, when a piece of ground is sold, insisting upon a certain style of building being put up. The cause of this may be their taking too elevated a view of the subject, which (from the word "architecture" being applied to the buildings in Spencer Street) I am inclined to think possible. Spencer Street, Cavendish Place, and, in fact, most other streets, consist of houses in which the great features of the elevations are three or four openings, forming windows and a door, an iron spout as eave, and chimneys, none sufficiently ornamental to dignify the building with the name of architecture, except perhaps the door, which might have been copied out of some old pictorial encyclopædia, under the head "Doric Architecture," and which, for lack of further ingenuity or skill, is made to do duty on all occasions, well justifying Mr. Hardy's remarks respecting monotony.

'The buildings in Chiswick Street, taken as a whole, are a mistake; there are there big windows, little windows, wide windows, narrow windows, high windows, low windows, arched windows, flat windows, red windows, white windows, in most unpardonable proximity. Taken, however, separately, I consider some of them as very superior houses for their class, and much better in appearance than those in Spencer Street. The taste and even requirements of each individual will very generally be entirely opposed, as here shown. I therefore recommend the Corporation to require their surveyor to regulate the main lines and features of such houses, seeing that a white be not built next to a black one, or that the windows of one be not

six feet wide, the next being perhaps fifteen inches, and so on with the other parts of the elevation. And this can be done effectually without much knowledge of "architecture," to which, as I said before, such buildings hardly belong. The result would be consistent and pleasing blocks of buildings.

'If any proprietor choose to incur the expense of employing a professional man, which is seldom the case, or should he have the requisite amount of knowledge and taste himself to apply a little architecture to the construction of his house so previously fixed, he should be allowed to do so, which would save the street from the monotony of which Mr. Hardy complains, and yet retain the whole in harmony by a close adherence to the main lines of the general design. The Corporation surveyor or other agent should make an elevation of each proposed new street, showing such general lines and principal features. The conditions of sale should require each purchaser to abide by them to the satisfaction of the surveyor or other agent. Until this is done, the evil will not be remedied. The plan of offering a premium for such general designs may fulfil the requirement, yet I think in houses which will scarcely (on consideration of the expense) exceed the limits of utilitarian building, the responsibility might have rested with the Corporation surveyor.'

UTILISATION OF INIGO JONES.

THAT portion of the public, small as it unfortunately may be, which is aware that total want of good taste indicates, if it is not synonymous with, very imperfect education, has had ample evidence of the justice of this view forced upon it during the past ten days. The accomplished advocate who held a parliamentary brief for the now disendowed and disestablished Carey Street Courts, was not ashamed to sneer at men who took thought for the architectural requisites of an edifice that Englishmen were about to build for posterity. Forgetful of the ancient adage about glass houses, Sir Roundell listened to the promptings of some invisible whisperer—it is not for us to indicate its nature more distinctly—which induced him to call its opponent 'the demon of good taste.' It was not *that* demon that was in practice at the moment. An orator who has courted the Muses, and who is supposed to be most familiar with the one which, of all the choir, should be the most delicately graceful, so that she be not a counterfeit—was it for him to sneer at *dilettanti*?

But the boldness of the onslaught of the man of figures threw this into the shade. 'I do not profess to be a man of taste,' said the Chancellor of the Exchequer, and he forthwith proceeded to prove his assertion. 'I know nothing of architecture, therefore I suggest that all architects' plans be abandoned, and that I be allowed to introduce a design of my own. I have within reach certain designs, made by one of the greatest architects known to England, for a royal palace. I propose to adapt them for the Law Courts. As to slight questions of inappropriateness, let me alone to get over them. I will cut out a wall here, and stop up a door there, and I shall save at least two and a-half per cent. to the country by adopting Inigo Jones's elevation instead of one by any architect who is unfortunately living, and therefore able to ask for his commission.'

Do our readers know what the design which it was thus intended to utilise, like old building materials, is? It is not a Government secret. The graceful symmetry and rich, elaborate ornamentation of the designs for Whitehall Palace are well known to the student of Renaissance architecture as defined by Palladio and Vignola. But one small block out of the whole noble structural composition took actual structural shape, but that single banquetting-room is one of the choice bits of the metropolis. The ceiling was divided into compartments, to be adorned by no hand less skilled than that of Rubens. A quay wall, with two broad flights of steps, was to divide the river front, 874 feet in length, from the Thames; and a vast, but harmoniously proportioned, palace, containing seven principal courts, was to extend 1,150 feet in depth from the river to the park front. The central court, which formed an unbroken space from the eastern to the western façade, was to be surrounded by a terrace of the height of the plinth of the main building, and 30 feet in width.

The building, if erected, would have been the noblest palace in the world. It would have been distinguished, above any other, for its costly sculptural ornamentation. The designs for the second and third orders, which we have in very finished detail, are rich with a wealth of sculpture and of relief—caryatides, masks, figures reclining in spandrels or lunettes, or standing out in bold outline on the sky line—such as it would task all the art of the England of to-day to produce. The interior is equally cared for and equally rich—panelled ceilings, sculptured chimney-pieces, windows and doorways of bold, harmonious, unstinted sculpture.

With all this, Whitehall would have been, what it professed to be, a Royal Palace. The entire plan was carefully adapted to the requisites of a royal abode. There is not a single room, over all that great area, that would have been suitable for such a purpose as the sitting of a legal tribunal. The King's Gallery, the largest apartment (in one sense), 130 feet in length, was only 20 feet wide. It was what the architect called it, a gallery. The Presence Chambers—for it is a remarkable peculiarity of the building that all the state apartments are in pairs, actual duplicates in plan—were noble rooms, some 95 feet by 50, but so approached by antechamber and vestibule, or by the grand circular gallery, as to be only fitted for the purpose denoted by their name. The throne rooms were smaller, and equally out of public reach. The grand feature of the part of the building containing the rooms specially devoted to the state occupation of a king and a queen (the only explanation of their arrangement), was a large circular court—a Persian court, the architect called it, probably from the fact that it was surrounded by a gigantic row of figures in place of caryatides, described as Persian captives, but more resembling the ancient Dacians. Order above order this circular court was adorned by the richest sculpture.

It is the design for a building such as this—the elaborate design for a royal abode, unstinted in rich ornamentation, and unfitted for any other occupancy—that it was proposed to utilise for a Palace of Justice! Truly it was

needless for the proposer of the substitution to disclaim the title of a man of taste.

But is it altogether a very mistaken thing to put in such a disclaimer? Would the hon. member have said with equal coolness, if it happened to be the case—I am not a man of letters? Judging from the experience of some of his colleagues, he would rather have adopted the plan of lamenting the large amount of time wasted in learning Latin and Greek. To depreciate what one has not, is an admitted license of the rhetorician; but to say coolly that one is unfit to deal with an important subject, from a neglect of the requisite education, and then to proceed to deal with it, in a manner that could only astound those who were not in equal darkness, is a piece of conduct without precedent, so far as we can collect, in a public man.

Well may we be thought the least educated country in Europe if men, who deal with aesthetic matters as questions of book-keeping, are unchecked when they glory in their shame.

OUR WATER SUPPLY.

NANTWICH.

THE plan of allowing the water to remain on all day all over Nantwich, instead of dividing the town into three districts and giving these districts the water one after the other for an hour each in the morning and the same in the afternoon, has so far succeeded admirably. In the higher parts of the town, where, under the old plan, the water came with very little force, the stream from the taps has remarkably increased. The firemen, on applying the stand pipe and hose to the hydrants, can now throw the water over buildings of which previously they could only touch the edge of the roof. As a single instance out of many, in Thomas's Row, off Beam Street, Nantwich, where, at the top houses, they could scarcely get any water at all, it now comes on with great force. Under the old plan everybody had to draw their water within the hour. The result was that people left their taps open, with vessels under, and when these were full the water ran over and was wasted. Now people have simply to draw the water when they want it, and there is no necessity for leaving taps open and vessels under them. One great beauty of this plan (which, it is to be hoped, will be available throughout the year as it is now) is that it will not entail the laying of fresh conduits, at a cost of something like 3,000*l.*, nor even of a special engineering scheme, at the sum of 250*l.* Much, however, as this change may have been welcomed by the general public, one class of the community has rejoiced above all others—that is to say, that part of the community engaged in the plumbing business. The increased force of water has in a large number of cases found out defects in the pipes connected with the water taps and the apparatus of the cisterns in town, and the man of lead has had to be summoned.

GUILDFORD.

The better water supply of Guildford is a subject well deserving the most earnest attention of the Local Board of Health. It will also interest others beyond the town of Guildford to quote the following information which was given at the Guildford Local Board last week. In the course of the business of the meeting, the clerk said that in accordance with instructions from the last meeting he had written to the various local boards of the neighbourhood to ascertain upon what terms they charged the water to brewers and other large consumers. He had addressed letters to no less than twenty-five boards of health, and had received replies from most, the principal of which were as follows:—At Dover the charge was 6*d.* per thousand gallons, and the supply was charged by meter. At Winchester there was a private company; large consumers were charged 9*d.* and small consumers 10*d.* per thousand gallons. At Chatham also a private company; the supply was by meter, and the minimum charge was 10*d.* per year to take up 200,000 gallons, and beyond that quantity 9*d.* per thousand. At Chelmsford the charge was 1*s.* per thousand gallons. At Reigate, which was supplied by the Caterham Spring Company, there was a minimum charge of 3*l.* 15*s.* per year for a maximum of 40,000 gallons; in excess of this the charge was 2*s.* per thousand up to 75,000 gallons, 1*s.* 9*d.* up to 100,000, and 1*s.* 6*d.* to 150,000 gallons. At Croydon the charge was also by meter; in the special district, in which the supply was compulsory in all houses, the charge was 6*d.* per thousand gallons, but out of the special district, where persons were not bound to take the water, the price was 1*s.* 6*d.* per thousand. At Worthing the supply was by meter, but it was stated that the meters were not a success. Some discussion ensued on this information, but no immediate action was taken.

COLUMBIA MARKET, BETHNAL GREEN.

THE scene of Miss Burdett Coutts's latest act of munificent charity is one which is associated in the public mind with poverty and squalor for the most part. Bethnal Green is not exactly the place one would select to visit in search of beauty or magnificence. And yet the new market buildings opened to the public on Wednesday hardly fall short of meriting such adjectives. They are palatial in extent, while their architectural design is in many of its parts of the most ambitious and elaborate character.

Naturally, therefore, the first thought which strikes a visitor to Miss Coutts's market buildings, is the complete antithesis they present to the whole visible surroundings. A characteristically squalid group of old and poverty-stricken streets and houses has been cleared away, and this noble-looking pile of buildings, covering two acres of ground, has been reared in their stead. Strong, we may say violent, as is the contrast between Columbia Market and the district it now centres, it is in this very fact that the institution finds its greatest significance. Nothing can be truer than the assertion that human beings inevitably become assimilated to their material surroundings. One would no more expect to 'gather grapes off thorns and figs off thistles,' than to find either refinement of mind or manner, or grace of life or person, in such a district as Bethnal Green. The work which owes

its existence to the large-hearted yet prudent charity of Miss Coutts is exactly of that kind to afford real pleasure from the conviction that it must raise the whole tone of life and taste in the people who surround it, and who in their daily life and avocations can no more escape from the beneficial influence which such works exert than they can avoid, in the contrary case, the degradation which is produced among large masses of population by filth and squalor and the usual accompaniments of great poverty. The kind of transformation which Miss Coutts's wealth so munificently bestowed has produced, in and about the Columbia Market, is the best as it is the first of all systems of 'primary education.'

Place objects of beauty among the people, and you create by their means, in process of time, that very taste and perception which are needed to appreciate them: when such external agencies have leavened and humanised the poorer masses, the need of the pulpit and the school is more likely to be felt as a real want.

It is a gratifying feature in Miss Coutts's building scheme that its purposes are so devised that, while every part of the work must alleviate the miseries of accumulated poverty, it has no tendency to pauperise the population. These markets are not laid down as free gifts. They are offered as comfortably arranged and well fitted shops to industrious tenants. The market has been established with the object of supplying the surrounding poor with sound and wholesome food at a fair and marketable rate; of bringing the producer and consumer into closer communication with each other, and of promoting habits of industry and thrift among the humblest class of traders, who at present earn an uncertain livelihood by hiring carts and barrows from exacting proprietors at exorbitant charges, and hawking their wares about the streets. To secure these objects it is intended that the wholesale dealers shall be selected from those who have already established a position and character for respectability in other markets; that the shops shall be occupied by farmers or their agents, who will be their own salesmen, and thus free their customers from the penalties inflicted by their dealing with the middle-man; and, lastly, that the costermongers and hawkers shall have the option either of selling in the open market, or of hiring their barrows and carts from the market stores upon such terms as will secure to them a better profit than that which they now receive on their hard day's work.

The plan consists of four blocks of buildings with arcades surrounding an open quadrangle. The north side of this space is occupied by the Market Hall. Externally this block is of great architectural pretension. It has a busy, picturesque, and what might be called a popular look about it. To our own notion it looks far too much like a German cathedral; that impression at least will give some idea of its elaborate character. Internally, the Hall is very effective in design, and the materials which compose it are admirably treated. The wooden vaulted roof, in the actual effect on the visitor, is very far superior to the impression which any drawing can give. The Hall measures 104 feet in length by 50 feet in width and 50 feet in height. Its length is divided into seven bays by clustered granite pillars, two feet in diameter and 35 feet high from the floor to the top of their capitals, which are of bronze and of varied design. From these spring the moulded ribs of the roof, which is groined throughout in pitch pine. The space in the centre of the hall, affording an area of about 2,600 superficial feet, will be unobstructed by fixtures of any kind, as it is intended for the accommodation of small dealers; but in the aisles, immediately behind the pillars, are ranged 24 small shops, 13 ft. deep, 6 ft. 9 in. wide, and 8 ft. high, supplied with office containing fire-place, desk, &c., and furnished with sink, counter, and other fittings necessary for the sale of meat, fish, poultry, &c. They are lined on all sides with polished Irish marble, very hard and close of grain. They are intended for second-class dealers. Above the shops are four galleries, each affording an area of 676 superficial feet, for the sale of flowers, roots, fruit, &c., and which are approached by staircases adjacent to the principal entrances of the hall. The hall is lighted by mullioned and traciered windows, which extend from a few feet above the galleries to the groining of the roof, with which their heads are concentric. Two compartments in each window are furnished with casements which are made to open outwards for ventilation. We wish Mr. Darbishire had seen fit to glaze these great windows with a glass which would have toned down the glare which the present white light produces. Behind the hall is the market yard, covering a space of 8,000 superficial feet, in which carts will unload, and most of the wholesale business of the market be carried on. For the purpose of giving proper access to this part of the market, Miss Coutts has constructed a new street, about 40 feet in width, leading direct from the Hackney Road. Crab-tree Row, leading to the retail market, is also being widened at Miss Coutts's expense.

At each end of the market hall is a building, forming a kind of wing, four storeys in height. The buildings constituting the east and west sides of the market square are four storeys in height, the architectural details being fully in keeping with the rest of the place. They consist of a series of shops, fronted by spacious arcades, the accommodation afforded each tenant consisting of kitchen, cellar, store, and closets in the basement; shop, parlour or office, and private entrance on the ground floor; and sitting-room and four bedrooms, with closets, &c., on the two storeys above. The central tower rising in the midst of each of these two groups of buildings contains arrangements for forcing the water supply of the market to a high level. At the back of the shops are a series of dwellings, respectively designated 'Georgina Gardens' and 'Angela Gardens.' They are intended as residences for City clerks and others of a similar class. The central quadrangle occupies an area of about 14,000 superficial feet.

From the strictly architectural point of view, the one most within our province, the whole effect of these buildings is up to the average mark. There is a certain amount of pluck in the general design, but an equal amount of timidity observable in the detail, which is so tiny and thin in most cases as to look as if the architect had been nervous about the quantities of his material. In other cases, such as angle piers and buttresses, where great breadth could have been obtained, the spaces are cut up and subdivided into an infinity of little parts. The arcades surrounding the quadrangle betray the same qualities. The soffits are thin, and the single shafts meagre for the scale of the building. One great merit in the work

is the goodness of the building, worthy of the reputation of the firm that executed it, Messrs. W. Cubitt & Co. The walls are of yellow brick, and terra cotta is largely employed for dressings, though its colour is such as to closely resemble stone. Probably this is less a fault than it would have been had the walls been built in red instead of white brick. Almost all the external woodwork is executed in teak.

The architect, as our readers are aware, is Mr. H. A. Darbishire. His clerk of works was Mr. Weller, and the contractors' representative Mr. Wheeler.

In concluding our notice of these buildings we can safely recommend our readers to pay them a visit. The effect of the design will come on the visitor in the nature of a surprise, and, if we mistake not, will be considered a treat when the appearance, the uses, and arrangements of the various parts have been inspected.

At the inauguration on Wednesday last, a highly distinguished and numerous company met Miss Coutts, whose sentiments in relation to the occasion were expressed on her behalf by His Grace the Archbishop of Canterbury.

PARLIAMENTARY PROCEEDINGS.

Irish Diocesan Architects.

In the Commons, April 22, Mr. BRODRICK said he had placed an amendment on the paper, that justice might be done to a small and deserving body of men, the diocesan architects, who were appointed under the 14th and 15th Victoria, known as Napier's Act. The Bishop appointed one in each diocese, and their duty was to superintend all the alterations of the glebe-houses, to make periodical inspections, to report on the repairs necessary, and to see that those repairs were properly completed. They were, indeed, such useful functionaries that he wished there were similar ones on this side of the water. There was no provision in the Bill for compensating these officers for the extinction of their employment. He had added the words 'or emoluments' after 'salaries,' because they were not paid by definite yearly salaries, but by a commission on the repairs they had superintended. No other class had so great a claim to a first charge on the funds as those who were the first to suffer from the change.

The ATTORNEY-GENERAL for Ireland said that these compensation clauses had been considered with care, and it was found impossible to extend compensation to every case and circumstance. (Hear.) In this particular case, the claims of these officials who called themselves diocesan architects would not be recognised, because there were no such officers. The diocesan architects had constituted themselves officers, but there were no such officials known to the law. He trusted that the hon. and learned gentleman would not press his amendment.

Dr. BALL concurred in the opinion that these could not be regarded as freehold offices. ('Oh!')

The amendment was negatived.

The Osterham Asylum.

On April 23, Mr. GOSCHEN stated, in precise terms, in reply to a query, that if the expense of the banquet given on the occasion of laying the foundation-stone of the Caterham Lunatic Asylum was voted by the district board, it would not be sanctioned by the auditor, as it was the universal practice to disallow all such charges. He had heard, but unofficially, that the entertainment was given by the contractor. The observations of the hon. member for Colchester were not to the effect that Government was prepared to sanction the expenditure of 490,000*l.* on five new buildings, under the Act of 1867, but that that was the estimated cost of those buildings—namely, two lunatic asylums and three fever and small-pox hospitals. With respect to the hospitals, it was intended to proceed at present with only two, and the total cost would, in consequence, be but 430,000*l.*

The Southern Embankment.

On April 24, Mr. TITE explained that the alterations in the Southern Embankment scheme in respect of the docks had been the result of an arrangement between the Metropolitan Board and the Lambeth Vestry; and that the two docks in construction at Lambeth are by private firms in the potters' trade, and at their own expense.

Alterations of the House.

On the same day, Mr. LAYARD, in answer to Mr. HEADLAM, said he had given directions for printing the plans for the alteration of the Dining-rooms.

The Temple Collection.

On April 26, Mr. W. LOWTHA asked the honourable member for the University of Cambridge why the collection of works of art, &c., in the British Museum, known as 'The Temple Collection,' no longer existed under that name, and whether some means could not be taken for keeping that collection together, or having the separate objects marked as having belonged to the late Sir Wm. Temple.

Mr. WALFORD would explain the facts of the case with reference to the Temple Collection, and he believed the hon. gentleman would find that the trustees of the British Museum had done everything to satisfy him and the public. The Temple Collection was left to the Museum some years ago, and for some time the collection was kept together as a whole, that it might be seen at one time; but since then other works of art of a similar nature had been given to the Museum or purchased by them, and it was then thought better to intermix them, so that objects of a similar character might be seen together. A catalogue of the Temple Collection was made and left in the Museum, and labels were placed on all the objects of art to show that they belonged to the Temple Collection.

Union of Army Offices.

Mr. SHAW asked the Secretary of State for War whether the rumoured purchase of Dover House by Her Majesty's Government was correct; and, if so, what were the objects for which such purchase had been made.

Mr. CARDWELL said it was not true that the lease of Dover House had been purchased by the Crown. But, on the matter to which he understood his hon. friend's question pointed, he had to say that the best mode of placing the War Department and the Horse Guards under the same roof was now under the careful consideration of the Government.

Gravesend County Court.

Sir C. WINGFIELD asked the Secretary of State for the Home Department when it was intended to commence the construction of the county court-house at Gravesend, as the site for this building was purchased two years ago.

Mr. AYRTON said a sum was placed in the estimates of the present year for this building, and if it were voted by the House the building would be commenced at once.

The New Law Courts.

On April 27, Mr. GREGORY asked the First Commissioner of Works whether the Government had decided finally on the site for the new Law Courts; and if so, whether the proposed site could be acquired without delay; and in what manner and how soon would the subject be again brought before the House of Commons. Perhaps the right hon. gentleman would be able to state the precise spot mentioned by the Chancellor of the Exchequer as a desirable site for the new Law Courts.—Mr. LAYARD: The Government have decided to propose to the House a plan for the erection of the new Law Courts on the site comprised between Somerset House and the Temple, bounded on the south by the Thames Embankment, and on the north by Howard Street and several small alleys and passages connecting that street with the Temple and King's College. This site will furnish six acres of building ground. Mr. Street, who is now occupied in adapting the plans which he has already prepared for the Carey Street site to this new site, informs me that he will be able to erect all the Law Courts, and every office necessarily dependent thereon, upon these six acres. It is my intention to introduce very shortly—if possible before Whitsuntide—a Bill which, should the House think fit to pass it, would enable the Government to proceed without delay to acquire the proposed site, and to commence the erection of the Law Courts upon it. I shall be prepared, on the introduction of that Bill, to give a full explanation to the House of the plan contemplated by the Government, and to point out its great advantages over all other plans hitherto suggested. At the same time I shall be able to give such assurances to the House as will, I hope, convince them that it may be carried out, including numerous and most convenient approaches, for the sum mentioned by my right hon. friend—viz., 1,600,000*l.*, or at a much less cost than any other scheme. Mr. Street is now preparing detailed plans, which I shall be able to submit to the House before the second reading of the Bill. Before sitting down I may state to the House that I have received a communication from the Chief Baron of the Exchequer, Sir Fitzroy Kelly, averring that he and all the Judges with whom he has communicated, except one, are of opinion that upon every ground, as regards the Bench, the Bar, the solicitors, the suitors, and the public—I quote his own words—the Thames Embankment should be preferred for the site of the Law Courts.

Mr. HUNT asked what was to be done with the Carey Street site, and whether notice had been given to those persons whose property would be required for the new site.

Mr. LAYARD promised to explain this when introducing the Bill.

Lord J. MANNERS hoped full opportunity would be given for discussion upon the Bill.

Mr. LAYARD said he had reason to believe it would be a public Bill, and therefore every opportunity would be given for discussing it.

New Port and Docks in Malta.

Mr. ONSLOW asked the First Lord of the Admiralty what was the present state of the works in the intended new port and docks at the Marsa in Malta, and when they would be completed, so as to afford accommodation to merchant ships.

Mr. CHILDERS.—The Marsa, or extension of the harbour proper, is complete, though some disappointment has been experienced from a large area of it having a rocky bottom. This we propose to remedy by laying down the requisite moorings. The works at the north-west basin have been suspended, partly at the instance of the local government, pending the decision as to its depth. Mr. CHILDERS added that he had just sent out certain instructions, which he hoped would speedily lead to a satisfactory settlement.

Greenwich Hospital.

Mr. TREVELYAN rose for leave to introduce a Bill to make better provision respecting Greenwich Hospital and the application of its revenues. In the course of his remarks he said that as yet the Admiralty had not determined for which purpose the main building should be applied. The cost of keeping up the seven acres of land surrounding the Hospital was 5,000*l.* per annum. In order to reduce the number of the inmates of the Infirmary, several of the patients were to be sent to Haslar and Portsmouth Hospitals, where they were to be maintained at the cost of Greenwich Hospital. Henceforth, admission to the infirmary of Greenwich would only be given to infirm pensioners or to those suffering from actual ill-health. It was added that the inconvenience of having the sick on ship-board had been felt so strongly by the Committee of the Seamen's Hospital, that the society had endeavoured to build a hospital on land, but it was found that to erect a suitable one would cost 80,000*l.*

Leave was given to introduce the Bill.

Discovery of Old Coins.—In digging the foundation of a house on the Cowley Road, Oxford, a large number of old coins, enclosed in an earthenware pot, have been discovered. The pot was broken by the workmen, and the coins were dispersed and taken away by a number of persons who happened to be near the spot. They were of silver, and of different sizes, the largest being somewhat smaller than the present shilling. The coins are said to be of the reign of Edward I.

LEGAL.

An Architect Suing for the Balance of a Church Building Account.

At the Leeds County Court, on the 20th ult., an action was brought by Mr. J. Green, architect, Todmorden, to recover 45*l.* which he alleged to be owing him by the vicar and others in the parish of Aysgarth, near Bedale, in respect of the restoration of the parish church, which the plaintiff had carried out. Measures were taken some years ago to put St. Andrew's church in a proper state of repair, and as it is one of the livings of which the corporation of Trinity College, Cambridge, are the patrons, that body contributed towards the expenses of the restoration. The cost of restoring the chancel was defrayed by Trinity College, and the cost of the rest of the work by the parish, which was represented by the defendants. In 1863 and 1864 plaintiff took dimensions and made out drawings, and the charge for this work at that time was stated to be 150*l.*; but some alterations were afterwards effected, and for this 50*l.* was charged, with 20*l.* in addition for extra travelling expenses, bringing the total charge in this respect against the parish of 220*l.* Of this amount 178*l.* had been paid, and there was a balance left—the sum sued for. A similar charge was made against Trinity College, and that body paid the sum. Plaintiff, beyond these amounts, received a commission of five per cent. upon the outlay in the reconstruction of the church, which was said to be upwards of 3,000*l.*

Several witnesses were called on the part of defendants to prove that the agreement with plaintiff by the Restoration Committee was, that he should receive five per cent. on the expenditure, and that that was to include everything.

His Honour took into account the conflicting statements, and said he would act as a jury would have acted in the case—that was to say, they would have split the difference. He gave a verdict for the plaintiff for 20*l.* 1*s.*, the odd shilling being added in order that the award might carry the costs in the court above; the suit having been sent down for trial by the Court of Common Pleas. His Honour, however, ordered that the parties to the action should pay their own costs in the County Court.

Important from Australia.

We read in the *Melbourne Argus*, by the last mail, that the case of Bruce v. Ligar and Another, now before the Equity Court in Melbourne, is one of some importance, and is likely to create a great deal of interest. The plaintiff is one of the trustees of the estate of the late John Vans Agnew Bruce, the well-known contractor for the Victorian Railways, and the principal defendant is the Surveyor-General. The trustee claims some 7,000*l.* from Mr. Ligar (who is also one of the trustees), being part of the proceeds of the sale of a station which belonged to him and Mr. Bruce, but for which he received the money. We are informed that an offer of 2,400*l.* was made on behalf of Mr. Ligar to settle the matter, but it was refused.

ON THE DUTIES OF AN ARCHITECT.

ON THE DUTIES OF AN ARCHITECT, WITH REFERENCE TO THE ARRANGEMENT AND CONSTRUCTION OF A BUILDING. Read at the Society of Arts, on Wednesday, April 28. By T. ROGER SMITH, Esq.

THE nature of an architect's duties with reference to the arrangement and construction of a building; in other words, the routine of his regular and most familiar professional work, is the subject which I have ventured to think it may be worth your while to consider this evening. There is much which becomes customary routine to the practitioner of any art, which it is yet well worth while that those should know who may have to criticise his works, or to avail themselves of his services, or who may think of his profession for their sons. In the case of many manufactures and arts, which are by no means of universal or even very general application, this sort of information has been eagerly sought and fully diffused; but, familiar as we all are with buildings, there exists good reason for supposing that by many the nature of an architect's work is less thoroughly understood than might have been expected: I have, consequently, thought that an endeavour to make quite clear what he can, and what he cannot do, would be of service. In this inquiry I propose to take a familiar example, that of a dwelling-house of good size, and to trace its history from its commencement to its completion, showing at each stage the share which the architect takes in the work; and I shall illustrate what has to be stated, by exhibiting the actual working and other drawings, &c., of a building of this sort, recently completed by myself.

Suppose, then, that an individual is possessed of a site, probably recently bought, and of the needful funds, and is minded to build himself a house. We will further suppose, for the sake of simplicity, that this is a country site, and that some circumstance points out beyond question one particular situation on the estate as proper for the building, so that no trouble as to selection of the exact spot has to be encountered. The question immediately to be solved being what sort of house to build, and how to set about it, the first step, in all probability, will be to visit, or at least to think and talk over some houses already known or known about; and probably, according to the degree of constructive skill or draughtsmanship he possesses, the intending proprietor will make some sort of sketch, or model, or other design. This will not have been carried on far or long without the question of obtaining skilled assistance being thought over; and either from a general idea that it is the right thing to do, or from a real knowledge that trained special skill is indispensable to the success of such an undertaking, we will suppose that it has been decided to call in an architect.

It is foreign to my purpose to say anything about how the architect is selected, though it is fair to add that the selection is a matter of considerable importance. In the case of public buildings, competition is very frequently resorted to; this is rarely done in private practice; and, in order to trace the course of a design produced under the most favourable and natural circumstances, it will be best to suppose that the architect is con-

sulted at the commencement of the undertaking, and entrusted with the work from the very beginning, not in consequence of his design having been chosen in a competition, but in consequence of his ability and integrity being known by the person intending to build.

The first step, after the architect has received some preliminary instructions as to the general nature of the building wanted, will be for him to visit the site. It is, perhaps, best that he should be able to form some very vague general idea of the size and sort of house intended, before visiting the ground it is to be built upon; but no wise architect will put pencil to paper, without first seeing where his future work is to stand, and what will be near it, and studying the peculiarities of the site with some care, or (if that be quite impossible) without trying to form a good idea of it from maps and photographs. The points to be specially noticed on a site are the aspects obtainable for different rooms, and prospects from different windows; the peculiarities of shelter or exposure; the approaches, and space for gardens, grounds, &c.; the facilities for drainage and water supply; the dryness or dampness of the site, and its levels; the nature of the building materials within easy reach; and such local peculiarities of surrounding, or association, or character of scenery, or of neighbouring buildings, as influence style or design. It is now necessary to have sufficient instructions to shape a design upon, and here, as is natural, the custom varies with the peculiarities of each client. Many clients make a rough set of plans—usually defective. Others go even further, for I have had a model put into my hands as my instructions. Those who cannot draw, and some of those who can, wisely prepare only a list of what they require; availing themselves, probably, of some of the many published works on the subject. It requires much care to make such a list complete; when, however, it is complete, and a trustworthy series of sizes for principal rooms has been added, such a list forms a good basis for the architect.

In all probability the most satisfactory results are obtained by simply telling the architect what requirements it is wished to accommodate, and what special or unusual arrangements are required to be introduced, and giving him access to any model, either as to arrangement, size of rooms, or treatment, which it is wished to follow—settling, in fact, the outlines of accommodation wanted in consultation with him, but leaving it very much to him to suggest how that accommodation shall be disposed. Thus, in a dwelling-house, the architect is best instructed by telling him how many members of the household, and how many guests, are to be housed; what are the habits of the family; what existing rooms in known houses the new apartments ought to resemble in size, in shape, or style; and what house or houses (if there be such) the client looks upon as models in any special portion or throughout.

It is often the case that this part of the question is not easily disposed of. The architect's previous knowledge of the subject, the client's knowledge of what he requires, and the difficulties of site, frontage, and what not, under which he labours, are not the same in any two cases, and the trouble varies as they vary.

(To be continued.)

NEW BUILDINGS AND RESTORATIONS.

A New Chapel has just been erected in Hatfield Town, Hatfield Broad Oak, at the entire cost of Miss Poole, of Matching Hall. It is a substantial structure of Cambridge white brick, picked out with red and black; well fitted up, lighted, and ventilated. Cost about 350*l.* Mr. Perry, of Bishop Stortford, architect.

New Church in Halifax.—The chancel corner-stone of the new church in Rhodes Street was laid on the 21st ult.

At Coad's Green, near Launceston, a recently-repaired Wesleyan Chapel has just been re-opened. A new gallery and spiral clock tower have been erected, a stained-glass window fitted in, 100 additional seats fixed, and two vestries built; also residence for the minister. The whole has been under the direction of Mr. C. P. Wise, architect, of Launceston.

The little church of Fleet Marston, near Aylesbury, Bucks, was re-opened, a few days since, after a complete restoration. The stained-glass window at the east end, by Messrs. Burlison & Grylls, was given by Mrs. Bickersteth. The church consists of nave and chancel, both of them of the Decorated period. The roof of the nave, an interesting work of the fourteenth century, which had for many years been hidden by a low flat ceiling, is now laid open, and restored.

The Proposed Public Hall in Carlisle is about to become a *fait accompli*. A meeting will be held early in this month, 'to consider the practicability and the advisability of erecting a Public Hall in this city.'

Cookermouth Union Workhouse is proposed to be enlarged. At the last meeting of the Guardians the clerk presented plans in reference thereto from the Poor Law Board. The Board stated that land for a site could now be got on very favourable terms, and they were of opinion that, instead of proceeding with the contemplated workhouse improvements, it would be better to build schools and dormitories.

A New Fever Hospital is talked of for Stockton. At a late meeting of the Local Board of Health, the medical officer reported that the cases of fever in the town were increasing, and recommended that a fever hospital should be established. The Mayor stated that he had received a letter from the Board of Guardians on the desirability of providing a fever hospital, and stating that they would be willing to co-operate with the Local Board in the matter. The Town Clerk said he had also received a letter, and had seen the clerk to the guardians, and told him that they were the proper authorities to provide accommodation for paupers suffering from fever. Mr. Richardson said the town ought to have a hospital. It was ultimately agreed that the Town Clerk should write the authorities in other towns to ascertain who provided fever hospitals under such circumstances.

The Parish Church of Windermere (Lake District) is to be restored and enlarged.

Proposed New Cemetery at Stockton-on-Tees.—The borough surveyor, having been instructed to prepare the plans for the laying out of the New Cemetery, has since laid them before the Town Council. The estimated cost of the land, laying out of the ground, and building of the chapels, was 7,500*l.* Sixteen acres of land had been purchased, but it was recommended that only eight acres should be laid out for the present, and the other eight let for ten years, at 3*l.* per acre.

The Church of St. Chad, Haggerston, built from designs by Mr. Brooks, has been consecrated. It is built of brick with stone facings, is very high, but plain, the windows being devoid of ornament; the capitals of the pillars and shafts are as yet uncarved, and the reredos is unfinished. Yet the general effect is good, and the appearance of the building impressive. On the north side of the choir is the organ chamber, and on the south a small chapel in which are three windows of coloured glass. High up in the centre of the apse, in which the choir terminates, is also a window of stained glass representing our Lord in Majesty. It is intended to carry the reredos up to the foot of this window. The altar, on which stand the two altar candlesticks, is placed on the chord of this apse, so that there is a space like an ambulatory behind the reredos.

New Town Hall.—A company has been formed for the erection of a new Town Hall in Rickmansworth, Herts. 206 shares (representing 1,030*l.*) were taken at the inauguration meeting.

A new tower and spire for St. Peter's, Bournemouth, is to be erected from designs by Mr. G. E. Street. The foundation-stone was laid a few days since.

The new Volunteer Drill Hall at Bedale was formally opened on the 22nd ult.

The New Church, Lennox Street (says the *Melbourne Argus* of February 17), was opened on Sunday last. The building is not yet finished according to the design of the architect—the tower has to be erected, and about half as much more length added, before it can be called complete. Up to the present, the cost of erection has been 2,300*l.*

Rebuilding of St. Andrew's Church, Hertford.—The first meeting of the committee appointed to carry out the works connected with the erection of a new church, met on the 22nd ult. at the Town Hall. The following resolutions were carried:—That on the specifications being approved, and the contract signed, it will be advisable at once to proceed with the work of pulling down and rebuilding the church, and that orders be given to the architect to that effect. That the allowance to the architect be 5 per cent. on the outlay, and 20 per cent. for travelling expenses and attendance on the works. That a clerk of the works be appointed at a remuneration of 2*l.* 2*s.* per week, and that Mr. M. S. Longmore be requested to communicate with Mr. Cousins, the clerk of the works at the new Union Workhouse, with a view to his being appointed.

The New Infirmary at Highgate (belonging to the parish of St. Pancras) will accommodate 524 beds, and the contract sum for its erection is 38,000*l.*, at the rate of 69*l.* per bed.

St. Winifred's Well, Holywell.—The Local Board have selected the designs sent in by Messrs. Scrivener & Son, of Hanley, Staffordshire, for new hot and cold baths in connection with the above celebrated waters. These baths are to be erected forthwith, and it is expected the Board will realise a very large income from that source, by which means they contemplate several important town improvements.

Kidsgrave, Staffordshire.—The Local Board have instructed Messrs. Scrivener & Son, of Hanley, to prepare a survey of the District Parish, as also to prepare a plan for the complete sewerage of the town.

New Independent Chapel at Heytesbury.—This chapel was opened a few days since. The new edifice is built on the site of the old one, and a long lease of the land has been granted by Lord Heytesbury. The architect is Mr. Stent, and the contractor Mr. Scamell, of Warminster. The style of architecture is 13th century Gothic, and the plan is a parallelogram, with immediate access to large and commodious class-rooms and vestry, with side entrance, lobby, &c. The chapel is seated with open deal benches, and will accommodate about 200 persons on the ground floor and 180 in the gallery.

Building Progress at Alton (Hants).—A large amount of building has been lately going on in Alton. A hop garden, recently sold for building purposes, has been bought up by working men and cottage speculators for the erection thereon of workmen's cottages. Agents who have the letting of property in the town and neighbourhood state that they have frequent applications for houses by people desirous of settling in the town; but the total want of a class of superior houses prevents many from making the town their residence. It is said that labourers from the adjoining villages seek to obtain cottages in Alton because of the indiscriminate almsgiving for which the town is noted.

Church Building.—The church of Rhos Crowther, Pembrokeshire, has been reopened after extensive restorations.—The new church at Burnhope, in the ecclesiastical district of Holmside, is progressing. The style of the architecture is Geometrical Gothic of the 13th century. The plan consists of a nave, chancel, organ-chamber, vestry, and western porch. The whole of the sittings will be free.—The parish church of Otley has been restored and reopened. It is dedicated to All Saints, and was originally a Saxon fabric. The east or old church window is certainly very ancient. The west, or new part of the church, it is conjectured, was built in the reign of Henry VIII. The church abounds with monuments. A new organ-chamber and a new vestry have been erected, and the whole of the church has been repewed.—The parish church of Eaton Socon, Beds, which has been undergoing an extensive restoration, has been reopened for public worship. The church is in the Decorated style of architecture, with the exception of the chancel, which is Perpendicular. The old square pews have now entirely disappeared, and modern oak seats have succeeded them; a few of the same

style, nevertheless, which were in the church before, have been restored. An old Norman font has been restored and replaced in the church, after being out for many years.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

House Property in London and on the Continent.

The following statistics are interesting as showing the relative value of house property in London and the chief continental cities. In London the average amount of rent paid by a tenant is from $\frac{1}{3}$ to $\frac{1}{10}$ of his income. In Berlin it is from $\frac{1}{3}$ to $\frac{1}{2}$, whilst in Vienna it is from $\frac{1}{4}$ to $\frac{1}{3}$. The average number of inhabitants in a house in London is 8, in Berlin 32, in Paris 36, in St. Petersburg 52, and in Vienna 55. The reason for the great difference in numbers between London and the cities of the Continent is the circumstance that our 'insular peculiarities' lead us to prefer that our house should be our castle, whilst abroad the system of flats is the rule, not the exception, as with us. Taking this fact into consideration, house rent abroad, except in provincial towns, is high; we should certainly think 200*l.* rent a high sum for a man with an income of 600*l.* a year.

Too Bad.

Who is the young man in Mr. Fowler's office who 'does' the architecture of his stations? At the South Kensington station of the Metropolitan Railway there have recently been superadded to the external structure certain decorative parts in cement—foliated capitals to piers and the like—so astoundingly, outrageously, and ludicrously bad that we wonder the very stones—or bricks—of the Museum hard by do not rise and mutiny. Has Mr. Fowler ever visited that Museum? Has his young man? If so, we must say the progress of Art education is slow in some minds. We invite the attention of Mr. Henry Cole to these 'Art-treasures.' He might perhaps induce the Metropolitan directors to let him have them for a time, 'on loan.' They would furnish an instructive lesson on the connection between architecture and civil engineering. Or, perhaps, they might induce the framer of the new law on elementary education to make it 'compulsory' on the part of the young men who do the architecture in engineers' offices.

The Sheffield Lock-out.

A strike, or to speak more correctly, a lock-out in the building trade is impending, the Master Builders' Association having signified their intention to the workmen of enforcing the 'hour system' of payment after May 1 (this day). It is expected that the question will not long remain open, as the masters are well united in their determination, and the trade is at present very dull.

The Building Trade in Barnsley.

Few, if any, of the numerous West Riding towns, of similar size and importance, can boast of a briskness in the building trade such as Barnsley now possesses. For some years past the town itself has been greatly improved. New towns, as it were, have been formed on almost every hand, which has caused the building trade generally to be very brisk. In almost every other town, notices have been given to the men to work under the hour system, but in Barnsley, although there were several members of the Builders' Association, no effort has been made to enforce the new rule. The masters, no doubt, feel the difficulty of enforcing the rule when trade is so very active, and when they have so many contracts on hand. Should the system, however, be generally adopted, there can be no doubt but the masters in Barnsley will follow those in other towns. The erection of cottage property within the past five years has been very great. In 1868 not fewer than 92 plans were passed by the Board, from which 300 houses and other buildings have been erected. In addition to the numerous streets which have been laid out, and on which buildings have been placed, several large works are in the course of construction. The Barnsley Gas Company have just let the work required to be done in the erection of a new plant at the outskirts of the town. The mason work required for the sheds has been entrusted to Messrs. Robinson and Sons, builders, of Barnsley; the tank to Mr. Ridal, builder, of Sheffield; and the holder to a Birmingham firm. The new Midland extension from Cudworth to Barnsley has within the past three years found employment for a large number of hands, inasmuch as the town is crossed by stone viaducts, or arches, at a good height. Although the line itself is nearly finished, there is still a good deal of work to be done. The Company are about to erect a new station on a large number of arches. In addition to this, a new County Court will have to be erected, as the present one is about to be taken by the Company. A good summer trade is vouchsafed, not only in the town, but in the South Yorkshire district, where a large number of new pits are being opened out.

Isthmus of Corinth Canal.

Piercing the Isthmus was vainly attempted by the Emperor Nero. Before the establishment of the Roman domination, the Greeks themselves proposed to effect a connection between the two seas, but were forbidden to prosecute the enterprise by the famous Pythian oracle, addressed to the Cnidians, which may be thus rendered:—

Delve not, nor towers upon the Isthmus pile:
Had Jove so willed, himself had made an isle.

The Suez Canal, the plant used for the excavation of which it is suggested to carry to Corinth, is the revival of a work of Necos II., the fifth king of the 26th Egyptian dynasty, reigning at Sais. He was the Pharaoh Necho of Scripture, who defeated and slew King Josiah at the battle of Carchemish, and was himself overthrown by Nebuchadnezzar, after a reign of seventeen years.

The Botherham Hospital Competition.

Ninety-two sets of drawings, comprising at least 650 sheets, are now being publicly exhibited in the various apartments of a small house in Frederick Street. As a rule they are badly hung, the best and most

important drawings being either close to the ceilings, or 'stowed away' in corners out of sight. This is the case notably with by far the most practical plan, and, in our opinion, the most truthful design, in the series. It has the motto 'Necessitas,' and bears the impress of anything but 'a prentice hand,' and we gladly take this opportunity of rescuing it from its ill-deserved obscurity. The design, which has a nice and thoroughly mediæval sentiment, is quiet, well fitted for its purpose, and represented by drawings we should like to see the rule in public competitions, and which at once fix themselves to be the work of its author. There is a simplicity and a thoroughly-working business-like character about the plan and design to which we are glad to draw the attention of those interested in the matter. 'Comme il faut' has given a nice sentiment to a work represented by an excellent set of drawings, but is quite at sea in his plan. 'Dux' has an imposing front with lofty slate tower, and a plan which has many good points.

The design bearing the motto 'Strive' is far above the average, and though carefully studied, and drawn with feeling, has not sufficient of the hospital character to satisfy a critical observer. 'Hospital's' design is good in sentiment, but ruined by his plan. 'Set square' deserves a passing notice. With these and two or three exceptions, the designs are ordinary and hardly commonplace, the influence of the 'Strand Music Hall Gothic,' yclept the 'Hair-stand-on-an-end style,' being strikingly apparent in many; and we cannot but draw the attention of those who are personally interested in the undertaking to the fact of the great bulk of the plans being thoroughly unfitted for hospital requirements.

The estimates range from 4,460*l.* to over 10,000*l.*, the former by the author of the design 'Necessitas' before mentioned. This should be an additional and urgent reason for the committee to take the only means at their disposal for ensuring a fair decision to the numerous competitors, and the best design for their hospital, by securing the assistance and advice of some eminent architect. Without such a step it will be absolutely impossible to arrive at a satisfactory conclusion. It may interest the authors of the drawing to know their work is insured against fire for the sum of 2,000*l.*

The Doré Gallery.

We have not space in our present number for more than the bare announcement of the opening, on the 26th ultimo, of a new Gallery, at No. 35, New Bond Street, in which 24 oil paintings by M. Gustave Doré are exhibited, and in which, moreover, there is space and light enough to view them. We have the less regret for being obliged to defer a more detailed notice, from the fact that we may now welcome M. Doré as a permanent guest; and we do welcome him, most heartily and sincerely, accordingly. We are rejoiced to hear that the apartment which has been arranged as a gallery (some 80 feet long and efficiently lighted from above) has been taken for ten years; and we trust that the reception given to a gifted artist, who pays so marked a compliment to the public opinion of this country, will be such as is due to his great and original merit. 'The Death-bed of Rossini,' which excited so much interest among the friends of the *maestro* in Paris; 'The Triumph of Christianity,' which was exhibited at the German Gallery last year; the original painting of 'The Neophyte,' a replica of which was shown at the same place; and a group from the 'Midsummer Night's Dream,' are among the pictures now on view. We hope to return to the subject.

Railways and other Works to be undertaken shortly in France.

The scheme of the seventeen new lines of railway, forming what is called the fourth *réseau* of the French system, is being approved bit by bit. The Corps Legislatif has approved of the treaty entered into with a society represented by M. Mangini, by the Minister of Public Works, for the construction of the proposed line from Lyons to Montbrison.

Approbation has in like manner been given to the treaty made by the same Minister with the Northern Railway Company of France, for the construction of a line from Arras to Etaples with branches, and of another from Luzarches to the St. Dennis and Pontoise Railway.

The concession of several lines in the departments of the Nord, the Pas de Calais, and the Aisne, made to a company represented by Messieurs De Melun, De Merode, and others, has also received the approval of the Legislative body.

The Minister of Public Works has laid three important projects before the Council of State:—The improvement of the bed of the Rhone between the Givers and Vienne, and of the navigation of the same river at the pass of Grigny in the departments of the Rhone and Isère; another for the enlargement of the station of Abbeville; and a third, for certain changes in the concession for a graving dock at La Ciotat, Marseilles, made to the Messageries Impériales.

The concession of the railway from Lérrouville to the Ardennes line will shortly be put up to competition; the maximum subvention offered by the Government is 13,500,000 francs (540,000*l.*), payable in sixteen equal half-yearly sums, commencing with January 15, 1871. The Government, however, reserves to itself the right of transforming, at the period just named, the subvention into ninety-year annuities, at the rate of 4 fr. 50 c. per cent.

A definite concession has been made to the Company of the *Chemin de fer du Midi*, for the construction of a line of railway from Condom to Port Sainte Marie.

Several other concessions are likely to be announced shortly.

Monument to Rossini.

The Achille Leclère prize for the best design for a monument in honour of the late composer Rossini has been won by M. Dillon. The work is to be placed in a garden, and the statue of the *maestro* is placed in a kind of temple; in the intercolumniations of the colonnade which surrounds the principal statue are four figures representing the four *chef-d'œuvres* of the master—'William Tell,' the 'Barber of Seville,' 'Moses,' and 'Semiramide.' On the central pedestal are inscribed the titles of Rossini's operas. The artist has made use of bronze as well as marble in his design.

General.

Preservation of Churches.—The House of Commons, on Monday, April 26, went into committee on the Irish Church Bill, and passed, almost without observation, the 24th clause, which provides that on commutation of an annuity the annuitant should receive the amount of any building charge to which he might be entitled. On Clause 25, containing the proposed enactments with respect to churches, and to the 1st Article thereof, providing that ruined or disused churches of a monumental character might be vested in the Commissioners of Public Works in Ireland, Mr. Disraeli moved as an addendum that such buildings should be preserved, and not used as places of worship. At present the Ecclesiastical Commissioners of Ireland defrayed the annual expenditure for repairing the churches out of an ecclesiastical fund arising from the prelates' estates; and what he proposed was that that privilege should be continued to the Irish Church, that the amount should be multiplied by fourteen years, and that the aggregate should be paid to the new Church Body. His first amendment, therefore, in this sense, applied to the ruined or disused churches.—Agreed to. Mr. Pim proposed to strike out the third section in the clause, that certain large churches of a monumental character, not exceeding twelve in number, should be partially maintained by the Commissioners. After some debating, the committee divided, and agreed to omit the section by 232 to 132. Clause 26, respecting burial grounds, was agreed to, after undergoing a few alterations of an unimportant character, and a discussion of some length, on a motion of Colonel Greville-Nugent, to vest the control over churchyards in burial boards, instead of the new Church body, which motion was withdrawn.

Church Furniture.—In the New Church at Sawrey, the communion table, the two chairs, and the kneeling stools, are of solid oak, carved and perforated from designs made by a gentleman resident in the immediate neighbourhood, and are the workmanship of Mr. John Taylor, carpenter, of Far Sawrey, who was the contractor for the woodwork of the church. The reading desk, also of oak, is the gift of the wife of the gentleman alluded to above, and is from a design made by Mr. Robt. Brass, of London, the honorary architect of the church. It matches the oak pulpit, but is lighter in appearance, in consequence of openwork having been adopted instead of panelling.

Sewers Rate, Lighting and Watching Rate.—From a lately-published Blue-Book we learn that the sums levied during the seven years ended with 1867 were:—1861: Sewers rate, in counties 36,323*l.*, in City of London 21,058*l.*; total 56,381*l.*: Lighting, &c. rate, 3 & 4 Will. IV., cap. 90, 4,598*l.*—1862: Sewers rate, in counties 31,120*l.*, in City of London 17,120*l.*; total 48,240*l.*: Lighting, &c. rate, 42,266*l.*—1863: Sewers rate, in counties 45,796*l.*, in City of London 16,631*l.*; total 52,427*l.*: Lighting, &c. rate, 36,837*l.*—1864: Sewers rate, in counties 44,010*l.*, in City of London 17,242*l.*; total 61,252*l.*: Lighting, &c. rate, 42,194*l.*—1865: Sewers rate, in counties 42,319*l.*, in City of London 17,771*l.*; total 60,090*l.*: Lighting, &c. rate, 41,846*l.*—1866: Sewers rate, in counties 41,325*l.*, in City of London 17,872*l.*; total 59,197*l.*: Lighting, &c. rate, 40,783*l.*—1867: Sewers rate, in counties 42,872*l.*, in City of London 40,075*l.*; total 82,947*l.*: Lighting, &c. rate, 40,888*l.* The leap in the City sewers-rate in 1867 is inexplicable; but on reference to the Home Office Blue-Book, from which the quoted figures were taken, it is plain that the 17,638*l.* 17*s.* 6*d.* paid over by the Chamberlain of London for main drainage purposes has been improperly ascribed to the Board of Works 'in aid of their expenses.' This probably points to the greater part of the increase. The lighting and watching rates look small, but the usefulness of the Act is abundantly manifested by the number of small towns and villages which avail themselves of its provisions. With the exception of Leeds, where the rates under the 3 & 4 William IV., cap. 90, amounted last year to 9,259*l.*, and of Bradford (near Manchester), which raised 1,295*l.*, the heaviest seldom exceed two or three hundreds, and the great majority are below 100*l.* a year. The aggregate amount for 1867 represents the requirements of 280 places. Inclusive of the City of London, 31 Commissions of Sewers have furnished the Blue-Book with accounts for 1867. The total expenditure of that year was 27,105*l.* for ordinary works and maintenance, 10,690*l.* for new works and improvements, 4,951*l.* for loans paid off and interest, 9,179*l.* for salaries and management, 37,170*l.* for other expenses; making the total expenditure 89,096*l.* The expenditure under the Lighting and Watching Act was 40,612*l.* in 1867; of that sum, 3,020*l.* was for new works and repairs of lamps, posts, and pipes; 29,915*l.* for gas, 4,692*l.* for salaries; and other payments, 2,984*l.* The rates are entirely devoted to lighting the localities in which they are raised.

Fall of a Music Hall.—The New Adelphi Music Hall, Union Street, Oldham, which was opened a few months ago by the Oldham Philharmonic Society, fell on the morning of April 19, and has become a complete wreck. The cause of this catastrophe is the undermining of the foundations while excavating the adjoining new buildings.

The Civil and Mechanical Engineers' Society has just handed us its book of rules for 1869. At the end is a list of papers read up to close of previous year, including some on foundations, iron girders, tunneling, building stones, retaining walls, stone and brick arches, and other subjects interesting to the architect and builder. It appears that the members of the society visited several of our great engineering works in progress during 1868. The hon. secretary is T. H. Roberts, Esq., and the meetings are holden at the Whittington Club, Strand.

Mr. Turner has been appointed surveyor to the Herne Bay Improvement Commissioners.

Covent Garden Theatre.—It is said that the Government are negotiating for the purchase of Covent Garden Theatre. It will be needed as a central station for the new telegraph system of management.

Robert Scott Lauder, R.S.A., one of our best known Scottish painters, is no more. He was born in 1803.

Roman Remains at Bath.—Discoveries are still being made of Roman remains during the excavations on the site of the old White Hart. The remains of the Roman wall, discovered south of the temple platform when the foundations of the south wing of the hotel were put in, have been traced right across Stall Street, and left passing under the foundation of the pump-room. The section of the soil at the site of the Great Temple supports the presumption that this building must have stood perfect or nearly so, less roof, as late as somewhere about 1070. In the angles of the carrying are remains of the red paint used by the Romans to decorate or preserve the stone.

The Accident at Saltburn-by-the-Sea, caused by a girder slipping from one of its piers during the erection of a bridge, calls for investigation. The important matter is whether we shall not speedily hear of many similar accidents arising from the defective iron and workmanship employed in the construction of so many modern structures. Ironwork is being let by open competition on specifications which, if faithfully carried out, must entail a great loss on the contractors, or these contractors must resolve to employ only inferior materials and workmanship. It may be said that engineers can secure themselves by close inspection, but the remedy is with themselves. They know, or ought to know, the cost prices of work, and should only recommend contracts being let to respectable contractors, and at reasonable prices; otherwise, the result will be that which invariably attends a penny-wise and pound-foolish policy.

Sewage Plans for Bucks.—At a late meeting of the Bucks Local Board the chairman called the attention of the Board to the great necessity which existed for a proper plan of the sewers of the town. At present no one knew their situation or their depth. Mr. Smith recommended that plans be provided without loss of time. Mr. Field said he thought it would be better to decide the other question as to the disposal of the sewage first, and so the subject dropped.

Fountains Abbey.—A great pier between two windows in a room next the kitchen in Fountains Abbey has recently fallen. Every misfortune of this kind increases the subsequent risk.

Destruction of a Church.—Early this week, the church of All Saints, Surrey Square, Old Kent Road, was destroyed by fire. The church was 110 feet long by 60 feet broad, and was fortunately detached from any of the surrounding property.

Northern Architectural Association.—The quarterly meeting of the Northern Architectural Association was held on Tuesday last, in the Old Castle, Newcastle. After the report was read, plans were exhibited of a wooden roof for the keep of the Castle, in which the Society of Antiquaries proposed to store their collection. It was explained that the society had originally intended to build a museum, but funds had not been forthcoming; and, while the idea had not been altogether abandoned, it was proposed in the meantime to deposit the antiquities in their possession in the keep. In the course of the investigations which had been made, it was discovered that there had formerly been a floor in the keep, and it was proposed to erect a gallery where it had been, and also restore a gallery which formerly existed either for the accommodation of musicians or spectators. It was also mentioned that the Corporation were in favour of covering the keep with a low-pitched roof; while the antiquarians were of opinion that it should be a high-pitched one, plans for both of which had been prepared.

Metropolitan Parishes.—On last Wednesday a deputation from the St. George's vestry, Hanover Square, waited upon the Right Hon. G. J. Goschen to express their views upon the union between the parishes of St. George's, Paddington, and Fulham, and to request the right hon. gentleman to assist them in obtaining the sanction of the Poor Law Board to discontinue the new parochial schools. Mr. Goschen said that before any order to stay proceedings could be issued, the consent of the two other parishes concerned must be obtained.

Disputes in the Building Trade.—A meeting of the master builders of Bradford was held on Tuesday to receive a report as to the result at the meeting of deputations of the master builders and the stone masons, in reference to the proposed alterations in the rules of the trade. It was reported that all the points, except two, which were of no importance, had been agreed to by the deputation of the operative masons, but the workmen, in an aggregate meeting, had refused to confirm the proceedings of the deputation, in so far as they relate to payment by the hour, and stone worked from quarries. The meeting of employers, therefore, came to the resolution that all the correspondence which had passed between the masters and the men should be published, and they would fall back upon their original notice, requiring the conditions as to the proposed alterations of mode of payment to come into operation on May 3, though they are at the same time willing to submit to the decision of an arbitrator. A lock-out on Monday is apprehended.

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Monday, May 3, at 8 P.M.—Annual General Meeting.

ROYAL ARCHAEOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.—The next Monthly Meeting of this Society will be held on May 7, at 4 P.M.

ARCHITECTURAL ASSOCIATION.—May 14, 7-30 P.M.—Special Business meeting. Mr. Birch's Paper 'On the Domestic Architecture of London from the 16th to the 18th centuries' will also be read, having been postponed to that date.

ARCHITECTURAL EXHIBITION.—Tuesday, May 4.—Opening Meeting and Soirée.

ASSOCIATED ARTS INSTITUTE.—Saturday, May 1, at 8-15 P.M., Montgomerie Banking, Esq., on 'The Renaissance Influence as Traced in the Elizabethan Dramatists.' May 15.—Discussion. Question: 'Was the Renaissance Movement Productive of any Real Benefit to Art?'

INSTITUTION OF SURVEYORS.—Monday, May 3, 8 P.M.—Mr. Menzies on 'The Distribution and Agricultural Use of Sewage.' Discussion on, resumed.

INSTITUTION OF CIVIL ENGINEERS.—Tuesday, May 4, at 8 P.M. 1. Discussion, 'On the Outfall of the River Humber.' 2. Time permitting, the following Paper will be read:—'Description of the Low Water Basin at Birkenhead,' by Mr. John Eliacott, Member of Institute C. E.

The Architect.

THE WORKS OF FINE ART COPYRIGHT ACT, 1869.

HUS runs the 'short title' of a bill, to the great importance of which we have already invited attention. This bill has been drafted in consultation with a committee appointed by the Society of Arts, and has been introduced into the House of Lords, where Lord Westbury has charge of it. On Friday last, as will be seen by our Parliamentary Report, this bill passed its second reading, Lord Westbury consenting—nay, in fact, himself suggesting—that it should be

referred to a Select Committee. 'Dealing with a subject full of difficulty,' said he, 'and which the Common Law does not touch, I do not pretend that this bill is perfect, and I am quite willing to have it referred to a Select Committee, that it may be thoroughly sifted and its language carefully weighed.' Even if scrutiny had not been challenged by these admissions of a man by nature less ready than most to own to any inferiority or imperfection, we should equally have felt it our duty to draw attention to the bill; but acting upon this broad hint that there are difficulties yet unsolved, we have examined its provisions carefully.

The fine art of Architecture appears to us to be the one point to which our attention ought to be directed, and it appears also to have been the one which the framers of this bill have felt it beyond their power to provide for. Nowhere are architecture, or the arts accessory to architecture, so much as named; and while we cannot but admit that the bill is a step in advance, so far as it relates to drawings, pictures, prints, sculpture, and even photographs, we are unable to see that it would provide satisfactorily for the case of executed architectural works—stained glass, mosaic, or for models showing unexecuted architectural designs. Perhaps the concluding words of Lord Westbury's speech may explain what has, in part at least, occasioned this deficiency. The noble lord said that 'he believed the bill, after consideration by a Select Committee, would succeed in gathering up the loose and uncertain enactments *already in existence*, and in combining them into one harmonious measure.' And it may well be that any measure not intended to go beyond the scope of existing legislation should fall short of a definite and express protection of architecture, for existing Acts are all equally deficient in that particular, so far as they are known to us.

The bill sets out by laying down the principle that 'The author of every original work of art' shall have for his life, and thirty years beyond, 'the copyright, or sole or exclusive right of copying, reproducing, and multiplying such work and the design thereof.' Nothing can be more reasonable; and to help our comprehension of this principle the bill defines the author as 'he who has designed or made any original work of fine art,' and a 'work of fine art' as 'every drawing, painting, photograph, work of sculpture, and engraving.'

These definitions receive amplitude from the context; but amplify as we may, there remains the fact that a *building*, however noble, is not included under the definition of a work of fine art, though the plans for it might be covered by the word drawing, and sculpture enriching it, paintings representing it, or photographs taken from it, would all receive recognition. Thus, as far as we can see, Westminster Abbey does not come within the definition of a work of fine art, while the smallest stereoscopic picture of a corner of it, or the worst of the many effigies within its walls, does. Here at the outset we have, as it seems to us, a defect which ought to be remedied by the introduction of the word Architecture.

Another blot, possibly, exists in the definition of an author as 'He who has designed or made any original work of fine art.' To the admission of him who has designed such a work we fully agree; and perhaps no better definition of what is meant by a design can be given than that embodied in this Bill—'An original conception represented by the author thereof in any work of art;' but is not the definition of the author open to doubt, so long as it places him who designs or makes on one level, supposing an executed work of architecture to be recognised by the legal mind as a work of art, for surely he who 'makes' the building is not the author, or even the joint author, in any sense? If, for example, the Albert Memorial manages to secure recognition as a work of art, will Mr. Kelk be recognised under this definition as one of the authors, and share the copyright with Mr. Scott? The thing is absurd, and requires to be set right.

We have indicated where the most important omission with respect to architecture exists. Buildings are not recognised as works of art. We are far, however, from feeling sure that practical difficulty may not arise to hinder their being so recognised. The feeling has been pretty generally entertained by architects, that any attempt to protect a building once erected and thrown open to the public is futile, and had better not be made; but if this were so, we should hold that works of sculpture erected in public, and open to general inspection,

ought to be regarded in the same light. If, on the other hand, the principle of copyright is of any value at all, it holds good of one work of art as fully as of another, and it is not justice to ignore a right because there is a difficulty in enforcing it. It is more difficult to preserve game than to protect poultry; yet the game laws are still in force. Why not then admit that a copyright exists in a work of architecture as such, as fully as in a statue?

This once conceded, there would remain other points to amend, or at least to provide for. Among these would be the question whether the copyright of any building remained in the architect's hands or those of the owner of the building, and the most useful enactment possible to architects would, of course, be one which preserved to them the sole right of copying in another building their own original architectural work. This would grant architects a protection that sometimes they sorely need, and would prevent their being employed to design one building, which, when erected, and the plans paid for, is repeated again and again by its owner, with no reference to the original author. It is true that the copyright is considered to go with the work of art in this Act; but we consider that it would be easily possible to show in evidence before the Committee on this Bill that the case of architecture is different from that of other works of art; for to copy a picture requires skill approaching that of the original painter; but to copy a building the handiwork of ordinary journeymen will suffice.

The Bill contains an excellent provision that after registration of a design the author may sell his studies made for the execution of it without prejudice to the copyright—that is to say, that they are absolutely his. Now, although there are few cases in which the architect of any work would desire to sell any portion of his sketches and studies—though, by the way, we can fancy that in many instances such studies would be readily saleable—architects have constantly differed from their employers as to their right to retain the working and other drawings used in the erection of buildings.

The regulations of the Royal Institute of British Architects as to professional practice and charges have done much to establish the architect's right to his plans; but nothing would be more easy or more serviceable than to add here a few words, including the plans of an architect in the same category as the sketches and studies of a painter.

In a further section of the bill (No. 9) occurs a provision which, not modified, might be attempted to be enforced against an architect injuriously. It is very properly made an infringement of copyright to repeat not only a design, but 'any part of a design,' and the original author of the design commits an offence by repeating part of a design after he has parted with his copyright in any work of art.

This could not with justice be left as applicable to architecture in such a way as would for instance exclude an architect from the use of any original feature in several different designs; say for example a series of moulded bricks designed by an architect and made use of by him in one building, the copyright of which passes in any way out of his hands. The same moulded bricks, even if so combined as to form features essentially different, would still be parts of the original design—much more would they be so if they were repeated in the same combination. And yet we conceive that, to prohibit an architect from using such features as these in one building, because they had been designed for another, would be almost as unwise, nay, as futile, as to prohibit a painter from introducing green colour, or representations of a dog or a double-barrelled gun, into one picture, because he has already used the same colour or painted the same objects in another. This point, however, ought to be guarded better than in the present wording of the Bill it is.

We have said enough, we hope, to prove that the attention of architects and the Architectural Societies ought to be directed to this Bill while before the Select Committee. There is now open an opportunity of securing adequate recognition of architectural copyright, which, once lost or overlooked, may not return in the lifetime of any of us, and we do trust it will not be allowed to slip, but that the claims and rights and position of the architect and of his valued auxiliaries, the glass-painter, the decorator, the mosaicist, the carver, &c., will be looked into. The present Bill is very broad, and its wording *probably* covers architectural drawings and decorative designs, but this ought not to be left a matter of doubt. The exact nature of the rights of copyright which it is just to reserve to each of these classes of artists ought to be defined, and the language of the Bill ought to be rigidly scanned to make it certain that that protection is secured, either under the existing clauses or by introducing necessary modifications.

The very enquiry into some of the rights of these artists will show that there are no inconsiderable difficulties in identifying them. For instance, where one artist gives the general design of a stained glass window, while a second makes the full-sized cartoon, and a third the window itself: who is 'the author?' or, are there three authors or two?—and have they joint rights? There is no doubt a right and a wrong in these matters, and the right answer to these enquiries can be arrived at, but it is not obvious and on the surface. One thing we are especially anxious should be noticed. There can be no doubt that gross injustice is often done to architects who submit designs in competition, and that the ideas of those who ultimately commission the erected building are in some instances culled from the drawings sent in and not recognised, but returned 'with the thanks of the Committee.' This ought not to be, and we shall have little satisfaction in the passing of the proposed Copyright Act if we are not assured that the

case of Competitions has been most carefully considered and found to be thoroughly provided for.

It may be satisfactory to know that the matter is under the consideration of the Council of the Institute of British Architects, but that body, especially at a moment when the election of new members has very much changed its constitution, can hardly be expected to do much unless supported and to some extent impelled by the action of the general body of architects.

To them we commend this matter, which is one that concerns them vitally; and we commend it not to them only, but to all our readers, for there is no person connected directly or remotely with arts or buildings who is not interested in an equitable, comprehensive, and final settlement of the question of copyright in works of fine art.

ARCHITECTURE AT THE ROYAL ACADEMY.

BY EDWARD W. GODWIN, F.S.A.

IF anything be wanting to complete the sketch of the gradual disunion of architecture and painting, which appeared in the last issue of this paper, it may be found in what is called the Lecture-room of the new Royal Academy. I gave last week the interesting and encouraging fact that, out of forty-four elections to the rank of Associateship, three only were architects; and it may be added, that the period—1841-61—during which these elections were made, was one signally successful in an architectural point of view. All Saints Church, Margaret Street; the selected designs in the Constantinople Memorial Church and the Lille Cathedral competitions; Brisbane Cathedral, by the same architect; the Oxford Museum; the Kildare Street Club; the Crown Assurance Office; the Assize Courts, Manchester; and some other public buildings which it is unnecessary to mention, have hitherto been unrecognised by an Academy that professes to promote 'the honour and interest' of architecture. This week we have an almost equally interesting and encouraging fact to note. There are 1320 works exhibited, and only forty-six of them represent modern architecture. The amount of wall-space given to architects is about equal to one wall and a half of the lecture-room, the whole of which we might have reasonably expected would have been reserved for and occupied by architectural subjects. Not satisfied, however, with driving us within these poor limits, our drawings in one corner are piled up just as of old, and the principle adopted in all the other rooms—to hang everything in good places—is here set at nought. If our sketches of what we are doing or proposing to do in our art were worth exhibiting at all, they were surely worth exhibiting so that they could be seen. That they are altogether out of place here is not now the question. Whether they are or are not, no one will be hardy enough to deny that it would be better for architects and their art to be a little more united in their annual exhibitions. This can only be done by securing the whole of one room at the Academy, and giving up the Conduit Street room, or by leaving the Academy altogether and making one, and only one, Architectural Exhibition at Conduit Street. What we want is a distinct utterance, and no mumbling. So long as the Academy professes to nurture architecture, so long we ask for something more than the paltry admission to its walls which once a year it does out. I doubt whether, in the history of the Academy, the annual Exhibition of Architectural Works has ever been so thoroughly unrepresentative. When I add that the best places and the largest spaces are absorbed by the contributions of Mr. G. G. Scott, R.A., his son, Mr. J. O. Scott, and Sir M. D. Wyatt, one may naturally wish to know what architecture has done that she should be treated so badly. Mr. G. G. Scott, R.A., sends two large frames, Mr. J. O. Scott contributes no less than five large perspectives of his unsuccessful design for Manchester Town Hall, and Sir M. D. Wyatt, not to be outdone in numbers, also sends five drawings of no inconsiderable area. If all this means that the fight for the Associateship is to be between Sir M. D. Wyatt and Mr. J. O. Scott, we can all of us well understand why they should both muster in such strong force. Although even here some of us would have thought that the buildings—the architecture itself, and not fancy designs on paper—would have been the test, not only of membership, but also of admission to the Exhibition walls in such large numbers. It is possible—scarcely probable—that the Academy has done its best, and had but few and poor works from which to make their selection. This, however, is one of those possibilities which are never suggested by anything but the spirit of amiability. Seriously speaking, I have not a doubt that the Academy cares as little about the hanging of architecture as it does about teaching it. Fair drawings of *executed works* by some of the best architects of the day have been rejected or made 'doubtful' for want of room. In the presence of a dozen frames containing water-colour sketches of old buildings, some of them buildings most of us must be tired of seeing, the excuse to the rejected of 'want of room' must sound idle and vexatious. It is not to be supposed, that because the Academy had got a new home and larger galleries, every architect of any art-position would contribute a specimen of his work. Those who have so contributed may think, and justly perhaps, that their fellow-workers ought to have put in an appearance. We naturally ask for Mr. E. M. Barry, A. We

have but two Academicians and two Associates to represent us, and if two out of the four fail to exhibit, it is hard to say what may become of us. It is not unlikely that architectural students may ask for others outside the charmed circle. Have they declined to send, or have they been rejected? Where are Messrs. Christian, Clarke, Burges, Pearson, Chamberlain, Clutton, Cockerell, Hadfield, Lynn, Jones, Pugin, Slater, White, and Withers? We are used to them, and expected them; we even thought it possible that, under the altered circumstances, Mr. Butterfield, Messrs. Shaw and Nesfield, and Mr. Bodley, might have made themselves visible. It is surely not possible that drawings of the actual works of any of these men can have been rejected for the sake of showing us *five* gaudy drawings of one by no means good design, or to make room for such uninteresting material as that shown in Nos. 984 and 1,017, or such defective architecture as that exhibited by Mr. P. C. Hardwick in No. 983, by Mr. G. F. Jones in 1,002, by Mr. Low in 1,007, and by Mr. Law in 1,015! Now that Mr. Sandys' 'Medea,' which was rejected last year, has at last found a place upon the walls, men have not much difficulty in estimating the art value of an Academy rejection. But this increase of knowledge, although comforting to the rejected, is of such a particularly special character, that it is not calculated to do the art of architecture much service or honour in the eyes of the public. Indeed, so blind are the of *ωολοι* in matters architectural, that even their great leader, the *Times* critic, has forgotten that there is such a thing as architecture, and has quietly wrapped it up in the words 'Engravings and Etchings.' It is true there is some excuse for this, inasmuch as in the catalogue the room in which architecture is placed is thus apportioned:—1. Paintings. 2. Engravings. 3. Miniatures, and—4. Engravings, Etchings, &c. The architectural works are in the second division, and people are thus taught the new creed of the Academy, that architecture is a kind of engraving. So far, then, as the Academy is concerned, it must be tolerably clear that Architecture has received nothing to excite her to thankfulness, and that the change to Burlington House has not proved in any way encouraging to our profession. It is just possible we may manage to survive this. Meanwhile, we have to be thankful to Mr. Street, A., and Mr. Waterhouse, for their drawings, which keep architecture above water. Taking the most favourable, the ultra-liberal view, there are not more than fifteen frames which ought to have been hung in any exhibition professing to be representative of what architects have been doing during the past year. I propose to take these fifteen (not including Burlington House) in the order in which they are placed in the catalogue.

967. 'New Villa at Boscombe, near Bournemouth, now in course of erection.'

Mr. R. W. Edis shows in this little work a decided advance. Good brick walls and tile roofs, well put together, with some artistic feeling in the composition of the roof masses. There is a little ungainliness in the disproportion between the heights of the windows, and the porch is not altogether the sort of thing for the house. A half-timbered porch would have been more in harmony.

975. 'Gonville and Caius College, Cambridge. New buildings now in course of construction.'

There is more uniform strength in this design than in anything I have yet seen from Mr. Waterhouse. At Oxford, and in his Town Hall for Manchester, we see evidence of a disposition to be pretty, to fritter away his masses, and so lose both rhythm and repose. This view of his work at Cambridge shows better qualities than all his other works put together. The style is founded on that of the late fifteenth century—rather French than otherwise. It is a pity that his large plain window and angle turrets in the top storey of the tower should have been rendered heavier by the addition of an accidental shadow in the drawing.

Mr. Waterhouse exhibits two drawings of his Town Hall, Manchester. They have been seen, criticised, and described so often, that it is quite unnecessary for me to do more than mention them.

977. 'New building in course of erection for the University of Glasgow.'

982. 'New parish church, S. Mary Abbot, Kensington (about to be erected).'

Both these works have attached to them the name of Mr. G. G. Scott, R.A. The drawings are showy (there are *red* shadows to the yellow dressings); but the architecture is so far below what we used to get from Mr. Scott, that one is apt to think that the kindness and amiability of the man have overgrown the vigour of the architect, and that Mr. Scott, out of gentle consideration for and desire to advance the young ones around him, has left them a free field with his name to help them. The extraordinary likeness between Mr. Scott's later works and Mr. J. O. Scott's design for a Town Hall is more than a family likeness between father and son. The same weaknesses and youthful inconsiderateness which are visible in the Town Hall, even down to the style of drawing, have been more or less visible in all that Mr. Scott has done since he lost the battle of the styles at the Foreign Office. It is no one's business to object to this style of retirement, but many of us yet long—

For the touch of a vanish'd hand, &c.

988 and 989 are two pen-and-ink drawings of new churches in course of erection. I should not select the steeple and western transept of St. Peter's,

Bournemouth, as an example of Mr. Street at his best. The church for the Lord Sudeley, in Toddington Park, is a much more successful work. The drawing is marred by bad perspective in the arches of the belfry windows, which seem to fall outwards at the crown. In the design there are only two very small features which one would like to see altered, and in the hope that they will be reconsidered I abstain from mentioning them.

993. 'View of a Design for proposed new Examination Schools at Oxford.' For a public building this is one of the best designs Mr. Street has ever exhibited. With the one exception of the hipped roof, there is little to which objection can be taken. The work is well-balanced, broad in treatment, and bold in conception. I heard a critic talk of the buttresses being stuck on, and there is some truth in it, looking merely at the drawing, which is in pencil, with a good deal of that brilliant sketching which Mr. Street delights in, and very little *constructive* detail shown.

Nos. 965, 980, and 1012, show coloured decoration—the first for stained glass, the second for a ceiling, and the third for walls.

The drawing, No. 1016, 'Blythwood,' by Mr. T. Roger Smith, has its merits and demerits so balanced that it is difficult to say much about it. If Mr. Smith thinks barge boards, stepped gables, and plain gables coped with wrought stone tabling, are mere fancies of the middle ages, and not the results of local conditions, then he acts up to his thought; but if, as I believe, these three features are all local peculiarities—the result of obedience to nature, our only governor—Mr. Smith has something to unlearn.

No. 1018 is 'The Interior of New College, Dulwich,' by Mr. C. Barry. Why the eccentric curves to the roof, and why so gaudily coloured?

Mr. Seddon exhibits an enormous drawing of his great building at Aberystwith. The size of the drawing and the bad colouring have, I suppose, been the cause of the frame being skyed. Had Mr. Seddon sent a careful pen-and-ink or monotone drawing by his own hand, an eighth or a sixteenth the size, it would have been in every way better. The *design* has been already before the public in various shapes, and has had its fair share of criticism.

LORD ELCHO'S COMMITTEE.

WHILE the Government is maturing its plan with reference to the Law Courts upon that part of Embankment land adjoining the Temple, and so satisfying one set of admirers of the banks of our ancient river, Lord Elcho's Committee is carefully pursuing its enquiries as to other portions of the Embankment, and developing plans for laying out the various sites thereon, which will rejoice those of our readers who take special interest in this subject. And those who may not enter into details will yet be glad to know that there is such an earnest spirit at work to do what is right, that we have every reason to believe this question, like the Embankment itself, will be reclaimed from the state of mud, muddle, and chaos which seemed at one time to be its inevitable fate.

Indeed this Committee, instead of referring solely to the Hungerford Bridge and Lancaster Place 'Viaduct,' expanded the scope of its enquiry to a degree commensurate with the more extended view of its duties taken by the members of the Committee.

As for the roadway, or viaduct, as it was erroneously called—for only a small portion of it was ever intended to be carried upon arches, and this merely to avoid disturbing the Savoy burial-ground—it was easily seen from the first that such a crude project, having all the appearance of a hurried compromise merely to facilitate the progress of the Bill at the time of its birth, was foredoomed by the very appointment of a committee to consider it.

But the question as to what is to be substituted is found to be a wider one than was probably anticipated, and the idea of planting a large public Museum and Gardens upon the site—though not a new conception—when once taken up, necessarily called for investigation and some definite plan of arrangement, if only to ascertain if the idea were feasible and worthy of recommendation, or if there were insuperable obstacles to its adoption.

It has long been evident to us that such a plot of land as that reclaimed from the river between Hungerford and Waterloo was worthy of some grand public building, but that even if it could be covered by such, it would be unadvisable at least to do so without the reservation of some portion for gardens or recreation grounds; while, on the other hand, to appropriate the whole of it to this latter purpose would but waste a valuable site, and necessitate the reconstruction of the back neighbourhood, or the ends of the streets now occupying the various levels of the frontage towards the river in an irregular line, leaving still the overpowering mass of the Charing Cross boiler-shed to be masked by foliage alone, for which fifty years' growth would not suffice. It is satisfactory therefore to think that a plan is being proposed for the establishment of the Natural History Museums on this site instead of at South Kensington, and laying out gardens and vacant spaces around the building, which is proposed to be raised upon a terrace nearly as high as that of Somerset House and the Adelphi. No doubt Mr. Waterhouse will be well able to provide proper access to the Strand, and communications with the various levels right and left.

The evidence of Mr. Fowler and Mr. C. H. Gregory (the President of the Institute of Engineers) as to vibration from railway trains has been highly important, considering the proximity of the new line to the

proposed building works, and no better evidence could be obtained. The mere calling for it was a sign that the Committee is alive to the difficulties attending construction under such circumstances. The opinions expressed, only serve to confirm our own views as to the non-injurious character of mere tremor induced by the passing of trains or any other traffic upon the walls of a building, but the enquiry failed to go far enough into the question to satisfy our minds that there was no danger to the mass of the surrounding soil for a much wider area than that to be covered by the buildings referred to.

The Committee could hardly escape enquiry as to the streets in communication with the Embankment at Whitehall, and from Charing Cross along the walls of Northumberland House; and this naturally led to Mr. Pennethorne's evidence, and the production of his plans for Government offices at Whitehall on the site of the projected palace, incorporating only that part of it which was erected by Inigo Jones—the Banqueting-room, now the Royal Chapel. To this we shall refer, perhaps, in detail, when it may be more decorous to do so. At present, we only express our satisfaction that such a suggestion has been definitely made by such an architect, and in such a manner as to combine the oft-cherished idea—now so lately revived—of working out this acknowledged grand design in a worthy manner *and on the right spot*, if anywhere.

At the time when it was originally proposed to separate the Natural History collection from the British Museum, the evidence of scientific men seemed to show some diversity of opinion as to site; but now we have the same great names reappearing—Owen, Murchison, and Huxley—in favour of the removal to the Embankment, and of establishing there such a collection as will answer both for popular and special scientific instruction.

The slight degree in which Professors Owen and Huxley differ with respect to the size and arrangement of the collections of Natural History and the Library to be attached thereto, in no way affects their united testimony to the advantages of the position for one or both of the objects of a museum; while Sir Roderick Murchison, speaking as a trustee of the British Museum, and in the name of many distinguished members of that body, thinks this site as good as, if not better for popular purposes than, Great Russell Street itself.

That South Kensington, too, will offer no opposition is evident from the assistance Mr. Cole affords by his well-digested information—as might, indeed, be expected from such a public-spirited director of one of our most flourishing Government establishments. At the same time all must see the difficulties to be dealt with in the possession of the site at South Kensington intended for this very Museum—though there need be no fear of loss on this account, even if it should be determined to resell the ground—considering the wonderful improvement of the locality in late years. Having gone thus far, we may assume that, with these disinterested views distinctly kept before it, Lord Elcho's Committee—by a judicious concert with the Metropolitan District Railway—may at last save the Embankment from the perils which threaten it, and make it a glory and honour to our age.

We must not forget, however, that the plans and ideas broached in our pages from time to time, even if unacknowledged, must have shown that the site was capable of artistic treatment in a variety of ways; and it is only natural for us to refer to what has been published in *THE ARCHITECT*, when we see with pleasure that the same ideas prevail in influential quarters. It is to be hoped that with reference to the Waterloo and Hungerford section of the Embankment, the importance of the existing features of the Bridge, with the Savoy on one side and the terrace of Somerset House on the other, may not be overlooked. These are, so to speak, natural lines in the general aspect of the whole sweep of the Embankment, which it would be fatal to leave out of calculation. What is wanted has been already suggested by Mr. C. F. Hayward,* viz., a block of buildings occupying the Savoy Hill (and standing on the very walls of the old palace itself), continuing the architecture and the terrace of Somerset House westwards, and returning northwards to the Savoy Chapel, thus overhanging the Gardens at the west end of the proposed new Museum building which have already been projected and christened Savoy Gardens in Mr. C. F. Hayward's plan. The River façade might repeat the features of Somerset House, and also the form of Mr. Pennethorne's new wing opposite Lancaster Place, so that the roadway to Waterloo Bridge would be flanked on the west by a pile of buildings, set back as on the east, and together forming a sort of square court, which, if connected also with the Strand by quadrant arcades or colonnades, would form an unrivalled access to our most splendid bridge, and to the terraces and the Embankment right and left.

This new building—or, let us say, continuation of old Somerset House—might bear the old name of Savoy, and become the Central Telegraph Station in connection with a West-end Chief Post Office, which will certainly be wanted before long. All this appears capable of being done without encroaching upon the two burial grounds, which have been a difficulty all along; but for the full statement as to these, and opinions thereon as expressed by Sir Chas. Trevelyan and others, we must refer to the Society of Arts' Transactions of last week. However, we repeat, some such artistic treatment of this part of the locality is absolutely necessary, and the more carefully the rest of the space is laid out, the more this small remaining portion will call for attention.

With this (and omitting Blackfriars and 'Alsatia' for the present as

* See *THE ARCHITECT* for March 18, p. 143.

unfinished), we think we may consider the Embankment scheme complete; and with these definite plans before us for the whole line, east, midway, and west, the occupation of the river-frontage from the Temple to Westminster will be satisfactory. The Law Courts under the able hands of Mr. Street, the Museums and the buildings at Whitehall under the care of Mr. Pennethorne and Mr. Waterhouse, are likely to form ornaments to our metropolis, and produce a series of architectural works which, taken in connection with the adjoining structures, will be unsurpassed by the dreams, even in their most enthusiastic moments, of the advocates of the Embankment site.

To the diversity of design we do not object. The separation between each work is complete, and variety will not be otherwise than pleasing in the long line of frontage; and if only the spirit of unity prevail long enough at the Office of Works to harmonise the several conflicting opinions, there is no reason why Mr. Pennethorne's genius should not have full scope in working out the design of Inigo Jones, at the same time that other architects are at work with more modern materials.

Those who have worked out these problems for themselves as a labour of love—receiving no public acknowledgment of their contributions to the solution of them—may console themselves when they see their hearts' desire accomplished, and take pride to themselves for having mentally seen beforehand what it required the bodily eyes of others to comprehend; or at least to feel such satisfaction as those pioneers in science whose names are lost in the splendour of ultimate results, and whose early work is forgotten in its latest development.

THE ARCHITECTURAL EXHIBITION.

IN commencing our notice of this the 19th Annual Exhibition of Architectural Drawings, we may fairly congratulate the Council on the general average collection of drawings exhibited by them, notwithstanding the greater attractions of the Royal Academy, which it was presumed would this year inaugurate the opening of the new rooms by doing justice to Architecture, and giving it that space and accommodation on its walls to which the increased importance and position of the Art fairly entitle it. This, we regret to say, is not the case; if possible, architects are worse treated than before, and the Academicians seem determined as far as possible to keep architecture from their rooms. The exhibition in Conduit Street is in every way up to the mark. Mr. Petit's drawings alone, which together with the sketches and decorations we reserve for a separate notice, are well worth a visit; and in addition there is a fair collection of meritorious sketches of old buildings, and a good series of architectural designs. So much may be said in general praise; but this must be tempered with a certain amount of blame, inasmuch as we still notice many drawings which should have been excluded, and we should have liked to have seen the photographs all hung together, and a stricter adherence to the rule as to frames, margins, &c. We must again protest against the number of meretriciously-coloured picture drawings, and regret that there are not more honest sketches or drawings by the architects themselves; we know architects do make sketches, and why we should be treated on these walls to a number of drawings in which the useless landscape and surroundings are made to overwhelm the architecture, as in too many cases they do, is best known to the profession itself. We recommend the Hanging Committee to rectify this another year. Of 300 and odd general drawings, certainly a fourth might have been excluded.

Numerically first, amongst the general drawings to be noticed is Mr. Seddon's drawing of Almshouses at Fulham (23), which has much careful study in it, and the arrangement of the lower storey and chimneys is well managed. The arrangement of the rear of the plan strikes us as being crowded and close. The oriel window in a gable, with its attenuated support, suggests the idea of an exaggerated lamp; the dormers are too close, and would not look well in perspective, nor do we understand the use of crowding arch above arch to support some three feet of masonry in the gable tops. In Mr. Seddon's drawings (55 and 56) of St. Nicholas Church, Yarmouth, now in course of restoration, there is much fair and honest study of the old work, although we must dispute the taking out the perpendicular windows in the north aisle to put in those of a century earlier. The tracery to the large window in south transept is poor and weak to a degree. We would only suggest to Mr. Seddon that the drawing of the masonry is hardly to his credit, and that, however pretty it may look on paper, the colour of flint work is not rose-grey.

What can we say of Mr. Ralph Nevill's drawing (26) of Mr. G. G. Scott's New Almshouses at Blackfriars? We forbear to criticise the building itself, as we cannot believe that it is fairly represented by the drawing in any way, and we hesitate to say too much about the drawing itself, as it is evidently that of quite a junior in the office; but we cannot too strongly protest against the vulgar and meretricious colouring, in which body colour seems to be the principal medium.

Mr. E. B. Lamb sends one of his usual designs (29) for a new Memorial Church at Smithfield, very like many of his other churches, but better. The thinness of the buttresses, and everlasting frittering away of broad spaces, cannot be too strongly condemned, and what use or object can there be in the spun-out miniature buttress rising up in the centre of the transept gable? We cannot praise the drawing, but the tinting is clever and artistic.

Mr. Hartshorne sends a good careful drawing (27) of a Church at Walsall, much damaged by the vulgar figures and crude colouring of the surroundings; the wooden porch is bad and inappropriate.

Mr. Brangwyn sends a charming little drawing (31) of the new 'Maison Communale' at Crnybeke, in the design of which the author has seized the spirit of the best type of Flemish work, and done full justice to his design. The dormers are picturesque and well proportioned, and the whole composition well and carefully studied. Mr. Brangwyn must forgive us if we

are somewhat hypercritical, and complain of the apparent weakness of the oriel support, and of the side pier of entrance doorway, the former rendered more weak by the coarse detail of the mouldings, and the latter evidently dependent upon some hidden tie to keep it from giving out; nor do we quite like the difference of the slopes of the chimneys and roof. These are matters which doubtless so good an artist as Mr. Brangwyn will have seen and rectified; as a drawing we cannot say too much in its praise—one of the best in the exhibition.

(25.) A pleasant drawing of some Village Schools near Godalming, by Mr. Howell, which would have been all the better without the laboured attempt to be picturesque and quaint in the bell gable and chimney. The design is otherwise good, but Mr. Howell should have given the name of the artist who coloured it.

Messrs. Walford and Evill send a drawing of a House at Pinner (34), the first idea of which is that it was made to show the patent roof tiles; and indeed an etching of this design, if we mistake not, has been put into the trade catalogue of the tile manufacturers. The design has many good qualities and much careful study. The upright brick arches could hardly carry themselves, but the whole is picturesque in its lines, though somewhat coarse in detail.

Mr. Nisbet would have been wise not to have sent his drawing of a Porch (86), and the Hanging Committee to have rejected it; it is as constructionally bad as his drawing for a Hunting-Lodge (40) is in design: instead of a Hunting-Lodge we have a pretentious cemetery chapel, and lodge combined.

(37 and 41.) Two clever and careful drawings of a House at Harpenden, by Mr. Crawley, which owe a good deal of their effectiveness to the architectural colourist, whose name ought to be given, though it looks very much like Mr. Nattress's bright tinting. What use is there in the elaborate arches to the tops of the gables, or in the wreathed and spiked cannon-balls in the garden front? The design has many of the bad features of the style with some few of the good. The conservatory, were it not for the weakness of the angle pier, would be good, and the stables look picturesque; we might remind the artist that stained glass does not usually show its colour from the outside. We give Mr. F. R. Kempton all praise for his fresh, bright, and careful isometrical View of the City and County Lunatic Asylum at Hereford (42), the drawing charmingly tinted in three tones of brown and grey. The design is unpretentious, but full of bits of thought; the chimneys and the ventilators are brought in well; we could say something against some of the composition of the windows, but we must not be hypercritical in what is generally so good.

(46.) Not one of Mr. Coles' best, and we can say but little of the building, as it has been elsewhere criticised, and the central tower is evidently not drawn from nature.

We are very disappointed with Mr. Charles H. Mileham's New Church, at Bettws-y-coed, North Wales (47 and 48), for we expected better things of him; the church has three or four styles in it; we presume the arrangement of the east end, without any window, is with a view to having painted decorations on the east wall with the light thrown from the north, but all this might have been done without so much muddle of styles. The bell gable is strong and bold, and a great relief after the pimpling little absurdities we have been accustomed to see. The drawings are good in feeling, but evidently hurried.

In 50 we have Messrs. Godwin & Crisp's premiated design for the Bristol Assize Court, perhaps, without exception, the best drawing in the exhibition, and one which we recommend all art students to study carefully. The history of this competition is tolerably well known—how Messrs. Godwin and Crisp were awarded all three premiums in the first competition, and were then ousted by the caprice of a committee who, for sundry reasons, wished for a second competition, and how, in this second competition, Mr. Street awarded the second place to the drawing in question. Those who may compare this design with the successful one will not think that Messrs. Godwin & Crisp's design suffers in the comparison—bold, vigorous, and dignified, and essentially carefully studied in all its parts. We might, perhaps, find fault with the apparent weakness of the angle piers of the first floor, and with the somewhat small balcony over the central door; the boldness with which the tower—the top part of which is suggestive of Compiègne—is designed, crossing the roof without any preparation below might, perhaps, be criticised, but we happen to have seen Messrs. Godwin & Crisp's Town Hall at Northampton, where the tower is similarly treated, and where the effect in perspective is exceedingly bold and good. We cannot accord too much praise to Messrs. Godwin & Crisp both for the design and the careful and honestly-tinted drawing which expresses it.

'Glenbegh Towers,' Killarney (52), by the same gentlemen, was also exhibited, if we remember rightly, in last year's Academy; a simple and effective design, in every way worthy of the authors' reputation.

In 51 we have a joint design by four architects, Messrs. Foster, Wood, Ponton, and Gough, for the new Institution and Library at Bristol, which we are bound to say is one of the worst drawings in the exhibition: bad in style, bad in drawing, bad in colouring—suggesting bad dreams of Mr. Godwin's Town Hall at Northampton, the Ducal Palace at Venice, and the animals at Leon Cathedral; the weakness of the angle piers, the vulgarity of the sculpture, and the poorness of the detail, lead us to regret that four tolerably-known architects should have acted so unwisely as to exhibit such a design. The artist must have suffered in the design, for when he leaves it for the old work in the right-hand corner, he is himself again. Mr. Ladds sends two unpretending and prettily put together designs (53 and 54); we especially like the 'Roadside Inn' (54), but should have liked to have seen the signboard, which is always a picturesque feature. This drawing is good and crisp, while the other is somewhat coarse. Mr. Watson, in his 'Design for a Small Pox Hospital at Homerton' (57), has not shown improvement, and we cannot congratulate him either on the general design or grouping of his buildings, but must commend the drawing as a cleverly tinted sketch, evidently done by himself. His 'Design for the Fever Hospital' (177), is better, but not what we should have expected from Mr. Watson. Mr. W. Smith sends one of the most careful pen-and-ink drawings in the room (58), wanting perhaps in freedom of touch, but showing much care.

In 59 we have the usual annual lithograph by Mr. J. Drayton Wyatt of a very ordinary church by Mr. Scott, R.A.

(61.) Shows a very clever drawing of a good design for the new church of St. Barnabas at Oxford, by Mr. A. W. Blomfield; the plan is in the form of a Basilica with short circular apse, and narrow side aisles, and is in every way well and carefully considered; the decoration is simple and good; the ritual arrangement of bringing the choir into the body of the church is wise, uniting the clergy and the laity as they should be. The general design of the tall clerestory windows is good, but paintings would be wanted in the intermediate blank spaces. We cannot like the roof or its decoration, and we like, least of all, the Baldachino over the altar. But as a clever sketch by the artist himself, too much praise cannot be given to the drawing.

(To be continued in our next.)

THE FIRST CLUBHOUSE AT BIRMINGHAM.

ON the 3rd inst. there was opened at Birmingham the first building erected in that town solely for the purposes of a clubhouse. The edifice is at the top of Newhall Street, in the centre of and in the highest part of the town; it is within a few yards of the Bank of England and all the other banking-houses. The style of architecture is Italian, with much elaborate detail and carving in every part that would properly admit of it. The fronts are to two streets, are two storeys in height, and of stone from the Pillough quarries, Derbyshire, with a massive balustrade protecting the basement area. The ground-floor is rusticated, and has square-headed windows with boldly-carved keystones, and recessed pilasters in the reveals. The entrance, which is in Colemore Row, opposite to Bennett's Hill, has four massive columns, with rich Corinthian capitals. The first-floor windows have balconies in front; the windows are circular-headed, with pilasters, consoles, cornices, and pediments, with carved keystones to the arches, spandrels, and other parts. These are of varied design, the triple windows being still further enriched to make them as salient points in the elevation. Above them is an elaborately carved frieze of foliage, with shields, charged with armorial bearings, including that of Mr. Colemore, of Cheltenham, who is the ground landlord. The cornice surmounts the frieze, and the whole structure is finished with a balustrade and pedestals bearing vases. On the ground-floor there is a spacious entrance-hall, leading to a corridor, out of which open a dining-room, 41 feet by 24 feet; the morning-room, 60 feet by 94 feet; luncheon-room, &c. The two first-named rooms have richly-pannelled ceilings, and details in character with the principal part of the work. The great staircase is of noble dimensions. It is divided into three compartments by stone columns, and lighted by triplet windows of large size. The first floor, which has a corridor extending the whole length of the building, leads to a drawing-room, library, billiard-room, &c. All the usual and necessary requisites are provided. The cost of it is about 16,000*l*. The architect is Mr. Yeoville Thomason, of Birmingham, whose designs were selected in competition.

ARCHITECTS AND ACOUSTICS.

WE see with much regret that among the eminent men who have been requested to act as a committee to investigate the acoustic properties of the Lecture Theatre at South Kensington, no architect's name is included. We speak with unfeigned respect of the gentlemen in question. No name, for instance, can be more properly associated with such an inquiry than that of Sir Charles Wheatstone. Nothing can be more proper than that Lieut.-Col. Scott should take his seat at the committee table. But we apprehend that no one would more freely admit, than would that distinguished officer himself, that the large demands made on the time of a military engineer, in order to acquire the mastery of his own profession, allow little opportunity for the formation of a familiar acquaintance with those numerous details which necessarily force themselves on the minds of those professional architects who, devoting their attention exclusively to civil architecture, are in the habit of dealing with public buildings. We object to no one—we undervalue the ability of no one. But the fact remains that an interesting and important inquiry into a subject entirely within the province of the architect, and fully treated of by architects, has been referred by the council to a commission on which no professional architect is asked to sit. It is disrespectful to the profession—of course unintentionally so—but no less is it a distinct slight. It is unjust to the object of the Commission, as much of the information which would thus have been naturally within the cognisance of very many men whose names will occur to the minds of our readers, will, beyond question, be less familiar to an entirely non-professional committee.

We very sincerely trust that it is not too late to amend this blunder. It is of much more importance to the Council of Education than it is to the Profession of Architects that this should be done. Acoustics will not cease to be a prime architectural question, however non-professional men may dabble, or men of physical science may experiment. But desiring, as we all should do, to see the hands of the friends of education strengthened in this country, we view with great regret any such serious miscalculation in any branch or department of the subject as must tend to shake the confidence of all thoroughly erudite men. We hail assistance in our studies from all sources. We welcome the physicist, the musician, the man of order, the engineer, the practical artisan. But we trust to be spared the discomfiture of seeing architectural questions treated of, settled, or even bungled, because they are dealt with behind the back of that profession to which they are naturally familiar and germane.

The Memorial to the Rev. J. Rashdall, late vicar of Dawlish, will take the form of a tomb of white marble, with granite base and pedestals, and will be surrounded with iron railings. The work has been entrusted to Mr. J. Blockler, statuary, of Dawlish.

INTERNATIONAL ART EXHIBITION AT MUNICH.

A General Exhibition of Works of Art of all Nations is to be held at Munich this year, opening in July, and closing at the end of October, and it is expected to be the most important art exhibition of the year. The direction of the exhibition is in the hands of the Royal Academy of the *Beaux-Arts*, and the Society of the Artists of Munich, under the immediate patronage of the King. The Commission or Managing Committee consists entirely of artists, headed by the Professors Ed. Schleich and A. de Ramberg.

The exhibition is to be held in a large building called the Palais de Cristal, and is to include works in painting, sculpture, architecture, engraving, and lithography, but not photographs or any copies or other productions by mechanical means. No works are, however, to be received (according to the programme), except from artists who shall be specially invited to exhibit, and yet the Commission assumes to itself the right of rejecting any work, and of making all arrangements, and announces that it will not listen to any complaint or protest on the subject.

The Commission will defray the expense of transport both ways by ordinary trains and routes, and the other conditions of the programme are like those of exhibitions of the same kind. Medals and other prizes will be awarded, and there will be a lottery organised for the purchase and distribution of works of art which are for sale.

Works for exhibition are to be received until June 15; but an exception is made in favour of those which may appear in the Paris Salon, the date in their case being extended to the middle of July.

M. Schwab, Bavarian Consul of Paris, is appointed Special Commissioner for the Foreign Section, and all applications for information from artists of other countries must be made to that gentleman.

THE BEAUVAIS EXHIBITION.

THE exhibition building, Beauvais, in the Department of Oise, to the north of Paris, will be opened, June 1, for the display of arts and manufacture, and especially for agricultural, horticultural, and archaeological exhibits.

M. C. Leveque—who designed the model of the cathedral which, filled with ecclesiastical furnishings, ornamented the garden of the Universal Exhibition of 1867—is the promoter of this scheme; the architect is M. Delabarre, of Paris. The Beauvais Exhibition promises to be a successful undertaking, and will be of popular interest, the wing devoted to works of art being already filled by 'loans' from all parts of France.

ARCHITECTURAL EXHIBITION SOCIETY'S SOIRÉE.

THE opening conversation took place on Tuesday evening last, at the Society's Rooms, 9, Conduit Street, and was numerously attended. It was undoubtedly one of the most successful meetings that the Society has had for some time past; and we congratulate the members also upon having dismissed from their programme the usual hour's speechifying. The selection of music was well given by the band under the direction of Mr. W. Hardy. The drawings seem to us superior to those of some previous years, and the large collection of sketches by the late Rev. J. L. Petit cannot fail to be interesting to all architects and amateurs, and will, we should imagine, aid much in bringing visitors to the Exhibition, now open to the public. Amongst those present we noticed Lady Belcher; Lord Henniker; the President of the Society, Jas. Ferguson, Esq.; Professor Delamotte, Professor Kerr; the Rev. Mr. Mitchell, Major Gen. Balfour, Mr. Hyde Clarke, Messrs. E. B. Lamb, J. P. Seddon, T. Roger Smith, W. Burges, C. L. Eastlake, the City Architect, C. Mayhew, Robert W. Edis, Wyatt Papworth, Paley, and many others of the profession. We give, elsewhere, a notice of some of the principal drawings.

SALISBURY CATHEDRAL RESTORATION.

THE REPORT from the Dean and Chapter (of which the following is an abstract) was laid before the Cathedral Restoration Committee at their last meeting:—

The Restoration of the *Exterior* of the Cathedral, commenced by the Dean and Chapter in 1863, and continued since 1864 by the aid of a public subscription, is at length on the eve of completion.

1. The first operation was to consolidate the Foundations with fresh concrete. The stonework was then repaired or renewed; a channel, coated with Portland cement, was carried round the building; and the whole was effectively drained. At the same time the earth, which to the height of between two and three feet had been heaped up against the walls, was cleared away. The plinth and base mouldings of the edifice being thus uncovered, its architectural effect has been strikingly improved. The surface of the Churchyard has since been lowered to the same level by the Dean and Chapter, from funds at their own disposal.

2. On a careful survey of the exterior, it was found that most of the flying buttresses were in a dangerous state. Some of them have been entirely rebuilt, and the rest have been substantially repaired. The finials, pinnacles, parapet copings, and mullions, throughout the building, many of them in a state of dilapidation and decay, have been made good. The decayed shafts, capitals, and bases of the numerous windows have been thoroughly restored. These were originally of Purbeck marble, a material peculiarly liable to decay. It was therefore resolved, on the recommendation of Mr. Scott, to employ in repairing them a variety of the Devonshire marble, as being more durable and less costly than the Purbeck. The juxtaposition of these two kinds of marble, differing as they do in external appearance, offended the eye. In order to soften the contrast, a process of

rubbing and oiling the surfaces of both is now being employed, under the sanction of Mr. Scott, with a view of assimilating, as nearly as possible, the colour of the new to that of the old material. The result of the experiment has, thus far, been highly satisfactory.

3. We next come to what was justly considered the most important part of this great work—the strengthening of the Tower, and the ensuring thereby the safety of the noble fabric itself. Here, it must be remembered, that the building originally terminated in an open Lantern, projecting 8 ft. above the ridges of the roof; that its walls are hollow, that the outer wall is only 2 ft. thick, the inner consisting merely of a light arcade; that the intervening space is an open triforium passage; and that the four corner piers are perforated by staircases. On a basis thus slight and unsubstantial was erected, about seventy years after the completion of the main edifice, the vast superstructure of the Tower and Spire. The effect of the pressure of so huge a mass soon became apparent, by the crushing of the Lantern walls, and the settlement of the four great piers at the intersection of the Nave and Transepts. As regards the latter, there is no reason to believe that there has been any serious movement in the piers, since they were connected by the two great arches in the Nave, at the close of the fifteenth century. And that they have remained stationary since the plumbing by Mr. Nash, the then Clerk of the Works, in 1691, has been ascertained after a searching investigation by Mr. Scott. The real, the imminent danger, lay in the walls of the Lantern, which, when examined by Mr. Scott, were seen to be in so dilapidated and shattered a condition, that the stability of the Tower for so many centuries may justly be accounted a standing wonder.

4. The grand object, then, was to strengthen and consolidate the walls of the Lantern, without overloading the four above-mentioned piers in the Nave. This object has been fully accomplished by means of an ingenious and elaborate system of iron ties, devised by Mr. Shields, the eminent civil engineer, whom Mr. Scott had called in to assist him in this delicate operation. The basis of the Tower having been thus made as secure as mechanical science applied with the highest practical skill could render it, attention was next directed to the interior. Many parts of this had been, for a long series of years, in a ruinous state. In the Lantern story eight windows, the four staircases at the angles, and the ashlar work, have been restored. So likewise have been two windows on each of the east, west, and north sides of the upper stories. And on the south side of the same stories four windows, which had been built up, have been opened out and completely refitted. At the apices of the windows of the uppermost story there have been added eight piers and relieving arches, on which the weight of the Spire is now in great measure supported. Portions of the interior of the Spire itself have been pointed, and the Cap-Stone, which was much dilapidated by the combined effects of time and weather, has been thoroughly repaired. The Vane has been newly gilded, and its movement facilitated by a simple self-acting contrivance for oiling it.

5. Attention was next directed to the West Front, every part of which stood lamentably in need of renovation or repair. The stone and marble work throughout have been restored, and the enriched mouldings of the Porches, on which a great deal of time and labour has been bestowed, are now far advanced, and will be finished, it is hoped, a month or two hence. These restorations have been executed with the most scrupulous care, every portion of uninjured surface being preserved, and that which was destroyed being reproduced in strict conformity with the remaining traces of the ancient work.

6. The Restoration of the West Front could not be regarded as complete, without an attempt being made to replace a portion, at least, of the Statues that anciently adorned it. The late Professor Cockerell has stated that there were originally on the exterior of the Cathedral 160 Figures, of which 123 stood on the West Front. In a lecture delivered at a meeting of the Archaeological Institute in this City, in 1849, that eminent authority expressed his high appreciation of the artistic excellence of the few mutilated Figures that still remained. From a minute examination of them it was inferred that the whole series on the West Front formed what is termed a Te Deum or Theological Scheme.

In accordance with this was the plan of Restoration proposed by Mr. Scott, and by his advice intrusted for execution to a sculptor of rising reputation, Mr. Redfern. The work, begun about two years ago, and still in progress, may be thus briefly described:—In the panel of the great gable of the West Front is a colossal figure of our Saviour, seated in Majesty. Ranged in successive tiers below this grand central Figure, there will be in the first tier, Figures of Angels; in the second, of Prophets and Patriarchs; in the third, of Apostles and Evangelists; in the fourth and fifth, of Saints, Martyrs, and Founders. It will be observed that in this plan Apostles and Evangelists are placed below Prophets and Patriarchs. The remains of two figures, those of St. Peter and St. Paul, proved that this must have been the order in which they originally stood, as in fact both the number and distribution of the niches admitted of no other arrangement.

7. Of the entire number of Statues required to fill the niches on the west front, about fifty will soon have been fixed in their places, exclusive of eight ancient mutilated figures which have been restored by Mr. Redfern. Amongst these are two on the buttresses, right and left of the great porch, the gift of Mr. T. H. A. Poynder, and eleven filling the row of niches immediately over the great porch, and representing the patron saints of Christendom, the munificent donation of the Rev. Charles Brooke Bicknell, Rector of Stourton, in this diocese. For the further prosecution of this portion of the work, or the entire restoration of the Interior, there are no available funds.

South Midland Institute of Mining, Civil, and Mechanical Engineers.—A new Institute has been started in Wolverhampton upon the model of the Northern Institute of Mining Engineers, by about five-and-twenty of the mining and mechanical engineers of the town and neighbourhood. The president is Mr. Henry Beckett, F.G.S. Papers are to be read and discussed from time to time; and the president is to deliver the inaugural address at the School of Art on June 7.

ENGINEERS AT COURT.

WE learn that the Emperor of the French, to whom the Institution of Civil Engineers have granted a diploma as honorary member, has received with his usual courtesy Mr. Charles Gregory, president; Mr. Bidder and Mr. McClean, past presidents; Mr. Cubitt, vice-president; Mr. Hemans, member of council; and Mr. Manby, honorary secretary, who came on behalf of the Institution to present the diploma. The Emperor has desired that his thanks might be conveyed to the members, with the assurance that he felt himself honoured by being enrolled among their number. He conversed with the deputation at their official reception, and they have had the honour of dining with him.

THE NEW RAFFAELE AT SOUTH KENSINGTON.

IN fulfilment of our promise in reference to the supposed original paintings by Raffaele now in the South Kensington Museum, we will take up first that bequeathed to the Museum by the late Rev. C. H. Townshend. For this painting Dr. Waagen, taking the safe ground of objection, yet honestly conscious of its merit, invents the somewhat forced theory of an unknown but excellent Netherlandish copyist, his Northern origin being indicated to the Doctor by the shape of the buildings in the background. These same buildings look to our own judgment as unlike the products of a Northern brain as can well be found; while the fact that the painting was bought from the Duke of Massa's collection by Lord Coleraine, from whom it passed into Mr. Townshend's family, leaves the *onus probandi* on those who insist on giving the picture a Transalpine origin. To the Verity picture a curious and very elaborate chain of evidence is attached, to which we invite our readers' attention, it having been placed at our disposition by the owner of the painting.

In 1505 Raphael painted, for Lorenzo Nasi, the 'Madonna del Cardellino,' now in the Tribune at Florence. The year following, in 1506, he began the Vallombrosa replica for that monastery, and finished it at the end of 1508. It was ordered by Don Biagio Milanese, General of the Order of Benedictines of Vallombrosa, who wrote a history of the monastery from 1400 to 1513, and whose portrait (now supposed to be by Raphael, and not by Perugino) exists in the Accademia delle Belle Arti at Florence. Some most interesting details are learnt from entries in the original account books of Vallombrosa which are deposited in the State archives at the Uffizi. The first of these entries about the picture is the payment to Raphael of 5 gold florins (*florini larghi in oro*) dated Jan. 7, 1506, and similar entries testify to other payments from time to time (as well as to a cask of wine) extending to Nov. 25, 1508, about the time Raphael went to Rome. According to these entries the following is a summary of the sums of money received by him for the Vallombrosa picture, amounting altogether to 60 gold florins, viz.:

		Gold florins.	
1506	Jan. 7	5	10 in 1506.
—	Feb. 14	5	
1507	Feb. 12	4	20 in 1507.
—	Oct. 24	6	
—	Nov. 27	10	
1508	Feb. 21	5	30 in 1508.
—	June 24	1	
—	Aug. 5	10	
—	Oct. 7	5	
—	Nov. 25	4	

It will be observed that although Raphael began in 1506, he received by far the largest number of payments in 1508. From this time the picture remained at Vallombrosa until the general suppression of the monastery in 1808—a period of three hundred years; and in looking through the Memorandum Book of the monastery ('Libro di Ricordanza') it will be found mentioned in 1788 as being the chief picture in their collection, which then included masterpieces of Perugino, Guido, Andrea del Sarto, &c.; and again in 1790, in an inventory of objects of art, made by order of the Grand Duke Leopold I. In the Siena edition of Vasari, published in 1792 by Padre della Valle, the picture is thus noticed in a footnote in the 'Life of Raphael,' page 246, after describing the Madonna del Cardellino of the Tribune, painted in 1505, for Lorenzo Nasi:—'Un altro similissimo di grandezza, d'antiquità e di perfezione, tanto da essere veduto da qualunque sia sia intendente una preziosa replica dal istesso Raffaele, esiste nella Sagrestia del Monastero di Vallombrosa, ed è conservatissimo a riserva d'una fessura tra le due tavole che lo compongono scollatesi per l'antichità.'

In 1508 the Raphael is mentioned in the 'Libro di Ricordanza,' which says that the Abbot Don Felice Predallini removed it from the library to his own apartments 'per maggior comodo.' On the suppression of the monastery at this time it was acquired by M. de la Fruet, employé of King Joseph of Naples, from whose widow, in 1835, it passed with other pictures of note into the possession of the present owner. The 'fessura' down the middle between the panels, as seen and noted by Padre della Valle in this edition of Vasari, was skilfully repaired when it was transferred to canvas by Haquin of Paris, but it can be still plainly seen. There exists a copy of it in the Magazzino of the Palazzo Vecchio at Florence, taken from the monastery, and at that time supposed to be the original; but on closer examination afterwards, at the Accademia delle Belle Arti, in 1812, it was found to be only a copy of the first, done by one of the monks. In this copy, the crack between the panels spoken of by Padre della Valle traverses the head, the face, the neck, and body of the Virgin, in the same way as in the original, and the copy bears on its back the seal and number (No. 2,599) which was put on it when taken from Vallombrosa, and shows from certain differences that it has been faithfully copied from their own Raphael (la nostra tavola di Vallombrosa), and not from that of the Tribune. These differences between the Raphael of 1505 in the Tribune, and the Vallombrosa Raphael of 1506-8, are shown in the latter by there being a more developed treatment throughout, as might certainly be expected from the

more mature age and experience of the painter. This is seen more particularly in the hand of the Virgin, which is much younger and of a different type; in the hand and figure of the Infant, and in more effective chiar-oscuro. Amongst many smaller details, part of the gauze round the middle of the Child is dropped, and the landscape varied.

ILLUSTRATION.

WEST DOORWAY, CATHEDRAL OF SANTIAGO DE COMPOSTELLA.

THE illustration which we give of this fine work has been drawn from the casts in the South Kensington Museum. Want of space compels us to postpone a careful account of the iconography of the porch, which has been prepared for us by the artist (Mr. Lonsdale), who has drawn and lithographed the illustration. This account will accompany our next illustration of this subject.

THE BUILDING TRADES' DISPUTE.

THERE seems little chance of arbitration being resorted to at Liverpool. The masons are willing to discuss the position of affairs with the masters, but object to leaving the issue in the hands of an umpire.

Referring to the position of affairs at Leeds, the *Leeds Mercury* says:—'The masons, who number some 300 or 400 men, and who have a strong union to support any action they may take, object almost entirely to the proposals that have been made to them. They say that their present position as to wages is a tolerably fair one to both parties, and while a few of them are desirous that courts of arbitration should have a fair trial, the vast majority are opposed to such means of settling disputes. They point to the joiners, and allege that several of the decisions made in their favour by Mr. Rupert Kettle, when he arbitrated in Leeds some months ago, have never been carried out by the masters, and they also feel, rightly or wrongly, that if a board of arbitration were agreed upon, the masters would be disinclined to accept any umpire whom they might select. The plasterers occupy a position quite as serious as the masons. They are asked to accept payment by the hour instead of weekly wages, and to submit to arbitration; and although it was understood about a fortnight ago that some agreement was come to, the bulk of the men are still dissatisfied with the proposals made to them. If they are to be paid by the hour, they ask that they may be put on the nine-hour system winter and summer, and that they may have $\frac{1}{2}$ d. more per hour than the masters offer, so as to make their weekly earnings equal under a reduced hour system to what they receive now. Their labourers think that they also are entitled to $\frac{1}{2}$ d. more than is offered, and, of course, the labourers' hours of labour will be regulated according to any agreement made by the plasterers themselves. With regard to the bricklayers, their position will remain as at present until August 1, a decision in connection with their trade, which was given in arbitration, remaining in force until that time.'

The masons of York as a body are stated to be satisfied with the proposition of the employers to pay them $6\frac{1}{2}$ d. per hour in summer, and 7d. and $7\frac{1}{2}$ d. per hour in winter, which would raise the wages about 4d. per week in summer, and 10d. per week in winter, amounting in the former period to 1*l.* 10*s.* 4*d.*, and in the latter to 1*l.* 7*s.* 10*d.* (the hours being much shorter in winter than in summer). The bricklayers, or at least those who were dissatisfied with the proposition to pay them $6\frac{1}{2}$ d. per hour in summer, and 6*d.* per hour in winter, have not so readily made up their minds. They have held two meetings with closed doors, but it is believed that they have arrived at no definite result.

About 250 masons and about 60 labourers connected with the principal building firms in Bradford left work on Saturday not to return again unless some arrangement can be effected in the terms on which disagreement has arisen. The joiners and carpenters have consented to an arrangement with their masters to settle all disputes by arbitration or conciliation. A meeting on this principle was held on Friday week to consider an application from the operative joiners and carpenters for an advance of wages. The reasonableness of the application was conceded, but the present time was regarded as unfavourable to the end desired. The employers, however, consented to make an advance in March next, and the arrangement was accepted by the men.

The iron trade disputes in the North are settled for the present; both sides having accepted the terms of Mr. Kettle, the arbitrator, namely, 5 per cent. rise of wages to the men, with no future changes for eight months.

ROTHERHAM HOSPITAL AND DISPENSARY COMPETITION.

WE have already mentioned the exhibition of the designs submitted in competition for this building, which is now open to the public. During the week or ten days previous to its opening the committee and their friends were admitted to a private inspection.

Instead of only about eighty that had arrived on the evening of the 15th ult., the number has increased to ninety-two or ninety-three separate designs, not including the alternative plans that accompany many; the individual drawings numbering little under 650 sheets or stretchers. These are, as we have already stated, most inconveniently hung in two wretchedly narrow lobbies, and seven very small rooms, the result being that only five of each architect's drawings—many send ten or twelve sheets—are exhibited in a vertical compartment, and the remaining plans are put out of sight behind the lowest drawing, and useless for reference or explanation of those that are hung. Gaudily coloured views, with backgrounds totally unlike the neighbourhood, occupy conspicuous positions, whilst valuable geometrical drawings are not exhibited. As only about one-third of the drawings are accompanied by perspective views, we ask the committee,

would it not be more fair to the competitors generally to place these out of sight, instead of the line drawings and explanatory plans?

The awkward arrangement of plan, and the scenery represented in the perspective views, lead us to the painful conclusion that few of the competitors have visited the site before preparing their plans. Many, we fear, will have cause to regret this false economy, for the ground is so hilly and peculiar in its approach and boundaries, that nothing short of direct inspiration would enable an architect to conceive its real character. Many really good plans are marred by the want of this very obvious precaution.

The requirements and practical working of an hospital appear to be subjects about which most of the competitors are profoundly ignorant. We have seen the printed instructions, which are very minute, practical, and well considered, and think that they alone should have opened the eyes of many as to what was expected from them. In spite, however, of these rules, many have the wards, convalescent or day rooms, &c., not at all or insufficiently lighted from the south, which all doctors agree in considering to be the most healthy aspect; for the same reason the exercise ground should lie to the south of the building, and in order to be of moderate size the wards should not be placed too near to that boundary of the site. It is required that the wards be at least 60 feet apart, and if separated from each other should of course be nearly as distant from the front or administrative block; but many have lessened this isolation by placing large rooms between the wards or bringing the front block within a few feet of the end of a ward. Ventilation is as necessary for the officers and servants as for the health of the patients. A bath-room for an hospital should be large, and the baths not in the corner of a room, as many suggest, but approachable from three sides, so that the nurses may conveniently place a crippled patient in them.

The mortuary should be so placed in the grounds that it shall be out of sight of the patients and not far from the road, although screened from it.

The attendance of out-door patients at a dispensary should be witnessed, in order to understand the requirements and amount of accommodation necessary. Many have provided very small rooms, others places that resemble private chapels. Some architects have suggested that externs should wander up a flight of stairs to the first floor when they require to see the physician, whilst others would drag them along a corridor and across a principal hall attached to a department with which they should have no communication.

The rules state that no expense will be incurred for any kind of ornamental work, except what is necessary to make the building look respectable. Now, many have used so much decoration that their estimates are thousands of pounds in excess of the stipulated cost. Generally speaking, we found that the more elaborate the design and highly coloured the view the greater the cost, and, not unfrequently, the oftener were the rules broken. Considering the number of the designs submitted in this competition and, in order to protect the committee from being unduly influenced by richly-coloured pictures, we would strongly advise them to appeal to some clever and independent architect to assist them in their selection; otherwise the authors of the rejected plans will not feel satisfied as to the justice of an award made by a committee of unprofessional men.

We understand that the medical committee were to give in their report on the sanitary arrangements of the different plans to the general committee on the 19th ult., after which the other members would commence their examination, with, we trust, professional guidance.

This competition is remarkable, considering the size of the proposed building, as having met more responses from the profession than any previous one of similar character or estimate.

Either business must be in a very bad state indeed, or pupils and draughtsmen are becoming very ambitious, to have allowed such a small work to have kicked up such an architectural dust. The practice is excellent for the young men, but tends rather to confuse a committee, who can protect themselves in such a case only by appealing to an expert.

PARLIAMENTARY PROCEEDINGS.

Eccelesiastical Dilapidations Bill.

IN the Lords on 29th ult., the Archbishop of York moved the second reading of this Bill. The subject, he said, had often engaged the attention of their lordships, and the present state of the law of dilapidations was very unsatisfactory. Cases often occurred where an incumbent was called upon to repair the house, upon entering on a benefice, that he might find almost a complete ruin; and yet he would be bound, if he obtained another living, at whatever period subsequently, to sustain the cost of the repairs, even when the work of ruin had been going on for years. The next defect of the law was, that there was not sufficient inducement to the clergy to keep their houses in good repair. The Bill, though by no means a complete measure, proposed to deal with these two points, and to provide for the appointment of official surveyors in each archdeaconry, in order to secure the uniform administration of the law. They would be appointed by the archdeacon and the rural deans. The Bill also provided that during a vacancy in a benefice, a survey should take place by order of the archdeacon, and upon the surveyor's report the incoming incumbent would be required within a certain time to execute the work; but in order to lighten the burden upon the successors of insolvent or imprudent incumbents it was provided that the governors of Queen Anne's Bounty should be empowered to advance money on mortgage, in the usual way, to the new incumbent to assist him in executing the repairs. There was also a provision for the inspection, by the surveyor, of benefices belonging to livings under sequestration; but if an incumbent chose to have the survey during his incumbency, and put his glebe-house or other building in perfect repair, he should be insured against any further demands for dilapidations for the next five years. The bill did not at present contain clauses affecting episcopal houses, or the residences of deans and chapters, because it was based on the recommendation of the committees of the Lower Houses of the Convocation of Canterbury and York, who had shrunk from dealing with that part of the question, but he hoped the clauses dealing with them would be

inserted in committee. Another omission was that the rights of patrons seemed to be insufficiently protected, inasmuch as it did not provide that the patron's consent to all loans should be obtained, nor was there any provision to enable patrons, in their own interest, to have buildings inspected from time to time. Reserving further comment on the details until they went into committee, he hoped the House would consent to read the bill the second time.

Lord PORTMAN suggested that the Bill should be withdrawn, and that the most reverend prelate should substitute for it the measure recommended by the select committee which met upon the subject in 1862, under the presidency of Lord St. Leonards. By this course a great saving of time would be effected, and much unnecessary discussion avoided.

The Bill was at length withdrawn, and the Bill which had passed through Committee was introduced and read a first time.

Public Institutions.

In the Lords, April 29, Lord ROMILLY laid on the table a Bill for facilitating the incorporation of educational, scientific, and charitable institutions, and reducing the expense of electing new trustees.—Read a first time.

Fine Arts Copyright Consolidation and Amendment (No. 2) Bill.

In moving the second reading of this Bill in the Lords on 30th ult., Lord WESTBURY said: We only give protection of copyright to works of fine arts in some cases for the author's life and seven years beyond, while in foreign countries the protection is given for the author's life and for a much longer period. Not only do we give a much shorter term of protection to foreign artists than our artists receive in other countries, but in other respects the state of our law is so imperfect as to make the reciprocity between this and other countries very imperfect. There are at present eight or nine statutes on the subject of copyright, the provisions of which are in many cases inconsistent, while their construction is throughout a matter of extreme difficulty. The first object of this Bill is to consolidate these statutes. It thus gives to the author of every original work of fine art first sold after the commencement of the Act a period of copyright for the term of the natural life of the author and for a term of thirty years after his death. He had fixed upon the term of thirty years because it is about equivalent to the average term of protection given by the laws of foreign countries. The Bill entitles the author to the right of reproducing his own work, the right to engrave, and the right to photograph. When the work is executed on commission, it is proposed that the entire copyright should vest in the person who gave the commission. When the artist executes the work for himself, then, if it be sold without reservation, the entire copyright will vest in the purchaser. But the artist may by an agreement, to be executed in writing, reserve to himself any part of the copyright—that is to say, he may reserve to himself the right to make a replica, the right to engrave, or to authorise others to engrave, and similar rights to which it was not necessary to allude. The Bill then proposes to allow the artist to retain his right of property in the sketches or studies he may make for his pictures, and it protects them against an execution for debt to the extent of 15*l*. It then points out how copyright may be transferred, and certain forms of transfer are given in schedules. All assignments, either of the entire copyright or of any part of it, are to be in writing. The next clauses relate to the covenants or agreements that shall be held implied on an assignment of copyright. Other provisions relate to the mode of registration, the forgery of monograms, and the sale of pictures with fraudulent misrepresentations. Penalties are imposed upon other frauds, such as working off a greater number of prints from an engraving than are stipulated for; or, upon working a plate until it is nearly worn, and then retcutting it, and selling engravings taken from it as if they were impressions of a new plate. In the next place the Bill gives to copyright engravings the same protection against the importation of piratical copies from abroad which is now given to works of literature. It will give a person whose copyright has been infringed the right to obtain a search-warrant, in order to ascertain what number of piratical copies have been made by the person who is engaged in injuring him. The noble lord concluded by saying that he should be happy for the Bill to be referred to a select committee.

The Earl of KIMBERLEY thought that the best course would be to read the Bill a second time, and then refer it to a select committee. Although he admitted the expediency of protecting works of literature and art by copyright, he could not regard copyright as an inherent right of property. It seemed to him the creation of legislation. He trusted, therefore, that they would not take an extreme view of the subject, but that while they would give adequate copyright to works of really high art, they would not extend the same protection to works of an inferior class.

The Bill was then read a second time.

Hamilton Gardens.

In the Commons, Mr. LAYARD, in reply to Mr. C. DENISON, said the rights of the Crown over that portion of Hyde Park known as Hamilton Gardens are precisely the same as over the Park itself. A small portion will be taken in order to carry out the scheme for widening Park Lane. He did not think it would be desirable to make any change by throwing open the remaining portion.

Site for the Public Offices.

Mr. LAYARD, in reply to Mr. W. H. SMITH, said it was intended to proceed this session with the bill for the acquisition of an additional site for the public offices in Great George Street, Delahay and adjacent streets. But certain properties on the plan in the two streets named would be excluded from the bill.

The Ordnance Survey.

Mr. CARDWELL, in reply to Mr. A. JOHNSTON in reference to a paragraph in the report of the progress of the Ordnance Survey, said it had been greatly retarded by obstacles thrown in the way by owners of deer forests. He was in communication with Sir Henry James, and he trusted that arrangements would be made with equal regard to the progress of the survey and the interests of proprietors.

The New Law Courts.

On May 4, Mr. PEMBERTON asked the First Commissioner of Works whether the particular attention of the Lord Chancellor had been called to the new site for the Law Courts selected by the Government, and whether his lordship approved the selection.

Mr. LAYARD observed that the Bill relating to this matter was a Government Bill, and the hon. member would perhaps excuse him from answering an inquiry as to the opinion of an individual member of the Government in such a case.

Lord H. LENNOX asked whether the right hon. gentleman would insure that members were supplied with plans before the Bill came on for discussion, and whether he would place a model of the new building in the library for the information of members.

Mr. LAYARD said he hoped to have lithographed plans in the hands of members perhaps before Whitsuntide; they were now being prepared by Mr. Street. As a model entailed an elevation, it would be a longer affair; but nothing would be settled until the House and the public had full opportunity of criticising the whole plan.

LEGAL.

Surveyors' Fees for Plans.

DOWLING v. HILL.

This case, tried at the Lord Mayor's Court a few days since, raised a question as to the rights of surveyors to recover for preparing plans and drawing up specifications. Mr. Kemp appeared for the plaintiff, a surveyor, of 15, Duke Street, Adelphi; Mr. Alexander representing defendant, a solicitor of Salisbury. Mr. Kemp called his client, who stated that he had been requested by the defendant to draw up a specification for a building. After he had proceeded with the work for some time it was shown to defendant, who submitted it to his builder, when it was found that the cost would be some 600*l*.; and defendant said he should not go on further. He had kept the drawings. In cross-examination, Mr. Dowling admitted that the specification was incomplete, but there was no necessity to finish it, because the defendant declined to go on, the cost exceeding the amount he had fixed. Mr. Harper, an attorney, deposed that he had a conversation with defendant, who wished to have a fair copy of the specification so far as it went to submit it to his builder. Mr. Alexander called defendant, who stated that he had known plaintiff as a friend. Being desirous to erect a building, he told Mr. Dowling that if he would draw up a specification he would give him 5*l*. Plaintiff submitted some drawings, which defendant said were fanciful, and more fit for almshouses than the building he wished to have erected. Subsequently the specification, in an incomplete state, was submitted to the builder. Defendant found then that the cost would be 600*l*., and as he did not intend to go to more than 300*l*. or 350*l*., he abandoned the plan. In cross-examination Mr. Hill said he was never prepared to pay more than 350*l*., as his lease would not warrant his going to any more expense. Mr. Edwards, the builder to whom the specification was submitted, said that the plan was useless, as it was incomplete, and would only lead him into difficulties. His Lordship, in summing up, said the case appeared to be an undefended one. Defendant himself admitted that he requested plaintiff to make the plans, and then abandoned the business in consequence of the cost, while he had kept the drawings from which the specification would have been completed, so that plaintiff could not finish the work. The jury, after a very brief consultation, found a verdict for the plaintiff for the full amount claimed, 5*l*. 18*s*. 6*d*.

Vice-Chancellors' Court, May 4.

(Before Vice-Chancellor Sir R. MALINS.)

CORNISH v. HALL.

This bill was filed to restrain the erection of certain buildings at Dagnall's Park, Norwood, within 25 feet of a road called Dagnall's Grove, of the value of less than 200*l*., or as a shop or beer-house, or in any manner contrary to a certain covenant. It appeared that the land known as Dagnall's Park was the property of the Rev. J. L. W. Venables and the Rev. G. A. Oddie, and was divided into lots for building, some of which were sold by auction, and other portions eventually purchased by the London and Brighton Railway Company, a part of such portion becoming surplus land, and having come into the possession of the defendant. The plaintiff became the sub-purchaser of other lots, and built two houses of the value, as was alleged, of 1,200*l*., which he had opened as schools. Under the original conditions of sale it was provided that the covenants should run with the land, that the buildings should not be placed within a specified distance of certain roads, should be of the value of 300*l*. and 200*l*. respectively, and be used as private residences, not as a shop or public-house or beer-house, and in the conveyance these restrictions were extended to 'any trade or business whatsoever.' The defendant having purchased the surplus land from the railway company in the early part of January, commenced building three houses, and it becoming apparent that they were to be used as shops and a beer-house, notice was given to him in writing by the plaintiff, and ultimately this bill was filed. An *ex parte* injunction was granted, and an undertaking given, which was continued till the present hearing.

Mr. Cotton, Q.C., Mr. Everitt, and Mr. Harvey, for the plaintiff, contended that the defendant's establishment not being permitted under the covenants was distinctly infringing the agreement.

Mr. Glasse, Q.C., and Mr. W. Pearson, for the defendant, argued that the covenant by the purchase by the railway company had been discharged; that the defendant purchased without any notice of the covenant, that he was not put upon inquiry, and that the conditions affecting the property had been entirely altered, and it had been parted with to persons not bound by it, because it was a simple conveyance in fee. The plaintiff took under the covenant of 1854, the original one being in 1851, and having two houses one was used entirely as a school, and therefore not as a private residence.

Mr. Cotton, Q.C., was heard in reply.

The Vice-Chancellor said, he should not dispose of this case without careful consideration. It involved a question of the highest importance, because if the defendant succeeded, there was no property in this great country, where privacy was so valuable, which might not be subject to the noise and the nuisance of trade. The plaintiff had offered not to insist on the question of distance if the defendant would not use his buildings as shops or public-houses, and it was for him to consider whether he would accept that offer.

ON THE DUTIES OF AN ARCHITECT.

ON THE DUTIES OF AN ARCHITECT, WITH REFERENCE TO THE ARRANGEMENT AND CONSTRUCTION OF A BUILDING. Read at the Society of Arts, on Wednesday, April 28. By T. ROGER SMITH, Esq.

(Continued from p. 238.)

WHEN the subject is once fairly grasped, the architect begins his design. Probably the mode of originating and elaborating an architectural design varies considerably, according to the habits and idiosyncrasy of each artist. I am inclined, however, to believe that, in most cases, a building is not first imagined as a building, but as a drawing—in fact, as a ground plan. Certainly the almost invariable custom is to commence upon the plan of the principal floor, and carry the arrangement of that on for some little way before touching any other part of the work. There will be ordinarily some simple germ, usually growing out of the arrangement of the communications between the best rooms, which will give the key-note, so to speak, of the whole. Such questions as the following are the ones which determine the lines of the skeleton of a plan:—Shall the building be symmetrical or irregular? Shall the rooms be entered from a hall or a corridor? In which direction will the offices, &c., lie best? From which side will the approach come? Where can the leading rooms be best placed for aspect, prospect, communications, and grouping? The chances are, that when these questions have been thought over for an hour, the true principle of arrangement, in order to combine them all, presents itself to the mind, and the key to the problem once found, the plan seems, in practised hands, almost to develop itself spontaneously.

From the first the designer ought to have present to his mind the possibility of forming a convenient series of upper rooms over those on his ground floor, the general nature of the roof which his ground plan will render necessary, and the leading masses externally and effects internally which his building will possess; and after he has gone some way with his ground plan he prepares plans of the upper floors, and elevations, or a prospective sketch of the exterior. This is all usually done to a small scale, and in many cases the drawings thus made have a very large amount of study devoted to them, and are altered and re-done very many times over, for in them lies the germ of the whole future work.

At length a series of fair sketches, embodying the main ideas of a design, has been prepared; and now, if not before, it usually becomes necessary to look into the question of cost.

In many cases the architect is furnished by his client, at the outset, with a statement of the sum to be laid out, as well as of the accommodation to be obtained, and it not unfrequently happens, by-the-by, that the first is not adequate to secure the latter. It is, however, a more frequent case that, in the first instance, the accommodation desired is named, and the architect is requested, in making his design, to state its cost as near as he can. However this may be, it may be accepted as a general principle, that most of us, when about to build, want more for our money than we can possibly get, and that, sooner or later, a conflict between cost and size has to be encountered. I, for one, always like to encounter it at the outset, and to endeavour to dispose of the question finally, although it is, undoubtedly, the most difficult part of our professional work to approximate, with anything like reliable accuracy, to the cost of a work for which nothing but the first sketches have been made, and perhaps hardly those completely.

The elements of this difficulty of estimating are two-fold—first, the extremely wide range of costliness or cheapness possible to buildings of the same size and for the same purpose; secondly, the extraordinary discrepancies which the estimates for the same work will present, when a dozen men are all tendering for the execution of the building, even when all of them are men whose business it is to get their living by knowing what work will cost to execute.

It may be supposed that architects have, or ought to have, at their finger ends, a series of trustworthy average prices; that it is familiarly known, for example, how much per bed a hospital ought to cost, how much per sitting a church, how much per room a dwelling-house, and how much per child a school. Again, it may be supposed that, bulk for bulk, one building will so closely resemble another that the price per cubic foot of bulk, or per superficial foot of area covered, can be gauged to a nicety; and it is quite true that such rough rules exist, and form the basis of our approximate estimates, but nothing short of very considerable tact, skill, experience, and adroitness in applying them to practice, will make them of any real value. It is a matter of simple counting to say how many rooms there are in a house, and of simple measuring to say what the cubic contents of a building, as shown on a set of plans, will be. It requires an amount of sagacity and experience not given to every one to say at what, of all the possible prices between eighty pounds and eight hundred, each room should be rated, or at what figure between fourpence and two shillings each cubic foot of contents should be priced. A few illustrations will show the truth of what I have been saying.

It is often urged that the difficulty of obtaining reliable preliminary information as to cost is greater than it ought to be, and perhaps it is so; but buildings are not the only articles of manufacture where prices range over a very wide margin. It appears to me that a house is a more complex thing than a black frock coat, or a wooden chest of drawers four feet high; yet the price of a coat probably ranges from three pounds to ten guineas, and that of a chest of drawers from thirty shillings to twenty pounds; and no such extremes as are exhibited in these prices, or a hundred other familiar

examples that I could name, are known in the building trade. In fact, it may be safely said that an approximate estimate of a building, prepared with care and candour by an experienced estimator, is to the full as reliable a document as any of the ordinary bases upon which transactions are begun; while the building which is the subject of it is very widely open to variations in the course of its after-progress.

It is very important to the future success of the undertaking that the plans, made at this its early stage, should be understood by those who commission the building. To some a plan is an almost unintelligible document, and, in that case, some slight model ought to be constructed, to make arrangement, and even in some cases appearance clear. With or without this aid, and with more or less trouble, the architect has now to see that his client fairly understands what he proposes, and fairly comprehends what he, the architect, judges will be the probable outlay. The amount of alteration which takes place at or about this stage of the work is often very great. In many cases the building has to be planned afresh, or rearranged, or cut down, or enlarged, many times over, before a result considered satisfactory is obtained; in others, the design is accepted without modification. Sooner or later, however, the design is supposed to be in the main settled, and now commences the preparation of the definitive drawings.

In some rare cases, the drawings made to embody the idea of the design can be completed for the execution of the work. In the majority of instances this is impracticable, and an entirely new set of plans is prepared. These ordinarily go by the name of 'contract drawings,' as they form the basis of the agreement with the builder who executes the work. The favourite scale for these drawings is one-eighth of an inch to one foot, that is to say, the drawing is very nearly one-hundredth of the size of the actual work, and the drawings usually prepared to this scale are plans of the foundation, of each storey, and of the roof: geometrical elevations of each side of the work; and two or more sections, cut through the building from end to end and side to side, on arbitrary lines chosen so as to show those portions of the construction or arrangement which it is most important should be exhibited. These are followed by drawings on a larger scale; for the whole course of the development on paper of an architectural work consists in re-drawing again and again portions of it (or the whole), each time to a larger scale. Thus the contract or working plans, if to an 'eighth' scale, as has been explained, are to a scale larger than (in fact the double of) the scale most frequently used for first sketches, and in their turn they are supplemented by drawings on a scale twice as large, namely, one quarter of an inch to a foot, showing in greater detail portions of the building; parts are again drawn out to scales of half an inch and one inch to the foot. Some details are then usually given to an eighth of full size, and the most important mouldings, enrichments, &c., are drawn full size. The set of contract drawings thus made by no means includes all the drawings necessary for the erection of the building, or even the larger number of them, but it contains all the most important general drawings, and sufficient details to enable a fair estimate to be formed of the work throughout.

The work to be gone through in the preparation of the set of contract drawings is arduous. They have often to be executed under pressure as to time, and yet they always ought to receive very full, careful attention, as in the preparation of them every point of importance, either in arrangement, construction, or treatment, ought to be anticipated and settled.

When the set of contract drawings is approaching completion, the architect has to prepare a document which accompanies them, and specifies the exact quality of material to be used, the precise mode of executing each portion of the work, and the thicknesses, weights, and other precise numerical definitions of every article open to doubt. This document is called a specification, and in writing it the custom is to describe the materials and work under different trades, thus:—1. Excavator. 2. Bricklayer. 3. Mason. 4. Carpenter. 5. Slater. 6. Joiner. 7. Plasterer. 8. Plumber. 9. Smith and Ironmonger. 10. Painter. 11. Glazier. 12. Bellhanger. 13. Paper-hanger.

The proper drawing of a specification is a work of labour amounting almost to drudgery, requiring great care, patience, precision, and acquaintance with work. The most essential points about it are, that nothing should be omitted, that nothing should be slurred over, or insufficiently described, and that the same amount of detail or compression should prevail throughout. It is, of course, a work in which system, amounting almost to routine, is essential; but, even with that assistance, the greatest vigilance is necessary to prevent omissions, however good the system may be. It is also customary to append to this specification a series of conditions, either those usual in building contracts, or such a modification of them as will suit the circumstances of the case. When these contract-plans and the specification are settled and near completion, it is not uncommon to make a second approximate estimate, and it is almost always worth while, for the basis of the estimate being in a much more complete state, it is possible to form a much more reliable calculation of the probable cost.

We have now reached the close of one complete phase of the architect's work, but one which has embraced really three distinct processes—the study of the subject, the general designing of the building, and the elaboration of the design in a practical shape. Let us for a moment review the nature of the work done thus far.

Of the architect's study of his subject, I said at the outset little—in fact, perhaps, too little—as in many cases this is a severe labour, and if, in any individual instance it is quite easy, the reason is because the architect has gone through the work of acquainting himself with the same subject on some previous occasion. In the example I have selected—that of a large dwelling-house—the habits of English families are so uniform, that an architect who has once mastered the subject may plan a house without much trouble, when he knows the size of the family and its customs. But in the case of each house-building architect there occurs a first good house, and to prepare well for that he requires to consider thoroughly the position and use of every room, and every part of a room, from the drawing and dining-rooms to the oven, scullery, and brewhouse. There are, however, many architects much engaged on public works, whose different buildings vary so much that each requires a separate investigation. For example, you can quite understand that there is little in common between a post-office, an hospital, a theatre, a palace, a court of law, a cathedral, a

range of public offices, a fountain, a country house, a college, and a temporary exhibition building; yet in one architect's practice, with the work of which I am very familiar, the drawings for all these were going on within a space of about two years. It is manifest that each of these subjects must have required no small amount of special study, in order to produce a building thoroughly suited to the convenient discharge of the business to be carried on.

(To be continued.)

SOCIETIES.

Royal Institute of British Architects.

ABSTRACT OF REPORT OF THE COUNCIL READ AT THE ANNUAL MEETING, 3RD MAY.

Since the last annual report was issued 26 Associates and 12 Fellows (of whom 9 were previously Associates) have been elected. In other classes of membership the numbers are as follow:—13 honorary Fellows, 9 honorary Members, and 78 honorary and corresponding Members, making, with ordinary Fellows and Associates, a total of 808 Members. There are also 10 contributing visitors, 9 students, and 10 temporary students.

The Council have to report that several meetings of the Professional Practice Committee have been held to deliberate on important questions, both of a private and public nature. In December last they received a deputation from the London Builders' Society, who were desirous of submitting, for the consideration of the Institute, the details of an arbitration clause proposed to be incorporated with future forms of contract. In the course of the conference many points were raised, which rendered it desirable that the professional relations between architects and builders, as well as between builders and their employers, should be discussed *in extenso*; and, with this object in view, a sub-committee was appointed, who, after collecting from various sources sufficient material for their purpose, will shortly report the result of their labours.

The exceptional terms offered to architects in connection with the limited competitions for infirmaries and similar buildings, to be erected in or near the metropolis, engaged the attention of the Committee for some time, and in connection with the scale of professional charges generally adopted by the Institute, involved a delicate and difficult question, which the Council trust has been sufficiently met by the resolution on this matter—a copy of which was forwarded at the time to individual members of the Institute.

The necessity for a careful examination of the Metropolitan Buildings and Management Bill, suggested at the Ordinary General Meeting on January 20, 1868, led to the appointment of a Select Committee on the subject, by whom the Bill was considered, clause by clause, during many sittings. Their final report, it will be remembered, was submitted for the approval of a Special General Meeting held on February 1, 1869, and, after a few amendments, was forwarded to the Metropolitan Board of Works in accordance with a resolution of the Special Meeting and at the request of the Board itself.

The Committee for the "Conservation of Ancient Monuments and Remains" has, happily, had but few instances of threatened destruction or neglect brought before its notice within the last twelve months. It has, however, tendered its advice on some matters of importance, and generally with a satisfactory result. The preservation of the Church of St. Mary Somerset, in Thames Street, one of the works of Sir Christopher Wren, which was proposed to be removed during the recent alterations in the City, may be mentioned as an instance in which the timely intervention of this Committee has been successful.

In reference to this subject, the Council have to record with much satisfaction the appointment of the Hon. Austen H. Layard, M.P., hon. Member, as First Commissioner of Her Majesty's Works, and that, in his official capacity, that gentleman has already claimed the attention of Parliament as to the necessity of placing ancient monuments of architectural interest under the proper supervision of Government.

The question of artistic education for architects, after a lapse of some years was again revived at the last Annual Meeting of 1868. The Council, feeling that the scheme of a voluntary architectural examination had not met, of late days, with the response which was at first anticipated, appointed a committee to reconsider that scheme, and in consequence of its recommendation passed several resolutions, their object being to encourage candidates to come forward for examination, not only by affording them increased facilities for study at the Institute, but by granting some formal acknowledgment to those who pass the examination with success. The Council has also been requested to determine the most appropriate form in which such an acknowledgment could be furnished.

A voluntary subscription was opened in 1868 by the Institute, in aid of the Palestine Exploration Fund. Upwards of 50*l.* was collected for this object, and forwarded to G. Grove, Esq., hon. sec. to the fund, whose interesting paper on the results of the expedition will be remembered. Additional interest will no doubt be felt in this undertaking from the fact that Professor Donaldson, P.P., Hon. Sec. F. C., has since become officially connected with it, and in the autumn of last year started for the Holy Land and joined the party of exploration. His letter, dated December 21, 1868, and published in the Institute Transactions, has already given some information on this head, and no doubt much more may be expected from the same source. Another letter from that gentleman, dated from Rome, March 3, 1868, refers to many important architectural works now being carried on in Italy. Both these communications have been published in the Transactions of the Institute.

The sessional papers read during 1868-69 have been of varied interest, and have comprised the following subjects:—

"On the Foreign Artists employed in England during the Sixteenth Century, and their Influence on British Art," by Sir M. Digby Wyatt, Fellow. Discussion on Sir M. Digby Wyatt's paper. "On the Fall of the Cupola of the Leopoldstadt Basilica, Pesth." "Apparatus to Determine

the Pressure of the Wind," by Professor F. Lange, honorary and corresponding Member, Karlsruhe (translated by C. C. Nelson, F.S.A., Fellow). "On the Works executed in Terra-Cotta at the new Alleen's College, Dulwich," by Charles Barry, Vice-President. "A Short Description of the Plans of Hospitals at Paris, Munich, and St. Petersburg," by Dr. Oppert. "The Opening Address by the President for the Session 1868-9." Discussion on Mr. C. Barry's paper "On the Works executed in Terra-Cotta at New Alleen's College, Dulwich." "On Mosaic Decoration," by A. H. Layard, Esq., M.P., D.C.L. "Notes on the Celtic, Roman, Moorish, and other Architectural Remains in Algeria," by Professor T. H. Lewis, Fellow. "A Descriptive Sketch of the New House at Homewood, Co. Wicklow," by Wm. White, Fellow. A communication from Professor Donaldson, past president, honorary secretary foreign correspondence (dated "On the Archipelago, *en route* from Athens to Trieste"). "On a Development of the Theory of the Architecturesque," by Professor Kerr, Fellow. "On the Science of Colour," by William Benson, Esq. "A Memoir of Joseph Bonomi, Architect and A.R.A., with a Description of his Design for 'Rosenath, &c.'" (illustrated by many original drawings), by Wyatt Papworth, Fellow. "On Masons' Marks, including an account of the Chevalier Da Silva's work, 'Signes qu'on voit gravés sur les Anciens Monuments du Portugal, &c.," by George Godwin, Fellow, F.R.S., F.S.A. "On Architectural Criticism," by E. Ingress Bell, Associate. A letter from Rome, dated March 3, 1869, addressed to the President, W. Tite, M.P., &c., by Professor Donaldson, past president, honorary secretary for foreign correspondence. "A notice of the Professional and Literary Works of the late Arthur Ashpitel, Esq., F.S.A., Fellow," by Wyatt Papworth, Fellow.

Ample accommodation has been provided for the display of architectural designs and drawings in the new buildings of the Royal Academy; and it is also noteworthy that the collection of casts possessed by the Institute, and hitherto preserved in one of the basement rooms, has been offered as a loan to, and as such accepted by, the authorities of the Architectural Museum, where they will be more accessible for inspection in future.

After the Report was adopted, the usual election of officers took place, and Mr. Tite was once more nominated to the Presidential chair. As, however, the result of one of the remaining elections was not formally declared on that occasion, we abstain from giving the list till our next issue.

One point deserves to be widely known. On the motion of Professor Kerr, a special meeting was agreed to be held, at which the whole question of how to give greater efficiency to the Institute, and render it more serviceable to the profession, is to be discussed. There is great room for improvement, and we heartily welcome the prospect of such an enquiry.

The Institution of Civil Engineers.

The annual festival was held on Wednesday week at Willis's Rooms, King Street, St. James's. Mr. C. H. Gregory, President, in the chair. The Duke of Buckingham, in giving 'Prosperity to the Institution of Civil Engineers,' coupled with it the name of the senior past president present, Mr. Bidder, and paid a high though deserved tribute to the value of the services of the civil engineers, whose works were not intended to benefit one class or one country, but the world at large. They had turned swamps and marshes into fertile grounds, raised water in dry and scorched-up plains, developed the hidden riches of sterile and trackless lands. They had promoted trade and commerce everywhere, and had done more to advance the happiness, prosperity, and convenience of mankind than any other body of men that ever lived. Mr. Bidder briefly returned thanks. Amongst the other speakers during the evening were—Lord Stratford de Redcliffe, Lord Lawrence, Lord Houghton, Baron Bramwell, Lord Bury, &c.

The Art Union of London.

The annual meeting of this Union was held at the Adelphi Theatre a short while since. Mr. Lewis Pocock, F.S.A., the hon. secretary, read the report, which stated that the amount of subscriptions to the Union was 11,109*l.* 10*s.* 6*d.*, and that the picture this year presented to the subscribers was a chromo-lithograph of Mulready's 'Choosing the Wedding Gown,' which had been very successfully printed. It was announced that the next work of art issued to subscribers had been chosen by competition, the artist being Mr. H. C. Selous, whose works, the 'Pilgrim's Progress' and the 'Surrender of Calais,' had been selected in 1852 and 1853 for the subscribers. The new work is to consist of a volume of twenty plates, illustrative of 'Hereward the Wake.' An announcement was made that Mr. Godwin was about to retire from the post of hon. secretary, that Lord Stanley and the Dean of Canterbury had become vice-presidents, and that vacancies on the council had been filled by the election of Sir Walter Stirling and Mr. G. W. Reid, of the British Museum. The reserve fund now amounts to 14,911*l.* 14*s.* 7*d.* The council keep in view the importance of obtaining a gallery, and are considering the practicability of establishing a permanent exhibition in connection with the society. The report referred to the extensive connection established abroad, and especially in our colonies, Peru, New Zealand, Boston (United States), and other places; and draws attention to a munificent bequest by the late Mr. Felix Slade, setting apart 45,000*l.* for the foundation and endowment of professorships and scholarships of fine arts. From the directions given by the testator to his trustees and executors, it appeared that unless the arrangements proposed be promptly carried out, this munificent gift will be lost. The ballot was then taken for the prizes before the meeting, and art gifts, to be chosen by the winners, of the value from 200*l.* to 10*l.*, with other gifts, were distributed. The proceedings closed with the usual vote to the chairman.

The Proposed Infirmary near Kennington Road.—The best, second best, and third best designs for this Infirmary (St. Mary, Lambeth) are respectively those of Mr. Andrew Wilson, Messrs. Stenning and Lepard, Messrs. Tyler and Foulsham. Messrs. A. and C. Harston's is the best Workhouse plan. The premiums are 150*l.*, 100*l.*, and 50*l.*; also 50*l.* for the Workhouse plan.

NEW BUILDINGS AND RESTORATIONS.

The New Church at Kensington has a nave, 110 feet long and 30 feet wide from centre to centre of the columns; the height to the apex of the wooden roof is nearly 80 feet. The two aisles, which are separated from the nave by columns of red granite, contain lateral arched recesses for altars. The chancel, which is 40 feet long, is terminated by a five-sided apse, vaulted and lighted by nine large two-light windows, under which is a richly moulded arcade. Over the chancel arch rises a *flèche* of wood and lead 150 feet in height.

New Swimming Bath.—At the last meeting of the Marylebone Vestry, the Chairman announced, as a Commissioner of Baths and Washhouses, that the new swimming bath would be opened for inspection in a few days.—Mr. Poland moved and carried a resolution approving of the proposal of the Metropolitan Board with regard to appropriating a portion of the Finsbury Park for building purposes.

The Sanitary Committee of the Paddington Vestry, at their last meeting, resolved that any plan for improving the old churchyard ought to comprehend a scheme for erecting a mortuary. It was proposed that the matter be referred to the Churchyard Committee, which was adopted by the board.

Lambeth Vestry.—At the last vestry Mr. Hill called attention to the fact of the purchase of a piece of ground by the guardians for the erection of a workhouse; and also to the opportunity it gave the guardians to open a line of communication between Kennington Road and Kennington Lane, in continuation of Hurley Road; and asked the guardians if they would provide for its being done? The chairman said the matter had been under the consideration of the Board, and that the guardians would do what they could in the matter for the benefit of the public.

St. Olave's Board of Works.—The clerk is empowered to purchase certain property for the purpose of extending the present stoneyard.—1,600*l.* is also to be borrowed from the London and Westminster Bank, wherewith to purchase certain property in Mill Lane and Tooley Street for street improvements.

The Foundation Stone of a chapel and schools for the Primitive Methodists of Leigh has just been laid by Jabez Johnson, Esq., J.P., of Pennington Hall. The building will be of a semi-Gothic style of architecture, having its principal front towards Bradshawgate. It will be constructed of brick, having Edge Fold stone and blue and white bricks for door and window dressings, and a pressed-brick front on north elevation. The means of ingress to the chapel are by two porches, one on either side of the principal front, and over each porch door there will be an inscription stone, with artistic riband name, having date, &c., carved thereon. The chapel will be an amphitheatre in form, and will be above the school, class rooms, &c., having neat open pewing to accommodate from 400 to 500 persons. The building—to cost 1,512*l.*—is to be completed by October 1 next. Architect, Mr. Edward Pritchard, C.E., of Leigh; builder, Mr. Thomas Bethell, of Earlestown.

St. James's Church, Halifax.—The works at this church have been rapidly pushed on since the laying of the corner-stone. The working of the four-light west window and the bell-turret (which is to contain two bells) are now complete. The aisle roofs have been put on, and the roofing of the chancel has been commenced. The chancel arch and east window are also finished, as well as the clerestory on the north side, and it is expected that the building will be ready for the roof of the nave by Whitsuntide.

Sunderland.—The foundation-stone of a United Presbyterian Church has been laid in this town. It is in the Gothic style of architecture, and will be built entirely of stone. Accommodation is provided for 300 persons; and the total cost will be about 3,500*l.* Mr. Thomas Oliver, of Newcastle-on-Tyne, is the architect.

Fullercoats.—A new hotel is about to be erected at this marine village, on the north-eastern coast. It will be in the centre of the bay, and have a fine sea view. Mr. Thomas Oliver, of Newcastle-on-Tyne, is the architect.

The New Smithfield at Hanley, Staffordshire.—The New Cattle Market at Hanley, provided by the Town Council at a cost of about 3,000*l.*, was opened on the 20th ultimo. It contains an area of eight thousand square yards. The principal frontage in Bethesda Street will be about one hundred yards in length. The accommodation to be provided, in the first instance, will be for 220 head of cattle, 1,620 sheep, and 100 pigs. The pens are formed of strong iron pillars with sockets, in which rails of wood are inserted. There will also be a 'champering' ground for horses, ten yards in width, along the west boundary wall. Some two thousand square yards of land will remain within the enclosed area of the market, even after pens to the above extent have been all fixed, on which additional pens will be erected as they are required; but that space is levelled and sewered, and the foundations for the necessary pavement and pens are laid, so as to admit of enlargement in conformity with the plan of the market. When the whole area is thus covered, there will be ample accommodation for 380 cattle and 3,600 sheep and pigs. The new Smithfield has been designed and laid out by Mr. T. Hewson, the borough surveyor.

Buxton, Derbyshire, wants to borrow 1,200*l.*, being 600*l.* for the completion of the Market Hall, 600*l.* for the construction of sewage tanks and the extension of the main sewer, and 100*l.* for sheep pens and sheds in the Cattle Market.

Warrington Workhouse.—At the meeting of the Warrington Board of Guardians on April 27, the Chairman said he was informed it was five years since the house was painted, and as the alterations were going on, it was thought not well to delay it too long. Mr. Johnson, at the request of the Board, promised to draw up a specification of what was necessary and the probable cost, in order that tenders might be advertised for.

Accident at Buswarp Church.—On Saturday morning last, Samuel Dean, clerk of the works at the Buswarp new church, fell from the sloping roof of the side aisle, and broke one of his thighs.

St. Jude's Church, Wolverhampton.—The new district church of St. Jude's, erected near Newbridge, on the right-hand side of the Tettenhall Road from Wolverhampton, has lately been consecrated. The site for the church and parsonage, together with 2,000*l.* towards the endowment fund, was the gift of Miss Stokes. The building was erected by Mr. Nelson, of Dudley, from the designs of Mr. Bidlake, of Wolverhampton, at a cost of 4,500*l.* The plan is cruciform. The nave is 92 feet 6 inches long by 32 feet 4 inches wide, the aisles 13 feet 6 inches wide, and the chancel 35 feet long by 23 feet wide. On the north side of the chancel is the organ chamber, and on the south side the vestry. The tower is at the west end of the south aisle, and the entrances to the church are under the tower and a porch in the north aisle. The seating is divided into four bays by central and aisle passages. The shafts supporting the nave arches and clerestory wall are of Aberdeen granite polished, as are also the shafts of the chancel arch, the caps being richly carved. The style of architecture is Geometric Decorated, and the materials used are Codsall stone for the walling, laid in level courses, rock faced, with dressings of light-coloured stone. The different colours of the two stones are very effective. The timber work is deal, stained and varnished. The glazing is with cathedral tinted glass in lead lights of geometric design. The pulpit and reading desk, which are of oak, and the font of stone, are in part a gift from the Rev. A. B. Gould. The contractor for the heating apparatus was Mr. Blakemore, of Wednesbury, and for the gas fittings Mr. Thomason, of Birmingham. The carving, which is well executed in the conventional style, is by Mr. Forsyth, of Worcester. The edifice seats 812 adult persons.

Some gentlemen in Leamington have resolved to start a new Provident Dispensary there; and a public meeting has been held, under the presidency of Lord Leigh, for the purpose of establishing it. The 'governor's fund,' derived from subscriptions and donations of governors, is intended to bear the general expenses of the institution.

The Foundation Stone of a New Chapel was laid at Framwellgate Moor on the 26th ult. The site is situated behind the row of houses skirting the high road. When completed, the building, which will be of red brick, with stone dressings, will seat about 150 persons, and the cost of erection is estimated at about 200*l.* Mr. Herbertson, of Brandon, is the contractor for the mason's work, and Messrs. Saunder and Mellerby, of West Hartlepool, for the joiner work.

The New Temperance Hall, in Exchange Street, Doncaster, has been formally opened, the occasion being celebrated by a public tea in the hall. The building has been erected from plans prepared by Mr. S. Richardson. It includes, in addition to the hall, a large room to be fitted up as a workman's free reading-room. The total cost will be about 400*l.*

Memorial Window.—During the past week a beautiful stained glass window, in memory of the late Mr. Thomas Stubbs, of Boroughbridge, York, has been placed in St. James's Church. The design, which has been executed by Messrs. Hughes & Ward, London, is founded on Simeon receiving the infant Saviour in the Temple. Underneath the window, on a brass plate, is placed the following inscription:—'Thomas Stubbs, of Boroughbridge, died 6th November, 1867, aged 71.'

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

A New Exhibition in London.

The extraordinary number of pictures excluded from the Exhibition this year—a considerable proportion having been actually accepted, and only finally omitted on the ground of want of space—has induced a committee of gentlemen and artists to form a select supplementary exhibition. A noble and spacious suite of rooms has already been secured in Bond Street, within two minutes' walk of the Academy. Mr. Moy Thomas has consented to act as secretary; and all communications should be addressed to him at 25, Old Bond Street.

Notes for Connoisseurs.

Berlin.—By command of the King, a great stained-glass window, destined for the Cathedral of Aix-la-Chapelle, is now on view in a temporary shed, specially erected for the purpose, in the 'Lustgarten.' It forms the last of a series of windows presented to that church by the late King Frederick William IV., and has for its subject the Virgin Mary as Mediatrix. It is considered one of the most important works of the kind—in size, richness of tone and execution—produced in modern times, and is specially interesting because all the accessory figures are portraits. This, as well as the windows which are already in their places, bear laudable testimony to the activity and skill practised at the Royal Manufactory of Stained Glass, which has now been in operation for twenty-five years.—The committee appointed by the municipal authorities to consider the interior decoration of the Townhall (Rathhaus) has closed its labours, after arranging the amount and disposition of the frescoes and sculptures to be executed. A sub-committee is appointed to control the actual execution of these several works of art.

The School of Art has begun its summer term with 350 pupils. The masters and lecturers are Messrs. Jacobsthal and Scholtz, architects; Messrs. Ewald and Schaller, painters; M. Göritz, sculptor; and M. Greiner, civil engineer.

Paris.—We have noticed the sale of the pictures belonging to M. Edouard Fould, but his collection was principally remarkable for other works of art than pictures. An Oriental sardonix, mounted on a box, sold for upwards of 300*l.*; and a similar stone merely set in a ring of gold, 100*l.*; a Milanese vase of the sixteenth century, in rock crystal, fetched 554*l.*, and a cup of the same period and material, 368*l.*; a small *aguière* in Oriental agate, 584*l.*; and a modern vase in Persian lapis lazuli, 404*l.* The collection of works in precious and hard stones was magnificent, and fetched very high prices. There were, however, objects of more artistic value, especially two

Limoges enamels—a triptych, with six leaves, attributed to Martin Didier, and sold for 316*l.*; and a picture of Bathsheba leaving her bath and surrounded by her women, attributed to Jean Courtois, which fetched 405*l.* The entire collection realised nearly 23,000*l.*

Two magnificent specimens of tapestry were disposed of the other day at Prince Demidoff's sale. A large piece, of Gobelins manufacture, representing an Oriental scene, after Leprince, sold for 644*l.*; and two pieces, of Beauvais manufacture, with four *portières*, with subjects from Don Quixote, which fetched 440*l.*

The collection of French pictures owned by the Marquis du Lau were sold in Paris on the 5th ult.; they only numbered twenty, but were nearly all gems. There were five works of Eugène Delacroix, one being the best of his *esnel* pictures, 'The *Convulsionnaires*, or Fanatics, of Tangiers'; others, a splendid sea piece, horses emerging from a bath, and a noble figure of a blind man, scarcely known, and quite out of his usual style. The other pictures are by Decamps, represented by two works; Daubigny, Rousseau, Isabey, Ziem, Troyon, Diaz, Corot, and others; and it is evident that M. du Lau's only aim was to secure one of the very best illustrations of the talents of each artist.

An account produced during a late debate in the Corps Législatif shows how great exhibitions interfere with the regular progress of other affairs. The amount taken at the doors of the *salon* reached 132,000 francs in 1866; in the following, Universal Exhibition, year, it fell to 86,000 francs; and last year, when the visitors to Paris were comparatively few, it amounted to 118,000 francs. The number of works purchased by the Government reached in each of these years the large sum of 155,000 francs, or 6,200*l.*

Notes from Germany.

Vienna.—The suburb of the 'Brigittenau' is for Vienna (on a very small scale, it is true) what Blackwall is to London, and here a new parish church is in course of erection from the designs of M. Fr. Schmidt. It consists of nave and two side aisles, with two towers and an open hall or pronaos at its western extremity. The chancel is apsidal, flanked on both sides by projecting sacristies and vestries, over which are arranged the oratories—as far as we are aware, a somewhat unusual position for the latter. Only the chancel is groined, the rest being covered in with a coved and panelled ceiling of stained wood, the principals exposed and wrought. There are no galleries, but stairs in each western tower reach to the ringing floor, and are left visible to that height from below. The style is a late Gothic, with boldly projecting buttresses, mullioned windows with tracery heads, and flying buttresses across the aisle roofs and between the clerestory windows. The walls are of brick, the freestone from Bohemian quarries, and the internal dimensions are 190 feet by 65 feet. The church is intended to accommodate 2,000 worshippers, and is estimated at 180,000 florins (18,000*l.*).

Munich.—A second Protestant church is about to be erected here, funds for which are now being collected. The King has contributed 25,000 florins from his private purse, and the Minister of Public Worship has promised another 10,000 florins.

Bremen.—Two new parish churches are being built in this city. One is in the Humboldtstrasse, from the plans of Herr Toppe, the contract of the builders (Struckmann Brothers) being 3,500*l.* The other is a new church for the old parish of St. Remberti. M. Henry Müller is the architect after competition, and the peculiarity is that the church has no chancel, this feature having been declared as un-Protestant by the Committee. The communion table will consequently be in front of the pulpit.

International Art Exhibition at Brussels.

The triennial exhibition is to open at Brussels July 25, and to close Sept. 26. The number of works which each artist may send is limited to four, but a number of drawings, miniatures, medals, &c., may be contained within the same frame. The Belgian Government pay the expenses of carriage within the frontiers going and returning. No work will be received after June 30, unless it has appeared at the Paris *salon*, in which case the time is extended to July 10; but as the *salon* does not close till the 20th of that month, works can only appear at the two exhibitions by special permission of the French commission.

The Government will apply a certain sum of money to the purchase, for the State, of works of art recommended by the jury, and also for the encouragement of young Belgian artists by pecuniary recompenses not to exceed in any case more than 1,000 francs.

The general prizes consist of a gold medal of honour—in each section, we presume; five other medals for painting, two for sculpture and medal engraving, one for engraving and lithography, and one for architecture. Three other supplementary medals may be awarded if the jury recommend it. This is certainly the very shortest list of awards ever offered at an international exhibition.

Passage of Mount Saint Gothard.

The Prussian and Italian Governments have determined upon the tunnelling of Mount Saint Gothard as the most favourable scheme in the interest of the two countries. The cost of the work, which will probably occupy eight or nine years in execution, is estimated at 6,840,000*l.*, and the capital is to be made up by subventions amounting to 3,600,000*l.*—1,800,000*l.* in obligations and 1,800,000*l.* in shares. The North, East, and Central Companies undertake to supply two-fifths of the capital in shares, and will take an equal share in the direction and administration of the line.

Bombay.

Dr. Macleod, in writing of Bombay, remarked that, 'save for the surrounding scenery, Bombay would be an uninteresting city to a traveller; and 'as to the native town, no Irish village of the worst kind has a look of greater poverty, confusion, and utter discomfort.' The *Bombay Guardian*, in commenting upon the above, remarks as follows:—There are many large and rather costly buildings in the native town, but they are built without the slightest regard to architectural effect. A European who should lose his way in the native town would discover many of these in

narrow and secluded streets and gullies. He would often see a capacious many-storied dwelling-house, and would perhaps see cows and buffaloes going up the steps and in at the front door. Such an idea as that of building their houses on some common plan, with reference to combined effect, is utterly foreign to the minds of our native fellow-citizens. Unfortunately, builders have a *Shashtra* giving minute instructions regarding the building of houses, the points of the compass which they are to face, and other details of construction, neglect of which would be considered fatal to the fortunes of the occupants. As the municipality have not taken these things into account in laying out streets, it often happens that the houses on a street, instead of presenting one face, all stand a little sideways, and exhibit a succession of zigzags. But we cannot assign all blame of the unsightliness of Bombay to the natives. The ugly-tiled roof spoils all our buildings. The hiding of the roof the Greeks considered almost a *sine quâ non* in architecture; but it seems to be the fashion here to make the roof as obtrusive and naked as possible. A good many expensive buildings are springing up on the Esplanade, but we look at them with more or less of trembling. It is a great mistake to insist upon a fine *façade* when the rear of the house (more conspicuous than the front, perhaps) is recklessly ugly. The row of out-houses connected with the bungalows on the Esplanade is more conspicuous than the bungalows themselves, and sufficiently suggestive of Dr. Macleod's Irish village.'

General.

Civil and Mechanical Engineers' Society.—The members of this Association made their second visit to works on Saturday last, and inspected the new Blackfriars Bridge (which is soon to be opened to the public traffic), by permission of the engineer (President of the Society of Engineers). The members afterwards visited the Blackfriars section of the Thames Embankment, by permission of Mr. Bazalgette. Amongst the gentlemen present were B. Haughton, president; F. H. Roberts, secretary; R. M. Bancroft, F. A. Klein, and G. W. Usill, members of council; G. R. Godson, H. Siccama, A. H. Peim, &c., &c. This day (May 8) the members of this Society, by permission of the architect, will visit the Italian Opera House, now building in the Haymarket.

A fire broke out, on Saturday last, in the stables adjoining the saw-mills of Messrs. Tomkins & Co., Green Bank, Wapping; and these (90 feet long by 20 feet broad), with a loft above, were completely destroyed. The Independent Chapel in Old Gravel Lane also had its back window burnt out.

Monumental Stones in Scotland.—At the last ordinary meeting of the Society of Antiquaries of Scotland, Mr. James Drummond, R.S.A., said: 'In the churchyard of Kilmartine is an ancient cross covering the grave of a family in the village; and the minister of the parish told me that not a long time ago it had stood by the roadside about a quarter of a mile from the church, where the socket still remains built into a wall. It was taken from that spot and appropriated by the village smith, whose only descendant, an old woman, holds by the claim. From the burial-ground attached to St. Oran's Chapel, one of the most interesting and beautiful of the monuments has been removed. This theft is especially to be regretted, as the stone had a small figure in a sort of central niche, dressed, it is asserted, in the Highland garb. Moreover, it was one of the few with the remains of an inscription, 'Hic jacet M'Leod.' There was also a galley sculptured on the top of it.'

Free Library and Museum for Paisley.—The foundation-stone of this fine building, the gift of Mr. Peter Coats, of Paisley, was laid one day last week with full masonic honours. The occasion was observed in the town as a general holiday, and from an early hour in the morning the streets were crowded with people from the neighbouring country, Masons in full costume, and the townspeople themselves in holiday attire. The place was decorated with flags, arches of evergreens, and innumerable festoons. A grand procession of trades, comprising 37 divisions, was formed at several different points, and marched through the principal streets towards the site of the building in High Street. Of Freemasons there were present no fewer than 4,300, with the Earl of Dalhousie, W.G.M., at their head, and comprising deputations from 109 lodges in the counties of Renfrew, Dumfries, Lanark, Argyll, Bute, Dumfriesshire, Stirling, Forfar, and Midlothian. In due time the procession reached the building, where the Provost and magistrates of the burgh, Mr. Crum-Ewing, M.P., Sheriff Fraser and Cowan, Mr. Peter Coats, Mr. Thomas Coats, and the leading office-bearers of the Grand Lodge of Scotland, had assembled. Lord Dalhousie having advanced to the foundation-stone, Mr. Peter Coats handed him a silver trowel, with which he at once performed the usual ceremony. A grand banquet in the evening terminated the proceedings. The building, which is nearly completed, has been erected at a cost of from 3,000*l.* to 4,000*l.*, and is in the Early Greek style of architecture, with a portico over the main front 48 feet in height, the entrance being approached by an imposing flight of steps. Besides ample accommodation for the purposes of the library and museum proper, the building contains an excellent lecture-room, committee and retiring rooms, &c.

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

THE ARCHITECTURAL ASSOCIATION.—June 11, at 7.30 P.M. Nomination of Officers.—'An Historical Account of the Artistic Treatment of Piers, Pillars, and Columns.' By J. Tavener Perry, A.R.I.B.A.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—Wednesday, May 12. Annual General Meeting, 4.30 P.M.

ASSOCIATED ARTS INSTITUTE.—Saturday, May 15, at 8.15 P.M. Discussion: Question 'Was the Renaissance Movement productive of any Real Benefit to Art?'

SOCIETY OF ARTS.—Wednesday, May 12, at 8 P.M. 'On the Ventilation of Drains,' by James Lovegrove, Esq., Assoc. Inst. C.E.

The Architect.

THE ARCHITECTURAL ASSOCIATION'S SCREEN AT THE EXHIBITION, CONDUIT STREET.

BY EDWARD W. GODWIN, F.S.A.

HIS screen is, to my mind, incomparably the most interesting feature in the Conduit Street galleries. For a few years past some of us have looked at this portion of the annual Exhibition of architectural studies with much hope, and talked not a little among ourselves on the future life of English architecture, as foreshadowed in these slight sketches. Slight sketches

unquestionably, perhaps a trifle too slight as a rule; but most of them anything but slight as designs, and deeply, solemnly important as the early youthful exhibits of an architectural student's first thoughts.

Many of my readers know better than I can tell them what the Association is and what it does. For outsiders like myself, it may, however, be noted that, within the body, there is a sort of practical self-education going on under the form of classes established for the study of various subjects connected with the great all-embracing art of architecture. A selection from the annual labours of one of these classes, called 'the Class of Design,' is brought prominently before the public every year in the Conduit Street Gallery, and is thus exposed to the test of examination and criticism. And here it may be reasonably asked why the labours of only one class should be submitted to such a test? Why have we not another screen, exhibiting the progress in free-hand drawing, or indeed of anything the classes may be doing? I do not now propose to discuss the machinery which the Association employs, but the Council may perhaps be inclined to receive one suggestion. Would it not conduce to better results, if architects from outside the body, distinguished for special knowledge, would give an occasional evening to a class in the character of visitor—say, for example, the subject for a given evening in a class devoted to the scientific branches of our art was Acoustics; would it not be desirable to secure the critical remarks of such a man as Mr. T. Roger Smith? If the Association fancy they would not receive encouragement and help from the members of the Institute, they are much mistaken. Of course, architects are no exception to the general selfishness of mankind, and your selfish architect is naturally the last man to wish prosperity to rising young architects; but, I take it, the Institute is not altogether composed of selfishness. Believing, too, that the labourer is worthy of his hire, and having no faith in *honorary* anything, I would suggest that the visitors should be retained by fee, for the sake of the principle involved, and not at all with a view to anything like remuneration. A nominal fee of a guinea for every attendance would be sufficient for a recognition, whilst the amount of knowledge thus flowing into the body from experienced men would be incalculable. Had such machinery been at work during the past year, I believe some of the work, as for example the designs for a Theatre, would have been impossible.

Turning now to the Screen, we find 19 exhibitors and 46 works. Of these, about one-half might have well been kept back. Of the remainder, the Association might fairly be proud; notably of Mr. Walter Spiers' Parsonage-house, Mr. R. S. Came's and Mr. Deal's Warehouses, Mr. Hill's Iron-work, Mr. E. C. Lee's Steam-Boat Pier, Mr. Henman's Sideboard, and Mr. Reed's Bridge Toll-gate. All the six designs for Churches are promising, especially those by Mr. Henman and Mr. Lee, and the three Cathedral Portals are also good, especially that by Mr. Henman.

Some of those which show more than usual care may be examined a little in detail:—The six designs for a Brick Town Church, and the three designs for a Cathedral Portal, are more uniformly

good than any other group of designs. Mr. Henman's Church is altogether admirable. It looks what it is intended for—a town church, and he has secured this appearance by means of a low external ambulatory, and a lofty grand clerestory. Where so much is good, I shall but draw the author's attention to his belfry, feeling sure that he can reconsider this advantageously. Mr. Lee's Tower is by far the best on the screen. The belfry and louvres under the square spire, peeping just over the parapet, have a charming effect; but Mr. Lee must be careful to avoid being tempted by these bits of 'charming effect.' They are too often nothing more than temporary delights—momentary pleasures, which grow fungus-like round art and life, stifling the architect, and leaving him little more than a clever sketcher. The nave is very good, and the church well planned; but the chancel is so depressed that it looks more like a western porch or galilee than the chancel of a town church. The nave is vaulted, but I am at a loss to see why the roof should be hipped. The section shows the wall decorations very fairly designed, but drawn on such a small scale (16 feet to 1 inch), with such a coarse line, that the whole design suffers from plethora. To know what to leave out when drawing to a small scale, and under certain conditions, is one of those bits of knowledge not too often sought, and when sought not so very easy to find.

The designs for a cathedral portal are very carefully and elaborately worked out. I cannot but regret that Mr. Webb should have expended so much good labour on such an impure style of art as the Flamboyant. Mr. Hill's design is very carefully drawn in pencil so far as the skeleton goes; but as the flesh of the design is the figure sculpture, and this happens to be omitted, Mr. Hill must not be surprised when I ask him to give us something more next time. Mr. Henman's portal is one of the best pen-and-ink drawings in the room. The details are most carefully drawn, and the proportions have been so far considered and *reconsidered*, that the author writes upon the doorway, 'Please to consider the height increased by 12 inches.' This reconsideration is especially gratifying. The figures in the tympanum are fairly drawn, especially S. Peter, but inlay should not have been selected for such a position. If Mr. Henman will take the trouble to put his work into perspective, he may probably discover the reason why all such inlays are objectionable.

Mr. Walter Spiers, in a somewhat rough, but cleverly tinted drawing of a design for a parsonage-house, shows effective roof-grouping, and some sympathy with half-timbered houses. It would be interesting to see a perspective of this design, with the cinquefoil over the staircase omitted. Mr. Alexander exhibits a very carefully drawn design, and deserves great praise for his treatment of the gables; but wood parapets are thoughtless introductions. The designs for a warehouse are very nearly being all good. Mr. Came's perspective, delicately drawn in sepia, is admirable as a design and as a drawing. It lacks vigour in line, and there are defects of detail, such as in the terminations to string-course on the fourth floor, the dormer in the hoard between the gables, and the coarse finials on the gable-tops. The capitals are all ill drawn, both in this and in Mr. Deal's two designs of the same subject. Indeed, wherever free-hand drawing has been applied, it is hesitating and weak. Apart from the drawing and tinting, which are dull, Mr. Deal deserves credit for both of his designs. Mr. Verity's 'classic' attempt derives some force and beauty from the grouping of the openings, and the execution is bright and pleasing. Mr. Reed in his Bridge Toll-gate is as successful as 99 out of every 100 architects could hope to be. I know of nothing in the Academy or Conduit Exhibitions more thoroughly piquant and pleasing than this little unpretending work. Mr. Reed, however, wants practice as a draughtsman. Very praiseworthy, too, is Mr. Lee's Steam-Boat Pier, carefully drawn and thoughtfully designed. If, like Mr. Henman's Portal, it reminds us too forcibly of a certain popular dictionary, we must not grumble. We must all of us walk before we run, if we intend to run at all; but when able to walk, there is no need for leading-strings. I have heard of a big boy in his teens, who was always hungering after his baby brother's food. Architects do the same too often; they take the children's food, to save themselves the trouble of digestion, and can descend to be mean, rather than work and think out with sweat of brow their designs for themselves and by themselves. Furniture does not seem to be much understood by the Class of Design. Mr. Henman's work, although very ineffective as a drawing, is incomparably the best. All the others are more or less heavy, fussy, and pretentious. It is too evident that Mr. Lethbridge and Mr. Barter have been founding their work on the very bad specimens of furniture which have been lately published in the pages of a contemporary.

OUR RAMBLER

ALONG THE SOUTHERN THAMES EMBANKMENT.

THE ANCIENT LAW provided for the arrival of a time when there should 'be no poor' among those who obeyed those merciful precepts. An observant visitor to London might almost be led to the conclusion that this happy time was close at hand in that metropolis.

It has been said that so rapid is the adaptation of the habits of the vast nomadic horde that lives amongst, without mingling with, the more settled inhabitants of this great capital, that if a row of hogs-heads were left on the pavement in certain quarters, they would, within a few days, form the homes of a distinct tribe, or group, of street folk, whom it would be by no means easy thereafter to dislodge.

It almost seems as if our improvers—railway makers, market builders, road makers, wharf builders, sewer diggers, or what not—had considered that the converse of this view must hold good; and that, by destroying the accommodation, such as it is, that sheltered many of the poor, they could, to an equal extent, destroy poverty itself.

The circumstance which led our Rambler to form the above reflection did not, however, so directly apply to poverty, as to commerce. Whether or no the builder can drive away the former, it is undoubtedly in his power to check and banish the latter. To a certain extent he seems to have recently become bent on so doing.

The Ramble along the 6,640 feet of Northern Embankment, from Westminster to Blackfriars Bridge, which we described on a former occasion, would give but a partial and inadequate idea of the works in course of completion for the protection of the shores of the Thames, without a glance at the southern quay wall, which extends from the south-western abutment of Westminster Bridge for a distance of 5,000 feet up the river towards Vauxhall. The section and river elevation of this southern wall are similar to those already described, but the work on the Lambeth shore has been far less expensive than that which replaces the ancient line of 'Strand.' The 6,640 feet of Northern Embankment were let in three contracts, for the sum of 875,500*l.* The 5,000 feet of Southern Embankment were let in a single contract for the sum of 309,000*l.* Thus, the former cost 395*l.* per yard run, the latter 184*l.*

To obtain a distinct idea of the Embankments they must be viewed both from the river and from the shore. The Rambler, therefore, took to a steamer at Westminster Pier, and made a trip to the Victoria Bridge and back again, with the express purpose of observing the pictorial effect with which the newly girdled reach of the river strikes the eye of the traveller by water. Then he walked from end to end along the partially completed roadway, visited the docks and cuts, wandered out on to the banks which are being removed from the widened channel of the Thames, and thus gained a clear idea of what had been done, or was doing, on the land.

The first thought, however, that occurred during the survey—a consideration more important than either the architectural beauty of the scene, or the engineering skill displayed in the works which adorn it—was this: What is to become of the commerce of the Thames? Two and a fifth miles of wharfage and river-side frontage have been swept away. From Westminster to Blackfriars, on the southern side of the stream, the wharf wall will, no doubt, some day be continued. As it is, this portion of the river frontage appears to be chiefly in the possession of a few large and wealthy proprietors, who make use of it for their individual convenience, rather than for the purposes of general commerce. Above the hideous new Suspension Bridge of Lambeth, a grim and sullen river wall extends to a considerable distance in front of the Penitentiary. From the lower part of this wall, down to the immediate vicinity of the Palace of the Legislature, a short length of riparian property remains in all the picturesque confusion that indicates a diversity of private owners. But this little space is all that is now allotted, above the limit of London Bridge, to that on which the wealth and importance of London were originally based, the water carriage borne by the Thames. It is true that the introduction of the railway system has done very much to alter, whether permanently or not remains to be seen, the value of water transit. But, in some instances, lines of internal canal are still in full activity. In other cases, where the water communications have fallen into the hands of the railway companies, and have been neglected and discouraged in consequence, there seems reason to conclude that the railway people, commercially speaking, have made a great mistake. But is it conceivable that, while the Birmingham Canal remains an active channel of traffic, the Thames should be improved away into a non-commercial stream? Parliament, no doubt, in its wisdom, ought to have duly considered this question before sanctioning a quay wall, the solid granite parapet of which looks down with contempt on the useless mooring rings held in the lions' mouths; but somehow Parliament is mostly too busy to attend to matters which merely concern the prosperity of trade, or the general welfare of the people.

For good or for evil, however, this great stretch of water-side frontage is now closed against its former traffic. In three places there are entrances through the southern wall, sneaking, subterranean sort of entrances, covered, not by drawbridges, that would admit any floating craft provided with a mast; but with flat girder bridges—bridges that make it their chief business to maintain the road and the foot-

way, as if there were no inlet beneath them. Nor is this so much to be wondered at when we observe that they give access merely to private basins. Potters thrive along this southern shore; and great potteries have provided private docks of their own, with inlets to the river, closed by substantial gates, every way equal in their workmanship to the fine granite mouldings of the wall, but each, one must confess, unblushingly exclusive and selfish.

One provision seems to have a more public aim. Beyond the boundary of one of the great pottery yards is a means of access to the river, which goes by the name of a 'draw-dock.' A roadway runs down for some distance between two walls, parallel to the bank, and then, turning at a right angle, continues, under a double girder bridge of some 12 to 14 feet span in each aperture, to the side of the stream. Communication is thus rendered possible between the river and the district behind the quay walls; but it is an accommodation of a very questionable, and, so to speak, unaccommodating, kind. Two great Thames lighters, if they could pass through the narrow openings of the draw-dock bridge, would choke up the whole of the roadway, or waterway, or whatever this hybrid slope may be called. And if the passage be intended to allow carts to descend to the river at low water, and amuse themselves in the mud, the plan does not seem to be eminently useful. For a means of drawing timber from the river the draw-dock would, no doubt, prove highly suitable, were it not for the right angle in its course, which would arrest the passage of any piece of timber but one of inconsiderable length. On the whole, therefore, it seems that the erection of this long quay wall must have inflicted a serious blow on the trade of the district which it bounds, a blow for which it does not attempt to offer any compensation.

Our Rambler heard that the inhabitants of this low-lying district had been subject to great inconvenience from floods, and that Father Thames was wont to enter their cellars, or even their kitchens, when he was a sheet or two in the wind, in a manner more familiar than welcome. A quay wall, combined with a proper regulation of the drainage, is no doubt a remedy for so serious an evil—obnoxious as it is to health no less than to comfort.

But such a river-wall as should fully answer the purpose of keeping out floods might be, at the same time, capable of utilisation as a continued wharf, or real quay. There is no absolute necessity that the road should immediately skirt the river. A line of communication was to be secured, existing interests were to be considered, and no doubt the simplest arrangement, and the one which involved the least purchase of land, and the least consideration of any kind, is that which has been adopted. But the construction of a true wharf-wall, to which lighters could moor, and on which they could load and unload, with, perhaps, the addition of a long timber gridiron or cradle for their support at low water, served by a parallel roadway, or by good lines of access to the street which runs parallel to the river between Lambeth and Vauxhall Bridges, would have been, it struck the Rambler, something far more suitable to the locality than the present very elegant esplanade.

The beauty of Mr. Bazalgette's wall does not suffer from the want of a foil. All persons whose ideas are hazy upon the subject of the picturesque should endeavour to clear them by paying a visit to the Lambeth Suspension Bridge. If the questions, sometimes keenly contended, as to the proper limit or boundary between the provinces of the engineer and of the architect could be decided by a single experiment, that is the one. Structural beauty, we are told, consists in the adaptation of the means to the end. That which does the duty required, at the least cost, is that which the engineer seeks. In some cases, indeed, while striving after economy, he has attained to actual beauty. Telford did so in his suspension bridge over the Menai Straits; Rennie did so not unfrequently; Brunel did so repeatedly. The masons of Gloucester and other cathedrals did so in their flying buttresses and in many other of those graceful problems wrought out in stone; William Rufus did so, in the rafters of his Hall. And there is a school, or at all events there are professors, who tell us that the two things are one, or, at all events, if we can attain one we may wisely condemn the other. Let us have what is cheap! It is sure to be beautiful enough for us; or, if not, what signifies? Engineers do not build to please the eye, but to earn dividends.

A visit to the naked, bald, unmitigated hideousness of Lambeth Suspension Bridge will afford a mute but irresistible reply to all such preaching. It is, no doubt, very cheap and very convenient. The substantial cylinders, plunged in pairs to support the piers, or towers, or whatever the odious coffins set up on end that carry the chains are called, are workmanlike and well set. Economy is written in the largest letters over every detail of the work, and so is UGLINESS. One feels the poorer, the meaner, the worse, for looking at the structure. One shudders to pass under it. How it feels to go over it the Rambler had not the courage to try. Not only is it hideous in itself, but it is the cause of hideousness in every portion of the landscape of which it forms a part. Coming down the stream from Vauxhall, one of the finest views in any city in the world is obliterated and spoiled until this grim barrier is passed. Look down a full Thames towards Westminster. Northward, the gilded pinnacles soar towards heaven; to the right the white granite wall of the southern shore glitters in the sun; the light and graceful arches of Westminster Bridge span the water with the happiest effect—all in vain; so long as those rigid, shapeless bars, that trunk tucked up under the roadway, that everywhere obtrusive, everywhere offensive, utterly tasteless,

bundle of rods stretches across the view, you have no eyes for anything else. Pass Mr. Barlow's engineering triumph, and a nightmare seems removed from the breast, and the scene opens on your relieved vision with a beauty that is magical.

The Northern Embankment of the Thames is a scheme which has had the advantage of being discussed for some forty years at least. Sir Christopher Wren planned it. The imagination of Martin the painter was kindled by the desire to realise in London some of the noble architectural features of his cloud-built cities. The veteran James Walker prepared a plan for the Corporation. Mr. Page brought forward a design of his own. Thus before the frontage line was decided on by Act of Parliament, and the construction of the Embankment was committed to the Metropolitan Board of Works in 1862, the subject had received the full attention of competent advisers. The state of the river bank in the very centre of so populous a part of London, the need of relieving the over-charged traffic of the Strand, the gaining in time, in distance, and in health, which the passenger from Westminster to Blackfriars would receive by the use of the embanked road—and the reclamation of about 37 acres of land from the bed of the river—all these concurrent reasons appear amply sufficient to justify the occupation of the Middlesex shore by the northern quay wall.

The line of, and the scheme for, the Embankment on the southern side of the Thames, originated with the Metropolitan Board of Works. The Act of Parliament for its construction was obtained in 1863. The amount of time and consideration which could have been devoted to the subject, within the brief period of a year from the authorisation of the northern wall, appears ridiculously small when compared to the long and repeated study bestowed on the northern plan. We trust it may not prove a case of 'more haste, worse speed!' The shoal of barges that cluster round any accessible spot west of the present termination of the river wall; the foundations of wharves and piers which are now being removed from the bed of the Thames far to the outside of the new line of frontage; and the naked state, so far as river wharfage is concerned, of the 1666 yards now fronted with granite, did not seem, to our Rambler, to testify to the wisdom of the Metropolitan Board of Works. The value of the reclaimed land, on the Middlesex shore, is a gain equal to some three-fourths of the cost of the Embankment. On the southern side more land is given up to the Thames than is gained from it, and the whole 300,000*l.* appears to be an uncompensated outlay. It is a great cost for a new road through a locality that by no means appeared imperatively to need one. Why this road should have been constructed so as to shut out commerce from the Thames we are at a loss to understand.

As an architectural embellishment of a previously poor and squalid locality, the Southern Embankment wall has unquestionable merit. The direction of its line of strike with regard to the position of the sun in the heavens (during those hours when Londoners are aware of the existence of sunlight) is probably the reason why the mouldings and other details of this wall look so much bolder than do those of its Middlesex pendant. The section is, so far as the Rambler could ascertain, identical, but it requires actual measurement to convince one of the fact. In each instance, however, may be regretted the absence of a boldly projecting string-course, which would at the same time have given the great pictorial element of shadow, in which the elevation of the work is deficient; and have allowed the gain of at least a foot in width, over the entire length of quays, by avoiding the present set back from the upper part of the curved retaining wall, to the face of the parapet. The gain, indeed, would only have amounted to rather more than a quarter of an acre, but even the modest sum of five thousand pounds is not to be despised, when it can be earned without any cost but that of a little forethought.

The long unbroken structure of the Lambeth wall is another feature which it possesses, that renders it more admirable, architecturally speaking, than its opposite brother. The huge piles of granite that beset the staircases necessary for the service of the river traffic, on the Strand Embankment, contrast, to their own disadvantage, with the greater simplicity of the Lambeth quay. Looking at the great engineering merit of Mr. Bazalgette's work, and at the questionable character, to use the more courteous phrase, of certain of its architectural details, we are reminded of a book written, in the French language, by an able French author, but containing English quotations. Our readers who are familiar with French literature know how such quotations usually make their appearance. If the Lambeth Suspension Bridge could only be removed or replaced, the effect of this long, white, regular line of gently curving wall would be one of a simplicity approaching to grandeur.

The engineering effect of the Lambeth wall on the river will be to increase its scour. A large area is offered to the incoming tide. The old bank, which is now being excavated at low water, filled into barges, and sent down the Thames to be used as ballast, ran out in one part as much as fifty yards beyond the present shore line, defined by the quay. At the lower end, on the other hand, the water-way is contracted; and here the substitution of the sheer unbroken wall for the old sloping banks will allow of the more rapid rush of that larger body of water for which the upper enlargement of the width of the Thames will make room. There can be little doubt that the tendency of the recent works on the river, considered as a system, the contraction of the water-ways between Blackfriars and Westminster by some thirty-seven acres, the substitution of vertical banks for the old broken flats, the repeated narrowing of the actual channel by the piers and

cylinders of so many new bridges, will be to induce the current to burrow deeper in its bed. Thames, with a full tide and an easterly wind, will flow higher than it could have done while choked by the narrow water-way of Old London Bridge. Thames, lined by retaining walls, and vexed by repeated bridges, will be engaged in a constant effort to deepen his channel. We are far from having heard the last of this result of our recent engineering.

THE INSTITUTE OF PAINTERS IN WATER COLOURS.

IT may be fairly said of this Society—if we are to judge from the standard of excellence reached in the present and recent Exhibitions—that it has avoided the fate of many other junior Art Societies, which, taking a confessedly second-rate position in the limner's world, become a refuge for those artists whose works are rejected elsewhere. It cannot indeed boast of a Burton, a Boyce, or a Burne Jones. The several specialities of art which are associated with such names as those of Frederick Taylor, Carl Haag, Alfred Hunt, and Basil Bradley, may be unrepresented on its walls. But, happily for that diversity of taste which exists and which always will exist among British painters and their patrons, it does include in its list of members many whose fame rests not more securely on the individual excellence of their work than on the peculiar character of subject, which by a sort of prescriptive right they have made their own. First and foremost among these subjects may be reckoned the pictorial treatment of architecture, which, since the death of David Roberts, might have fallen into desuetude but for the exertions of Louis Haghe, Carl Werner, S. Prout, G. Simonau, W. Deane and others, whose works have long been identified with the Exhibition at this Gallery.

In the first page of the catalogue we find the title of a spirited and powerful work by Haghe, viz.: 'The Transept of Tournay Cathedral' (4), deftly drawn and coloured. The splendid chancel screen, rich in marble and carved panels, forms a prominent and effective feature in this view, while the picturesque crowd of ecclesiastics and peasants below is grouped with all the knowledge of a painter who has attained the secret of making his figures subservient to the purpose of architectural effect, without forgetting the interest derived from their costume and action.

The 'Interior of All Saints' Church, Margaret Street' (8), by John Chase, is, from the glaring freshness of its local colour, a far less thankful subject; and though the painter has taken what most artists would consider a fair license in subduing the crudity of certain hues, he has failed to give pictorial interest to the scene. Much of the execution is undeniably *painty*. The brass work fittings, for example, are represented by pure yellow, with little or no gradation of tint or suggestion of metallic sheen, while the drawing of carved work—especially in the capitals—betrays an ignorance of *motive* in architectural detail which is fatal to the picture.

With a word of praise to Mr. Harry Johnson's 'Granada and the Alhambra' (10), we must pass on to Mr. W. Deane's 'Interior of San Francisco, Assisi' (31), the very name of which recalls the highest sense of beauty which we can associate with grand simplicity of architectural forms, and delicate, well-toned hues of surface decoration. There is much that is tender and well-intentioned in this work, but unfortunately Mr. Deane wants practice in figure-drawing, and to this fact, taken in conjunction with an apparent indecision as to which portion of his subject should be defined and which generalised, may be attributed an appearance of weakness—the worst fault of his drawings.

Whatever may be the shortcomings of Mr. Haghe, want of force is a charge which cannot be brought against his interior of 'St. George's Chapel, Windsor' (37), where the Burial of King Charles the First is introduced by way of giving historical interest to the scene. We might, indeed, have spared some of the stern rigidity with which the minuter details of the elaborate stall canopies are mapped out, but, with that single drawback, every portion of this remarkable work is all that could be wished. The incident of the burial itself is full of dramatic power, and the clever group of Royalist figures in the fore-ground—watching half-mournfully and half-indignantly the obsequies of their lamented King—lends powerful aid to the composition. It is, perhaps, unfortunate for Mr. Skinner Prout that he bears a surname which was once associated with the best productions of English art in the pictorial representation of architecture, and we say this in no disparagement of his own work, which is often excellent, but because people *will* draw comparisons, especially when, as in the present instance, something in the choice of subject or method of treatment suggests what may be, after all, an unconscious plagiarism. It is well known that the elder Prout made no scruple of exaggerating on his paper those effects of time and weather which have generally more charm for the painter's eye than the refinements and proprieties of architectural detail. This license—call it fault or virtue as we may—his relative certainly perpetuates. It is impossible to examine his views at Abbeville (21), Rouen (42), Vire (55), without feeling this tendency in the artist to prettify and make a scene of his subject. They are all, however, excessively clever drawings, full of that dash in execution and play of colour which are sure to make such works attractive, and far more attractive than the result of more conscientious adherence to fact in representation.

Mr. Carl Werner's delineation of architecture is, in regard to accuracy of form and scrupulous fidelity of detail, absolutely faultless; but we cannot accept his colour as equally true to nature's key. Whether it be that in the latter case his perceptive faculties are less keen, whether he lacks as a painter the extraordinary power of execution which he certainly possesses as a draughtsman, or whether he wittingly and with definite purpose avoids the subtleties of blended and superimposed tints, we cannot say; but it is remarkable that while his studies have all the startling reality of a photograph, there is a uniform smoothness of tint in his treatment of local colour which is suggestive of printed work. This peculiarity is more than usually apparent in his view of the 'Entrance of the Citadel at Cairo'

(204), which presents an otherwise perfect picture—not only of the interesting structure which gives it title, but (by the addition of a crowd of well-studied figures) of Arabic street life. The Château de Chillon (71), with Bonnivard conducted as a prisoner to the fortress by the soldiers of the Duc de Savoie, is an excellent composition, full of beauty; whether we regard it as a landscape or an architectural study; though here again we must submit that the colour of the lake and distant hills has an unfortunate tendency to *prettiness* not worthy of the artist's brush.

Of Mr. Werner's 'Memnonas at Thebes during the Inundation of the Nile' (92) it is scarcely too much to say that, however much opinions may differ as to the method of his work, this extraordinary drawing could have been produced by no other water-colour painter in England. It embraces a double effect of light, the greater portion of the scene being steeped in full moonshine, while a fire lighted by a group of natives between the colossal and half-defaced figures casts a flickering glare on each. The first impression produced—let us honestly confess it—is one of intense truth in representation; and it is, perhaps, only the exceptional conditions of effect, coupled with the fact that it must have been to a great extent studied from memory, which leads one first to examine more closely, and afterwards to doubt whether this drawing is, after all, so literal a transcript of nature as a casual observer would certainly take it to be.

The same painter's studies of Oriental life, 'A Barber's House at Cairo' (138), and 'A Tailor's Shop at Damascus' (276), will be examined with pleasure by those to whom *incident* in pictorial art is of more importance than the impress of individual handiwork and feeling, and it must be remembered that a large majority of amateurs belong to this class.

The architectural subjects selected for illustration by Mr. G. Simonau, a Brussels artist, differ not more widely from those which we have just mentioned than their broad, bold handling does from the scrupulous neatness of Mr. Werner's execution. Under the title of a 'Bridge on the Nahe at Creuznach' (170), Mr. Simonau introduces us to one of those dreary half-dismantled 'back settlements' of an old German town, in which no one but a painter would tarry for five minutes, and in which half the picturesque interest depends on poverty and dilapidation. The crumbling plaster and neglected roofs—the ducks paddling in the lazy stream, over which women stoop to wash their dirty linen—do not sound cheerful materials for picture-making, and yet this is a noble drawing, limned and coloured by a master hand. Let us compare it with the pretentious struggle for architectural effect and magnificence of costume embodied in Mr. Deane's 'Festa of the Corpus Domini, Venice' (169), which hangs immediately above, false in colour and feeble in drawing; and we can but repeat the old truism that, after all, it is not the subject, but what a painter does with it, which constitutes a real work of art. Mr. Simonau also sends the view, 'A Street in Limburg' (145), another artistic and powerful work.

We must now turn to some of the more important landscapes and figure-pieces in the exhibition. Among the former, Mr. Edmund G. Warren exhibits a wonderfully realistic study from nature, the subject being the skirts of a wood in the full bloom of summer, with chequered light gleaming through the thick foliage and falling with startling reality on the foreground and middle distance. Here every detail is made out with extraordinary care—ferns, foliage, beech trunks, deer—all individually true to fact, but without obtrusion, and in perfect harmony. Such a work is at once an honour to, and characteristic of, its age, for in no other age has this literal rendering of landscape been achieved or even attempted in such degree; and here a serious question presents itself in connection with Mr. Warren's work, viz., as to whether it will last. Here is a landscape painted almost entirely in body colour—a material of whose permanent endurance we can certainly not yet judge, seeing that its present use is a comparatively modern innovation. We trust, for the sake of posterity, that such drawings may stand the test of time.

Mr. Kilburne's opening scene in Enoch Arden (207)—the boy and girl lovers sitting on the rocks in close converse, while Philip stands moodily apart, watching them—is admirably conceived and executed. Such a subject, in the hands of a commonplace artist, would assuredly have degenerated into affectation or vulgarity. But the chief charm of this picture is, that while Mr. Kilburne has invested the expression of his children with genuine sentiment, he has lost none of the simplicity of childhood in their features. Let us add of the accessories to this group—rock, sea, and sky—that they are equally worthy of the artist's brush.

'The Doubtful Coin' (45), by Mr. H. B. Roberts, is but a new name for a typical scene with which, under the title of the 'Rent Day,' &c., most of us have been long familiar. We recognise at once the conventional landlord or rent-collector, stern and uncompromising in expression, with his right-hand man or bailiff, half grim, half comical, in his yellow waistcoat and spectacles—the stagey tenant, in his traditional cloak—the parchment deeds and other 'properties' spread about the table, after the regular and approved fashion. This class of art is sure to find admirers in the mixed crowd of Exhibition loungers, and, what is more, rarely fails to fetch its price. But, with the exception of a certain cleverness in execution, it has little attraction for educated taste.

We have only space to mention a few other of the most notable works in this Gallery, viz.:—'My Grandfather's Choice' (16), an effective and characteristic old-world study, by Corbould; Mr. Green's 'Persuasion' (22), a *genre* picture, of some merit; the 'Faust and Marguerite' (163), chiefly remarkable for its original treatment of a hackneyed theme, by Mr. J. D. Linton, who also sends two other works, 'Squire Thornhill and Olivia' (245), and 'The Connoisseurs' (252), and two historical pictures widely different in aim, sentiment, and mode of execution, but each praiseworthy after its kind—L. Haghe's 'Cromwell on the Morning of the Battle of Naseby' (93), and Corbould's 'Joan of Arc' (63).

Upwards of 100 gold coins, some of them belonging to the reign of Henry VIII., were recently discovered at Dunblane while an old house was being pulled down. The coins are in a good state of preservation. It is said that the value of the metal is about 80*l.*

ON THE MOTTO OF THE ACADEMY CATALOGUE.

'If it be true,' says Rosalind, 'that good wine needs no bush; 'tis true that a good play needs no epilogue; yet to good wine they do use good bushes, and good plays prove the better by the help of good epilogues; and we may presume to extend her argument by adding, that good books of all kinds prove the better by the help of good mottoes. This is hardly the place to enquire into the origin of mottoes on title-pages, however interesting the subject might be, or to discuss the purposes they are supposed to subservise. There is evidence enough of the extent to which they continue to be adopted, in books of all kinds, from the 'Modern Painters' to the 'Tusseau Catalogue.' Whatever may be its value, the custom of using them is a good old-fashioned one, and deserves to be commended, as amongst other ends, it sometimes suggests to the reader the spirit in which it is wished that a book should be read, or the subject be regarded, and sometimes the spirit in which the author professes to have written.

There was nothing unusual in the first Catalogue of the Royal Academy, published in 1769, bearing a motto on the title-page, and it was hardly surprising that it should be in Latin:—

Major rerum mihi nascitur ordo.

The Academy's Professor in Ancient Literature, Dr. Samuel Johnson, considered English words unworthy to form the epitaph on an English writer in an English church, so it would be strange if at such a time the infant Academy lisped in English. The interest of the public in the early exhibitions was therefore solicited for the title-pages of the succeeding catalogues by Pliny, Cicero, Livy, Horace, Quintilian, Publius Syrus (the patron of the *Edinburgh Review*; although none of the founders ever read any of his works), Martial, Ovid, Seneca, Ariosto, Epicharmus, Velleius Paterculus, Pindar, Homer, and Philostratus. If the first Professor in Ancient History, Oliver Goldsmith, M.B., had lived long enough, one can fancy him suggesting that his erudite friend, Ephraim Jenkinson, might be allowed to grace the catalogue with some of the opinions broached by Sanchoniathon, Manetho, Berosus, and Ocellus Lucanus, for the apophthegms with which that gentleman confounded Dr. Primrose have almost as much reference to painting, sculpture, and architecture, as some that might be taken from the Academy's favourites.

For forty-three years no English writer was considered eligible to supply a sentence for one of the title-pages. In 1812, however, the Academy had the hardihood to take a few lines from the 'Winter's Tale,' and with all due respect for those very pretty fellows Epicharmus and Velleius Paterculus, the English motto appears to be quite as appropriate as theirs; indeed it seems to us to indicate one relation of art more subtly than all the previous mottoes combined, or than many a ponderous discourse subsequently delivered in the Academy and elsewhere. It is from the well-known speech of Polixenes to Perdita, and this is how it appeared:—

*Nature is made better by no mean
But nature makes that mean; so o'er that art
Which . . . adds to nature, is an art
That nature makes.
The art itself is nature.*

Observe how neatly it was trimmed, before it was served up. In 1853 the same quotation is made, but copied more truly, and this is all, it would appear, that it is possible to discover in Shakespeare during a whole century, in any way fitted for the compilers' purposes.

Shakespeare was succeeded by the Classics (the learned Benjamin West was President) until 1817, when another English motto appeared; this time it was taken from the Report of the Parliamentary Committee on the Elgin Marbles, and it is equally deserving of attention by the Parliament now sitting:—

Your Committee cannot but submit to the attentive reflection of the House how highly the cultivation of the Fine Arts has contributed to the reputation, character, and dignity of every Government by which they have been encouraged, and how intimately they are connected with the advancement of everything valuable in Science, Literature, and Philosophy.

In 1819, and again in 1852 (good English mottoes are supposed to be scarce, therefore there must be thrift in using them), Bacon was allowed to supply the sentence—

Painting raises the mind by accommodating the images of things to our desires.

Then, until 1827, Greeks, Romans, and Michael Angelo were the chosen ones, when what Dr. Johnson said of dramatic imitations was applied to painting and sculpture—

Imitations produce pain or pleasure not because they are mistaken for reality, but because they bring realities to the mind.

Not a very deep remark, perhaps, but there are worse in Latin; and such as it is, it served again in 1844. In 1830 there was an extract from an old report of the British Institution, with which we are sure everyone will agree:—

We feel, however, no apprehension but that the spirit of the British artist will be awakened and invigorated whenever a free and fair scope shall be given to his talents, whenever he shall be stimulated by the same patronage as that which raised and rewarded the Italian and Grecian masters.

In 1833 Adam Smith's 'Theory of the Moral Sentiments' was the source from which the motto was taken, but it is rather long for quotation here. Sir Joshua's 'Discourses' were first thought of in 1836, and artists and visitors were reminded that

The value and rank of every art is in proportion to the mental labour employed in it, or the mental pleasure produced by it.

This motto answered also in 1861. In 1846 Sir Joshua was again honoured by being chosen, this time informing us that—

A passion for art and an eager desire to excel will more than supply the place of method.

And the somewhat eclectic motto for 1862—

We must be contented to make up our idea of perfection from the excellences that are dispersed over the world,

was taken from Sir Joshua's 'Tour.'

In 1839 the motto was from Wood's 'Essay on Homer,'—

We consider nature but transiently till the poet or painter awakes our attention and send us back to life with a new curiosity, which we owe entirely to the copies that lay before us.

The President, Sir Martin Shee, furnished the motto for 1847, which says, in the true Academy style—

To nature still we must look, through the productions of the great masters, and consider even the best works of antiquity but as the telescopes of taste to mend our vision, not to bound our view.

For 1848 a characteristic sentence was taken from Hogarth:—

True art can only be learned in one school, and that school is kept by nature.

Pope, in 1850, shrewdly says:—

Art is like a prudent steward that lives on managing the riches of nature.

And in 1851, the Great Exhibition year, the capital motto,

The pencil speaks the tongue of every land,

is from glorious John Dryden, and is a model of what a motto ought to be—short, vigorous, and appropriate.

For 1854 this familiar couplet was taken from Pope:—

Nature, like liberty, is but restrained
By the same laws which first herself ordained.

With the addition of the two preceding lines, it was used again in 1865.

It is hardly necessary, perhaps, to give the later English mottoes, but we do so to make our selection complete. In 1866, the year after his death, the fine motto was from Sir Charles Eastlake:—

Beauty in all its highest forms is calculated to impress on human beings the belief in a perfection greater than the world contains.

In 1867 it was from Sir Thomas Brown:—

I call the effects of nature the works of God, whose hand and instrument she only is. Nature is not at variance with art, nor art with nature, they being both servants of His providence.

And last year's was from Isaac Disraeli:—

The poet and the painter are only truly great by the mutual influence of their studies. Milton, Michael Angelo, and Handel belong to the same order of minds; the same imaginative power and the same sensibility are only operating with different materials.

To sum up the results: in a hundred years the Academy Catalogues have eighteen mottoes in English. If we exclude those from painters and from official reports, we have ten sentences to represent all the allusions or sentiments that in any way relate to art in the richest and noblest literature in the world. There are seventeen mottoes from Cicero (almost as many as from all England), and not one word from Edmund Burke, of whom such a judge of ancient and modern literature as Thomas De Quincey could say, 'that for the intellectual qualities of eloquence, in the fineness of understanding, in depth and in large compass of thought, he far surpassed any orator ancient or modern.' It cannot be possible the Academy Authorities know so little of English poetry, that one garbled sentence from Shakespeare, four lines from Pope, and one from Dryden, are all they can discover suitable for so simple a purpose. An ordinary school-boy ought to be able to find a hundred sentences from a hundred English authors in every way appropriate.

It does not matter much in what language the motto of the Catalogue is expressed, as a large number of the visitors probably never look at it. Even if there were no motto, its loss would not be minded, for the paintings would be likely to be of the same character, and would meet with as much appreciation as if the title was nearly covered with the best sentences in any language. But if such things are to be used, our own language answers all purposes as well as any dead or living language. Why should another tongue be adopted rather than ours? English words are as fair, they become our mouths as well, and if they are conjured with, they will fill the Academy treasury with shillings as quickly as any other words can. The English mottoes we have taken will compare favourably with the remainder in other languages; and remembering this, we must regret the want of national spirit by which it has happened that so small a proportion are home made.

Since the present President attained his high office, none but English mottoes were adopted until this year. We had hopes that we saw the last of the classical mottoes until those in English were exhausted. We were disappointed, however, at finding on the Catalogue just issued the words

Labor et ingentum.

There are some words for which corresponding and equivalent terms may not be found in other languages. But it is not so in this case. It would have been easy to represent the ideas as truly by familiar English words as by Latin words. Neither is the motto a sentence that can be ascribed to any 'classical' author for its origin, it denotes no great research on the part of whoever suggested it, nor is it easy to see the advantage it gives to the Academy or to the visitors. It is merely the latest example of an absurd fashion which the Academy has too long followed.

PARIS ANNUAL EXHIBITION OF WORKS OF ART.

THE doors of the Salon in the Champs Elysées were thrown open on the morning of May 1, and ten thousand visitors went to take a first glance at a collection of nearly five thousand works of art. The growth of the Paris Salon, or exhibition, is marvellous; in the year 1853, the catalogue of which is before us, the number of entries was 1,768, this year it is 4,230. The number of oil paintings is 2,452, and this is not so large as that of last year.

The possession of a permanent place of exhibition enables our neighbours to find room for everything, and to put it where it can be seen, and they could still do so even if the extent of the collection were twice as large as it is, which is certainly not to be desired. As to the management of the light, the method adopted in the French galleries at the Universal Exhibition—namely, that of covering the glass roof with thin unbleached cotton, and then suspending a semi-transparent false ceiling or canopy in the centre of the room, at about the height of the top line of the pictures—

seems to be definitely adopted, and to give general satisfaction. The fact that such a number of paintings as are contained in the fifteen great rooms devoted to oil paintings should all have sufficient and not too much light is one which well deserves notice and the attention of artists of every class as well as managers of public institutions; and being produced by the simplest possible means gives additional value to the achievement.

The sculpture is placed in the central area of the building, which is laid out as a geometric garden and charmingly decorated by the Horticultural Society, whose spring exhibition will be held here during the current month, the larger pieces being placed in the central and transverse avenues, and the rest against the sides and ends, which are draped with dark neutral-tinted calico. This placing of sculpture amongst vegetables, as certain carping critics expressed it, is, on the whole, eminently successful; every work is sufficiently isolated and can be viewed from all sides, while the large expanse of the area keeps the air fresh and the senses of the visitor un-fatigued. The superiority of this to the gallery system was triumphantly proved when on two occasions lately the works of the sculptors were exhibited in the lower side aisles of the building. In 1867, when much of the French sculpture was shown in the enclosed central garden, it was almost universally admitted that the glare of unshaded light was injurious to the effect of the more delicate works. Notwithstanding the central roof-covering of unbleached cotton referred to, the mass of light is too great for delicate sculpture in white marble, and probably it would be well on some future occasion to try the effect of a *velum* or canopy suspended at a moderate distance from the ground, or else to place a slight screen over the smaller groups and statues which occupy the sides and ends of the garden. As many English artists and amateurs are in the habit of visiting the Paris Salon, we think it well to draw attention to this important subject of the lighting of works of art, which may here be studied on a large scale.

The Emperor's grand prize of a hundred thousand francs has had a bad effect on the exhibition of paintings; there is an unusual number of large canvasses which, in spite of great technical ability and a very marked improvement in colour and—in general—admirable drawing, only prove the absence of historical, religious, and high poetic art. Every attempt to reach either of these pinnacles must, we fear, be pronounced a lamentable failure, and we deeply lament that such is the case, for in the fine arts every great achievement is a benefit and a stimulus for the whole civilised world.

There is one large work, not painted with a view to the great prize, which occupies the most prominent place in the central room of the exhibition, and deserves special notice; it is a painting of immense size, for a concert room connected with the new Grand Theatre of Bordeaux, by M. Bouguereau; the subject, Apollo in Olympus. The brilliant god is playing before Jove and all the assembled divinities. The composition of this work is wanting in keeping; Jove is wanting in grandeur, Apollo in importance as the central figure, Venus and the Graces in beauty; but there is a large amount of fine, bold, and careful drawing in the figures of Mercury and others in the foreground, especially valuable in a decorative work of such magnitude. A school which can produce such drawing as is here seen only wants a little more sentiment to place it in the first rank.

It would be unfair to speak generally of two thousand easel pictures in a few short lines, but we may just indicate the remaining contents of the great central room in which most of the gems are placed. Muller has a really fine historical work—a worthy pendant to his famous 'Last Days of the Reign of Terror'—representing the struggle between Lanjuinais and the savages of the Convention on June 2, 1793. The scene wants the sad charm of the former, the passion exhibited is all of one kind; but the work is that of a master, and the most remarkable that we have yet found in the exhibition.

A picture by Fromentin, representing Algerian Arabs performing a military fantasia, occupies the place of honour on the lower line, and is a brilliant work, full of life and colour; the central figure, a fierce old soldier, who seems to have excited both himself and his horse to madness, is very remarkable; in fact, the whole composition, drawing, and colouring of the work reflect the highest credit on the artist.

The most noticeable amongst the remaining works are two military subjects by Protais, showing no advance on the part of this artist; landscapes by the late Paul Huet, d'Aubigny, Nazon, and François; a bit of remarkable Alpine scenery by Gustave Doré, who this year exhibits two works of the same class; and a charming study beneath the beeches in Burnham Wood, by our countryman, MacCallum. We should like to see this clever artist extend his horizon a little, but admire his observation, his truthfulness, and his effects, whether of gnarled roots, crumbling banks, or sunny glows. We must not omit to mention one of Blaise Desgoffe's marvellous pictures of *objets d'art*, flowers, and tissues; and exquisite fruit-pieces—ripe plums and apricots lying on a mossy bank—by M. Maisiat of Lyons.

We must dismiss the sculpture for the moment, with the simple mention of a few of the most prominent works. A statue of Mdlle. Nilsson, as Ophelia, by M. Falguière; Despair, by M. Perraud; Narcissus, by M. Hiolle; the Woman taken in Adultery, by M. Cambos; and a statue of Cleopatra before Cæsar, by M. Clésinger, an elaborate example of composite statuary, tinted marble loaded with enamelled work and jewellery.

In the Architectural section there are upwards of ninety exhibitors, but the names and numbers were not in order on the opening day. There seems to be a paucity of designs for great buildings, but a good many churches, and some important restorations proposed or executed. We are sorry to find only one English name in this section.

Fire at Plymouth.—A fire broke out on Sunday morning (the 9th) in the large steam biscuit factory of Messrs. Dawe & Serpell, Commercial Road, Plymouth. The whole of the buildings and their contents were destroyed. The premises were formerly part of the Government Lambhay Victualling Yard, where the men-of-war were victualled from before the erection of the Royal William Victualling Yard, Stonehouse.

SOUTH STAFFORDSHIRE INDUSTRIAL AND FINE ARTS EXHIBITION.

ON last Tuesday the South Staffordshire Industrial and Fine Arts Exhibition was opened by Lord Granville in the hall which has been erected for the purpose in the grounds attached to Molineux House, Wolverhampton. The building, which is of iron and glass, forms a central nave 150 feet long by 60 feet in width, and 18 feet high at the spring of the roof, which is semi-octagonal, and rises to a height of 45 feet from the floor. Around the building is a Fine Arts Gallery, containing nearly 800 oil and water-colour paintings. The objects of industry exhibited are placed on the floor and outside the building. The Executive Committee, in their address to Lord Granville, said the first idea of this undertaking was conceived about a year ago by a few persons who were much interested in promoting the welfare of the Wolverhampton School of Practical Art and of the South Staffordshire Educational Association. Both these institutions were much in need of funds to increase their utility; and a proposal was made that any surplus derived from the proceeds of the exhibition should be divided between them. It was felt, too, that the great importance and variety of the manufactured products of South Staffordshire and East Worcestershire had never hitherto been fully shown by collecting them in one place, and that the proposal to supply this want by a local industrial exhibition, supplemented by fine arts and natural history collections, could not fail to excite widespread interest, and benefit all classes in the district. The address went on to show how, with these objects in view, the building had been erected. Three acres of pleasure ground had been secured around it, and a list of 200 guarantors obtained. It stated that the industrial exhibitors numbered upwards of 130, and the contributors of art treasures more than 120. The committee then acknowledged the kindness of Her Majesty in lending the Abyssinian trophies; of the Kensington Museum managers in sending specimens of metal work, water-colour drawings, &c.; and of the Secretary for India in contributing objects from the East Indian Collections.

Lord Granville stood upon a dais (surrounded by Lord Lichfield, Lord Wrottesley, the Bishop of Lichfield, Sir Smith Child, M.P., Mr. M. Ingram, M.P., Mr. Villiers, M.P., Mr. Weguelin, M.P., the Mayors of Wolverhampton, Birmingham, Worcester, and Kidderminster, and many others), while the address was read by Mr. N. N. Solly, J.P., Vice-Chairman of the Executive Committee. In responding, he spoke of his having fifteen years ago laid the foundation stone of the School of Art in that town, a town with which in early times his family had been connected, and in the chief industries of which he was himself immediately interested. It was a high distinction for the district that they should have been among the first to erect a building specially for the purposes of promoting industrial art. The address spoke of a surplus. His experience since the first exhibition was that if the promoters made two ends meet they deemed themselves fortunate. As, however, the committee here, who aspired so high as to look for a surplus, were men of business, he supposed and trusted it would be secured. His Lordship praised what he saw around, speaking with especial pleasure of the building, and the chasteness of its decoration. It was no slight praise to the contractors that it should have been delivered up complete on the day promised. What was exhibited in the hall could not but prove highly instructive to all who saw it. Fifty years ago no thought was given to the education of the operative, and twenty-five years ago it would have been thought unnecessary to educate him beyond the immediate range of his calling. But now that we had rivals in other countries, our industry, if it was to be successful in its competition with that of other nations, must be educated, and the education must extend, not to the men only, but also to the masters. Referring to the committee's acknowledgment of the Queen's contributions, the noble Earl spoke of Her Majesty's unabated desire to promote that which was at once most dear to herself and to her late Consort, the industrial and art education of her people.

After the ceremony, his Lordship was entertained at luncheon in the Exchange.

The architect and designing decorator of the Exhibition Hall was Mr. Bidlake, of Wolverhampton, and the contractors were Messrs. Clarke & Co., of the same town.

NEW CONSERVATIVE CLUB HOUSE.

THE new Junior Carlton Club is from the designs of Mr. Brandon, and has been erected by Messrs. Lucas Brothers, at a contract cost of about 40,000*l.* The principal front is in Pall Mall, nearly opposite the old Carlton, and the other front in St. James's Square. The Pall Mall entrance is at one end of the building, as there was not sufficient space for the length of the rooms to run from front to back. Three storeys are shown externally, beside a basement. The ground storey has circular-headed windows, an entrance porch on rich and massive columns at the eastern end corresponding with a similar projection, containing a circular bay window at the western. The first floor storey is the site of the coffee-room, which runs along the entire length of the house, and presents nine windows, surmounted by richly carved circular pediments, resting on polished red granite shafts. The second floor has an equal number of square-headed windows with richly moulded architraves, above which is a panelled and carved frieze and cornice, the whole elevation being surmounted by a balustrade. With the exception of the granite columns to the first floor windows, the whole front is of wrought stone. The entrance hall is square, and the staircase entirely of stone, with heavy bronze balusters; a polished marble plinth extending to the second floor. The columns and pilasters in the hall, too, are of the same material, the floor being a tessellated pavement by Minton & Co. A smaller entrance hall gives access from St. James's Square, and contains another staircase. On this floor also are the reception room, morning room, and members' smoking-room. The grand coffee-room, before referred to, is 123 feet long, by 30 feet wide, and 20 feet in height: about 30 feet from the western end of it is a screen of Scagliola marble columns, beyond which is

the portion of the room allotted for strangers, and the length of which extends from front to back of the building. The walls and ceilings of these rooms are panelled, and richly moulded and ornamented. A handsome library looking on to the square occupies the remainder of this floor. On the second floor are—a strangers' smoking-room, two billiard-rooms, one to contain two tables, and the other one table, the Parliamentary library, a small card-room, old newspaper store, and offices, and private apartments for the secretary and assistant-secretary of the club. Above this floor is an attic storey, devoted almost entirely to sleeping rooms for the servants, and provided with bath-rooms, and every requisite for them. Descending below the ground again we come first to a mezzanine basement, in which are sundry offices in connection with club business, but chiefly dressing-rooms for members. On the main basement is a vast kitchen, fitted with every appliance necessary for cooking on the most extensive scale, a proportionately sized scullery, housekeeper's, butler's, or still-rooms; several larders for different kinds of provisions, and extensive cellarage, with a lift provided especially for the lowering of wine from the street. There is lavatory accommodation on every floor; the bells throughout the house are rung by electricity; there is a hydraulic 'lift' for raising to each floor, and the latest improvements in heating and ventilating have been adopted. The building is fire-proof. The gas fittings and other metal works are provided by Messrs. Benham of Wigmore Street; and the upholstery is supplied by Messrs. Banting of St. James's Street.

ARTISTS' GENERAL BENEVOLENT INSTITUTION.

THE Fifty-Fourth Annual Dinner of this Institution took place on the 18th instant, at Willis's Rooms, under the presidency of Lord John Manners.

The CHAIRMAN, in giving the toast of 'Success to the Institution,' observed that in some countries gratitude was shown towards those who embellished the forms of civilised life in various modes, and the claims of art were recognised by a generous State patronage. Such a course was not consonant with the habits and customs of England; but in this matter of assisting art, the Government of this country could claim credit for having done something by the installation of the Royal Academy in its new home at Burlington House. That measure of public support still, however, left to private individuals the duty of showing their gratitude to those who achieved these triumphs of art. It was with the reverse, wants, and sufferings of artists that this society, whose claims he advocated, occupied itself. During the last year the society had received eighty-one applications for assistance, and had distributed 1,432*l.* in grants for relief. Among the recipients of the relief afforded were representatives of several miniature painters. There were no collections in ancestral houses that were more interesting than miniatures. Their wonderful finish and brilliancy of colour, and the minute rendering of dresses and accessories, brought back to mind the qualities of the sovereigns, statesmen, and eminent men of the fifteenth, sixteenth, and seventeenth centuries. The great luminary of day, the sun, had, however, lately cast its shadow over this charming branch of art. That being so, and the sphere of the miniature painter becoming more contracted, it was the more incumbent upon individuals who derived pleasure from the contemplation of works of art to endeavour to meet the ever-widening circles of distress which these changes must produce. All the branches of art were subject to the countless vicissitudes of human life, and in the moment of suffering and despair this society offered its discriminating aid, respecting the sacred privacy of the artist's life and home, and administering with economy the funds which the benevolence of its subscribers had provided. A proposal had been made to found a college for providing education for the children of artists, and that plan would shortly be submitted for the consideration and support of the institution (cheers).

Sir F. GRANT, in replying to the toast of 'The Royal Academy,' made some interesting observations respecting the present exhibition. The committee's task this year had presented special difficulties, arising from their inexperience of the capabilities of the new building, but they hoped that next year, with increased knowledge and experience, they should be able to give still greater satisfaction. The first impression of the committee was that they would not have pictures enough to cover the walls, and it was not till a late moment that they became aware of the melancholy fact that they would be straitened for room; but the committee went to work with the most laborious zeal, and at length all the selected pictures were hung. They were immensely indebted to the energy of their architect, Mr. Smirke, who came to the rescue in what threatened to be a serious emergency, and in a couple of days, by employing a large number of workmen, had temporarily prepared the lecture-room so that it could be used for the purposes of the exhibition. But when all had been done, the committee, to their great sorrow, found themselves obliged to refuse some thirty or forty pictures whose merit was sufficient to make the committee anxious to have found room for them if possible, as forming part of the 4,600 works of art sent in. It was said, there was to be a supplementary exhibition. He begged to say, on the part of himself and colleagues, that he earnestly hoped it would obtain the greatest success.

Among other toasts, Mr. A. TROLLOPE proposed the various Societies in connection with Art, the Old and New Water-colour Exhibitions, the Dudley Gallery, and others, reminding his hearers that the Royal Academy was by no means the only exhibition in the metropolis in which the painter's art was represented.

To this fact the CHAIRMAN also bore testimony, observing that in the various exhibitions now open in London not less than 3,760 pictures were on view.

The subscriptions acknowledged during the evening reached the handsome figure of 1,517*l.*, a larger amount than is on record at any previous gathering of the friends of the institution.

GROUND PLANS OF TWELVE DESIGNS FOR THE NEW CATHEDRAL, BERLIN.

PRUSSIAN 0 50 100 200 300 FEET

Engraved by W.W. Spink & Co. London, E.C.

Bourges Cathedral,
DOOR WAY IN SOUTH PORCH.
FROM A PHOTOGRAPH.

THE STRIKES IN LANCASHIRE AND YORKSHIRE.

ON Saturday, 8th inst., seven hundred plasterers struck work in Manchester, leading likewise to the enforced idleness of a hundred and fifty labourers. The masters some time ago gave notice of their intention to adopt the system of payment by the hour, and to refer trade disputes to arbitration; but on Thursday, only two days before the notice expired, the men announced their determination to reject those conditions, and left their work simultaneously.

The operative stonemasons have for the most part refused to comply with the appeal of Lord Lichfield and others to avoid a strike, by submitting the questions in dispute to arbitration. Those questions chiefly refer to the masters' proposals for payment by the hour, the abolition of restrictions on the use of machinery, and the cancelling of the rule which prevents stone being worked at the quarry. The Liverpool men have come to a temporary arrangement with their employers; and at Lancaster, on Saturday, it was resolved by a majority to continue work on the masters' terms; but at Bradford, Bolton, and several other towns, there was a turn-out on Monday, and there is every likelihood of the strike becoming general.

The masons of Wolverhampton have also struck against payment by the hour, the settlement of disputes by arbitration, and the using up of worked stone. There has been a partial lock-out at Bolton.

The ironmasters of the North of England and their workpeople are to be commended for the sensible way in which they have settled disputes. Some time ago the men demanded an advance of ten per cent. upon their wages, which the ironmasters declined to accede to, and the matter was submitted to the local board of arbitration, but no settlement could be arrived at. Mr. Rupert Kettle was then called in as arbitrator, and that gentleman, after going through the masters' contracts, intimated that the trade would not bear an advance now, but would probably bear what the men asked before long. Mr. Kettle, however, suggested an advance of 5 per cent., and the compromise has been cordially accepted on both sides. A further happy suggestion has met with general approval, and is to be tried. It is that a sliding scale of wages should be formed, based on the selling prices of manufactured iron. It is obvious that such a scheme has great difficulties in its way; but if it can be made to work, the question between capital and labour will be so far settled. Once got it generally accepted that profit and wages should bear a certain definite relation to each other, and let it be distinctly agreed what that relation should be, and a treaty of peace between capital and labour will have been signed and ratified.

The operative house-painters of Glasgow struck work on Monday for an advance of wages.

RENOVATION OF ARTHURET CHURCH.

THE ancient church of Arthuret is situated at almost the extremity of the English Border. Originally a low, mean building, adapted to its exposed situation, and often destroyed by the Scots in their devastating raids across the Border, the present church, according to Hutchinson, was built in 1609; but the date, judging from the principal parts of the present edifice—chancel, nave, and aisles—appears to be earlier than the year 1500, and it is probable that the original edifice was built during the latter part of the 15th century. The style of architecture is 'Tudor.' Now, however, the old has been made new, most of the leafy covering of the walls has been removed, and the pleasing alternations of green yet sombre ivy and grey crumbling stone have given place to a mixture of light and shade occasioned by the difference between the ancient and modern masonry, which has, to a considerable extent, destroyed what mainly constituted the charm of the edifice. The tower, except as regards the doorway in it, has not been touched, the principal portion of the external improvements having been made at the east end. Originally the roof of the chancel was flat, and somewhat lower than that of the nave. It has now been raised so that the whole of the roof from the tower to the end of the chancel is of the same height. The old east window has been accurately and carefully restored, and the gable surmounted by a cross. This cross is entirely new, is four feet in height, is very neatly sculptured, and has the date of the renovation, 1868, carved at its base. The raising of the gable in this manner is a great improvement, and gives a better effect to the large chancel window. The other external alterations require little notice, being merely renovations of the old walls, without changing the construction of the edifice. In the interior, however, everything is changed, the whole of the arrangements having been altered; and there is nothing to remind one of the past except one or two old cenotaphs upon the walls. Perhaps the most important improvement is in the roof, from which the old flat plaster ceiling has been removed, and succeeded by an open roof of oak. The floor, except in the centre aisle, has been boarded—an improvement which increases the comfort of the congregation. The pillars and arches, which were previously covered with plaster, have been stripped of their covering and carefully cleaned. In order to increase the number of sittings, the centre aisle has been made narrower by elongating the seats, which have also been greatly improved by having been converted from old-fashioned square pews into open benches. The western and chief doorway has been enlarged; it was formerly small and round, but is now composed of a pointed arch, and is a very handsome doorway. But the chief improvements and alterations are in the chancel. Here the old reading desk has been replaced by a new one of oak, elegantly carved; and a handsome oak pulpit has also been substituted for the old one, and has been placed in the nave at the foot of the chancel steps, instead of in the chancel itself, as was the case with the old one. On the north side of the chancel a Gothic oak screen has been erected in front of the pews appropriated to the use of the Graham family. On the south side is a small vestry, a convenience which the church did not formerly possess.

The greatest ornament of the chancel, and, indeed of the whole church, and that for which the church will always be most celebrated, is the

window erected in memory of Sir James Graham. It is 18 feet in height, and 14 feet in breadth, and alike as a whole and in its minutest details cannot be regarded otherwise than as one of great beauty. It contains six lights, all filled with stained glass, and its general appearance is very imposing. The building has been renovated under the superintendence of Mr. D. Birkett, architect, the window being from the establishment of Messrs. John Scott and Son, stained glass manufacturers, Rickerigate.

ILLUSTRATION.

SOUTH DOOR, BOURGES.

THE Cathedral of St. Stephen of Bourges is remarkable for the number of its portals. The western façade has five grand entrance doorways, corresponding with the respective widths of the nave and the four aisles. On the north and south sides of the church, which is without transepts, at the sixth bay, are lateral porches, forming, in each case, the approach to a richly-sculptured doorway. A view of a portion of the southern portal is given as one of our illustrations for this week.

The doorway is divided into two entrances by a central shaft; against this is placed a standing figure of Our Lord, whence the porch derives its name of 'le portail du Christ.' The statue is now much mutilated; originally the right hand was in the act of blessing, and the left held the orb.

The lintel is carved into twelve niches, containing seated figures of the Apostles, and, in the tympanum above, not shown in the drawing, is Our Lord in glory, surrounded by the evangelistic emblems. In the nooks of the jambs are figures of kings and prophets, standing on short pedestal columns, and surmounted by canopies. The nook-shafts terminate in richly historiated capitals, the key to the interpretation of which is now lost. The semicircular enclosing arch consists of three orders of mouldings. That next the tympanum is carved into figures of angels in adoration, and offering incense; the next is formed of apostles, prophets, and kings; and the third is a roll-moulding, richly ornamented with interlaced work. The whole bears traces of the colour with which it was formerly decorated (Girardot & Durand, Cath. de Bourges).

This portal, together with the parallel one on the north side of the church, is remarkable as being, for the most part, of a much earlier date than any of the rest of the work in the building. The present Cathedral was projected in A.D. 1172 by the Bishop Etienne, to replace the old church of the eleventh century, but was not actually commenced till the early years of the thirteenth. Now the sculpture on these doorways dates from A.D. 1140–1150, with the exception of the figure of Christ, the mouldings of the plinth, and some of the little columns supporting the figures (in the lithograph, the one in the central shaft and the outer one in the jamb); these are evidently work of the thirteenth century. These doorways must, therefore, have formed part of the earlier edifice, and, on account of the beauty of the sculpture, were preserved and incorporated with the new work (Viollet-le-Duc, vol. viii., p. 204). A parallel case to this is the Porte Ste. Anne, of the Cathedral of Paris; in England, also, there are numerous instances in which a richly-sculptured Norman doorway is the only relic of a previous structure. The porch in front of the portal was erected in the middle of the thirteenth century.

The door, which is a fine specimen of fifteenth-century woodwork, was presented to the Cathedral about the year 1450 by Jean, Archbishop of Bourges, and son of the celebrated Jacques Cœur of that city. The arms of the Cœur family are seen displayed on one of the little shields in the upper panels.

H. W. L.

THE BERLIN CATHEDRAL COMPETITION.

ON several former occasions we have mentioned the competition which was invited for this purpose, and which resulted in the production of 55 sets of designs, now exhibited at Berlin. Although all Europe was invited to compete, but few non-German architects responded, and the exceptions were one Belgian, two Frenchmen, and a naturalised Egyptian (a German by birth), Herr v. Diebitsch, of Cairo. The last, yet in many respects not the least, to arrive was a set of plans designed by H.R.H. the Crown Princess of Prussia. The idea of a great Protestant Cathedral for the capital of Protestant Germany emanated with the architect Schlüter, who, about a hundred years ago, was employed in erecting the present Palace, at right angles to which then stood an old Dominican church. But Schlüter did not live to finish the Palace or to begin the Cathedral, and his successor Baumann, after finishing the former building, pulled down the Dominican church in 1707, and erected the barn-like edifice which at present does duty as the chief metropolitan church of Berlin. Then Schinkel, who afterwards did so much for his native city, appeared on the scene, and attempted to give Baumann's barn a more monumental character by adding the three domes and the portico, with which the traveller is familiar. But he felt that even in its altered form the Dom was not worthy of the position it occupied, and produced a Gothic design, magnificent in plan but faulty in elevation, faulty at least as regarded by the light of our present knowledge of and feeling for Gothic. This is the plan No. 7 on our illustrated page. The third design was that of King William IV. of Prussia. Having to deal with a site measuring about

400 ft. by 250 ft., he appropriated the space to a Cathedral 228 ft. by 210 ft., and a 'Campo Santo' 183 ft. square by the side of it. The church was to have five aisles, the central one or nave having a width of 80 ft. by a height of 140 ft. to the top of the vaulting. The 'Campo Santo,' destined for the interment of Prussia's greatest men and of the royal family, was to consist of open cloisters round an open central space, and the walls were to receive frescoes, the studies for which were prepared by the great Cornelius.* Unlike the two former plans, this was in the Byzantine style, the motive for the adoption of that style being to identify the simplicity of the Lutheran service with that of the primitive church, as distinct from the Roman Catholicism of the middle ages. About the year 1846 operations were commenced by laying the foundations of the cloisters, but two years later the works were stopped.† M. Stüler was then commissioned to prepare the fourth design (see No. 3). He did so. A large model was made, and the plan, which was a modification of the King's, was adopted, when the project was again shelved at the death of the late King. Then M. William Stier produced his plan (see No. 5), but it was not accepted; and finally, in 1867, the idea was once more brought forward, and in the autumn of that year the present competition was published by decree of the Minister of the Interior. But, from what we hear, this ill-fated work is still as far as ever from actual execution. The jury, after throwing out all Gothic designs, as unsuitable to the surroundings and to the character of the city generally, have closed their deliberations; and their verdict is that, whilst admitting the beauty and fitness of many of the plans, and especially those of ten competitors, they cannot recommend the execution of any particular plan, and they advise a fresh competition. The ten designs recommended are those of Messrs. Ende and Böckmann, Orth, Heyden and Kullmann, Eggert, Gropius and Schmieden, Adler, Klingenberg, Spielberg, Hildebrandt, and von Quast. All these gentlemen discard nave and aisles as unsuited to the Lutheran form of worship, and have adopted the central hall in the various modifications shown in the collection of plans which we give this week. They all accept the idea that the Campo Santo should be retained intact as already begun; we have thought it unnecessary to show it more than once, namely, at No. 3. Another feature is the attempt which has been made to have as it were two churches within one building, namely, one for ordinary service and another for great occasions of public character. How far this has succeeded may be best seen in Plan No. 1, that by Messrs. Ende & Böckmann (who make one altar do duty for both churches). The style adopted in the present series of plans (except Nos. 3, 5, and 7) is chiefly Renaissance and Modern Romanesque, with central domes, rising in some instances to a height of 350 ft. and 400 ft., whereby the Museum on the one side and the Palace on the other side of the square would be completely dwarfed. The present competition has done some good; it has called forth the artistic talent of Germany, and especially of Prussia, in a manner never attempted before, and the appeal has been answered in a satisfactory way, and has proved that the arrangements of a Protestant Cathedral are capable of other than the ordinary treatment as exemplified in Nos. 5 and 7. It has also shown the fallacy of the idea of building two churches in one, and the possibility of retaining the Campo Santo, upon the foundations of which so much money has already been expended.

South Staffordshire and East Worcestershire Institute of Mining Engineers.—The monthly meeting of this institute was held lately at the George Hotel, Walsall. The final arrangements were made for the transfer of the property and funds of the old association to the new, and it is hoped that the site for a new building for the institute and museum will soon be provided. The visit to the North of England district is fixed for the 25th inst., the members returning on the 28th. Eleven new members were appointed, making 115 in all. After the conclusion of the business, Mr. Henry Johnson, the honorary secretary, was presented with a gold watch-chain and locket, as an expression of the appreciation of the members of his services during the last two years.

* From whose hand huge cartoons, covering no less than 6,586 square feet, are preserved.

† After a sum equal to 45,000l. had been expended in foundations and preliminary works, such as embankment walls, &c., next the river Spree.

THE NEW WOOLWICH WORKHOUSE.

ARCHITECT'S RATE OF PERCENTAGE.

AT the last meeting of the Guardians, in pursuance of notice of motion to rescind the Board's resolution appointing Messrs. Church & Rickwood architects of the new union house, the Board was specially convened to consider the subject. Mr. Gibson said he had no doubt that Church & Rickwood would do the work properly, but argued that the remuneration of 4 per cent. was too high. He cited Beverley, Oxford, and Islington, where only 2 per cent. had been paid. Mr. White complained that no definite answer had been given to his question at the last meeting, and said he had received numerous letters from ratepayers complaining of the high charge. If the Poor Law Board had not confirmed the appointment of Messrs. Church & Rickwood, the resolution could be rescinded. It was usual, where contracts exceeded 5,000l., to pay 2 or 2½ per cent. He understood that Stepney workhouse had been selected by the Board as a model for their own. If that were so, there would be no great inventive power required, but simply a matter of copying, which was in favour of a low remuneration. He had no doubt of Messrs. Church & Rickwood's ability, but considered that if they were employed it should be upon a reduced scale. The Rev. H. Brown said, Messrs. Church & Rickwood had already commenced the work, and would have to be paid if the resolution were rescinded, whilst other undesirable consequences might accrue. Mr. Tuffield believed Messrs. Gibson & White were acting in good faith, and with every disposition to benefit the ratepayers, but he considered 4 or even 5 per cent. fair remuneration. They might get it done for 1 or even ½ per cent., but there would be the probability of collusion between the architect and builder, and underhand practices, so that he regarded it as an absolute essential that the architect engaged should be of undoubted rectitude. They had the latter quality in Messrs. Church & Rickwood. Mr. Graham said with regard to Mr. White's observation relative to inventive powers, there was a vast amount of professional skill beyond the mere dimensions and arrangement of the wards, workshops, &c. There was a difference in the levels on the two sides of the workhouse site of 25 ft. The remuneration of 4 per cent. was most reasonable, and he did not believe any honest architect would take it for 2 per cent. He then cited several instances where architects and builders had connived together, and where patented articles, particular kind of bricks, &c., had been used.—The motion for rescinding the resolution was put, but subsequently declared lost.

A letter was read from the Poor Law Board, enclosing a letter from Messrs. Gosling & Son, architects, 76, King Street, Woolwich, in which they informed the Poor Law Board of the appointment of Messrs. Church & Rickwood, as architects, at 4 per cent. They complained that it was in direct violation of a resolution "That no appointment should be made unless duly advertised and competed for." The first they heard of it was from the reports in the newspapers, and considered 4 per cent. excessive, causing a loss of 600l. to the ratepayers, the Islington Workhouse having been built at 2 per cent. They begged that the Poor Law Board would not sanction the 4 per cent., but that they would cause the work to be thrown open to fair competition. It was resolved, on the motion of Mr. Tuffield, to send a reply to the Poor Law Board, stating that no such resolution as referred to by Messrs. Gosling & Son existed on the minutes; but that the Board had in the exercise of its judgment accepted Messrs. Church & Rickwood's offer of 4 per cent. He believed the 4 per cent. included the taking out of the quantities. Mr. White said if the latter was the case, his end would be accomplished; on which Messrs. Church & Rickwood were communicated with, Mr. Church attending and stating that it did not include the quantities, which were paid for by the builder, who added it in the price of his estimate. One per cent. was a usual charge for taking out quantities. Mr. Tuffield remarked that it had been found sometimes that buildings could be erected cheaper without quantities, and it might become a question in the future as to whether they would have them or not.

The subject then dropped.

THE CHILMARK QUARRIES OF WILTSHIRE.

THE stone obtained from the quarries of Wardour and Tisbury is rapidly taking its position as a first-class building stone in the metropolis. The district wherein the quarries are situated belongs to the Portland and Purbeck series of the upper oolite, and the siliceous limestones of the neighbourhood were favourably reported upon by the Commissioners appointed in 1839 to visit the principal quarries, and to inquire into the qualities of the stone to be used in building the New Houses of Parliament. From the Chilmark quarries came the stone with which Salisbury Cathedral was erected in the thirteenth century; and Sir Christopher Wren, reporting upon the edifice in 1668, records his opinion that the stone was little inferior to Portland in durability. At the present time, after the lapse of 600 years, the entire building is in good preservation, excepting the western front, which is slightly decomposed. Various other ancient buildings in the vicinity testify also to the durability of the stone, which, during late years, has been somewhat extensively employed for edifices in the western counties, and also in the metropolis. From the five quarries now worked by the Wardour and Tisbury Stone Company, three classes of stone are excavated, the first from a hard bed producing a stone of close even texture, and of yellowish-brown colour, weighing 148 lbs. to the foot. The average thickness of the bed is 3 feet, and it can be obtained in blocks of any length. It is especially adapted for steps, landings, paving bed stones, or to any kind of work exposed to hard wear. The second class is a somewhat lighter stone, weighing 135 lbs., of less tensile and compressive strength, and is available for general building purposes. From the third quarry a stone of a rich yellow tint of fine texture is obtained, capable of being worked to the most elaborate designs. The average thickness of the bed is 4 feet, but it can be obtained as thick as 5 feet. In a well-arranged price-list the directors of the company tabulate the prices of this stone conveyed from the quarries to all parts of the United Kingdom.

PARLIAMENTARY PROCEEDINGS.

Courts of Justice (New Site).

On Monday, the 10th instant, in the Commons, Mr. LAYARD rose to move for leave to bring in a Bill to repeal portions of the Act 28 and 29 Vic., c. 49, and to enable the Commissioners of Her Majesty's Works and Public Buildings to acquire a new site for the erection and concentration of the courts of justice, and of various offices belonging to the same. It had been urged that the question of the Thames Embankment had already been under discussion, and that the question of the erection of the law courts there had already been negatived. Now, that was not the case. No doubt the idea of erecting an Embankment had existed for centuries. At any rate it had prevailed ever since the time of the great fire. But up to the last two or three years no person in the metropolis had realised what the Embankment was, and the discovery had only recently been made of the value of the site for public buildings. When the question of the law courts was discussed, that of the Embankment was not taken into consideration. He would now point out the several sites which had been proposed for the erection of the new courts of justice. With respect to the Carey Street site, the Chancellor of the Exchequer had entered so fully into the financial part of the scheme, that it was unnecessary for him (Mr. Layard) to enter into it at any length. The House was induced to accede to the Carey Street site on one condition, and that was that the expense should not exceed 1,500,000*l.*, and it was specially agreed that until a certificate was given that the cost should not exceed that sum, the power accorded should not be exercised. The certificate was given that the site should not cost more than 700,000*l.*, and that the building should not cost more than the same sum. Now what had been spent on the purchase of land? The sum of 880,991*l.* 7*s.* 5*d.*, and the commissioners stated that the whole expense of the acquisition of land and the erection of buildings would be 3,200,000*l.* The estimate for the land was 800,000*l.*; for additional land to be purchased, 700,000*l.*; for the building, 1,574,000*l.*; for architect's commission, 74,000*l.*; for furniture, &c., 150,000*l.*—making together 3,200,000*l.* The estimate contained no provision for approaches. The only approach worthy of the name was the Strand. The building would be in a perfect hole, surrounded on all sides by squalid and mean structures, which must be swept away. On accepting office he found the present state of things then existing, and was expected to introduce a bill for acquiring additional land at an expense of 700,000*l.* He found that the House had acted on information that was incorrect—that the approaches could not be constructed for less than 1,000,000*l.*—making above 4,000,000*l.* before the buildings and the approaches could be completed. He communicated with the Chancellor of the Exchequer on the subject, and found that his right hon. friend had arrived at the same result on the financial question. It was considered improper to continue that enormous expenditure, and that it was desirable to put a stop to the erection of the buildings on the Carey Street site. It then became his duty to look at other estimates. That of the hon. member for Bath amounted to 2,710,000*l.*, and the plan was to place the law courts on the Carey Street site, without purchasing additional land, and the offices on the Embankment. There were many arguments against that scheme, one of which was that all the offices mentioned might not be necessary. Then came the converse plan, to place the courts on the Embankment and the offices on the Carey Street site. The objection with regard to the expense was the same, as the cost would have been about 3,000,000*l.* The next plan was that which had been most ably put forward by Sir C. Trevelyan: it was a very magnificent one, and it had received a great amount of public support. Sir C. Trevelyan had mixed up with it a variety of suggestions, such as that the Society of Lincoln's Inn should be transferred to Somerset House, and that the latter building should be raised a storey, which had rather interfered with the calm consideration of its merits, and into which he (Mr. Layard) did not then think it necessary to enter. The great objection to the scheme was its very considerable cost, which would amount, so far as he could judge, to at least 3,250,000*l.* But high as that estimate was, he believed that the work would cost less than that which it had been proposed to erect on the Carey Street site, because all the approaches to it, with the exception of one to the north, were already made. He had on a former occasion stated that the Chief Baron of the Court of Exchequer communicated to him his own opinion, and the opinion of the great majority of the common law judges, in favour of the Thames Embankment site; and he would then read from the learned judge's letter the following passage, which clearly enunciated that belief:—'All the judges with whom I have been able to communicate—with the single exception of one, and that one who only thinks that proximity to Lincoln's Inn is essential—are, as I am, strongly and decidedly of opinion that upon every ground, as regards the bench, the bar, the solicitors, the suitors, and the public, the Thames Embankment should be preferred.' (Hear, hear.) Then again he found that the Societies of the Inner Temple and of the Middle Temple had memorialised the House in favour of that site; and although there was a strong opinion against the proposal among the members of the Society of Lincoln's Inn, those gentlemen had not attempted to petition the House against it, in consequence, as he believed, of the difference of opinion which prevailed in that society itself upon the subject. It might, however, in his opinion, be fairly objected to Sir C. Trevelyan's plan that the cost of its completion would be excessive, and that the site was far too large for the purpose intended. Another scheme was that there should be erected upon the Carey Street site the same building which the Government proposed to raise upon the Thames Embankment. It was suggested that that would be the more economical mode of proceeding, but he believed that it would be found a much more expensive one. The cost of the site at Carey Street was, as he had already stated, 900,000*l.*; the cost of the building would be 1,000,000*l.*; and they would still have to construct the approaches, which would involve an outlay of at least 500,000*l.*, or probably of a sum nearer 1,000,000*l.* Under those circumstances, the Government had determined, after careful consideration, on selecting for that purpose the space bounded on the east by the Temple, on the west by King's College, on the north by Howard Street, and on the south by the Thames Embankment. There was this to

be said in favour of that scheme, that it would not render it necessary to purchase any expensive frontages, and that almost the whole of the property to be bought belonged to one proprietor, the Duke of Norfolk. It was said that the ground laid low, but he believed it was one of the most commanding sites in the metropolis, for the level of Howard Street was almost the same as that of the Strand. The ground in question was of the space of six acres, and he found that there could be erected upon it eighteen Courts, and all the offices that it would be necessary to attach to these Courts. He had gone fully over the plan with Mr. Street, the proposed architect of the building, and he was bound to state that that gentleman had met him most honourably, and that although he had been at first in favour of the Carey Street site, he at present approved of the new proposal. In adapting his plans to the new site Mr. Street had hit upon a much better arrangement than in connection with his former site. He had not had occasion at all to alter his general plan for the Courts and the offices. It had been said that the proposed building would project eighty feet beyond Somerset House, but there was no truth in that assertion. The terraces of the Law Courts and of Somerset House would in fact be continuous. The only part of the building which would project beyond Somerset House would be a railway station to be erected at the extreme east corner of the site. Furthermore, the new site had the advantage of affording every necessary approach without casting any expense whatever upon the public. The only approach, in fact, which it would be necessary to construct would be one to the north—an approach which would be equally necessary at Carey Street, which also would require approaches constructed upon the east and west. So far as approaches were concerned, the Embankment would be readily accessible from all parts of London. He proposed to form a terrace to Somerset House, along which the judges would be able to drive and alight from their carriages on a level with the Courts. They could not have done this at Carey Street, but would have had to ascend 40 steps on the north side and 70 or 80 on the Strand side, and the public would have had to ascend 100 on the same side before getting access to the Courts. Another advantage possessed by the Embankment site was having the two blocks of building—the Courts and the offices—separate, so that either could at any time be tended northwards, irrespective of the other. The expense of the new scheme was the next matter for consideration. He had gone most carefully into the estimates, and had found that the land would cost 600,000*l.*, and the building 1,000,000*l.*; making altogether a sum total of 1,600,000*l.* This amount he pledged his honour would not be exceeded. There could be no mistake about the cost of the land, and as to the building he was persuaded that 1,000,000*l.* was the outside price. According to the estimates for Carey Street a suitable building was to be erected on 7½ acres of ground for 750,000*l.*, whereas at the Embankment site he was allowing 1,000,000*l.* for only six acres. The Office of Works, over which he presided, had greater power in the way of checking expenditure than formerly, and he should take care that not a shovelful of earth would be turned or a stone laid until he had contracts to assure him that the cost would not exceed 1,000,000*l.* The site upon the Embankment had one or two economical points in its favour. All the material, for instance, to be used in the building could be conveyed by water, and the traffic of the City would not be interrupted, as it must necessarily be if the Carey Street site were adopted, and the streets in that busy neighbourhood were for some years to be blocked up by the conveyance of stones and other material. Moreover, much less ornamentation would be required for the building upon the Embankment. In the case of a building where only portions of it could be seen at one view, a great deal of ornamentation was necessary in order to make it effective; but by placing the palace upon the Embankment it could be taken in by the eye all at one view, and simple proportions would be sufficient, the effects being left to be gained by massiveness and the arrangement of light and shade. Another point in favour of the Embankment was that the building could not be extended either right or left, so that there would be no inducement for purchasing unnecessary land, whereas if extension were at any time really necessary, it could easily be effected towards the north. But it was urged as a difficulty that 500,000*l.* would be lost by re-selling the site at Carey Street. This would not be so. He had already had offers for the purchase of that land at the actual price paid for it by the Government (hear, hear). They would not only be able to recoup themselves, but to do more than that. Another difficulty was that with respect to the railway station. If it had been placed in the very centre of the Law Courts it would have been very objectionable, but he had opened communications with the railway company and with the Temple, and he had every reason to believe that they would be able to place a station near the entrance of Essex Street. Then as to the alleged loss of time in transferring the site. They could not commence building on the Carey Street site in less than a year. They would have to get an additional site. If they had not given up the plan, the houses on the additional site must be acquired; but in any case, all the working drawings and specifications had to be made, and it would take a year before the drawings could be made and the work be commenced. They proposed to proceed at once as if notices had been given. This course was irregular, and it would be necessary to ask the House to suspend the standing orders. (Oh, oh, and hear, hear.) They proposed to proceed as if the notices had been given in November. They proposed to limit themselves to June 30 before putting their powers in execution. The Bill would be referred to the examiner, who would state that the standing orders had not been complied with; and it would then be for that committee to advise whether the standing orders should be complied with. If, as he hoped, they were suspended, then the Bill would be read a second time and referred to a committee, who would see that no injustice was done to the owners and occupiers of land, and this course, he believed, would be found to be just to them, for Government would be ready to give the notice to treat in three months. It was proposed to proceed at once to give the notices to treat, and to avail themselves of compulsory powers up to June 30, 1870. They had but two parties to deal with—the Duke of Norfolk, who was the chief owner, and who, he believed, would throw no obstacle in the way of the Government, and the occupiers of the houses.

If the House consented to this plan, not a single hour's delay would take place. The sketch plans were ready, and would be lithographed and in the hands of members in a few days. As to delay, he thought that in a building that was to last for generations, the delay of a year or two was a matter of minor consequence (hear). But here they might proceed at once to clear the site, and begin building on Howard Street and the Thames Embankment. He thought there might be some modifications of the plan, and he thought it would bear cutting down, for the thing had been done on far too great a scale. Upon these six acres, with proper supervision, the whole arrangement could be effected at a moderate sum. All the House was asked to do was to accept these plans in principle. He had been asked if he would have a model placed. He thought no public building ought to be erected without a large model being placed for the public, but that would take some time. It would be his duty to see that proper elevations were drawn, and opportunity should be given to the House and to the public to inspect them. A great deal of criticism had been drawn upon the suggestion of his right hon. friend that Inigo Jones's front might be adopted; but he (Mr. Layard) thought it belonged to the past, and might not be suitable for a court of law (laughter). He did not think that a palatial building should be placed beside Somerset House. His impression was that the style to be adopted should be Gothic, but not ecclesiastical Gothic. He should like to see that kind of Gothic adopted which was used by the Italians—such as that of the great ducal palace and the neighbouring buildings at Venice. That was a style of Gothic not so expensive as ecclesiastical Gothic, and not so much ornamented. Besides, he did not think it right to impose on Mr. Street a style which he had not made the subject of study. Mr. Street was a man of great ability, and a thoroughly conscientious man, and no doubt would execute a work satisfactory to himself and to the public. He believed that, if the plan of the Government was carried out, they would have on the Embankment a building that would be an ornament, not only to the metropolis, but to the whole country (hear, hear). He begged for leave to introduce this Bill.

Sir R. PALMER did not propose to ask the House to refuse its sanction to the introduction of the Bill, but should challenge its opinion upon the second reading. It was untrue that the House had only to choose between the recommendations of the Commission and the plan of the Government. That Commission comprised numerous and influential members of the bench, the bar, the solicitors, and officers of the courts. It was incorrect to say that it represented the views of other people. It thoroughly worked out the scheme, and was in communication in reference to it with the Boards of Treasury under the respective Governments of Lord Palmerston, Lord Russell, Lord Derby, and Mr. Disraeli. The present First Lord of the Admiralty was not only a nominal, but a working member of it, and that right hon. gentleman would best know how to answer what had been said by the First Commissioner of Public Works as to its expenditure of time and their prodigal extension of the original estimate of the cost. It was untrue that the Commission had spent, or could spend, a single farthing of the public money that had not been authorised, or that it had in a single respect exceeded its functions, or had committed the Government or the House to the expenditure of a single farthing or to the purchase of a single acre. It was—and always had been—possible for the Treasury to decide that they would not take more land than was required for the original building, and he could conceive nothing more unreasonable, more unjust, or more uncandid than to bring forward the original views of the Commission as the excuse for now giving up the scheme. The Treasury might at this moment, by taking the more limited ground, put up a suitable building at no greater cost than what would be expended on one on the Howard Street site. On the Carey Street site they had cleared $7\frac{1}{2}$ acres, at the cost of a great displacement of the labouring population. There was space enough to form wide roads for access, and to leave surplus land besides; and they must remember that if the site was now to be given up the mere interest on the money would amount to 25,000*l.* a year. And all this was to be done to please the First Commissioner of Public Works. He desired to mention another matter on which the Chancellor of the Exchequer had formerly made a statement that had given rise to much misapprehension. His right hon. friend had stated that the bill of costs of Messrs. Field and Roscoe amounted to 27,832*l.*, but the persons who put these figures into the hands of his right hon. friend had forgotten to inform him that out of that sum no less than 23,881*l.* had been paid by Messrs. Field & Roscoe out of pocket, on behalf of the Government and by arrangement with it; that their costs for extensive services spreading over three and a half years were only 3,951*l.* His right hon. friend could not avoid having a similar bill to pay over again. With regard to the present scheme it was proposed to take six acres, without making the slightest allowance for approaches east or west. To give one at the east end they must take more land and diminish the site, and on the west by King's College there would be no approach, and they would have to advance an irregular line to the edge of the railway cutting. The levels would also be worse than the Carey Street site. The approaches to the Thames Embankment from the north would be such as would be necessary for the Carey Street site. The approach from the north would be at the narrowest part of the Strand, and if this site was carried out they would have to widen this part of the Strand. From combining ecclesiastical with Palladian architecture, they were, by adopting this site, inflicting a real grievance upon the profession and the public. This ecclesiastical architecture would be placed in a hole for the public to see going up and down the river, and, as his hon. friend represented Southwark, he had no doubt he would frequently be there to admire it, but the general public would not have the pleasure of admiring the thing that was to be placed on the Embankment. The building would not be a decoration to the metropolis. He had never discussed this matter upon a question of architecture, but upon the principle that Carey Street was the best, and that a building there erected would be an ornament and a decoration to London. (Hear, hear.) Much had been said about expense, but he should like to see an account of the money that had been laid out upon the Foreign Office, the India Office, and Burlington Gardens. No one appeared to have checked these things, but his hon. friend the member for Southwark appeared to have two voices, one which spoke well of his friend and

another the reverse. He doubted if all the judges were in favour of this scheme.

The CHANCELLOR of the EXCHEQUER restated what he had before stated to the House, in order that there might be no false issues raised. It was a grave error, the commissioners having appointed Mr. Field their secretary, to appoint the firm of which he was a member as the solicitors to the commissioners. He was not aware of any recommendation of the commissioners to erect anything but the building planned by Mr. Street. It was wrong of the commissioners to prepare a Bill for acquiring the Carey Street site.

Lord J. MANNERS said it was not the commission who prepared the Bill, but the Government of Lord Russell, with Mr. Gladstone as his Chancellor of the Exchequer. With regard to this site, if it was approved of, the Government would become land jobbers on the most gigantic scale. With regard to the expense, the right hon. gentleman had pledged himself, in a manner that no minister ever had or would do again, that the expenditure should not exceed one million.

Mr. GOLDNEY was opposed to the new site.

Mr. TITE said he should reserve his opinion till he saw the plan. The confusion had arisen chiefly from the necessity for acquiring a fresh site. One advantage of this discussion, if there were none other, would be that the building would be brought within moderate dimensions.

Sir G. JENKINSON hoped that before the second reading a proper plan would be shown.

Mr. LAYARD said that proper plans would be produced.

LEGAL.

Consistory Court, May 7.

(Before Sir Travers Twiss.)

DR. EVANS v. SLACK AND SMITH.—IMPORTANT JUDGMENT.

This morning judgment was delivered in the case of Dr. Alfred Bowen Evans, rector of St. Mary-le-Strand, who applied for a faculty to empower him to make certain alterations in his church, the churchwardens, representing the vestry, opposing.

Sir Travers Twiss, in delivering judgment, said:—This is an application on behalf of the Rev. Alfred Bowen Evans, rector of the parish church of St. Mary-le-Strand, for a faculty to authorise him to remove the whole of the furniture and fittings of the interior of the said parish church, including the chancel thereof; to raise the floor of the chancel and repave the same, together with the floor of the nave of the church, and to refit the nave and chancel with furniture of an altered character, the whole of the expenses of the same to be defrayed by the rector. The grounds set forth in the application why permission to make the proposed alterations should be granted, are that the present pews or seats in the church are inconveniently arranged, and that the other alterations were required for the comfort and convenience of the inhabitants of the parish resorting to their parish church for the purpose of divine worship, and further, that by the proposed alterations twenty-eight additional sittings will be gained. The churchwardens, on the other hand, in their act on petition, have alleged that the pews or seats are conveniently arranged, that they are handsome in appearance, and suitable in character to the architecture of the church, that they are made of oak and are as good as new, and during the last year have, at the suggestion of the rector, been fitted with new gas pillars, and that the alterations proposed to be made in the church are not required for the comfort and convenience of the inhabitants resorting thereto. They further allege that the pews or seats are amply sufficient for the accommodation of the average number of parishioners and their families who have attended service in the said church either before or since the year 1861. The learned judge referred to the arguments of Dr. Evans's counsel, and to the cases 'Groves and Wright v. the Rector and Parishioners of Hornsey,' and to the case of 'Brett v. Jones.' Neither of these cases, continued his Lordship, are precisely in point, inasmuch as the present application is for a faculty to remove and alter the communion-table, the communion rails, the pulpit, the font, and the whole of the sittings in the nave of the church as well as in the chancel, none of which are stated to be in a dilapidated state, and the whole of which have been provided at the expense of the parishioners, being such furniture and fittings as they are bound by law to provide. It is not an application to add anything which may be for the greater convenience of divine service, but which the parishioners are not bound to provide, such as an organ, or what may be for the additional accommodation of the parishioners, as in the case of a gallery, inasmuch as the evidence fails altogether to make out the case set up by the rector in his original application, that by the proposed alterations additional sittings will be gained. It is an application, in fact, on the part of the rector to be allowed to make these alterations at his own expense, with a view to increase the comfort and convenience of the parishioners generally, and especially of the poorer inhabitants of the parish, who are deterred, as he alleges, from attending divine service by reason of the present insufficient accommodation. The Court has, therefore, to consider, in the first place, whether the rector has established his position that the present sittings are inconvenient and ill-adapted for public worship, and that the parishioners are deterred thereby from attending divine service, and that the proposed refitting of the church, if carried out, will not merely conduce greatly to the comfort and convenience of the parishioners generally, but will be a great inducement to the poorer inhabitants of the parish, who have hitherto absented themselves from divine service, to attend the same. The result of the evidence given is to satisfy the Court that the present sittings, although they may not be comfortable to all, and may be actually uncomfortable to some of the persons who are in the habit of attending divine service in the church of St. Mary-le-Strand, have not by their positive discomfort deterred any of the parishioners from attending divine service, and that the rector has failed altogether in sustaining the burden of proof which the law imposes upon him on this part of his case. I must, in fine, reject the application of the rector, and decline to grant the faculty as prayed for.

Ball Court—May 11.

(After-Term Nisi Prius Sittings at Westminster, before Mr. Justice MELLOR and a Common Jury.)

STROUD AND ANOTHER v. ABERY.

This was a part-heard case, and was an action brought by the plaintiffs, who were brickmakers, carrying on their business at Islington and elsewhere, against the defendant, a retired builder. It appeared from the plaintiffs' evidence, that the defendant and his son called at their office in November, 1867, and gave an order for the bricks in question. The defence was, that the son, and not the father, ordered the bricks. It was stated in the course of the evidence that the son had absconded in consequence of some love affair, the nature of which did not transpire.

Mr. Serjeant Parry and Mr. Macrae Moir appeared for the plaintiffs; Mr. Philbrick and Mr. Poynter for the defendant.

The jury returned a verdict for the plaintiffs for 57l. 12s., the amount claimed.

THE NEW ROYAL ACADEMY.

To the EDITOR of THE ARCHITECT.

SIR,—I really think it is time the Architects should cry out in their own defence. The Architect of the new Academy, in his arrangement of the several galleries, appropriated one to Architecture, and in the last hour this room was once more assigned to Painting, the Architects being thrust into the Lecture Room, where the greatest portion is occupied by steps, much to the inconvenience of the public. The Architects are thus deprived of exhibiting many of their works either in their own rooms or in those of the new Academy. This, to say the least, is not very complimentary to the Academy's Architect, or very considerate towards the profession generally, who were looking forward to better times and better feeling from the R.A.s. The Architects should address a letter to the Council on the subject.

Your obedient Servant,

May, 1869.

AN ARCHITECT.

THE ROYAL ACADEMY.

SIR,—I have read with great attention Mr. Godwin's able article on this subject in your issue of May 1, and am reluctantly obliged to thoroughly agree with and believe in most that he complains of therein. I say reluctantly, because I would fain have believed, as regards architecture, that those who represent this branch of art in the Academy would have striven to have obtained a due and proper recognition of their art. In one statement made by Mr. Godwin, namely, that 'one very important step has already been taken in widening the class of Associates from twenty to an INDEFINITE number, so as to identify all good workers with the Royal Academy,' I fear he has not been explicit enough. Such a statement as this would inspire a hope which I fear would be vain; for if it be true that some such rule as the following one holds sway, no such hope can possibly exist. The rule I refer to, and which I am credibly informed is correct, is to the following effect, namely, that if (at a time when NO VACANCY exists—mark the words!) there be a man of such exceptional power that it is thought he ought at once to be elected, he must be nominated by twenty members, or one-third of the whole constitution, then put up to ballot, and must be elected by two-thirds of the votes present. And (here mark the inconsistency as regards an indefinite number) when the next vacancy occurs, he is absorbed into the twenty Associates; but, until this time, he is not a full Associate, nor can he himself, his widow, or his family, receive the usual pensions, &c. Such a rule, if this be correct, practically makes the proposition as regards an indefinite number of Associates *nil*; for until, from death or some other cause, a vacancy occurs in the charmed twenty, any artist brought in under the rule above quoted becomes simply an outsider or a mere nominee, to be absorbed, 'tis true, in due course; but as the average number of vacancies in the whole sixty members is only about two to two-and-a-half per annum, it is evident that, except for one or two months, the list is never likely to be increased beyond the original sixty. Now, Sir, can anything be more prejudicial to art than this?—for undoubtedly most artists naturally look upon the Academy as an earthly paradise, into which they may be allowed at some time to enter. With such restrictions as at present exist, as set against the very large number of artists who are notoriously eminent, and estimating the average number of vacancies at two-and-a-half per annum, there can be but little hope that many of them will ever enter the sacred walls; for, giving the widest scope to the outsider clause, it would be at least thirty years before one hundred new members could be elected, and then some twenty-five would have to be outsiders. Is this fair or just in any way carrying out the spirit of making the number of Associates 'indefinite'? As regards architecture, it is probably in the memory of many architects that at one time the octagon room in the old building was entirely devoted to their works. This was bad enough; but from the time when even this small room was taken from them, the treatment of architecture has been yearly getting worse and worse. To judge from Sir Francis Grant's speech at the 'Artists' General Benevolent Dinner' on Saturday last, architects are indebted to Mr. Sydney Smirke for their present position on the walls of this year's Exhibition; for I gathered that to him was due the sudden temporary fitting up of the Lecture Room for 'engravings, miniatures, &c.,' for the purpose of making place, in the room originally set aside for architecture, for the accepted pictures which towards the end of the hanging were found yet unhung. Surely architects have just cause of complaint against Mr. Smirke—if, acting on a desire to see all accepted pictures hung, he made the suggestion to utilise the Lecture Room for architecture, &c.—that he did not at the same time use his best endeavours to see the works of his professional

brethren fairly treated, and not placed in the up-and-down manner in which they now appear. Mr. Godwin will doubtless correct me if I am in error in any part of this letter, but I fear that all I have said is but too true: if so, it is high time in the interests of art in this country that some radical change were effected, and it behoves artists of all denominations to see to it.

I am, Sir, your obedient servant,

AN ARTIST.

Arts Club, Hanover Square, May 10, 1869.

NEW BUILDINGS AND RESTORATIONS.

New Lunatic Asylum for Lancashire.—A special meeting of the magistrates of Lancashire has been holden at Preston, to consider the propriety of erecting another lunatic asylum for the county. It was stated that authority had been obtained by the General Finance Committee to purchase a site for the new asylum in Whittingham, a few miles from Preston, and that one of the instructions of the committee was that the asylum, which would have to be for pauper lunatics, should contain accommodation for 1,000 patients. The cost would be 20,000l. It was resolved that a committee be appointed to provide an additional asylum, and that the sum of 20,000l. be borrowed or taken up on mortgage of the rates of the county for the purpose.

Monument to Dr. Whewell.—The master and fellows of Trinity College, Cambridge, have decided to intrust to Mr. Woolner the execution of the monument to Dr. Whewell, which is to be placed in the ante-chapel of the college. The statue of the late master will stand next to that of Lord Macaulay, some little distance to the right of Roubiliac's fine statue of Newton.

Proposed New Infirmary at Canterbury.—The surveyor to the Local Board, Canterbury, has presented a report prepared at the request of the Court by him, upon the proposed erection of a new infirmary. The report stated that it was beyond all possibility to think of converting the present infirmary into a building as required by the Poor Law Board, and therefore recommended the erection of a new one on the south side of the workhouse.

The New Unitarian Chapel, Todmorden, occupies a position on one of the hills to the south of the valley in which the town lies, and through which the Lancashire and Yorkshire Railway passes. The plan of the chapel consists of chancel with vestry and organ chamber, and nave with side aisles. A graceful and lofty tower and spire, rising to the height of 192 feet, are placed on the town side of the building, completing the entire group, and rendering the whole a pleasing and conspicuous object when seen either from the railway station or the town. Mr. John Gibson, of London, is the architect, from whose designs the works were executed. The style employed is the Decorated period of Gothic; and the cost of the building, about 30,000l., was defrayed by Messrs. Fielden, of Todmorden, in memory of their father. The chapel will seat about 500 people. Not being very large, compared with the outlay, the whole of the work has been completed in a very perfect and costly manner. Cut stone has been used throughout for the masonry, and marble columns internally, with oak for the benches and woodwork generally. The roofs are of an elaborate character. The tower contains a peal of 8 bells, and an illuminated clock. Three beautifully-executed stained glass windows enrich the chancel. Messrs. Clay & Son, of Audenshaw, supplied the woodwork, and the mason's work was carried out by day labour, under the management of the clerk of works. Immediately opposite to this chapel, on the other side of the valley, lies the Parsonage.

Salford.—Richmond (Congregational) Chapel.—The foundation stone of the new lecture hall and schools was laid April 1. The new buildings are contiguous to the chapel, and of the Gothic style, and comprise on the ground floor a lecture hall 69 feet by 35 feet and 48 feet 6 inches to the ridge, with spacious vestibule and entrance giving access to eight class rooms. The infants' school is 42 feet by 28 feet 6 inches, with separate entrances. Each school has lavatories, &c. The external walls will be faced with stock bricks, relieved with blue bricks to the arches of the doors and windows, and moulded bricks to the string-courses, with stone dressings to the doors and windows. The principal elevation will comprise two entrances. The gable will be pierced by a large window of five lights with elaborate tracery. All the roofs are of high pitch with open framed principals, and covered with Welsh slates with ornamental ridge tiles and iron cresting. The buildings will be warmed and ventilated by Messrs. Haden of Trowbridge. Cost, about 3,500l. Mr. W. Southern is the contractor, under the superintendence of the architect, Mr. John Lowe, of Manchester.

The West Window in Hanley Church, Upton-on-Severn, is to be filled with stained glass of the richest and best quality, the subject of the design to be 'The Ascension.'

The New Church, Longton, the foundation-stone of which was laid by the Right Rev. Dr. Ullathorne, early last summer, is a Gothic building, erected from the plans of the celebrated ecclesiastical architect, Mr. Pugin. It is rapidly approaching completion, and already ornaments the quarter of the town in which it is situated.

New Chapel and Schools are to be erected in Wellington Road, Liverpool. The contemplated buildings (in connection with the United Methodist Free Church) will cost about 3,000l.

The New Station at Dronfield, Derbyshire.—The site of the new station has been chosen by the engineers, and the station and platforms have been staked out. The spot is that best known as the Mill Dam, in the centre of it, and near to the old Tilt. The station-master's house and goods warehouse will be commenced without delay, and will afford all necessary accommodation for the public. Access will be had to the station ground from the Sheffield and Chesterfield Road at a point near to Wilson's malthouse.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

The Architectural Alliance.

The Eighth Annual Meeting of delegates from the Allied Societies was held in London on Wednesday last. The proceedings of this meeting have always been considered as private; but the most important of the documents laid before the delegates—a digest of sundry reports on the state of architectural education—will appear in our next.

Exhibitors at the Academy.

The *Illustrated London News*, in its opening critique on the Royal Academy, gives us some elaborate statistics to prove that the 'outside native artists' are much worse off at this year's exhibition than they used to be at the old place. But we may remark, although it may be true that there are only three more paintings in oil hung this year over last year, the amount of canvas on the present walls is much greater; that is to say, all those little unsightly works some few square inches in size, which were never really good, and which seemed to be hung only to fill up little crevices and corners, have this year disappeared, and their number has been filled up by larger and more important works. Nor is it altogether fair to inveigh against the members of the Academy for the amount of their contributions, seeing that to the last moment it was believed that there would be more space than would be required, and that it is only natural that they should have wished to enter a good appearance at the opening of their new house. We may add that we cannot find, on inquiry, there is any foundation for the statement that some of the accepted pictures have not been hung.

Visit of Working Men's Clubs to New Blackfriars Bridge.

The third visit of clubs affiliated to the Working Men's Club and Institute Union, to buildings and public improvements in progress in London, was made on Saturday last. The previous visits were to the works of the Holborn Valley Improvement and those of New St. Thomas's Hospital. On this occasion the works of Blackfriars Bridge, now closely approaching completion, were inspected. Mr. Edward Hall, F.S.A., architect, a member of the Council of the Union, as before conducted the party; which included, besides about one hundred members of working men's clubs, Mr. Hodgson Pratt, one of the honorary secretaries; Mrs. Pratt; Miss Smith, Assistant Secretary; Mr. James Hole, of the Council; Mr. R. N. Wornum, Mr. Coningsby, and others. Previous to the inspection the visitors were assembled in one of the workshops, when Mr. Hall delivered an explanatory lecture, entering into the conditions to be regarded in the design of a bridge, and different systems for the construction of bridge-foundations. Having noticed the different formations of the substructure of bridges, Mr. Hall spoke of the superstructures, when he referred to the changes involved in the use of cast-iron, and afterwards wrought-iron, whereby the opposite requirements of easy gradients and heights for the passage of vessels were most easily reconciled.

After the lecture, which occupied more than an hour in delivery, the party proceeded to the works themselves, where Mr. Hall pointed out such portions of the construction as he had referred to, and were above water, as well as the construction in progress for the connection of the Thames Embankment with the bridge. It is to be regretted that these two great metropolitan improvements are not more harmonious in plan.

The Embankment now canters in to the abutment of the bridge—the total water-way provided at the bridge being greater than that of the river where is the straight portion of the Embankment. The first design for the bridge had the abutment corresponding with the general line of the Embankment; and it may be reasonably assumed that the architects of the bridge are not responsible for the present arrangement, which provides a face of the Embankment exposed to the almost direct force of the tide, and a corner for the deposit of silt and the accumulation of the various refuse floating on the Thames. The proceedings on Saturday concluded with votes of thanks to Messrs. Joseph Cubitt and Henry Carr, the architects of the bridge, and to Mr. Bryant, with a warm expression of acknowledgment to Mr. Hall.

The Dudley Gallery.

The Committee of the Dudley Gallery held their annual dinner on the 29th ult. at the Star and Garter, Richmond. There were present a considerable number of the members of the committee and their friends. The Chairman (Dr. Hamilton), in proposing the toast of the evening, 'Success to the Dudley Gallery,' stated that, since the commencement of the undertaking to the present time, there had been sold at the Gallery works to the value of over 18,000*l.*—a sufficient evidence of the advantage of the institution. The toast of 'The Royal Academy' was responded to by Mr. Wells, A.R.A., and that of 'Architecture' by Mr. Edis. The health of the Chairman, which was very warmly received, was proposed by Mr. Lealie, A.R.A.

Discovery of Roman Pavement in London.

A very interesting Roman tessellated pavement has been discovered in excavating for the new street opposite the Mansion House. The portion at present uncovered, and which will not long remain untouched, is about thirty feet square, very perfect, and with a beautiful design worked on it in alternating red, black, and white stones.

Mr. Thornycroft.

Her Majesty the Queen, accompanied by the Princess Louise, has paid a visit to the studio of Mr. Thornycroft, the eminent sculptor, and critically examined the model of the equestrian statue of Her Majesty which Mr. Thornycroft has in hand for Liverpool. The statue is to be placed near that already erected, in memory of H.R.H. the Prince Consort, in front of St. George's Hall. We hear great praises of the Princess Louise's knowledge of art.

General.

Monument to Bishop Lonsdale.—A monument has just been erected, in Eccleshall churchyard, over the grave of Bishop Lonsdale, by the members of his family. It will be remembered that the late Bishop was buried on October 24, 1867, in a spot, chosen by his friends, at the north-eastern corner of the churchyard, near the iron wicket leading into the Castle grounds, and through which he was accustomed to pass on his way to church. The monument is in the form of a memorial cross, belonging to an early period of church architecture, and similar in design to many that are found in this country, and still more commonly met with in Ireland. It rests on an octagon base of grey Aberdeen granite, rising two steps, and measuring 8 ft. 4 in. across. In the centre of this base is fixed a square block of the same material, with the sides sloped away from the top. Out of this block or plinth springs the shaft of the cross, the upper limbs of which are connected by a circle. With the exception of the octagon base, which is tooled down perfectly smooth and level, the whole of the monument is highly polished, and the front boldly engraved. The contrast between the dark blue colour of the polished granite and the light grey tint of the unpolished base is striking. The monument measures about 11 ft. 6 in. in height. A short and simple inscription is spread over the sides of the plinth beneath the shaft. On the east side or front, facing the walk, is engraved the Bishop's name, showing the spot where he is buried; on the north side, towards the Castle, is stated the length of his episcopate; on the south side, opposite the church, is inscribed his age; and on the west side, or back of the monument, is recorded the date of his death at Eccleshall. The whole of the stone was wrought, polished, and engraved at Messrs. Fraser's Granite Works, Aberdeen, under the direction of the contractors, Messrs. Bevers, of Southwark. The site is not all that could be wished, being too low, and too near the boundary fence to admit of a favourable front view; but, in spite of this disadvantage, the monument is effective and successful. It is massive without being heavy, plain and yet handsome. Thoroughly Anglican in character, and free from all foreign peculiarities, it is a good example of this kind of monument for an English churchyard, and reflects credit on the eminent architect, Mr. Gilbert Scott, by whom it was designed.

Coming Art Exhibition at York.—The Exhibition will probably take place in the Lecture Hall, Goodramgate. Some alterations will be made by which the gallery will be rendered available for the exhibition of paintings and sculpture. The saloon will be reserved for philosophical instruments, scientific apparatus, and educational appliances, and for occasional popular lectures. The space under the galleries is to be fitted up with stalls, at which ladies will preside, and with cases for the display of goods by local exhibitors.

The Royal Academy and the Exhibitors.—Mr. Moy Thomas, in a letter lately published, contradicts the statement made by the Committee of Arrangement that all the pictures accepted by the Council were duly placed. Mr. Thomas says he is ready to furnish the names of artists whose works were classed neither in the 'doubtful' nor 'rejected' category, who received and are still in possession of the customary season tickets, inscribed with their names, as exhibitors, but whose pictures have not been hung. In making this assertion, Mr. Thomas disclaims entertaining a feeling of hostility towards the Academy, whose difficulties this year, he says, are well known.

The Institution of Civil Engineers.—At the closing ballot for the Session 1868-69, held on Tuesday, the 11th inst., Mr. Charles Hutton Gregory, President, in the Chair, eleven candidates were balloted for as Associates, and declared to be duly elected, viz.:—Mr. John Henry Abbey, Borough Surveyor, Huddersfield; Mr. Edward Brotherton Carroll, Locomotive Superintendent, Bombay, Baroda, and Central India Railway; Mr. James Farrar, Engineer to the Bury (Lancashire) Improvement Commissioners, &c.; Mr. Frank Garrett, Leiston; Mr. Henry Newson Garrett, Leiston; Mr. James Howard, M.P., Bedford; Mr. Harry Edward Jones, Engineer of the Wandsworth Gas Works; Mr. Thomas Miller, Ipswich; Mr. Frederick Peck, Furnival's Inn; Mr. Henry Minchin Simons, Bowling Iron Company; and Mr. James Williams, Secretary of the Midland Railway Company.

Proposed Industrial Exhibition.—It is proposed to hold an industrial exhibition at Andover in July, for which purpose the Mayor has kindly granted the use of the Town Hall. The success attending a similar exhibition at Abbott's Ann last year has prompted the committee to hold another for the united neighbouring parishes of which Andover is the centre.

A Clock of superior construction, with bell of great power, and four dial plates, is to be placed in the tower of the new Market and Corn Exchange, Shrewsbury.

Chelsea New Bridge.—Since this bridge was opened in 1858 the expenditure for repairs and maintenance has been 28,946*l.* 4*s.* 3*d.*

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

ROYAL INSTITUTION OF GREAT BRITAIN.—Friday, May 21. Prof. H. C. Fleming Jenkin, F.R.S., on the 'Submergence and Recovery of Sub-marine Cables in Deep Water.'

ROYAL ARCHAEOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.—The next monthly meeting will take place at 4 P.M. on Friday, June 4.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Monday, June 7. Ordinary Meeting.

ASSOCIATED ARTS INSTITUTE.—Saturday, May 29. By Lemon H. Michael, Esq., on 'True Nobleness in Art.' And Annual Meeting.

THE ARCHITECTURAL ASSOCIATION.—Friday, May 28. Rev. H. M. White, M.A., on 'Taste.'

STATISTICAL SOCIETY.—The Seventh Ordinary Meeting of the present Session will be held on Tuesday next, the 18th inst., at Eight, when a paper, by Mr. Samuel Brown, 'On the Statistics of the Netherlands,' will be read.

THE INSTITUTION OF CIVIL ENGINEERS.—There will be no meeting on Whit-Tuesday.

The Architect.

THE PAINTINGS AT THE ROYAL ACADEMY.

By EDWARD W. GODWIN, F.S.A.

UNTIL the rejected works have been seen, it is quite impossible for anyone to say whether the selection of paintings for this year's Exhibition at the Royal Academy has been founded in justice and wisdom, or in favouritism and prejudice. If the selection has been both wise and just, very remarkable indeed must be the pictures which are as yet invisible. Let us fancy, if we can, for one moment, anything worse than Mr. Calthrop's 'God's Acre' (38), Mr. Cope's 'Domestic Chaplain,' Mr. Frith's 'Altigidora,' or Mr. O'Neil's astounding contributions. One cannot complain at all of the appearance of wasted wall space which the galleries present, when we see such pictures as these, believing at the same time that in their selections the Council of the Royal Academy have acted neither unjustly nor ignorantly. It may be noted that of 1,081 drawings, miniatures, engravings, and etchings, there are 173 portraits, and in this calculation I do not include those portraits of models which go under convenient Italian names—so that it may readily be seen how easily one, or even two, rooms of the eleven now occupied might have been shut up altogether. The 'Lecture Hall,' now temporarily fitted up as an exhibition room to receive the odds and ends of the show, might very well have been left alone as originally designed; the only result of Mr. Sidney Smirke's officious offer on behalf of his professional brethren, i. e. to give up the architectural rooms to the painters, and let the architects go with the odds and ends, is, that the public is bored by more bad paintings than it otherwise would have been. Whether the selection has been just or unjust, no one can accuse the hangers of being otherwise than fair, except perhaps where they have exceeded the bounds of fairness, and have been forgetful of themselves. The hanging has never been more faithfully done, and probably never so wisely. For example, portraits as a rule are placed above the line, and Mr. Sandys' 'Medea,' rejected last year, is not only accepted, but is placed on the line in company with Mr. Lewis's 'Seraph,' and Mr. Orchardson's 'Duke's Ante-chamber.' If easel pictures are to be painted, Mr. Sandys will show us how they are to be treated, viz., as precious objects set up by themselves, as we would set up a precious enamel or glorious goblet—objects which might endure even when the surrounding walls had developed into fitly painted and sculptured architecture; for I need hardly say, that in any well-decorated house it would be impossible to find shelter for that rough-and-ready scene-painter's style of art which is so popular—popular because it serves as well as anything else to cover up ugly blank walls, and it supplies the material for the photographer and engraver. I need hardly say that there are very few pictures in the Royal Academy which can be looked at, apart from their trade value, as precious objects. Apart from the painting, most of which seems to have been done from a desire to cover as much canvas as possible, the subjects chosen are either positively unpleasant or weak. Even the best works are what ladies call 'dreadful,' or have little in them besides drawing. The great majority are vapid in the extreme. Take, for instance, the watery sentiment in Mr. Barnes's 'Last Rose of Summer,' and Mr. Frith's 'Hope and Fear.' These are by no means exceptional instances. The historical, or *historical incident* subjects, have also their weak—very weak—representatives, to wit, Mr. Cope's 'Price of Victory' (46) and Mrs. Ward's 'Scene from the Childhood of the Old Pretender.' Of 'religious' subjects there are very few illustrations, and these, with one or two exceptions, look as if they had been designed for the publisher of a cheap Bible. Very different is it with what may be called the *religious sentimental*. The old sad story told by Mr. F. Holl in 210, and the memory of home and scenes long forgotten which Mr. Faed has managed to infuse into the face of the handsome woman at 119, are amongst the few recollections which will have a humanising effect after the Exhibition has become a thing of the past. Those painters who have been inspired by the classical or mythological have been generally more successful; for, if the meaning be here and there somewhat vague, it must at least be conceded that the drawing and composition are mostly the results of strong artistic

judgment. As a contrast to this, one of the most sorrowful sights in the new galleries is to be found in the evidence of the worn-out powers which certain artists so clearly declare by their pictures. The sorrow of it makes a man keep silence who might otherwise be compelled to speak hard things against the vineyard and the labourers therein. I propose now to take in detail some of the pictures in the five rooms to the left of the entrance.

In Gallery No. 1 there is nothing of sufficient importance to detain us very long. The pictures to be seen in it are (4) 'Under the Wall of Maestricht; Arrival of a Canal-Boat,' by C. N. Hemy; (7) 'Sister,' G. A. Storey; (15) 'The Arab Story-teller,' J. E. Hodgson; (28) 'Loch Coruisk,' J. MacWhirter; (30 and 32) Sir E. Landseer's masterly studies of lions; the water and the sky in (45) 'The Return of the Dove,' G. F. Watts; the Japanese dress in 49, Mias J. Escombe; (51) 'Salmon Poachers,' H. Moore, and (60) Mr. Stone's illustration of an event in the life of the Princess (afterwards Queen) Elizabeth. This last is the only one of the ten just mentioned which afforded the artist an opportunity of showing any power he might possess as a wall painter. I regret to say that the opportunity has not been seized. That the story, or historical event, or whatever Mr. Stone likes to call it, has been told—and that, too, somewhat completely—is undeniable. That the picture will engrave well and be popular is also pretty evident. That Mr. Stone has exercised great research, and is wise enough to picture things as they appeared to the actors in his scene—and not as Mr. Archer, and most artists paint them, in the time-worn condition of a few centuries later, or as we now see them—is also noteworthy; but with all this Mr. Stone has failed to produce either a monumental or decorative work, i. e. a work which would bear translation to a wall. I have said thus much because this painting would at first sight attract what may be called the professional sympathy of architects in search of wall painters.

In Gallery No. 2 the most interesting pictures, from an architect's point of view, are those by Mr. Marks, Mr. J. F. Lewis, Mr. Princep, and Mr. Orchardson, all of which show qualities eminently to be desired in the painters who are to decorate our architecture. I may be wrong in including Mr. Lewis, for it is quite possible that his somewhat finicking method has become a habit of life with him, and that he is one of the few who should be told off to do easel pictures, as things to be looked into. 'The Minstrels' Gallery,' (69) H. S. Marks, must have been originally designed for a wall painting; and having said this, it is impossible to give it greater praise. The colour is not all one would desire; for, like a number of his brethren, Mr. Marks has the faculty of putting it on so that even the purest and the brightest of tints seem affected by a sort of fine charcoal dust. (91) 'A Siesta,' is by Mr. V. Princep; who, if he would and could paint a series of reclining figures as well as he has arranged this one, might, with a little caution, decorate the upper portion of a high room. I say 'upper portion,' because in this, as in all his works, there is an unpardonable coarseness—by the way, the bronze fountain does not help the composition. Mr. Orchardson ought to be our next R.A. 'The Duke's Ante-chamber' (103) is altogether good; good in subject and in sentiment; good in colour and in composition; good dramatically, for every figure tells its story; and good monumentally, for it would not be difficult to translate it into a noble wall decoration. I have already spoken of Mr. Sandys' 'Medea.' Architects will be especially thankful to this painter for the *manner* in which he has treated the story of Medea. All great artists—Greek, Japanese, or Mediæval—would have treated it in much the same manner, viz. by adopting a strong conventional background and by the free use of symbols. I can quite understand that this free use of symbolism, combined with the gold background and its very conventional wood and fleece and ship, should have led the Council last year to reject it; that they should have repented this year, when there were so many claimants at their doors, is a sign of wonderful promise.

In Gallery No. 3, or the large gallery, the few good things are almost swamped by the vast number and the huge size of the bad things. Sir E. Landseer's 'Swannery invaded by Sea-Eagles' (120) holds its place midst good and bad by virtue of the grandeur of its drawing and composition of form. Of colour there is little or none, and the dull browns and greys which make up what little colour there is, are put on in the most sketchy way. Here and there, as in the eagles' heads and swans' feet, there is more work and greater results, but if Sir E. Landseer has seen everything in an eagle's head and beak, why could he not have shown it us, and why omit such a line as that which occurs in every eagle's beak? Mr. Hook has left

the sea for the land: (124) 'Cottagers making Cider' is a very unsatisfactory painting. The poor cottagers look as if they had been compelled to make cider before Mr. Hook and a distinguished company. Mr. Calderon's best work this year is to be found in (128) 'Sighing his soul into his lady's face; but why should a background of foliage be flicked in after the manner of busy scene-painters? 'The Disgrace of Cardinal Wolsey' (130), by J. Pettie, is a fine work, and if Norfolk were a trifle less comic in his mock courtesy, the picture might be described as very fine. Mr. G. D. Leslie gives us something very tender and beautiful in 'Celia's Arbour' (133). Mr. E. Gill has pictured (141) the 9th verse of the 1st chapter of the book of Genesis. Mr. Mason, in a few small frames, chiefly in 153, shows intense sympathy with nature, not without a certain dash of sadness. Mr. Elmore is at his greatest in 'Katherine and Petruchio' (164). Note the impatient foot of the shrew. The composition looks as if it might be made decorative. In the centre of the wall, opposite Sir E. Landseer's 'Swannery,' we have Mr. Maclise's sole contribution, 'King Cophetua and the Beggar-maid' (171). Admirable in drawing and decorative in composition, but having no purity or beauty of colour, and quite devoid of texture, the tent, the flesh, the armour, the leaves, and even the pie-crust, are all uniformly woolly; whilst the colour looks as if the sketch has been finished in charcoal, which the artist, in his subsequent process of painting, had never been able to eradicate. Mr. E. Frère's charming picture of 'La Glissarde' (183); and the colour and painting in Mr. Millais' portrait of 'Mr. Lehmann's Daughter' (127), are things to remember.

In Gallery No. 4 there is a beautiful composition of children's heads by J. Sant (189). One of Mr. Faed's beauties, 'Letting the Cow into the Corn' (205), will probably be voted very pretty. Mr. J. Holl's work (210) 'The Lord gave, and the Lord hath taken away,—blessed be the name of the Lord,' is one of the best pictures of the year; the sentiment of it is so true and utterly devoid of anything which might be even suggestive of the maudlin. I have only space to note Mr. Hook's 'Boat' (217); Mr. Millais' portrait of 'John Fowler' (225); and Mr. Poole's 'Moonlight' (257), which ought to have a little recess to itself.

In Gallery No. 5 Miss Mutrie exhibits (270) some good flower painting, Mr. Armitage has a monumental-looking figure (272), Mr. G. D. Leslie is as usual tender and beautiful (281). In (295) 'The Commentator on the Koran,' Mr. J. F. Lewis again gives a genuine easel picture—to my mind by far his best. Note especially the right side of the picture, the tiles, &c.

NOTES FROM ABROAD, No. II.

(FROM A CORRESPONDENT.)

OUR last 'Notes from Abroad' ended with our arrival at Genoa. 'Genova la Superba' well deserves her name. Although her streets are narrow, and her chief character is commercial, she is yet a superb city, truly a city of palaces; the principal streets, the Via Balbi, Via Nuova, and Via Nuovissima, resemble our own Pall Mall in the neighbourhood of the Club-houses, only the buildings are more grand and palatial in their character. In vain we imitate the Italian palaces of the sixteenth and fifteenth centuries; like all imitators, we fall far short of our models. Michael Angelo was right—the imitator is always in the rear; would that we could persuade all imitators, be they Gothic or classic, and their exclusive admirers, of this most certain fact. Amongst the finest palaces, we would particularly cite the Brignole, the Brignole Sale, the Doria Tursi (now the Municipal Palace), and the Balbi. It is impossible without illustrations to convey an idea of the grandeur of these palaces; we may, however, cite, as their chief merit, great boldness and breadth of treatment in design and detail as regards the façades, and a vestibule with staircase and courtyard of very striking effect. It is a great honour for one man to have been the architect of at least ten of these palatial buildings, due, as they are, to the genius of Galeazzo Alessi, of Perugia; and it is also a credit to the painter Rubens that he should have been the first person, so far as we know, to publish the designs of them. It is, above all things, natural that the princely painter should have appreciated such princely works, and we strongly advise your readers to refer to his book, 'The Palaces of Genoa,' which we believe is to be found along with that of Gauthier in the library of the Institute, or in that of the Royal Academy. What personal pride and sense of social dignity must have actuated these great nobles of old, to induce them to erect buildings at their own cost which outvie the combined efforts of hundreds of our noblemen and gentlemen at the present day in their clubs! When we add, moreover, that almost all these palaces contain galleries of paintings of great value collected by their owners, a still greater idea is afforded to us of the magnificent spirit of personal aggrandisement which actuated these *gran signori* of the seventeenth century. Away from all these splendid buildings, in the western part of the city and close to the

seaside, as is only fit, stands the great palace of Andrea Doria, the great 'Principe,' the great Admiral of Genoa, who kept a fleet of his own of 22 galleys, and for his services in the cause of his country and, we fear we must add, of the Emperor Charles V., received this building as a public gift. The building itself, though vast, is marked by extreme simplicity; that which renders it particularly attractive to lovers of art, is its richness in paintings and decorations by Pierino del Vaga, to whom are due so many of the best arabesques of the Vatican, executed under Raphael's direction, and who, in his misfortunes, found protection and employment from the great warrior and statesman. The plan and style of his work are excellent, but the full value of it is lost, owing to its restoration of late years. It is still, however, full of interest, and not unworthy of the consummate artist who designed it. The gardens also are well laid out, and, with broad walks, fountains, and terraces, from which fine views of the bay are obtained, present a pleasant idea of the old Italian style of gardening. The great fountain, however, is marred by one of those stupid 'concetti' of the later Italian School, in which the fine old Admiral is represented as Neptune triumphant, and, we need hardly say, in a state of most improper nudity. More interesting than this vast palace is the house in which Andrea Doria lived, the doorway of which is a richly-sculptured specimen of early sixteenth century work, of the same class as those we have already described at Savona. It is in the square of the San Matteo church, the burial-place of the Doria family, and is surrounded with old houses of great archaeological interest. As regards the earlier architectural buildings of this city, they have been much destroyed: one, however, remains, which in its façade presents some features of very high merit; the triple-arched entrance in black and white marble is fine and effective, and is rendered still more so by the broad flight of steps which lead up to it. This is one instance amongst many in which the old architects evinced their taste in a manner which is entirely lost sight of by our modern designers: the value of a base and gradual rise from which the main body of the building springs, and on which it rests, is indispensable for the due effect of any edifice, and is always, we think we may say without exception, to be found in the great buildings of mediæval Italy. The great west entrance of the Cathedral is certainly a noble design, and presents some remarkable works in sculpture, amongst which the twisted columns, clearly meant to represent twining boughs, since they have the branches lopped off still remaining, are very noticeable, as being amongst the earliest of their class, *i.e.*, the commencement of the fourteenth century. This was the period of its restoration; but earlier and most remarkable portions of the first church, consecrated in the year 1118 by Pope Gelasius II., still are to be seen in the north and south porches, which are amongst the richest examples of their kind we have ever met with, and we regret exceedingly that no illustrations of them have yet been made.

Concerning the very rich Renaissance Chapel of St. John the Baptist, and the exceedingly elaborate shrine or 'capone of San Giovanni,' wonderfully worked in silver gilt by Daniel di Terramo in the fifteenth century, we have no time to dilate. Both chapel and shrine well deserve inspection, as being rich in sculptural and ornamental work of a very high order. We do not profess to do justice to the various beautiful works of art which the traveller will meet with here or elsewhere; we give merely notes by the way, and seek rather to stimulate curiosity, and induce students to travel and see for themselves, than to give a precise description of the admirable works which are so abundant in this land, which is a complete treasury of art, and would exhaust volumes of critical notices.

From Genoa we proceed by rail to Chiavari, a city remarkable for its arcaded streets, the columns of which are of antique type, and for its shipbuilding yards. It is a very beautiful and peculiarly picturesque place, where artists would find mines of work, and from here to Spezzia the landscape painter might while away months. We feel sorely tempted at this point, owing to the effect made on us by the town of Nervi, to dilate upon the propriety or impropriety of painting with various designs and colours the outsides of buildings. We confess that, logically, we can see no objection to the practice, if the climate admits of it. Why not paint the outside as well as the inside of your house? Any artist will tell you it is delightful; it makes the houses themselves picturesque, and gives colour to the landscape; and is not the artist the best judge of what is desirable and fit in such cases? In the mean time we are willing to admit that the practice would hardly suit our damp, foggy, and stormy climate; but in this sunny land it seems quite correct, and harmonises admirably with the surrounding scenery and bright sky. We should add, that even in the grand palaces of Genoa many portions are painted with architectural designs, and one noble piece of architecture, the palace Brignole *Rosso*, takes the name *rosso*, or red, from the deep rich brick colour with which it is entirely covered. We must not leave Genoa without saying a word about its modern buildings. Of these the principal are the railway station—a very fair piece of Italian architecture; and the great marble monument to Columbus, an ambitious and well-sculptured work, lately erected, as the inscription states, by 'Grateful Italy,' which does not appear very appropriate. It seems to us that Great Britain and America have more reason to be grateful to the great Genoese navigator than Italy; but we must not be hypercritical in such matters.

The next place of interest we come to is quiet old Pisa, in every respect a great change from noisy, lively-looking Genoa.

We come here upon street architecture of Tuscan severity; but the great point of interest is naturally the lonely field near the old walls, where stand in grey antiquity and solemn beauty the celebrated group of the Cathedral, Leaning Tower, Baptistery, and Campo Santo, of the respective dates 1063, 1174, 1153, and 1278. Externally, not one of them, if now erected, would receive an architect's approval, and yet they are full of charming effects. Not so, however, the interior of the Duomo, which is as fine a piece of architecture in composition, proportion, and colour as Italy possesses. It is unfortunately ruined, though, by the practice recently adopted in the churches of suspending an immense dark-coloured awning for about 50 feet up the central nave, to act as a sounding board for the preacher in the pulpit; and preaching now is uncommonly active here, as the priests feel the wicked world is against them, and there are powerful enemies abroad. As to the Campo Santo, it is full of works in sculpture and painting which alone would repay the student a visit to Italy; and as regards sculpture especially, quite a history of the art is to be seen within its walls. It has been excellently illustrated by Lasinio in his beautifully etched work 'The Campo Santo of Pisa,' to which the student is referred; whilst Cresy and Tayler's work on the architecture of the buildings themselves is very good in its way. As regards leaning towers, we have little new to say, except that from the badness of the foundation at Pisa, half earth, half sand, they are of common occurrence, that of San Nicolo being a very remarkable example. Speaking of towers reminds us that we have forgotten to mention the brick tower of Pietra Santa, a fine piece of construction, square in plan, with a circular stone staircase inside, resting on projecting courses of the main brickwork of the tower. At Pietra Santa also are to be seen several beautiful examples of Renaissance sculpture in the cathedral, principally by Stagi and Donatello. The marble pulpit by the former is an exquisite work, and deserves to be better known: in design and execution it is very graceful and effective. But to return to Pisa: no archæologist should fail to visit the church of San Piero in Grado, some four or five miles out of the town, for it is one of the most perfect examples remaining of an early Christian church. Tradition says that St. Peter landed here first in Italy, and the *grado*, or step, is that to which his galley was moored. It contains most remarkable fresco ornamentation of the eleventh century, ascribed to Giunto of Pisa, and the external walls are remarkable for the series of rough majolica pateræ which ornament them, and on which is to be seen a lively representation of the very vessel which bore St. Peter to the spot. It has been supposed that these coloured earthenware pateræ were brought by Crusaders from the East, but we think there can be no doubt that they were of local manufacture, and clearly in this case, owing to the subject just mentioned, were made to order: the patterns on them are also generally roughly Romanesque in character; and it is to be remarked that, besides the present church, fine examples of the same class are to be found on the walls of San Paolo l'Orto (one of the best specimens of Pisan church architecture), St. Andrea, St. Martino, Sta. Cecilia, and San Michele fuori le Porta, in the tower of which latter church, probably dating from the eleventh century, one very fine and large green platter (for that is in fact what they all are) attracts the eye particularly, and we think there can be little doubt that all these were made in the alluvial valley of the Arno, and were simply used as cheap ornamental substitutes for coloured marbles as employed in the Duomo and other of the more important buildings.

From Pisa to its old rival and final conqueror, Florence, the present capital is but a few hours' ride by rail, and we may find ourselves on truly classic ground: hardly a step but we meet with familiar and world-famed mementos; in this house Dante of immortal memory was born; here Michael Angelo lived and worked; here the many-sided Leonardo, master of all the arts and sciences; here Cimabue, Giotto, and Orcagna laid the foundations of all modern art; here Bufalmacco rested, and here Vasari wrote; Galileo dwelt here, and here Milton visited him. The names of Machiavelli and Guicciardini belong to the streets in which they lived; and amongst other tablets, which it is the good custom here to place on the houses where the greatest of our race have dwelt, we were much moved on meeting with one to the memory of Elizabeth Barrett Browning, whose works and sympathies made (so the inscription goes) a ring of gold to unite Italy and England. Lovely Florence! It was our first love, and still reigns supreme in our affections. City of flowers, and of beautiful and noble spirits! No city in the world can produce such an array of names to illustrate all that is admirable in art, and honourable to human nature. Florentine architecture also has always been our model of what is excellent in art. It may be *tant soit peu* severe, but how much better is that than the paltry frippery of such works as are now regarded as the pride of Paris, and even of London! Even if alone, we raise and will ever raise our voice against that wretched redundancy of ornament which is now the criterion of merit in architecture. The true excellences of our art, proportion and deeply-studied detail, count for nothing; and this, we regret to say, is in a great measure owing to the prevailing fashion of the day, the pseudo-French, German, and Italian Gothic works which alone the fashionable and half-educated public consider *comme il faut*. What is there in such palaces as those of the Strozzi or the Riccardi which can please such tastes as these? absolutely nothing. The public would look with a blank stare on the Palazzo Uguccioni and wonder what you can see to admire in it; and yet it is perhaps one of

the most beautiful productions of architectural art the world can boast of, be its designer Raphael or not. But our chief attraction is ever the building, now a sort of church, called Or San Michele, or 'now St. Michael,' for it was not originally intended for a church, and is quite unfitted for one in fact. Not only is it almost perfect as a building to our mind, but it contains moreover that triumph of architecture and sculpture, the shrine of Orcagna, which is quite lost by being placed in it. We do not think that human genius and the most careful mechanical execution can go beyond what is to be found in this truly beautiful work, designed and executed by Orcagna himself, of course with such assistance as was absolutely necessary, though it is related that he worked at the most minute details with his own hands. All the sculpture, which is the principal ornament of the shrine, is beautiful; it represents various episodes in the life of Jesus and of the Virgin; almost all of equal excellence. All the surrounding mouldings, with their ornaments, in which the pilgrim's shell is prominent, are most original, effective, and yet delicately worked; the whole forms a square of about 20 feet each way, raised on steps, each face having high gable ends, and in the centre was to have been, so it appears to us, a spire, but this is unfinished, bearing on a small scale some resemblance to St. Mary Redcliffe's at Bristol. Well might Orcagna be proud of this work, on which he has inscribed these words: 'Andreas lionis, pictor Florentini oratorii archimagister extitit (anò?) 1359.' This unique work of one artist has, so far as we know, never been properly illustrated; and the same remark applies to the building (Or S. Michele) itself, which is a noble piece of architecture, adorned with sculpture by the greatest artists of the fifteenth and sixteenth centuries quite worthy of it. It contains also many interesting mural frescoes now fast going to ruin, and the stained glass has all the richness of Bourges, Chartres, or Canterbury choir, with better drawing and clearer colour. The old Bargello or Town Hall and Prison has been converted into a Florentine museum; it has been carefully restored in parts, and newly decorated in others. We regret that the head of Dante by Giotto should have been quite renewed, though we think it has been very well done, and is very characteristic. Signor Cavalcaselle, who is so well known for his valuable works on Italian art especially, is keeper of the museum, and we have no doubt that everything which comes under his supervision is well carried out. There is no catalogue of the contents of the museum at present, nor is a description of it to be found in Murray, so we have made a *résumé* of its contents, which is, however, too extended for your Journal. Suffice it that some of the finest works of ornamental art belonging to the Medici, heretofore in the Uffizii, are now to be seen here. Majolica, rock crystal, ivories, furniture, and sculpture—in the last department the museum is particularly rich—and some of the pieces by the great masters of the Renaissance are unapproachable for their excellence, except by the Grecians of old. And indeed we strongly suspect that a good deal of Grecian and Etruscan blood still flowed in the veins of these dwellers in ancient Etruria. Were we to devote as much space to the subject as it deserves, we should never get on to the Uffizii and Pitti galleries of pictures and sculpture, now joined by the private passage belonging to the Medici right across the Ponte Vecchio. The wonderful beauties of these collections can never be surpassed; they are unapproachable, even by the riches of Rome, as a magnificent example of all the arts combined to raise and delight the mind of man. Let every one who loves art come here; to have seen and have studied them is a necessary part of every architect's education. We will not trust ourselves to a description of their combined attractions, for what description, however minute, could do justice to them? We say again, come and judge for yourselves; in these railway days it is a mere holiday trip. And not only are the buildings and their contents deserving of careful study, but the gardens of the Pitti Palace, known as the 'Boboli,' have always seemed to us a model of what is tasteful in an art too much neglected by architects of the present day, yet one which forms an important adjunct to their more legitimate work, and in which one English architect at least (Kent) excelled. W.

THE NEW THEORY OF STEAM.

IT is not the contour of an animal or a machine (says a letter in a late issue of the *New York Tribune*) which determines its specific character; that arises from what is within. Configurations of the steam engine are being constantly modified without affecting its intrinsic qualities. Now in the essential points involved there is a real similitude between it and its natural forerunners, the animals. They are substantially alike. The leading characteristic of both is to produce and give out force; for not only do the same mechanical principles rule in both, but the fundamental one by which they generate power and impart it. Formerly muscular force was ascribed to vitality, or the element of life; but the fact has long been ascertained that, as respects the source of their physical energy, animals are as purely material machines as those constructed by ourselves. Thus writes Professor Henry, in the Smithsonian Report of 1866:—'In the early study of mechanical and physiological phenomena, the energy which was exhibited by animals, or, in other words, their power to perform what is technically called work, was referred to the vital force. A more critical study of these phenomena has, however, shown that this energy results from the mechanical power stored away in the food and materials which the body consumes; that the body is a machine for applying and modifying power precisely similar to those machines invented by man for a similar pur-

pose. Indeed it has been shown by accurate experiment that the amount of energy developed in animal exertion is just in proportion to the material consumed. . . . The combustible material may be considered the food of the steam engine. How is it, then, that in evolving equal amounts of force, we are said to consume from ten to twenty times more fuel than Nature? Chiefly because we run our engines with a fluid highly heated—so much so as to fuse metals—while she runs hers at ranges of temperature comparatively cool. We use it at 300°, 400°, and 500° F. She rarely exceeds 100°. In robust health our blood varies little from 98°. Raised to 110° we are inflamed with fever; languor, constitutional derangement, and laboured or hurried respiration ensue. (So superheated steam-engines are in constant exacerbation, burning up the vital fluid.) But can our popular motors be run with steam as low in temperature as the blood of the horse or elephant? Perhaps not at once—that would be too great a leap for the dull and indifferent to take, though not for the enlightened, aspiring, and energetic—but certainly they may in time approach it. That they can now use it considerably below 212°, with unexampled advantage, has been made evident. Let them do that, and ere long they will be started at 180°, the boiling-point of spirits; but ere reaching that point, they will have ceased to consume as much fuel for the power of one horse as should suffice for that of five or six horses.

OUR COTTAGE HOMES OF ENGLAND.

THE Report of the Rev. J. Fraser, the Assistant Commissioner appointed to explore the villages and rural districts of certain counties, contains some interesting facts concerning Sussex. He tells us that 'the majority of the cottages that exist in rural parishes are deficient in almost every requisite that should constitute a home for a Christian family in a civilised community.' In the district of Southwater, Sussex, an old farmhouse has been converted into a cottage, and the chimney is so huge that on a wet day the rain puts the fire out, and on a cold stormy day the inmates have sometimes been compelled to go to bed to keep themselves warm. Anything seems capable of being turned into a cottage. Sometimes the original article is a stable, where coach-horses were kept, before the railway drove away the traffic. Some of the worst of these places are 'parish cottages,' erected in the time of the old poor-law. Others, 'almost uniformly bad,' are cottages run up by squatters on the waste, or held upon a lifehold or copyhold tenure, and which have not yet fallen to the lord of the manor. Others again, constructed of the flimsiest materials, are the work of speculative builders. 'Open' parishes, like Docking, in Norfolk, and South Cerney, in Gloucestershire, 'into which have been poured the scum and refuse' of the 'close' parishes adjoining, abound with some of the worst instances of improperly constructed and over-crowded dwellings. 'Socially, nothing can be more wretched.' Economically, the imperfect distribution of cottages embarrasses the farmer in his demand for labour. Physically, these ruinous, ill-drained cottages, small in the space which they afford, and crammed with occupants, are replete with danger to health, giving a ready home to fevers of every type, and intensifying the tendency to scrofula and phthisis, which already exists in consequence of low diet and frequent intermarriages. Morally, the results are of the worst. In such a home life is to be found the cause of other evils—the want of moral purity, which shows itself in the general conduct of thousands. So extensive is the evil that Mr. Fraser says out of the three hundred parishes which he visited he could only remember two—Donnington, in Sussex, and Down Amney, in Gloucestershire—where the cottages appeared to be both sufficient in number and admirable in quality. The poverty of the agricultural labourer and his consequent inability to pay more than a very small amount of rent may have much to do with the miserable character of his dwelling. But it is quite impossible that energetic, intelligent, and healthy labourers can be reared in these wretched abodes. Hence the present state of things is injurious to the master as well as the man.

THE DRAINAGE OF TOWNS.

ONE of the most important questions of the day, touching as it does the health of thousands, is that of the drainage of towns, considered in conjunction with water supply. It is no longer to be borne that towns situated on the banks of a river should be allowed to turn their sewage into the stream, and thus pollute the water which is drunk by the inhabitants of other towns and villages lower down. This crying evil, which was acquiesced in in our English *laissez-faire* way for so many years, is now in a fair way of being rooted out of the land by the strong hand of the recent Acts of Parliament bearing on the pollution of rivers or on the utilization of sewage; and we shall probably be assisting in the good work by calling the attention of our readers to the subject.

Now that by the Acts of Parliament sewage will not be allowed to flow into rivers, except under stringent regulations as to its purification and deodorization, the great questions which have to be considered by towns situated as we have described are—

1. How is the sewage to be purified so as to combine efficiency and economy?
2. What is the value of town sewage, and how can that value be best realised?

The first question is susceptible of several answers; and each of these views of the subject has its advocates. The sewage may be purified by filtration, or by the precipitation of the solid matter, or by the extended use of Mr. Moule's system of dry-earth closets replacing the present water-closets. The value of Mr. Moule's adaptation of a principle which has been well known at least ever since the book of Deuteronomy was written, is undoubted. We do not think, however, that in it we can find a solution of the difficulties inseparable from the drainage of a large town, though in particular situations the earth closets may be most usefully employed.

The difficulties attendant on the carting to and fro of the earth for a town are very great, and the larger the town the greater the inconvenience

becomes. Water, as we all know, has the quality of rising, either by pumping or by natural gravitation, to the tops of our houses, where it remains a quiescent power until required; when called upon, it is at once available to carry solids downwards and away from the house or town. This circumstance of water being a convenient means of transport will, we think, always give the water-closet system an advantage over the dry earth invention, even if all other conditions were equal. It is to be recollected, moreover, that the waste water of a town has to be provided for even if Moule's earth-closets were universally in use, and so a double system would be necessary. The cost also to each individual householder of an alteration of system would be serious, and would alone present great difficulties in the way of its adoption.

We think, for these and other reasons, that in the present state of things we must devote our attention to improving the existing system of drainage, and we proceed to consider the two processes of dealing with liquid sewage, viz., by precipitation and by filtration.

The precipitating process is by no means free from difficulties. A good precipitating agent has to be found which will combine efficiency, cheapness, and ease of transport, and further, in the use of this agent more or less skill or mechanical contrivance is required. Then, after the solids have been precipitated, they have to be got rid of. The value of them as a manure is a moot point, and, in order that they should be employed in agriculture, they must be sold at such a price as will render farmers ready to pay for cartage from the spot, where the precipitating process is carried on, to the land to which they are to be applied. Here the manure obtained by precipitation comes into direct competition with guano, ordinary farm and artificial manures. Further, it is very doubtful whether the precipitating process removes all noxious qualities from the sewage, so that even if it be economical, which we much doubt, its efficiency is not beyond dispute.

Many of the objections to the precipitating process apply also to the filtration process, so long as it is carried out (as is generally understood by the term) in artificially constructed filter-beds, where the system presupposes a concentration of sewage at particular points. In the filtration process, however, we believe, the true answer to the first question is to be found; but, in saying this, we would draw a sharp line of distinction between an artificial filter bed, and the great natural filter which we possess in land under cultivation. Concentrating the sewage at any point on artificial filter-beds involves us in a cloud of difficulties, to some of which we have briefly alluded in the consideration of the precipitating process. The reverse, viz. diffusion of the sewage over a larger area of land, proportioned to the size of the town from which the sewage comes, gets rid of nine-tenths of the objections. And, moreover, if utilization of sewage is to be a commercial success, this process promises the best results. There can be little doubt that the more rapidly the ingredients of sewage reach the plant which they have to manure, the greater will be their fertilising power, and there is, we believe, no process by which the rapidity of transport is so well ensured as by letting the sewage flow directly on to the land in which the plant is growing. Thus, no system can be so economically successful as that which combines filtration and utilization at one spot.

If we were asked to describe the beau idéal of an efficient sewage filter-bed, we should indicate one that thoroughly separated solids and liquids, that stored up all the valuable ingredients for future use, that deodorized and purified the sewage during the process of separation, and that never required renewal or repair. Land under cultivation with proper subsoil drainage furnishes all these desiderata, the one condition being, that the sewage should be diffused over a sufficient area to prevent any particular spot being overcharged, or, so to speak, that the filter-bed should be large enough and efficiently handled.

The solution of the first question, *How is the sewage to be purified so as to combine efficiency with economy?* is, we believe, to be found, as we have indicated, by applying the sewage of a town just as it comes away in the sewers to land in cultivation and in suitable positions, but not in any process of precipitation, or artificial filtering. The earth is the best of filter-beds, and the most powerful of deodorizers—Mr. Moule's earth closet testifies to its efficiency in its latter capacity, and the difference between the spring water in our wells, and the surface rain water which is their source of supply, shows us the earth's filtering power. The sole condition, as we have said, is, that a sufficient area of land should be used; and fortunately we have the results of experiments to guide us as to the proper quantity. This question of area is so much mixed up with the cost of any system combining purification with utilization, that we will consider it under the head of the second point for enquiry, viz. *What is the value of town sewage, and how can that value be best realised?* We have already, we fear, in treating of the first question, over-taxed the patience of our readers, and therefore we will reserve our remarks on these points for a future occasion.

REVIEWS.

TREE AND SERPENT WORSHIP; OR, ILLUSTRATIONS OF MYTHOLOGY AND ART IN INDIA IN THE FIRST AND FOURTH CENTURIES AFTER CHRIST. From the Sculptures of the Buddhist Topes at Sanchi and Amravati. Prepared under the Authority of the Secretary of State for India in Council. With Introductory Essays, and Description of the Plates, by James Fergusson, Esq., F.R.S., M.R.A.S. London: India Museum, 1868; W. H. Allen & Co., 13 Waterloo Place, Publishers to the India Office.

The public of England are indebted to the able perseverance of Mr. Fergusson on the one hand, and the liberality of the Secretary of State for India in Council on the other, for the magnificent volume which has been recently published on the subject of the remains of two Buddhist temples in India, which, as well from their former splendour as their amplitude of materials for illustration, have been selected as the best exemplifications of a once widely-spread and extremely curious form of adoration. The columns of THE ARCHITECT may hardly, perhaps, be considered a place for the notice of a subject so profound and so abstruse in antiquarian character as Tree and Serpent worship; and yet without some review of it,

the work itself, and its very beautiful and profuse artistic illustrations would be almost incomprehensible.

In Mr. Fergusson's exhaustive Introduction to the work, he has traced Tree and Serpent worship not only to every portion of the Old World in ancient times, but to the New. When and where, or how it may have originated, and how it spread so as to become a portion of ancient Pagan belief over the greater part of the globe, it is impossible to conjecture; but those to whom the subject has any interest will be gratified by the extreme completeness with which Mr. Fergusson has brought all points connected with it, and many original observations in its elucidation, before his readers. In relation to the Christian faith and its predecessor the Jewish, they will find the worship of the serpent traced from the brazen effigy to which worship was paid in the wilderness when the plague was stayed, to the period of final discountenance of adoration in the time of the Prophet Ezekiah, a period of six hundred years, to be renewed by the Ophite sect of Christians, who, according to Tertullian, preferred belief in the serpent to that of Christ, because the former brought into the world the knowledge of good and evil. Again, in regard to groves and trees, from the sacred bush or tree of Horeb to the sacred groves of Baal, and those planted by King Ahab and his successors, which were denounced by the prophet Isaiah, Mr. Fergusson's record is most complete.

Into Phœnicia and Mesopotamia, and thence into Græce, Mr. Fergusson follows this curious subject with a profusion of learned illustration and reference, of which it is impossible, with the limited space at our disposal, to give even an abstract. Nor is it necessary, indeed, to recapitulate the familiar classic legends of the destruction of the Python by Apollo, or the conversion into serpents of Cadmus and his wife as a 'cure for ills that had become unbearable.' Of actual serpent worship in Græce there is ample confirmation; and Mr. Fergusson, as we consider with reason, attributes it to the fact that an old 'Turanian serpent-worshipping race in Græce was passing away to make place for one of Aryan form;' and yet, for many centuries, the old superstitions, whether as to hallowed groves or serpents, remained unchanged.

In Rome we find less evidence of serpent worship, but specimens of coins are given on which are serpent emblems, indicative, perhaps, of power or wisdom. In Germany the Aryan element was too strong for the admission of serpent adoration; but of tree worship in sacred groves the evidence is conclusive, from the period of Cæsar's wars till long after the people became Christian. Our readers may not be aware that, according to Mr. Fergusson, 'one of the last and best known examples is that "Stock am Eisen" in Vienna, the sacred tree into which every apprentice, before setting out on his "Wanderjähre," should drive a nail for luck. It now stands in the centre of that great capital, the last remaining vestige of the sacred grove round which the city has grown up, and in sight of the proud Cathedral of the Christian which has replaced its more venerable shade;' and he adds in a note, that the festival of the Christmas tree, at the present day so common throughout Germany, is almost undoubtedly a remnant of the ancient superstition.

In Sarmatia, as late as 1386 A.D., we learn, according to Olaus Magnus, that the Poles worshipped as gods fire, serpents, and trees; and that serpents and trees were adored by the peasantry in Esthonia and Finland within the limits of the present century is perfectly established by the work of a local pastor, J. W. Boelclir, who details the invocations to serpents used in the Finnish worship. Through Scandinavia and France the record continues with the same profusion of learned research and illustration. Mr. Fergusson is avowedly sceptical upon the subject of Celtic Druidism in England; but he does not deny that serpent worship may have prevailed in Wales when it had disappeared elsewhere, and he admits the existence of adoration of sacred trees and groves. Passing by the vexed questions of the antiquity and purpose of Stonehenge, Avebury, and other English Temples, we gladly notice his admission of Serpent worship in Scotland, and his descriptions of the stones on which serpent emblems are carved, though he seems to attach no particular antiquity to them.

In Africa, as part of Fetish worship, Snake and Tree adoration flourish at present. 'In Whidah the three classes of gods worshipped are Serpents, Trees, and the Ocean, the same Trinity as was established in the Erechtheum in the Acropolis of Athens more than 3,000 years ago.' Unaffected alike by Christianity or Mahomedanism, the most unchanged portion of the African population have preserved all the rites of this faith. 'It may be very horrible,' writes Mr. Fergusson, 'but as far as we at present know, it is the oldest of human faiths, and is practised with more completeness in Dahomey than anywhere else, at least in the present day.'

Want of space alone prevents our following the author through Mexico and North America generally, where proofs of Snake worship are very abundant, into Persia, Cashmere, Cambodia, China, Oceania, the Feejee Islands, and Australia, Ceylon, and finally India. Here Mr. Fergusson finds it very difficult to define the original Serpent worshippers. They were not certainly Aryan invaders, and may have been a portion of that great Turanian race who, probably before them, had possessed themselves of the southern portion of India. The 'Nagas' or Serpent race, as related in the Mahabharat, were subdued by the Aryans and became subject to them, and in 691 B.C. a Naga or Serpent-worshipping Dynasty held the throne of Maghada in Bengal. In 623 B.C. the great Buddha was born, and the Serpent faith became gradually incorporated with the doctrines preached by him and his successors, under the denomination of Buddhism; and when that creed was adopted by the people of Middle and Southern India, the descendants probably of that ancient Turanian race already alluded to who had settled there, they seem to have retained their ancient superstition.

As part of southern Buddhism, therefore, the Snake and Tree worship undoubtedly existed; and it is there that up to the present day it is maintained among the lower orders, who are possibly the mixed descendants of the ancient Turanians. These people are no longer Buddhists, but Hindoos; and though Buddhism has been extinct among them for upwards of a thousand years, the Tree and Serpent worship are still existent, underlying the comparatively modern faith of Hinduism.

The Tope at Sanchi, one of the group described by General Cunningham's work on the Bhilasa Topes, was a monument built to enshrine relics

of Sariputra and Mahā Mogalava, two of the principal disciples of Buddha himself. The date of erection is nearly of the first century after Christ, a period in which architecture may be said to have been commenced in India. We need not here enter into particulars of the earliest specimens of the science in India; they will be best learned from Mr. Fergusson's *History of Architecture*, wherein its progress from the imitations and principles of wooden edifices, in the Adjunta and other Buddhist Cave Temples, to its development into actual building, are clearly given. The first efforts in stone were on the mortice and tenon principle of wood. Two pillars were erected, and across them was laid a beam of stone. Multiples of these in squares produced a building, as we see in Karnac and Dendera in Egypt, and in all the most ancient structures in India and in Græce, and it is beside the present question to claim for it an Egyptian or Indian origin, though few, perhaps, will doubt the Egyptian. The illustrative photographs of the Sanchi Tope, and the diagrams of its construction, explain its structure perfectly. It consisted of a hollow truncated hemisphere, built of stone and mortar, and is probably the earliest form of dome in existence. Mr. Fergusson attributes its form and construction to Turanians of Bactria, whence they can be traced by their tree and serpent worship, not only to India, but to Cambodia and Java.

But the architects of the Sanchi Tope, though their principles of construction were limited and rude, possessed the faculty of ornamental embellishment in a very remarkable degree; and it is impossible to examine the minute details of their work without being deeply impressed with the grace and vigour of the execution of figures, groups, processions, friezes, &c., with which the northern, eastern, and southern gateways abound. There is nothing extravagant or repulsive about them, as is the case with much of the Hindu architecture which followed. The whole is harmonious, and in many respects of great elegance, as is shown in the photograph plates, No. 13, 14, and 15, of the eastern gateway. Almost all the groups are illustrations of tree and serpent worship, and represent devotees in varied attitudes making offerings to the object of adoration. It is impossible here to describe these groups, which are fully explained by Mr. Fergusson, and we must refer our readers to the plates and their descriptions, which we are assured will amply gratify them. In the Sanchi Tope the beautiful drawings by Colonel Maier have been photographed for this work; and their admirable spirit and correctness will be best proved by comparison with the photographs from actual remains.

The Tope at Amravati is of similar design with that of Sanchi, but its date is three centuries later; and it is evident from its details of sculpture how materially the native artists had improved both in the design and execution of its ornaments. There is no advance in, or alteration of, the principles of construction. In the details we see the pillars with capitals and crossbeams applied to all, as well to the facing of the external enclosure as to other portions. Of the amazing extent of the work of embellishment Mr. Fergusson writes as follows. He is speaking of the outer rail, as it may be termed, of the inclosure of the Amravati Tope:—

'There were apparently twenty-four pillars in each quadrant, and eight at least in each gateway—say, 112 to 120 in all. This involves 230 to 240 central discs, all of which were sculptured; and as each of these contains from twenty to thirty figures at least, there must have been in them alone from 6,000 to 7,000 figures! If we add to these the continuous frieze, and the sculptures above and below the discs on the pillars, there were probably not less than 120 to 140 figures for each intercolumniation—say, 12,000 to 14,000 in all. The inner rail contains probably even a greater number of figures than this; but they are so small as more to resemble ivory-carving. But except the great frieze at Nakon Vat, there is not perhaps, even in India, and certainly not in any other part of the world, a storied page of sculpture equal in extent to what this must have been when complete. If not quite, it must have been nearly perfect, in all probability, less than a century ago.'—E. 166.

We have not only Mr. Griggs' admirable photographs in illustration of these sculptures, but some of the actual sculptures themselves, now in the India Museum. How rich and elegant their discs or bosses are, how varied in detail, how perfect in design and execution, our readers can judge for themselves by plates 50 to 55. Sometimes in conjunction with the most graceful female figures, again with dwarfs and grotesque monsters, or with rich foliage, there is an exuberance of fancy displayed in all, which throws into the shade the most florid of Gothic ornamentation. Plates 58 to 62 are even richer and more wonderful, for in them groups of figures take the place of ornamental geometrical designs, and are full of grace and character. Nor were we to attempt, which would be impossible, any particular descriptions of remarkable objects, could we say more than that they possess a charm which no Eastern sculpture has ever yet afforded us. There are great variations of design and of execution as might be expected, and the designers and sculptors have not always been equal in merit. It is probable, too, that the execution extended over a long period, possibly a century or more, portions being gradually added by devotees, without, however, interfering with the general design; but, taking them as a whole, they are truly wonderful specimens of art, of a period in India as yet little known to art history, and in its own degree as wonderful as that of Græce or Rome. Mr. Fergusson considers indeed, p. 221, that 'we can now assert with confidence that all the permanent forms of art arose in India, after its inhabitants were brought into contact with the Græcian kingdom of Bactria. It seems probable that such sculptures as we have of Asoka's reign were actually executed by Græcian, or at least by Yavana, artists, and from his time (350 B.C.) to the present day we can trace the rise and fall of Hindu art, almost without a break.'

We must, however, bring these remarks to a close, only regretting that we are unable to notice every point with which we have been interested and instructed in this very remarkable book. The labour with which it must have been written—step by step in regard to serpent and tree-worship—the immense mass of authorities, ancient and modern, which have had to be consulted; the fine taste and architectural scientific acquirements which have been brought to bear upon its production, entitle its author to the respect and admiration of all true lovers of art, as well as of all antiquaries and archaeologists. Where Mr. Fergusson esteems himself

right, he is positive in his arguments and deductions; where he is doubtful, while he states his own opinion freely, he leaves the issue to the results of further investigation. We trust that this noble volume is only the precursor of others of a kindred nature, and that at some future period it may be produced in a form which would render it at once popular and reasonable; and we trust that Mr. Fergusson's own hopes in this respect may be realised.

To our professional brethren we commend the study of the details of this Buddhist sculpture. Many of them, especially the discs or bosses, might be adapted in reality or in spirit to Gothic architecture; and while the designs of the ruder styles of the middle ages are still accepted as high art, we think that those of the possibly Bactrian sculptors of the first few centuries of the Christian era are in many respects more perfect and beautiful.

ILLUSTRATION.

SOUTH KENSINGTON AND M. LAMEIRE'S DRAWINGS.

By W. BURGESS.

WE certainly owe a great deal to Professor Kerr. Both his 'New-leaf Discourses' and his 'English Gentleman's House' are eminently edifying; more particularly the two short chapters in the latter work which are devoted to 'Elegance' and 'Ornamentation' respectively.* A careful perusal of them lets us into the secret why we have so little either public or private art; and if the facts are as therein stated, we can hardly help agreeing to the conclusion which has lately more than once been put forth—viz., that in matters of art the said English gentleman is utterly uneducated. If we go into the matter, and inquire the reason of this state of things, we find firstly that he does not obtain the education of the eye, for he is not in the habit of seeing beautiful buildings and works of art around him, and secondly that he has had no regular teaching at the university where he has been brought up. The consequences are painfully apparent in his after-life. Neither his town house nor his country mansion exhibits any art which is part and parcel of the building, while in his seat in Parliament he is especially anxious to let it be known that he does not profess to understand anything about art, but that the great objects to be sought for are convenience and economy. If we go a little further, and inquire as to his ideas of art as an aid to religion, we shall find that he either takes the Puritanic view that the perfection of ecclesiastical architecture is bare walls and a roof, or that ecclesiastical art is a congeries of crockets, notchings, loudly-coloured diapers, and the usual wretched stained glass. Perhaps he goes even beyond this, and belongs to an archaeological society, and collects filigree work, Chinese curiosities, or pottery; but with even all this he has no idea of art in its grandest form—viz., as an adjunct to architecture. Say that he has a new house built; he has got in reality a skeleton which wants clothing with flesh. How does he proceed to do it? Does he seek to make each room a work of art different in its decorations—different in its colouring and different in its furniture, but each telling some story, either on the walls or on the ceiling or on the furniture? Not in the least. The architect goes out—for that gentleman is aware that five per cent. on the bricks and mortar has paid him, and he knows that five per cent. on the decoration will not pay him, even if he possessed the education to do it; so the upholsterer is called in, and we have what we see in every house, and the state of things which has been so euphoniouly described in Mr. Kerr's two chapters on 'Elegance' and 'Ornamentation.'

Now the moral of all this is that the English gentleman ought to be educated in matters of art in his early youth, say at the Universities. The Slade bequests may perhaps be the beginning of such a system; and if they should be, Felix Slade will have done more for his country than almost any other benefactor.

Supposing the English gentleman to have acquired some real knowledge about the arts, the good that would follow would be immense.

In the first place any honourable member who rose up in the House upon some important art question (say such as the Law Courts) and prefaced his observations by the remark that he did not profess to know anything about the arts, would be coughed down, and the declaration would be considered as disgraceful as if he got up and declared that he did not profess to understand Latin.

Again, the English gentleman would then rather prefer to employ architects who could direct the decoration as well as the building of his house, and who could sit down there and then, and show him how the figures would come on the walls, or range themselves with regard to the lines of the architecture. Then the architect would have to educate himself, and so would the artists he employs; for be it observed that it by no means follows that the man who paints 'the last fond look' or 'love's first sigh' on a canvas for the Academy, is fit to do a simple and severe procession on a wall—on the contrary, it will take him a considerable time, and perhaps a good many

* 'Elegance, therefore, unassuming and unelaborated, touching in no way the essentials of home comfort, never suggesting affectation and pride, moderated by unimpassioned refinement, and subdued even to modesty, will be invariably acceptable in England. Even where extreme wealth and exalted rank render it incumbent upon a family to surround itself with the most cherished products of industry and genius, it will be rarely and rarely that will be esteemed—perfection of workmanship and pure or pleasant excellence of design, rather than splendour or luxurious richness or imposing grandeur. Simplicity still, and subdued power, the greater the power the stronger the subtling hand, will be cherished even in magnificence, and the glare of pomp despised.'—*The Gentleman's House*, by Robert Kerr. Murray, London: 1865. Page 87.

failures, before he can succeed to his own and to the architect's satisfaction.

The same remark applies to the sculptors; and if we descend lower in the social scale we should find the architect preferring those workmen who are able to draw, and who know something of the history of their arts or trades. Now it is evident that although the higher orders may eventually get their art education at the Universities, some large system of machinery is required to render instruction in the arts accessible to the lower and middle classes. This machinery is professedly supplied by the Department of Science and Art at South Kensington; i. e. it professes to educate the eye by means of its museum, and to teach drawing by means of the various schools of art scattered over the country. Let us see how the system works. In the first place, let us take the museum. There is hardly a word to say against its contents or its management, but there is a great deal to be said about its situation. People go there to make a holiday, and doubtless a great deal of good is done in that way; but suppose a cabinet-maker or a silver-chaser wants to consult any article, he must either lose a quarter of a day or reserve his visit until the evening, when perhaps the gas-light is not sufficient to enable him to obtain the requisite information. The fact is that the situation of the museum is not in the manufacturing part of the town. Had it been built all round Leicester Square, the result would doubtless have been far more beneficial; but at the same time the very highest praise must be given to Mr. Cole for his energy in the collection and arrangement of the museum part of the affair. He would still more deserve our gratitude if he would take his broom and make a clean sweep of the school department. As it at present exists it is a delusion and a snare. It has hardly turned out one man of mark, but heaven only knows how many it has utterly disheartened and discouraged from going into the arts at all.

I believe most of us have heard strange legends of the early days of the school, and of the jealousy of the professional painters, who were afraid that it would be the means of flooding their profession, and how the students were made to declare on their entrance that they did not intend to become portrait painters, or historical painters, or landscape painters, &c.

The declaration might just as well have been saved, for 'Dyce's Outlines' were introduced, and I question whether any one was ever known to become a painter of any kind after going through that book.

What is really wanted is a series of schools in town and country where the student, after a very few preliminary exercises, should be taught the figure, and properly instructed in it by a competent staff of masters who have been trained to teach it, who know their anatomy, and who, if required, could point out the differences between a Roman and a Greek statue. Of course I do not imply that students should go at once to the life; on the contrary, they should go through a proper course of drawing from the flat and the round in the first instance, and the art of stippling might even be omitted with advantage. When a man can draw the figure, ornament becomes very easy. Certain days might be set aside for it, and certain lectures from a proper text book, i. e. such a one as Owen Jones is capable of supplying (say a special edition of his 'Grammar of Ornament') would be given at certain intervals, with the lecturer's own observations. Such schools would be attended, not by workmen only—on the contrary, architects, sculptors, painters, and the students in all the cognate arts would be only too glad to obtain in them their first instruction in the figure. We should then see decorators making a study, not how to avoid the figure in their designs, but how to introduce it; and that trade might perhaps in time present us with an English M. Lameire—for that gentleman is only a decorator, and has passed his life in a decorator's shop—and yet at the late Great Exhibition at Paris the judges awarded him a first class gold medal. It is even said that they were going to give him the great medal for architecture—a mistake, by the way, they could hardly have had the chance of making in England; although let us hope the day may come when it may even be possible for them to do so. I am informed that these drawings have occupied the evenings and Sundays of M. Lameire for seven years, and have been under consideration not less than nine. If we look at them carefully, we cannot fail to be astonished at the mass of knowledge, both literary and artistic, demanded in their production—the frieze, evidently the most excellent part of the composition, demanding an acquaintance not only with the history of France, but with its archæology and kindred studies. The apse and eastern end evince a most careful study of the Apocalypse; while the arrangement of the figures, the balancing of the groups, and the style of the drawing, evince the very highest study and skill.

Take, for instance, the three specimens selected for illustration in the present Journal. The first one shows part of the great frieze, the real size of the drawings. The first figure is Charles Martel, 'Dux Francorum;' he holds the mace in one hand, and with the other leads the horse of Charlemagne, 'Imperator Occidentis;' behind him, on the ground, is a Saracenic helmet, which serves at once to indicate his victory at Tours, and with the cloak to give an extended base to the figure, so as to balance the head of the horse, and to connect, in some measure, the feet of Charles Martel with those of the quadruped. The equestrian figure of the great emperor, if not the very best of the series, at least divides the honour with that of St. Louis. M. Lameire has done wisely introducing the Imperial coronation robes which are traditionally attributed to him; al-

DRAWING AT THE KENSINGTON MUSEUM.

though a perusal of the letter-press and an inspection of the plates in Willemin's 'Monuments inédits' most effectually dispels any illusion on that head. It is true that the crown, which is a Byzantine work, and part of the sword, may go back to his time; but the names of sundry succeeding emperors on the woven borders of the garments give evidence of a later origin, and even the arch over the crown presents us with the name of Conrad. By the way, it is very evident that at one time there must have been a second arch intersecting with the other at right angles, for the attachments are clearly shown in Willemin's plates. M. Lameire has hardly done justice to the sword handle, which he might very safely have copied from Willemin's plate, whereas the one in his drawing has a very theatrical appearance. It is worth while observing how the equestrian figure is made into a mass and strengthened, firstly, between the horse's legs, by the inscription and the broken Saxon idol; and secondly, above the hinder parts, by the upper parts of the figure of Witikind, the prince of Westphalia, and Desiderius, the last king of the Lombards; thus illustrating the Saxon and Italian victories of Charlemagne.

The second illustration shows the triforium, the frieze above it, and part of the roof. The architecture is eminently designed for decoration; that is, there is the greatest amount of plain surface, and the least possible quantity of moulding and sculptured ornament. Observe how the strong bands of horizontal ornament divide the various parts, and observe also how the ornament is made double and the lower band of it made geometrical where special emphasis is required, *e. g.*, at the springing of the roof. This geometrical ornament, which takes the shape of a continuous fret, not only serves to emphasise the line of cornice, but it helps to contrast with, and to bring out the figures below. Some of the heads even rise up into it: but there is less confusion in this happening in the case of a purely geometrical pattern than there would have been had foliage been used instead. The figures in the frieze represent Augustus as the founder of the Roman Empire, standing in his chariot and holding the figure of Victory. Behind him come captives, among which we easily distinguish the Egyptian. Then follows Attila in a litter borne by four warriors; one of them tramples on a Corinthian capital, showing the destruction of the arts. It should be observed that Attila's shield, quiver, and spear, together with a human head, are suspended from the litter.

In all these figures we observe the same balance and the same system of connexion that we have seen in the group of Charlemagne. Below all runs a continuous inscription, which does duty as a border,—but a mere foliage border would have been out of place; firstly, because it would have merged into the foliated (painted) brackets below; and secondly, because it would have apparently deprived the lintels of their requisite character for strength.

The idea of the roof is that of a velarium attached to a painted architectural composition, which occupies the lower part of the vault. The very lowest portion is kept quite plain to give a sort of base to the painted architecture, and to allow for the part cut off by the projection of the cornice when seen from below, just as a good architect slightly stilt his arches for the same cause. This is one of the little points which clearly prove that M. Lameire is a practical man and knows his profession.

The third lithograph is part of the sanctuary, and in my opinion is hardly so successful as the nave, although, to a certain degree, the same principles may be observed. Thus, elaborate multifoils with their accompanying foliage hardly appear fit places for inscriptions; we expect something more valuable in such frames; and the way the foliage springs from the circle hardly gives the same apparent strength as if one of the two scrolls had been reversed. A continuous line also appears to be wanted a very little below the springing of the arches, so as to separate the latter from the abacus; and down below the long panels between the columns present us with a very unsatisfactory mode of filling in; *viz.*, a single scroll. In a horizontal position or even round an arch the single scroll does very well, but in an upright position, especially in connexion with such severe architecture as the present, it is apt to look weak.

In the original drawings we hardly notice these little slips, for our eyes are attracted to the exquisite Baldachino over the altar. As this has not been lithographed, it is useless to describe it, but I most sincerely advise all students, both young and old (for when should an artist cease to study?), to go to South Kensington and make the most of these drawings before they leave the country. And this suggests the question why such a contingency should take place at all; and when, as we all know, South Kensington has bought many more costly objects, and far less useful ones, than these. Witness the silver shield for 2,000*l.*: surely something less than half that sum should be forthcoming for such a work. It is true that we have an economising Ministry, which has actually gone to the length of cutting off the stained glass from the restoration of the Chapter-house at Westminster; but still it must be remembered that, in all probability, no particular instruction would be derived from the said stained glass, whereas a great deal of very particular instruction is to be derived from these drawings, and what instructs our artists and workpeople improves our manufactures, and thereby helps to accomplish that very desirable object of the nineteenth century, *viz.*, the increase of our national wealth. But supposing M. Lameire's work to be purchased: the next thing is how to get the most out of our purchase. I do not think that much good would be effected if it is simply hung

up at South Kensington, where the mass of the visitors would pass it by to look at the more attractive jewellery and antiquities. On the contrary, I believe more good would be done if these drawings were sent from one school of art to another until they were known all over the country. A full account of their excellencies and also of their defects should be most carefully drawn up and printed, and the master should read the description to the students with the drawing before him, making at the same time his own remarks. The drawings should remain a month or three weeks before they were removed to the next school, and the students should have the fullest liberty of studying and copying them. I venture to think that in this manner we should soon have something very satisfactory for our thousand pounds.

Who knows but that even the English gentleman may partake in the general benefit, and gradually arrive at the discovery that elaborate decoration need neither be 'meretricious,' 'obtrusive,' or 'pretentious;' and that there is no necessity for continuing the state of things described in Professor Kerr's work; but until art education is more general among the upper classes, I fear we shall do very little to improve the present very unsatisfactory state of things, and that such monstrosities as the Trafalgar Square Fountains (to mention only one example) will be the rule instead of the exception.

P.S.—Mr. Tarver has obligingly drawn another section of the frieze, which thus makes the fourth lithograph from M. Lameire's drawings. There is very little to be observed concerning it, as the same principles of composition run through it as in the groups that have been engraved. The figures are Peter the Hermit, Pope Urban, Godfrey de Bouillon, and Hugh de Vermandois.

Concerning the costume, it should be noticed that the mailed gloves are not represented in contemporary documents as being divided into fingers. The blazon of the arms of Jerusalem is remarkable, as being an instance of metal upon metal. The heralds tell us the reason for this infraction of the ordinary rule was to more particularly distinguish these arms. M. Lameire has introduced Hugh of Vermandois as being the brother of Philip I. of France, and therefore a representative Frenchman connected with the first crusade, although his conduct was by no means satisfactory; for being sent by the princes, after the capture of Antioch, on an embassy to Constantinople he never returned; thus behaving, as Odoricus Vitalis tells us, like the raven sent from the ark.

THE STATE OF ARCHITECTURAL EDUCATION.

THE following Report was read, at the late meeting of Delegates of the Societies forming the Architectural Alliance, by their Hon. Secretary:—

GENTLEMEN,

The five reports which have been received from the Allied Societies in London, Birmingham, Glasgow, Liverpool, and Manchester, may be summarised as follows; but it would be unfair to any of them to consider such an epitome as this a complete report, for each of the reports contains carefully condensed information and views deserving of the most serious attention.

I can, therefore, only call attention to the salient points on which information was requested, and to the suggestions as to a course to be pursued which are contained in these reports, with a view to assisting us in our deliberations respecting our future course of action.

1. The age at which Architectural pupils usually leave school?
In London, Seventeen; Birmingham and Liverpool, Fifteen or Sixteen; Glasgow, Fourteen to Sixteen; Manchester, Fifteen.
2. The usual term of articles?
London and Manchester, Three to Five years; Birmingham and Liverpool, Five; Glasgow, Four or Five.
3. What proportion of those who enter the architectural profession are articulated to an architect?
London, 75 per cent.; Birmingham, all architects *proper*; Glasgow, no articles, but a course of service partly remunerated; Liverpool, one-third of *practising* architects, but *all* the present rising generation of architects.
4. What proportion of those who enter an architect's office have passed through a school of art?
London, 6 per cent. have passed through a school of art; Glasgow, 80 per cent. attend a school of design; Liverpool, perhaps one-half, including those attending a school of design.
5. The steps usually taken during the term of articles for the improvement of the pupil?
In London seldom more than office routine and the *suggested* attendance on architectural societies and classes; in Birmingham, beyond office routine, perhaps left pretty much to themselves; Liverpool, very little; Manchester insignificant, with a few honourable exceptions.
6. What facilities exist in your district for improvement to the pupils? What Schools of Art, public or private? What lectures, casual or regular?
In London very numerous lectures and classes at several institutions. Birmingham—the Government School of Art. Glasgow—the School of Art and a public library. Liverpool—lectures and classes at two institutions, the Government School of Art, a library, and papers. Manchester—School of Art and Mechanics' Institute.

7. What means your Society takes for the improvement of those who have not yet passed through their pupilage?

London, papers and classes and prizes; Birmingham, none; Glasgow, free use of rooms and library; Liverpool, papers and prizes; Manchester, papers and classes.

8. To what extent is the practice of study and sketching from existing buildings carried, and how far is it encouraged by the principals?

London, encouragement of the practice is neglected, and few facilities given; Birmingham, it is not done so much as it ought; in Manchester there is a sketching class.

9. How far could the existing facilities for instruction be modified or added to to increase the extent of architectural education?

The gist of this question is: What, in the opinion of the societies, is to be done?

The London Architectural Association says, and in this all the other societies agree, students use only to a small extent the facilities afforded to them.

The London Architectural Association also says that this is caused by the want of a recognised system, and suggests that time should be taken from the masters in the daytime for attendance on lectures, &c., by the students.

They urge examination as the proper ultimate admission to practice, voluntary for the present, compulsory for the future.

The Birmingham Society have to suggest increased library and museum accommodation.

The Glasgow Society say that action for the pupil has proved itself useless, and that the necessary examination before entering their architectural Institute is expected to produce more activity from pupils than kind advice can do.

The Liverpool Society urge increased library accommodation, and that Architects should pay more attention to their pupils, but that a compulsory examination would afford the strongest inducement to architectural education.

The Report of the London Architectural Association is supplemented by this resolution:—'And this association feeling strongly the desirability of obtaining a system of compulsory education and examination, in order that the profession of architecture may be established on a similar footing to other professions, would appeal to the societies throughout the country, through the delegates to the Alliance, to join with the association in petitioning the Institute to take such steps as they may deem necessary to enforce a proper system of Architectural Education and Examination with the ultimate view of petitioning Parliament to make such examinations compulsory.'

We have then before us the following considerations:—

The importance of enlisting the Architects in the advance of the pupil's education.

The desirability of increasing in each town facility for self help.

The necessity of a system pressed upon the pupils for self education.

The absurdity of a profession like that of Architecture being without systematic examination for entrance, and the course to be pursued to render such examination legally necessary before an Architect can practise.

I have to suggest then that whatever course of action is taken by the Alliance, should be systematically directed to the above objects *seriatim*.

THOMAS M. RICKMAN,
Hon. Secretary.

ON THE DUTIES OF AN ARCHITECT.

ON THE DUTIES OF AN ARCHITECT, WITH REFERENCE TO THE ARRANGEMENT AND CONSTRUCTION OF A BUILDING. Read at the Society of Arts, on Wednesday, April 28. By T. ROGER SMITH, Esq.

(Concluded from p. 238.)

BUT passing from the study of special subjects, a work which involves many visits to existing buildings of the same sort, I should like to return to a dwelling-house, and to touch upon a few of the points to be thought of in the planning of it and the working it out for execution. The relative position of each room in connection with all the others; the aspects of the windows; the communications, such as the hall, the corridors, and the staircases, require to be arranged for. Each room must be of the right size, shape, and disposition. In every main living-room the ordinary articles of furniture must be prepared for, and places assigned them, and the same in every bedroom, large or small. The position of window, door, and fireplace in each room, must be settled so as to avoid draughts, discomfort, and smoky chimneys. Light must be secured for every hole and corner all over the house, and so must ventilation. The service from the kitchen must be so provided as to bring the provisions into the dining-room readily, but to keep smells out. The duty of every servant, all over the house, must be understood, and all the endless appliances of a large house thought of. There must be a place found for the range and the hot-plate, and the jack, and the dresser, and the closets, and the shelves of the kitchen. The shelves, sinks, and plate-racks, the coppers and washing-boards, the vegetable bins and the water supply of the scullery, must be all provided for. Care must be taken of the wine-cellar, the beer-cellar, the stores, the linen, the china, and the plate. Ovens, boilers, hooks, safes, plate closets, linen closets, housemaids' closets, baths, hot water, cold water, cupboards, lifts, and all manner of appliances are to be thought of; rooms for the family, and rooms for the guests; the nurseries, the upper servants' rooms, the various services of butler, cook, housekeeper, footman, dairymaid, stillroom maid, must all be thought of, all planned for; all must be brought compactly together, and each must be kept out of the others' way. Whilst these matters are being disposed of, there are also many points in the structure that need attention in preparing working plans. Proper foundations must be provided for, and an equable distribution of the weights on the walls. The flues must be carried up into proper chim-

ney stacks, the construction of bresssummers, girders, floors, partitions, roofs, &c., must be devised. The arrangement of the roofing, so as to be easily freed from snow, the mode of bringing away rain-water, the drainage, the outfall or cesspool for the drains, the necessary precautions against damp, bad smells or tainted water, each and all of these must come under review, not one of them can be left to chance, any more than the putting together of the masonry or the brickwork, the thickness of walls, the quality of glass, or the weight of lead. All this time an entirely distinct set of considerations is also present to the architect's mind; his building is to please the eye, as well as accommodate the dwellers therein, and, whether there be the richest elaboration or the most rigid simplicity, he will not have fulfilled his duty to his employer, or been loyal to his art, if he has not striven to render the effect of his work, especially of the inside of his house, pleasing, harmonious, and appropriate.

I could go on further in this strain, reminding you that it is generally necessary to fix the nature of all the materials, the quarry—often the special bed for the stone—the quality of the bricks, and so on of every material throughout the structure; but I have said enough, I hope, to convince you that a vast amount of forethought and care is here wanted. I have only to repeat that all this has mostly to be done in a hurry, as few clients think of giving their instructions till that season of the year when the building ought to commence. Notwithstanding any hurry that may have existed, any error or oversight made at this period may probably—more probably than not—be a lasting injury and a cause of endless discontent, if not discovered in time for remedy in the course of the work; and even if it be so discovered and remedied in time, but at the expense of extra outlay, it will most likely be a source of grave complaint. I honestly confess that my wonder is not that oversights occur sometimes, but that they are so few and infrequent as they really are.

As the plans approach completion, the architect has to advise his client as to the means of executing the building. It is not very unusual for the proprietor to become, to some extent, his own builder, or at least brick-maker: time forbids our enlarging upon the work this entails on his professional adviser. The remaining courses are, either to agree with a contractor to execute the work at a schedule of prices, or to agree with a single contractor for a definite lump-sum, or else to invite several contractors to tender, and give the work to the lowest bidder. The plan of inviting contracts by public advertisement is, fortunately, seldom resorted to for private work; and the old plan of contracting with various tradesmen separately, though it still holds ground in the north, has been generally abandoned in the midland and southern counties. Whichever way is adopted, the architect has to negotiate the business, and commonly, if there is a competition or a negotiation with a single contractor, he has, from his knowledge of the trade, to nominate the contractor or contractors.

In any case where an estimate in a lump-sum has to be prepared, a more or less elaborate document, called a bill of quantities, is got out. This is sometimes prepared by the architect, but in and about London it is customary for a separate professional man, called a measuring surveyor, or quantities surveyor, to make it out. In either case, this bill is supposed to show with accuracy the whole amount of every description of labour, material, or article introduced into the building. In London these documents are prepared in the most extraordinarily elaborate detail, as their extreme length will abundantly show; in the country they are generally more condensed. A blank copy of this bill is furnished to the builder who estimates, or to each builder if there are more than one, and he puts his own price to the items, calculates the amounts, and bases the tender he sends in upon the result so obtained.

It sometimes happens that the estimate thus obtained is at once agreed to and accepted. At other times it is desired to reduce the amount of it, and in this latter case the architect has to arrange such variations or omissions as will admit of this being done.

Without further delay, however, we will suppose an agreement as to carrying on the work come to somehow, a contract signed, and a commencement about to be made. The architect has now, usually, to seek, and appoint, and engage for his employers a clerk of works, and to set out the building in its exact position on the site, and to fix some unmistakable level. This done, work is begun, and, from that time till the close of the operations, the architect has personally to visit the building, and has also to keep on continually preparing additional explanatory drawings, and, I might as well add, to furnish duplicates, sometimes triplicates, of working drawings, for the use of the contractor and clerk of works.

The objects which the architect has to keep in view during the conduct of the works, and especially during his personal visits to them, are, in the main, two—he has to satisfy himself, first, that the contractor and every man he employs are doing their duty; and, secondly, that the building will carry out his intentions and supply his client's wants.

To insure that the conduct of the work shall be satisfactory, it is necessary constantly to watch the materials and workmanship, either brought upon the ground, or introduced into the building, or in preparation at the workshops. I need hardly add, that to do this efficiently the architect must be a good judge of both work and material—an accomplishment requiring some amount of experience and attention. Where there is a disposition to evade the conditions of a contract, this part of the architect's work becomes both difficult and responsible, and at all times a certain amount of anxiety is involved in it. To a very large extent, however, the inspection of workmanship and materials can be facilitated by the clerk of works, if he be clever and honest. He is placed on the works on purpose to see, every day and every hour, that the contract is carefully and honestly executed, and I must say that I have, again and again, received the most valuable assistance in this branch of my duty from various clerks of works engaged under me.

In his other object, the architect has to bear in mind, during his superintendence of the work, that no one can be of much assistance to him. There is no part of his duty which he can less easily or less wisely delegate to another, than that constant watchfulness which is imperatively needed to ensure the success of the building, both as a contrivance and a work of art.

Drawings, explanatory of the original plans and specifications, are continually in demand. The larger number of them, perhaps, relate to the artistic part of the work, and consist of full size profiles of mouldings and drawings of enrichments, or of details to a large scale, to show with precision and exactitude what is meant; but many structural drawings are wanted, and others are often called for to show modifications of the design; for there are few buildings in progress where some changes are not made. Sometimes a new want strikes the employer, or a new light dawns upon the architect. At other times an omission may be discovered, or an obvious improvement will suddenly present itself. At any rate, some alterations are usually called for, and require to be drawn out.

Constantly, also, during progress, specimens of moulded or enriched work, or full-sized models of features, are fixed in their intended place, and the architect has to visit the work, to satisfy himself that their effect will be as he wishes. In this way the superintendence of the work proceeds, and almost always involves some work for the pencil up to the very last, while the designing or the far less pleasant task of selecting chimney-pieces, stove-grates, fittings, paperhangings, and decorations, is as essential to the full success of the architect's work (and should be as fully left in his hands) as the design of masonry or joinery.

It may be asked whether the architect has any means of enforcing the execution of the contract, in conformity to his directions and wishes, and I reply that he has such means. The hold upon the contractor, which all building contracts give the architect, is the power of the purse. Buildings are always partially paid for as they go on, and always upon certificates from the architect. It becomes, therefore, part of the architect's duty to grant these certificates, and in giving them, he has to see that the amount certified represents the proper proportion and no more of the contract price, and that the work is properly done; for it is his duty to withhold his certificate if his complaints remain unattended to, or his orders are not complied with. In cases of work by a schedule of prices, very careful measurements are made; and, when the work is done in other ways, suitable valuations are made from time to time; but, in some shape or other, the architect requires to be armed with the only power which will effectually enable him to protect his employer and secure attention—that of controlling the cash payments.

When, at last, the work is completed, it becomes the architect's duty to make up a statement of accounts. All claims for extra or additional works are checked and measured by him, or by the measuring surveyor for him, and the counter claims arising from the omission of work included in the contract, but not carried out, are valued. A balance is struck after every item has been scrupulously examined, and, if necessary, fought over. And the architect's last duty is the signing a final certificate that the balance, whatever it may be, is payable to the contractor.

I have now, I think, gone through the most salient points of an architect's ordinary duties, such as they exist when there are no accidents or bankruptcies, and no disputes, difficulties, obstacles, or other hindrances of any special magnitude; and, with the hint that such difficulties do not unfrequently arise, and impose on the architect different duties, sometimes as a negotiator, at other times as an advocate, or again as an arbitrator, I might, I think, leave the subject. Yet, if you will bear with me a moment or two longer, and not think my tale a fable because I try to point it with a moral, I have something to add.

Perhaps the most obvious sequel to all that I have said is the inquiry, 'If all this is needed for the success of a building, who furnishes a sufficient amount of care when there is no architect?' The reply is, that most of it is not furnished, and the building suffers; and, as to the remainder, either some skilled or experienced assistance must be employed, or else other work properly designed is copied, and thus a portion of that thought, without which a building cannot be built, is secured; and, lastly, that much of the time of skilled artisans is spent, where there are no regular plans and no skilled direction, in furnishing, imperfectly and piecemeal, substitutes for that which ought to be clearly arranged and laid down for the workman by the architect.

If I have said enough to dissuade any person from becoming his own architect, this paper will not have been without service. Though there is no mystery in the planning and direction of work, this yet requires a very large amount of knowledge and familiarity with the subject; and, though an individual who desires to build, can, if he please, employ any number of men, and gain a good deal of experience in rectifying their mistakes, such experience is dearly bought, and comes too late for its purpose.

I have throughout studiously avoided giving prominence to the art side of this question; but here at least I must say that, however skilled a draughtsman or even a designer any private individual may be, he will be sure to be deficient in that technical knowledge which inspires the architectural treatment that a building receives from a good architect; here, at the best, defects are, to my mind, inevitable in the work of every man who has not measured and drawn much existing architecture.

Few persons readily understand that, because architecture deals with things quite familiar in one aspect of them to those who live in buildings, or buy or sell them, it is yet necessary to have long practice, in order to combine with economy and judgment the different parts of a room, and the different rooms of a house; and to provide a place for all that has to be included within its four walls. Almost as few recognise the fact that if they can draw an architectural feature when they see it, that power is quite different from that of the architect who has to draw a whole building and its parts as he imagines them, and then to furnish for every portion the profiles of the mouldings, the sizes of the panels, the treatment of the carving to a large size. As a simple instance, it is easy for any person to draw a window with mullions, but no one who has not studied as well as sketched will be able to settle whether the width of the mullions should be a fourth, or fifth, or sixth, or what proportion of that of the adjacent light. The difference between a narrow and a wide mullion is equivalent to a total difference of style; a mullion of 5 inches would be out of place if one of 7 inches was correct, and when it was done, the amateur would see that something was wrong, but would not know what; and it is to attain the power of regulating the half-inches in cases like this, that the student of

architecture has to wander for months, or even years, through the districts where good buildings exist, making notes and drawings; and, let me add, there is nothing short of a perfect knowledge of these details, and incessant attention to them, which can give harmony, unity, and character to a building.

It may be natural, and I hope is not out of place to add, that the architect who does these services thoroughly has fully added the value of his fees to the value of the building. That he has quite work enough to do in earning them will be apparent to any one who turns over the plans and specifications of a large work, and forms some idea of the additional time spent in superintendence. I trust you may be willing to believe that the client has value received in the building for what he pays. The architect's remuneration, in ordinary cases, is, customarily and legally, a commission at the rate of five per cent. upon the cost of the works. This pays him very unequally, in some cases being sufficient, in others not so; but I believe it is a very fair way of payment as far as the employer is concerned, for it represents an increased standard of excellence throughout the building as compared with what, under the most favourable circumstances, might have been reached without the architect, and this increased excellence is really an increased money value.

In concluding, I should like to say a word as to some peculiar demands made sometimes upon an architect's skill, and to point out what he ordinarily cannot and does not do. No architect can make a bad builder do good work. He can make all sorts of agreements and stipulations that the work shall be good, and can try very hard to enforce them, but there is a certain proverb about silk purses and the materials suited for their manufacture which will help to illustrate the impossibility of success. It is as well to add, that the architect can materially help to secure a good builder, and that he can generally prevent a good builder from doing bad work.

The architect cannot, from the very fact that he is human, ensure perfection in every part of the work; but if he is able and careful, his services carry the building a great deal further towards excellence than is often imagined; and though no amount of care makes it quite certain that every flue shall draw, and every lock shall work, that the arrangement shall be all that can be desired, and the effect please everybody, yet a skilled architect, working for a good client, will go a very long way towards this result.

The architect is not ordinarily called, as the engineer is, to calculate accurately the endurance of his materials, because his walls must be thicker than the weights on them demand in order to keep out the weather, and his joists must be stiffer than is needed to support the floor, in order to prevent the ceilings from cracking, and so throughout; but he has a great deal of that sort of calculation to perform, in which tables and experiments can but imperfectly guide him. He has to judge of foundations, and the balance of weights in his structure; of the sufficiency of windows and passages; of the probable effect on the eye of features not yet commenced; and of the suitability and durability of materials. Lastly, he has often greater difficulty in the management of men than of works, and the cross-purposes at which clients, builders, landowners, clerks of the works, foremen, and tradesmen are sometimes playing, often give him enough to do in his character of negotiator. Here, however, I do not purpose to follow him. I have purposely kept out of sight much of what the architect has to do as an Artist. I shall certainly not be expected—if I say so little as to a side of his employment which ever demands his constant attention—to add anything as to other classes of duties or difficulties which are uncertain and irregular in their occurrence. I, therefore, here leave the subject, trusting that my paper may be judged to have furnished a fair account, and nothing beyond a fair account, of the nature of the ordinary and routine occupations of those professional men to whom you are in the habit of entrusting the design and superintendence of the buildings you erect.

LEGAL.

THE CHARGE OF CONSPIRACY IN THE BRICK TRADE.

On Monday, 26th ult., at the City Police Court, Manchester, Mr. Thomas Hayes, President of the Manchester Master Brickmakers' Protection Association, appeared on remand, charged with conspiracy.

Mr. Leresche, for the prosecution, briefly stated the facts of the case. The defendant carried on business in Manchester as a master brickmaker, and was chairman of the Master Brickmakers' Protection Association. The charge against him was that he had conspired with various other persons for the purpose of extorting money and stopping the trade of the Messrs. Griffiths. Some time in the course of last year Mr. Ralph Waller, a gentleman possessing land near Withington, entered into an arrangement with a person named Deady, who carried on the business of an architect, builder, and contractor, to let him some land for the purpose of erecting dwelling-houses upon it. As soon as the land was covered by the buildings, there was to be a conveyance of the land, on a chief rent, from Mr. Waller to Mr. Deady, and then there was to be a mortgage upon the same from Mr. Deady to Mr. Waller as a security for the money. Mr. Deady proceeded to erect the houses, but, owing to his being in difficulties, they were left in an incomplete state. Mr. Deady shortly afterwards placed himself in the hands of a solicitor, and several attempts were made to keep him out of the Bankruptcy Court. In the meanwhile the buildings in question were neglected, and the works remained suspended, upon which Mr. Waller served the usual fourteen days' notice upon Mr. Deady to continue the erection of the houses, otherwise he should complete them himself. Mr. Deady being unable to complete the houses, Mr. Waller entered into an agreement with a Mr. Wilshaw, builder, of Manchester, to finish the houses; Mr. Wilshaw sub-let part of the contract to Messrs. Griffiths & Son, the prosecutors, to do the bricklaying, and accordingly, in December, 1868, they began the work, and sent to Messrs. Bowker and Jones, brickmakers, to obtain a supply of 2,000 bricks. On December 2, prosecutors' carter went to Messrs. Bowker and Jones for the purpose of getting more bricks, and while on the way he met the defendant. On reaching Messrs. Bowker and Jones's yard,

Mr. Bowker refused to allow him to take away a single brick. On December 6 Mr. Wilshaw attempted to obtain bricks from other brickmakers, when he received a circular from the Brickmakers' Association inviting him to attend a meeting of the committee, to hear a complaint from the defendant about the matter in question. He refused to recognise the authority of the Association, and did not go to the meeting.

John Worsley, a carter in the employ of Messrs. Joseph Griffiths and Son, bricklayers, Chorlton Road, gave corroborative testimony.

Horatio Griffiths gave evidence that the defendant Hayes said as to his father and the Withington job, 'I should advise him to get out of it as quick as possible, because if he finishes those houses I shall make him responsible for my money. I will have my money if I spend a fortune upon it. I shall stop all Mr. Griffiths' work until it is paid if he finishes those houses.'

Joseph Griffiths said he received a note left by Hayes with his wife. In the letter he said, 'You must not proceed any further with the work at Withington, but must attend a meeting of the committee of master brickmakers that night at a public-house in Fountain Street,' the name of which he forgot. It was signed by the defendant, and written with a pencil. Hayes warned him to come to the meeting to make arrangements with their committee at the house in Fountain Street, as if he didn't they would stop his trade in the whole district, and if that didn't do would withdraw his men, and charge him with the expense. Soon after, he got a communication from Worsley, the first witness, that bricks could not be got. He found it impossible to get bricks, and the works had to stop for a fortnight.

John Pownall, examined by Mr. Leresche, said he was the secretary of the Master Brickmakers' Protection Association.

By Mr. Leresche: The society consisted of about 80 members. There was a committee appointed, the members of which met at the Shakspeare Inn, Fountain Street, Manchester. He did not recollect having attended a meeting of the committee on September 17 last. On referring to the book he saw that there had been a meeting on that day, but there were no particulars whatever of what had been done at it. He could not say whether he was at the meeting or not; he would not swear he was not present. He objected to answer the question whether that meeting had been called by him as secretary, and he did not recollect whether it had been called by the defendant. Looking at the document (handed to witness) he could not say that the meeting was called by Hayes or at his request. He declined to answer the question whether a resolution had been passed at that meeting with reference to the supply of bricks to Mr. Wilshaw. He did not recollect issuing a notice asking Messrs. Wilshaw & Griffiths to attend a meeting on January 7. He remembered meeting Mr. Griffiths in Cross Street about that time, or it might be a few days after the meeting was held. They had no conversation in reference to the job at Withington. Griffiths did not complain that the society had been taking liberties with the job at Withington, and witness did not tell him that the society had passed a resolution in reference to it. Nothing whatever passed between them in reference to a resolution.

John Griffiths was the next witness. When he met Pownall in Cross Street he asked him if the resolution passed at the meeting applied to the Withington job or to the whole district, and he replied, 'Certainly, it applies to the Withington job.' He subsequently said it applied to the whole district. He then asked Pownall what they thought of themselves as honest men in passing a resolution the effect of which would be to rob witness of his bread, and he replied, 'I had neither voice nor vote in the matter. It is hard that Hayes should lose his money.' Witness said, 'Yes, but it is harder to make a man pay that doesn't owe it.' He proposed to sell the bricks in spite of them, but he received an answer to the effect that if he did they would stop him altogether. He saw the defendant Hayes on December 19—two days after the first meeting—when some conversation took place between them in reference to the Withington job. Hayes asked him what he thought of himself in going against their wishes, and he replied, 'I will endeavour to do what is right;' to which Hayes rejoined, 'Very well, we will take our own force.' Witness told him not to interfere with him or his business, or if he did he might look out. After that he endeavoured to get bricks from various brickmakers in the neighbourhood, and all went well until January 6, when Parkin & Hewitt, from whom they had been getting bricks up to that time, refused to let them have any more. He saw Mr. Hewitt after they had ceased to supply him, and Mr. Hewitt made a statement to him.

At this stage the case was adjourned until the following Saturday, and was not closed till Monday, May 3, when the magistrates decided that there was not sufficient evidence on which to send the case for trial; but they bound over Messrs. Griffiths & Son to prosecute at the coming assizes.

Exchequer Chamber.—May 14.

(Sittings in Error, before the LORD CHIEF JUSTICE, JUSTICES BYLES, KEATING, SMITH, LUSH, HANNEN, and BRETT.)

LORD DERBY v. THE BURY IMPROVEMENT COMMISSIONERS.

The Court gave judgment in this case. The question for the consideration of the Court was, whether the defendants, the Bury Improvement Commissioners, were justified in making a common sewer through Lord Derby's land, in order to carry away the sewage of the town, which had been previously carried off by a stream of water, which had become a nuisance. There were no means of removing it except by the construction of a new sewer. Four questions were raised for the consideration of the Court. The first was, whether any power existed in the commissioners to make a new sewer under the Nuisance Removal Act? Second, whether the commissioners had power to exercise a discretion as to the course and position of the new sewer, or whether they were bound to follow, as near as possible, the course of the old nuisance? Third, whether the improvement commissioners had abused their powers in what they had done? And, fourthly, whether the improvement commissioners were disabled from acting under the Nuisances Act, they having powers to do the work under the local Act by giving the necessary notices, but which notices had never been given? The Court held there was no doubt that the improvement commissioners had power to make

new sewers to carry away a nuisance. The necessity of making a sewer was a matter of fact, and it was for the commissioners to exercise their judgment in what direction it should be made, and so long as they exercised an honest discretion, without misconduct or negligence, they were not liable to have their judgment overruled. Thirdly, that it was not an abuse of the powers vested in them by the statute; and, fourthly, that there was no inconsistency in the co-ordinate powers of the nuisance and the local Acts, and the commissioners could adopt either. The judgment, therefore, in this case ought to be reversed, and entered for the defendants.

Judgment for the defendants.

Exchequer Chamber.—May 15.

(Sittings in Banco, before the LORD CHIEF JUSTICE and Justices KEATING, LUSH, HANNEN, and BRETT.)

FARMER v. THE COMMISSIONERS OF SEWERS IN LONDON.

This was an action brought by the plaintiff, who kept the Railway Hotel, in Liverpool Street, against the Commissioners of Sewers, to recover compensation in damages for the loss he had suffered in consequence of an alteration in the level of the street, whereby the access to his house was not so convenient as formerly. The Commissioners of Sewers had raised the level of the road, so that instead of going one step up as formerly to enter the plaintiff's house the public had to descend two steps. The two questions for the opinion of the Court were—first, whether the plaintiff was entitled to compensation; and, secondly, provided he could recover, whether it was by an action at law. The Court of Exchequer had given judgment in favour of the plaintiff.

Mr. Browne, Q.C., for the defendants, contended that they were a public body, exercising powers for the benefit of the general public, and they were not liable. They were empowered by their Act to raise or lower streets, and to pave and repair them.

Mr. Keane, Q.C., was heard for the plaintiff, and contended that the judgment of the Court of Exchequer was right, and asked this Court to affirm it.

The Court, after hearing the lengthened arguments of the learned counsel, said they were of opinion that the judgment of the Court below must be reversed. There was no power in the Act to give compensation to persons whose premises were injured in works executed by the defendants.

Judgment reversed.

PRESIDENT GRANT'S TRIUMPH.

To the Editor of THE ARCHITECT.

SIR,—The President of the Royal Academy has achieved a signal triumph. Those of us whose memory can extend to the early years of the present reign may remember the emulous contest that was carried on between the vendors of two rival descriptions of blacking. Before advertising had been organised into its present system of sensation, surprise, and swindle, Warren and Day & Martin covered the walls of Europe with their posters. They appealed, not in words to the cupidity of the world, but graphically, to the aesthetic sense of mankind. In one form of pleading was exhibited a half-dressed man, leisurely shaving himself by the reflection of his polished boot. In another an irate cat, with voluminous tail, and back elevated into a gothic arch, was advancing on three electrically agitated legs, to encounter his own image in the boot.

Sir F. Grant, P.R.A., has distanced this early art. The pair of boots, of which he has gratified us by exhibiting the portrait, has never been exceeded, so far as our experience extends, either in size or in polish. The officers of the Royal Artillery, for whom this work of art has been produced—it is No. 83 in the catalogue of the exhibition of the Royal Academy of Arts for the present year—are to be congratulated. We can hardly extend this congratulation to the friends of the late Field-Marshal Sir Hew Dalrymple Ross, R.A., who appears behind, or as it were in, the boots. His features, though drawn with a degree of hardness and of harshness that was no doubt intended to heighten the spectator's admiration of the brilliant polish of the boots, are not agreeably rendered. The question of how far the adjuncts of the main object of a painting should be subdued in tone, in order to heighten the effect of the central figure, has evidently been one of considerable difficulty in the experience of Sir F. Grant. In this case the result would have more redounded to his permanent fame, if the subject had been more elaborated in the mind before being committed to canvas. The subtle flattery that is concealed in the art by which the nominal subject of a painting is sunk into a mere accessory, is not peculiar to Sir F. Grant, although probably no artist has carried out the system with more vigour. Last year we had a portrait of a lap-dog, supported by a lady; this year we have the boots of a Field-Marshal, with the owner as an adjunct.

It is clear that our artists of all orders, especially our architects, will have to reconsider their ideas. When we see what is exhibited and what is rejected by the Royal Academy, we are compelled to conclude that the traditional ideas of what is excellent in art require reconsideration. At all events they do not appear to guide the taste of the Committee of Selection.

Our rising artists will do well to bear in mind that the qualities which ensure fame are not those which ensure exhibition on the walls of the Royal Academy. It will be for them to select which path to follow. At present the two seem to be but rarely compatible, or compatible rather by fortunate chance than for any other assignable reason. We must congratulate the members of the Academy on the distinguished position which they are taking in the history of art.

A. Z.

NEW BUILDINGS AND RESTORATIONS.

Church Restoration.—At a vestry meeting held at Axminster, last week, a plan was submitted for the restoration of the church. The plan showed the pulpit placed against the south-western pier of the tower arch, with the 'reading desk' against the opposite or north-western pillar. The organ gallery only was proposed to be removed; the organ was to be placed at the north-eastern extremity of the church, near what was heretofore known as the workhouse gallery staircase, and to be raised a step or two above the floor. The present pews were to be removed, and benches substituted, those in the body of the church below the proposed new position of the pulpit to face the west, and those beyond the pulpit towards the west to face the east, all facing the pulpit. The vestry also to be removed further westward. After some discussion it was resolved that estimates be procured and funds collected towards the necessary alterations.

Church Building.—**EASBY.**—The church, after thorough restoration, has been reopened. The edifice possesses interesting features, amongst which may be mentioned some curious wall-paintings of rude design, specimens of the decoration of the twelfth or thirteenth century. **BURTON LATIMER.**—The parish church has been reopened for Divine worship, after undergoing restoration. The high-backed pews have given way to the ordinary rush-bottomed chair. **GRANTHAM.**—The reopening of St. Wolfran's Church, after an extensive restoration, has taken place. A new roof has been placed on nearly the whole of the church, the pews have been removed, and replaced temporarily with rush-bottomed chairs. The total cost of the restoration has been between 16,000*l.* and 17,000*l.* **CHURCH.**—The chief stone of the new church of St. Thomas has been laid. The style is Early English. The building will consist of tower, nave, and two aisles, with chancel and chancel aisle on the north side. The edifice will afford accommodation for between 1100 and 1200. The total cost is between 10,000*l.* and 11,000*l.* **SOUTH KENSINGTON.**—The dedication stone of the new church of St. Matthew has been laid. The church will consist of nave and chancel, with aisles, and a tower at the west end of the south aisle. The style is Early Decorated. **SUNBURY.**—After alterations and repairs Lamarsh Church has been reopened. A new vestry has been erected on the north side of the chancel. The tower is now surmounted by a new octagon spire.

Society for the Prevention of Cruelty to Animals.—On the 4th inst. Miss Burdett Coutts laid the foundation stone of the future permanent buildings of this institution, in Jermyn Street, St. James's. The new building is to be of Portland stone, and in the Italian style. The cost of it, in addition to the site, will be about 2,900*l.* The Earl of Harrowby, as president, made a short address to the meeting, pointing out the benefits which had accrued from the exertions of the Society since its establishment in 1824, since which time they had obtained no less than 16,000 convictions against persons proved to have been guilty of cruel treatment of animals. The silver trowel, which was inscribed as being presented to Miss Coutts, and which was really a present worthy of her acceptance, as it was a fine work of art, was then brought out of its case, the mortar spread, and the stone lowered amid loud applause.

Opening of the New Church at Sawrey.—On May 13 the little church at Sawrey, on the Lancashire shore of Lake Windermere, was opened by the celebration of Divine service. The honorary architect is Mr. Robert Brass, of London, and the design is in the Early English style. The church consists of a nave, transept, and chancel. It is covered with an open timber roof, in character with the rest of the building. The walls are of the stone of the country, the quoins, string courses, mullions, corbels, and chancel arch of fine proportions, being of freestone brought from a distance. The church is well lighted by ten lancet windows of two lights each, with a large three-light window at the east end, and a large five-light one at the west. The porch and bell-tower are on the north side, the lower portion of the latter forming the vestry; and on the south side is an organ-chamber to correspond. The contractor for the carpentry work was Mr. John Taylor, of Sawrey; for the masonry, Mr. Isaac Crossdell, of Birthwaite; for the walling, Mr. George Bowness, of Esthwaite; for the plumbing and glazing, Mr. Edward Cragg, of Bowness; for the painting and staining, Mr. Thomas Gott, of Bowness; and for the plastering, Mr. John Pattinson, of Windermere. A fine-toned bell of cast steel, and weighing several hundredweight, the gift of Mr. Sowler, Q.C., of Sawrey Knotts, has been for some time in the tower. The pulpit is a solid structure, but quite in keeping with the pleasing architecture of the church.

New Chapel at Battersea.—A few years ago a Methodist mission was commenced at Battersea Park, and a building erected, but this is now too small; and it is resolved to have a new chapel on the adjoining land.

Bocking Congregational Church, Braintree, has been reopened, after entire renewal of the interior. At the services held on the occasion the organ built for the church by G. M. Holdich, Esq., of London, at a cost of 250*l.*, was opened by the builder. The church plans were drawn by C. Pertwee, architect, Chelmsford, and the work was carried out by J. Brown, of Braintree.

Gainsborough Church.—The alterations in the parish church, Gainsborough, comprise the raising of the sanctuary and the chancel floors, and the placing of carved oak stalls for the choir in the place of the present seats, together with a new marble pulpit, and other improvements. The execution of the woodwork was entrusted to Mr. Cant, and of the ironwork to Mr. Baines.

The Contracts for the new Methodist school at Halifax have been let for 2,250*l.*

Falmouth—Police Cells.—The Watch Committee, having taken into consideration the condition of the present police cells, have come to the conclusion that new police cells should be constructed, and that the space under the Falmouth Town-hall is in every way suitable. Their report is approved.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

The Rotherham Hospital Competition.

The decision in this competition has been published, and is as follows:—The first prize is awarded to the design of Messrs. Mallinson & Bakewell, architects, of Leeds and Dewsbury (on whose plan was the motto 'Æsculapius'), subject to their being able to build the hospital at their stipulated price, 4,500*l.*, or within ten per cent. of that amount. Messrs. Mallinson & Bakewell have formally affirmed their ability to erect the edifice at the cost originally specified. The second prize (50*l.*) was given to 'A Loreburn,' the author of the design being Messrs. Cromby & Sons, Dumfries. Mr. Hill, of Leeds, competing as 'Deo non fortuna,' received the third prize, 25*l.* We have been informed that the designs submitted under the motto 'Yew Tree,' by Mr. Ralph Nevill, were considered to rank fourth in order of merit.

The Roman Pavement discovered in the City.

As already mentioned by us, a fine specimen of Roman tessellated pavement was discovered whilst excavating for works connected with the new street from Blackfriars to the Mansion House. The exact site is as nearly as possible in the centre of what used to be the triangle formed by Bucklersbury, the Poultry, and Charlotte Row, and the level is no less than 17 feet below the present level of roadway at the Mansion House. Altogether the pavement found covers an area of some 150 superficial feet, and is formed of black, white, and red pieces of pottery, measuring about half an inch each way, and laid out in geometrical interlacing bands, the bands containing galloches, fret, &c. Beneath this mosaic, which is in parts as bright in colour as when first laid down, hot-air flues are traced running in various directions, but these will not be followed up until the mosaic has been taken up and removed to the Guildhall. By the time these lines appear, the pavement will have been viewed by thousands, the 19th, 20th, and 21st having been appointed for the admission of the public; but no doubt those interested in this treasure trove will have no difficulty in obtaining admission by applying at the Clerk of Works' office, opposite the side of the Mansion House. We are reminded of a passage in Stow, showing how often and how curiously history repeats itself. Writing in 1598 he says that three years before, 'Thomas Tomlinson causing in the high street of Cheape a vault to be digged and made, there was found, at fifteen feet deep, a fair pavement like unto that above ground, and at the further end at the channel was found a tree sawed into five steps, which was to step over some brook running out of the west towards Walbrooke; and upon the edge of the said brook, as it seemeth, there were found lying along the bodies of two great trees, the ends whereof were then sawed off, and firm timber as at the first when they fell, part of the said trees remain yet in the ground undigged. It was all forced ground until they went past the trees aforesaid, which was about seventeen feet deep or better; thus much hath the ground of this city in that place been raised from the main.' The italics are ours.

Notes for Connoisseurs.

A very choice collection of modern pictures, of the highest class, the property of a well-known amateur, deceased, has been lately disposed of at the rooms of Messrs. Christie, Manson, and Woods, in King Street, St. James's. Among the more valuable and important examples were the subjoined:—Lot 19. Frederic Goodall, R.A., 1852.—'The Cottage Door,' a small but beautiful picture—76 guineas (Gambart). 21 and 48. Marcus Stone.—'Stealing the Keys from the hands of the Roundhead Soldier,' and a Female regarding 'Old Letters,' scene from *Christina Rossetti*—110 guineas (Pendleton). 30 and 42. J. Archer, R.S.A., 1864-5.—'Buying an Indulgence' and the 'Convent Gate.' 'Go thy way to a Nunnery'—Shakespeare—105 guineas (Eckford). 33 and 43. G. Hardy.—'La Sœur de Charité' and 'Birdie'—125 guineas (M'Lean). 37. E. Frère, 1859.—'The Prayer,' an exquisite cabinet example—190 guineas (Wardell). 35. Same artist.—'The Cradle,' equally fine, cabinet size—160 guineas (Gambart). 37. F. D. Hardy, 1867.—'Baby's Birthday,' a splendid domestic scene, with numerous figures—305 guineas (Wilson). 39. Marcus Stone.—'From Waterloo to Paris.'—155 guineas (M'Lean). 45. F. D. Harvey.—'The Mousetrap,' a juvenile piece—121 guineas (Williams). 49. T. Sydney Cooper, R.A., 1867.—A splendid landscape, the 'Canterbury Meadows, with Cattle'—156 guineas (Tooth). 50. T. Faed, R.A.—'The Lady of Chalot,' a charming cabinet picture—190 guineas (Hayward). 51. J. C. Horsley, R.A.—'Burning the Books,' scene from Don Quixote. Exhibited in the Royal Academy. A splendid picture—410 guineas (Wilson). 52. R. Ansdell, A.R.A., 1854.—'The Shooting Pony.' A fine cabinet example.—112 guineas (Graves). 53. T. Webster, R.A.—'The Soldier's Return'—165 guineas (Herbert). 54. W. Orchardson, A.R.A.—'The Story of a Life.' An aged lady relating her story to her grandchildren. Exhibited at the Royal Academy, 1866—350 guineas (Holland). 55 and 65. F. R. Lee, R.A., 1854.—'A Highland Stream,' and a pair of small river scenes in Devonshire—130 guineas (M'Lean). 56. J. Pettie, A.R.A., 1866.—'The Arrest for Witchcraft,' a splendid work exhibited at the Royal Academy—360 guineas (Whitworth). 57. P. F. Poole, R.A., 1857.—'The Mountain Stream'—120 guineas (Pendleton). 59. J. C. Horsley, R.A., 1855.—'The New Dress,' a charming cabinet picture—75 guineas (Fores). 60. Clark-Stanfield, R.A., 1859.—'Tenby Bay,' a splendid work—340 guineas (M'Lean). 62. J. C. Horsley, R.A., 1866.—'Going to a Party,' a beautiful example—160 guineas (Holland). 63. T. Faed, R.A., 1865.—'The Last of the Clan,' with numerous figures, a magnificent work and the gem of the collection—750 guineas (M'Lean). 70. H. Schlessinger, 1859.—'A Conversation, scene between a lady and her guardians'—75 guineas (Smart). 71. Marcus Stone, 1867.—'Seeking Shelter,' a very fine work—112 guineas (Ditto). 72. F. W. Hulme and H. B. Willis.—'River Scenery, North Wales, with Cattle'—185 guineas (Ditto). 73. James Webb, 1866.—'The Castle of Ischia; Bay of Naples'—95 guineas (Davis). 74. W. Duffield, 1868.—

A Dead Stag in the Snow; a splendid cabinet picture—185 guineas (Radcliffe). 75. Same Artist.—A Dead Swan, Game, and Fruit; a large and brilliant example—310 guineas (Fores). 77. L. Hughes, 1856.—'An Artist in his Studio;' a very fine work—128 guineas (Holland). 78. E. W. Cooke, R.A.—'The Goodwin Sands;' a lifeboat going to the rescue of the crew of a stranded vessel near the floating light; a chef-d'œuvre of the artist; exhibited at the Royal Academy, 1857; from the Collection of the late Sir Culling Eardley—575 guineas (Agnew). This was the last picture in the collection. The whole realised 7,760l.

Indian Notes.

A line of railway is about to be constructed to the foot of the Neilgherry Hills. It has already been sanctioned, and the Madras Railway Company have been requested to proceed with surveys, plans, sections, and all other preliminaries for the actual commencement of work.

The construction of groynes at Cochin for the protection of the beach from erosion by the sea has proved perfectly successful, and there seems now to be some chance that the western coast of India will one day be able to boast of a worthy port at the terminus of the vast system of the Madras Presidency railroads.

A new Civil Engineering College, presided over by Mr. Wilkieson, C.E., has been opened at Chudderghat. This college was established by His Excellency the Prime Minister, Sir Salar Jung.

The Shaik Othman Aqueduct at Aden, a moiety of the expenses of which was defrayed by the Sultan of Lahedj, has been completed. Aden will thus, it is hoped, be permanently furnished with a good supply of pure drinking water, the want of which has, for many years past, been one of the greatest drawbacks to the place.

A train was taken across the Boree on March 8, on the Great Indian Peninsula line, now pushing on towards Raichore; and the works have thus been carried in that direction 320 miles from Bombay.

Architectural.—The Government of India has recommended to the Secretary of State the creation of the appointment of Consulting Architect to the Government of Madras, on a consolidated salary of 1,200 Rs. per mensem.

It is reported that Government intend to restore all the marble work in Humayun's tomb at Delhi.

The new Mission Church at Ambrotic, Khetwadi, has been opened for public worship.

A chancel is to be erected to St. John's Church, Pesbawur, 'in memory of the many gallant and worthy officers, civil and military, who have fallen in the valley by sword or pestilence.'

On March 1, the old Post Office at Bombay was burnt to the ground, and a new building must shortly be erected to supply its place. The plans for the structure, prepared by Mr. James Trubshawe, late consulting architect to the Bombay Government, and Mr. Roger Smith, have been before the Government of India for years, and were only sanctioned a short time previous to the destruction of the old building. The new Post Office is calculated to cost 60,000l., and part of it will be so built as to render the extension of the premises easy, by the addition of a second storey, should additional accommodation at any time be necessary. The building will probably be erected on a piece of reclaimed land between the Dockyard and the Apollo Bunder.

The digging of the foundations of the new buildings for the High Court of Bombay was commenced on March 1, on the Esplanade, nearly opposite the Agra Bank.

The Government of India has recently sanctioned the construction of a building intended to accommodate the public offices at Akyab, at an estimated cost of 11,645l.

General.

The New Courts of Justice.—A return has been published which shows that in four years, 1865-6 to 1868-9, the sum of 886,000l. has been issued out of the Exchequer on account of advances for expenses of the site, &c., for the new Courts of Justice, viz.:—In the first-named year, 40,000l.; in the second, 438,000l.; in the third, 317,000l.; and last year, 91,000l. During the same period amounts of 40,000l., 363,000l., 375,000l., and 105,000l. have been repaid to the Exchequer out of the surplus interest fund of suitors of the Court of Chancery, making a total of 883,000l. Up to April 20, 1869, the purchase of site has cost 820,641l. 2s. 3d.; expenses of the commission, 3,096l. 6s. 9d.; surveyors' expenses, 12,762l. 12s. 6d.; legal expenses, 30,679l. 14s. 2d.; architects' charges, 9,865l.; incidentals, 8,222l. 3s. 9d.; making a total of 885,266l. 19s. 5d. In addition to this sum 2,830l. 17s. was paid from the vote for public buildings for preliminary expenses.

Kensington Church.—The old parish church of Kensington is doomed to destruction; the last services within its walls were performed on Sunday last. A new and very beautiful church is to be erected on its site.

The Emperor's Roman Villa.—The Emperor Napoleon is having a villa built at Rome on the Palatine Hill. The ground has been bought from the King of Naples for a sum of 50,000 f., and on the spot are found the remains of the Palace of the Cæsars. Although the new erections are nearly terminated, excavations are still carried on under the direction of M. Rosa (a descendant of Saviour), who is the conservator of the ruins.

The Price of Land.—Some land in the parishes of Streatham and Croydon, which a few years ago only brought 200l. per acre, has lately been sold at the rate of 1,400l. per acre; and on Tuesday some land at Acton was sold at the Mart for 1,350l. per acre, which a few years ago would not have realised more than 300l. per acre.

Oxford Drainage.—A writer in the *Times* of the 15th says:—Oxford is in a swamp. During part of the year it is surrounded by stagnant water. This cannot be healthy, and it is certainly disagreeable. In severe weather Oxford is ice-bound, cold, and dreary. When the water retires the

placo is covered by mist and fog. There is low fever in some parts of the city. All these things are a serious impediment to the increase, development, and general utility of the University, for they prevent that concourse of the best class of persons which would otherwise flow there and reside there. The engineers of the Thames Conservancy have reported that for 26,000l. the city of Oxford and its immediate neighbourhood can be made wholesome and well drained. Why should not Oxford follow the example of Cambridge and make a subscription to improve the outfall of the river?

It is proposed to hold a Great International Exhibition in Spain—at the Escorial Palace.

Flint Implements.—During the past year much discussion has arisen consequent on the finding of undoubted flint implements and flakes in what is known as the 'Hessle clay,' in Holderness, at Kelsea Hill. Bones of the extinct mammalia are found beneath this clay at Hessle and at Kelsea, but the flint implements embedded in a formation of the late post-glacial period, and so immensely older than the wide river gravels of the palæolithic age, presented a puzzle to geologists and archaeologists both. Recent visits by the Rev. J. L. Rome (of Hull), the Rev. W. S. Symonds (of Pendock, Tewkesbury), and Sir Charles Lyell, have led to the discovery that the clay yielding the flint implements on the west of the pit is not the Hessle clay proper, though derived from it. The deposit is regarded as being the washings of many centuries from old Kelsea Hill; and thus the highest geological authority gives a relative date to the clay, which makes it probably not older, and possibly more recent, than the flint-bearing wide river sands of York and Malton.

QUESTION AND ANSWER.

Question in Professional Practice.

SRR.—Who ought to take out the 'quantities' in a building contract?

The undersigned maintains that, unless building surveyors keep insurance offices, and can, not merely in theory, but in practice, indemnify contractors from loss by *under-measurement* (and why not clients also from *over-measurement*?), the architect of the building ought *ALWAYS* to take them out, with or without some surveyor or other advocate on contractor's behalf.

Because, *inter alia*,

1. The architect best knows the work intended, and precise meaning of the drawings and specification.
2. If he does not, the act of taking them out will perfect his knowledge of it; and, till he has taken them out, he can never really know the defects of, and perfect, his drawings and specification.
3. Because, having to prepare details during progress, and see the work carried out, he can neither do one nor the other *well* and justly unless he has the 'dimension book' always to refer to. Having it, I conceive he should always have the power to rectify *great errors pro or con*, if they occur.

WILLIAM YOUNG.

The Architect.

‘THE USEFULNESS OF THE INSTITUTE.’

I judge from what we see occurring around us, one may well conclude that, to the bulk of English architects and architectural students, a period of commercial depression, such as that we are undergoing, is not an altogether unmitigated evil. Architects who do not belong to professional societies, and architects who do, are alike meditating on the prospects of the profession, and on the *status*—a very unsatisfactory one—its members occupy in the busy community around them. Take from our metropolitan architects their country commissions, and what, as a rule, is the nature of their London practice? Truly the very reverse of ‘architectural,’ in the strict sense of the term. Foreigners come to London, and, rambling through its busy streets or secluded squares, will rarely find the pencil of the architect manifest in the plan, the proportions, or the decoration of our town dwellings, costly and highly rented though they undoubtedly are. Let the visitor make the round of our London suburbs, and he will find little to disabuse his mind of the inevitable impression that, in their house-building, the English do not employ architects at all. In this particular, and surely important, class of edifices, it is a mockery to prate of the ‘progress’ of taste and civilisation. We are making no advance whatever.

‘Let observation with attentive view
Survey the place from Bermondsey to Kew,

and surely no city in Europe so emphatically proclaims, as does London, the derelict condition of its architects. There are old houses in Portman, Cavendish, Grosvenor, and Hanover Squares, ay and old houses again about Gray’s Inn and Bloomsbury, that, albeit they are in their *ensemble* undeniably dowdy, give us as we pass them a cheery smile, with here and there a stone or a wooden doorway, on which some old boy of even the Bœotian days of Queen Anne has employed ‘the lamp of sacrifice,’ and made it chaste or quaint, as his humour led him—anyhow wholesome to look at. Such a doorway says at once, ‘Come in, and welcome!’ Let us enter, and we shall find old mantel-pieces, surbases, door-frontispieces, and ceilings to show that, for even a London dwelling-house, there were architects in those days; and that these things were all of them ‘purpose-made,’ to use one of the vile phrases of our own day, when there is no individuality in Cockney house-building, and only two phases of house-art to enjoy in a walk through London—to wit, brick house upon brick house, with door and window-holes crowned with two-inch York coping; or, ditto ditto, ‘done up’ with pilasters and ‘archy-traves,’ and crowned with a ‘neat cornish and ballystrade,’ not indeed ‘purpose-made,’ but applied by the speculating builders alike to the dwelling of the peer and the gin-shop of the peasant.

Ay, ‘the speculating builders.’ The mention of these gentry brings us round again to the object we had in commencing these observations. We have in London the architect, the contractor, and the speculating builder. Here and there a church or a bank, or a small corner shop, or an insurance office, indicates the handiwork of the two former; but the mighty metropolis in the mass, what of it? It is the work (anything but handy work) of the speculating builder; and the worst of it is that the London public, seeing this gentleman’s productions all around them for miles and miles—ay, and miles again—look upon him as the author, designer, and first-cause of all London ‘architecture;’ and in the main they are right! The evil is owing largely to the short leasehold system; but in some degree it can surely be encountered and be ultimately removed.

The remedy will not be forthcoming in our day, but future architects may see it. It lies in a searching, severe, and thorough reform of our existing system of architectural education. We sneer at the speculating builder, poor fellow! but if we continue to look on an architect as a person who has served three or five years’ apprenticeship, as the case may be, to learn ‘the art, trade, and mystery’ of an architect and surveyor, the public will look upon him in the same way, and will draw a very fine line indeed between their estimate of the ‘builder’ so called, and the ‘architect’ so educated—or rather so uneducated.

Existing architects—even the oldest or the best of us—have little to be proud of, when we reflect on the many, rare, varied, and conflicting qualities an architect ought to possess. Few, if any, but architects themselves are conscious of their number and difficulty of acquisition. What a house-architect should be, should know and be able to do, was described the other night at the Society of Arts; and the paper we have reprinted left out matters supplemented by speaker after speaker in the discussion that ensued. The necessary qualities are indeed ‘legion.’ Mr. Smith’s paper was intended to give the external public some insight—perhaps its first

insight—into them. Dickens, in one of his popular tales—and some people will read nothing else—describes a truculent architect sending his pupil into his back yard, there to find a heap of bricks wherewith to try his hand at building a house; (!) and ere the close of the same wondrous ‘architectural’ tale, excites the hysteric indignation of his readers at Mr. Pecksniff’s appropriating to himself as its architect the design (‘supplied’ all complete in one clever drawing?) of his quondam pupil; nor does the writer, the friend and companion of artists by the way, stand alone in his *naïveté*. The outside public know nothing of an architect’s duties: witness even recently the ludicrous escapade of our accomplished Chancellor of the Exchequer in his anticipated saving of 2½ per cent. by his Whitehall Palace *réchauffé*!

Now, if we cannot quite teach even cabinet ministers what are the duties and the uses of an architect, we can at least, or we ought to, popularise a solution of the question ‘Who is an architect?’; and even this will be an immense improvement on the present state of things. All professional writers are agreed as to what are the essentials of excellence in building, and what the essentials (three-fold) of an architect’s training; but even architects themselves are, strange to say, unable to declare to the external public who is and who is not an architect. The public voice would doubtless decide it thus—‘Any one who calls himself an architect—on a brass-plate;’ and, sooth to say, we do not yet know how authoritatively to gainsay its *dictum*.

The public, indeed, proceeds to settle with a high hand, not only who is an architect, but how he shall practise his profession; what he shall do for his fees, and what fees he shall receive; who shall compute his quantities, who shall be responsible for them and to whom; what the surveyors shall receive; and all the rest of it—utterly regardless of every principle of etiquette, of custom, or of ordinary consideration for matters it is profoundly ignorant of.

While all this is going on, and every day’s delay increases the anomaly, the Royal Academy of Painting, Sculpture, and Architecture is holding its ‘one hundred and first’ Exhibition, and, as if in mockery of architects, and complaisant echo of the popular voice, has opened its new domicile with one of the most paltry architectural displays we remember. For above a century has the Academy ‘fostered’ the art in this country; and it would not be amiss to inquire, of what earthly use to English architects is or ever has been the Royal Academy? It now appears, that after a full century of its neglect, architects have been compelled, at the instance and initiative of that commendable body the Architectural Association, to establish their own Architectural Exhibition. It is hopeless to look to the Royal Academy.

There is another royally chartered institution to which in their extremity the young architects naturally turn. Much to its credit, it established some years ago the Voluntary Examinations; though from an inherent defect in its own constitution it was unable or unwilling to invest them with a conventional value, that would year after year impel the students to avail themselves of their obvious advantages. The architectural student, who had won his spurs, carried them home with him; talked about them to his friends, who forgot them; but saw, year after year, new fellows and new associates elected to annex F.R.I.B.A., &c., to their names, not merely on their works, but in even the London Directories, and the public applause courted, and not unfrequently won, by the display of these imposing titles; and while this was so, and the Institute, really rich in its somebodies, yearly gathered in its nobodies, the students very naturally meditated on the commercial worthlessness of the Voluntary Examination pass; and, being merely human and commercial, as were the Fellows and Associates who were supplanting them, fell away, and virtually dropped the examination scheme, excellent though it was. One thing was at least made very clear, viz., that the Institute, by its application of the scheme, left the moot question, ‘Who is an architect?’ just where it had been and still is—in *sublimis*.

Years ago the Institute might have taken up the grave question of competitions; but did not. It will some day find itself compelled to do it. Let us leave it for the present. The graver question of architectural education—the settling of ‘Who is an architect?’ once dealt with, will be found to embrace and to deal with that and nearly every other professional question at issue.

There are, we trust, signs, as we said at the outset of these remarks, of a general movement upward of the professional body. It assumes just now the demand for a higher course of education, and it is well. The Architectural Alliance (again at the instance of the Association) is about to petition—memorialise would be a fitter term—the Institute to exert itself to procure a system of compulsory examination. This is a step in the right—the only right—direction.

The Institute, if willing, may be powerless to influence the Imperial Parliament in the direction of a compulsory examination. We fully expect to learn that this will be the issue of any attempt to promote such a step; but with a very slight, and doubtless very practicable alteration of their charter, the Institute may within its own body accomplish all its intending petitioners hope for. It can set its own house in order, and so arrange matters that, in place of being what it is and has been for years, a mere London club of Architects, it may really become what it should be—a truly National Corporation: consequently it was with great pleasure that we heard of a resolution of the Institute itself having been passed at its

annual meeting on the 2nd inst. to the effect that 'the Council be requested to call a special meeting, to consider a motion that a Committee be appointed to determine what course is necessary to increase the usefulness of the Institute.'

'The Usefulness of the Institute' would doubtless be increased by the adoption of many possible improvements. But what would really enhance its efficiency would be this—to take measures at once for laying down a compulsory rule for the examination of all future Associates and other inferior members, and a higher one for all future Fellows.

This the Royal Institute of British Architects can very well afford to do. It numbers among its members some of the most distinguished architects of the country. These gentlemen have fortuitously, and for good fellowship and respectability's sake, joined its ranks. It can point to them as its worthy Fellows and Associates, but—and this is its blight—it has never made an architect. Outside architects become famous without the Institute, and then for mere fellowship enter its ranks. In return for its royal prestige the Institute undeniably does some good to the profession, but there is one great evil it does undeniably perpetrate, and it is this—it opens wide its doors to the good and the bad architect alike, and its membership is little or no guarantee of the possession of a knowledge of the science or the art of architecture. We say this in a professional journal, in friendly counsel, and with a long-felt deep desire to see the Institute take its proper position, and in doing so raise the whole standard of the profession.

The Institute can now well afford to bring in such a reform. On the other hand, English architects who are not in its ranks can well afford to let bygones be bygones, and rest satisfied with seeing all present Fellows and Associates retain their rank without examination. Let those who have now been admitted throw all ungenerous, selfish feeling aside, and reflect on the immense number of ardent young men, not yet of their body, and who, but for such a reform as this, never may be. There is certainly a great and a reasonable clamour outside for a better state of things; for some means of enabling the public to separate the quack from the expert; even, in short, for a new Society of Architects. Let us all hope that it will be inaugurated by what would appear to be the object indicated by the recent motion of Professor Kerr and the Architect to the City of London, a radical reform in the Institute itself.

OUR RAMBLER

AT THE ROYAL ALBERT HALL.

TO see the works of the Royal Albert Hall from a point which commands a general view of the whole, it is almost necessary to climb the scaffolding of the Memorial in Hyde Park; and months ago, when the great Amphitheatre, now ready for its roof, was less advanced, and from the Kensington Road presented only the appearance of a vast mass of reddish brickwork, it was a surprise, on gaining that point of observation, to behold once more, at one's very feet, the fine sweeping lines and massive walls which a traveller in Italy has learned to associate with the greatest civil works of the Romans—their amphitheatres; lines to which we are quite unaccustomed in modern practice, and walls such as now but seldom occur in secular buildings, although often met with in modern engineering works.

The Albert Hall is, as has been hinted above, essentially a Roman Amphitheatre in its form and main idea, but it is a modern adaptation of that idea, and for a purpose wide of the bloodthirsty rage after savage excitement which seems to have drawn the crowds of Old Rome into the Coliseum. There appears to be little room for doubt that in Rome the spectacle in the arena was almost all-absorbing, or at any rate so exciting as to concentrate upon itself the main attention of the spectators. In our modern English displays, and especially in the monster assemblies which our International Exhibitions and our Choral Societies have taught us to draw together, there is no doubt a very strong tendency to take almost more pleasure in watching the crowd and mixing with it than in examining the exhibition or display which draws that crowd together; or if this be going too far, it is at any rate certain that the crowd intensifies—where it does not create—the interest taken in the spectacle. The person who could sit solitary in an empty theatre and see a play acted before himself alone with pleasure, or even with patience, must be something more, or less, than human; and the denser the crowd, the greater the impression made upon each member of it by all the others.

This wonderful attraction, this animal magnetism lurking in a multitude, is the true secret of the charm which draws Londoners to the Crystal Palace. London has hardly any spectacle to offer of equal interest to that presented by the great Handel Orchestra at Sydenham, full to the ceiling with tier upon tier of animated fellow-creatures; though this is surpassed in some respects by the richer and more condensed, though smaller, display to be seen in the Opera House on an attractive night, when all the rank, fashion, and beauty of London at the height of the season can be taken in at a glance, or scanned in detail.

To double the Handel Orchestra and attract into it an audience as distinguished as that of the Opera itself, is (stated broadly) the ambitious and brilliant proposal of the Corporation now erecting on the South Kensington estate the Royal Albert Hall of Arts and Sciences. That building will start with the advantage of having a numerous and a very fashionable body of seat-holders for its owners; and should the two

thousand persons, many of them of high distinction, who are to pay for its erection, be disposed to show themselves in it when it is open, there can be little doubt that the remaining six thousand for whom there is room will flock there to look at them, and, as far as seeing goes, will be well repaid by the sight. It may be open to doubt whether the means which will have to be taken in order repeatedly to draw such audiences together may not be such as to contrast somewhat strongly with the kind of monumental or memorial character implied by the name of the building and by its local relationship to the Albert Memorial, but this is not the place for such an inquiry. The present paper only proposes to tell something of what has been seen by the writer during several rambles over the works.

The building which we propose to describe lies between the Horticultural Gardens and the main Kensington Road, and was contemplated some time ago. It will, indeed, be in the recollection of some of our readers that at the time of the great limited competition for the Albert Memorial, separate designs for a Hall to be at least partly connected with the monument were asked for, and were submitted by some of the architects. What is now being carried out is an oval building, of which the longest axis lies north and south. Its general design is due to that clever military engineer and architect the late Captain Fowke, and the actual execution to Lieutenant-Colonel Scott. It will be a covered amphitheatre of great size, and it is proposed to hold in it public congresses, performances of music, exhibitions, conversaziones, distributions of prizes, and other similar monster meetings.

The site having been granted by the Commissioners of the Exhibition of 1851 on terms equivalent to a free gift, the expense of erecting the building remained to be met. This expense was estimated at 200,000*l.* (an average of 25*l.* per sitting), and it was determined to raise the money by selling two thousand of the seats at one hundred pounds each. Of these by far the larger portion, though not the whole number, has actually been taken, and a contract is entered into with Messrs. Lucas under which the Corporation building the hall are, we understand, secure from the risk of being called upon to make up the deficiency from any other source, if the full two thousand be never sold. Such contracts are often necessary, in order to facilitate the action of large bodies of men whom it is impossible to render individually responsible; but of course, as they partake of the nature of an insurance as well as a contract to build, they raise the cost of any structure by a very perceptible percentage.

This important building resembles closely, as we said before, in shape and arrangement an ancient Roman amphitheatre, and it even approaches to the dimensions of some well-known examples. It differs, however, very materially, as we shall see, in construction and in distribution of seats from those simple, convenient, and almost indestructible structures. The shape adopted is quasi-elliptical, and the seats will partly slope up from the centre towards the walls, and partly rise in tiers, gallery above gallery. The central floor space is not to be the invariable centre of attraction (as it was with the Romans), and will therefore often be occupied by seats for the audience. The continuity of the tiers of spectators above it, which, in an old Roman amphitheatre, was unbroken, is, on the other hand, interrupted by a large orchestra and an organ, intended to be the most complete in the world.

The interior then will present in the centre an oval floor space, known as the arena, and holding, when used by an audience, 800 persons. Round this comes a zone of seats rising rapidly, seat above seat, and containing probably the best seats available. This is termed the amphitheatre. Behind and above these comes a belt of boxes in two tiers. Above these is a second wide belt of sloping seats, known as the balcony. This reaches the main wall of the building. Above this point that main wall, pierced by an open arcade of lofty and wide dimensions, will be seen, and this arcade with the kind of loggia behind will form one of the main features of the interior. This loggia forms a picture gallery 20 ft. in width, encircling the building and lighted from above; and on any occasion when additional sittings are required, they will be obtainable here to the extent of 2,000. This brings the total to over 8,000, thus made up:—

Arena	800
Amphitheatre	1,900
Boxes (two tiers)	820
Balcony	2,700
Gallery	2,000
	8,220

These zones of seats do not—except the top gallery—sweep uninterruptedly round the structure, nor do they rise in an unbroken slope. At one end of the oval are placed the large orchestra and organ, and in the interruption caused by this feature will occur one of the great variations between this modern amphitheatre and any of its classical prototypes. The belts of boxes will form a second contrast, and the interruption which they will cause to the sweeping slope from the arena to the outer boundary—which existed in the Roman amphitheatre, and has been preserved in the Sydenham orchestra—will probably combine with the feature already named to modernise largely the whole aspect of the interior.

What appearance the covering of an ancient amphitheatre may have presented is open to doubt, but there can be no hesitation in saying that, with our command of wrought and cast iron and glass, we have the means in our hands of roofing in such a structure as has

been described more completely and effectively than the ancients. The Leeds Exchange, a remarkably clever work of Mr. Cuthbert Broderick, has an area similar in shape to the one under discussion, which has been roofed over without any central lantern on the principle of trussed purlins, running in a direction more or less parallel to the longer diameter of the oval. The roof of the Albert Hall will not be of this nature, but will rather resemble in construction that of the 'Halle aux Blés,' and will, in fact, present a series of radiating trussed ribs, uniting in a central ring and rising from the walls; the homely and familiar example of a very flat umbrella being the best comparison we can think of, as not inapt to give an idea of the general form and curve of the covering. The ceiling is of a flatter curve than the outer roof, and will, we believe, be very largely formed of glass, and the roof covering will be also to a great extent semi-transparent glass. To prevent inconvenience from the direct rays of the sun, a velarium made in distinct gores, corresponding to the spaces between the ribs of the roof, will be used; and we understand that it has been arranged to furl or unfurl each gore separately. By this judicious contrivance the individual sections of the velarium will be of a size not too large to be managed with ease, and so much of it only need be used at any one time as is absolutely required. The open eye in the centre, protected from the direct entrance of rain, will no doubt act as a ventilator, and the space between the inner transparent glass ceiling and the outer roof-covering will afford an opportunity for the same sort of effective lighting up at night as has been practised at the Théâtre Lyrique in Paris.

All that we have as yet described lies within or rests upon the main wall of the building, which encloses the auditorium and carries the roof. A second wall less high, but of great strength, runs outside of and parallel to this, and the space of twenty feet is left between the two. This space holds the staircases, crush rooms, and refreshment rooms, and the picture gallery already named. On the lowest storeys, where the boxes and amphitheatre approach one another, box-corridors have been readily obtained behind and under them, and within the main wall. Altogether it is calculated that space enough to accommodate the whole auditory is afforded by the rooms and corridors. The staircases are carried on iron girders and carriages, and are of stone. They are numerous, well placed, and wide, those giving access to the highest gallery being the least roomy, and they are to be supplemented by lifts for the use of the lame and infirm, or others.

The walls are entirely of brick, with dressings of terra cotta. The general system of floor construction employed is that combination of iron girders and concrete known as Fox and Barrett's. This is well understood in this country, and probably as well suited to our materials as any familiar method. It was, we believe, the extra cost entailed by the employment of any novel plan which prevented the attempt being made to introduce some lighter and yet simple fire-proof floor. This is to be regretted, for when iron and terra cotta have been used with so much intelligence separately, it would have been of great advantage could we have been presented with a good example of their use combined.

Thus far we have dealt with the general shape and internal aspect and arrangements of the building. The exterior will present a lofty wall of red brick, relieved by terra cotta dressings of a rich cream colour freely introduced. This wall rises to a height of about 80 feet from the external ground-level, and within this, rising above it, and some 20 feet back from it, will be seen the real main wall, which, including its parapet, reaches a height of somewhere about 100 feet; from this wall will spring the roof. The two walls we have referred to are, in fact, the main features of the brickwork, and they run round quite uninterruptedly. From the outer wall, on the ground-level, three porches are thrown out, one at each side, and one at the northern end. The southern end, joining on to the conservatory of the Horticultural Gardens, will be entered thence. These porches are almost entirely formed of the terra cotta used for the dressings, and the entire base of the external wall is faced with a moulded and panelled mass of the same, reaching to a height of about 13 feet, so as to form a highly-enriched plinth for the upper part to stand on. Above this base the outer wall is divided into three storeys, and the crowning features of the upper storey will be the frieze of Mosaic work to which the Rambler called attention in an earlier number.* There can be no doubt that the external features of the building will excite much notice as they come to be seen. The treatment of the terra cotta will probably not only draw attention to the suitability of this material to take a large share in the exterior treatment of London work, but will show excellently well the views of those who hold that terra cotta should be burned as it comes from the mould and used in small blocks. The blocks in use here do not measure more than 18 inches in any direction, and average 4 courses high (varying from 3 to 5 courses); they are bonded either 9 $\frac{1}{2}$ or 4 $\frac{1}{2}$ inches into the brickwork, and are used as they come from the kiln, having been burned as they were moulded. The design of individual ornaments and features is no doubt open to criticism; but we consider that this terra cotta work, when seen in large masses, will furnish the strongest of all arguments in favour of the plastic rather than the sculptural treatment of the material.

In the actual carrying out of the work much practical care has been

shown. The brickwork is carried up in a material virtually incompressible—a mortar made of one part of lime and one of cement with six of sand; and if some extra expense has been incurred here, it has been compensated for by an entire freedom from settlements, and the possibility of *stepping* the foundations so as to suit the varying nature of the bottom, which, over so large an area, was found by no means uniform. The dryness of the whole has been ensured by running a drain round the building seven feet below its floor level. This drain has intercepted and carries off a large amount of water, and its work is doubly important because the arena is sunk 15 feet below the finished level of the external ground. The piers of the main—and of some of the minor walls—are pierced by flues for ventilating purposes. These will serve as channels for fresh air, which is to be forced in by fans driven by steam power. The main wall is three feet thick above the ground-floor level, and rises, without diminution of thickness, to the height of 102 feet from the arena floor to the wall plate. This plate is a tremendous structure in itself, covering the whole top of the wall, and so bolted together as to form a continuous tie of the most solid character. To it are bolted chairs, in which sit the feet of the principals or ribs; and not the least curious part of the aspect of the works at the present moment is presented by the incomplete ribs, rising at various points, and stretching themselves out in the air as though trying to reach the central framework on which they are all to be united.

We have spoken of the present aspect of the work—and to some extent that aspect is less interesting than what was presented a month or two back. Then the centre of the area was occupied by a tall and solid scaffold, from which four arms of scaffolding, so to speak, radiated north, south, east, and west. The motive power for the hoisting and pumping was a steam engine at this centre, a hoist was placed in each of the four arms, and the materials thus raised were readily carried to the work. This arrangement seems now almost choked up by a most prodigious framework of timber scaffolding, the central part being of squared timber and the remainder of poles. The object of this scaffold is to carry the platform used in fixing the trusses of the roof; and as the space below is not unencumbered, and the distance from centre to circumference is a variable quantity, it is probable that in thus forming a platform of great strength and large size the contractors have acted wisely; but the contrivance has a clumsy look as compared with the beautiful travelling scaffold which we referred to in our Rambles at the St. Pancras Terminus.*

Some idea of the main lines of the different galleries may, however, even now be obtained, for they are in a forward state; and a slight notion is got of the vast size of the interior when catching a remote glimpse of a piece of wood, rudely cut to represent a human figure, and painted white. We learn that this speck is the full-size outline of a vocalist placed where she would stand in the building. Notwithstanding the vast extent of space, there is every ground for hoping that the building will prove well adapted for sound. The use of resonant materials, and the proper distribution of the structure, have been understood by those who have the work in charge, and have been very carefully attended to; while the glass ceiling seems to us to offer a safeguard against any danger of echo from above.

The actual, if not apparent, size of the structure may be understood from the leading dimensions. The greatest diameter of the space enclosed by the main wall is 219 feet 4 inches; the shortest diameter is 185 feet 4 inches. The extreme length of the building, exclusive of porches, is 272 feet, and its breadth 238 feet. The height, from the level of the arena to the wall-plate, is 102 feet, and to the base of the lantern 157 feet. The heights from the finished ground level to same points will be respectively 90 feet and 142 feet 3 inches. The depth of iron ribs of roof at the centre will be 17 feet 9 inches.

The plan of the structure is not a true ellipse, but an approximation formed by uniting four arcs of circles, and does not differ, we believe, by so much as 9 inches from a true ellipse at any point. The longer axis, or centre line, runs north and south; and, prolonged northward, would cut the centre of the Albert Memorial; while, if prolonged southward, it coincides with the central line of the Horticultural Gardens. There will be a foot approach from the gardens, and the two lateral porches will be used as carriage porches; but it is extremely probable that the north porch—next the Park—will be used as a foot entrance only. The road in front of the building—between it and the Albert Memorial—will probably be straightened, and made parallel with the main lines of the two buildings; and provision has been made, in putting in the foundations of the north porch, for a tunnel under the roadway—an improvement which the experience of the tunnel between the Crystal Palace and the High Level Station ought to encourage the directors to undertake.

It only remains to add, that we reserve for an early number a more detailed account of the iron roofing. The main structure is being carried out by Messrs. Lucas. The terra cotta is supplied by Messrs. Gibbs and Canning, of Tamworth, and the facing bricks are Cawte's Fareham bricks. The whole work is under the superintendence of Lieutenant-Colonel Scott, R.E., as 'Director of Works.'

The New Congregational Chapel, Toxteth Park, Liverpool.—In a limited competition of fifteen, the plans of Mr. Oliver, of Newcastle, and Mr. Henry H. Vales, F.R.I.B.A., of Liverpool, were selected and submitted to the general committee, when four voted for Mr. Vales and four for Mr. Oliver, the chairman giving the casting vote for Mr. Oliver.

* ARCHITECT, No. 2, 'Our Rambler at South Kensington.'

* ARCHITECT, No. 6.

RESTORATION OR CLEANING.

THE COUNTESS OF RICHMOND'S TOMB.

A CONTROVERSY has sprung up, at the close of the Whitsuntide holidays, on a subject of unusual interest for our readers. The gilded bronze effigy on the tomb of Margaret, Countess of Richmond, mother of King Henry the Seventh, has been cleaned from the black incrustation which has hitherto veiled the delicacy of the work from the eyes of the present generation. It was, no doubt, anticipated by the founders of the superb monuments of the Tudor times, that the protection of the bronze in which they wrought by a coat of gold would enable it to defy the tooth of Time. Had the gilding been sufficiently thick, or at all events sufficiently homogeneous and impermeable, we must still hold that such would have been the case. As it is, however, sulphur, in some subtle form, has penetrated the sheath of gold, and has attacked the copper of the subjacent alloy. It would seem that an action similar to that termed *verdigris* has taken place, for a salt of copper has exuded from the surface of the work, and has spread over and concealed the gold. The removal of this disfigurement (as to which the merit of perfect success is claimed for the First Commissioner of Works and Public Buildings and his subordinates) is said to have restored this fine tomb to its original beauty. An extension of the process to the other bronze monuments in the Abbey is proposed. It is resisted, on the other hand, by the citation of the usual arguments against restoration, and by the statement that the present dingy state of the bronze work so thoroughly harmonises with the subdued tone to which neglect and unremoved dust have reduced the former splendour of the Abbey, that a bright golden hue would be incongruous and displeasing.

In almost all questions on which it is possible for educated men to hold diametrically opposite opinions, such possibility arises from the fact that different principles are involved. It is so in the present case. Two distinct orders of consideration go to the decision of the propriety of restoration. Monuments may be regarded as works of art, or as historic memorials. The artist and the archaeologist will thus look at them from different points of view.

The former will first desire to be able to see the work of his predecessor in as fair and well-tended a condition as when it received his final touch. This feeling may be divided between the wish to see a work of art as perfect as it could possibly be rendered and the desire to trace the very touch of the creative artist. But, in either case, it will be essential to the satisfaction of the admirer that all excrescence should be removed, and that the work of decay should be arrested. It may be matter of doubt whether it is preferable to attempt to restore, in the case of any perceptible injury suffered by the object. To see a hand without fingers, or a face without a nose, always causes positive pain to a sculptor; but men of taste may be, and are, divided on the question whether it is better to replace such losses or not. As matter of artistic education, it is certainly better to have the undoubted work of a master, even if unfortunately imperfect, than to possess the result of such a restoration as may have rendered the subject more agreeable to the eye. Thus the Venus of Milo has more value to the student of sculpture than the Venus de' Medici, although the latter will always command the far larger number of admirers.

From the artist's point of view, then, the only question as to the propriety of cleansing the Westminster bronzes will be, how far it can be done without destroying any of the delicacy of the original work.

The archaeologist looks at the matter from the very opposite point. To him the corrosion is as real as the sculpture; the work of the tooth of Time is as precious, as an historic record, as is that of the chisel of Phidias himself. With all collectors this sentiment is strong. The green result of metallic decomposition is lovely in the eye of the *connoisseur*. At first it was prized only as an evidence of authenticity. By degrees it assumed an adventitious value, and at length the enthusiastic admirer of the antique hugs the very scythe of Time.

The archaeologist, then, will naturally and consistently urge that the tombs should be left alone.

One consideration may, however, be added, which, other things apart, seems to turn the scale in favour of the artistic view of the case; although without going so far as to be in favour of restoration, properly so called.

The loving and purposed neglect of the archaeologist tends to the destruction of the object of his admiration. The wiser care of the artist tends to its preservation. To carry, as far as possible, the assent of our readers to this proposition, we will confine it specifically to bronzes. In the case of gilded bronzes, we do not see what objection can be urged to the process of cleansing, if it can be perfectly effected. We have an instructive illustration of the case in the present state of the antique bronzes in the Museum of Naples. There we can see, side by side, statues of equal antiquity, the one part, green, mouldy, with the surface entirely gone, being replaced by a series of pits, the sharpness of the original work lost—and, what is worst of all, the whole bronze incapable of being cleaned, or in any way preserved; crumbling before our very eyes, with a certain and not very tardy decay. We see others bright, clean, and polished, sharp in every outline of contour, or eyelid, or subtle and delicate wrinkle, durable as well as beautiful, and capable, with due care, of a preservation to which we can affix no term.

The oxidised bronzes have been taken from the Tufa of Pompeii. The slow chemical action that has taken place for nearly two thousand years has wrought a disintegration, lamentable in itself, and yet more lamentable in its results with regard to the future.

The non-oxidised bronzes found at Herculaneum have been wrapped round in an impervious coat of molten lava. From this they came forth as from the sand of the founder, in the exact state in which they were maintained as ornaments for worship or for use when Vesuvius woke from an immemorial slumber. As such they may endure as long as man cares for Rome and Roman relics.

The London atmosphere during four hundred years has not had the same destructive effect as the Pompeian Tufa, and the tombs in the Abbey have been partially protected by their gilding. The actual incrustation is only

a stage in the progress of slow decay. To arrest this decay would be the wish of every one. That this can only be done by a process that shall leave the monuments in the same state as that in which they were when first completed, should hardly be considered objectionable by an unprejudiced judge. But the work will be incomplete unless, by electro-metallurgic or chemical means, the golden sheath be so far completed and perfected as to prevent a renewal of the corrosive atmospheric action, which will otherwise recommence with increased activity.

That the imaginative charm of 'the holiest of our holy places' would be broken by the restoration of the pale golden lustre with which the features of the Virgin Queen, and her more lovely and unfortunate cousin, gleam from their lofty monuments, we do not believe. Let the most conservative archaeologist be reassured. He may count, for his lifetime at least, on the unbroken prescription of ecclesiastical neglect. Let us varnish the tombs in the Abbey to the lustre that adorns some of the finest Italian churches, and we may yet safely count on the care of the dean and chapter to allow, within a year or two, so thick a pall of dust to gather over them as shall satisfy the yearnings of the most passionate admirer of a subdued tone. When we see how our finest marble sculptures are obscured by the evidence of long neglect, we need not be apprehensive as to the overpowering splendour of our cleansed and purified bronze.

THE ARCHITECTURAL EXHIBITION.

(SECOND NOTICE.)

WE must protest against Mr. J. W. Fowler not mentioning Mr. Street's name as the architect of the tower and spire in his drawing (62) of St. Mary's Church, Lichfield, as, we are sure unintentionally, an unwarrantable appropriation of another man's brains. Mr. Street's tower and spire is strong and good, although the composition of the flat pediments over the belfry windows does not seem quite happy, and the cornice and parapet are weak; but this may be the fault of the drawing. We cannot like the way in which Mr. Fowler has carried his clerestory windows through the chancel, and the general sameness of the tracery shows poverty of design and want of study; the east window is in bad perspective, but the drawing is carefully tinted. In his view of Binbrook Church (60), we give Mr. Fowler all credit for his tower and spire and boundary wall, which are clever. The general design is more simple, but open to the same objection as 62, as regards the clerestory windows; and Mr. Fowler, or his artist, might bear in mind that shadows are not so blue as he has depicted them.

No. 65 is a sketch for new premises proposed to be erected in Oxford Street, by Mr. Robert W. Edis, the zealous Hon. Secretary of the Exhibition. This design suffers considerably from the drawing, which seriously detracts from the merits, and adds to the demerits: making allowance, therefore, for this, we must give great credit to the treatment of the second and third floors, and the way in which the continuous arcade of the second floor is gathered together in couplets under the bold dormer roofs of the third floor; the design deserves more than ordinary attention as being an illustration of terra-cotta decoration. We wish Mr. Edis had carried the leaded glass which is shown in the upper windows throughout the building. We suppose, as usual, Mr. Edis has been the victim of the client, and been obliged to sacrifice solid masonry, which is so manifestly wanted in the base of the building.

We are sorry to see Mr. I'Anson's name attached to the drawing, 66—Views of House at Shoreham; for, independently of the perspective being very unhappy, the drawing is weak, and the architecture common-place—not in any way worthy of Mr. I'Anson's name and reputation.

In his Schools at Bromyard, Herefordshire (69), Mr. Kempton fails as much as he excels in his design of Asylum at Hereford (42).

Mr. J. W. Fowler, in his drawing (70) of Morton Hall, Notts, presents us with a careful, effective sketch with much praiseworthy design, damaged by the perfectly unnecessary addition of the ornament to the top of the parapets and the undeveloped character of the turret; the chimneys are effective, and very good bits of plain brickwork. The colourist deserves the greatest credit for his broad treatment of the whole drawing, though his shadows are careless.—(71.) A careful pen-and-ink sketch of All Saints' Church at Moulton, Leicestershire, as restored by Mr. W. Smith. This appears to be a very conscientious restoration, and does Mr. Smith credit as an antiquarian.

We must protest against the design of Sacrament, St. Saviour's Church, Croydon (72), by Messrs. Mullins and Lee. It is simply drawing-room sculpture, with pretty inanities of figures and plenty of alabaster surroundings, but nothing tending to improve the architect's or the sculptor's reputation, and we must protest once for all against alabaster forming a basement for common brickwork. Mr. G. R. Clarke exhibits St. Luke's Church at Maidenhead in No. 73. It is a very plain building.

We are glad to see Mr. Ewan Christian's name again in the catalogue. His House at Combe End (74) is a plain, unpretending design, with many good parts; the chimneys are bold and good, and the grouping of the offices picturesque. His Church at Folkestone (75) would have been a very successful drawing, had it not been coloured in such a metallic manner; the west end, as shown in the photograph attached, is simple and good, as also are the transepts and east end; but we do not like the way in which the aisles are proposed to be roofed—the numerous gables would take away from the breadth of the building, and utterly hide the simple and unpretentious clerestory; the triviality of the insertion of coloured stone or brick in the relieving arches, and the weakness of the doorways, are the chief faults in this design. The belfry windows are powerfully designed, and Mr. Christian's example of attaching an explanatory plan to his drawing is much to be commended.

Manchester will soon cap Oxford in towers and spires; but, however effective they may be in the bird's-eye view of the city, we cannot see the use of the big, square, and somewhat ugly campanile tower in Mr. Thomas Worthington's drawing of Police Courts, &c. (77), which seems to crush the rest of the building; the detail throughout is poor and weak, and the archway at the end not in character with the other work.

No. 78 is a good pen-and-ink drawing of a new church at Hartford, by Mr. John Johnson; the belfry stage of the tower and the spire are exceedingly well managed and carefully designed, as also is the porch, saving the very ugly canopy cutting up through the apex of the gable; this we hope Mr. Johnson will reconsider. 79 is another careful and well-tinted drawing of Langton Hall, by Mr. J. W. Fowler.

We are glad to see Mr. Ernest Turner, in his Shop Front, Bond Street (82), attempting to leave the beaten track of girders and bracketed cornices, and honestly arching over his window and door openings; the windows on first-floor seem too small for their work, and cannot Mr. Turner persuade his client to complete the whole front, and thus avoid the incongruity of the old and new work? 83 is a very beautifully executed outline drawing of the very beautiful interior of the Church of St. Mary Overy, by Mr. W. Howes; careful and good in perspective and drawing.

Mr. W. Emerson, in his drawings for New Club at Bombay (87) and Entrance to New Markets at the same place (88), shows some very bold and vigorous work, very early in its character and well-studied throughout; the cutting in two of the heavy vaulting ribs is novel, but hardly satisfactory, and the whole detail is coarse, but evidently designed to suit the capability of the Bombay workmen, and the drawings are carefully drawn and tinted: we should hardly have supposed that the same architect could have designed the proposed New Bank at Bombay (86), for it is as bad as the others are good.

Messrs. Hadfield and Son contribute a heavy pen-and-ink sketch of New Church and Presbytery proposed to be erected at Bradford (90); the church has many good parts, though we think the west entrance squat and poor, and we object to the continuous line of roofing over nave and aisles; the secular buildings are not remarkable.

No. 91 is an anastatic sketch of a new Church at Avon-Dassett, in Mr. Buckeridge's usual style; his Design for the Chapel of the Anglican Convent (153) at Oxford is very good, and one of the best we have seen of Mr. Buckeridge's works.

We almost think we ought to congratulate Messrs. Blackmoor and Withers that their designs for Baptist Chapel (92 and 95) and for St. Mark's Church (101 and 102) at Sheffield were unsuccessful.

Mr. Chancellor sends three admirable sketches for Staircases to Country Houses (93), carefully studied and worked out in different coloured woods, the effect of which would be good and pleasing; we cannot speak too well of the drawing, and wish we could have seen more such details on the walls of the Exhibition. In 96, 98, 99, 100, and 103, we have three unsuccessful designs for a New Church at Slough. 96 and 103, by Mr. W. Fowler, are very effective pen-and-ink drawings, to which the referee awarded the first place; which the committee, however, reversed—to their shame. The east end is well treated, and the triple lancet windows would come out well in perspective; the angle pinnacles of the tower are poor in the extreme. There is much to praise in this design, and little to complain of, except perhaps the too minster-like character of the eastern buttresses. Mr. Conybeare's design (98) is more pretentious than good; the design 99 and 100, by Messrs. Seddon and Spiers, has many good qualities in the interior; we are, however, at a loss to conceive how Mr. Seddon could possibly have combined with a gentleman whose architectural proclivities are notoriously at variance with his own. The tower and spire out-Seddons even Mr. Seddon; the north and south porches would be useful, and form good features in the western view: we do not like the treatment of the clerestory, which is almost a reproduction of Mr. Seddon's church at Chigwell, and the composition of the nave roof with the central arches is unhappy. 104 shows another drawing by Mr. Fowler for a church at Lincoln, simpler in treatment, and decidedly better than his other designs.

We would desire to accord all praise to Mr. Thomas Goodman for his careful pencil-drawing (108) of the Porch, South Benfleet Church, Essex, in which the construction is well shown. We recommend the study of this drawing to all architectural students. Messrs. Innocent and Brown contribute their successful design (110) for new Baptist Chapel at Sheffield, which, if anything, seems more pretentious than those we have named, although there are parts to be praised. Mr. Chancellor, in his drawing (111), shows two cleverly-tinted elevations of proposed alterations to Stoke College, Suffolk, carefully treated in red brick, and great improvements on the old façades shown in the same drawing: the tower is unworthy of the rest of the work, nor do we like the sham dormers or conservatory.

Mr. Waterhouse sends a perspective view of the Manchester New Town Hall (117). This building has been before criticised; the drawing to which the hanging committee have given the place of honour at the head of the room is a fine example of effective tinting, and shows well the main masses of the building. There are portions of it which, when examined in detail, seem open to revision, and we hope Mr. Waterhouse will make one or two alterations in carrying out the work, especially the dormers, the squat entrance doorway, the statues stuck against the wall, the weak turrets of the central gable, and the end masses. If the present drawing is thoroughly accurate in detail, we trust also he will improve the treatment of the impostes of the second-floor windows, which otherwise are the best feature in the design. His other drawing (127) of New Mansion at Easeney Park is less successful in drawing and in colouring, and the general grouping less effective than Mr. Waterhouse's massing of his work usually is.

The two pale and apparently working drawings of the proposed new Church of St. Peter, at Clerkenwell (139), by Mr. E. L. Blackburne, would have been very good, except that here and there Mr. Blackburne has descended to weak tricks for effect.

Last, but not least, among the Gothic drawings we must notice Mr. John O. Scott's wonderfully got-up interiors of his competition design for the Great Hall (167) and Council Chamber (168) of the proposed Manchester Town Hall. Splendid in drawing, and vivid and attractive in colouring, we fear they rather tend to mislead the general public, who are so disposed to look upon the glory of the drawing, rather than the purely architectural merits of what the drawing is really, or rather should be, a symbol of. There are many points that we cannot like about the designs, but they were fully discussed and criticised at the time of the exhibition at Manchester, and we therefore now prefer to leave them with a word of praise

for the way in which the drawings have been got up. With these two drawings we have finished the Gothic portion of the Exhibition as expressed by drawings. The other side, together with the photographs, we leave for a further notice.

THE OASTLER MONUMENT AT BRADFORD.

THE monument raised by public subscription to the memory of the late Mr. Richard Oastler, designated in his lifetime 'The Factory King,' was inaugurated at Bradford a few days since, by the Earl of Shaftesbury. The memorial was the result of a subscription throughout the manufacturing districts, chiefly of the West Riding of Yorkshire; and the circumstance that Bradford had been the centre of the Ten Hours' Bill movement, and that a larger amount of subscriptions had been raised there than anywhere else towards the erection of the monument, induced the subscribers to settle upon that town as the site. Designs were invited, and that of Mr. J. Birnie Phillip, of London, was selected, the cost of the statue to be 1,000*l.* The casting was entrusted to Messrs. H. Prinee & Co., Southwark, London. The statue represents Mr. Oastler in the act of making an appeal on behalf of the factory children, two of whom are grouped at his side. The weight of the body is sustained by the left foot, which is firmly planted on the ground, while the right leg is thrown backward and rests on the toes of the foot. The right arm crosses in front of the body, the hand extended towards the children, while the left arm partly encircles them. The boy is looking down in modest attitude, while the girl clings to her youthful companion, but looks up to him who is their protector and advocate. The group is of bronze, and is placed on a pedestal of polished red and grey granite. The enrichment of the cornice is incised and gilt, as also the inscription, which runs as follows:—'OASTLER, born at Leeds, December 20, 1789; died at Harrogate, August 22, 1861.' The figure of Mr. Oastler is dressed in an ordinary frock coat, with trousers and gaiters covering the boots. The likeness is considered good. The factory children are attired—the boy in corduroys and smock, the girl in a striped dress, with pinafore in front, and both wear Yorkshire clogs. The total weight of the bronze is upwards of three tons. The pedestal came from the works of Messrs. D. H. & J. Newall, Dalbeattie. There are two steps of grey granite. The outside dimensions of the first step are twelve feet on each side, and its height is one foot. It is composed of six pieces. The second step is seven feet eight inches square, and fifteen inches high, and is composed of four pieces. Next comes a third block of grey granite, one foot eleven inches thick, and five feet seven inches square. A moulded plinth, twenty inches thick and five feet two inches square, follows. The die, or pedestal proper, is four feet high, and four feet six inches square. The next course consists of one foot five inches of red granite, five feet four inches square, which forms the cornice. This is surmounted by a course of grey granite, eleven inches thick, and four feet eight inches square. On this is placed the bronze group, the base of which is four feet square. The height of the principal figure is ten feet six inches, of the boy six feet six inches, and of the girl five feet six inches. The total height of the monument from the ground is twenty-two feet seven inches, and the weight about thirty tons. The work of erection has been carried out by Messrs. J. & W. Beanland, builders, of Bradford. The total cost of the monument is about 1,500*l.* The site selected is an open piece of ground near the Midland Railway Station, in a central part of the town.

MIDDLESEX HOSPITAL HOME FOR NURSING.

THE project of erecting proper buildings for the accommodation of nurses, in connection with the Middlesex Hospital, having been carried into effect, the ceremony of opening them took place on the 16th instant, by Her Royal Highness the Princess Mary Adelaide of Teck. Service having been performed, the distinguished visitors were shown over the new building; the Regent, Clayton, Cambridge, Founder, and Percy wards being subsequently visited. Mr. Wyatt, the architect of the new building, was afterwards introduced to the Princess. The Home for Nursing is five storeys high, and constructed so as to afford accommodation for upwards of fifty nurses. A separate apartment, comfortably furnished, is allotted to each, and in addition four isolated rooms are set apart as hospital wards for nurses suffering from serious illness. A handsome refectory, 60 feet in length, forms an interesting feature in the building, with its kitchen, scullery, &c., attached. On each floor of the Home, above the basement, a bath-room, with every convenience, is provided.

THE AMSTERDAM EXHIBITION.

THE Sub-Committee met on Monday, the 10th inst., at the house of the Society of Arts, to consider the question of applications for space from intending exhibitors. As these have now become very numerous, and the principal British trades and industries are likely to be well represented by important houses, the Committee have felt warranted in applying for an extension of space, which has been granted by the Central Committee at the Hague. The municipal authorities of Amsterdam have also placed at the disposal of the Exhibition Committee a square in front of the Palace, where booths or stalls will be erected for those desirous of effecting sales, which cannot be carried on in the building. This affords an opportunity of exhibiting and obtaining orders for many kinds of articles not coming strictly within the scope of the Exhibition. Parties desirous of renting these stalls or booths, which are sixteen yards square, should make immediate application to Mr. P. L. Simmonds, the London Secretary, 3, Castle Street, Holborn.

Every arrangement has been made by the Mansion House Committee and the various consuls, &c., for the Netherlands at the shipping ports to facilitate transport, reduce expense, and relieve British exhibitors from all trouble. A fund has been set on foot to defray the contingent expenses of publicity, printing, correspondence, &c.

BISHOPSNYMPTON PARISH CHURCH.

THE parish church of Bishopsnympton, near Exeter, was re-opened on Ascension Day, after considerable works of restoration. The work was commenced in July last, and the outlay has amounted to more than 1,300*l*. The chancel has had a ceiling removed and the roof for the most part renewed, the old principals and arched braces doing duty with good effect in an open boarded roof. A new reredos of Bath stone has been erected at the east end; and a new two-light stained glass window from Messrs. Beer's establishment has been erected to the memory of the late Rev. Canon Hoherden. The south aisle has had its cradle roof uncovered, repaired throughout and re-slatted, and carved bosses fixed at the intersections of the ribs. Three new Bath stone windows have been put in, and the west wall is re-built. The nave roof, a cradle plastered between the ribs, has been adorned with carved bosses. The church has been re-seated throughout with red deal open seats, the bench ends and fronts having tracery. The plastering has been removed from the walls, and the whole interior exhibits the stone, having neatly pointed joints. Two old windows on the north side have been repaired and reglazed. The floors of the avenues are laid with Haywood's black and red tiles. The font, a Norman one, has been restored by supplying four shafts in Purbeck stone. The tower of the church, which is a very tall and imposing structure, requires much repair, which has yet to be undertaken. The Rev. J. Thorne, the rector, has been the chief promoter of the work, aided by contributions of friends, the Bishop of Exeter giving to the amount of 500*l*.

The work has been carried out, under the superintendence of Mr. Ashworth, architect, of Exeter, by Mr. Cock, of Southmolton, builder, the Bath stone work by Mr. Gould, of Barnstaple, the carving of the reredos by Mr. Hems, and wood carving by Mr. Sendell, both of Exeter.

ST. OLAVE'S CHURCH, MARYGATE, YORK.

THIS church, which had been closed for three weeks for repairing and partial decoration, was opened for divine service on Sunday the 9th inst. Hitherto the decorations in the church had been of a temporary character, but it having been determined by the rector and churchwardens that something in the way of permanent embellishment should be accomplished, a design was prepared by Mr. J. W. Knowles, mural decorator, by whom the work has been successfully carried out. Around the east window two borders have been painted, one on the face of the wall, and the other in a deep hollow which runs around the outer edge of the window. The former is composed of leaves and flowers alternately, buff and gold, on a sage green ground, and the latter is of a pointed design, having one side brown and the reverse buff for a ground, and on which the pattern is red and grey. The wall space on each side of the window, as high as the cupings of the lights, is covered with a quatrefoil diaper of sage green, filled in with foliated crosses in red, and six pointed stars in gold. Across the top of this diaper work is a crested border of buff and gold on a deep red ground, and at the base a foliated one in buff and brown on a gold ground. The portion of the wall above this diaper is powdered with roses in red, and on it two ribbons illuminated with the text, 'Holy, holy, holy, Lord God of Hosts, heaven and earth are full of Thy glory.' Under the reredos is a rich diaper composed of lozenges of scarlet on a green ground, each lozenge being alternately covered with gold and pink *fleur-de-lis*, and the cresting at the top of the reredos is picked out in gold.

The wall all round the church is painted six feet high of a dull red, with an ornamental border, and the top edge of green leaves, divided at intervals by gold Maltese crosses and grey flowers. One side of a pillar (the rest of which are at present painted stone colour) has been decorated, and it has been proposed to extend this additional embellishment to the whole of the pillars at a future time.

GAS AND WATER.

WIDNES.

THE gas supplied to the consumers at Widnes is said to be of inferior quality and high in price. At Blackburn the price is 3*s*. 9*d*. to 4*s*. for 20-candle gas; Nottingham, 3*s*. 2*d*., 18-candle gas; Rochdale, 3*s*. 3*d*. to 4*s*., for 20-candle gas; Walsall, 2*s*. 4*d*., 14-candle gas; Salford, 3*s*. 4*d*., 20-candle gas; Stockport, 3*s*., 20-candle gas; Warrington, 3*s*. 4*d*., 20-candle gas; Lancaster, 4*s*., 21-candle gas; Southport, 4*s*., 21-candle gas; Preston, 3*s*. 4*d*., 18-candle gas; Wigan, 3*s*. 4*d*., less 10 per cent.

It is suggested, before the Local Board proceed to expend further capital on their gas works, that the present capacity of their works shall be ascertained.

LONDON WATER.

The report of Professor Frankland, of the Royal College of Chemistry, shows that the water supplied to London, tested by samples drawn in April, ranged from 28.4 tons of solid impurity in the New River water to 42 tons in 100,000 of the supply of the Kent Company. In Bristol, samples drawn in February showed 28.66 tons of solid impurity in 100,000 tons supplied by the Bristol Waterworks Company; and in the supply furnished at All Saints Lane no less than 127.28 tons. At Manchester, sample taken in June, there were only 6.2 tons of solid impurity; at Lancaster, in November, only 4.68 tons; Preston, in August, 12.44 tons; Newcastle, in September, 23.40 tons; Glasgow, in July, Loch Katrine water, only 3 tons; Edinburgh, in September, the Crawley Burn, the Swanston, and the Colinton water, ranging from 11.28 to 14.10 tons; the Coniston water, 22.68 tons; Dublin, the Varty water, brought from a distance of thirty miles, only 6.34 tons; Cartan's pump water, from the most used of the Dublin wells, 81.62 tons. It will thus be observed that water supplied to Lancaster, Manchester, and Glasgow, is of much greater purity than any that can be had in London.

Mr. Page's paper, to be read before the Society for the Encouragement of the Fine Arts, is postponed to June 10. The subject touches upon the relations between engineering and architecture.

PROPOSED NEW ROADS NEAR TRURO.

THE Truro and Redruth Turnpike Trust held a meeting lately, at which a proposal was discussed for the construction of two new roads in the neighbourhood of Truro. The first proposal is of importance, because the road would open up a new route for communication between Truro and Perranporth and throw open the extensive traffic with the Chiverton mining district, avoiding altogether the steep and dangerous hill at Kenwyn. The road suggested would commence at the end of the New Road, near St. George's Church, and pass by Bosvigo Bridge and New Mills, ending on the Perranporth Road, beyond Shortlanes End. To make the project complete, the road ought to be continued on to Perranporth, through the Calestick Valley, right through the Chiverton district. The other road suggested is from Malpas to St. Clement's, by the water side, to join the road constructed by the late Mr. Vivian, from St. Clement's to Kiggan Bridge, near Tresillian. It would cost about 800*l*. It is necessary, however, that the Trust should obtain a new Act of Parliament to enable it to effect the desired improvements.

ILLUSTRATIONS.

PICTURE FRAMES AT THE ROYAL ACADEMY.
(FIRST NOTICE.)

THE commonplace expression, 'What a beautiful frame!' often resorted to by those who feel themselves incapable of appreciating the beauties of a picture, is nevertheless a pertinent remark on a very important though apparently secondary feature. The chief object of a frame is to enclose a painting, to give force and brilliancy to its colours, and to isolate it from all surrounding objects; and although it would probably be the case that those persons who contented themselves with admiring a frame, when asked to criticise a picture, would also be unable to distinguish between good or bad taste in its frame, there are still many occasions when, looking at a picture as a whole, we become aware of something wanting in the frame.

The opening of the new Royal Academy Exhibition seems to shadow forth, as it were, a new artistic era in England; and in the great transition now taking place in art, it is not unreasonable to suppose that all accessories must necessarily follow the onward march of progress. We have looked forward, therefore, to this Exhibition, and not without reason, for some slight improvement in the design of picture frames; and we have this year the additional opportunity of comparing notes between English frames and those of our Continental neighbours. Strange to say, in many points we seem to have changed characters with them. A certain amount of elegance, but with too great decoration of detail, will be found to exist as the essence of modern French architecture. Expression and vigour we assert as our own. In the comparison of the English and foreign frames, however, we shall find, with certain exceptions, that the latter qualities exist throughout the foreign frames, whilst the former qualities are distinguishable in the greater number of our own. If we may judge from the examples before us in this Exhibition, there seems to have been little progress made in the design of foreign frames during the last fifty years; they all belong to the 'style de l'Empire,' and in their main form resemble the style of frame which prevailed in England at the beginning of this century, enriched, indeed, with a bold and vigorous ornament, rendered more effective by the burnishing of certain portions of the gilding. In England, with few exceptions, we have abandoned the 'style de l'Empire' frame, and we have fortunately almost got rid of the heavy traditional frame with its ogee moulding, covered with sprawling natural foliage or with Louis XIV. ornament; in fact, these frames are only to be found accompanying the works of those who seem to have also lost all sense of the progress of art in their pictures. In their place, however (with the exception of certain noticeable examples to which we shall, by the assistance of drawings, call attention presently), a style of frame has sprung up, evidently the work of framemakers alone, and calculated to give the greatest amount of detailed ornament with the least amount of design or effect. This style of frame is named, we believe, the arabesque; the mouldings vary in form, and are almost entirely covered with a flat unmeaning ornament, called arabesque, but which really belongs to no style. At a little distance, in fact at such a distance as the picture would have to be looked at, it is impossible distinctly to see the ornament, which in fact only serves to break up what would otherwise be an agreeable and subdued surface; so that the chief object of the frame is done away with altogether. The design of these frames, as well as their execution, rests entirely with the framemakers and gilders. There are, fortunately, a few painters, and Mr. Leighton notably amongst them, who have long recognised the fact that their powers of imagination and composition ought not to terminate with their canvas, any more than an architectural design should be complete in itself without any reference to the buildings or features which immediately surround it: it is especially to these, therefore, that we purpose drawing the attention of our readers. Our drawings made from actual measurements are all to the scale of $\frac{1}{4}$ full size, and though far from complete, give specimens of the more remarkable frames in the Exhibition.

If we refer to any frames of which we have given no drawing, it will be either that they resemble others, or that there is no immediate necessity for their representation. Commencing with the first room, and taking the pictures as far as possible in their order, we have (No. 7) Mr. Storey's picture in a frame which is to be recommended more for its simplicity and perfect keeping with the picture, than for its mouldings. The outer bead set on edge is very objectionable in form, and it is difficult to understand why it should not have been set square with the rest of the frame. No. 27 (by the same painter) we find in a similar frame, with a slight punctured ornament in the surrounding panel, which, while giving additional richness to the frame, does not detract from the general effect. Comparing these frames with No. 62, also by Mr. Storey, we shall be able to see what a mistake he has made by the introduction of so much exuberant ornament

NEW MUNICIPAL OFFICES : LIVERPOOL.

M^r ROBSON ARCHITECT.

without a broad internal margin to separate it from the quiet tones of the picture. Mr. Calthrop (No. 38) has adopted a frame which, while good in many respects, would have harmonised better with the subject of his picture if the *renaissance arabesque* around had been less gay.

In No. 60, Mr. Marcus Stone has endeavoured, with a great want of success, to combine two essentially different styles of frame. He has next his picture a broad margin of wainscot with the grain showing through the gilding, and a series of plaster mouldings with framemaker's ornament to serve as a border to it. With such a margin of gilded wainscot a bolder ornament, carved in the same material as in Messrs. Prinsep's or Wynfield's frames in the same room, or Mr. Yeames's (No. 432), would have been more in keeping, though neither would have accorded with the style of the picture.

No. 84 is a new style of frame, which would be good except for the exceeding heaviness of the angles; it would have been better if the border bead had continued straight round, and if the corner ornament had been smaller.

In Mr. Poynter's picture (No. 110) we have a frame designed by the painter, which agrees well with the subject and treatment of the painting. It is perhaps a little too small, and the difference made in the corner *patere* is too slight to be of much value; the close juxtaposition of these *patere* also suggests a running border, and therefore they ought not to have been emphasised at the corners.

No. 117 is the first foreign frame of importance, and there is no picture in the whole Exhibition which derives more effect from its frame than this one does. Compare it with that employed by Mr. Solomon in No. 787, and we shall be able to see wherein lies the value of a frame. Although there is more colour in Mr. Solomon's picture than in Mr. Merle's, the former looks poor and weak; and the difference of effect between the two, mainly caused by the employment of a large and small frame, is surprising. Mr. Merle's frame is one of those we put down as belonging to the 'style de l'Empire,' the only difference being the employment of a semicircular enriched bead, instead of a flat one, as outer border. The ornament is bold and vigorous, in fact almost too much so for the careful elaborate painting, but its scale, as well as the size of the frame, agrees with the scale of the figures, which fill up the whole picture. A frame like Mr. Solomon's ought only to have been employed for a picture when the figures were a quarter of their size.

Mr. Millais' marvellous portrait of Miss Lehmann (No. 127) is enclosed in a frame belonging to a different style, which we may assume is Italian. The inner border of the frame is scarcely large enough to carry the large pierced ornament round, nor is it wide enough for the size of the picture.

In No. 154 we have the first specimen of a Belgian frame, in style somewhat similar to those of the French school. Although this form of frame encloses its picture better than others, it is not altogether pleasing; the ornament, however, is the best of its kind, and in style it forms part of the picture, and adds to its beauty. We here note the employment of burnishing, to emphasise certain parts of the ornament. It is very essential that, when any part of a frame is burnished, this treatment should be carried into the ornament, or else the dark reflections which burnishing gives divide the mouldings into vertical and horizontal lines, and the ornament seems cramped between them. In Mr. Marcus Stone's picture we noticed that the burnished line divides in half the two portions of his frame, and in certain lights it seems as if there were a hollow space between the two parts, and the inner frame had either shrunk or been made too small for the outer part. It is curious also to note that in England burnishing seems never resorted to, except in the case of lines, whereas in most of the foreign frames the ornament is entirely represented and brought out by this treatment. No. 421 is another of M. Tadema's frames, in which the same style is employed. The *cavette* moulding is, perhaps, too large for the size of the picture and its figures, and the mouldings are not so successfully grouped as in 154; but the ornament is good of its kind, and shows a careful attention to the style of the picture.

The mouldings and general effect of Mr. Richmond's frames (Nos. 81, 168, 302, &c.) are so good that we should be inclined to suppose, at first, they were designed by himself, were it not that we find the same debased ornament in the panels of all his frames. We fear, therefore, that his framemaker is responsible for them; for it is scarcely possible to imagine that Mr. Richmond could have so slight a knowledge of ornament as to have designed, or given directions for the imposition of, the wretched grotesque figures sitting at the corners of all his frames. It is strange also that Mr. Richmond's clients, who are chiefly clergymen, should be content to sit in close contact with such vile demons as these, except they be the representatives of devils already cast out, who are hiding themselves in the inmost recesses of the frame panels.

Mr. Richmond, jun., has in No. 277 a poorly-designed frame, which has an absolute need of *patere*, or some ornament, to break up and relieve the long monotonous panel round his picture.

Mr. Leslie's frames are among the least happy in the Exhibition. The frosted surface has a coarse and vulgar appearance, which detracts from the quiet and beautiful tones of his painting. In the picture of 'Celia's Arbour' (133) he has departed from the usual rule, by making the upper part of his frame wider than the rest. If this was done to admit of the sprawling and badly-designed foliage which is now stuck on, the result was certainly not worthy of its object. One of the chief faults of his frames, as well also of those of Messrs. Yeames, Wynfield, and Prinsep, is that the main portions of them, viz., the panel round, is almost on the same plane as the picture itself. Compare them with the foreign frames—M. Merle's or M. Tadema's—and the value of setting back the pictures will easily be recognised.

M. Portael's frame (174), which we assume is French, and is now rather old and tarnished, is different in design from those we have already spoken of, and would look better if more isolated from other pictures. We would call attention to this frame for the delicate and artistic modelling of the principal bead, in which the influence of Greek art is evident more than in any other picture frame in the Exhibition, excepting in those of Mr. Leighton.

Mr. Yeames' frame (432) is vigorous and bold. The picture would have gained had a broader margin of plain gold been given, and, as we have be-

fore noticed, a deeper set back; but the ornament can be well seen at a little distance, and belongs to the style of the period which Mr. Yeames chooses to represent.

Mr. Sandys' frame (99) is one of the most original in the Exhibition. The simple Gothic mouldings and their good contour accord with the style of painting. The absence of any ornament is extremely judicious, and tends to increase the value of the small figures and emblems in which the picture abounds. The splayed surface at the bottom, which in any other style of picture would have been objectionable, because of the too great glare of reflected light from it, here, by its contrast, gives a gloom and solemnity to the mysterious incantations represented. The black panel round also brings out in better relief the gold background of the figure. If we have a fault to find with any part of the frame, it is with the burnished bead, which looks rather common and out of place.

Mr. Calthrop, in his 'Andromeda' (247), has employed a similar style of frame; but the mouldings are clumsy and badly grouped; the frame is much too large and heavy. The black margin round the picture is objectionable, and the whole entirely out of keeping with the picture.

Mr. Elmore's picture (No. 164) has a frame which, in its *ensemble* and style, is so good that we cannot but regret that its execution was not entrusted to some one who knew more about the Elizabethan style of which it partakes. The lines of the design are right, but all the ornament, which ought to have been in bold relief, has been flattened down, as if it had been subjected to a great heat, and partially melted.

In No. 162 we have another frame whose general effect is good, or at least in harmony with the subject; but which fails in its mouldings and the painted decoration on its surface. The intention is visible, but the design and execution are defective.

THE MUNICIPAL OFFICES, LIVERPOOL.

THE Municipal Government of Liverpool has arrived at its present condition, power, and comprehensiveness, by slow degrees and through the growth of years. Some forty years ago, three (indeed four) separate bodies were in existence which now are united in one. The first was the ancient Corporation of Liverpool, which managed its large landed estate, disbursed its payments, and voted monies for town improvements, public charities, and other objects. A second was the Highway Board, on which devolved the care, proper repair, and maintenance of all public streets, causeways, and sewers, and which derived its funds from rates levied on the inhabitants. The third consisted of two Water Companies, on the joint stock principle, which endeavoured to pay a reasonable dividend by supplying the rapidly increasing borough with pure water.

These three (or four) bodies are now, for good or for evil, merged in the great corporation known as the Council of the Borough of Liverpool.

The Gas Companies have, in their turn, amalgamated, and, in consequence, been restrained within certain legislative enactments in the public interest. But, as the Council have not, as in some other towns, acquired any control over this department, we are not at present concerned with it.

For some years after the merging of the various public bodies (except the Gas Company) in the Council, the different departments continued to occupy their old offices, situated in different and distant parts of the town, until the great inconvenience, growing year by year in proportion to the increase of public business, compelled the centralization of the buildings also.

The result has been the erection of the Municipal Offices.

The new building has frontages to three streets 60 feet wide, and a reserve of land to a fourth street of equal width, on which, at some future time, it is not impossible that a new council chamber (not included in the arrangements of the present building) and other buildings may be constructed. Its general arrangement, as may be seen by the accompanying plans, is that of a quadrangle of some 4,800 square yards, with domed pavilions at the four corners, and a tower about 210 feet high, rising out of the north front. A wide corridor runs round the building on each floor, and in each of the four internal angles are placed, in direct communication with four main entrances, stone staircases having hydrants (in case of fire) on each landing. The offices on the ground and first floors are considered to be of equal value, and are so treated architecturally, the corridors being groined in brick and plaster, and, together with the staircases, lined with a rich tile dado, while the whole of the joiners' work, such as doors, skirtings, and window-linings, is of wainscot oak.

On the ground floor five committee rooms have been arranged. These are finished alike, with high wall framing of oak, filled in with inlaid mahogany panels by Oppenheimer, and parquetry floors. The furniture is also designed to be in keeping with the style of the rooms.

In the arrangement of the offices, the communication of one department with another, and with committee rooms, electric bells and copper speaking tubes have been used to a considerable extent. The latter are found to be invaluable for comparatively short distances, while the former have great advantages over the old-fashioned sort of bells for long distances, inasmuch as they obviate the necessity of numerous cranks and levers continually liable to disorder. The warming and ventilation consist simply of a copious supply of fresh air, warmed by a low-pressure hot-water system, open fires and apertures for vitiated air. The result is thoroughly successful. A hoist, having a small hydraulic engine attached, lifts the coals, &c., from the basement to the various floors. The tower has a powerful clock, which will shortly be controlled by electricity to ensure accurate Greenwich time; the dials are eleven feet in diameter, and the chimes

MUNICIPAL OFFICES, LIVERPOOL.

SCALE OF FEET

are modelled (like those of Westminster) on the bells of St. Mary's, Cambridge; the hour bell only weighs two tons, whereas it ought to have been six for such a town as Liverpool; this defect, however, can be remedied at any time, the clock being sufficiently powerful to lift the hammer for a much heavier bell.

Externally, the building is of a massive columnar sort, formed of large blocks of clean hewn stone. Its architecture, though in some degree founded on the Corinthian type, is so independently treated that the name of no ancient style can be properly applied to it. To take a single instance, it may be mentioned that the large capitals of the principal order are nearly all modelled from English ferns instead of the exotic acanthus. The sculpture is the work of Mr. Earp, of London, who has succeeded much better in the fern-leaved capitals than in the symbolical figures of the attic story. The successful application of high-class figure sculpture, at moderate cost, forms one of the great difficulties of architects of the present day.

Some criticism has been excited by the treatment of the tower, terminating, as it does, with a square and galleried spire having corniced crockets for skyline, as forming the chief feature of such a building. The treatment may be open to criticism: but the first necessary element in the composition was undoubtedly height; the second, outline; and neither of these essentials have been wholly missed. Further, it was important that the entire result should be that of a municipal tower. The total cost of the land, building, furniture, and fittings, amounts to about 160,000.

The building has the singularity (in these days of rapid building) of having been planned and commenced by one architect, and carried out and completed by another. And it bears marks of the handiwork of both. As a whole it does not pretend to any great or high-art qualities, but simply to be a set of public offices of solid, durable, and convenient kind, suitable to such a town as Liverpool.

Now that the various departments are all concentrated in the new building, the use of the Town Hall must of necessity be defined. If left standing, it can hardly be used except for the purposes of the Mayor and the Council. It is a fine building by Wyatt, some eighty years old, and is well worthy of preservation, irrespective of its strong local prestige.

EDWARD ROBERT ROBSON.

HOUSE-RAISING IN CHICAGO.

THE idea of raising an existing structure gradually by means of screw-jacks, and sufficiently high to enable the proprietor to gain an additional storey *under* instead of *over* his house, is by no means a new one, and has occasionally been attempted with success both in this and in other countries. But nowhere, perhaps, has this method been carried out in such a wholesale manner as within the last year at Chicago in the United States, and in order to understand the reasons which induced the inhabitants of that city to employ such means of adding to the accommodation of their houses, it will be necessary to say a few words about the city itself.

Chicago is situated at the junction of a small river of the same name with Lake Michigan, and consisted, soon after it was first founded in 1830, of only seventy inhabitants. The number, however, rose in ten years to 4,853, and in 1845 to 12,088. In 1850 we find its inhabitants numbering 29,963; in 1860, 110,973; in 1865, 178,900; and last year (1867), no less than 230,000. To discuss the causes of this unprecedented increase in the population of a single town, would be beyond the objects of this journal; suffice it to say that to the favourable position of the new settlement its rapid development is chiefly due. A canal, begun in 1838 and finished in 1848, connects Chicago with the Illinois river, thus establishing water communication between the Mississippi and Missouri. The first railway from Chicago was opened in 1850 as far as Elgin; now a network of railway systems, some 5,000 miles in total length, connects that city with the whole state of Illinois, with sixteen great commercial towns on the Mississippi and Missouri, with the prairies of Iowa, Wisconsin, Minnesota, and Missouri, with the cities on the Atlantic by no less than three different routes, and, lastly, with the mines on Lake Superior. The trade of the place consists chiefly in corn and cattle. In 1838 the export of corn was represented by the modest figure of seventy-eight bushels; in 1864—the year of the civil war—it rose to forty-seven million bushels. About a thousand head of cattle pass through Chicago daily on their way from west to east, and in the three winter months a million pigs are annually salted and sent away. Indeed, one new quarter of the city, finished last year at a cost of two millions of dollars, is entirely devoted to the reception of animals, and contains stabling and sheds for 20,000 head of cattle, 75,000 pigs, and 20,000 sheep, besides the 'Houghhans,' which is the caravanserai for cattle-dealers (with 200 beds), a bank, telegraph office, &c. The chief street in this cattle quarter is named after the Broadway in New York, and is a mile long, by a breadth of 75 feet.

The valley of the Michigan is at a high level compared with the country around, and hence the spot which the first settlers selected for their new town was, for sanitary reasons at least, ill adapted for the requirements of a large town. But the American is, as a rule, indifferent to sanitary arrangements, and thinks it time enough to mend matters

when such considerations really become of vital importance, trusting to his national 'cuteness to help him out of the difficulty. And so it was in this instance. The first great step was to raise and pave the streets. This was done; the streets were raised 4 feet, subsequently 3 feet more, in all 7 feet; and as a matter of course the houses had to follow suite, and so it came about that whole blocks were raised, some first the 4 feet, and subsequently the remaining 3 feet, others the entire 7 feet at once. It was necessary to raise an entire block, sometimes consisting of as many as forty houses, at one operation, because, as with us, each house has but one party-wall dividing it from its neighbour. The joists in these houses are invariably laid parallel to the front, because the average width of each 'lot' is from 25 to 30 feet, and the rooms, especially on the ground or shop floor, are consequently of greater depth than width. In most cases only the shell of the building is of brick or stone, the internal walls being partitions of wood with brick-nogging or lath and plaster, as with us, and there appears to be no Building Act which prevents the erection of chimney breasts on wood corbels, as this is the ordinary mode of construction. Another peculiarity which strikes an English architect is the extreme thinness of the outer walls, upon which, as we have seen, the stability of the structure is made to depend more than in England, where internal walls of brick or stone help so much to stiffen a building. The thickness of an outer brick wall rarely exceeds twelve inches by a height of often six storeys; neither is the manner in which the bricks are laid of the best kind, for it consists principally of old English bond, namely, of seven courses of stretchers (each course consisting of three bricks four inches wide laid behind one another) to one course of headers. The plan usually adopted in raising the blocks was as follows:—Having obtained a sure footing on either side of the wall to be raised, as also under all openings where practicable, needles are gradually introduced, extending through the wall, and resting at either end upon a 'jack.' The average distance of the screw-jacks is about 4 feet apart, but 3 feet is preferred. The screw is 2 feet long by a diameter of 2½ inches, and contains 48 turns of the thread, which is ⅜ths of an inch thick. One man is told off to every twelve jacks; he is armed with an iron bar 4 feet long, and at the sound of a loud whistle from the foreman every man gives his jacks half a turn. Meanwhile the house is by no means deserted, for all within it goes on as usual; the lady is in her favourite rocking chair sipping her 'candy,' the gentleman keeps his long legs where they were upon the table before him, and enjoys his 'quid' quite unconcerned about the operations going on beneath him. Indeed the work is of necessity so gradual as to be quite imperceptible, for on an average the half-turn of every screw takes five minutes, the result being that in a day of ten hours a house is only raised twelve inches. When this height is reached, every alternate screw is usually withdrawn, and placed upon a higher bed, when they in their turn take the superincumbent weight off the remaining screws, and the operation of raising them also is repeated. In this way many entire blocks of buildings have been raised, as also other houses standing alone, such as Tremont House, Briggs's Hotel, and the Metropolitan Hall. Briggs's Hotel is a corner house with two frontages of 150 and 200 feet respectively, and is six storeys high. In 1866 it was raised 18 inches, the operation extending over a period of six weeks. That the system, which we have described, should have called forth a new class of workmen is not surprising, and accordingly contractors for this species of work are called 'house movers and raisers,' and possess a stock-in-trade of sometimes upwards of 2,000 jacks wherewith to meet the requirements of house-raising Chicago.

SOCIETIES.

Royal Institute of British Architects.

ON Monday, May 31, a special general meeting of members only will be held at eight o'clock, for the purpose of electing an Honorary Secretary for Home Duties, Mr. Wyatt Papworth, Fellow, having communicated to the Council his resignation of that office, to which he had been elected at the last annual general meeting. The following motion (by Professor Kerr) will also be discussed:—

'That a Committee be appointed to enquire into the operations of the Institute, and to propose means for increasing their efficiency.'

Both these matters involve important considerations, and for the sake of the Institute we trust that the various opinions which they are likely to elicit will find a fair hearing. Above all things it is desirable that in the election of a new Honorary Secretary, the question of party feeling should be put completely aside. Whatever may be the individual tastes and artistic convictions of a gentleman in this position, they neither need nor ought to affect the discharge of his duties in the least degree. Those duties, since the appointment of paid officers, have been practically rendered very light, and might be easily undertaken by anyone of sufficient status to command respect, and with sufficient tact, judgment, and discretion, to ensure and deserve popularity.

The gentleman who now for, we believe, seven years, has filled the posts, first of senior and then of sole Secretary for home affairs has done much to entitle him to the gratitude of his professional brethren. To him it is very largely due that a spirit of party which some years ago threatened to eclipse every other movement in the profession has been tranquilised; and, turning to his practical services to the members, no one who values the 'Transactions of the Institute,' as now published and illustrated, ought to forget how much improvement in their form and appearance has been effected during the past seven years. Should the solution of the uncertainty, which at the present moment exists, be found in the re-election of the late honorary secretary for another year, we shall have an officer who has shown and will show equal courtesy alike to those with whom he happens to agree and to those from whom he happens to differ; and who has habitually devoted much time to the Institute.

There is however, no doubt, a desire which has been a growing one to change, not so much any individual, as the policy administered by the officers of the Institute, and a change of policy generally implies a change of officers. It has been felt that the Institute, if kept up, has hardly been pushed forward of late years; and while we fully admit that to maintain the efficiency and dignity of such a body is no small service, we cannot but see that more might be done by the organisation at Conduit Street than has been done, and that a great field of usefulness and activity lies open which is at the present moment but imperfectly filled. There is, in fact, a call for advance and change, and if one of the shapes which that call has taken is a desire for fresh officers, we cannot feel surprised.

Civil and Mechanical Engineers' Society.

Paper 'ON THE BRIDGE OVER THE RIVER THAMES, CARRYING THE WEST LONDON EXTENSION RAILWAY.' Read April 21, 1869. By WILLIAM LAWFORD, Mem. Inst. C.E.

This bridge was erected for the purpose of carrying the West London Extension Railway (which connects the North-Western and Great Western Railways with the Victoria Station, at Pimlico) across the River Thames, between Chelsea and Battersea, under the provisions of an Act of Parliament, which received the Royal assent on August 13, 1869.

The bridge consists of five segmental arches of wrought-iron, each arch having a span of 144 feet on the skew, with a rise of 16 feet, or one-ninth of the span. There are also, on the Middlesex side of the river, six, and on the Surrey side four, land arches of brickwork, each with a span of 40 feet and a rise of 10 feet. The total length, therefore, of the whole structure is 1,270 feet. The abutments and piers of the five main openings are massive pieces of masonry, and are carried to a depth of 36 feet below Trinity High Water mark, and 14 feet below the bed of the deepest part of the river. The soffits of the arches at the crown are 22 feet above the same point (i.e. Trinity High Water mark), in accordance with the requirements of the Admiralty and the Conservators of the River Thames. The level of the rails is 26 feet above Trinity High Water mark. The width of the river between the two abutments is 776 feet on the skew, and 706 feet on the square. The width of waterway afforded is 720 feet. The angle at which the bridge crosses the river is 75 degrees. The greatest depth of water is 22 feet below Trinity High Water mark, the average rise and fall of the tides at this place being about 13 feet 6 inches.

The Piers were constructed in cofferdams, the inner row of piles being 5 feet from the outer edge of the lowest course of masonry, and were driven to a depth of 15 feet below the bed of the river; the outer row were 5 feet from the inner row, and driven to a depth of only 8 feet from the same point, the space between the two rows of piles being filled with puddled clay. At the conclusion of the work, the outer row of piles were drawn, but the inner row were cut off level with the bed of the river. As the masonry of the piers proceeded, the space between them and the piles was filled with puddled clay, well trodden in, to a height of 3 ft. above the bed of the river. Each pier stands on a bed of concrete 2 ft. thick, extending 3 ft. beyond the lowest course of footings; on the concrete is laid a course of York landings 1 ft. (12 in.) thick, and projecting 1 ft. beyond the footings.

The foundations are carried up in brickwork to within 2 ft. of the bed of the river, where there is a through course of stone 2 ft. thick; from this point to the springing of the arch the piers are faced with picked face Ashlar of Bramley Fall stone. There is a second through course of stone half-way between the bed of the river and the springing, and the upper or last 7 ft. of the piers, including the springers (which are 3 ft. thick), are entirely solid stone-work. The two abutments are built similarly to the piers, except that they have hollow chambers filled with gravel to a height of 3 feet above the springing of the arch:—each abutment being just on the edge of the river, required only half a cofferdam for its construction. All stonework of both piers and abutments above springing height is tool dressed. The concrete used in this bridge was composed of five parts of gravel to one of blue lias lime, and the mortar of two measures of sharp sand to one of the same sort of lime.

RIVER ARCHES.

Each of these is composed of six wrought iron ribs, arranged in pairs 2 ft. 6 in. apart from centre to centre. The arch or voussoir of the four main or inside girders is formed of $\frac{3}{8}$ -in. vertical plates, 39 in. deep at the springing and 24 inches deep at the crown, with double angle irons, each 4 in. \times $3\frac{1}{2}$ in. \times $\frac{1}{2}$ in. top and bottom, to which the flanges are attached by means of rivets; there is also a packing strip 8 in. by $\frac{1}{2}$ in. between the angle irons and the flanges. The flanges consist of two $\frac{3}{8}$ in. plates 18 in. wide. The upper member of the inside ribs is a horizontal parallel girder, similarly constructed, but only 24 in. deep throughout its entire length: the vertical web is $\frac{1}{2}$ in. plate from the pier to the point where the upper and lower member intersect, i.e. 15 ft. from the centre of the arch, and from this point both vertical webs are $\frac{3}{8}$ in. in thickness; the bottom flange of the horizontal girder consists of one plate 16 $\frac{1}{2}$ in. wide by $\frac{1}{2}$ in., 2 angle irons $3\frac{1}{2}$ in. \times $3\frac{1}{2}$ in. \times $\frac{1}{2}$ in., and a packing strip 8 in. by $\frac{1}{2}$ in.—the upper flange is 15 in. wide, all other dimensions being the same as those of the lower flange: but the top plate is slightly curved inwards towards the rails. In the two outside ribs the voussoir is constructed as already described, but is 30 in. deep at the crown, and 39 in. at the springing; it may be well to mention here that in these two girders, on the outside faces of the arch, all the rivets, excepting those in the angle irons, are countersunk—no cover plates either being visible at the joints—the whole centre web presents, therefore, the appearance of one smooth unbroken plate; this centre web is a $\frac{3}{8}$ plate, the two flanges are single $\frac{1}{2}$ in. plates 16 in. wide, the angle irons $3\frac{1}{2}$ in. \times $3\frac{1}{2}$ in. \times $\frac{1}{2}$ in., and the packing pieces 8 in. by $\frac{1}{2}$ in. The upper member is constructed in the same manner as that of the inside ribs, but it has throughout the whole span $\frac{1}{2}$ in. vertical plates, and is only 18 in. deep at the crown of the arch; the upper flange is 18 in. wide, and is parallel with the lower flange, which is only 15 in. wide; the angle irons and packing pieces are of the same dimensions as those already described for the inside top members. The

total depth of the girders, both inside and outside at the centre of the arch, is the same, viz. 48 in.

The sectional area of each of the four main girders is as follows:—

In the arch, at the springing	80 sq. in.
In the upper member	43 "
Total	123 sq. in.

and at the centre of the arch, where the upper and lower members are, together, 105 sq. in., the mean average being 114 sq. in.; these are the full sectional areas, including the rivets.

The voussoir and the upper horizontal girder of the four main girders are connected together by a lattice spandrel, composed of H iron, of three different sizes, viz., 7 in., 6 in., and 5 in. by $\frac{1}{2}$. A stiffening bar of flat iron $\frac{3}{8}$ in. thick is added to each side of the H iron, connecting the lattice bars throughout at the angles of intersection. In the outside girders, the lattice and stiffening bars are all made of double T iron, riveted together thus $\frac{1}{2}$ and of the same dimensions as the H iron, i.e. 7 in. by $3\frac{1}{2}$ in., 6 in. by 3 in., and 5 in. by $2\frac{1}{2}$ in.—all $\frac{1}{2}$ in. iron. Each pair of ribs is connected near the haunches by means of frames, composed of angle irons, cross-braced, and riveted to the ribs, forming an open-box girder; this principle is continued to the crown of the arch, where the voussoir and top girder unite in a double cell. Each pair of main girders are braced together at the haunches by means of trellis transverse girders, 2 ft. 6 in. deep, carried up at equi-distant intervals to within 10 feet of the centre of the arch; there are seven of these in each half arch; they are composed of angle and bar irons, $3\frac{1}{2}$ in. \times $3\frac{1}{2}$ in. \times $\frac{1}{2}$ in. The top members of the main ribs are secured together by the cross girders, which carry the roadway; they are fixed over the whole length of the bridge 4 ft. apart from centre to centre, and are composed of a middle web of iron 10 in. deep and $\frac{1}{2}$ in. thick, the bottom of which is flanged with double angle iron, $3\frac{1}{2}$ in. \times $3\frac{1}{2}$ in. \times $\frac{1}{2}$ in., and the top with double channel iron, on the lower flange of which the buckle-plate flooring rests—the cross girders rest on the lower flange of the top main girder, and are secured in their places by iron knee pieces riveted through the centre webs. The main or bearing girders are again cross-braced by diagonal rods, bolted to a centre plate and to brackets riveted on to each of angles: there are three sets of these tie-rods in each half arch. Upon the end of each arch or voussoir a plate of cast iron 3 in. thick is fixed, the back of which is placed quite true and even; these again fit into heavy cast iron shoes (weighing 2 tons each) let into the stone skewbacks of the piers and abutments; and by means of wrought iron wedges are finally adjusted in their seats. Contraction and expansion are provided for as follows: cast iron standards are bolted to the stone work of the piers, and united by a cast iron frame secured with bolts and nuts—these standards have recesses to receive the ends of the horizontal girders, and secure them in position, at the same time allowing for horizontal motion; a bed and bearing plate, planed perfectly parallel and fixed under the ends of the horizontal girders, upon which they slide.

The railway is a double line of mixed gauge, and is carried over the bridge by means of longitudinal timbers with transoms every 10 feet apart. Ash ballast is used all over the bridge; a cast iron moulding is attached to the horizontal girder throughout its whole length, and a cast iron plinth is bolted on to the top of the same; an ornamental cast iron parapet is fixed on the plinth, and the whole is surrounded by a wooden hand-rail.

The iron of which this bridge is built was manufactured by the Shelton Iron Company, at Stoke-upon-Trent, and is perhaps better known as Lord Granville's iron. In the experiments made for testing the quality of the iron, it bore a tensile strain of nearly 18 tons per square inch without showing any signs of fracture.

The H and T iron used in the spandrels was rolled by the Butterley Iron Co.; about three quarters of the ironwork was made and put together by Messrs. Calvert, of York, and on the collapse of that firm it was completed by Mr. Charles Langley, iron shipbuilder of Deptford. The contractors for the whole work, and, indeed, for the whole of the West London Extension Railway, were Messrs. Brassey & Ogilvie, names well known in the railway world, and a sufficient guarantee that the work would be well and substantially carried out. The width of the bridge between the cast-iron parapets is 30 ft. in the clear. The total width of the piers from out to out, above springing level is 36 ft. 6 in., and at that level including the cut waters 53 ft. 6 in. The total cost of the bridge was 104,000*l.*, or 82*l.* per lineal foot, and 2*l.* 10*s.* per superficial foot. The materials used in its construction were—

2,000 cubic yards of concrete	
11,100 "	brickwork in mortar
130,000 cubic feet of stone	
2,160 tons	wrought-iron
366 "	cast-iron
2 "	lead
28,000 cubic feet of timber, exclusive of the piles.	

This bridge was the joint design of Messrs. Baker & Bertram, the chief engineers of the North-Western and Great Western Railways. It was opened for public traffic on March 2nd, 1863, since which date some hundreds of trains have passed over it daily, and I am not aware that up to the present time any expense whatever (beyond the maintenance of the road) has been incurred either in repairs or otherwise. The bridge was only 15 months under construction, i.e. from the time the first stone was laid until a locomotive passed over the river.

The bridge was very severely tested on January 7th, 1863, by Captain Tyler, R.E.

The narrow gauge load consisted of two locomotives and tenders, funnel to funnel, and two tank engines—total length of train, 132 feet; total weight, 176 tons. The broad gauge load consisted of two tank engines, in the same position as the narrow gauge engines, each drawing six loaded coal waggons—total length of train, 276 feet—total load, 292 tons; these two loads, collectively, being equal to about $2\frac{1}{2}$ tons per lineal foot.

1st. The narrow gauge load passed over No. 1 arch at full speed, the deflection = 5/100ths foot.

2nd. The broad gauge load passed at full speed—same result.

3rd. The broad gauge load on one road, and narrow gauge on the other, both passed together over No. 2 arch at speed. On going over No. 1 arch, No. 2 rose 3/100ths ft.; on going over No. 2, it deflected nearly 10/100ths ft. = rise and fall = 13/100ths ft.

4th. Both loads were brought to rest on No. 2 arch, deflection 11/100ths ft.; when the load passed slowly over No. 3 arch, No. 2 rose 2/100ths ft. rise and fall = 13/100ths ft. Both loads remained stationary for some time on this arch, but no further deflection took place, and with the removal of the load, the girders rose simultaneously to their original height.

5th. The same thing was done on No. 3 arch with a precisely similar result.

6th. The same experiment was made on No. 4 arch, and in exactly the same manner as the fourth experiment.

Rise of arch, 2/100ths ft.; Deflection, 10/100ths ft.; Rise and fall, 12/100ths ft.

7th. The same thing was done on the fifth arch; the rise was 2/100ths ft.; deflection, 8/100ths ft.; rise and fall, 10/100ths ft.

The bridge was very steady throughout these experiments, and there was very little lateral vibration, even when both loads passed at the same time in the same direction, either slowly or at speed.

At the termination of the paper a very spirited discussion took place upon the details of construction of this and other bridges, in which the President, Messrs. Uxill, Walton, Godson, Meakin, Seif, Bancroft, Roberts, and Lawford took part, and it was resolved unanimously that the best thanks of the Society be given to Mr. Lawford for his valuable paper. The meeting was then adjourned.

To the Editor of THE ARCHITECT.

THE CONCENTRATION OF THE COURTS OF LAW.

SIR,—It is now some thirty years since it was determined that the Law Courts should be removed from Westminster, and the Palace completed by demolishing the anomalous structures on the north, and building a suitable front. At this day the Palace is nearly complete, but this imperfection remains, and seems likely to remain.

It is now proposed to remove the Law Courts to the Embankment, while the offices in Somerset House are being vacated, and their inmates transferred to Whitehall. The period is suitable for constructing temporary Common Law Courts, like the Equity Courts in Lincoln's Inn. The quadrangle and open space of Somerset House will afford room for the Courts, while plenty of apartments can be found on the ground floor for judges' rooms, offices, &c.

In this way, first of all, the Palace of Westminster will be cleared, and, secondly, the Common Law Courts will be at once brought close to their ultimate site, and near the Equity Courts, so that the whole legal profession will be concentrated with less inconvenience than remaining at Westminster, and with small expense.

Your obedient servant, E. R.

THE ARCHITECTURAL MUSEUM.

SIR,—I should be glad to let those who are interested in the Museum know, through your columns, that we are now busily engaged in arranging our collection. The task of sorting and finding suitable hanging space for the various objects in so large a collection occupies, it is found, a longer time than was at first anticipated. Hence a slight delay has arisen, for which I should be glad to explain the cause to the public; and here I would remark that it is felt by those who are carrying on this work that, considering the advantages gained by Architects for an annual guinea, and the very disinterested way in which Art Amateurs have come forward, we may fairly look for more general help from the profession.—Yours truly,

J. CLARKE, Hon. Sec.

[* * We regret that want of space prevented our inserting this letter in our last issue.—Ed.]

THE SECRETARYSHIP OF THE INSTITUTE.

SIR,—As Mr. Robert Kerr is sending round for signatures to a requisition to Mr. Charles Fowler to allow himself to be proposed for the vacant secretaryship of the R.I.B.A., you will perhaps be so good as to allow me to say that our late secretary, Mr. Seddon, will be proposed for reelection at the meeting on Monday next.

I am your obedient servant,

51, Russell Square, London, W.C., May 27. GEORGE EDMUND STREET.

Burlington House and its Alleged Illegal Projection.—Some weeks ago the attention of the Metropolitan Board of Works was called to the circumstance that a structure had been erected at Burlington House, Piccadilly, which projected over the foot pavement, contrary, it was stated, to the provisions of the Metropolitan Building Act. Mr. Vulliamy, superintending architect, on being asked if it had received the sanction of the Board, stated that the structure referred to consisted of a porch, built of brickwork, in front, with wooden side enclosures, and that no application had been made to the Board for their consent to the erection, and no sanction had been given. The Board directed that a communication be addressed to the vestry of St. James's, Westminster, on the subject, and the vestry, on receiving the communication, referred the matter to the Works Committee, and that committee has recommended that no steps be taken at present in reference to the porch and projection, which recommendation the vestry has approved.

NEW BUILDINGS AND RESTORATIONS.

New Offices of the Poplar District Board of Works.—The 'inscription stone' of the new offices of the Board of Works for the Poplar District was laid on the 20th inst. The site is at the south-east corner of the Poplar recreation ground. The design of the new buildings was offered to competition, and the result was that Messrs. Hill and Fletcher took the first prize, and Messrs. N. and C. Harston the second. These four gentlemen were appointed joint architects, and in March last tenders were received for the erection of the offices, the highest being 15,997*l.*, and the lowest 7,333*l.* The latter was accepted, and the execution of the works entrusted to Messrs. Baker and Constable, of Islington. The plan of the building is rather novel. The ground floor of an octagonal tower, placed at the angle of the two streets, forms the entrance hall; passing through this hall and a vestibule, on the left are the main staircase and offices for the clerks' department, and on the right a corridor communication with the rooms to be occupied by the surveyors, medical officers, and inspectors, &c. The strong rooms and housekeeper's living rooms are in the basement, approached by separate staircases. On the first floor are placed the board-room, committee-room, waiting-rooms, &c. The board-room will be in length about 60 ft. and in width about 40 ft. But little money is to be spent on the interior decoration of the board-room, as the architects have relied solely upon the well-arranged proportions of the room, which contains a large gallery for the use of the ratepayers. To obtain access to this gallery a separate staircase is provided, with an entrance from Woodstock Road. The exterior walls are to be constructed of brickwork of the best quality, with stone cornices and window dressings. The principal entrance door to the octagon hall will be of Portland stone, with polished shafts of Scotch red granite. The board-room windows will have similar granite shafts, and carved stone capitals and bases.

At the last fortnightly meeting of the Oxford Local Board, the General Purposes Committee reported that plans had been received by the surveyor, from Mr. Butterfield, architect, of the gateway of Keble College, with lecture rooms above, to be built by Messrs. Parnell, of Rugby, and that he recommended the same for approval. Alderman Carr said the proposed gateway projected 5 feet from the frontage of the present building. Everybody who saw the Keble College would regret that it was not set back 12 or 14 feet from the Parks Road, as it spoils one of the prettiest streets in course of construction in Oxford; and he was afraid that before long, in order to obtain proper light and ventilation, the trees in front of the college would have to be cut down. The first question that arose in his mind was, whether the projection of 5 feet would encroach on any part of the road; and, secondly, whether the builder or the committee of management would be prejudiced by an alteration of the plan.—Mr. Grant proposed that the subject of the gateway be postponed to the next meeting of the Board, to give them an opportunity of looking into the question. He should be sorry to attempt to deal with the matter if they had no power, but he thought there were ways and means of accomplishing what the Board desired. He considered the road was miserably cramped, and if the 5 feet projection were carried out, it would be still more miserably cramped. Alderman E. T. Spiers seconded the motion. He was very sorry to find a building like Keble College brought so close to a narrow road like the Parks Road. Professor Bernard regretted that the road was so narrow where the college was being erected. As regarded the building, it should be remembered that the trustees purchased a certain quantity of the land upon which they had to erect a college containing a certain number of rooms. All he wished was that the Board should not make an objection which they could not sustain. The motion was then agreed to.

New Roman Catholic Church.—Archbishop Manning and Bishop Morris, assisted by many of the clergy of the Roman Catholic dioceses of Westminster and Southwark, opened a handsome church on May 23, at Sunbury-on-Thames, about 15 miles from London. There were present a considerable number of the laity, amongst whom were the Duc de Nemours and the Princess de Nemours. The church was only commenced last summer, and forms a very striking addition to the beautiful scenery by which it is surrounded. It is Gothic, of the Early English style, and is built of Kentish stone. The interior is 60 ft. long by about 30 ft. wide, and has an apsidal chancel. The nave is separated from the aisles by columns, from which spring four arches. It is well lighted by several windows. Architect: Mr. Charles Buckler, of Hereford Square.

St. Luke's Parochial Schools, Gloucester.—The foundation-stone of these schools was laid on Whit-Monday. The building will consist—on the ground-floor of boys' schoolroom, 70 ft. by 20 ft.; girls' schoolroom, 60 ft. by 20 ft.; and infants' schoolroom, 65 ft. by 20 ft., with class-rooms attached to each, and separate entrances, affording accommodation for over 450 children. A house for the master is attached, with offices and yard, containing on the ground-floor parlour and kitchen, and three bedrooms on the first floor. Spacious play-grounds are provided. The schools and class-rooms will be 12 ft. high to the wall-plate from the floor, and the timbers of the roof, which are to be exposed to view, will be stained and varnished. The building is intended to be constructed of red brick, with bands of ornamental coloured bricks. The design was prepared by Mr. Alfred Wm. Maberly, architect, of Brunswick Road, Gloucester, under whose superintendence the works are to be carried out. The estimated cost is 2,000*l.*, but it is expected that 2,650*l.* will be required.

Newcastle-on-Tyne.—New slaughter-houses have been commenced in this town on the principle of the abattoirs of France. Mr. Thomas Oliver is the architect.—A new mission chapel and residence is about to be erected from designs by Mr. Thomas Oliver. The style is Gothic.—The contracts for erecting a large drill shed have been let to Mr. Kennedy, of Jarrow. The building will be 180 feet by 50 feet, and rooms for dressing, smoking, &c., are attached; Mr. Thomas Oliver, architect,—whose designs have also been selected for the proposed new Congregational church, Toxteth Park, Liverpool.

The new western dock at Hull will be formally opened on June 28. It is thought probable that some member of the Royal family will be present. A grand banquet will be given by the Hull Dock Company on the occasion.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Mr. Street's New Design for the Law Courts.

It will be remembered that it was only on the 20th of last month (April) that the intention of the Government to move the Law Courts to the Embankment site was first made known, and that on the 4th of the present month Mr. Layard stated that Mr. Street was already engaged on plans for the building adapted to the new site. Even those familiar with the extraordinary rapidity with which that brilliant architect works, may be astonished to know that finished sketches of his new design are already complete. Perhaps no architect engaged on a work of such importance and size has ever before enjoyed the immense advantage, after studying his subject for months—in fact, years—and mastering the whole of its details, of being suddenly called upon to throw his work into an entirely new form, with the additional incentive of a magnificent and novel site. To the few by whom as yet the designs have been seen, their superiority even to Mr. Street's matured design for the Carey Street site is strikingly evident. The new and happy disposition of plan and of exterior features, suggested to the architect by the change of locality, will prove the best vindication of that change, while the contrast between the simple and complete arrangement of the plans shortly to be laid before the House, and the best arrangement that can be placed upon the existing misshapen site without purchases of additional land, will not fail to strike every observer capable of forming a judgment. We should not feel justified in laying before our readers any descriptive account of the design at present, but we cannot forbear stating that the difficulties of the site will be found to have proved—as difficulties do in the hands of a man of real genius—the stepping-stones to success. The unusual outline of the ground, and the difficulty of treating Somerset House Terrace (to quote only two examples), will be seen to have led to two of the most original and successful features of the whole.

The Soirée of the Institution of Civil Engineers.

Mr. Gregory, the President of the Institution of Civil Engineers, held on Tuesday last the first reception that has taken place in the new rooms of the institution, and a very large number of gentlemen accepted his invitations. Indeed, spacious as the suite of handsome reception rooms now is, they were at one period of the evening almost inconveniently crowded.

The fine proportions of the large meeting-room, although they were marred by the want of suitable decorations to the walls, were the subject of many remarks. Mr. T. H. Wyatt, the architect of the building, has certainly produced an effective result; though we doubt whether, looked upon as a room for meetings, the old lecture theatre was not better. On the present occasion, however, filled with models, or actual specimens, of all that is newest or most striking in mechanical invention, and crowded with visitors, this hall left nothing to be desired.

A large number of choice paintings and works of art, lent by the members and their friends, were displayed on the walls and in the rooms.

Most of the leading engineers of the day were present; among them we noticed Mr. Bidder, Mr. Hawkshaw, Mr. Page, Sir Charles Fox, Mr. Haywood, Mr. R. Rawlinson, and Mr. Whitworth. Among the architects present we may name Mr. Fergusson, Sir Digby Wyatt, Professor Donaldson, Mr. Marrable, Mr. Edmiston, Mr. Pocock, Mr. Talbot Bury, Mr. Hayward, Mr. Eastlake, and Mr. Roger Smith. The visitors included Professor Liebig, two sons of Count Bismark, Sir Charles Trevelyan, Professor Owen, Mr. Edwin Chadwick, Mr. Hyde Clarke, Mr. Hepworth Dixon, and many others. The arrangements were very complete, down to that detail where such entertainments most ordinarily fail, *i. e.*, the system of taking care of the hats and coats, which was in this instance thoroughly satisfactory.

The Architectural Publication Society.

At the annual meeting of this society, to be held at Conduit Street on Monday, May 31, a plan for gaining such an accession of subscribers as shall insure the completion of the very valuable Dictionary of Architecture now in course of publication by the society will be brought forward. We are happy to understand that, in consequence of a circular which has been sent round to members of the architectural profession, many new subscribers have been already obtained. The non-completion of the dictionary is not to be thought of, and we hope the proposals now under consideration will be largely embraced.

The Society of Arts Soirée.

The Soirée of the Society of Arts will be held as usual in the South Kensington Museum, the most appropriate if not the only place for so large an assemblage as that occasion always draws together. Cards are not yet issued, but the evening of June 23 is fixed as the date of this reception.

Portsmouth.—Society for the Culture of Science and Art.

Under this title a new society has been formed in Portsmouth, which indicates an improving spirit in the right direction. The session has just closed, the society having been instituted on February 2, the Mayor, Mr. Edwin Galt, presiding. The inaugural address was delivered by him on February 25. Eight or nine papers have been read on subjects of scientific importance during the session. We believe it is intended in the next session to introduce papers of more general interest, including those relating to constructive science, &c., &c.

'More Lost than the Egyptians in their Fog.'

Meteorological observations have been made during two years at three stations on the Isthmus of Suez, an account of which has been given by M. Le Verrier to the French Academy. It is said that the introduction of the waters of the Mediterranean to the lakes has sensibly increased the hygrometric humidity of the atmosphere, and that fogs, as dense as those of Paris, have been observed in this rainless district.

General.

The Site for the Law Courts.—In a circular just issued, the Incorporated Law Society of Liverpool express their opinion that the choice of the site of the new Law Courts and offices is a question which affects the provincial members of the profession almost as much as the metropolitan members, and the public as much as either. They say, the additional delay which would be caused in acquiring the Government site would be a grave objection, even if the new site were an undoubted improvement on the old one; but as the latter is more suited in every way to the purposes for which it is intended, they have no hesitation in recommending the Carey Street site, whether the larger or smaller building upon that site be ultimately resolved upon by Parliament. The reasons shortly stated are:—1, because the Carey Street site is in the very heart of legal London, while the Government site is at the southern extremity thereof, and is far removed from all the Inns of Court and attorneys' chambers, except the Temple and Essex Street; 2, because the close concentration of barristers and attorneys round the new Law Courts and offices will tend to facilitate the administration of justice and the transaction of legal business, and such concentration will be best attained by adopting the Carey Street site, which is already surrounded by the chambers of barristers and attorneys, while only two sides of the Government site, *viz.*, the north and east, are at all available for all these purposes, the south and west sides being shut in by the river and Somerset House, and even on the north side the existing houses must be diverted from their present uses, and many of them doubtless rebuilt before they can be made available for purposes of the law; 3, because, on the Carey Street site, the courts and offices about to be erected can be subsequently extended, if necessary, much more easily than on the Government site; 4, because the Carey Street site is already acquired and ready for building on, and the plans approved; and the Government site is, for the most part, covered with houses which will have to be bought at an uncertain cost, and at more or less delay. The document is signed by the President, Mr. John Yates.

The new Church at Meole, Shrewsbury, lately opened, consists of a wide nave, with north and south aisles, south porch, chancel—the width and height of the nave terminating in a three-sided apse—north and south chancel aisles (in one of which is placed the organ from the old church, the other contains seats for the school children), also vestry. The tower, which will be at the west end of the north aisle, is carried up as far as the first stage. There are convenient open seats in the nave and aisles, and stalls in the chancel, all of oak, providing accommodation for 500 persons. The pulpit, which is of stone, inlaid with coloured marble, stands at the north-east angle of the nave. The font has also alternate panels of coloured marble and carving. Messrs. Maw & Co.'s encaustic tiles have been used for the chancel. There is a reredos of marble, with central cross of white statuary. The apse is also further enriched by a damask hanging. Mr. Boulton, of Cheltenham, executed the carving throughout the church. The windows are glazed with cathedral-tinted glass, by Messrs. Done & Davies, with the exception of the central window of the apse, which is filled with stained glass by Messrs. Morris & Co., of Queen Square, London. In the centre light is a painting of The Crucifixion, with the Virgin and Child underneath, the side lights being divided into panels containing double figures of angels, apostles, martyrs, prophets, and kings; in the head of the window is represented Our Lord in Glory, surrounded by angels. The style of the church is Early Decorated. The walls have been built of Red Hill stone, cased internally with Shelveke, which is also used for the dressings. The shafts to the arcades are from Beesford Wood; those supporting the chancel arch are blue Pennant. Mr. W. Dodwell has supplied the warming apparatus. The architect is Mr. Edward Haycock, jun., of Shrewsbury.

The Feversham Memorial, the foundation stone of which was laid on May 17, will be fifty feet high, will rise from a four-stepped base, and have a basement of twenty-four feet square. It will be built of silicious sandstone from Biledale and Farndale, on the estate. The cost will be about 800*l.*, and within the memorial will be a marble statue of the late Lord Feversham, to be executed by Noble, of London. During the restoration of the parish church the removal of the floor of the chancel led to the discovery of a number of stones with square cavities cut in them. The only conjecture as to their use that we have heard is, that they served to step the wooden posts which formed part of the walls of an early Saxon church. All the stones, with one exception, were buried again beneath the chancel floor. The one saved was used on the day of inauguration for the reception of the document, coins, &c., and now reposes beneath the foundation stone of the Feversham Monument.

The Statue of the Marquis of Westminster in Chester, from Mr. Thornycroft's studio, has an inscription cut in the solid block, with gilded letters on the west side of the pedestal as follows:—'Richard, 2nd Marquis of Westminster, K.G.; the generous landlord; the friend of the distressed; the helper of all good works; the benefactor of the city. Erected by his tenants, friends, and neighbours, A.D. 1869.'

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

ROYAL INSTITUTION OF GREAT BRITAIN.—Lectures on Saturdays, May 29 to June 12; by Emanuel Deutsch, Esq., on 'Semitic Culture,' at 3 P.M.

ASSOCIATED ARTS INSTITUTE.—Saturday, May 29. Paper by Lemon H. Michael, Esq., on 'True Nobleness in Art'; and annual meeting, at half-past 8 P.M.

ARCHITECTURAL ASSOCIATION.—Friday, June 11, at half-past 7 P.M.; 'Historical Account of the Artistic Treatment of Piers, Pillars, and Columns,' by J. Tavenor Perry, A.R.I.B.A.

ROYAL ARCHAEOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.—The next monthly meeting will be held on Friday, June 4, at 4 P.M.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Monday, May 31; special general meeting at 8 P.M.

SOCIETY FOR THE ENCOURAGEMENT OF FINE ARTS.—Thursday, June 10, 8 P.M., 'On Architecture connected with the Structures of Civil Engineering,' by T. Page, Esq., F.R.G.S., F.G.S.

The Architect.

THE ROYAL ACADEMY EXHIBITION.

BY EDWARD W. GODWIN, F.S.A.

THE paintings which remain to be noticed are, with a very few exceptions, worse even than those which mainly fill the five rooms we have already gone through. This assertion must be taken, however, in a general sense. For although the majority of paintings in the galleries No. VI. to No. X. inclusive are eminently uninteresting in subject, and weak in execution, and although these galleries happen to contain such works as Nos. 348, 353, 363, 364, 425, and 465, still we find nothing sufficiently low in the scale of painting to be put in comparison with some few of the paintings which deface the walls of the galleries on the other side of the house.

Chief among those worthy exceptions to which I propose now to call attention are the works of what, for the sake of distinction, may be called the Classic School, represented by Mr. Watts, Mr. Leighton, Mr. A. Moore, and Mr. Tadema. When to these are added the works of Mason, Walker, Sandys, and H. Moore, Mr. Millais' *Vanessa*, and M. Vertumni's *Pontine Marshes*, I should not perhaps be far wrong in saying that the strength of the Exhibition rests mainly in this side of the house. Besides the artists whose names have just been mentioned, there are others whose works this year may fairly be classed with the exceptional group. Mr. Armstrong, for instance, has made a great advance; Mr. Armitage has in some measure restored himself to that position he was bidding fair to lose by his *Herod's Feast*; whilst the works of Griffiths, M. Linnell, G. H. Broughton, and J. Castiglione, must not be forgotten.

If we seek among these for evidence of decorative powers, or, in other words, if we look at these pictures with a view to find if their authors would be likely to assist architecture in the capacity of wall painters, we shall have little difficulty in discovering much that must be regarded as favourable from an architect's point of view. Capacity and inclination are, however, very different things, although we see, or fancy we see, in certain works strong evidence of their authors' capacity for wall-painting. The decoration of architecture by colour, which means a little more than wall-painting, is impossible, unless the painter has some knowledge of, and love for, architecture, and an inclination to decorate it stronger, or at least as strong, as his desire to paint easel pictures, or his anxiety to appear on the walls of a fashionable exhibition-gallery. Gallery No. VII. is more than usually strong in presenting us with evidence of this capacity, expressed in three widely different ways, by three eminently modern artists. Mr. Leighton, dealing with Greek Mythology, gives us, in *Dædalus and Icarus* (460), what might be called 'the grand and monumental;' and although there is a great deal of perspective, and the drawing has certainly none of those flat qualities which are so desirable in wall-paintings, there is nevertheless strong evidence of the artist's power to conventionalise. It may be that the conventionalism is somewhat stagey—'academic' is, I believe, the proper word for it—still for any conventionalism we are grateful in these days of nambypamby realism. If Mr. Leighton would think more of what the Greeks did, or would have done, and less of what the French do, he would find a conventionalism essentially belonging to his own art infinitely more satisfactory than that which he now feels himself compelled to borrow from another. It is hardly necessary to say, that Mr. Leighton's idea of colour is at total variance with that of all good wall painters, from the flourishing days of Assyria downwards. By the way, I must not forget to note that the pedestal in this picture shows us how the Greek masons utilised their defective columns. Mr. Albert Moore revives the Greek element in form and accessories; he tells us no story, he gives us no expression, but he relies on his composition and drawing, and the exquisite loveliness of Greek costume. 'A Quartett: a painter's tribute to the art of music, A.D. 1868' (No. 483), is certainly very lovely. It is eminently decorative in its composition and general treatment; and had the mere painting been a little more careful, it would have had the rare merit of being a true easel picture as well. There are two great qualities which should place this work high in the estimation of architects, viz., its flatness and its brilliancy—a brilliancy attained (and this

is especially noteworthy) with the most temperate use of colour, and by virtue of the most consummate knowledge of the value of white. It may be questioned whether, in this climate, where two days out of three are dark and gloomy, such excessive temperance be desirable in painted decoration. The easel picture can be placed in the light best suited for it, and in such cases the tenderest tones may be adopted with success; but in wall decoration, or architectural painting, whilst we do not want such deep tones and rich Venetian colouring as would produce the effect of a dark hole in the wall, we at the same time as little desire to see such faint and undecided tints as would produce the effect of stained white-wash. Better figure-drawing it is impossible to get. The picture is really composed of valuable studies of seated and standing figures, and of Greek drapery; but the way in which these studies are united with musical instruments, and finally named, is as violent an anachronism, as if an architect were to erect a series of Greek columns connected by an un moulded entablature, and crowned by the spire of Salisbury Cathedral.

Widely different from the painters whose works have been just noticed is Mr. T. Mason. In 'Girls Dancing' (No. 488) we have a work highly decorative in sentiment, and by no means difficult to translate into architectural painting. The band of blue sea which goes across the length of the picture, the proportion which the depth of this band bears to the divisions above and below, the way in which the canvas is filled up, although only three children and one tree occupy the field, are amongst the most thoughtful things in the whole exhibition. In the tree alone there is a wealth of composition. It is true that before the foreground and the sea-shore there is a landscape with very distant figures, farmhouses, &c., but so slight as to produce, at a little distance, the effect of a pattern, and thus it in no way interferes with the real subject of the picture or the decorative quality of the design. The colour *per se* is undoubtedly very good, but the artists we want to paint architecture must give us brighter and more joyous qualities.

To speak roughly, we want neither chalk nor mud. Besides the works in Gallery No. VII., Mr. Leighton exhibits (377) 'St. Jerome,' and a bogey lion (his diploma work), (705) 'Electra at the Tomb of Agamemnon,' and an inferior composition, 'Helios and Rhodes' (854). Mr. A. Moore, in 690, has a large and careful drawing of a nude figure, called 'A Venus.' The rough canvas, the painting, and the light in which the picture now stands, contribute to produce an effect of slightness in this work which it might not present in another position. As now seen, the flesh looks as if it had been built up by a long process of stratification; and some of the modelling of the body looks, from the same cause, rather coarse. As the Nestor of the classic party, Mr. Watts maintains his position in his small picture 'Orpheus and Eurydice.' The colour, the composition, and the spirit of the picture, all proclaim it his best contribution. The colour is especially great, but is the greatness of shadow rather than of light, and wants the brilliancy of a southern climate to illuminate it. On a particularly bright morning the work may be properly seen, if the visitor goes directly to it; but nine months out of the year it should be placed in a glass-house, if it is to be seen at all; whilst in this, and all such pictures, Time will soon render even these conditions of lighting unnecessary.

The other works in these galleries which I have marked for notice are Mr. H. Moore's pictures (Nos. 328 and 605). No. 328, 'Bright Weather after a Gale,' is indeed true to its title and to nature. The painting is somewhat coarse, and it is necessary to stand three or four yards from it to see it properly; No. 605, 'Coast of North Wales: Cattle basking on the Beach,' is one of the finest landscapes in the rooms. No. 382, 'Caught by the Tide,' by Mr. Hook, has the usual Hook sea and rocks; one well-posed boy, and two other children who hamper the boy in more ways than one. No. 337, 'Nursing Donkey,' is spoilt by a 'prettiness' or affectation I should scarcely have expected from Mr. Hughes. No. 387, 'Vanessa,' by Mr. Millais, demands at least twenty-feet sight distance and a dull room. The painting itself is marvellous. In No. 365 Mr. Armitage shows certain decorative powers of composition. 'Christ calling the Apostles James and John the Sons of Zebedee' (Matthew iv. 21) is suggestive in design, although the Christ is weak, and the colour anything but satisfactory. Mr. Armstrong's 'Hay-time' (No. 375) has a good figure in it: viz., the woman with the baby. The dress is exquisite—a delicate purple pattern on white. This is not the first drawing of short-waisted women we have had from this artist, and therefore it may be hoped it will be the last. The same feeling for colour and flat treatment which is evident here may produce much greater

results, if combined with a costume less ungainly than that which Mr. Armstrong seems so anxious to immortalise. Mr. Allom exhibits an interior of the Church of S. Jaques, Antwerp (No. 393), which ought to have been with the Architecture. As it is now hung it is impossible to see it. The drawing seems very admirable. Mr. F. W. W. Topham (No. 398) produces, at first sight, a bright and decorative effect by virtue of adopting light walls as a background to his figures.

In Gallery No. VII. we have a decorative work by M. Tadema (No. 421), 'Une Danse Pyrrhique,' a subject which has the appearance of being strained: its drawing and colour are not what I should have expected. Mr. J. Griffiths, like Mr. Topham, has adopted a white back-ground in 'Soonabhaee' (No. 429). There is careful management of architectural accessories. A band of dark green leaves fills the top of the picture over the marble terrace, and the yellow figure composes well with its temperate and decorative surroundings. Mr. W. Linnell sends a large and important work (No. 461), and Mr. Perugini gives us a very fair study of drapery (No. 482), not quite equal, however, to last year's Daphne. Mr. Boughton's 'March of Miles Standish' has merits; but I must hasten on to Mr. F. Walker's single contribution, 'The old Gate' (No. 485). The sentiment and the management of colour deserve great praise. The drawing, too, is good, note especially the working man in the right-hand foreground, the dogs, and the ducks. One feels that the children have been placed by Mr. Walker with a promise of 'goodies' if they would only stay quiet; and although mere size has apparently been a temptation to Mr. Walker as to many others, still the winter landscape is cleverly filled in, and I never yet saw so much made of nine steps and two bad gate piers. No. 825, Gallery No. X., is a most careful drawing of 'The Room of Antiquities in the Louvre,' by M. Navlet. Was the subject worth such carefulness?

The Water-colours are, generally speaking, so inferior, that it is matter for wonder why a room should have been set aside for them, whilst Architecture was thrust on one side. I may, in passing, just note a very odd composition, No. 625, by W. B. Scott; Mr. R. T. Pritchett's capital crowd of 'Fish-buyers' (No. 598); and Mr. C. N. Henry's realistic 'Mill Pond' (No. 685). Although the paintings in this year's Exhibition are, as a rule, not only not flattering to, but absolutely misrepresentative of, our position in the art-world; still there are works enough to show that we have made progress. When however, we turn to the sculpture, there are scarcely half-a-dozen works worth the marble out of which they are cut, and only one of this half-dozen worth exhibition.

I do not include in this estimate any of the busts or portraits, which, with the painted likenesses, ought to be exhibited in a room by themselves, as being contrary to the whole intention and spirit of these arts; which ought, rightfully, to have no existence apart from architecture. The one piece of sculpture this year is, I need hardly say, by a foreigner, 'The Youthful Hannibal Strangling the Eagle,' allegorical of the struggle between Carthage and Rome during the Punic Wars (1,208). M. D'Epinau has given us in this group something really worth studying. We have but to compare it for a moment with Mr. Westmacott's 'Child and Swan' (1,193), or the works by Mr. Weeks, R.A., or Mr. Marshall, R.A., to be utterly ashamed of the Academy's position as regards the art of sculpture. There is probably no other art—not even the dramatic art—which is in such a hopeless condition. In the face of this it may seem ungrateful to M. D'Epinau to take objection to anything. Still, I cannot help thinking, that if the left hand had been as energetic as the right hand, or if the talons had a very little more hold on the flesh, the struggle between Carthage and Rome would have been more truly indicated. I have only space to note the grand action of the group—which, like all grand actions, look well from every point of view—the truly feathery feathers, the expressive clutching of the toes, and the admirable rightness of the eagle's beak, all the more grateful to us because of Sir Edwin Landseer's strange shortcoming in this particular feature.

Altogether the exhibition does not seem to me to show that marked improvement in the arts which many would have us believe. There are far handsomer rooms, far larger canvasses, much better hanging; but, with some few brilliant exceptions, the paintings are not up to the mark of former contributions. Sculpture is as moribund as ever; and architecture, though the most progressive of the arts, has been almost literally turned out of the house.

The Somerset Archaeological and Natural History Society will this year assemble at Axbridge, in the vicinity of which town are bone caves, and other objects of interest.

THE LAW COURTS AS THEY ARE TO BE.

IN our last issue we stated that Mr. Street's design for the Law Courts on the Thames Embankment was already prepared. The plans, as we then said, involve a disposition to a large extent new, and they are accompanied by a lucid and straightforward report, in which the architect of the new building, after a careful examination of both sites, gives his decided verdict in favour of the Embankment; and perhaps this verdict is all the more valuable from the circumstance that Mr. Street is not understood to have shared in the first instance the views of those who, like Sir Charles Trevelyan, proposed and promoted the change of site which we have advocated. It cannot but be gratifying to ourselves to find the side which we have consistently supported receiving the adhesion of one who has the best opportunities of fully judging the whole matter, and in whose judgment so much confidence is so deservedly placed.

Mr. Street has prepared a block plan, showing the building on the Embankment, with its approaches and surroundings; and ground and principal-floor plans of his design. He has also prepared a plan to show how the already purchased land may be used for the New Courts of Justice without the purchase of any additional land whatever, and has in the report fully described the advantages and disadvantages of both. He begins by pointing out that his original design, as approved by the Courts of Justice Commission, cannot be carried out upon the Carey Street site without large additional purchases of land, and that many departments which it had been proposed there to provide for must be excluded, if the area to be covered with buildings is so small as is now proposed; so that whichever site be adopted, an entire revision of the design becomes equally necessary. And he then proceeds to explain his two designs, commencing with the design for the Embankment, and dividing his examination under the headings of—approaches and surroundings; light, quiet, and air; arrangement of the building, as involved by the nature of the site; levels; advantages, or the contrary, from an architectural point of view. We will try to give some idea of what is said relative to the Embankment design:—'The approaches to the building, as shown on the block plan,' observes Mr. Street, 'are many and admirable. They possess the merit, which cannot be too much dwelt upon in the case of such a building, of being not only ample for the purpose, but of being such as would be for the most part free from all noisy traffic, except that which is coming to the building itself.' The Embankment roadway and the railway and the steamboat access, are naturally first noticed, and we are glad to find that the suggestion first publicly made in these columns of moving the proposed railway station to the foot of Essex Street is intended to be carried into effect. Between the new building and the Temple a new and wide street, running from the Strand to the Embankment, is to be formed, in part coinciding with Essex Street; and this street it is proposed to prolong—as Sir Charles Trevelyan has uniformly urged should be done—across the Carey Street property, as a direct north and south thoroughfare. Howard Street, on the north of the Courts, is to be widened, and a street is to be formed between the building and King's College. We may add, what Mr. Street does not add, that whenever this street is formed the mean back of King's College and its chapel, propped up on iron posts, will loudly call for some architectural improvement.

The terrace in front of Somerset House is to be used as the judges' access to their courts, being nearly on the level of their own rooms, thus converting, as we said last week, a great difficulty into a convenient appendage. As a further approach, a bridge over the Strand is suggested, giving access from Lincoln's Inn to the principal floors of the building, also a tunnel under the new Essex Street, giving access from the same quarter to the ground floor of the Courts. A bridge to the Temple can be readily constructed crossing New Essex Street; but, on the other hand, owing to changes which have had to be made in the levels of the buildings on the Carey Street site, 'The barristers from the Temple and Lincoln's Inn could not have the bridges originally proposed for their use' for access to the Carey Street building. This modification in accessibility goes very far towards reversing the conditions of convenience of the two sites, even as regards the existing legal quarters of London.

The real measure of the distance between one site and the other is the distance from the centre line of the Central Hall in Carey Street to the centre line of that on the Embankment. This is 942 ft.—three minutes' walk, or thereabouts, at the easy rate of 3½ miles an hour. The Courts on the Embankment will be 2 furlongs and 47 yards from the SE. angle of Lin-

coln's Inn Fields, $1\frac{1}{2}$ furlongs from King's Bench Walk, Inner Temple, and exactly half a mile to Doctors' Commons. The distance to the Houses of Parliament is not given; indeed, singularly enough, the great advantage which facility of communication along the Embankment between Westminster and the Courts will give, has been all but overlooked by the advocates of the removal. It was not noticed in the debates, and yet to counsel who are members of Parliament, or who practice before Committees of the House, to solicitors who are also Parliamentary agents, and to many others, this facility is most valuable.

Lastly, Mr. Street shows that on two sides (the east and north) Government, by recasting the existing streets, will have the character of the surrounding buildings entirely in their own hands; adding, that on the King's College side 'the singularly lugubrious character' of that edifice is the only ground for complaint, but that no inconvenience or nuisance can be expected thence, while the vast space of the Embankment, the Thames, and the Temple Gardens, will wonderfully benefit the whole building. 'To conclude,' says Mr. Street, 'it is difficult to conceive a public building being erected on any site in London with greater advantages in its surroundings than this site affords.' Sir Charles Trevelyan himself could hardly wish more said.

Light, air, and quiet, are briefly stated to be most satisfactory, and such annoyances as might rise from the railway being reduced to a minimum by its station being underground and shouldered out of sight, so to speak, by a big tower, the advantages of the site in these respects are recognised as so great that nothing is left to desire.

Turning now to the building itself, we find that naturally Mr. Street has felt it necessary to rearrange the whole scheme. The original principle of separating the Courts from the offices by internal streets and quadrangles has been still kept in view, and the arrangement of the Courts and rooms connected with them is substantially the same that it was in the plan approved by the Commission, but the small internal areas for lighting the rooms below the Courts have been made larger, and the jury rooms and staircases and lobbies have been improved. The broad feature of the present plan is that the Courts, Central Hall, and all the rooms for juries, witnesses, and the public, are massed on the western or Somerset House side of the site; some of the offices—*e.g.*, Vice-Chancellor's Chambers—being included in the upper and lower floors of these buildings, while the great group of offices runs round three sides of a large quadrangle on the eastern or Temple side, the quadrangle being virtually open towards the river, as a grand semicircular colonnade or loggia which forms the southern entrance to it will not impede light or air.

The western portion of the present design resembles very closely the core or heart of the old Carey Street design; the central hall being, however, two bays shorter, and eighteen courts being provided instead of twenty-one. The eastern portion is entirely different. The oblong open quadrangle (its greatest length running north and south) here introduces a new feature, and secures the free access of light and air to the very heart of the building. As to the amount of office accommodation obtainable, Mr. Street holds out a hope that by judicious compression a great many departments may be sufficiently provided for in this large range of buildings.

The entrances have been so managed that, going in at various levels, many offices have the practical effect of being on the ground floor, which, on a level site, would have to use steps up or down, and the judges have no flights of steps or lifts to encounter.

As to the architectural treatment, Mr. Street—after referring to the high opinion he held and still holds of the merits of the Carey Street site *when completed, by the additional purchases* not now to be made, and the difficulties which he had dreaded in dealing with the Embankment, owing to its curved outline and the Somerset House Terrace, adds—'in working out the plan to suit the site, I think, as is so often the case in architectural designs, that the very difficulties of the case have proved in the end to be its greatest gains.'

Mr. Street has advanced his building to the line of Somerset House Terrace, and it rises from the Embankment itself without any terrace. His parapets will be as nearly as possible on a level with those of Somerset House, while the raised portions of the building, the central hall, and the towers will be so removed from it as not to affect it. On the other hand, the curve of the frontage has given an opportunity for throwing forward all the eastern end of the building, and obtaining an irregularly broken line of frontage, though a very well-balanced one; and Mr. Street lays great stress on the benefit of this irregularity as affording means for effects of light and

shade, such as will be of great value in a building of this length, and as contrasting to the advantage of both buildings, with the regular lines of Somerset House.

Lastly, the architectural effect of the building will be in no small degree enhanced by the many excellent points of view from which it can be seen. The near views of the detail which the Embankment will afford will be delightful, and from Blackfriars below or Waterloo above, the finest possible points of view will be found. Mr. Street's perspective study of the building shows it from Waterloo; and hence, not only the whole front will be seen, but the central hall rising above and crowning the structure and binding together the features of the composition; from many more distant points the gap between Somerset House and the Temple seems to call for such an enrichment of the skyline as Mr. Street's design will provide.

We regret that want of space prevents our following Mr. Street closely in his examination of the defects of the Carey Street site as at present standing, or examining in detail the gallant effort he has made to make the most of it. We believe Mr. Street has honestly done his best to fit his building upon this site, and we are sure that nothing more damaging has been said by the friends of the Embankment than what Mr. Street here says in reference to this part of his undertaking, taken in conjunction with the careful plans he has produced.

In approaching this part of the subject, it becomes necessary to refer to a plan and pamphlet showing an impracticable mode of utilising this site, which have been put forward by the Incorporated Law Society, which according to the simple, though somewhat caustic, statement of Mr. Street, do not establish the claim of that body to speak with authority on matters of architecture. The dexterity rather than the integrity which characterises the pleader has been aimed at by the legal surveyors, the plan which they put forth shrinking in one direction and expanding in another, like a witness when subjected alternately to the bullying of a hostile counsel, or to the mild leading questions of a friendly advocate. Unfortunately for the case of the Law Society Mr. Street has a *locus cross-examinandi*, and the imaginary legal plan turns out to be not only 'misleading,' but positively 'incorrect.'

Passing by this, however, we find that Mr. Street's view of the land already purchased is, that it is a site which puts the greatest difficulties in the way of a satisfactory plan; that it will be absolutely necessary to alter the adjoining streets in order to get any access to it at all, and that all the property facing or adjoining these streets is of the most incongruous description, and if not now purchased for rebuilding, is such as it would become imperatively necessary to purchase and rebuild at some future time, when proximity to the Courts shall have given it a higher value than it now bears. In respect of light, air, and quiet, he adjudges the Carey Street site to be deficient.

The actual arrangement of the design for this site shows the Courts and their Central Hall on the northern portion, and the offices round a quadrangle next the Strand, with a detached block, much like a fort, occupying the queer triangular space to the west. It was a direction to Mr. Street to dispense with the many steps up to the Judges' rooms, so much objected to in his early design, and this he has done, sacrificing at the same time, as has already been said, the access by bridges from the Temple and Lincoln's Inn. He has produced, no doubt, a fairly convenient building, but one vastly inferior to that which he has shown to be possible on the Embankment. To the æsthetic advantages of the Carey Street site, with its great elevation and its fine opportunities for a sky-line, Mr. Street is not blind; but he believes that the diminished size of the work, and the absence of the lofty towers of the Probate department, will greatly lessen his opportunities for using these advantages; while other counterbalancing, indeed preponderating, benefits are found in the situation of the building where it can be so well seen as it will on the Embankment.

We may add, that the vistas down the various streets from the Strand afford opportunities for fine effects, of which we hardly think Mr. Street has made full use. If, for example, in working out his northern façade he can bring the centre of it to coincide with the centre of Norfolk Street, the view of that feature down this fine wide street would have a peculiar charm. This, however, may be well left to the judgment which has secured and combined so many other advantages in a design, the adoption of which we may now count as certain, and the erection of which will confer a new ornament on the Metropolis, and increase the credit enjoyed in Europe by the architecture of England in the nineteenth century.

OUR RAMBLER

AMONG THE BRONZE MONUMENTS IN WESTMINSTER ABBEY.

A RAMBLE in Westminster Abbey! Does there not seem something incongruous, irreverent, almost sacrilegious, in the expression? Is it not too sharp a contrast between the shadowy antiquity of the days when kings built cathedrals and founded chantries *pro animarum salute*, and the strong gas light, or magnesium light, or electric light, of the full nineteenth century?

But if there be such a discrepancy, it is in the name alone, not in the actual character of our grateful task. And the blame, if blame there be, must be laid on the poverty of the English language: which, out of its 43,566 words, can not provide us with a satisfactory substitute for the term that we have prefixed to the species of descriptive article, for their kind acceptance of which we have to express our gratitude to our readers.

The Rambler desires to adhere to a modest impersonality, contented with the function of describing, so far as is in his power, scenes of ancient, or of permanent, interest to the readers of the ARCHITECT. He could hardly otherwise forbear to intimate the existence of special and powerful reasons binding him, more than most men, to love and honour the very shadow of the Abbey Church of St. Peter.

Hat off, therefore, in every sense, did he devote a morning within the present week to the careful examination of a subject which has taken no slight hold of the public mind. No man who cares for archaeology, for architecture, or for art, can fail to take an interest in the subject of the recent operation on the tomb of the Countess of Richmond. And the moment seemed thus most opportune for a general survey of the bronze monuments contained in the Abbey.

The materials for the study are ample. The time during which they have been collected extends over a period of 356 years, from the assumed date of the effigy of King Henry the Third, A.D. 1272, to that of Villiers, Duke of Buckingham, A.D. 1628.

The character of the work employed by the artists of the bronze tombs and effigies differs in method no less than in excellence. Thus we have brass founding proper, beaten and riveted work, chasing, pouncing, and enamel of extreme beauty. The art of the sculptor, the engraver, the worker in mosaic, and even of the jeweller, have all been brought to bear in adorning some of the splendid monuments of kings and queens, and illustrious subjects of the English crown, who are commemorated on the gilded bronzes of Westminster Abbey.

Of course, we are not now about to speak of what are ordinarily termed brasses. A few of these are yet un plundered in the Abbey; two very fine ones, dating in 1397 and 1399, adorning the low, square-built tombs of Robert de Waldeby and of the Duchess of Gloucester, in the Chapel of St. Edmund. We confine our special attention to the effigies proper—figures in the round, *built*, or cast, in bronze, and for the most part, as far as inspection is possible under their present pall of dust, originally gilded.

The first remark which strikes the observer with unexpected force is, that the most ancient of these priceless monuments are also by far the most beautiful. Few things in sepulchral sculpture, in or out of the Abbey, surpass the tranquil, dignified, natural beauty of the effigy of Queen Eleanor of Castile, A.D. 1200. That of King Henry the Third, the second founder of the Abbey, is hardly inferior. That of Aymer de Valence, Earl of Pembroke, A.D. 1296, although the face is rude and almost archaic, shows a skill in beaten work, in chasing, in the delicate *appliqué* work of the coronet, or rather diadem, that surrounds the helmet, and which was formerly adorned with jewels, and above all in the enduring enamel, which proves that the artificers of the latter part of the 13th century were artists of a very high order of merit.

It is by no means every visitor to the Abbey who is aware of the existence of the effigy of King Henry the Third. It lies on the top of a double altar tomb, a sarcophagus piled on a sarcophagus, in the centre of the north side of the Chapel of King Edward the Confessor. These coffers were overlaid with coloured marble and rich mosaic, most of which has disappeared. But the pure tints and high polish of the slabs that remain—serpentine of the colour of malachite and red Egyptian porphyry—are uninjured by the lapse of time. So is the still extant mosaic covering, the greater part of which is to be found on the north side of the upper part of the tomb, in which the undimmed brilliancy of the gold, and the general enamelled effect of the *tesserae*, are as fresh as in the work of the Prince Consort's Memorial, now so near completion. Had the tomb of King Henry the Third not been *peeled*—whether owing to want of adhesiveness in the original cement, or (more probably) to the cupidity or violence of those who failed to reverence its sanctity—it would still be as fresh as when it was reared. It cannot be denied that this observation has much weight with reference to the degree of care, or of cleansing, which it will be proper to bestow on monuments of this description.

Twisted columns, overlaid with mosaic, stood at each angle of this tomb, as was also the case with the shrine of the Confessor. The splendour of these inlaid, gilded, ornate, monuments, must have been highly imposing, and the application of the same style of columnar protection, and of mosaic decoration, to the tombs of the Founder and of the Restorer, was no doubt intended by the latter to mark a joint claim on the gratitude of England. On the top of the upper coffer, or member of the tomb, lies the gilded bronze effigy of the King, the form and features perfect, the gold still gleaming from the unsold sock, or shoe, but the whole covered with such a thick coat of dust

(except where the metal seems almost to effloresce in some mode of slow decomposition on the robe), that it is impossible to say more as to the details of a very fine and careful work. The ceiling over the tomb has lost all adornments of carving or of gilding, and is reduced to the state of a few old boards.

One thing the Rambler felt to be undeniable. The statue of King Henry III. ought to be dusted.

The tomb of Eleanor of Castile, Queen of Edward I., dating A.D. 1200, is a coffer, or altar tomb of wrought stone, surmounted by an effigy in gilded bronze. The canopy, or tabernacle work, that divides the sides of the tomb into compartments, is remarkable for the triangular pediments, which, with trefoil perforations beneath them, shelter five escocheons on either side; the tomb, however, being built so close to one of the pillars of the chapel as to hide about a fifth of the length. These escocheons bear the lions of England, then increased to three, the quartered arms of Castile and Navarre, and the bends and bordure of Ponthieu; Queen Eleanor being a descendant of that very Count of Ponthieu who seized Harold on the shores of Normandy, and whose ransoming the Saxon chief to William of Normandy led to the famous oath on the relics, and, later, to the battle of Hastings. Through Queen Eleanor, Guy of Ponthieu was an ancestor of English kings.

The inscription inlaid around the upper ledge of the tomb is in Gothic thirteenth-century letters. The slab is entire, cast in one piece; not in two, like that of some later tombs. The face is very beautiful, the hair flowing from under a crown adorned with large *floure-de-lys*. The hands are extremely delicate, the left half closed on the bosom, the right extending its taper fingers to hold a sceptre which has vanished from the dainty grasp. The pillow on which the head rests was chased with the arms of Castile. There are cherub heads as corbels to the gilded canopy, or baldachin, which lies on the slab of the tomb above the head, in the relative position which would be occupied by a canopy over an erect figure. Oaken cherubs also adorn the carved ceiling over the tomb. The figure is defended, on the outer or northern side of the chapel, by a wonderful wrought iron grille, and is perhaps the sole monument which has been respected, absolutely, by all touch but that of Time, and but tenderly handled by Time himself. It is the gem of the ancient part of the Abbey.

Only six years later in date than the work of the Italian artist (Torelli, it is said, was his name) who wrought the two effigies above described, the monument of the Earl of Pembroke presents a singular contrast in the style, no less than in the beauty, of the work. The head, showing the face through the open part of a plain, unvisor helmet, is the only cast part of the figure, and the execution of the features is poor and almost shapeless. But round the helmet is drawn a beautiful coronet of embossed, or rather *appliqué* work, bearing marks of the setting of large jewels. The corslet, the armour for the arms and legs, as well as the hands, are all of beaten work riveted together—in fact, a suit of thin brass armour, made for the occasion. The pillow has been covered with enamel, and the colours are still preserved. On the left arm is a triangular, or rather heater-shaped shield, twenty inches long, covered with cloisonné enamel, almost or altogether perfect, and blazoned with the coat, barry of 28, argent and azure, 19 martlets, gules in orle. The tinctures are diapered over with gold. The figure lies on a wooden tomb or coffer above the stone altar tomb, and it is on record that much of this was formerly covered also by enamelled work or brass. Small enamelled escocheons still remain along the margin of the tomb, as witnesses of the splendour of the original work. The arms of Valence are correctly sculptured on the stone portion of the tomb, showing that the unusual number of bars and of martlets enamelled on the shield arose from ignorance or carelessness on the part of the enameller.

The tomb of King Edward the Third, on the south side of the Confessor's Chapel, is of carved stone, under a canopy of tabernacle work in wood, both greatly decayed. Side supports and canopy are affixed to the bronze slab. These adornments show what description of work has been broken away from the adjoining tomb of King Richard the Second and his Queen, where eighteen ugly holes gape around the effigies. The cushion has been stolen from beneath the head of King Edward, and the grim bearded countenance has almost an archaic aspect. Violence has not been spared against these monuments, although the later has suffered more than the earlier; a sign that the memory of the martial character of Edward the Third, though not strong enough to save from iconoclastic fury the images that were niched in the supports of his canopy, protected the effigy of that sovereign from the marks of dislike offered to that of his grandson. The workmanship of the later tomb, also, was originally inferior to that of the former, at least as far as the countenance is concerned. The diapered pattern on the robe of King Richard the Second is almost entirely concealed by a coat of dirt.

The above six figures, or five tombs, are all the bronzes to be found in the Chapel of the Confessor, and in that of St. Edmund. With the last of these, the monument of Richard the Second, we close the fourteenth century, the date being 1399. One hundred and ten years more bring us down to the time of the Countess of Richmond, in the south aisle of the chapel of King Henry the Seventh, the operations on which led to our present visit. About the same date is assigned to the unrivalled monument of the royal founder of that fretted tabernacle of stone, and of his queen; and two large and complex monuments—one to Villiers, Duke of Buckingham, in the north transept or side chapel, that opens from the central aisle or species of

chancel of this unique building; and the other, to Ludovic Stuart, Duke of Richmond, in the corresponding position to the south—close the list of the grand Westminster bronze monuments with the respective dates 1628 and 1623.

Of these two last-named monuments it is not possible, for the moment, to speak with much detail, as the gates of the inner chapels which they occupy are not unclosed without the special mandate of the Very Reverend the Dean, who, for the week, was not in residence. They are covered with a more dense and palpable veil of dust than any other objects visible, or rather invisible, within the precincts of the Abbey. It is almost impossible to distinguish the materials of which the figures are composed; only a small hole in the pillow of the Duke of Buckingham, and a finish, which is not that of marble, in the edge of the drapery of the weeping female figures that guard the chambers of Ludovic Stuart, giving assurance of their metallic character. The portraiture in each instance is good; the embossed armour, especially in the Richmond effigy, is very fine; and the figures around the tomb of Buckingham, notably one who rests his head on his sword, with an intervening cushion of upturned beard, are of a high order of merit. The floriated, open work, metal canopy of the southern tomb is apparently almost crushed by the weight of a tremendous Fame, trumpeting on the summit. The Duke of Buckingham's Fame, at the foot of his tomb, has lost her trumpet; which, if more than an allegory, would be all the better for the duke. Not the faintest glimmer pierces the dust to tell whether these monuments have been gilded. They are worthy of more minute inspection.

Properly to describe the superb monument of King Henry the Seventh and his Queen would exceed our limits. The perfect and uninjured tomb, with its highly relieved medallions, its supported escocheons at head and foot, its four boy-angels seated on the corners, and its serene, noble, faithful effigies, has been happily preserved by the lofty and ponderous screen or tabernacle which surrounds it. Over each of the bronze gates in this grille, one north and one south, and again at either end of the structure, a gigantic crowned rose projects as a lamp, in which, no doubt, it was designed that perpetual light should burn in honour of the departed. But the thirty-two saints and angels that stood, each in its canopied niche, around this magnificent brazen fence, have met with disrespectful usage, which it is a matter of unfeigned satisfaction to find thus diverted from the tomb itself.

A remarkable proof of the manner in which the iconoclastic fury, to which we must attribute the mutilation of the grille of King Henry the Seventh's tomb, was modified by some still lingering feeling of special reverence for certain saints among the assailants, is afforded by the few remaining effigies. St. George, the patron saint of England, is perfect, with the exception of his sword, being the only figure left at the west end. On the south side, St. John, whom legend connects with the founding of the Abbey, has lost only two fingers. The Confessor is untouched, and the gilding of the small canopy over his head is more brilliant than any other part of the grille. This, however, we believe to be a modern experiment. Beneath the Confessor, St. Bartholomew, who seems to have had some special claim on the veneration of the Londoners, has only lost his hands. The uninjured figure at the north end corner is no doubt St. James; but it may have been thought by the mob to represent the pilgrim who bore to the Confessor the ring from the Evangelist, as a somewhat similar figure is represented, together with the King in a closed crown, whom we take to be the Founder, on one of the medallions; and by the north gate is a statuette, in flowing robes, with the hands gone, and a sort of iron skull cap with a very narrow brim, representing a saint whom we are unable to identify. It can hardly be St. Edmund, as there is neither crown nor arms; why it should have been called St. Basil does not appear. The remainder of the statuettes necessary to the symmetry of the grille, together with some of the canopies and pedestals, have been violently broken away. The large hexagonally-pierced, open-work columns at the corners, are in good condition. Within the grille the tomb appears to be intact. Its design and detail are superb, and the effigies, guarded by the grille, and roofed by the rich fretwork of the chapel, may be considered, with the exception perhaps of some Egyptian marvels, the finest royal monument in the world.

It is only necessary further to refer to the tomb of Margaret of Richmond, mother of King Henry the Seventh, in the south aisle of the chapel founded by her son, the recent restoration of which has called for the present inquiry. Perplexity is not altogether banished by a visit to this monument. On the one hand, there is no doubt that much of the delicate work of the bronze effigies which we have described above is obscured by their present neglected state. Gold, again, is one of those materials which defies time though it does not defy cupidity; and there is nothing inconsistently modern in the gleam of gold. The tombs of the Founder and of the Restorer are defaced, not by the decay of the gold mosaic, but by its abstraction. In cleaning the effigy of Margaret of Richmond, therefore, we are to some extent brought close to the work of the original artist. But it is only to some extent. The face, head, and hands, are left untouched; they appear to have been originally painted, differing in this respect from the other effigies. They are now in the condition of what would be called fine old bronze—a condition which no one could attempt to modernise, to scrub, or to scale. Again, the fur doublure of the robe is left comparatively untouched, giving a dark contrast to the restored brilliancy of the latter. This doublure was also painted, as was the hood, and the white wimple under the chin. The least

satisfactory part of the work arises from the appearance of the copper through the gilding in many parts, and we are strengthened in the opinion which has before been intimated by the ARCHITECT, that an effective cleaning will be unsatisfactory, for more reasons than one, unless the portions cleaned be also regilded.

As to one thing, however, there can be no doubt. The next step requisite to be taken in the Abbey is the cleaning of all the monuments east of the nave by the simple process of dusting. We rejoice to see that, as a consequence, probably, of the opening of the nave for special religious service, that good work has been performed on the monuments in this part of the minster. The effect is most admirable. Some of our old acquaintances can hardly be recognised. No harshness, novelty, or any other unpleasant element of tone is introduced. The monuments do not look fresh or staring, but they are visible and often very beautiful when thus, almost for the first time, seen in their ensemble. The Minerva on the Fleming monument looks down from beneath the shadow of a helmet that reminds one of the Medici Chapel. Wordsworth seems to listen to the echo of the organ. If to the Chapel of the Confessor, of Henry VII., of St. Edmund, and in fact to the whole of the Abbey east of the organ-screen, there be extended the same careful and proper method of removing long-neglected dust and dirt that has been so successful in the nave, we shall be able to see in what state our royal bronzes actually are. It may seem almost superfluous to add that this tribute to ordinary decency must be paid before we are in a condition to discuss the propriety of any more severe treatment. It is possible that in different cases different rules may be found to apply. For instance, the treatment of the knots, the portcullises, the eagles, the crowns, and the repetitions of the H's, that ornament the brazen gates of the chapel is one thing, that of the perfect effigy of Queen Eleanor another. When dust is gone, we can say more about the state of decay and decomposition. Preservation is our just duty, but dust does not preserve; on the contrary, there is reason to believe that it exerts a sensibly destructive power when long undisturbed. Let the bronzes of Westminster be now, for the first time within our memory, unveiled; and it will then be possible intelligently to inquire what further tendance they may claim of those who would preserve them.

THE NEW OPERA HOUSE, PARIS.

THE late discussion on the extraordinary Budget has put the public in possession of the facts of the case of the New Opera House.

The statement made by certain members of the Opposition was that the total cost of the building, including site, &c., would be 48,000,000 f. (1,520,000l.); the official statement in reply was substantially as follows. Ten months after the acceptance of the plans of M. Garnier, the estimates were prepared, and amounted to 29,000,000 f. M. Walewski, then Minister of State, was alarmed thereat, and insisted that the amount should be diminished, and it was cut down to 18,000,000 f. As the works progressed, however, it was found that this sum would be totally insufficient, and the estimates grew gradually to 20, 21, and 25 millions. At each successive rise the matter was referred to the General Council of Civil Buildings, and each time the administration insisted that the amount should be kept down as much as possible. Now that the building was in a very advanced state, the cost could be given without hesitation or reserve, and it amounted to 31,000,000 f. (1,240,000l.)

Amongst the causes of the increased expenditure was the discovery of springs which, said the Governmental commissioner, amounted almost to a river. Of course the water had to be pumped out, and, in order to secure the foundations, it was necessary to excavate to great depth, and actually to construct a concrete pit of the extent of 11,500 metres. Next came changes in the plan, alterations in the disposition of the surrounding buildings to produce a harmonious effect; then the bold and novel arrangements of the interior caused a large unexpected outlay; and, finally, the construction of the building having been extended from five years to ten, the ravages caused by time and the weather had to be made good.

The height of the building, foundations included, is, it appears, about 235 ft., and the cost per metre covered just under 108l., a rate considerably lower than that of the Madeleine or the New Louvre.

In the above account the purchase of the ground is not included, because the surplus which had been or which remained to be sold had risen so much in value as to cover the expense of the site.

Amongst the claims for admiration, rather a fantastic one, with respect to the New Opera House, is that it has been intentionally made a kind of permanent exhibition of the finest kinds of rare stone and marble to be found in France, and the following is the list of those employed:—Jasper, from the quarry of Saint Gervais, Mont Blanc; brown granitic porphyry, from the wood of Vauban; green porphyry of Tournay; red granitic porphyry of Planoise; porphyritic granite of Saint Martin du Puy; micaceous granite of Lormes; coral red syenite, from the top of the Thom at Servance; syenite of a dead leaf colour, from Ménil, Servance; porphyritic granite, from Mount Corau; blood stone marble of Sampans in the Jura; violet marble of Sampans; Damparis stone (called Saint Yele) from the Jura; white jasper stone of Damparis; stone called *l'Echailou*, from Revon, Isère; white ditto, from Saint Quentin; pierre d'Austrude, and several kinds of soft stone from the department of the Yonne.

All these materials have, it is said, been selected with great care and tested with respect to their power of resistance; the jasper of Mont Blanc, of which the columns are made, is reported to have yielded extraordinary results—a block weighing 2716 kilogrammes bore weights equal to 1830 kilogrammes per square centimètre.

The Great American Artist, Hiram Power, who is at present in Florence, has modelled the features of Mr. Longfellow.

QUEEN ELIZABETH'S GRAMMAR SCHOOL.

KINGSTON-ON-THAMES.

IN answer to an invitation that appeared in our columns some time since, about twenty-eight designs have been submitted in competition for the new building that the committee propose to erect in order adequately to accommodate the rapidly increasing number of scholars that the popularity of the present head master has attracted to this venerable scholastic foundation.

The history of this school dates back to ante-Reformation times, and many great men who have distinguished themselves in literature, politics, and art, have thumbed their primer in the fine old Gothic chapel that is now used as a schoolroom. It is thought by some that Turner, the great artist, attended this school. The records connected with this foundation contain entries of many valuable bequests made by some of the wealthy guilds of the City of London who still take an interest in the school.

The intended site for the proposed new building lies on the London road immediately opposite to the present school, possesses a good frontage, and extends backwards for some distance, allowing ample space for a large playground.

The twenty-eight designs above referred to have been, by the permission of the Mayor of Kingston, disposed along the walls and benches of the Crown Court. A more inconvenient and unsuitable place for such a display could scarcely have been chosen. In but few instances has it been possible to place all the drawings illustrating one design in a compact group along a single wall or bench, many drawings being separated by a considerable distance from the remainder of their set.

A few good men have responded to the invitation of the committee, but not in all cases with a happy result. As the school is dedicated to Good Queen Bess, we were surprised to find that so few had adopted the very effective architecture of her period, especially as the committee at one time proposed to include that style amongst the instructions to competitors. Of those who have employed Elizabethan architecture, only one or two seem to be 'at home' in it.

The cost of the new building is not to exceed 5,000*l.*, but some of the more elaborate plans have little chance of complying with this condition. A straggling plan necessitates a multiplicity of external walls, which mean money; and as the funds in hand are small, the more compact the grouping of the rooms, the better the chance of the committee's interests being advanced. Some of the competitors, possibly from not having visited the site and present school, have shown in their plan a chapel tacked on to the new building. After the scholars have moved into the new home that is to be provided, it is intended to restore the present school to its original use as a chapel, a renovation that could easily be effected at a moderate outlay.

We understand that the committee intend to call in the assistance of an architect to guide them in their decision; we have, therefore, every reason to hope that they will by that means be protected from fictitious estimates and costly plans, whilst those competitors who have adhered to the instructions will be fairly treated.

THE STRIKES.

A STRIKE or lock-out of the Manchester bricklayers and labourers has been prophesied for this week. The masters insist upon payment by the hour instead of by the day or the week, and to this the men object. The latter require the oldest labourer to 'carry first,' and the masters insist that it shall not be the oldest, but the best. The men require that there shall be one labourer to one bricksetter, and that bricks shall not be wheeled in a barrow, but be carried in a hod; but the masters declare that they will not employ more labourers than there is occasion for; and that, where work is on a level and ladders are used, they can economise by using the barrow rather than the hod. Eight hundred labourers met on Wednesday, the 26th ult., when they unanimously agreed to insist on the 'man to man rule,' and to discard the wheelbarrow.

Late accounts state that there is every appearance of a continued strike among the masons. Both masters and operatives have issued circulars stating the terms upon which they will resume work, and these differ so materially that there is little hope of a speedy settlement. About 200 non-union masons continue at work, a number of them being employed in the construction of a new foundry near the Great Float, Birkenhead, and at the works at the Sefton and Stanley Parks. The masters are making efforts to get more non-unionists. The following figures have just been published by the secretary of their trade society. List of the towns still on strike, with the number of masons out thereat:—Birmingham, 30; Cheltenham, 3; Liverpool, 18; Manchester, Hulme, and Salford, 294; Oxford, 2; Sunderland, 8—total, 355. The following are the numbers locked out:—Bolton, 18; Coventry, 6; Liverpool, 334; Leeds, 105; Lymm, 4; Old Swan, 12; Wakefield, 9; Wolverhampton, 10—total, 525.

Halifax and Wigan have to be added to the list of towns in which strikes have been commenced by operatives connected with the building trade. In both towns the hour system, the adoption of which the master masons insist upon, is the principal question in dispute, and the operative masons, both in Halifax and Wigan, having refused to work by the hour, a lock-out has taken place in each town.

The *Manchester Examiner* reports that one dispute in the building trade has been settled by arbitration. The Wigan joiners claimed an advance in their wages of two shillings a week, and were able to show clearly that the rate of payment in that town was below the amount received in neighbouring places. The disputed point was left to the arbitration of Mr. Alderman Cross, as well as a question as to overtime, and another as to the limitation in the number of apprentices. The arbitrator's decision has just been given. He allows the men an advance equal to 1*s.* 9*d.* per week, and abolishes the rule as to the limitation in the number of apprentices. The decision is binding, and by its acceptance a strike will be avoided.

We learn from Horncastle, in Lincolnshire, that the bricklayers of that town struck work some time ago for an advance of 2*s.* per week. The

masters had to comply with their demands, and this week the labourers have done the same, but the masters are holding out—as some of them are at work upon contract jobs which will not allow of the extra wages being paid, without serious loss.

ILLUSTRATIONS.

WEST DOORWAY, CATHEDRAL OF SANTIAGO DE COMPOSTELLA.

IN THE ARCHITECT of May 8 there was given a general drawing of this portal, which forms the inner doorway of the western porch of Santiago Cathedral, in Galicia. A cast of the portal, in its entirety is now in the collection of the South Kensington Museum.

The porch, locally called the 'Portico de la Gloria,' is vaulted in three bays, corresponding with the respective widths of the three entrances; the north and south bays are nearly square, the centre a double square; all three being groined with quadripartite vaults. In the middle of the last century, when the whole of the western front of the cathedral was rebuilt, the external face of the porch was cut away to give place to the new outer doorways, only the shafts, taking the longitudinal and diagonal ribs of the vaulting, being preserved.

Through the courtesy of Mr. Street, and Mr. Murray the publisher, a view of the interior of the porch is given with this description. It is taken from Mr. Street's well-known book on the Mediæval Architecture of Spain. It may here be stated that the discovery, as it may be termed, of this monument by Mr. Street, first drew the attention of the authorities at South Kensington to the beauty of the work, and suggested the idea, since so well carried out, of acquiring a cast of the doorways for the benefit of the Museum.

We are able accurately to ascertain the name of the artist who conceived and executed this splendid work, as well as the date of its erection, thanks to an inscription engraved on the soffit of the lintel spanning the central doorway, and which runs as follows:—

'ANNO AB INCARNATIONE DNI. MC. C^o. LXXXVIII^o. ERA 1^a. CCXX^a. VI^o. DIE K-L APRILIS SUPERLIMINARIA PRINCIPALIU PORTALIU ECCLESIE: BEATI JACOBI SUNT COLLOCATA PER MAGISTRU MATHUEM QUI A FUNDAMENTIS IPSORUM PORTALIU GESSIT MAGISTERIU.'

'In the 1188th year from the Incarnation of Our Lord, the 1226th of the Era of Spain, on the day of the Calends of April (April 1st) the lintel-stones or the main portals of the church of the Blessed James were laid by Master Matthew, who carried out the works on the said portals from the foundations.'

Noteworthy in this inscription is the redundancy of dates, a case of very frequent occurrence in inscriptions, charters, deeds, &c. executed in the Middle Ages. The second date given in this instance (1226) is the year of the era of Spain. The Spanish era, founded on the Julian Calendar, was created in the year 38 B.C., and was a consequence of the conquest of the country by the Romans. It was also adopted in Portugal, Africa, and in the southern provinces of France, and was not abolished in the western portion of Spain till the beginning of the fifteenth century. (Sir H. Nicolas, 'Chronology of History.')

The only other facts concerning the architect that have come down to us are, that in 1161 he built the bridge of Cesures, in Galicia, and that in 1168 he received a pension from Ferdinand II. in recognition of his services as master of the works to the Cathedral of Santiago (Cean-Bermudez, 'Arquitectos, &c.' vol. i. p. 33). The kneeling figure looking east, at the base of the central shaft, is, according to local tradition, the effigy of 'el maestro Mateo.'

The three bays of which the portal is composed are spanned, as will be seen in the elevational drawing, by semicircular arches, the smaller ones having two orders of mouldings, the great central one having three. The latter is filled from the springing by a tympanum, supported on a central shaft, and on corbels at the sides.

The whole of these arches are crowded with figure sculpture, forming one great scheme of iconography illustrative of the Last Judgment. In the tympanum is a colossal figure of Our Lord in glory, seated on a throne and showing His wounds. He is surrounded by the four Evangelists, all represented as young and beardless, supporting the emblematic Beasts on their knees and writing their Gospels, except in the case of St. Matthew, who is here shown with wings, thus combining in his own person the Emblem and the Evangelist. This central group forms the subject of the lithographic illustration given in the present number. It is to be remarked that the usual order in which the Evangelists are placed is here inverted, St. John and St. Luke being to the right hand, and St. Matthew and St. Mark to the left of Our Lord. On either side of the Evangelists are angels holding the instruments of the Passion; those to the north the pillar, the cross, and the crown of thorns; those to the south the spear and the nails (in this instance four), the ewer and scroll, the scourges, and the reed and sponge. Above these, in two lines, are crowds of little figures in adoration, some holding books and scrolls, to which they point. They probably represent the 144,000 mentioned in the Book of the Revelation. Many are crowned, others are receiving crowns from angels above. At the top of the tympanum, on either side of Our Lord, is an angel censuring.

The enclosing semi-circle is formed by the figures of the twenty-four elders, all seated and crowned, with stringed instruments of music in their hands; eight of the elders are also holding 'vials full of odours, which are the prayers of saints.' (Rev. v. 8.)

At the springing of the vaulting ribs are figures of angels disposed as follows: two on either side of the central door, having in their

CENTRAL GROUP
IN TYMPANUM

Drawn by W. W. Spangler & Co. London, E.C.

arms or at their sides little naked figures representing the souls of the blessed; opposite each of these, on the other side of the vault, a group consisting of a seraph in the middle with an angel on either side, all in adoration and holding scrolls; and, at each of the four corners of the porch, an angel blowing a trumpet. On the side of the porch shown in the drawing, the springing of the diagonal ribs of the two small bays is not decorated with angels, but is masked by the wings of those at foot of the longitudinal ribs.

The archivolt of the north side-door is composed of two orders of mouldings, both of which are richly decorated with sculpture. The outer rim contains a number of little figures seated and bearing labels, alternating with leaves; the inner also contains numerous small figures in a thicket of foliage, the central one of which appears to be in the attitude of benediction. The whole is probably intended to be a representation of Paradise.

The southern side-arch is also of two orders, both deeply hollowed and filled with carving, the subject of which is the Act of Judgment. At the crown of each rim is a head, and two hands with scrolls; the upper being the head of Our Lord with a cruciform nimbus, the lower that of an angel, probably St. Michael. On the left hand, both in

the hollows and in the label, are shown the souls of the damned tormented by demons and serpents; on the right, angels bearing the souls of the blessed; some of these latter are also seen in the label in attitudes of adoration.

The central shaft, supporting the tympanum, is composed of a cluster of six columns, and rests on the prostrate figure of a man embracing two monsters, into whose open jaws the Galician peasants have a custom of throwing a handful of sand before entering the church. The front column of the shaft is decorated with a figure of Santiago (St. James Major), in whose honour the church is dedicated. He is seated on a throne, the feet of which rest on lions, and holds in his right hand a scroll, in his left his usual attribute—the palmer's staff. In the original doorway he has a nimbus enriched with jewels, which is not given in the Kensington cast, and which Mr. Street, in his work on Spain, supposes to be an addition of a later date. The short column supporting the statue of the patron saint is historiated with the genealogy of Christ. In the capital is a representation of the Trinity; the Father supports the Son on His knee, the Holy Dove is seen in the abacus moulding above; while angels, two on either side, are offering incense. The main capital to

WEST DOORWAY, CATHEDRAL OF SANTIAGO. (FROM STREET).

the cluster of shafts is composed of subjects from the Temptation. The corbels that take the ends of the lintel are decorated with half-figures of angels with scrolls, the inscriptions on which, as in the west front of Chartres, being merely painted on and not engraved into the original stone, are naturally not reproduced in the cast. In this case, as well as in the rolls and books held by the prophets and apostles, these inscriptions are also for the most part either very indistinct, or only partially seen in the photographs on account of the perspective. This is much to be regretted, as it would be interesting to compare these inscriptions with those prescribed in Greek iconography, as set forth in Didron's 'Guide de la Peinture.' The eyes also of the figures are painted on, not cut into the stone; in fact, sufficient remains of colour have been found to show that all the statues were originally richly decorated in gold and colour.

The jambs that take the arches form a series of nooks filled with engaged shafts, all of which are carried up in two stages, the upper stage being enriched with statues supported on capitals, excepting the two shafts that take the longitudinal vaulting ribs; these are carried up plain without any interruption but that of an annulet moulding, which is continued all round the jamb, and ties in the

whole sheaf of columns. Three of the nook-shafts are richly decorated with spiral carving, and interlaced work with little men and animals chasing each other through the foliage; but in these, as well as in the capitals where figures and beasts are introduced, there does not appear to be any definite subject. The bases, ornamented in the spandrels with *griffes*, now in many cases nearly worn away, are elevated on a plinth carved into the likeness of lions, bears, dragons, and other animals, symbolical of the various vices.

The band of nearly life-sized figures, which encircles the upper portion of the jambs, consists, iconographically, of two groups: on the two northern piers and their responds on the opposite side of the porch are ranged the Prophets, who predicted the coming of Christ and the events of His life; on the southern piers the Apostles, who were witnesses of the fulfilment of the Scripture; the Old Testament thus being on the north and the New on the south side of the church, according to the almost universal practice during the Middle Ages. The apparent inconsistency in assigning the more honourable position, i.e. the right hand of Our Lord, to characters from the Old Testament, is thus explained by M. Didron:—'The right and left hands of the spectator entering the church determine respectively

the right and left sides of the building; except in the sanctuary and in subjects like Last Judgments in portals; here it is the Sovereign Judge who determines the right and left, and thus reverses the right and left of the spectator' (Ecclesiologist, vol. 18). The range of Apostles and Prophets seems therefore intended to form part of the general decorations of the church (doubtless originally further carried out in the painted glass, &c., on the same principle of placing the Gospel on the right and the Law on the left), the scenes carved in the arches above forming a subject complete in itself.

The series of the Apostles consists of eleven figures, including St. John the Baptist, and is disposed thus:—Commencing from the centre, and walking round the porch towards the right, we have first, St. Peter, in pontifical garments, his right hand raised in benediction, and having in his left three keys, expressing the dominion over heaven, earth, and hell; then St. Paul, with a book; St. James Major, with his pilgrim's staff and a scroll, *here* in his character as an apostle, and identical in features with the figure on the central shaft, which represents him as the Patron; St. John bearing a book; six apostles, four with books and two with rolls, whom it is difficult to identify, owing to the absence of attributes, and the illegibility of the inscriptions; and lastly, St. John the Baptist, carrying the Lamb, enclosed in a circular aureole. The prophets, again beginning at the centre, and proceeding towards the left, are:—Moses, with his rod and the tablets of the Law; Isaiah, Daniel, Jeremiah; six other prophets all with scrolls; and opposite St. John the Baptist, a female figure, crowned, and carrying a scroll, evidently intended for the Queen of Sheba in her character of one of the Sibyls, who, though themselves heathen, are said to have foretold the coming of Christ to the Gentiles. It will be remarked that the majority of the Apostles are shown with books in their hands, while the Prophets, with the exception of Moses, carry scrolls; this is owing to the circumstance that 'books, on account of their greater importance in size, and being also capable of containing more matter, were regarded as symbolic of the loftiest wisdom. The roll only (though there are many exceptions to the fact) was placed in the hands of the Old Testament Prophets, because they saw the truth but imperfectly and through the veil of metaphor, while the Apostles, to whom the truth was fully revealed, carry books.' (Didron, 'Hist. de Dieu,' Bohn's edit., p. 180.)

The absence of nimbi to all the apostles excepting St. Peter is accounted for by the want of the plain background on which the sculptors of that period were wont to carve the nimbus in low relief, it being correctly shown throughout the tympanum and in the south arch. The influence of Byzantine on Western art, which is so noticeable at Chartres (especially in the west doorway, erected in 1170, to which in many respects this portal bears great analogy), is exemplified in the present instance in a very marked manner by the honour paid to the personages of the Old Testament. A nimbus, perfectly similar to that borne by St. Peter, is given to Moses, and doubtless (as in the north porch of Chartres) the other prophets would have been distinguished in a like manner but for the material difficulty above mentioned. Then, again, all the prophets but two, who have sandals, are barefoot, a distinction accorded in Western art to none but God, the angels, and the apostles. St. Peter also, in his gesture of benediction, in raising only one finger instead of two, departs from the usual custom of the Latin Church.

The whole of the detail of this grand portal is of great beauty, particularly that of the capitals and the carving on the nookshafts. Above all, one is struck with the pure and noble expression of many of the heads, the most noteworthy being those of Our Lord, the Evangelists, and some of the angels. Little of the beauty of the original work appears to have been lost in the cast which has been taken by Mr. Brucciani. This gentleman was sent specially to Spain for that purpose, at a cost of 2,300*l.*, by the authorities of the South Kensington-Museum, to whom a debt of gratitude is certainly due for thus bringing within the reach of all so fine a specimen of a noble period of art.

The main dimensions of the doorway were taken from drawings by Mr. Brucciani made on the spot, as the cast has not yet been properly put together at the Museum, owing to want of space. The details in the accompanying illustration, and of which it is proposed to give a few more in a future number, are drawn from the photographs published by the Arundel Society, and finished from the cast itself.

H. W. LONSDALE.

THE ROOF OF THE ROYAL ALBERT HALL.

WE give a view, with details and plans to a small scale, of the framing for the iron roof of this building, which was fully described in our last number. The roof is now being fixed, and the nature of its construction is well seen from the drawings, but want of space compels us to postpone a description of it.

PICTURE FRAMES AT THE ROYAL ACADEMY.

SECOND NOTICE.

CONTINUING our review of the frames of the Royal Academy Exhibition, those of Mr. Leighton come next under our notice. As we have before remarked, Mr. Leighton has always deemed it worth while to bestow the most careful attention and study on this feature; and the same refinement and knowledge of the best and most subtle forms of Greek art which are displayed in his pictures, enter also into the design of his frames. His first

in No. 377, the diploma picture, is a simple and plain frame demanding no comment. In No. 469, Daedalus and Icarus, the frame is divided into three divisions; the inner one is treated like the architrave of a cornice; thus giving those set backs which are so valuable as contributing to the apparent solidity of the frame. In order to accentuate the divisions of the three fascias, small grooves are sunk between them. In the marble temples of Greece, with the bright sun and clear atmosphere, the slightest projection would be sufficient to give a dark line of shade, and such grooves therefore would not be required to define the fascia of the architrave in a cornice; with a similarly moulded architrave, however, in a gilt frame, exposed only to a diffused light, they become very necessary, and it is strange that their value has not been more recognised in other frames.

The middle division of the frame is relieved by pateræ, round which a similar groove runs. The outer division, or border, has the ordinary egg and tongue, and the leaf ornament of the Erechtheum pilasters: the juncture at the angles, however, is not Greek, and inclines us to the belief that this beautiful border was executed at so much per foot. A Greek artist would have masked the corner and joint by a leaf.

None of Mr. Leighton's frames are burnished, and we think judiciously, as the 'surface mat' of the gilding harmonises better with his pictures.

In 705, 'Electra at the Tomb of Agamemnon,' we have perhaps the most beautiful frame in the whole Exhibition; extremely simple and refined in its lines, it would be impossible to imagine any border which could agree better with the subject of the picture or with its treatment. In this case the ornament was probably painted after the frame was made; it is difficult, therefore, to understand why a better arrangement of the angle ornament has not been devised. This is one of those points, however, in which an amateur in architectural detail is sure to fail. In the picture, also, we notice a similar lack of knowledge. Mr. Leighton has been able to grasp the general effect of Greek work, and to represent pretty correctly the flutings, echinus, and abacus of a Doric column; but he has failed to represent or has forgotten the existence of the annulets of the necking, and, what is far more important, the necessary joint under the capital, which was always accentuated in Greek work. The effect of painted ornament on the gilded surface of the frame is very good, and might with advantage be more employed in other frames. Mr. Leighton's remaining frame (No. 864), though more elaborate in its mouldings, and showing even more study in its design, is nevertheless too heavy; the contour of the mouldings in section takes, instead of a concave, a convex form, which can rarely be pleasing, and the ogee curve outside the frame gives it additional bulk and heaviness. Still, the subtlety of design in the mouldings is beyond all praise; and were it not that the subject of the picture especially required a light frame, we should be inclined to place this one next to 705, as second in point of merit among the Academy frames.

Mr. Albert Moore's frames (483 and 649), though Greek in style, are very different in design from Mr. Leighton's; the frames of the latter are treated as if executed in ivory, marble, or its substitute plaster. Mr. Moore's are carved in oak, and the design is in accordance with the scope of the material. The mouldings are few, simple, and effective, and there is just as much ornament as is necessary to relieve them of monotony. No. 483 might have been a little smaller with advantage to the picture, and there is a slight confusion in the lines; this is, however, not the case in 649, in which every part of the ornament tells its tale, and the sparkling effect of the whole frame is delightful. Mr. Walker's frame (No. 485) is original, but lacks design in the contour of its mouldings, which in section form a straight line nearly; had there been a deeper concave moulding in the centre, one or two grooves to accentuate more the other divisions, and a plain 2-inch margin within, the frame would have gained considerably by such additions. Whilst we are in this room (VII.) we would call attention to perhaps the worst frame in the Exhibition. Mr. W. Linnell, in No. 461, has at length completed his fine picture of Aurora in Romagna. The Linnells' pictures, as a rule, do not appeal to our sympathies for their refinement; there is always a touch of vulgarity about them, more especially in their foregrounds and figures: but in this picture of Mr. W. Linnell's, the subject is grand, the figures solemn, characteristic, and, for a landscape painter, well drawn. We regret much, therefore, that he has not had the good sense to depart for once from the traditional frame of his family, and adopt one more in harmony with the subject of his picture. The frame is very large, and is covered with the most unnatural natural foliage we have ever seen; if ever an opportunity presented itself of displaying a little thought in the design of a frame, this picture would have offered a good field; and we are sorry to see that Mr. Linnell has not availed himself of it.

Mr. Armitage, in his picture of the Sick Chameleon (272), has a frame with Egyptian ornament; the contour of the mouldings is very good and effective, and the ornamental accessories are in keeping with the style employed. The sacred scarabæi are very appropriate, and fill the angles well, and the disposition of the lotus flowers is good. There is no one who would say, on looking at this picture, that the frame does not give additional interest to the subject. The costume of the figure is probably modern; but the ornament of the frame carries us back to the time when Egypt and her armies ruled the world, and when its beasts and reptiles were regarded as sacred in their symbolic representations of the mysterious attributes of the Deity. At the present day, instead of being cared for and tenderly nurtured, such a reptile would have been instantly killed on account of the superstitious feeling that it possessed an evil eye. Mr. Boughton's frame (No. 493) is apparently French in design, the inner mouldings recalling a foreign treatment. There is a want of repose in the ornament of the cavetto moulding, which detracts from the general effect; otherwise the picture is well enclosed in it, and isolated from all surrounding objects. In No. 736, Mr. Graves's frame resembles in its main form M. Portael's frame (No. 174), of which we gave a drawing last week. The ornament is very good in design, and is well modelled.

The Water-Colour Room is not conspicuous for its frames. They are all of them poor and weak, and display an utter want of design. In Nos. 628 and 549 are two frames with large and clumsy leaves round. Mr. Calderon

picture frame (No. 643) resembles Mr. Storey's No. 7, to which we called attention last week. The insertion of small sunk patere gives additional interest to the panel round. We notice that the gold margin here being under the glass does not count as part of the frame, which looks small consequently for the size of the picture. Mr. Clifford's picture, with its somewhat heavy colouring, required a good bold frame instead of a simple two-inch border without moulding or ornament. In Mr. Lehmann's picture (No. 862), a lady burning her love letters, an attempt has been made to bring the frame in accordance with the melancholy subject by filling up the interstices of the network border with black. As this has been carelessly done, and the ornament itself was defective in precision of modelling, the effect is extremely unsatisfactory. The contour also of the mouldings is very poor.

Our review terminates with Mr. Prinsep's frames, of which we give drawings in Nos. 131 and 730. They are apparently somewhat studied from those of Mr. Leighton, and have the same general effect. The egg and tongue ornament, however, is not Greek, and, therefore, does not accord so well with the mouldings. No. 730 is the best of the two, but the picture would have gained had the fascia in the middle been smaller, and had there been an additional internal margin.

In summing up the tendency of the remarks we have made, we find it exceedingly difficult to lay down any precise rules for guidance in the choice or design of frames, inasmuch as they must necessarily differ, not only in proportion to the size of the picture, but also according to its subject and treatment. Mr. Albert Moore's frame in No. 649, for instance, is not only in accordance with the subject of his picture, but suits admirably the flat treatment employed throughout in his tones of colour. A deeply recessed frame, or one covered with rocco ornament, would in this case have been singularly out of place. We think that the treatment of the inner mouldings of a frame generally is more important than the outer border. And we take the opportunity of again calling attention to the excellent effect produced in Mr. Tadema's or Mr. Leighton's frames by recessing back at two or three intervals, with small fascias between the margin of the picture; this treatment gives a solidity and constructional strength to the frame, and permits of the employment of any amount of decoration in the outer border. Of course a richly decorated series of mouldings does not suggest, although it may possess, strength in construction: if, therefore, there be no internal margin, not only does the picture suffer from the contiguity of the decorated surface, but a sense of insecurity in the holding together of the frame is felt. In Mr. Millais' frame, for instance, to his portrait of Miss Lehmann it is very possible that the rather coarse Italian ornament round is constructional; in other words, that it assists to hold the frame together: yet it has a contrary effect, and seems to require altogether a much stronger internal frame in order to carry this heavy ornament. In Mr. Storey's frame, No. 62, there is really no constructive part to the frame at all—the lavish ornament which covers the whole being an element of weakness, and not strength. In almost all frames a plain margin of at least two inches should surround the picture: whether this should be parallel with the plane of the picture or slightly inclined, as in Mr. Tadema's frames, is a matter of slight importance.

Another essential point to be borne in mind in the study of frames is the way in which the return to the wall is treated. In an exhibition this is likely to escape attention, because the close contiguity of the frames prevents the return being seen. Due regard, however, should be paid to their effect when isolated, and from this point of view we think that Mr. Portaels' frame, No. 171, Mr. Graves's, No. 736, and Mr. Moore's are the most pleasing in form. Mr. Leighton's frames have straight sides, and, as their depth is not great, they may look well; but Mr. Tadema's frames must look like boxes against the wall, on account of their depth, and when seen sideways would be very objectionable, especially in a small room. The employment of pateræ or of a flat indented ornament in the panel round a frame, provided there be good design in such ornament, which is not always the case in this Exhibition, tends to enrich a frame without detracting from its ensemble. For certain pictures we think that the judicious employment of burnished ornament, as in Mr. Tadema's frames and the French ones generally, is well worth attention.

In conclusion, we would remark that we should have liked, had it been possible, to classify the frames in some order; but properly to illustrate such classifications, we should have been obliged to give a much larger series of examples; and, as our object was rather to draw attention to the best types than to write a full account of Academy frames, we have confined ourselves to the most remarkable in point of originality of design and harmony with the pictures enclosed in them. One point we wish specially to impress upon our readers is, that in a frame lies a not inconsiderable portion of the completeness of a picture, as all those who have had the opportunity of seeing canvases in artists' studios will easily recognise. If, therefore, any additional value can be given to a picture by the addition of a frame, it is surely worth while to give some consideration and thought to the latter, and not trust entirely to the caprices of the framemaker, who sees beauty only in elaboration of detail or perfection in finish; and, if all our painters would give some slight attention to this important subject, and, if necessary, call in the assistance of the architect, whose province it is, more especially, to occupy himself with mouldings and conventional ornament as in the designs for cornices, &c., we feel sure that a more satisfactory result would be arrived at. In that case our labours will not have been expended in vain in calling attention to the design and execution of picture frames.

The Municipal Council of Charleroi in Belgium has determined to petition the Minister of Public Works against continuing to work the coal mines under their town. It seems that the system of honey-combing the ground underneath is, at last, beginning to tell, some very ugly settlements having recently taken place at the barracks in the Haute Ville. As far back as 1839 the local engineers warned the council of the danger, but, like other corporate bodies, it was slow to move, until probably the mischief done is past repair.

SOCIETIES.

The Royal Institute of British Architects.

At the Special General Meeting on Monday last, Mr. J. P. Seddon was unanimously re-elected Honorary Secretary for Home Affairs. We regret to learn that for some reason which did not transpire, Professor Kerr withdrew his motion for a committee to inquire into the means of rendering the Institute more efficient, and that, consequently, no discussion took place on that subject. We sincerely trust that it will not be allowed to drop, and that if no committee be appointed, the Council will themselves take the matter into their serious consideration.

Architectural Publication Society.

The Annual General Meeting of the subscribers was held at No. 9 Conduit Street, on Monday afternoon, 31st ult.; William Tite, Esq., M.P., in the Chair.

The annual balance-sheet was presented, from which it appeared that the balance in hand available to pay the cost of production of the parts of illustrations and text then on the table, and for future issues, was 346l. 11s. 2d.

The following resolutions were agreed to:—

1. That it is desirable to secure the early completion of the Dictionary of Architecture.
2. To attain this end this Meeting authorises the Hon. Secretary to take such measures as may be necessary to obtain the immediate accession of a sufficient number of new subscribers, and pledges itself and the Society to actively aid in making the work as widely known as possible, and in procuring fresh members.
3. That in the event of success attending these exertions, the entire cost of the Dictionary is to be fixed for old and new subscribers at 15l. 15s.
4. The number of copies available being limited, this arrangement and the advantages attendant thereon shall apply:
 1. To those subscribers now on the lists who may before the close of this year pay up all subscriptions due or outstanding on December 31, 1868.
 2. To new subscribers who may pay down the fifteen guineas in one sum.
 3. To new members who elect to pay the fifteen guineas by instalments in the order of frequency of payment.

It was decided that this experiment be immediately made, and that the meeting adjourn for a month or six weeks to receive a report from the Hon. Secretary on the subject; also that Mr. Wyatt Papworth explain to the adjourned meeting how much time the completion of the work would probably take if sufficient funds are found.

Resolutions of thanks to the chairman and the various officers of the Society having been passed, the meeting adjourned.

NOTES ON NOVELTIES.

Antill's Stench Trap.

This ingenious apparatus, applicable to all descriptions of drains, claims to give effect to certain pneumatic and hydraulic principles. The difficulty which Mr. Antill professes to meet is that of affording a free flow to impurities, and, at the same time, guarding against the connecting-pipe being clogged, and the return of the impurities represented in foul gas or air charged with noxious matter. The interior of the base adjusted to the pipe contains two metallic curves in reverse and obverse positions, so arranged as to contain at all times a certain amount of water. When the flow is on, the water already in the trap moves on; but the arrangement is such that a residue must be left on the cessation of the stream, affording a check to noxious exhalations, which, if in the form of gas, discharge the impurities in the liquid retained in the stench trap; and this check is itself renewed each time it is called into use.

NEW BUILDINGS AND RESTORATIONS.

St. James's Church, Hereford, is cruciform in plan, and consists of nave, north and south aisles, transepts, chancel, sacristy, and south porch. The aisles are continued eastward of the transepts, and form an organ chamber on one side, and an additional space for seats on the other. The nave is 72 feet long internally, and is divided from the aisles and transepts by arcades of four arches on each side, those opening into the transepts being unusually wide. The width of the nave and aisles in the clear is 44 feet, and the width across the transepts is 64 feet. The nave, from the floor to the ridge, is 42 feet high; the chancel is 35 feet long by 20 feet wide, and 40 feet high to the ridge. There is a warming crypt under the sacristy, approached by an external stair, containing one of Gurney's patent underground stoves for warming and ventilating the church. The south porch is constructed as the substructure of the future tower and spire, and contains the first few steps of the corkscrew staircase to the ringing loft and belfry. The style adopted is Early Geometrical. The west front is pierced with three windows, one of three-light and two others of two-light each; the chancel by a three-light window at the east end, and by two two-light windows at the side; the transepts by four-light windows, and the sides of the aisles by seven two-light windows. The clerestory is pierced by eight sexfoiled circular windows. All the windows contain foliated tracery in the heads. The building has been constructed with Three Elms quarry stone, with box-ground Bath stone dressings, the interior throughout being ashlared random-ranged Bath stone, axed on the face and set in wide joints, and relieved with bands and vousoirs of blue stone. The roofs are framed with pitch pine, boarded and felted, and covered with Whitland Abbey slates. The timber and boarding are left their natural colour. The sittings are also of pitch pine, varnished over. The aisles and chancel are tiled, Godwin's ornamental encaustic tiles being used throughout the latter. A handsome encaustic tile rosettes has been set up against the east wall

under the chancel window. The works just closed have been carried out by Mr. Gough, builder, of Bishop's Castle, under the superintendence of the architect. The church will accommodate 600 persons, but provision has been made for additional accommodation, should it be hereafter required, by the erection of galleries; and the whole of the sittings are free.

The Countess of Huntingdon's new Church, in Staffordshire, erected in 1800, owes its origin to the munificence of Mr. A. Cooper. The old church was one of the class of unsightly structures commonly erected in the early period of Nonconformist history. So complete, however, has been the transformation, both of exterior and interior, that the old building is scarcely recognisable. The works exteriorly comprised the erection of a new orchestra and vestry, the introduction of new windows, glazed with tinted glass, and an alteration of the arrangement of the window openings throughout, which have received stone arches and imposts, in lieu of the old brick arches removed, and plaster arches and imposts interiorly; and stone dressings have been suitably introduced in other parts of the building. A new portico has been erected with coupled pilasters and arches on three sides, surmounted by a stone cornice and balustrade; an inner vestibule is provided, laid with encaustic tiles. The roof—which, though containing plenty of sound material for a good roof, had been damaged by unskillful treatment in construction—has been restored and re-slatted. The old horizontal ceiling has been removed; the roof timbers, now exposed, have been wrought or cased; and the appearance further improved by the introduction of carved braces and pendants. The internal alterations comprise entirely re-seating the body of the church, with open benches of good width. The woodwork throughout is stained and varnished, and the building warmed by the apparatus of Messrs. Haden and Son, of Trowbridge. The contractors are Messrs. Stonier Brothers, of Rochester, near Ashbourne; Mr. W. Sugden, of Leek, is the architect.

New Wesleyan Chapel, Alsager (Staffs.).—This neat and substantial building, erected from the plans of Mr. G. B. Ford, architect, Burslem, the foundation stone of which was laid in June last year by Mr. A. Shaw, was opened on the 1st inst. The building is in the Gothic style of architecture. Red pressed bricks, relieved by bands of black and white bricks, with stone dressings, have been used in the construction. There is a gallery over the entrance porch and vestibule. The orchestra, in which is placed a handsome new organ, is at the back of the pulpit, underneath which is the minister's vestry, and at the rear a commodious class-room. The roof of the chapel is ceiled half-way up in a vaulted form, and is so constructed as to prevent any reverberation of sound. The space between the ceiling and the roof will act as a ventilating chamber, into which the vitiated air will pass from the chapel by a simple and effective mode of revolving shutters, and underneath these shutters are panels with ornamental wood. The internal woodwork is of red deal and pitch pine, stained and varnished. The windows are glazed with cathedral tinted glass, in leaded quarry lights, with a margin of coloured glass round each light. A warming apparatus has been fixed by Mr. William Boulton, of Burslem. The floor of the chapel is calculated to seat upwards of 400 persons. The total cost of the building, including the land and organ, is expected to be at least 2,500*l.* The contract has been carried out by Mr. John Stringer, of Sandbach.

The Industrial Schools at Leavesden.—The last meeting of the St. Pancras Board of Guardians was specially to consider the minute of the School Committee, which recommended that application be made to the Poor Law Board for power to suspend the works in connection with the erection of the Industrial Schools at Leavesden, with a view of ultimately disposing of them. Mr. North, as chairman of the School Committee, was opposed to the erection of schools at such an outlandish place as Leavesden, where those who professed economy were erecting buildings for the accommodation of 700 children, when 500 was the *maximum* number they were likely to send there. The land had cost 4,000*l.*, the builder's contract was 37,600*l.*, and it was estimated about 13,000*l.* would be required for fittings, or considerably over 50,000*l.*, upon which they would have to pay interest. Medical men had proved that the massing children together engendered disease; and although they had, as he was told, paid the builder 9,500*l.*, he contended the first loss would be the least, and that the best thing they could do was to dispose of the buildings and site at Leavesden, and make use of the needless infirmary at Highgate for their accommodation. Mr. Parson seconded a motion in accordance with the minute, which was ultimately carried.

Cheadle Hulme Congregational Chapel.—The memorial stone of a new chapel, for the accommodation of the Congregationalists resident in Cheadle Hulme, Macclesfield, was laid on the 27th ult., in the presence of a numerous assembly of spectators, by Sir James Watts. The site of the building, given by Mr. Story, the mason work of which is nearly completed, is close to the Cheadle Hulme Station of the London and North-Western Railway. The chapel is in the Gothic style of architecture, and has a spacious schoolroom in communication with it. The contractor is Mr. G. Atkinson, of Stockport. Mr. Henry Littler, of Manchester and Cheadle Hulme, is the architect. The cost of the building will be probably about 3,000*l.*

New Church at Lewisham.—On the 8th ult. the memorial stone of a new church at Lewisham, to be dedicated to Saint Mark the Evangelist, was laid by the Right Hon. the Earl of Dartmouth. The church is to be of English architecture of the time of Edward II., divided into nave, north and south aisles, chancel, and organ chapel, with vestries for clergy and choir, and a narthex and tower, with ashlar spire, rising to a height of about 160 feet at the western front. The dimensions of the edifice are—nave and aisles, eighty feet by sixty feet; chancel, twenty-eight feet by thirty-nine feet. The walls are to be built of Kentish Rag, with Bath stone dressings. The seats to be open and stained, and the chancel stalls of oak. The church will seat 750 persons, and owing to the nature of the site (from its inclination eastward) schools may be formed under the chancel. The present contract (about 7,000*l.*) embraces a portion only of the building. The contractors are Messrs. Carter & Sons, of Holloway. The architect is Mr. W. C. Banks, of Gracechurch Street.

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Acoustic Experiments at South Kensington.

Whether the mantle of that preacher who so charmed his audience that 'those who came to scoff remained to pray' has descended upon the shoulders of Mr. Cole may be a question. But that some such effect was produced on the numerous, but exactly proportional, audience that filled the Lecture Hall at the South Kensington Museum on Wednesday evening, with not one person too many, and not a single vacant seat, is unquestionable. Those who, note-book in hand, grave in face and feature, and bent on acoustic science, found themselves entering the Museum a little before 8 p.m. on this evening, had occasion to perceive, by the rustle of silken trains, and the gleam of dark braided hair, the presence of a distracting bery of fair fellow-students. And before the evening closed with a noble performance of the national anthem, the investigators in question had arrived at the conclusion, that, if that evening's occupation had been the study of acoustics, it was by far the pleasantest department of the exact sciences with which they were acquainted.

It was the Lord President of the Council, according to Mr. Cole's modest disclaimer, to whom we were indebted for the practical idea that one way of trying the acoustic properties of a room was to sing in it. However that may be, so charming a surprise, on a birthnight too, will be long remembered by those who had the good fortune to be present. Mr. Cummings sang with admirable delicacy and sweetness, and rose to tones which we can only compare to the *shout* of the nightingale at his fullest song. Miss Edith Wynne sang three touching ballads, so as to draw not only applause loud and long, not only *encores* well deserved and gracefully acknowledged, but the deeper tribute of tears. The softer notes of this lady's voice are to ordinary singing what whisper is to speech; but it is the whisper of Mrs. Siddons, audible throughout the house. Mr. Sullivan drew applause alike for his music, and his mode of conducting the brilliant improvised orchestra of nearly sixty voices.

The success of the experiment was perfect; a result due as much, we apprehend, to the complete filling of the room without overcrowding, and to its comparatively limited size, as to any more direct acoustic perfectness. Not a note of the solos was lost in any part of the theatre; and the effect of the chant-like commencement of the part-songs was magical.

We cannot omit to call attention to the admirable lighting of the room by four lines of burners, arranged in a square near the ceiling. Whether owing to the tint of the walls—a sort of dark olive—or to any other cause, the lustre was so like that of daylight, giving its proper tone to each shade of hair and of complexion, and to each detail of the graceful toilettes of the fair singers, that, looking at the orchestra, the sense that the light was artificial entirely disappeared, and more than once one wondered that the sun had not set.

The Thames Embankment.

The report of the select committee appointed to inquire into the roadway and viaduct proposed to be made on the Thames Embankment from Hungerford Bridge to Wellington Street, Strand, has been issued. The committee are of opinion that the Metropolitan Board of Works ought to be relieved from the formation of the intended roadway from the Embankment below Charing Cross Railway Bridge to Wellington Street, and that so much of the Act 25th and 26th Vict., c. 93, as applies to the formation of this roadway, should be repealed. The committee consider the suggestion to erect a Natural History Museum in this locality, and to combine with it terrace walks and open ornamental ground, is deserving of the favourable consideration of Parliament, as best meeting the requirements of all parts of the metropolis, both north and south; and that in the event of any such building being erected in this locality, due consideration should be shown for all private rights. The committee do not express any opinion on the probable cost of applying the sites in question to the erection of such a building. Mr. Walker, Superintendent of the Metropolitan Police, has stated in evidence that a carriage approach from Parliament Street, by Derby Street, to the Embankment roadway, is necessary to relieve the traffic at Bridge Street going from the Thames Embankment roadway to the Houses of Parliament and the west of London.

The Lungs of London.

The death of Sir Thomas Maryon Wilson is an event of importance. Not only the owners and occupiers of property in the neighbourhood of the estates of the late baronet, but those interested in the habitability and health of London, should direct prompt and earnest attention to the change which is thus introduced into the state of a long-vexed question. Of course no one can attempt to invalidate the rights of the owners of the estate on utilitarian grounds. At the same time it is of the greatest importance that these rights should be ascertained; so that, in case of this district being now given over to the builder, the minimum amount of residential damage may be inflicted on the neighbourhood.

Discovery at Westminster Abbey.

Among the many interesting discoveries which have from time to time been made by Mr. Scott, and those who under him have the charge of the Abbey, the most recent is by no means the least valuable. It is well known that the shrine of St. Edward the Confessor was taken down wholly, or at least to a great extent, at the Dissolution, and re-set up in Queen Mary's time. Many portions of the old work were restored in wood, and while it is in some respects doubtful what was the arrangement of certain parts, there can be no doubt that the existing restoration, if it can be so called, is incorrect. A fragment marble has recently turned up, and it was, we believe, Mr. Poole, the Abbey mason, who first recognised that it corresponds exactly to the portions still left of the original cornice. This fragment when fitted into place settles the question—one of those hitherto incapable of solution—of the position of the columns at the western end of

the shrine. It is not clear that the cornice did not break round the angle of the tomb as it does at present, and that the original twisted shafts are not now in the original position.

St. Pancras Workhouse.

A somewhat startling discovery in a sanitary point of view has been made in the St. Pancras workhouse, which may afford a useful hint to those concerned in the erection of such buildings. The room occupied by the late medical officer, and the infirmary wards adjoining, have been for some time pervaded by a noxious sewer smell, all attempts to trace the origin of which have hitherto failed. At length, in examining the basement of the building, an opening was found large enough to admit a man to pass from one end of the infirmary to the other, and this space was found to contain a quantity of foetid matter; in two days 2,266 gallons were baled out. The infirmary is ventilated by shafts in the walls which were intended to admit pure air, but which in fact conveyed the vitiated air and sewer gas from the accumulation in the basement of the building. The leakage is supposed to have arisen from the canal adjoining it being higher than the base of the infirmary, but it is thought by others probable that it arose from the burial ground adjoining the premises.

New Docks at Fleetwood.

On the 2nd inst. the first sod of the new docks was cut. They will cost about 50,000*l.*, and be 600 feet long, 400 feet wide, and 23 feet deep outside at high water during an ordinary spring tide. Mr. Cox, of London, is the engineer; and Mr. C. Chambers, of the same place, the contractor.

Lord Palmerston.

On the 2nd inst. a statue was inaugurated at Southampton, in honour of Lord Palmerston, by the Earl of Carnarvon, with a grand ceremonial, and a banquet in the evening.

The Great Imperial Prize.

The French Minister of Fine Arts has appointed the Commission to award the extraordinary quinquennial prize of 100,000 francs for a great work in painting, sculpture, or architecture. The following is the list of the members of the Commission:—

Painters.—MM. Couder, Robert-Fleury, Cabanel, Gérôme, members of the Institute; Amaury-Duval, Barrias, Baudry, Jalabert, Larivière, Lenepveu.

Sculptors.—MM. Dumont, Guillaume, Barye, members of the Institute; Barre (Jean-Auguste), Cabet, Carpeaux, Crauck, Gumery, Thomas (Gabriel-Jules), De Triqueti.

Architects.—MM. Duban, Labrouste, Lefuel, members of the Institute; Ballu, Bœswillwald, Clerget, Garnier, Questel, Reynaud (Léonce), Viollet-le-Duc.

The Institute, or rather, in this case, the Academy of Fine Arts, has renounced any part in the competition, and any member of the Commission becoming a candidate is required to resign.

It is not believed that the prize will be awarded on the present occasion; and the Emperor, or his Minister, seems to share the doubt; for in the case of no worthy work being discovered, the amount of the prize is to be presented to the funds of the United Association of Painters, Sculptors, and Architects.

Stained Glass.

A window of stained glass has just been erected in the Catholic Church at Raheny, Co. Dublin. It is from the studio of Messrs. Earley & Powells, Camden Street Works, Dublin.—Three windows of stained glass have been erected in the chancel of the Catholic Church, Butlersbridge, Co. Cavan. In the centre light is depicted the Crucifixion of our Lord, with the Blessed Virgin and the two Marys at the foot of the cross. The windows on either side contain full-length figures of St. John and St. Paul. The windows are the gift of Hugh Blessin, Esq., of New York, a former resident in the parish.

Mr. E. Deutsch.

This gentleman has returned to London from his Eastern journey, having deciphered the inscriptions on the 'great stones' of the Temple platform, and found them to be Phœnician masons' marks. Thus the original builders of that side of the Temple wall were of the age of Solomon, and probably the craftsmen of Hiram, King of Tyre. Mr. Deutsch has also recovered the lost letters of the Maccabean Hebrew alphabet.

Notes from Paris.

In a corner of the permanent Exhibition building in the Champs-Élysées there is, at this moment, a model intended to show how Paris may, at a trifling outlay of 80 million francs, be converted into a maritime port, by means of a canal 112 miles long. It is a suggestion emanating in the first instance from the fertile brain of a Paris banker, M. J. Ardoin, and without stopping to enquire whence he proposes to raise the necessary capital, or the utility of the canal when completed, we sketch the general outlines of the scheme. The canal is to begin at Dieppe, where the outlet would be protected by an immense breakwater. It is then to traverse the *Arques* valley, and, crossing the Seine and Oise rivers, to arrive at the capital by way of Neufchâtel, Beauvais, and St. Denis. At Paris the canal would cross the Great Northern Railway, and finally end in an enormous basin reaching from the suburb of St. Denis to that of La Chapelle, and between the St. Ouen station and the Seine: this basin to be the 'Port of Paris.' Amongst the minor works which this scheme comprises is a short canal between the 'port' and the Seine, with two enormous locks, the river being here 62 feet higher than the contemplated basin. Then the Villette Canal is to be continued under the Buttes Montmartre to the Seine, with wet and dry docks between it and the 'Maritime Canal,' the present goods shed of the Northern Railway being on a level with these docks. The 'Canal Maritime' would be at such a level as to permit the free passage of ships' masts under all bridges, with two exceptions, when the masts would have to be lowered. The model, which is made to a scale of half a millimètre to the mètre, is 296 feet long.

A new terminus is in course of construction at the Orleans Railway. It is 918 feet long by 166 feet wide. The roof is a flat segment, rising 40 feet

in the centre. The highest point is 92 feet, the wall plate 52½ feet from the level of platform. When finished, the roof will contain no less than 1,320 tons of cast and wrought-iron. The scaffolding employed in its erection contains 2,700 cubic feet of timber and 29 tons of iron.

Works shortly to be undertaken in France and Belgium.

The Saumur and Cholet line at Doué will cross the calcareous plateau where inexhaustible quarries of building stone and a number of lime-kilns are in active operation, and it will pass near Brossay, which is renowned for its hydraulic lime; it will also touch the coal mines of Châtellaisson.

M. Philippart, President of the railways of the Hainaut collieries, has applied for the concession of that part of the line from Orleans to Rouen which traverses the department of the Eure, through St. André, Evreux, and Louviers, and also of the line from Acquigny to Dreux, by the valley of the Eure, with branch line from Pacy-sur-Eure to Vernon. The subventions for these lines amount to 5,734,500 francs in money, and a free grant of the land required for the line from Evreux to the limit of the department of the Seine Inférieure.

The town of Châtellerault has voted the sum of 4,000*l.* for a line of railway from Argentan, passing by Châtellerault and joining the Nantes and Tours line at Port Boulet; the Minister of Public Works has, however, insisted on a preliminary survey, which is estimated to cost 600*l.*, which sum is to be defrayed by the three departments interested, and the Châtellerault Council immediately voted its proportion of the amount.

A society, with a capital of 400,000*l.*, has been formed in Paris, with the object of constructing a floating basin and docks at Gravelines, and a preliminary examination is now being made on the spot.

The Girdle Round the Earth.

The Atlantic Telegraph has conveyed the intelligence of the completion of the Pacific Railway. It is difficult for the untravelled Englishman to realise what this announcement means. The character of this stupendous work is one altogether unfamiliar to our experience. In magnitude it is the largest engineering work in the world, running for one thousand seven hundred miles through unsettled country, and across the very back-bone of the New World, and forming a portion of connected railway communication of some three thousand miles in length. Rough in execution, light in the weights of rails, and knocked out of hand with a galloping rapidity, the line rather resembles what we should call a contractor's temporary-road than a public or completed railway. For traffic such as pours over our own trunk lines it would be altogether unsafe and ineffective; but for the locality and the circumstances of the case, the Pacific Line possesses the first great requisite, practicability. First, it was possible; secondly, it is none.

If constructed at the average rate of English railways, the Pacific Line would have cost its shareholders upwards of eighty millions sterling. If we take the rough proportionate reckoning, that a dollar spent on railways in America is the equivalent of a pound spent on railways in England—which is not far from the mark if length of line be the only element regarded—we shall still have to face the enormous sum of eighty millions of dollars. It is probable that the cost has been considerably below this figure; but, if so, what an idea must we form, not only of the persistent energy, but of the admirable practical industry, of the Atlantic pioneers! One thousand seven hundred miles of light branch railway in our own country, bringing the more remote country districts into organic connection with the great locomotive system, would be cheaply purchased at 6,000*l.* per mile. They would form a property not only remunerative *per se*, but also augmenting in no slight degree the value of all other railway stock, and binding yet closer together every British interest.

General.

The Fine Arts Copyright Act, to which we drew attention a short time since, is being taken into consideration by some of the leading Architectural Societies, with a view to obtaining a definite understanding as to architectural copyright.

Captain Rudston Read has propounded a plan which is to provide improved dwellings for the working classes on a basis so profitable that a large surplus revenue is reckoned upon, available for a variety of purposes, including a sick fund, an educational fund, and a fund for the reduction of national taxation. At the same time it is considered that pauperism will be reduced within the narrowest possible limits. It is to be a State scheme, under the direct authority of the Government; the organisation to resemble that of the present poor law, with a central board and local authorities.

Builders' Benevolent Institution.—At the late general meeting of the subscribers to the Builders' Benevolent Institution, it was stated that since the foundation of the institution there had been 104 male and female pensioners on the funds, the men receiving 2*l.* and the women 20*s.* per annum. At the present time the number of pensioners of both sexes is 46. The money, invested in the Three per Cent. Consols, amounts to 11,706*l.* 9*s.* 8*d.* for the relief fund, and 2,951*l.* 12*s.* 7*d.* for the building fund.

Art Manufactures.—On the 27th ult., Mr. Layard, M.P., attended a meeting of the London Artisans' Club and Institute, when a paper 'On Art as Applied to Manufactures' was read by Mr. J. G. Crace. There were also present Lord Lyttelton, Sir John Bowring, and Mr. Hodgson Pratt. In the course of a brief address Mr. Layard said that to him a subject of great interest was the adornment and embellishment of public buildings. There was nothing, in his opinion, more calculated to raise taste in this country or to create a high intellectual and moral feeling than the internal adornment of public buildings. If it pleased the gentlemen in the House of Commons to allow him to retain the position he held under the Government, he hoped to be able to show the people of this country that there was something in internal decoration. This country he considered almost entirely ignorant of what internal decoration really was. Mr. Layard afterwards spoke of the effect which the culture of flowers in the public parks had upon the minds of the working classes.

Wells Cathedral.—On the 20th ult. a meeting in aid of the proposed restoration of the west front and Chapter House of this cathedral was held in the Chapter House. It was proposed, after discussion, to restore the canopies in certain instances, and in others to repair them. There were 4,700 feet of column in the west front, at 6s. per foot, so that it was a question of blue lias or marble. Lord Taunton moved that it was desirable to carry out the restoration of the west front according to the plan recommended. He remarked that it had been proposed to have coloured glass in the Chapter House, but he thought it better to have no coloured windows than to have paltry ones. Resolution carried. A committee was then nominated, and the meeting terminated with a vote of thanks to the President.

New Town Hall at Bradford.—A short time ago the Bradford Town Council adopted a site of 2,000 yards of ground (acquired in dealing with street improvements) in New Market Street, a very central point for the purpose of a Town Hall. The council has just issued printed instructions to architects as to the character of the building required on the site, and giving a schedule of particulars as to the extent of accommodation to be provided for the several departments of the corporation. The cost of the building is not to exceed 40,000*l.* The architect whose design is selected as the best will be entrusted with the execution of the work, receiving in payment a commission of 5 per cent. on the actual outlay. The architect whose design is the second best will be paid 200*l.*, the third best 100*l.* The designs are to be delivered to the Corporation not later than September 1 next.

Dumfries New Infirmary.—A meeting of the building committee in connection with the new Infirmary buildings was held on the 22nd ult. at Dumfries, for the purpose of further considering the plan of Mr. Starford, architect, which was produced in an amended form, an estimate based upon it amounting to 8,650*l.* 9s. 8*d.* The proceedings of the committee will be laid before the governors at a special meeting on the 9th inst.; and should they be confirmed, the building will be commenced forthwith.

Workhouse Waterworks.—The Coventry guardians are considering a scheme for establishing waterworks for their private accommodation at an estimated cost of 500*l.*, whereby they hope to reduce the cost 50*l.* per annum.

Mr. Abner Wedgwood.—This gentleman died a few days since at the early age of fifty-six. Mr. Wedgwood was a descendant of John Wedgwood, of Haracles, near Leek, from whom also descended Josiah Wedgwood, the eminent potter. The earlier years of Mr. Wedgwood's life were spent with the late Mr. John Ridgway at the Cauldon Place manufactory; subsequently he became connected with the Trent and Mersey Navigation Company. The latter part of his life was principally spent in superintending agricultural operations and improvements upon his various estates. He was buried at the parish church, Burslem, Staffordshire, on the 24th ult.

Hanley (Staffs.) New Cattle Market.—The success of this market is so great that the demand for pens for both beasts, sheep, and pigs, exceeds the accommodation provided. Accordingly, arrangements have this week been made for the erection of a sufficient number of additional pens to accommodate 80 cattle and 560 sheep.

The Government Survey in Cheshire.—A staff of officials connected with the new ordnance survey of this county have been located in Macclesfield since December. At present their operations are confined to the Hundred of Macclesfield, and to the coal fields of the district, which dip into Derbyshire and Yorkshire. Up to the close of the last month 12,500 imperial acres had been surveyed, chiefly in the north and west of Macclesfield, and in a few days the survey of the town will be commenced. The scale on which the country districts are being surveyed is twenty-five inches to the mile (the old scale is one inch to the mile), while the town will be mapped on the extended scale of ten feet to the mile.

Shap Granite Works.—On the 27th ult., at the Shap Granite Quarries, near Kendal, Westmoreland, a huge blast took place. With 75 lbs. of powder a solid block of granite, measuring 40 ft. by 30 ft. by 15 ft., and weighing 1,500 tons, was blown from the monstadeposit of Wastdale Crag.

Sewage of Towns.—A Towns' Drainage and Sewage Utilisation Company has been incorporated. The company propose to assist the local authorities of towns in disposing of their sewage, by acting as a medium between the sewer authorities and farmers disposed to apply sewage on lands they already occupy, or who may become tenants of land irrigated with sewage, after it has been properly laid out for the purpose.

The Spanish Inquisition.—Within a few hundred yards of the new Plaza de Dos Mayo, in Madrid, there is a locality called the Cruz del Quemadero. Through it a new road was lately opened, and lumps of charred wood were found, interspersed with ashes, evidently the remains of some huge fire. Iron rings were grubbed up; human bones, a cranium, a long tuft of hair, having belonged to some female. All these were more or less charred. Some of the iron was partially fused, and the texture of bone intermingled with sand was plainly discernible. A gag too turned up. In fact, this field of the Cruz del Quemadero was the place where the Inquisition disposed of some of its victims. Here were the ghastly proofs of the horrors of which this place had been the scene, suddenly brought to light after the lapse of two centuries. On May 12, 1669, 83 heretics, including 20 Hebrews, of whom five were women, were immolated on this very spot. The pile of wood was 80 ft. in length by 7 ft. in height. A great concourse witnessed the *auto da fe*, and the horrible ceremonial completed, the people buried the remains of the victims under cart-loads of earth. An entire bone of a human vertebral column, a portion of a tibia, a fragment of a shoulder-blade with a hole through it, and a bit of a rib, all bearing the marks of fire, were also turned up. The Quemadero is so frequented by people in search of relics, and the explorations of these strata have been so extensive, that the authorities have barred the frontage off, and prohibited access. It is their intention to cut out a square block, and there erect a monument.

The Bermuda Dock.—Mr. John B. Day has just published a large and well-executed chromo-lithograph of this extremely important and original engineering work.

Maryport Harbour.—The Board of Trade are reported to have approved of the dock proposed at Maryport, and the trustees are waiting to receive the assent of the Public Works Loan Commissioners. It is expected that the works can be completed within two years. The West Cumberland Coalowners' Association were petitioners against the scheme.

A Stained Glass Window, the gift of Dr. N. Rogers, and the work of Messrs. Clayton and Bell, has been placed in the south transept of Westminster Abbey, above the monument to Milton. It is in two parts, each canopied, and containing a figure: that on the left represents David, holding a pen and scroll, and looking upwards; the fallow light contains the figure of St. John writing the Apocalypse.

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

ROYAL ARCHAEOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.—The next monthly meeting will take place on Friday, July 2, at 4 P.M.

ROYAL INSTITUTION OF GREAT BRITAIN.—Monday, June 7, 2 P.M. General monthly meeting. Saturday, June 12, Lecture by Mr. Deutsch on 'Semitic Culture.'

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Monday, June 7, 8 P.M., ordinary general meeting.

ARCHITECTURAL ASSOCIATION.—Friday, June 11. Nomination of officers. Also, a Paper by J. Tavenor Perry, Esq., A.R.I.B.A., on 'An Historical Account of the Artistic Treatment of Piers, Pillars, and Columns.'

APPOINTMENTS VACANT.

INDIA.—July.—Forty Appointments in the Engineer Establishment of the Public Works Department in India will shortly be open to public Competition. W. T. Thornton, Secretary, Public Works Department.

KENDAL.—Borough Treasurer to the Corporation of Kendal, Westmorland. Salary, 50*l.* per annum. Mr. Thomas Harrison, Town Clerk, Kendal.

PENRTH.—As Assistant or Resident Engineer, to Superintend Works of Pipeage, Machinery, and Pumping Machinery. A knowledge of the German language desirable. Salary from 400*l.* to 600*l.* per annum. W. Lindley, Engineer-in-Chief, Penrh.

COMPETITIONS OPEN.

ARRAS, FRANCE.—Architects are invited to send in designs for a Church to be erected at Arras. The building is to be 40 metres long, without the clock tower, and 18 metres wide, and it is to have three aisles, three entrances, to be approached by a flight of five steps, and to be surrounded entirely by railings 1½ metres high; sub-basement of Belgian stone. The plans are to include a general one of the entire building, a fully-detailed description, and a careful estimate, with such perspective views and details as the artist may think fit to add to the former. The style of the building is required to be 'Decorated Roman of the last period'; and the sum to be expended, including commission, is 80,000 francs (8,200*l.*). The authorities do not undertake to adopt the prize plans, in which case the author of the best and second best designs will receive 600 francs and 300 francs respectively. It is added, that the columns are to be of hard Belgian stone, and the rest of the building of Creil stone; the vaultings are to be real, and not in ceiling, or of wood with visible ties. The jury is composed of the Bishop of Arras, the Maire, a Canon, two members of the Municipal Council, an Engineer, the Secretary-General of the Museum, and the Vice-President of the Council of the Prefecture. The designs are to be sent by the end of July.

BIRMINGHAM.—June 10.—Wanted Plans for the proposed Erection of a Building on land adjoining the Workhouse, capable of accommodating 200 Epileptic Pauper Inmates, together with the Estimated Cost of such proposed Building. William Thompson, Clerk to the Guardians, Parish Offices.

BELGIUM ACADEMY OF ARTS AND SCIENCES.—For best enquiry (essay) and report on the period at which Architecture in the Low Countries became affected by Italian influence. Premium, 1,000 francs, about 40*l.*

BRUSSELS, BELGIUM.—A competition is announced for the production of the best Water Meter. The inventor of the instrument offering the greatest advantages is to receive a reward of 200*l.*; the second best, 120*l.*; and the third, 80*l.* The Meters are to be sent in to the Secrétaire de l'Administration Communale, Hôtel de Ville, Bruxelles, before 12 o'clock on October 31 in the present year.

CLIFTON (Bristol).—The Guthrie Scholarship. Values 50*l.* a year, and 20*l.* added. One or more scholarships of 60*l.* and one of 25*l.*, at Midsummer. Apply to the Secretary.

CONSTANTINE, ALGERIA.—Three prizes, of the value of 3,000, 2,000, and 1,000 francs, are offered for the best designs for a theatre to be built at Constantine. Programmes of conditions, accompanied by a sketch, may be obtained either at Constantine, at the office of the Société Générale Algérienne, No. 13 Rue Neuve-des-Capucines, Paris, at the Prefecture of Lyons, or the Mairies of Marseilles, Bordeaux, or Orlans.

DEVON.—June 12.—Plans and Specifications for Repairs and Alterations to Chudleigh Parish Church, Devon. G. B. Eilcoombe, Esq., Chairman of the Chudleigh Advertiser, Trustees, Rocklands, Chudleigh, Devon.

LEYDEN MUNICIPALITY invites Designs and Models from Sculptors of all countries for a Statue of Boerhaave, in the costume of Professor of Leyden University. September 1.

LINCOLN.—June 14.—For Plans and Designs for a New Church. Mr. T. Heffernan, Secretary, Lincoln.

LONDON.—June 28.—London and County Land and Building Company (Limited).—Plans of the best and most profitable way in which to arrange in building sites their ground in Canonville Street, City. First premium, 75*l.*; second, 50*l.*; third, 25*l.* Mr. R. B. Looker, 14 Clement's Lane, E.C.

NORTHAMPTONSHIRE.—June 8.—Plans and Specifications for Rebuilding Whitfield Church, situated near Brackley, Northamptonshire. The Churchwardens of Whitfield.

PHILADELPHIA, PENNSYLVANIA, U. S.—September 1.—For Designs, Specifications, and Estimates for New Public Buildings. First premium, 400*l.*; second, 300*l.*; third, 200*l.*; fourth, 100*l.* For particulars, to H. C. Pugh, Secretary of Board of Commissioners, S.W., corner of Walnut and Fifth Street, Philadelphia.

PLYMOUTH, DEVON.—For Designs for New Guildhall, Law Courts, Public Offices, &c. Premiums 100*l.*, 75*l.*, and 50*l.* July 14. Whitford, Town Clerk, Plymouth.

ROYAL ACADEMY OF ARTS.—Burlington House. For the best Painting in Oil, or Model and Design in Painting, Sculpture, and Architecture, the Gold Medal and the Discourses of Presidents Reynolds, West, &c.; and for the best Copies of Drawings, &c., the Silver Medals, &c.

SAINT JEAN D'ANGELY, FRANCE.—The authorities of St. Jean d'Angely have decided on completing the Church commenced in the town by the Benedictines, but of which the works were stopped in 1789. Estimate 200,000 francs (8,000*l.*), the architect's honorarium to be equal to 4 per cent. The competition is confined to architects of Charente and the four adjoining Departments.

VIENNA, AUSTRIA.—This Municipality require Designs, Plans, Estimates, &c., for the Erection of a New Town Hall. Open to all Europe. For Particulars, Austrian Consul-General, Paris.

WESTBROMWICH.—For Designs, &c., for a complete School Establishment for accommodating 400 children. Premiums: 1st and best Design, 50*l.*; 2nd, 30*l.*; third, 20*l.* Mr. H. Ward, Lombard Street, Westbromwich (Plymouth, Royal Academy of Arts, St. Luke's).

WOODSTOCK.—For a Plan of the Burial Ground at Woodstock, to be divided into Grave Spaces. B. B. B. Hawkins, Clerk, Woodstock.

The Architect.

THE TREATMENT OF TERRA COTTA.

By GILBERT REDGRAVE.

THE use of terra cotta as a building material has now become such an established fact, and so much has lately been said and written on the subject of the qualities and capabilities of terra cotta, that I could scarcely hope to adduce any fresh particulars or throw any new light on these points. My intention, therefore, is to say a few words upon the *treatment* of terra cotta; that is, its disposition and arrangement, considered with reference to the structural necessities which the employment of it renders imperative.

It may, perhaps, be as well to begin by stating that there are two distinct views on this question, involving two entirely different modes of treatment, both of which are advocated by influential supporters, and have numerous excellent reasons in their favour. I will endeavour, as briefly and impartially as possible, to explain these views, and then point out which of the two modes of treatment I consider most suitable. For the sake of comparison I shall, in the following remarks, speak of those holding these different opinions as the *old* and the *new School*; and the two theories, if I may so call them, I shall designate the *natural* and the *artificial*. First, then, as to the old school, holding the artificial theory.

When, at the commencement of the present century, architects became ashamed of the brick walls, with holes in them, which had so long been the characteristics of the only style practised in this country, they began to look about them for some cheap and suitable dressing and adornment for their various works. Of course, stone was procurable, but the few available means of transport rendered it costly and confined its application within narrow limits. With the demand for something to take the place of stone came the supply, and we soon read of a number of manufacturers proposing to furnish the public with (so called) artificial stone.

It will not be necessary here to mention the makers by name or even to explain the composition of their substitutes for stone—all that I need say is, that terra cotta, as it is now called, was one of those artificial stones, and its great similarity to the material it aimed to represent was put forward as a main point in its favour. *Artificial* is, I must own, a very hateful word, and in case, by the name I have chosen, or rather which was originally chosen for it, as we have seen, I should be accused of doing injustice to the system pursued by the old school, I will substitute for it the term imitative. In this imitative treatment of terra cotta, dating, as I have shown, from the earliest period of its revival in this country, consists the principal peculiarity of the old school, assuming that it is possible, by extreme care and attention on the part of the manufacturer, to produce the effect of stone work—the whole tendency of the old school is to a stone treatment of terra cotta. To arrive at this result, it becomes of importance that the tint chosen for the terra cotta of any particular building should be light in colour and uniform throughout; that the blocks should be large and imposing, that the ornament should be confined to bands and masses, that the plain surfaces should be perfectly true and regular; and, in short, that the material should be so disposed, that to the eye even of the practised observer it should appear stone.

The new school, consisting of the advocates of the natural treatment, can in reality boast of more antiquity, and can produce authorities of a far earlier date, than their brethren inclining to the imitative treatment. Although in this country the theory of natural treatment is of comparatively recent date, the architects of Italy seem, in the best period of Italian terra cotta, to have been almost unanimously in favour of this treatment; and when I speak of the school as new or modern, I do so merely in order to distinguish it from what has been, till lately, the received idea on this subject in England. The natural theory, as the name implies, assumes the clay to be a material requiring a treatment suitable to its nature and composition, and adapted to the processes of its manufacture—a treatment which

shall involve a distinct and characteristic style of ornament, a size of block convenient for the manufacturer and not liable to be confounded either with brick or stone; and, finally, one by means of which all the peculiarities of colour and form should be emphasized rather than concealed; in short, the direct opposite of the imitative theory.

Having, then, in this manner accomplished the first part of my work by explaining the two treatments, and pointing out the chief features of each, I will now indicate the arguments in favour of the natural treatment, which I trust to be able to show is the right one. Terra cotta in any quantity can only be produced from moulds, and these moulds when large are very heavy and difficult to manipulate. The natural treatment, therefore, leads us to select a manageable size for the blocks, and accepts the limit thus laid down as a necessity. There is the more reason for so doing from the fact that these small blocks dry much truer, burn harder, and are less liable to imperfection than large and massive pieces made to counterfeit stone. This ascertained size, say a cubic foot or thereabouts, is one which can in no way be confounded either with brickwork or masonry, and with blocks of this size the advocates of the natural treatment are contented. Their only other care is to select some form of construction and ornament which shall harmonise with the size of the blocks, and present a speciality for the material they are dealing with.

Terra cotta architecture must necessarily be studied *per se*, and the architect's aim (when employing terra cotta) must be to impress at once upon everyone the nature and peculiarities of the material he has been making use of. I find a great difficulty here in explaining in writing exactly what I mean: perhaps I may do so better by giving an example. Having to execute a long moulded and enriched string course, the enrichment to be a guilloche between an upper and lower base and of plain mouldings, the architect, adopting the imitative treatment, would make the blocks in lengths of from two to three feet; he would require the unfortunate manufacturer to keep the lines perfectly true; he would grumble at a change, however slight, in the tints of adjoining blocks; and he would probably have the vitreous surface of the terra cotta removed, in order to conceal any slight imperfection or inequality in the arrises and joints. The advocate of a natural treatment, on the other hand, would break up the string course into several heights, and would not exceed a foot or 16 inches in the lengths of his blocks; he would point with admiration to the charming variety and play of colour in the material, and would look upon the slight irregularity of the leading lines as imparting a certain picturesqueness, and as affording a relief to the monotonous perfection he would be justified in requiring had the work been executed in stone. Lastly, the slight differences in the enriched portions of his string course would approximate more to the inequality of manual work, and avoid the unchanging repetition which is found in too carefully made terra cotta.

The great argument, however, in favour of the natural treatment is that, having moulded the block from the artist's own model, it undergoes no touching, polishing, and scraping by the manufacturer's workmen. This is *THE great evil* of the imitation terra cotta. In order to get the beautiful surface and finish which is aimed at therein the actual touch of the artist is lost, and the delicacy and often the entire feeling of his work is obliterated. In the matter of cost it is self-evident that the natural treatment has again a very great advantage, for the manufacturer is here called upon to omit that stage in the production of the material which requires him to employ more skilled labour than any other part of the process. As an art question I think that there can scarcely be two opinions; unfortunately the architect who has been accustomed all his life to the truth and regularity of stonework, requires a long time before he can become converted to a picturesque treatment such as the natural one must, to a great extent, be; but when once he is able to feel that it is not absolutely necessary, because the lines are ruled straight on paper, that they should be equally so on the building, the further changes in his creed on the subject of colour and ornament are speedily accomplished. Of course, manufacturers, as a rule, discountenance entirely a system which degrades them, as I have heard it put, into little better than brickmakers; but I cannot admit that any arguments which have been adduced by them have done much more than persuade me that they were struggling for a false notion—a notion which, when it has been discarded and the true theory of terra cotta, *baked clay*, has been adopted in its stead, will throw into all the more prominence the fact that the natural treatment is the only one able to replace paint and stucco in London.

THE SHRINE OF ST. SEBALDUS, NUREMBERG.

IN very apposite illustration of our recent Ramble among the bronze monuments of Westminster Abbey, we have to call attention to a new acquisition made by the South Kensington Museum.

In the North Court, near the beautiful reproduction of the pulpit of the Baptistery at Pisa, is to be seen a plaster model of the Shrine of St. Sebaldus, a bronze work now existing in the church dedicated under the invocation of that saint at Nuremberg. This wonderful production of Gothic fancy and German skill is ascribed to Peter Vischer and his sons, and dated between 1506 and 1519, being thus exactly coeval with the tomb of Margaret of Richmond, erected A.D. 1500, and with the monument to Henry the Seventh and his Queen Elizabeth of York, dated 1502-1509.

We must be content with but a brief reference to this elaborate work, which well deserves a full description. The actual condition of the Kensington model is inferior, in matter of finish and sharpness, to the objects of the same nature with which we are already familiar. If we look for details of execution, we shall be disappointed; but we have the materials for a general conception of the bold originality and lavish decoration of the shrine presented to us in the cast. The design of the work is that of a sarcophagus supporting a tabernacle, or enriched canopy, by means of graceful, slender shafts, or rather rods, the arrangement of which recalls that of the portable canopies that are borne over the Host in the processions of the Romish Church. Over both the tomb itself and this wrought *co-opertorium* is spread a host of saints, and martyrs, and lovely boy-angels—the grisly founders of the church bearing the implements of their martyrdom, one a saw, and one a sword, and the like—and the cherubs sounding every form of instrument of music. The boldness of the fancy, and the untiring elaboration of detail in which the members of this symbolic army are niched and perched upon, under, and around the shrine, are, as far as we can remember, unrivalled. It is as if the founder had fallen asleep when he had completed the structural or architectural work in which were laid the relics of Sebald, and then, either in his dreams, or in the actual goblin life that was at that time believed still to haunt the mountains and forests of Germany, a train of gnomes and elves had poured in to inspect his work, to haunt and occupy the tomb, or to perform, in elfin fashion, the obsequies of the occupant. Since the stone and wooden effigies, instinct with sudden life, came down from every niche, and pedestal, and altar throughout Rome, to perform the midnight funeral of Pope Formoso (whose body his successor in the papal chair had ignominiously cast into the Tiber), statue and symbol have rarely been so numerously collected in honour of a tomb. But the Roman procession has left its trace only in legend and in poetry. The Gothic gnomes, converted fairies, Christianised cupids, or whatever may be their appropriate titles, have been turned to stone, or rather to metal, by the wand of the artist, and remain mute, but yet eloquent, witnesses of the luxuriant wildness of the Teutonic fancy. The thirty-two saints who guarded the grille of Henry the Seventh must have looked poor and tame in comparison to the Nuremberg host.

The occasion is not inappropriate for putting the question to our friends at South Kensington, 'Why is the cast of King Henry the Seventh, taken from his tomb, allowed to remain mutilated?' Not only has it no hands, but it so distinctly gives the idea of having been taken from a statue the hands of which had disappeared, that it cost the writer another visit to the Abbey in order to make sure that no error had crept into his description of the perfect state of the Royal effigies. Not only are the hands uninjured in the bronze, but their exquisite workmanship forms one of the most striking details of the entire monument. We are sure that it is only necessary to call the attention of the authorities of the Museum to the mode in which

these ungentle hands

Have lopped and hewed, and made the body bare
Of the two branches

in order to have the effigy restored to the placid dignity of its sepulchral slumber.

Doncaster Parish Church.—A meeting of the committee for restoring the parapet and pinnacles of the parish church was held at the Vicarage on the 2nd inst. At the last meeting an estimate was submitted by Mr. Teale, the architect, of the probable cost of taking down the present pinnacles and replacing them with others of smaller dimensions, which estimate amounted to the sum of 500*l.* Mr. E. Denison, Q.C., offered to contribute one-half the cost of such alteration, on condition that it was carried out on a plan of which he approved. It was also shown that the pinnacles were in a very dangerous state. The result is the starting of a subscription to meet the necessary outlay.

OUR RAMBLER

AT RUNCORN.

THE course of his wanderings having led your Rambler to Liverpool, he determined to visit the latest addition to the already numerous family of gigantic bridges which span nearly all the principal watercourses of this country; so taking train at Lime Street, where a large hotel in course of construction from the designs of Mr. A. Waterhouse, and the new roof over the recently enlarged station, attracted his attention, works which are well worthy of being described, he travelled to Ditton, at which place commences the new line of which the bridge forms a part.

On alighting from the train, one of the best views of the bridge and of the viaducts at either end of it is at once obtained. The general effect is striking, and at the same time pleasing to the eye. It does not often happen that a bridge and its approaches are seen at a glance, as is the case at Runcorn. Here the railway runs parallel with the river for a considerable distance, and then sweeps round with an easy curve to the right, gradually rising till it reaches the edge of the river, which it crosses at right angles, leaving a clear headway of 75 feet for passing vessels; then curving slightly to the left, it vanishes into the high ground at the back of the town of Runcorn. Thus by standing between the railway and the river on the Lancashire shore, a complete view can be obtained of the works.

After leaving the old line, there is a very heavy embankment, which is succeeded by a viaduct, built on the curve, of very good proportions, and consisting of forty-nine arches, each of 40 feet span, which are, however, interrupted by a small embankment on the top of a hill. We then come to six arches, each of 60 feet span, which are in the waterway of the river. The first portion of the viaduct is entirely faced with Staffordshire blue bricks, which, however much to be commended for durability and soundness, have an exceedingly gloomy effect when used in such large quantities as in the present case; and it is to be regretted that some attempt was not made to enliven the mass by the introduction of a material of a lighter colour; a stone stringcourse at the rail level would have marked the horizontal line of the structure and relieved the monotony of the hue, whereas the slightly projecting course of blue bricks which exists can scarcely be seen. The appearance improves as the river is approached, the piers of the 60-foot arches being of Bramley Fall stone, the superstructure above the springing of the arches being faced with light yellow bricks and coped with stone.

The parapet walls are battlemented, and over the last span they project over the face of the work, and are supported on stone corbels, which are also carried round the abutments and piers of the principal spans. These latter are faced entirely with Bramley Fall stone, and on the abutments are castellated towers of the same material, which are connected by a pointed arch spanning the railway, and forming a very imposing entrance to the bridge.

The whole of the stonework is well executed, and conveys the idea of great strength and solidity; but exception must be taken to some of the mouldings, which are poor in design and too small for the magnitude of the structure.

Will engineers ever condescend to consult architects on matters of ornamental detail? The latter have long since discovered the advantage of obtaining the assistance of the former when they are compelled to employ ironwork in the construction of their buildings, and corresponding advantages would ensue if engineers would avail themselves more frequently of the taste and skill of architects in matters lying more especially in their department.

The girders of the bridge are constructed on the double-lattice principle, with parallel top and bottom flanges. There are three main openings, each having a clear span of 305 ft.; the depth of the girders is 27 ft. The lattice bars are placed at an angle of 45 degrees, and are bolted together at their intersection by 1-inch bolts. They are prevented from buckling by a zigzag trellis-work placed between the outside and inside webs. The top and bottom tables are composed of boxes built up of solid plates and angle irons, to which the lattice bars are attached. The distance between the two girders, of which each span is composed, is 25 ft., affording space for two lines of rails. The floor of the bridge is composed of cross girders about 10 ft. apart and 2 ft. 2½ in. deep at the centre; between them are placed four longitudinal girders—one under each rail; the space between these girders is covered with curved wrought iron plates.

The general effect of the girders is extremely light, the spaces between the lattice bars, which are about 3 feet square, being sufficient to allow plenty of light to pierce the mass, in spite of there being four systems of lattice work, one behind the other. The girders are painted a light neutral tint, which adds to the effect.

A footpath is carried on cantilevers on one side of the bridge, which is approached from the Lancashire side by an inclined path, and on

the Cheshire side by steps cleverly contrived under one of the arches. At this end of the bridge there are three 60-foot dry arches, and thirty 40-foot arches of similar construction to those already described. The total weight of wrought iron used in the work is nearly 5,000 tons, and 300 tons of cast iron. The whole of the plates, angle irons, bars, &c., were planed at the joints, and the rivet holes were all drilled; and so accurately were the drawings prepared and the work executed, that only five or six plates required any alteration to make them fit accurately into their places.

It is unfortunate that the appearance of the structure should have been spoiled by the introduction of a *sham* which might have been easily avoided. We allude to the cast-iron plates which cover the junction of the girders on the piers. These are intended to represent castellated towers of masonry, bearing large shields ornamented with the coats of arms of London, Liverpool, the Railway Company, &c., and are grooved and painted to match the real stonework. No doubt metal was employed because there is not sufficient space on the piers to build towers of masonry, but why attempt to deceive the eye, when an appropriate screen of iron might have been designed which would have been honest and real? The mode of constructing the coffer-dams was novel and ingenious. A scaffold was first erected on the site of the dam, by means of screw piles of wrought-iron, 4 inches in diameter, with cast-iron screws; these were driven through the bed of the river, which is composed of sand and gravel varying from 18 feet to 30 feet thick, into the rock. Cast-iron caps were fixed on the top of the piles to receive the timber uprights of which the scaffold was composed. Cast-iron boxes or caissons, 5' 10" by 5' 0" and 3' 0" deep, were then bolted together, so as to form a hollow column, and lowered into the bed of the river. When they would no longer sink by being weighted, divers were employed, who, working inside, removed the sand from underneath, and eventually bedded them in the rock. Subsequently an air-tight cover was placed on the top of each caisson, and the water excluded by air being pumped into them at sufficient pressure, which enabled the men to work in their ordinary dress. This method is very similar to that described in the ARCHITECT of March 20.

As soon as one caisson had reached the rock, others were sunk on either side of it, and this operation continued till the whole space to be occupied by the pier was enclosed. The lower portion of the caissons was filled in with concrete, and the vertical joints between them made water-tight by wooden piles being driven into hollows left for this purpose in the castings, the surplus space being filled with clay puddle. The greatest depth of the foundation is 55 feet below high water. The plan adopted for these coffer-dams answered its purpose admirably, no difficulty being experienced in keeping them free from water. On one occasion they were subjected to a severe trial, owing to the wind having caused the tide to rise to an unusual height, and the water stood within 10 in. of the top of the dam; but this did not cause any interruption of the work, the masons working on in security. The girders were constructed *in situ*; the rapid flow of the tide through the contracted waterway at this point prevented the adoption of the plan, so successfully employed elsewhere, of floating the girders between the piers and lifting them into their places. Nearly the whole of the scaffolding used to support them rested on screw piles of the same construction as those used for the staging of the coffer-dams, and the mass of timber required to carry the great weight of iron must have presented a very complicated appearance.

The remaining portions of the line do not present any special features. It rejoins the main line near Aston, and is about six miles long. The principal object attained by its construction is the decrease in the distance between Liverpool and London, which is reduced to the extent of nine miles; and also some relief to the overcrowded Liverpool and Manchester line; in addition to which it provides a long wanted railway communication with the important town of Runcorn, where a neat and comfortable station has been erected. Whether these advantages will repay the enormous outlay time will show. A suspension bridge was projected to cross the Mersey at the same spot as long ago as 1814, of which Telford was the engineer, but the scheme was abandoned. The central span was to have been of 1,000 feet, and would have greatly exceeded that of the Menai Bridge. Numerous projects have been started for crossing the river at this place, and Mr. William Baker, the engineer to the London and North-Western Railway Company, who designed the bridge we have described, has been fortunate in obtaining so good an opportunity of displaying his ability. The contractors for the whole line were Messrs. Brasey & Ogilvie, the ironwork being undertaken by Messrs. Cochrane, Grove, and Co., of Dudley. The contract sum was 369,591*l.*—but that amount has been considerably exceeded. The line was opened for goods traffic early in the present year, and passenger trains commenced to run over it on the 1st of April.

The works were started in 1863; and considering their magnitude, the time occupied in construction was not excessive.

Saint Bernard's (Bridgnorth).—This old hospitiun, or wayfaring house, situate on the verge of the Common of Morfe, has sustained great damage by the late thunderstorm. On May 28, at least 100 tons of the rock behind the house fell with a great noise. A cave, in which were stowed some old carved oak and curiosities, suddenly collapsed, and became one huge mass of boulder stone, smashing outhouses and everything in the way. The loss and damage will exceed 200*l.*

ENGLAND IN 1869:

A RETROSPECTIVE REVIEW OF THE TRAVELS OF COSMO III.

PART II.

Four years before Cosmo visited London more than a hundred thousand of its inhabitants perished by the plague; three years before, thirteen thousand two hundred houses and a hundred and thirty-six churches had been burnt down; and two years before, England had to endure the disgrace of the Dutch fleet riding in the Thames. And although the people had recovered to some extent from the effects of these calamities, yet the gaps made by the fire were in 1869 too evident. So that a more unfavourable time could hardly be chosen to become acquainted with London, and any one who knew continental cities could not help being disappointed at its appearance. Nearly all the public buildings must have been considered as mean: there was not one statue in all the streets, and there were no churches or palaces, like those to be seen in cities that bore no comparison with it in wealth or reputation. It is not then surprising to find it stated in this book, that with the exceptions of the Tower, the Saloon at Whitehall, Westminster Hall, and Lord Clarendon's New House, 'all the edifices were inconsiderable.' The ordinary houses are described as being in general of a common description, not very high, and built of wood and ill-baked bricks. Unlike Paris, there was seldom more than one family in each house. As an edict had been published enjoining that wood was to be used as little as possible, only the framing, doors, posts, &c., were then being made of it. More than five thousand houses had been rebuilt since the fire, in style approximating towards that introduced into Italy, and quite different from what was the ancient fashion here. The streets, too, were being widened and straightened, paved, and channels made at the sides. Buildings were increasing in number every day, to the profit of those who owned ground at a distance from the river, along which no more buildings were allowed to be erected, so as to make the city broader, it being then too long and too narrow; and the Italians were shrewd enough to see that, under such circumstances, Earl St. Alban's (in whose house they lodged), who owned the entire square or place in which his house was (the site of Jermyn Street and its neighbourhood), would soon have it covered with houses. Although we see that London 'continues to grow as fast as a young town of logwood by a water privilege in Michigan,' it is hard to realise the differences in area between the London of to-day and two hundred years ago. How strange it reads that Islington was a collection of houses in the country, that Moorfields 'was a place of two large inclosed squares; this leads to a second, and that again to a third, which are surrounded by abundance of mulberry trees, and add much to the agreeableness of the space of ground occupied by this grand place, which is appropriated to the sale of horses,' and to find the view from the back windows of St. James's Palace described as 'most beautiful and diversified, the eyes wandering over groves, meadows, the canal, Westminster and its suburbs, altogether forming a very lovely prospect!' But it is time we should turn from London in general to the principal buildings it had in 1869, and hear what the Italians thought of them. We will first take Whitehall, where, as Macaulay says, the king kept open house every day, and all day long, and where half the juggling and half the flirting of the metropolis was carried on. This they describe as being nothing more than an assemblage of several houses, badly built at different times and for different purposes, consisting of lodges, galleries, halls, and chambers, there being about two thousand of the latter. The only thing in it they thought worthy of a palace was the Banqueting Room, 'lately erected according to the rules of architecture, and adorned with pilasters and other decorations.' There could not be much difficulty at that time in determining the site of the scaffold, for they say that on one of the window stools 'are still to be seen drops of blood, which fell there in the execution of that dreadful enormity, so deeply imprinted that they cannot be obliterated from the spot, though they have been frequently washed in the hope of doing so.' Nor do they forget to state how Cromwell, through fear, went secretly every night, first into one and then into another of the numerous chambers, without even his domestics knowing his movements. Of St. James's Palace they thought but little: 'the building is ancient and mean, owing to the rudeness of the materials of which it is composed, and from the irregularity of its structure it has no external appearance of magnificence. It was then occupied by the Duke of York, in whose apartments were seen models of men of war, executed from the Duke's designs; for in 1669, as in 1869, it was a doubtful problem what was the best form for vessels, and both Charles and James were amateur naval architects; Charles in fact being so enthusiastic, that he was willing, if we may believe Burnet, to give even his enemies the benefit of his ability. The chapel was then set apart for the Roman Catholic services for the queen. St. James's Park is described as being surrounded by a wall, and having a long, straight, and spacious walk, intended for the game of the mall, with large elms growing on each side of it. Close by is a canal, the work of the Protector Cromwell, of nearly the same length as the walk, on which are several species of aquatic birds brought up and rendered domestic. The rest of the park is left uncultivated, and forms a wood for the retreat of deer and other quadrupeds. Old Somerset House, at that time set apart for the queen-mother, they thought 'a noble habitation.' In the court-yard was a long pole with a crown on top, set up when Charles was restored. Behind the palace was a garden extending to the river, with walks and elm groves for a shade to those who amused themselves with looking at the boats continually passing and re-passing on the water. Hyde Park was such another place as it is to-day—'many carriages with ladies and gentlemen assembling there of an evening.' They are careful to note that 'its beauty was greatly diminished by Cromwell, who, in order to render the vicinity of London more open, cut down the elms, which were planted in rows.' It was the custom that all persons, when they first met the King and Queen, or Duke and Duchess of York (who often went there), to salute them, but not afterwards. It was the rule, too, that laqueys and footmen were not permitted to enter the Park, but had to remain waiting outside the gates. The only house belonging to the nobility that is described is Lord Clarendon's famous house (which stood on the site of Albemarle Street), probably because it had so much of the Italian style

about it. The people, they say, have given it the name of Dunkirk House, for they consider my Lord Clarendon the cause of Dunkirk having been sold to France, and by this appellation would insinuate that the money gained in the negotiations had been employed in building this palace. It is in an advantageous position, which increases its magnificence, being in front of a wide street leading down to St. James's Palace, which is directly opposite it. Its form is square, the outside embellished with stone ornaments according to the rules of architecture, and is extremely light and cheerful, the interior being commodious and sumptuous. The garden is surrounded by walls, which support flourishing espaliers formed of various fruit trees, which render the view very agreeable, although the garden has no other ornament than compartments of earth filled with low and beautiful parterres and spacious walks. The next place we come to is Covent Garden, and this is what it was like in 1669: 'Two sides are occupied by houses, one by the façade of a church in a good style of architecture, and the other by the palace of the Earl of Bedford, the trees of which project over the walls, they not being raised much above the ground; and in the middle of the square is erected a pillar on which are several sun-dials, which serve for emblems, enlivened by various mottoes, one of which, alluding to the hours, says, "Perennet et imputantur." Near Covent Garden (somewhere about the site of the present Adelphi Theatre) there existed in the Strand, in those days, a Burlington Arcade sort of place, called the New Exchange. Although it had been only sixty years built in 1669, the Italians describe it as having lost its colour from age, and become quite blackish. 'It contains two long and double galleries, one above the other, in which are distributed, in several rows, great numbers of very rich shops of drapers and mercers, filled with goods of every kind, and with manufactures of the most beautiful description. They are, for the most part, under the care of well-dressed women, who are busily employed in work, although many are served by young men called apprentices.' As we accompany them down the 'great street called the Strand,' we next meet with old Temple Bar, which then 'served as a residence for some collegians, who study the ancient Norman language, in which are written the laws of the kingdom relating to the administration of justice; there are many masters appointed to instruct them and qualify them for pleaders.' In the chapel of the Temple they saw, on the pavement, many figures in basso-relievo, representing several knights in armour, with the badges of the order.

After leaving the Temple, we follow the Prince and his suite to the black mined stone heap that the fire converted old St. Paul's into. At the time they visited the ruins, a great part of Inigo Jones's portico was left, and as it might be expected, from being in the Italian style, they thought highly of it, 'and its stones worked with great perfection and symmetry according to the rules of the Corinthian order.' Of what was left of the rest of the church they say, 'one sees only a huge heap of stones cemented together by the lead with which the church was covered; this, when melted, fell amongst the ruins, which have entirely covered the relics of antiquity that were there formerly, and demolished many splendid monuments, both of Catholic bishops and other distinguished men.* The difficulties with which, as Carlyle says, brave Sir Christopher had to contend, arising from foolish unarchitectural bishops, red tape officials, and idle Nell Gwyn defamers of the faith, seem foreshadowed in the observation, 'that the king, in order that the memory of this temple may not be lost, has resolved to restore it, not indeed to place it again in its primitive and magnificent condition, which could not be accomplished but at vast expense, but to render it fit for the worship of the Anglican sect, and sufficiently capacious to contain the people.'

Two hundred years ago it was the fashion to dabble a little in science. Charles had not long founded the Royal Society, and instead of wild dreams of politics, wilder dreams of science occupied the thoughts of many people. Through the influence of John Evelyn, Gresham College (with a collection of books belonging to Lord Howard, of which he didn't know the use) was made over to the Society, and as we are in the City with the Prince we may take the opportunity of visiting in his company the 'King's Brivy Council for Philosophy and his Great Council for the three Estates of Mathematics, Mechanics, and Physics,' as Graunt styled the Society. It would appear that the Prince did not visit it on a Thursday, the day on which the Society met, after dinner, as there is no account of the proceedings. We get a glimpse, however, of their museum, at that time in charge of 'Doctor Robert Hook, a man of genius and of much esteem in experimental matters,' in which, amongst other strange things, were 'an ostrich whose young were always born alive, an herb which grew in the stomach of a thrush, the skin of a Moor tanned with the beard and hair white; but more worthy of observation than all the rest is a clock whose movements are derived from the vicinity of a loadstone, and it is so adjusted as to discover the distances of countries at sea by the longitude; towards this the planets or satellites of Jupiter are of great service.' At the head of the scientific men of that day stood the Hon. Robert Boyle, who, as Herschel says, seemed animated by an enthusiasm of ardour which hurried him from subject to subject, and from experiment to experiment, with a sort of undistinguishing appetite. He was visited by Cosmo, and his character must have made a deep impression on Magalotti, the chronicler of this traveller's history. 'If in his person,' he says, 'the true belief had been united with correctness of a moral life, nothing would have remained to be desired,' and it is said he endeavoured to remove the one imperfection by trying to convert him. Boyle was after making his improvements in the air-pump, and great things were expected to be done with its assistance. The Prince was shown 'many beautiful experiments to discover the effect of the rarefaction and compression of air upon bodies, by observing what took place with animals when exposed to it, and hence may be learned the cause of rheumatism, catarrhs and other contagious disorders produced by air, and of various natural indispositions.' The air-pump has done good service to science, but somehow with all its help the rheumatism and catarrhs unfortunately continue amongst us. The Prince saw an instrument that indicated and registered the changes in the weather 'by means of a watch, a thermometer, a mariner's compass, and a small sail like that of a windmill,' another in-

strument that might be useful nowadays in technical education; 'and by this said person who has never learned, may draw any object whatsoever; a globe of the moon, of peculiar construction, and several other things worthy of attention,' with all of which he gratified his curiosity in the most agreeable manner. There was another visit he made in connection with science which deserves to be recorded, and that was to the Mangia of Worcester's engine at Vauxhall for raising water, which is thus described: 'It raises water more than forty geometrical feet by the power of one man only, and in a very short space of time will draw up four vessels of water through a tube or channel not more than a span in width, on which account it is considered to be of greater service to the public than the other machine near Somerset House.' It is curious that no notice is taken of the principle of the machine, its appearance or size, nor is it possible to infer from this description whether any use was made of it for the public, but there is little doubt it was our first steam engine.* The other machine near Somerset House, which conveyed the river water to a great part of the metropolis, is described as being raised upon a wooden tower, and put in motion by two horses, which were continually going round.

(To be continued.)

THE LAW AND SCIENCE OF ANCIENT LIGHTS.

By HONORABLE COX, M.A., BARRISTER-AT-LAW.

PART I.

Legal Principles.

IN suits and actions respecting ancient lights, a material question usually arises as to the extent of the injury experienced or apprehended. The plaintiff has for many years enjoyed the access of light to his windows, and they are obscured, or about to be obscured, by the erection of contiguous buildings. How is the obscuration to be measured? The published investigations of this subject are very imperfect, and some of them show a ludicrous ignorance of well-established principles of optics. The evidence of the persons who, by legal courtesy, are called 'experts' is often absolutely worthless; and in various papers read before learned societies respecting this subject, the methods of calculating obscuration are, I do not hesitate to say, so utterly erroneous that they fail to give even approximately accurate results.

The question, besides its practical importance, is one of great interest both to the lawyer and the mathematician. It unfortunately happens that an exact solution cannot be obtained without mathematics; and hence an objection may be urged with reference to the process about to be explained, that it is too scientific and abstruse. The law, it may be argued, will not take cognisance of the niceties of mathematics, but will deal out justice by broader and simpler rules. The answer to this argument is, that accuracy is a primary condition of justice, and that unless the rules of optics are applied with precision, at least in establishing the general theory of the subject, the grossest injustice may sometimes be inadvertently committed. Besides, when the general theory has been settled, the application of it is extremely simple, and requires nothing more than a rudimentary knowledge of arithmetic and surveying.

Judges continually lay the greatest stress upon the degree of obscuration. For instance, in the case of *Martin v. Haddon* (2 Law Rep. Eq. 426), before Vice-Chancellor Kindersley, that very eminent Equity judge observes, with reference to the particular case before him:—'The quantum of sky-area which the new elevation shuts out is about thirteen degrees measured horizontally, and eight or nine degrees measured vertically. That is in itself a very small portion of the total sky-area visible to a person looking out of a vertical window where there is no obstruction; which area is of course 180 degrees measured horizontally, and 90 degrees measured vertically. . . . But, at the time when the defendant commenced his new building, a very large portion of the sky-area was already shut out of the plaintiff's workshop window by pre-existing buildings, and only a very limited portion of sky-area remained available for that window. And the question is, not what proportion of the total sky-area does the defendant's new erection shut out from the plaintiff's window, but what proportion does it shut out of that "proportion" of the sky-area which was not already shut out by existing buildings.'

This passage is quoted because it shows very clearly the general character of the problem to be solved. I shall endeavour to show hereafter that the principle of the calculation here given is incomplete, and that in many cases the obscuration is to be measured, not by the degrees or angular measurement here indicated, but by a proper linear or superficial measurement. This judgment, however, is in other respects very valuable and instructive. It shows that the subject, unlike most other branches of law, is essentially quantitative. To the same effect may be cited *Webb v. Hunt* (14 W. R. 725, and 'Weekly Notes' of 1866, p. 165), where it was held that a deprivation of nearly one-half the light enjoyed by the plaintiff's windows justified the interference of the Court.

SECTION I.—The Right derived from long enjoyment.

For the sake of clearness it will be necessary to explain some of the more important features of the law of ancient lights. In the first place the right is dependent on long enjoyment. The modern rule in this respect is contained in the following section of the Prescription Act (2 and 3 Will. IV. c. 71 § 3.)

'And be it further enacted that when the access and use of light to and for any dwelling house, workshop, or other building shall have been actually enjoyed therewith for the full period of twenty years without interruption, the right thereto shall be deemed absolute and indefeasible, any local usage or custom to the contrary notwithstanding; unless it shall appear that the same was enjoyed by some consent or agreement expressly made or given for that purpose by deed or writing.'

The right is therefore statutory, and is based upon uninterrupted enjoyment for a period of 20 years. Upon this point it will be useful to quote

* It is curious how closely the Italians' description agrees with the entry in Evelyn's *Diary* for September 7, 1666.

* Why do all writers on the steam engine that mention this visit give the date of it as 1666 instead of 1669?

Lord Westbury's judgment in the House of Lords in the case of *Tapling v. Jones* (11 H. L. Cases, 290), which was argued most elaborately. Lord Westbury says, 'The right to what is called an ancient light now depends upon positive enactment. It is matter *juris positivi*, and does not require, and therefore ought not to be rested upon, any presumption of grant, or any fiction of a license having been obtained from an adjoining proprietor. . . . After an enjoyment of an access of light for 20 years without interruption the right is declared by the statute to be absolute and indefeasible; and it would seem therefore that it cannot be lost or defeated by a subsequent temporary intermission of enjoyment not amounting to abandonment. Moreover, the absolute and indefeasible right which is the creation of the statute is not subjected to any condition or qualification; nor is it made liable to be affected or prejudiced by any attempt to extend the access or use of light beyond that which having been enjoyed uninterruptedly during the required period is declared to be not liable to be defeated.' Lord Westbury goes on to criticize, with his usual acuteness, the expression 'the right to obstruct a new light,' which he regards as fallacious. The right is that of a man to use his own land, though his so using it may obstruct the light received through the window of an adjacent house.

When it is said that the right depends upon 20 years' uninterrupted enjoyment, it must be understood that the word 'enjoyed' in the statute does not necessarily imply that the building for which this right is claimed must be occupied, or even fit for occupation, during the whole of the 20 years. This point was raised (January, 1869), in the recent case of *Courtauld v. Legh* in the Court of Exchequer (4 Law. Rep. Common Law, p. 126). There the plaintiff's house was completed as to its external and internal walls, roofs, floors, and windows, more than 30 years ago, but the fittings, papering, and painting were not completed, and the house was not inhabited or rendered habitable until about 15 years before the date of the action. Yet the Court of Exchequer held that the statutory right to light and air was complete. The house and windows were 'enjoyed,' not by occupation, but by ownership.

It follows, from the principles already laid down, that the owner of ancient lights cannot, on the one hand, destroy his privilege as against his neighbour, nor, on the other hand, extend that privilege by enlarging his windows. The neighbour has a right to obstruct his new windows, or new portions of windows, but, on the other hand, he must not do so in such a way as to obscure the old lights. Such is the effect of the curious and instructive case of *Tapling v. Jones* above cited. The plaintiff had made extensive alterations of his house, and lowered the first and second storeys and the windows in them; but the new windows occupied part of the site of the old apertures. The defendant, after these alterations were made by the plaintiff, erected a lofty warehouse, which obstructed the whole of the plaintiff's lights. The plaintiff thereupon caused them to be restored to their former state as to size and position, and called on the defendant to restore the former enjoyment of light and air. The case occasioned a great diversity of opinion in the Courts below, but when it came before the House of Lords, there was a unanimous opinion in favour of the plaintiff. Lord Westbury asked whether a man having an absolute and indefeasible right to a certain access of light could defeat it by opening new windows, and answered the question in the negative. The opening of new windows was not in a legal sense an injury to the neighbour. He might obstruct the new portions; but not so as to darken the old lights. He considered that the defendant's wall, so far as it obstructed the ancient apertures, was an illegal act from the beginning. Lord Cranworth to the same effect said:—'He has a right to build, and if thereby he obstructs the new lights he is not committing a wrong. But what ground is there for contending that because his building so as to obstruct a new light would afford no ground of complaint, therefore, if he cannot so build without committing a trespass, he may commit a trespass? I can discover no principle to warrant any such inference.'

It will be observed that this important decision of the Supreme Court of Appeal in 1865 enormously increases in practice the privilege of free access for light, and in crowded cities like London greatly restricts the power of erecting new and lofty structures overshadowing a neighbour's land. It was forcibly argued at the bar by Sir Roundell Palmer, that if the defendant might obstruct the new lights only, and not the old with them, the effect would be that a person who has an ancient window may acquire a right to any number of additional windows by so contriving their position as to place them completely under the protection of the ancient window. Undoubtedly this consequence must often follow in practice from the decision in *Tapling v. Jones*. One side of a building may be a great dead wall, with the exception of a single aperture. The owner may open out as many more as he pleases, and they will all enjoy the privilege of the first, if his neighbour cannot obstruct the new without obstructing the old.

SECTION II.—Rural and Urban Occupiers.

Another controversy of equal importance refers to the relative rights of rural and urban occupiers. In the case of *Clarke v. Clarke* (1 Law Rep. Ch. Ap. 16), Lord Chancellor Cranworth is supposed to have held that the right to access of light was not so extensive in towns as in the country. His Lordship said:—'Persons who live in towns, and more especially in large cities, cannot expect to enjoy continually the same unobstructed volumes of light and air as fall to the lot of those who live in the country. The steady spread of buildings in and round large towns gradually but surely obstructs some of the light and air which the houses in the interior of the place formerly enjoyed. And, in estimating the damage, if any, occasioned to the plaintiff, we must not omit the consideration that the place in which he complains of obstruction to light and air is a large and populous city.' This dictum led to rather alarming consequences. It might be inferred that occupiers in towns were to submit to a greater degree of injury than dwellers in the country; and two of the cases which followed seem to have been based on that principle (*Durrell v. Priethard*, 1 Law Rep. Ch. Ap. 244; *Robson v. Whittingham*, *Ibid.*, p. 442). In both those cases Lord Justice Turner expressed his assent to the principle laid down by Lord Cranworth in *Clarke v. Clarke*, and added, 'I think that this class of cases had been carried too far before the decision in *Clarke v. Clarke* was pronounced.'

Obviously these decisions of the Appellate Courts affected the very founda-

tion of the law of ancient lights. The litigation almost universally arises with respect to houses in towns; and if the proposition is established that the occupiers of such houses are to submit to encroachments which would not be tolerated in the country, it is not difficult to see, that by degrees all the light which could be obstructed by neighbouring structures might be taken away with impunity. It seems, however, clear that either Lord Cranworth was misunderstood, or that he changed his opinion, for in a later case of *Yates v. Jack* (1 Law Rep. Ch. Ap. p. 295), decided in March, 1866, he fully recognised the rights of urban occupiers to the unimpaired enjoyment of their ancient lights. The case seems to show that such an occupier is entitled to substantial preservation of all his light—not merely of so much as suffices for the trade in which he happens to be engaged—but of all that may be required for any future purpose. This latter proposition, however, is apparently in conflict with Lord Westbury's decision in *Jackson v. the Duke of Newcastle* (33 Law J., Ch. 698), and must be received with the qualifications and limitations stated by Vice-Chancellor Wood (now Lord Hatherley) in the case *Dent v. Auction Mart Co.*, to be mentioned presently. Lord Cranworth's words are—'The right conferred, or recognised, by the statute 2 & 3 Wm. IV. c. 71, is an absolute, indefeasible right to the enjoyment of the light without reference to the purposes for which it has been used. Therefore, even if the evidence satisfied me—which it does not—that for the purpose of their present business a strong light is not necessary, and that the plaintiffs will still have sufficient light remaining, I should not think the defendant had established his defence, unless he had shown that for whatever purpose the plaintiff might wish to employ the light, there would be no material interference with it.'

Only four days later (March 28, 1866) Vice-Chancellor Wood gave his judgment in the case of *Dent v. Auction Mart Co.* (3 Law Rep. Eq. 238), and observed that the decision of Lord Cranworth, last mentioned, removed the difficulty occasioned by his observations in *Clarke v. Clarke*, and proceeded:—'I cannot suppose the Lord Chancellor on the Land and Justice to mean that in reality there is any substantial difference between the right which a plaintiff has to seek the protection of this Court when he lives in a town and that which he would have if he resided in the country.' In the case of *Morris v. Headon* (2 Law Rep. Eq. 425), Vice-Chancellor Kindersley followed this decision of Vice-Chancellor Wood, and added that, 'with respect to the right of the owner of ancient lights to be protected against any obstruction to the access of light and air to his windows, there is no distinction between houses in towns and houses in the country.'

(To be continued.)

THE STRIKES IN THE BUILDING TRADE.

IN Yorkshire and Lancashire the masters have just issued an appeal to all operative masons not belonging to the Union, offering them work as old hands with especial advantages. The appeal, which is signed by twenty-eight of the principal building firms in Leeds, Sheffield, Manchester, Wigan, Bradford, Wolverhampton, and Coventry, states that every effort which has been made by Lord Lichfield, Lord Elcho, Mr. Hughes, M.P., Mr. Mundella, M.P., Mr. S. Morley, M.P., and other gentlemen connected with the building trade, has been of no avail, and they now have come to the determination to offer the following terms: to all masons employed by the undersigned in Manchester 7½d. per hour, 54½ hours to constitute a week of 38s.; Bolton, 7½d. per hour, 54½ hours per week, 38s.; Leeds, 7½d. per hour, 50 hours per week, 30s. 3d.; Coventry, 6½d. per hour, 57 hours per week, 30s.; Sheffield, 7d. per hour, 55½ hours per week, 32s. 6d.; Wolverhampton, 6½d. per hour, 56½ hours per week, 32s.; Bradford, 7½d. per hour, 50½ hours per week, 30s. 6d. The masters also propose to pay the railway fares of men, at the end of a fortnight, from whence they came; or if at the end of the month the terms of employment are not satisfactory, the master will pay the mason's railway fare back, and also protect the new hands from all annoyance and molestation.

WENDOVER PARISH CHURCH.

THE parish church of St. Mary has during the past year been undergoing a thorough restoration, both internal and external, and on the 1st inst. the edifice was re-opened by the Bishop of Oxford. The church is of the Gothic style of architecture, with square embattled tower, nave, with north and south aisles, and chancel. The interior of the edifice presents a marked contrast to its condition before the restoration. On the south side the old tracery in the windows has been cut out, and refitted with new tracery as in the original edifice. The plaster covering the external walls has been removed, and the surface newly faced in flint, with Bath dressings. The old brick buttresses have been destroyed, and new flint-faced and stone-dressed ones erected in their place. Most of the buttresses around the building are entirely new. The singular brick buttresses at the tower have also been re-faced with stone and flint. The clerestory walls have been brought down to a level with the nave arches. The different roofs are entirely new, except those of the side aisles, which are re-leaded. The nave roof has been raised to its former pitch and new tiled, the chancel and chancel aisles being also tiled. The old porches have been taken away, and new ones erected in their place. The windows have been re-glazed with cathedral glass. The interior has also been thoroughly renovated. The floor is paved with Lugwardine tiling, ornamented in the chancel. An oak credence table placed in the chancel is deserving of notice. The altar rail is of brass, with ornamental scroll-work. The communion table is of handsome make in oak, and is covered by a splendid altar-cloth. There are, too, some very handsome oak stalls in this portion of the edifice. The seats are open, and of oak throughout the building. There is a new font of Caen stone, the work of Mr. W. Thompson, of Aylesbury, from a design by the architect. The oak stalls are by Mr. Cooper, of Aylesbury. The roof inside is of open deal.

The cost of the whole work amounts to about 4,000l., the greater portion of which has been supplied by Colonel Smith and other members of the family. The architect is G. E. Street, Esq., A.R.A., diocesan architect; the contractor, Mr. G. Cooper, of Aylesbury; and the stonework is by Mr. W. Thompson, of the same place.

NEW BLACKFRIARS BRIDGE.

AS far as regards the ironwork and the piers, the new bridge may be said to be complete. The ironwork has had two coats of paint; the last to be given is one of a rich bronze green. The outer iron spandrels of the arches are covered at the intersections of the lattice work with large ornamental bosses, much after the pattern of the well-known heraldic rose. These decorations are to be richly gilt, and the colour contrasts which will be afforded by the gilding, the bronze green, the red polished granite, and the white carved stonework, will make this bridge, as seen from the river, one of the most beautiful works of its kind. All the granite columns have been fixed, and polished to the smoothness of an agate. Each column stands on a richly-carved pedestal of white Portland stone, and is surmounted by a most massive capital carved in birds, flowers, and sea and river weeds. Four of these capitals have been finished. The other four are well in hand. Above these capitals will be placed the carved recesses, in each of which branched lamps will be placed as beacons to warn the passing river traffic by night where the sharp-edged piers are. A double row of lights like this will certainly be necessary on a bridge where the footways are 15 feet broad and the roadway nearly 50 feet. About two-fifths of the whole bridge have already been paved with buckle-plates. The abutments on the Surrey side are finished. These are noble monuments of stone work. They rise with the solidity of the old Egyptian temples, and with a massiveness that is really grand. They are each surmounted with bold, splendidly-carved cornices, and when seen at low water, rising to a height of nearly 60 feet from the shore, have a most imposing effect. Nearly all the ornamental parapet-work has been delivered at the bridge, but only a few short lengths have been placed in position. It is a very ornate specimen of Venetian Gothic in its most florid style, and does great credit to the founders. From the inside of the bridge this parapet will appear rather low, being only 3 feet 6 inches in height. From the river, however, it will look bold and sufficiently lofty, as it will stand on the summit of a rich cornice. The new bridge will cost altogether about 320,000*l.*, or at the rate of about 4*l.* the superficial foot. At this rate it will be one of the cheapest permanent bridges yet built in London.—*The Ironmonger*, May 31.

LIVERPOOL MANURE WHARVES, SANDHILLS.

THESE extensive and convenient premises, in course of erection during the last twelve months, have been completed, and will be at once delivered to the Corporation by the contractor, Mr. Wells, of Birkett Street. The building, wharves, and other works have been constructed from designs by Mr. Newlands, the borough engineer, and are very suitable for their purpose. The building itself, which fronts Commercial Road, is 535 feet in length, the main elevation being ornamental in appearance. In the centre are the stable-lofts and other apartments, the stables being in wings on each side. At the north and south ends respectively are the general superintendent's and stable-keeper's houses. The yard and wharves to the canal boundary are about 180 yards in length by about 50 yards in depth, and occupy an area of between two and three acres. The stables, commodiously arranged and substantially finished, are six in number, and contain accommodation for sixty-five horses. In connection with the main building there are also a large storehouse, smithy, wheelwrights' shop, and veterinary hospital, and, immediately adjacent, is an engine-house with chimney 60 feet high, together with a cookhouse for cooking the horses' food by steam. The yard and the stables extend about 35 yards towards the canal on a high level. Beyond this again are the wharves, extending to the edge of the canal, which at this point has been widened to the extent of six yards. The wharves immediately on the edge of the canal are 15 yards in depth, running in length 150 yards, uniform with the canal as widened. A strong pier-wall has been erected at the canal, with two projecting piers at each end, extending to the ordinary east boundary of the canal, and forming a basin to the wharves. Over this basin six iron tips, each 42 feet in length, have been erected, and from these tips the manure will be discharged from the carts into the boats. Provision is also made for the manure being discharged into railway waggons as well as into the canal boats, and to effect this a railway connected with the Lancashire and Yorkshire line runs along the wharf, immediately under a high level boundary wall, from which the manure can be discharged direct from the carts into the trucks. Facilities are therefore afforded for the quick despatch of the manure both by railway and canal. There is also another similar line running parallel with it over the wharves, and connected with the Yorkshire and Lancashire Railway, this last branch having been specially stipulated for by the Earl of Derby for the accommodation of his tenantry and property in that locality. On the opening of the new establishment at Sandhills the Phillips Street wharves will, in all probability, be closed.

PRE-HISTORIC REMAINS.

THE Rev. Canon Greenwell, of Durham, has concluded a survey of the ancient roads, camps, cairns, Druids' circles, and pit dwellings of Northumberland. Two cairns were examined at Burgh Hill, parish of Rothbury, on the south side of the Coquet, and just to the north of the fine British camp at Lordenshaws, on high ground, at the east end of the Simonside range. The whole district abounds in remains of pre-historic times. Not far to the west of the Lordenshaws camp is another interesting one at Tosson, to the north of which four cists, containing unburnt contracted bodies, were found, with two urns, two large jet buttons, an iron spear-head, a bronze buckle, and a club made from a red deer's antler. One of the human skulls has been engraved by Drs. Davis and Thurnam. Afterwards, in a hollow between two large stones, and about midway between the two camps named, and upon the slope of Simonside, two bronze, leaf-shaped swords, with three rings, and the pommels of the sword handles, were found, and are now in the museum of the Duke of Northumberland at Alnwick Castle. On the north side of the Coquet, and about three miles

from where the above-mentioned relics were deposited, another bronze sword was found, with two rings. This is in possession of Sir William Armstrong, at Crag-side. Large stone cairns crown the ridges of the hills. The first cairn was 32 feet diameter, and 5 feet high. In the centre was a cist made of four slabs of stone, set on edge, and covered by a single slab 5 feet by 4 feet and 7 inches thick. The bottom was the natural surface of the ground. The cist was quite empty, the body buried there having gone entirely to decay. This is almost always the case in ancient burials, where, as in a cairn of stones, the air has free admission. No relics had been interred with the body. The second cairn was a few yards to the west of the first, 26 feet diameter, and 4 feet high. At the centre was a cist formed of four slabs set on edge, with a cover 3 feet by 2 feet 3 inches, with a second and smaller one laid on the top of it. The body had been laid in the cist, and then covered with light sand, but, as in the preceding opening, not the least trace of it was found. Among the sand were pieces of charcoal and sherds of British pottery. Within the camp at Lordenshaws were two (if not three) 'hut circles'—the foundations of the humble habitations in which these early people lived. One of these was examined by clearing out the soil which had accumulated within it. It was not quite circular, having a 19 feet N. and S. diameter, and a 17 feet E. and W. The surrounding wall was 3 feet thick, and 14 inches high, and in some places was very regularly laid in courses of carefully selected stones. The entrance had been on the S.E. side, but from the walling being somewhat destroyed the exact width could not be made out. On the south and east sides the hut had been flagged. None of the floor stones showed signs of fire, but there were several showing fire action found above the floor. A row of floor stones extended round the circle, and at the north-east side one had been used as a grindstone, and was worn quite smooth. One flagstone had a hole bored through it. No charcoal, potsherds, bones, or flints were found, nor anything which showed sign of habitation except the burnt stones and the two floor-stones named. One relic, supposed to be a whetstone, was, however, found. Two places of sepulture were examined on the north side of the Coquet upon Cartington Fell. One was a flat bowl-shaped cairn, of large size, in the centre of which was a cist. Near the cist was a deposit of burnt bones, the remains of a body which had been burnt on the spot, and covered with charcoal and a flat stone. About 100 yards north of this cairn was a circle of large stones, eight of which were standing and one laid down. The inner diameter of the circle was 14 feet. These stones were partly enclosed within a cairn, 28 feet diameter and 3½ feet high, and it is probable that at one time the inner space of the circle had been filled with stones since removed for walling purposes, and that the circle was within a cairn. At the centre was a hole which contained the bones of a burnt body.

ILLUSTRATIONS.

THE BERLIN CATHEDRAL COMPETITION.

IN a recent issue (No. 20) we presented to our readers a collection of the twelve principal plans which attracted attention during the Exhibition of Designs for a new Protestant Cathedral for the capital of Prussia, and we alluded briefly to the history of what, up to this moment at least, is barely more than a *good intention*. We say barely, because, as our readers are aware, a beginning was at one time actually made with the Campo Santo, the works of which were, however, stopped in the year of Continental trouble, 1848. In the present issue we return to this subject, in order to give a page of some of the elevations, and so to complete our information concerning a competition which, considering the scale and character of the proposed edifice, may not unjustly be called one of the most important since the Reformation. In doing so, we think a few words on each design may not be unwelcome.

No. 1. *Stüler*.—On comparing this elevation with Plan 3, it will be found not to agree. This is because the late M. Stüler submitted two designs, and the plan exhibits the first of these. In 1855 he submitted another, only retaining the Campo Santo and centre projecting portico, and it is this second design of which we give the front elevation. A reference to Plan 3 will show an interior space of 223 feet by 210 feet divided into a nave 80 feet wide by 140 feet high, with a series of round arches rising to a height of 55 feet, and containing galleries. The nave is flanked by four aisles and the ceilings throughout are flat, only broken by iron girders under the principals. Behind the portico of seven openings rose the gable of nave 159 feet high, having on either side two enormous towers 352 feet high.

The Campo Santo is a court 183 feet square, surrounded by cloisters, the inner walls of which are to contain Cornelius' frescos, and on the eastern side are arranged the Royal Mausoleum and the vestries. Colonnades connect the building with the Palace on the right and the Museum on the left; this idea has been retained by most of the present competitors (see plans 2, 3, 4, 6, 8, 9, 10). The interior decoration is in mosaics, frescos, marble, bronze, and gold; the exterior of brick, with terra cotta ornamentation to string courses and openings. The *second* design differs considerably from the first, the chief feature being the dome, 135 feet diameter, which rises to a total height of 320 feet to foot of lantern. The façade immediately over the portico shows that the four aisles have given place to two only, but the way in which the three bays rise above the seven arcades is not quite happy. The treatment of the dome is in Italianised Romanesque—the angle towers, however, with their storeyed arcades, are purely Italian.

No. 2. *Orth*. Plan No. 9. The general arrangement of this design is a space 160 feet square for festival services, having on its western side the church, 160 feet by 50 feet. The whole is surrounded by arcades 20 feet wide, running round three sides, whilst the fourth contains the chancel with apsidal end, and two chapels for christenings and weddings. Eight very slight columns, placed so as to form four large and four small sides, carry a dome 100 feet diameter. The portico, in front of which is a terrace with altar for very great open air occasions, is connected by arcing, with two octagonal towers 190 feet high, whilst the dome is 240 feet high. The style is modern-German Romanesque, with purely classic details in pilasters and architraves.

FIG. 9.

No. 3. *Ende and Boeckmann*. Plan No. 1.—Here, too, there is an arrangement for festival and ordinary occasions, and the altar is placed midway so as to serve both purposes. The easternmost part resembles a huge chancel with its aisles on either side, in which are slightly raised galleries indicated on plan. A dome 120 feet diameter rises from a square central space, the cut-off corners being large enough to form chapels for ceremonies of a partly private character, and the north and south arches supporting the dome lead to shallow transepts, whilst the west arch opens upon the pronaos or vestibule, the latter, however, still forming an integral portion of the church. The west front is 140 feet high, flanked by towers 240 feet high, which in their upper storeys are octagonal, surmounted by small domes. The great central dome is 345 feet to foot of lantern, and reminds us of St. Peter's at Rome, especially in the treatment of the two pilastered storeys immediately under the springing of the curve.

No. 4 and 5. *Adler*. Plan No. 10.—Four massive piers, only broken up by narrow staircases leading to the galleries, support, at a height of 150 feet, an octagonal structure 60 feet high, above which rises a dome (circular on plan) to an altitude of 300 feet from the ground to foot of lantern. Three of the four arches, 100 feet high, contain galleries in two storeys, one 20 feet from the ground, the other at the level of the springing of the arch, but further back, and over the two storeys of corridors which, on the ground-floor, almost surround the entire church (see section). On the fourth or east side is the chancel ending in an apse, which is circular within, but octagonal without. Three arched bays, surmounted by a flat pediment, form the portico. The octagonal drum under the dome, with its cornice at a little more than middle height, reminds one of Santa Maria del Fiore at Florence, but there the resemblance ends, for whilst in the latter instance the upper half of the drum is pierced by circular windows, and carries an octagonal dome, Mr. Adler's design shows semi-circular openings spanning the width of a group of three lights in the lower half and supports a circular-ribbed dome. The details are Renaissance, and the material is taken as stone throughout, a circumstance not without pecuniary drawbacks in a district naturally so peculiarly destitute of that commodity.

No. 6. *Gropius and Schmieden*. Plan No. 12.—The plan of this design would please Mr. Spurgeon; it is essentially a "congregational" arrangement. A central space, 130 feet square, with the corners cut off and formed into niches, is bounded on three sides by high semi-circular arches, with galleries in the shallow transepts. The staircases to these galleries are arranged in the corners which reduce the external contour into a simple square. The fourth side is occupied by the chancel and vestries. The octagonal centre rises to a height of 130 feet, upon which is placed a circular arcaded drum 90 feet high; on this rests the dome, which is 310 feet high, with an exterior diameter of 150 and an internal one of 130 feet. The top of the dome is formed by an iron ring nearly 70 feet in diameter, which admits of the introduction of a huge top light, and upon this rests the lantern, ending in a spire. A portico of seven openings by two deep is surmounted by a flat pitched pediment, and is flanked by two square towers about 225 feet high, the cornices and string courses of the main building returning round the same. The material is brick throughout, with occasional use of terra-cotta.

No. 7. *Eggert*. Plan No. 11.—This design is in plan not unlike the last; by a series of ambulatories and projecting porticoes on the south and west, some valuable space seems uselessly sacrificed, but for the greater advantages gained in the treatment of the exterior. A dome, 112 feet diameter, reduced to 100 feet higher up, occupies the centre, resting upon four wide and four narrow arches, and rising to a height of 260 feet to foot of lantern. As in most of the other designs, galleries are arranged in either shallow transept; the western opening contains the choir and organ, placed high, so as not to intercept the effect of the dome on entering. The vertical portion of the central space under the dome is 177 feet wide, and at a height of 125 feet terminates in a rice cornice; from this springs the dome, the thrust of which is taken by the massive piers forming the four angles of the square substructure. The elevation presents a singularly varied and imposing exterior. The front of the short nave or pronaos is formed by a bold arch flanked by short towers in which the arch form is repeated in a modified degree, and the great rose window under the arch is crowned by a flat gable in which we recognise some of the characteristics of Rhenish Byzantine. Behind this spreads, not rises, the main building, flanked by two towers at the angles, 150 feet high, and beyond this rises the dome. A row of 20 windows are divided by slightly projecting pilasters, then comes a low tier of arcading, whence the dome rises out of a series of semicircular openings, with a gable and a 'victory' over each. The style is Byzantine although not without a feeling of Italian Renaissance, particularly in the towers.

No. 8. *Klingenberg*. Plan 6.—This is an Italianised Germanised 14th century Gothic design, owing to which fact it was honourably mentioned on account of the merits of the plan rather than of the elevation. Upon 12 unnecessarily massive piers rests a dome 126 feet diameter; the sides of the polygon are 60 feet high and only 33 feet long, notwithstanding the great diameter of the space obtained, and the arches in these sides are 22 feet in the clear, opening on to a sort of polygonal aisle, 20 feet wide, running round the central space, but interrupted in the east by the chancel, and in the west by a nave 65 feet by 40 feet, and intended for ordinary services. Over the encircling aisle galleries are arranged, 30 feet from the floor of the church, which seems somewhat too high for practical use; it has the effect, however, of getting them out of the way. The west front of the nave is 75 feet high, the chief feature being a pointed enriched and recessed arch flanked by two octagonal towers. On the right and left is a 'Gothic' arcade, behind which rises the main structure of the church, led up to by a series of 'ridge and valley' roofs over the aisles and small chapels. Twelve enormous windows, nearly 80 feet high, are divided by flying buttresses partially filled in; then follows a low storey with three arches over each window, and thence springs the circular dome, crowned by a lantern, the top of which is 370 feet from the ground. The exterior dome itself is 275 feet high, and there is a second internal one only 250 feet high. The materials for this design are brick and stone.

Nos. 9 & 10. *Heyden and Kyllmann*. Plan No. 2. This design seems

to show more than any other, more even than that by Mr. Orth (plan 9), a somewhat satisfactory solution of the 'two churches' theory, and in giving greater prominence to the space for ordinary services than Mr. Orth was able to do, these gentlemen have hit upon the hexagonal arrangement for the festival portion, utilising the surrounding chapels for that purpose. The sides of the central hexagon, which carries the dome, are 55 feet wide; from a sub-base spring a series of clustered columns, over which, at a height of 50 feet, runs an entablature round the whole church. The arches are surmounted by a high frieze ornamented with a continuous fresco-painting. A gallery runs round the central space above this, as at Boulogne, and then twelve well-proportioned windows, divided by pilasters, form the drum of a flattened dome 100 feet diameter and 220 feet high from the floor of the church. The space intended for ordinary service consists of a space 70 feet square and 100 feet high, covered by a very flat dome, with two smaller squares on each side also covered with domes, and communicating with the larger hexagonal chapels. There are no galleries, except one for the organ at the west end, and curtains shut off the larger space on ordinary occasions. The portico consists rather of an enormous *porte cochère*, with a triumphal arch as high as the Arc de l'Etoile at Paris. Beneath it is placed an equestrian statue of the King. On either side rise two towers together, with their spires 240 feet high, between which is the dome, 280 feet to foot of lantern. The twelve-sided drum at its base is deeply recessed, giving great richness to this part of the structure, and is surmounted by a cornice and balustrade broken up by pedestals and statues. The circular windows in the dome give light to the top open ring of the inner dome. The design collectively and in its details is Italian Renaissance, and would harmonize, more than any of the other designs, with the Castle on the one hand and the Museum on the other.

No. 11. *Spielberg*. Plan No. 4.—Four angle piers, broken up by small circular recesses, carry a flat dome 115 feet diameter and 250 feet high. As in some of the other designs, three of the main arches open on to flat transepts. Beyond the fourth arch is the chancel which forms the base of a tower originally designed 500 feet high, but afterwards lowered to 400 feet, as shown. The west front is composed of a large arch 90 feet high by 50 feet broad, filled in with an independent arrangement of doors and windows, and the whole crowned with a flat gable. The four angle towers do not detach themselves from the main building until 130 feet high, when they end with octagonal sides and pointed domes. Between them is the flat dome, resting on a twelve-sided drum, having strongly marked pilasters at the angles, and pierced by a series of rose windows. Beyond rises the tower over the chancel, octagonal on plan, and with a pointed dome. The design, which in parts is almost Saracenic, is supposed to be in brick, with a liberal use of terra-cotta.

We have thus concluded a brief description of this very interesting set of competitive designs. The elevations—which, for want of space, we have not been able to include in the present double sheet of engravings—are those of Messrs. Schinckel, Stier, and Von Quast—plans 7, 8, and 9. We have added at Figs. 12 and 13 the outlines of some of the chief buildings which at present more or less surround the site, in order to give an idea of the relative heights of these buildings, compared with those of the designs which we have just described.

A, Fig. 12, is part of Schinckel's Royal Museum, in strictly Greek (Ionic) style, the first stone of which was laid in 1824. The side at right angles to the site for the cathedral is 276 feet long, and is externally but one storey in height. Kiss's celebrated 'Amazon and Tiger,' as well as his other great work of 'The Man and Lion,' are on either side of the broad flight of steps leading to the interior. The tower (b) shown in outline behind the Museum belongs to a church situated at some distance to the east of the church on the Gensdarmen Markt; its height is 225 feet, and it is a copy of those on the Piazza del Popolo at Rome. The building in outline c is the present cathedral alluded to in our article of May 15. It now occupies the site of the proposed cathedral, and would, of course, come down, but a comparison between its minute proportions and those of the would-be successors is interesting.

The building d, Fig. 13, shows a portion of the Royal Palace, which occupies one of the sides of the Lustgarten, at right angles to the site of the Cathedral and facing the Museum. The building, which is Rococo Renaissance in style, has a frontage of 626 feet, and contains in its main parts four storeys 102 feet in height. Part of it was begun as far back as 1538, but was altered and finished between the years 1699 and 1710. The designs are by the elder Schlüter, who began the building; but, he falling into disgrace at Court, it was continued by Eosander and Von Göthe, and finished by Böhme. The dome, e, in outline behind it, is part of this Palace, and is 220 feet high. The great tower, f, to its left, is some distance from the site, and belongs to the new Hôtel de Ville, now in course of erection. A model of this building was in the Paris Exhibition two years ago. Mr. Wisemann is the architect, and the building is estimated at four million thalers (600,000*l.*).

The particulars of a new competition are shortly expected; they will probably exclude the Gothic style as unsuited to the city of Berlin, and the attempt to arrange two separate spaces for ordinary and grand occasions will be abandoned as impracticable. The plans and elevations we have reproduced from the *Deutsche Bauzeitung*, a small but well-written Berlin journal devoted to architecture.

THE NEW LAW COURTS.

WE give, this week, the ground plan of Mr. Street's design for the New Law Courts as proposed by him for the Thames Embankment Site, and a block plan showing the building with the adjoining streets, &c., to illustrate its position and approaches.

After the account of this design which we gave in our last number it will suffice if we extract, in explanation of the illustrations now furnished, a passage from Mr. Street's Report which he has addressed to the First Commissioner of Works. He remarks:—

'The shape of the ground is so completely different from that which I had to deal with, in making the previous plans, that I have had to

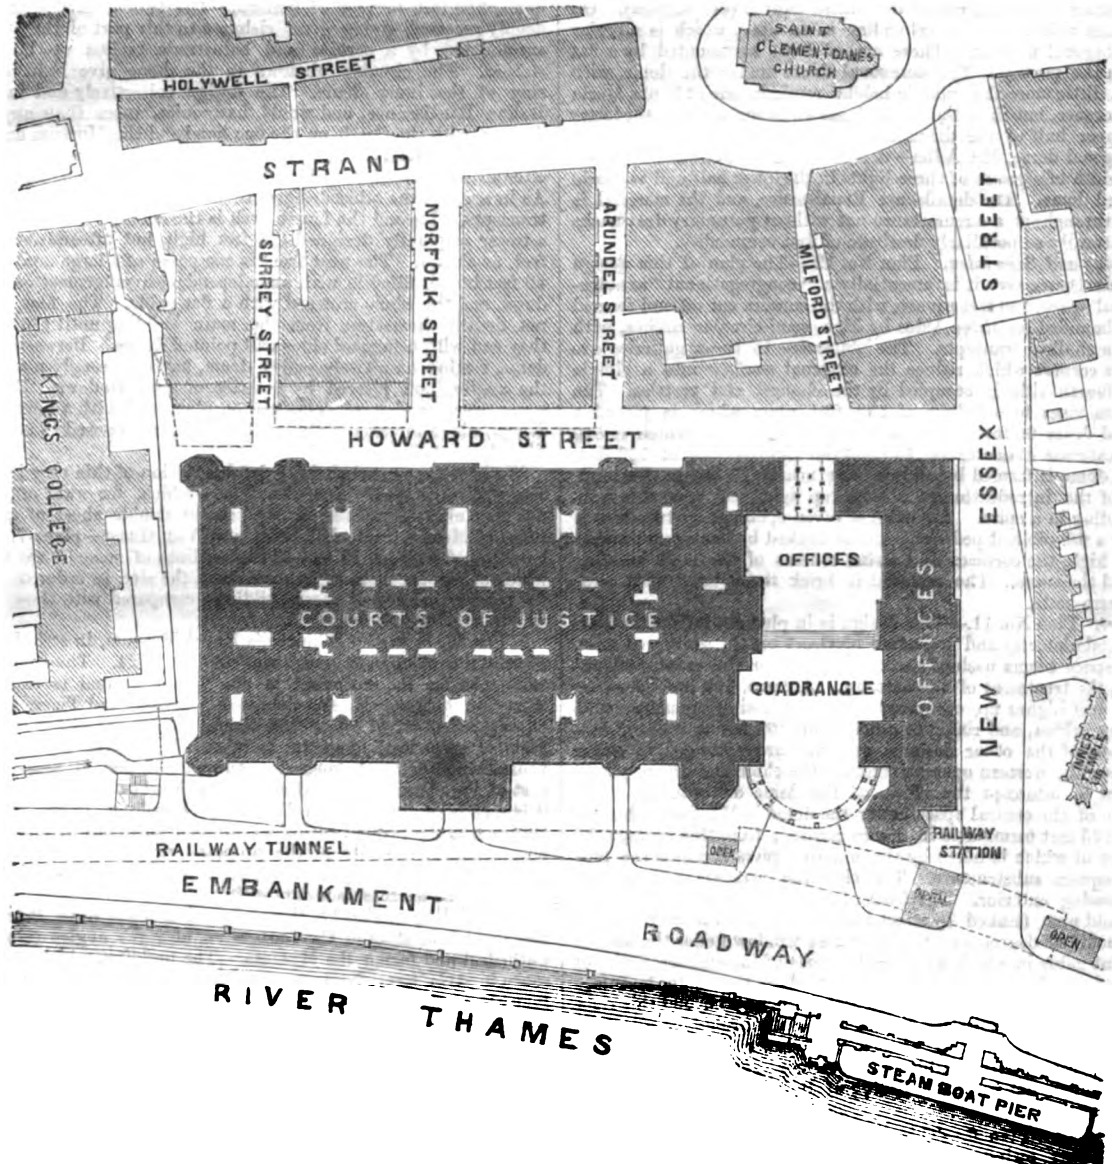

re-arrange my whole scheme. My principle was, from the first, to separate the Courts from the Offices by internal streets and quadrangles; and, in the plan approved by the Courts of Justice Commission, this principle was carried out as completely as possible. If it can in any way be accomplished, I am persuaded that this is the arrangement which will secure the greatest simplicity and ease in the use of the building, and cause the least confusion; and though I think it will be impossible to secure it completely on the Embankment site, I have still kept the same principle in view, and have adhered to it as closely as I could.

The broad feature of my plan now is, that I put the Courts, Central Hall, and all the Rooms for Juries, Witnesses, and the Public, to the western side of the site, and the great group of Offices round a Quadrangle to the east of it. But, as the upper and lower portions of the buildings which surround the Central Hall and Courts would not be required for their use, I propose to provide some of the Offices—as, e.g., the Vice-Chancellors' Chambers—above and below the Judges' Rooms. They are so planned as to staircases and mode of access as, I believe, to minimize any confusion which might otherwise arise

from their neighbourhood to the Courts, and their position will no doubt be felt by the Judges to be better than it would have been in my former plan.

The arrangement of the Courts and Rooms connected with them is substantially the same as it was in the plan approved by the Commission. In that plan I was always pinched for space between the Strand and Carey Street, and I was compelled therefore to make the small internal areas for lighting the rooms below the Courts themselves smaller than I would have wished. I am able, in the new plan, to give a few more feet to each of these areas, and so to make a great improvement by putting the Jury Rooms immediately under the Courts, whilst I also improve the Jury Staircases and provide Lobbies at the back of the Bench to all the Courts, as well as improve the light to a number of rooms and corridors.

I propose to give the public an entrance to the Central Hall in Howard Street, opposite Norfolk Street, and other entrances at its eastern and western ends. In this way every facility will be given for access to the Courts which surround this Hall, whilst it will not form a natural line of thoroughfare for people who have no business

THE NEW LAW COURTS.

to transact in it. The public coming from the Railway, the Steam-boats, or the Embankment, will all enter by the Eastern Quadrangle. But, to prevent the annoyance which would be caused if this were used as a public carriage thoroughfare, I propose to make its pavement at two levels, divided by a terrace or flight of steps across the centre. Carriages then will be able to enter the Quadrangle either from the north or from the south, but will have to return by the way they came.

A good deal has been said as to the access for the Judges; and as it has been held to be important that they should not have a great height to mount to their rooms, I propose to avail myself of the roadway already existing on Somerset House Terrace for their benefit. They will probably always come to the Courts from the Embankment roadway, and I assume that some carriage access will be contrived from thence to the western side of Waterloo Bridge, so that they will be able to drive or walk to an entrance only some ten or twelve steps below the level of their own rooms. Here they will have, as in my previous plans, a continuous corridor, entirely without

disturbance by the professional or general public, whose staircases will not open into it. I can also provide a Judges' entrance in Howard Street, or on the Embankment, if it is thought desirable to have either of them.

The Bar Rooms will, I think, be best placed to the north-east of the Central Hall, where they will be most easy of access from both the Temple and Lincoln's Inn.

The Royal Commission on the New Law Courts held a meeting on the 4th inst., which was attended by Mr. Lowe and Mr. Layard, and it was unanimously agreed that a committee should be appointed to examine minutely all the questions of measurement and cost.

THE MUNICIPAL OFFICES, LIVERPOOL.

IN the view of this building, given May 29, we inadvertently mentioned Mr. Robson alone as the architect. We are asked by Mr. Robson to state that the original plan and design was by Mr. John Weightman, now an Alderman of the Corporation of Liverpool.

REVIEWS.

THE YEAR BOOK OF FACTS IN SCIENCE AND ART. By John Timbs. Lockwood & Co., 1869.

Mr. Timbs' annual work has made its periodical appearance for a long series of years. But though in this sense old, it is always new in matter. The present volume is illustrated with a portrait, and pre-faced with a brief but interesting biographical sketch, of Mr. Joseph Whitworth, F.R.S., to whom mechanical science is already so much indebted, and who has so munificently provided for its advancement in the future. The main portion of the work is as usual compiled (with due acknowledgments) from the scientific journals or daily papers of the preceding year. It makes no pretence to be more than a mathematical scrap-book, fixing the transient image of the ephemeral press, and thus affording a review of the most important discoveries and improvements of the year, so far as they have come generally under the notice of the reading public. The subject matter is grouped under the several heads of Mechanical and Useful Arts, Natural Philosophy, Electrical Science, Chemical Science, Natural History (subdivided into Zoology and Botany), Geology and Mineralogy, Astronomy and Meteorology. An Obituary is likewise given. A general index adds to the completeness of the whole. The work is in reality a common-place book; but when this is said, it must be recollected that the common-places of our day frequently contain much more of marvel than the fairy tales or stories of enchantment of olden time. Most will find something, some many things, instructive, or at least interesting, in its pages—things, it may be, which the daily drive of occupation has forced them to skip in the half-read magazine or journal.

MATERIALS FOR A HISTORY OF OIL PAINTING. By Sir C. L. Eastlake, P.R.A. London: Longmans, Green & Co.

The second volume of Sir Charles Eastlake's 'Materials for a History of Oil Painting' concludes, though unfortunately it does not complete, the researches which Sir Charles instituted into the various processes and modes employed by the old masters in the production of their works, and unfortunately also it leaves off at what to artists would have been one of the most interesting portions of the work; that is, an investigation into the materials and modes of painting of the Venetian school. Nor is there also any detailed account of the practice of the Spanish painters. As it is, however, we have in these volumes a very fair history of the development of oil painting, and a sufficiently comprehensive description of the different articles employed, with their effects in time, to form a groundwork for what might be termed a science of art materials. The work is necessarily of a somewhat technical character, and consequently more interesting to the artist or amateur than to the general public.

The volume before us opens with an account of the Hospital of S. Maria Nuova, founded in 1285 by Folco Portinari, the father of Dante's Beatrice, and for the chapel of which he commissioned Cimabue to paint a Madonna. A century and a half later, another Portinari added to the decorations of this chapel several works, among which were two, by Memling and Van der Goes, apparently the first oil paintings exhibited in Florence. From this time, the time of Antonello da Messina, the practice of painting in oil was more and more generally adopted by the artists of Italy. Considerable distrust was at first expressed of the new style, and indeed for a long period, long after all doubt of the permanency of oil painting had been set at rest, we find artists working partly in tempera and partly in oil, and this either for the sake of some fancied additional security, or for certain qualities and excellences found to result from the combination; the latter reason being the most probable, at least if we may judge from the effect of certain modern pictures executed in this way, and which have appeared at recent Royal Academy Exhibitions.

Before proceeding with his inquiries into Italian art, our author recapitulates his account of the practice of the Flemish painters. They, it appears, painted almost entirely 'alle prima,' and consequently used varnishes with their colours without any subsequent application. These varnishes are all described, and we learn that the one in most repute, and which in its results has proved most successful, is that made from amber, 'varnice d'ambra,' and this Sir Charles informs us may now be made with great excellence. We remember the late Sir David Wilkie prepared some for his own use, and he applied it to one or two of his pictures: whether it was badly made, or whether the materials previously employed did not agree with it, we know not—the result eventually proved anything but satisfactory.

The advantages of oil painting over tempera, namely, increased roundness and depth, fusion of tints, and richness of colour, could not fail to impress the painters of Italy, and we find that the three great pupils of Verocchio—L. di Credi, Pietro Perugino, and Leonardo da Vinci—eagerly adopted the new mode, and carried it to a great length. The last was the most daring innovator of the three, painting, as he did, solidly in a purplish negative tone on a ground tinged with yellow to counteract the subsequent work, but without always finishing (and notably in the 'Mona Lisa') with such warmer colour. The latter circumstance may be partly owing to the artist's dislike to disturb the delicate modelling of his preparation, or it may be the result of the cold inky tones of the same, eating through the delicate glazings and 'sfumato' tints of the final painting. This practice of modelling in negative or 'dead' colour was one employed by many subsequent painters. Correggio, we are informed, prepared his flesh in this way, though in his draperies and back-grounds he was more disposed to paint at once; and our own Sir Joshua treated several of his portraits in the same manner.

Want of space prevents us from describing the manner of Raphael, Fra Bartolommeo, and the other artists referred to by the author; and we pass to the concluding and most interesting chapter—on the methods of the Venetians. And here the reader cannot fail to perceive how well calculated were those methods to produce that rich and delicate colour which has given in this respect the palm to this school. The subject having been sketched in, with such alterations as the composition may have demanded, the whole was painted solidly and boldly, after which the much-prized

'sfumato' appearance was obtained by scumbling light over the picture and wash a view to the final glazings: thus Titian would go over his skies with a yellowish or cream colour, somewhat like the practice of the modern French. To correct any excess of softness in this stage, a more 'colpeggiato' or touched effect was produced by crisping the lights, and the work was then ready for the final diaphanous painting, which resulted in that combination of depth, richness, and subtle grey, that forms the characteristic charm of the works of this school.

In considering the practical advantages to be derived from these researches into the modes of painting, and materials employed by the old masters, we find that as regards the former, the exigencies of modern art require in many cases a different course to be pursued. As the ancients confined themselves chiefly to the representation of Scriptural or classical subjects, in which realism was neither attempted nor deemed desirable, they were enabled so far to conventionalise their compositions or their forms as to leave themselves at liberty to paint their pictures in various stages. Now-a-days, the necessity for a faithful rendering of the subject, for a conscientious delineation of the appearance of nature, combined with the increased eclecticism of modern art, prevent us from always pursuing the same course. If, however, we are prevented in this respect from availing ourselves largely of the experiences of our predecessors, there is no such objection to our study of the materials which they employed. How great is the necessity for some such study it is almost needless to state. An examination of the works of deceased British artists is sufficient to prove the importance of the point. We find them either cracked, faded, or smoky and black, evidencing that ignorance of their materials which the artists themselves deplored. And at the present time matters are not much improved. If we ask half a dozen different men what ground they paint on, what medium or colours they employ, we find that no two work alike, and hold the very vaguest notions of the chemical action of the articles they use. In considering the remedy for this deplorable ignorance, the first thing which occurs to us—and we think the suggestion worthy of grave consideration—is, that the Royal Academy should appoint some competent chemist to investigate the nature and action of the various materials employed in art, and to record his experiences for the benefit of artists. Such is the progress of modern science that one might predetermine in many cases the eventual effects of time, and these labours of Sir Charles Eastlake would form an invaluable clue to the study of the past. Nor would we have the materials for oil painting to form the only subject for study. Mural decoration is growing so largely into favour, and so little is known as to the best methods of executing it, that they would also form a proper subject for investigation. We have seen the miserable results of fresco as applied in the House of Lords; and if we may trust the opinion of a friend, a pupil of Kaulbach, it is doubtful whether the water-glass method employed by Mr. Herbert is calculated to achieve any great degree of permanence. Judging from the remains in our old ecclesiastical buildings, distemper appears most suited to stand the English climate; but much light might be thrown on the whole subject by proper scientific enquiry, for it must not be supposed that because, this country is comparatively cold and damp, it is necessarily injurious to works of art. Rembrandt, as Sir Charles points out, employed certain vehicles and varnishes, which in the dry heat of Italy would have cracked and blistered, but which secured for his pictures perfect durability in the chillier and more humid atmosphere of the north, and we have no doubt that in this country similar compensations might be obtained. Something or other ought to be done. It is lamentable to think of the works of a Landseer or Millais injuring or perishing like those of Reynolds and Wilkie; and although much knowledge and experience might be attained by the individual artist, nothing like thorough and comprehensive information on the subject can be obtained otherwise than by a scientific and properly directed course of study.

To the latter part of the present volume the editor has appended a series of essays, or rather sketches of essays, on art, compiled by Sir Charles at different times. These, so far as they are theoretical, read very much like most essays on art; but they are combined with many excellent hints on practical matters, likely to be of considerable service to artists.

In conclusion we may state that this work is of great value to all who are interested in the subject, and we trust it may induce the authorities either at Burlington House or South Kensington to institute some such course as that above indicated, and enable us to take advantage of the information which the late President has given us in his 'Materials for a History of Oil Painting.'

PARLIAMENTARY PROCEEDINGS.

Military Labour.

In the Commons, on the 4th instant, Mr. HANBURY-TRACY asked the Secretary of State for War whether the necessary work required in the external painting and whitewashing of the Royal Artillery and East Infantry Barracks at Aldershot, for the performance of which tenders had been invited by public advertisement, could not be undertaken by military labour, under the direction of the commanding Royal Engineer of the district; and what would be the saving effected, including advertising, if soldiers were employed to do the work, paying them by the piece according to the existing regulations.

Captain VIVIAN said, it had been found difficult to employ military labour in this particular work, because, in order that the work might be done efficiently, it must be done continuously, and Aldershot was a camp of instruction, to which the troops were brought for short periods of time. The experiment was tried in 1865, and though several workmen were brought in to assist military labour, work which usually took three months occupied five months, and the estimate considerably exceeded the ordinary amount.

The Courts of Justice.

Mr. BENTINCK asked the First Commissioner of Works whether the sketch of the new design for the 'Courts of Justice Building,' now in the Library, and bearing the name of Mr. Street, had been approved by Her Majesty's Government for erection on the Thames Embankment; whether he adhered to his recommendation, made in that House on May 10 last,

that the style of the new building should be the 'Gothic employed by the Italians in the early part of the fifteenth century,' and whether he was of opinion that the new design fulfilled that condition; whether the three towers connected with the new design were intended for the preservation of documents or to serve any useful purpose besides that of ventilation, and what was their probable cost; and whether he would exhibit in the Library the elevation of the 'river front' and 'park front' of the Westminster Palace, designed by Inigo Jones, and engraved in the works of Inigo Jones, published by Lord Burlington and Kent.

Mr. LAYARD said that when his hon. friend asked him if he approved of the sketch of the new design referred to for the Courts of Justice building he would say that it was never his fortune to see a more beautiful and artistic piece of work; but he would remind his hon. friend that the elevation was a mere sketch. If the House should approve of the erection of the Law Courts on the Embankment, he should think it his duty to have a model placed in the Library, or some other part of the House to which members might have access, and so be able to form an opinion. As to the second part of the question, he begged to say that he did not recommend that the style of the new building should be the 'Gothic employed by the Italians in the fifteenth century.' What he did say was that he thought Gothic was the most appropriate style for the English Law Courts. He did not advocate Ecclesiastical Gothic, but said that the Italians had made use of Gothic for a similar purpose in the fifteenth century, and that such a building might be erected without having recourse to Ecclesiastical Gothic. As regarded the three towers, this was a mere sketch, and therefore he could not answer the question of his hon. friend. With respect to the fourth part of the question, the river front of Inigo Jones had been exhibited for some days in the Library, where it might be seen by his hon. friend.

Clerks of Works.

Mr. M. CHAMBERS gave notice, on the 7th inst., that on going into Committee upon the Army Estimates, he would call attention to the anomalous position of the clerks of works and clerks of the Royal Engineer Department, and to the denial of pensions to their widows, and that he would move a resolution declaring these clerks entitled to the same rights and privileges as other non-combatant members of the military service.

The London Sewage.

On the 8th inst. Colonel FRENCH asked Her Majesty's Government what was the result of the inquiry as to the formation of a bar across the Thames, below Barking, from the sewage of London.

Mr. BRUCE replied that Mr. Rawlinson, the well-known civil engineer, had been instructed to inquire into the subject. He had made a preliminary inquiry, and had given notice of a public inquiry, which was to be held on the 21st inst. That investigation would be prosecuted with all due diligence, and the report, when made, would be laid upon the table of the House.

LEGAL.

Court of Queen's Bench.—June 2.

(Sittings in Banco, before the LORD CHIEF JUSTICE and Justices MELLOR, LUSH, and HAYES.)

HINCHCLIFFE AND ANOTHER v. THE QUEEN.

This case came before the Court on a writ of error. The plaintiffs in error were tried at the last assizes for Yorkshire, at Leeds, before Mr. Justice Lush, for conspiracy for molesting workmen and others at Sheffield. The indictment contained twenty-four counts. They were found guilty and sentenced to fourteen months' imprisonment. It was contended that the conviction was bad, on the ground that the verdict was returned on the indictment generally, whereas the eleventh count, which charged them with endeavouring to coerce James Howell to become a member of the Master Builders' Association, disclosed no offence, and that upon that count the verdict ought to have been entered for the defendants. Conviction affirmed.

Vice-Chancellors' Courts.—June 7.

(Before Vice-Chancellor Sir R. MALINS.)

RIDGWAY v. GRAVES.

This suit arose in consequence of the fire by which Her Majesty's Theatre was destroyed in December, 1867, on which occasion the defendant's gallery of pictures was destroyed. He had proceeded to rebuild such gallery, and the plaintiff, who is one of a firm of army agents in Waterloo Place, and whose premises were not injured by the fire, complained of a diminution of his light, that the height of the wall was almost double, and the opinions of various scientific men were taken in favour of that view. On the other hand, witnesses on behalf of the defendant deposed to an opposite view, both parties themselves giving evidence.

The VICE-CHANCELLOR said:—The whole matter was in anticipation of injury, and it greatly depended upon the height to which the wall of the new Opera House was carried, the old one being, as was agreed, of the height of 75 feet. It was a question which could be judged of by the actual facts, and the wall complained of, built by the defendant, being raised scarcely 2 feet, and the gutter, according to the present mode of proceeding, under the Commissioners of Works, being non-projecting, he (the Vice-Chancellor) was satisfied that the plaintiff had as much light substantially as he had before. Of all the ten or twelve clerks employed by the plaintiff none had made affidavits. The bill ought never to have been filed, and it must be dismissed with costs.

Court of Exchequer.—June 7.

(Sittings in Banco, before the LORD CHIEF BARON, Mr. Baron BRANWELL, Mr. Baron CHANNELL, and Mr. Baron CLEASBY.)

DAVIS v. TAYLOR.

This was a demurrer to a declaration. The issue to be determined in the cause is a very important one, as similar questions must be constantly occurring. The defendant is an architect, and the plaintiff is a builder who

had performed some work under a contract to be paid for upon the certificate of the defendant that the work had been properly done. The declaration in substance alleged that the defendant, without reasonable and probable cause, withheld his certificate when he knew the work had been properly done; that, to injure the plaintiff, he maliciously and fraudulently withheld the certificate, and the plaintiff could not obtain payment from the person for whom the work had been performed. The declaration was demurred to on the ground that there was no contract between the plaintiff and defendant, and no circumstances out of which could be implied a duty towards the plaintiff in respect of a breach of which the plaintiff could sue. The declaration set out an agreement between the plaintiff and the building owner, in which it appeared that the buildings were to be erected to the satisfaction of the defendant, an architect, and payment was to be made by the building owner upon the defendant certifying that the work had been properly done.

Mr. MILWARD contended that there was no contract between the plaintiff and defendant, and no duty imposed on the latter. An architect in such a position was as an arbitrator, against whom no action would lie.

Mr. HOLKER urged that the action would lie, because the defendant, having taken upon himself the position of architect, an office similar under the circumstances to an arbitrator, was liable to an action for breach of duty if he acted dishonestly; and also that, if there were no duty, yet the defendant having been guilty of a malicious act causing damage to the plaintiff, an action would lie against him at common law.

At the conclusion of the arguments, the Court took time to consider judgment.

TOMBS IN WESTMINSTER ABBEY.

SIR,—There is, fortunately, no reason to fear that the features of the effigies of 'the Virgin Queen' and those of 'her more lovely and unfortunate cousin' are likely to be tampered with by the cleansers of the brazen effigies. Maximilian Colte, the sculptor, worked in alabaster, and, with the exception of minor details, there is no gilding about the figures, and absolutely no bronze to be interfered with. I venture to call your attention to this fact, because the notice of the Countess of Richmond's tomb in your impression of May 29 not only implies that the effigies of Elizabeth and Mary are of bronze and gilt, but tacitly consigns two more royal tombs into the hands of the restorers. I need hardly say, Sir, that considering what is in prospect for the early monuments, we cannot take too much care of those of a later period which are left unrestored.

I am, Sir, obediently yours,

June 4.

ALBERT HARTSHORNE.

NEW BUILDINGS AND RESTORATIONS.

Great Northern Railway Church at Peterborough.—On the 28th ult. the Bishop of Peterborough consecrated this church, which has been built for the locomotive establishment of the Great Northern Railway Company at New England, about a mile north of the Peterborough Station. Mr. Teale, of Doncaster, is the architect. The church is 104 ft. long and 48 ft. wide, and has a low central tower, but no transepts, a pyramidal roof covered with the stone slates of the country, and a semi-circular apse.

The Foundation Stone of the memorial church of St. John the Evangelist, at Lineal-cum-Colamere, near Ellesmere, was laid on June 2. The church was designed by Mr. Street, architect, London, and the plans are to be carried-out by Messrs. Powell and Son, of Preses, the contractors. It will cost upwards of 2,000*l.*, and is the gift of Lady Marian Alford, in memory of John, late Earl Brownlow. In anticipation of its completion it may thus be described:—Built of Cefn freestone, in the Early Gothic style of architecture, to seat 236 persons. Its form a simple parallelogram, consisting of nave, chancel, and chancel aisle, with open timbered roof, and carved ribs. The bell turret, between the nave and chancel, rising at the division in the roof between the chancel and nave, and to have two bells. In the body of the church five two-light windows with traceried heads, and a three-light lancet-headed window comprised under one arch in the west gable. The chancel terminating in a gable window of five lights in tracery; its roof being boarded in internally, and divided into panels by moulds and ribs.

Gloucester Cathedral.—A great work is being carried forward in Gloucester Cathedral. The restoration of the choir has already been executed; the stone tracery of the two easternmost windows on the north side has been taken out and renewed, and the re-glazing commenced; the three remaining windows have to be restored. The exterior work in the south transept is completed. The chapels dedicated to St. Andrew and St. Paul are restored; and some progress has been made in the restoration of the chapel of St. Philip, which is to form the memorial to the late Sir C. W. Codrington, M.P. The entire work will cost 40,000*l.*

Wilmslow New Schools.—On the 1st instant, the new Sunday, day- and infant schools, just completed, at Wilmslow, near Macclesfield, in connection with the parish church, were formally opened. Built of grey brick, they are relieved by slight touches of red, in arches, bands, string-courses, &c. The framework of the windows is of stone; the roofs are of slate, in two colours, arranged in patterns. The tracery of the windows has ornamental glazing, which has been done by Messrs. Edmundson & Co. The new schools will accommodate 350 scholars, and combine separate rooms for girls, boys, and infants, together with a master's dwelling-house. The fittings include the latest improvements, the seats and desks being so constructed as to be used either as benches for concerts, tables for tea-meetings,

or forms and desks for the work of the day school. The site comprises 2700 square yards, and has enabled the committee to provide two excellent and spacious recreation grounds. The architects are Messrs. M. & H. Taylor, Manchester; and the builders, Messrs. J. Robinson & Son, Hyde.

Malvern New Club-house.—Early in the year a movement was commenced for the establishment of a club-house at Malvern. Subscriptions were rapidly obtained, and, when the amount promised reached 2,000l., a site was obtained, and a commencement of the work made. Plans and specifications having been furnished by Messrs. Haddon, architects, and approved by the committee, tenders were received for the building, and that of Mr. William Porter, Malvern Wells, at 1,500l., was accepted. The building was at once begun, and is now in the course of rapid completion. The Royds Lodge are also making an effort for the erection of a masonic hall in Malvern, which is likely to prove successful.

The Severn Waterworks.—On the 7th inst. the Mayoress of Tewkesbury laid the foundation stone of the new waterworks for that town, in the presence of the Committee of the Cheltenham Waterworks Company. After the ceremony a luncheon was provided by the committee at the Town Hall.

Abergavenny Butter Market.—Effort is being made to render the temporary butter and poultry market, now held in the cattle market, as convenient as possible. The work of demolishing the old market-place, &c., in Cross Street, is rapidly progressing; but at present there is no effect to be noticed other than that the 'opening' which has been made brings the Great Seyrriid very prominently into view, and thus adds another object of interest to the street passenger.

Chipping Sodbury Church.—This old church, dedicated to St. John the Baptist, having undergone a thorough restoration, was re-opened on June 5. The outside has been cleared of the coat of rough cast, so as to expose the local stone of the walls as originally intended. The square embattled tower is, owing to its height, a conspicuous object for a long distance. The openings of the bell stage have been filled in with tracery instead of the old rough stone louvres, and the beauty of the tower is thus improved. Inside, the wall between the tower arch piers has been removed, so as to throw open to view the west window, the tracery of which has been renewed. The south porch has been entirely rebuilt, and the niches in front have been supplied with canopies which cover figures of John the Baptist, Virgin and Child, and John the Evangelist. A new vestry has been erected on the north side, and underneath it has been placed a warming apparatus. During the progress of the work the remains of an old pulpit were found in one of the bays on the north side of the church, nearly opposite the south porch: this has been restored, and is quite unique. The walls have been cleansed from the coats of lime and coloured washes with which they were formerly disfigured. The old high pews have been removed, and open benches, of neat design and with carved panels, substituted; the number of sittings has been increased by 130. The chancel screens, as well as the stalls for the clergy and choir, are of oak, richly carved. The reredos is of alabaster, with side panels of Caen stone. The east window is by Clayton & Bell, and is a very successful work of art. The cost of the restoration has been 4,000l. Mr. G. C. Street, of London, was the architect; and Messrs. Wall & Hook, of Brimscombe, were the contractors. The old organ, not being large enough, has been removed, and a more suitable instrument, by Vowels, of Bristol, erected in its place.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

An Anniversary.

Such of our readers as delight to commemorate anniversaries, tercentenaries, and the like—and the spirit, though easily turned into ridicule or abused for jobbery, is in itself commendable—may care to be reminded that exactly a hundred years have elapsed since Josiah Wedgwood opened his celebrated works at Etruria. On June 13, 1769, we are told that the master-potter himself threw several vases to inaugurate an undertaking destined to produce so great an influence on the Ceramic art of England. Happily, too, the discoveries of Wedgwood have not shared the fate which curiously enough has overtaken many of the improvements in this art. Robbia, Palissy, Henri Deux ware have, as is well known, germinated, flourished, and decayed, almost within the lifetimes of their inventors. Our great English potter has been more fortunate, whose labours have been, and still are, well and wisely seconded by his descendants. A certain class of connoisseurs, indeed, who thrive upon accurate knowledge as to particular specimens of art, and care more to trace the intricacies of the sale-room than to watch the beneficent influences of genius, have pushed the laudable reverence for 'old Wedgwood' to the conclusion that 'new' Wedgwood ware cannot be good. To them modern art, particularly if of their own country, is trash and rubbish; nor would they willingly believe what ocular evidence nevertheless will easily confirm, that medallions and ornaments now issue from the works of Messrs. Wedgwood as pure in design, as sharp in execution, as any with which the joint labours of Josiah Wedgwood and John Flaxman ever enriched the last century. We have in our mind's eye at this moment an exquisite female figure, executed in pale grey and white jasper, lately shown to us, a very recent production of Messrs. Wedgwood. It is by such work as this, rather than by statues and monuments, that centenaries are best celebrated, and to such undertakings we may heartily offer the old classic greeting of *Stet fortuna domus*.

Soirée and Dinner of the Institute.

The Annual Soirée of the Royal Institute of British Architects will be held, in all probability, on the evening of Thursday, July 1. It is also proposed that the members should dine together at the Crystal Palace on the previous Saturday (June 26). These occasions are always looked forward to. The Institute soirée is well known, both in the profession and

beyond it, as an uncommonly agreeable social and artistic reception; and the dinners (which have not uniformly been held) have always, when they have taken place, been found enjoyable by those who have attended them. It is especially to be hoped that many of the country members and others who do not very frequently attend meetings of the Institute will make an effort to be present on one or both of these occasions.

Her Majesty's Theatre.

The pit of Her Majesty's Theatre, or rather the stalls—for it is proposed to occupy the whole of that part of the building as stalls—have recently been enlarged at the expense of the stage, the front of which has been cut off to an extent equal to the width of an additional row of stalls. This is a further and a considerable misfortune added to the many which have befallen this once-celebrated place of public resort through the fire which destroyed it in 1867. One of the secrets of the acoustic success of the old building was the shallowness of the stage and the way in which its front was brought forward, so that a singer at the footlights was fairly among the audience. This advantage is now entirely lost, and a proportionate loss of effect may be confidently anticipated, if ever the house comes to be sung in again.

The Monuments in Westminster Abbey.

We are informed on the best authority that it is, and has been for very many years, customary to cleanse and wash the monuments in the nave of Westminster Abbey every two years, and that they are dusted constantly. The Royal monuments are also dusted every two months. In dusting some at least of these monuments a brisk current of air is raised by an apparatus like the bellows of a smith's forge, which passing through a flexible tube, can be directed on to any part of the object, and so remove the dust without any rubbing or even touching the old work.

Indian Notes.

Engineering.—Arrangements are being made for the immediate prosecution of the Soane Canal project by the excavation of the Western Main Canal, of which twenty-eight miles are laid out ready, and the construction of the Eastern Main Canal, with the Arrah and Patna branches, and works incidental to these undertakings. The estimated cost at the outset is set down at 580,000l.

A material change is apparently coming over the Indus Delta, in consequence of the silting up of the Keedeewarree, or Suttah, mouth, which has now become so shallow that natives can wade across from one bank to the other. The main channel of the river has been diverted to the Hujamnee mouth, which is both widening and deepening.

The works of the Madras Irrigation Company have so far progressed that the canal is in a condition to receive the waters of the Toombudra, when filled by the monsoon, and is navigable for a distance of 62 miles. The canal water has now reached the Culua, with a depth of 9 feet under the Mittacoudal Bridge.

The Government of Madras have appointed a commission to inquire into the minor irrigation works of that presidency.

The repair of the Madras Pier has been sanctioned at an estimated cost of 28,742l. Mr. Black, the superintendent, finding it impossible to remove the works of the old pier from the gap, proposes to screw down, on both sides of the breach, three rows of piles, well fixed together at the top by wrought iron girders, carrying a platform of a width sufficient to form two lines of rails, the centre portion being left uncovered for the present.

Mr. Fryer, Assistant-Superintendent Geological Survey of India, has been specially deputed by Government to examine the Chanda coal-fields. Should it be found that the coal answers the expectations formed of it, it is in contemplation to open a branch railway or tramway from the most approved of the mines to the nearest place on the main line.

An Engineering College is about to be established at Hyderabad in connection with the Nizam's Government, for the purpose of training native and Eurasian youths for employment as zillah and assistant engineers within His Highness's dominions.

A land line of telegraph is being constructed as an alternative to the cable between Gwadur and Cape Jask, which, it is hoped, will tend to the permanent security of the Indo-European communications.

At Malligaum, Government have sanctioned the sinking of four of Norton's tube wells in the bed of the river, running within 400 yards of the cantonment.

A mission of American gentlemen has arrived in India, with instructions from the United States Government to report on the Irrigation Works of India, and on the different systems of cultivation in India, China, and the East. The mission consists of the Honourable C. D. Poston and Colonel Grant. They have had an interview with Lord Mayo, and the Provincial Governments have been instructed to further their objects.

Bordeaux.

The Tower of St. Michel at Bordeaux has been completely rebuilt, as originally constructed. It took nine years of uninterrupted labour, and is 367½ feet high, being the highest single tower and spire in Europe. The cost is said to have exceeded 20,000l. The architect entrusted with the work was M. Abadie, a gentleman of considerable repute in France, who has lately very successfully restored the Cathedral of Angoulême Perigueux of Bordeaux. M. Abadie was also architect of the new Hôtel de Ville at Angoulême.

Cologne.

Almost on the same day on which the Roman pavement was found in London, a similar one was discovered here, also whilst excavating for a new sewer. The breadth is only nine feet; the length is not yet known, as the pavement extends beneath a neighbouring street. It is only six feet below the present street level, and the design, in red, black, and yellow stone mosaic, terminates at the excavated end in a semicircle, arranged in a fan shape with broad interlaced bands. The magnificent south porch of Cologne Cathedral is now entirely finished and free of all scaffolding and hoarding. There are no less than 107 statues in the niches (38 of which are of life

size), besides eight compositions in bas-relief. They are all the works of one sculptor, Professor Christian Mohr.

Cologne is without a theatre of any kind. The summer theatre was lately burnt down, and the town authorities have refused permission to erect a temporary edifice in place of the Stadttheater, also consumed by fire some short while since.

Madame Alma Tadema.

This lady died at Brussels on May 28, at the early age of 32. The deceased lady was the wife of Mr. L. A. Tadema, from whose studio we have two classic and, in conception, very original pictures at the Royal Academy this year, namely, the 'Amateur Romain' and the 'Danse Pyrrhique.'

General.

A Colossal Statue of the Queen for Montreal has just been cast at the foundry of Messrs. Holbrook & Co., Chelsea.

Orders have been sent to Toulon for the Imperial yacht destined to convey the Empress to Alexandria for the opening of the Suez Canal to be in readiness by September 27.

Nottingham is to have a new park, Clifton by name. The following are its quoted recommendations:—1. That it would greatly benefit the town. 2. Ditto the Clifton estate. 3. That it would be a lasting memorial to Sir Robert. If a statue is to be erected, behold the fitting site!

Rev. Alexander Dyce has bequeathed to the South Kensington Museum his dramatic library, with its unique editions of Shakespeare, and all his pictures, miniatures, antique rings, and other works of art, upon the condition that a suitable room is built to receive them.

New York erects 2,600 buildings this year. There are 80,000 lots covered now and 60,000 left. Therefore within twenty-five years every inch of Manhattan Island will be covered with brick and mortar.

A Large Room has been discovered at Herculaneum which must have served for a kitchen. In it was a wooden clothes-press, entirely carbonised; also 14 vases, a candelabrum, and a lamp, all in bronze; several vessels in glass and terra-cotta; a small marble statue of a faun, and two broken tables, one in marble and the other in slate. These excavations are carried on by means of the grant of 1,200*l.* by King Victor Emmanuel, made for that object.

At Wolfsden, in Switzerland, the workmen engaged in pulling down an old half-timber house of the fifteenth century discovered a large earthenware jar secreted under the flooring of the ground storey. Upon examination it was found to be full of silver-gilt coins of the thirteenth, fourteenth, and fifteenth centuries, some bearing the effigy of the Abbess of Fraumünster of Zurich, others that of the Abbot of St. Gall, and others the arms of Bâle, Schaffhausen, Zurich, Berne, and Laufenberg. These coins were doubtless hid during the war which raged throughout Switzerland more or less during the fifteenth century.

Bucknell Church.—The enlargement and restoration of St. Michael's parish church, Bucknell, in the Salop Archdeaconry of the diocese of Hereford, are being proceeded with by the builder, Mr. Gough, of Bishop's Castle, under the superintendence and according to the plans and specifications of T. Nicolson, Esq., F.S.B.A., the Diocesan architect. It is intended to add a north aisle, an organ chamber, a sacristy, and a warm-air crypt; to re-build the tower and porch, and to put new windows throughout the church—the present ones being mostly modern insertions. An arcade of four arches will throw the new aisle open to the nave. The roof-timbering will be brought into view, and be newly boarded, felted, laced, and covered with Whitland Abbey slates; the external and internal masonry repaired; the body of the church re-seated in pitch pine; the chancel suitably stilled with new piscina, sedilia, and credence; the bells re-tuned and re-hung. The total cost will be about 1,600*l.*

The Proposed Bridge across the Mersey.—At a meeting of the Committee of Works of the Mersey Docks and Harbour Board, held on June 4, Messrs. Low and Thomas, the projectors of the proposed Liverpool and Birkenhead Railway, were present by invitation. The principal features of the scheme discussed by the Board were the two piers proposed to be placed in the river, and the height of the bridge above high-water mark. One member of the committee considered that the height of 140 ft. above high-water mark was insufficient, and others were of opinion that objections would be raised to the piers in the river. Messrs. Low and Thomas were referred to the conservators of the river, and if no objection was raised by them, the Committee of Works thought that the Mersey Docks and Harbour Board would not raise any difficulties.

For some years the western tower of Ely Cathedral has been considered unsafe. Recently some internal scaffolding to the south-west turret of the tower has been fixed, by order of the present Dean, Dr. Goodwin, who has consulted Mr. G. G. Scott as to the firmness of the walls. Oak beams and iron bracing are also to be added to prevent the bulging of the walls, or the fall of any part of the upper portions of the tower.

The Hull Western Dock will be inaugurated on the 28th inst. The area of the dock is 23 a. 0 r. 1 p., and it increases the aggregate dock area of Hull to 84 a. 0 r. 16 p. A banquet will be given on the occasion by the Dock Company at Kingston-upon-Hull in one of the dock warehouses. The King's Lynn Dock Company will inaugurate its dock on July 7.

The Bermuda Dock.—The huge iron Bermuda Dock, constructed by Messrs. Campbell, Johnston & Co., will leave England on or about the 20th instant, conveyed by a squadron of our most powerful men-of-war. She will be towed down Channel by the 'Terrible,' probably assisted by some smaller steam vessels.

Art Schools' National Competition.—The following gentlemen have acted as the examiners of the works sent up in competition from the schools of art throughout the United Kingdom:—Sir Francis Grant, P.R.A.; Sir M. Digby Wyatt; Messrs. J. C. Horsley, B.A.; F. Pickersgill, R.A.; R. Westmacott, R.A.; and E. J. Poynter, A.R.A.; assisted by Mr. Redgrave, R.A., and Mr. Bowler. Upwards of 64,000 works have been examined in this competition.

The Government has bought the immense building known as the Victoria Ale Stores at North Woolwich for 40,000*l.* A deposit of 3,000*l.* was paid some months since, and said to have been forfeited, but it is believed that the necessity of removing the clothing stores from Fimlico, and of obtaining waterside premises suitable for shipment, has led to the present purchase. The building and its appurtenances are to be at once handed over to the charge of the police from the Royal Arsenal.

QUESTION.

New Road-Laying.

SIR,—I should like to know the process of laying down roadways, &c., as is being done by the Swiss Company in Threadneedle Street. It appears very durable, but will, I think, be very slippery after a short time.

June 4.

A SUBSCRIBER.

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

THE ARCHITECTURAL ASSOCIATION.—Friday, June 25.—Half-past 7 P.M.: Election of officers. 'The Art Treatment of Iron,' paper by Mr. Lucy W. Bidge, V.P., A.R.I.B.A.
ROYAL ARCHÆOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.—The next monthly meeting will take place on Friday, July 2, at 4 P.M.

APPOINTMENTS VACANT.

INDIA.—July.—Forty Appointments in the Engineer Establishment of the Public Works Department in India will shortly be open to public competition. W. T. Thomson, Secretary, Public Works Department.

KENDAL.—Borough Treasurer to the Corporation of Kendal, Westmorland. Salary, 50*l.* per annum. Mr. Thomas Harrison, Town Clerk, Kendal.

LONDON.—June 17.—Engineer and Clerk of the Works to Middlesex House of Correction, Coldbath Fields. Salary 200*l.* a year, going upward to 250*l.* Mr. John S. Shaife, Clerk to Visiting Justices, House of Correction, Coldbath Fields.

PEETH.—As Assistant or Resident Engineer, to Superintend Works of Pipeage, Masonry, and Pumping Machinery. A knowledge of the German language desirable. Salary from 400*l.* to 600*l.* per annum. W. Lindley, Engineer-in-Chief, Peeth.

WHITECHAPEL.—June 15.—Whitechapel Union.—Assistant Engineer at the Workhouse. Wages 2*l.* per week. William Vallance, Clerk, Clerk's Office, Whitechapel Workhouse, June 1, 1869.

COMPETITIONS OPEN.

ARRAS, FRANCE.—Architects are invited to send in designs for a Church to be erected at Arras. The building is to be 40 metres long, without the clock tower, and 18 metres wide, and it is to have three aisles, three entrances, to be approached by a flight of five steps, and to be surrounded entirely by railings 1½ metre high; sub-basement of Belgian stone. The plans are to include a general one of the entire building, a fully-detailed description, and a careful estimate, with such perspective views and details as the artist may think fit to add to the former. The style of the building is required to be 'Decorated Roman of the last period;' and the sum to be expended, including commission, is 80,000 francs (8,000*l.*). The authorities do not undertake to adopt the prize plans, in which case the author of the best and second-best designs will receive 600 francs and 300 francs respectively. It is added, that the columns are to be of hard Belgian stone, and the rest of the building of Creil stone; and the vaultings are to be real, and not in ceiling, or of wood with visible ties. The jury is composed of the Bishop of Arras, the Maire, a Canon, two members of the Municipal Council, an Engineer, the Secretary-General of the Museum, and the Vice-President of the Council of the Prefecture. The designs are to be sent by the end of July.

BELGIUM ACADEMY OF ARTS AND SCIENCES.—For best enquiry (essay) and report on the period at which Architecture in the Low Countries became affected by Italian influence. Premium, 1,000 francs, about 40*l.*

BRADFORD.—September 1.—Competitive Designs for the new Bradford Town Hall. To the Architect whose design is selected, 5 per cent. commission and the execution of the work; 2nd best, 200*l.* premium; 3rd, 100*l.* Mr. W. T. McGowen, Town Clerk, Corporation Offices, Bradford.

BRUSSELS, BELGIUM.—A competition is announced for the production of the best Water Meter. The inventor of the instrument offering the greatest advantages is to receive a reward of 200*l.*; the second best, 120*l.*; and the third, 80*l.* The Meters are to be sent in to the Secrétaire de l'Administration Communale, Hôtel de Ville, Bruxelles, before 12 o'clock on October 31 in the present year.

CONSTANTINE, ALGERIA.—Three prizes, of the value of 3,000, 2,000, and 1,000 francs, are offered for the best designs for a theatre to be built at Constantine.

Programmes of conditions, accompanied by a sketch, may be obtained either at Constantine, at the office of the Société Générale Algérienne, No. 13 Rue Neuve-des-Capucines, Paris, at the Prefecture of Lyons, or the Mairies of Marseilles, Bordeaux, or Orlans.

DEVON.—June 12.—Plans and Specifications for Repairs and Alterations to Chudleigh Parish Church, Devon. G. B. Killocombe, Esq., Chairman of the Chudleigh Advowson Trustees, Rocklands, Chudleigh, Devon.

LEYDEN MUNICIPALITY invites Designs and Models from Sculptors of all countries for a Statue of Boerhaave, in the costume of Professor of Leyden University. September 1.

LINCOLN.—June 14.—For Plans and Designs for a New Church. Mr. T. Hefferman, Secretary, Lincoln.

LONDON.—June 26.—London and County Land and Building Company (Limited).—Plans of the best and most profitable way in which to arrange in building sites their ground in Camomile Street, City. First premium, 75*l.*; second, 50*l.*; third, 25*l.* Mr. B. B. Looker, 14 Clement's Lane, E.C.

PHILADELPHIA, PENNSYLVANIA, U. S.—September 1.—For Designs, Specifications, and Estimates for New Public Buildings. First premium, 400*l.*; second, 300*l.*; third, 200*l.*; fourth, 100*l.* For particulars, to H. C. Pugh, Secretary of Board of Commissioners, S.W., corner of Walnut and Fifth Streets, Philadelphia.

PLYMOUTH, DEVON.—For Designs for New Guildhall, Law Courts, Public Offices, &c. Premiums 100*l.*, 75*l.*, and 50*l.* July 14. Whiteford, Town Clerk, Plymouth.

ROYAL ACADEMY OF ARTS.—Burlington House. For the best Painting in Oil, or Model and Design in Painting, Sculpture, and Architecture, the Gold Medal and the Discourses of Presidents Reynolds, West, &c.; and for the best Copies of Drawings, &c., the Silver Medals, &c.

SAINT JEAN D'ANGELY, FRANCE.—The authorities of St. Jean d'Angely have decided on completing the Church commenced in the town by the Benedictines, but of which the works were stopped in 1789. Estimate 200,000 francs (8,000*l.*), the architect's honorarium to be equal to 4 per cent. The competition is confined to architects of Charente and the four adjoining Departments.

VIENNA, AUSTRIA.—This Municipality requires Designs, Plans, Estimates, &c., for the Erection of a New Town Hall. Open to all Europe. For Particulars, Austrian Consul-General, Paris.

WESTBROMWICH.—For Designs, &c., for a complete School Establishment for accommodating 400 children. Premiums: 1st and best Design, 50*l.*; 2nd, 30*l.*; third, 20*l.* Mr. H. Ward, Lombard Street, Westbromwich.

The Architect.

THE COMING SCHOOL OF ART.

NEW things,' says our shrewdest, perhaps our wisest English writer, 'are like strangers, more admired and less favoured,'* and nowhere is this truth more illustrated than in the circle of the Fine Arts. We have, for example, within our own day seen the works of a new school of painters eagerly sought after, wondered at, admired; but oppressed by the unsparing and unfriendly criticism of the same judges who would yet look leniently upon works which had few other merits than the negative one that they had not left the beaten track. In the days of our fathers the position of Gothic architecture was a not dissimilar one, and at the present moment the works of a certain group of painters are beginning to be looked for by the public with that critical curiosity which breathes more of wonder than favour, and seems to herald the dawn of a new school. What will Architecture gain or lose from the change? This is to us an all-important enquiry; but first let us have a word or two about Change in itself.

It is mostly, if not always, a healthy sign when a decidedly new treatment crops up. How much there must have been in the great days of architectural progress to provoke the dislike of members of old schools! We can fancy a master mason, who had been trained on the Confessor's buildings at Westminster, living to testify his supreme disgust at the florid and ornate enrichment of what we commonly know as Norman. Let a little time pass, and we can fancy one of the old school 'of the period' lamenting over the spread throughout England of the pointed arch as an ingenious but unwelcome innovation. A little later there must have been those who looked with distrust upon tracery as the beginning of decadence in the art of building; and so we might go on imagining the reception which awaited each step in that sequence of innovations which almost in our own day has been run through backwards; for, beginning at Pugin and florid Perpendicular, we have gone rapidly up the stream of time till the advanced guard of our progress have at least reached Early French Romanesque.

We believe it is no secret that a great step in the art of painting is considered, at least by some eminent living French artists, to lie within their reach. The naturalistic treatment of historic and sacred subjects has become a favourite idea with them. Of this the works of Alma Tadema may be taken as a conspicuous example not unfamiliar in England. This artist has studied the remains of Greece, Rome, Egypt, and Assyria, and has reproduced, in works having all the reality of the present, the scenes of the past. Mr. Poynter has done the same, and with almost equal success, in this country; but here he stands almost alone, while Tadema's name is on the Continent only one among a group; we may say, indeed, a school.

Another section of French painters, whose views are understood to be shared by that unequal, but most prolific genius Gustave Doré, look to colour as that which a new French school shall render in a manner hitherto unknown. This may be possible, and any movement which Doré might choose to head, if he threw all his energy and power into it, would be sure to land those who join it in some sufficiently conspicuous position; but more than this we cannot venture to predict. In architecture there seems to us even less of genuine healthy change—less of useful innovation—in France than there has been; and we may say the same of sculpture, notwithstanding the ability and training of French sculptors. But without pursuing Continental art further in search of novelty, let us turn homewards, and, looking at the arts broadly, enquire what of healthy innovation, what, in fact, of progress, is to be seen? What new school is rising or maturing? What sign is there that as old things wear themselves out, others are preparing to do their work and do it better?

Beginning where, for the moment, the attention of artists and critics is concentrated—at the Royal Academy Exhibition—we find the bulk of the popular painters still working in the same groove down which the impulse of Hogarth's powerful mind and singular sympathy with the nature common to Englishmen started them long ago.

* Bacon's Essays. 'Of Innovation.'

We find that the pre-Raphaelite influence has all but died out among painters of subject, though still strongly at work in our landscape art; but we find a few works denoting a feeling for the use of painting as mural decoration, and for a severe treatment alike of composition, drawing, and colour, which may possibly betoken the dawn of a new school. Everyone looks at the paintings of Mr. Albert Moore, for instance, with that curiosity and that distrust which a novelty always awakens, and no one seems quite sure what to make of his works, even while admitting that they possess good qualities as well as strange ones. These works and sundry others, including Mr. Marks's little processional picture, seem to belong to a class which had no existence till very lately among us.

If we turn now for a moment to Architecture, there is no very prominent sign of innovation in exhibited works, though there are indications of greater attention to decoration than ever before. We have, as has been already said, run the gauntlet of several styles pretty briskly, yet there are few architects' works which we could single out at the present Architectural Exhibition or at the Academy which show marked progress in any one direction, nor can we readily point to such novelties in buildings in progress. But if there is, on the one hand, a leaning among some painters towards a severe self-restraint within bounds hitherto scorned by all of them, there do seem some corresponding signs of a growing appreciation of the value of the allied arts in the works of architects.

The time has been, and that not long ago, when a building erected with no polychromy or sculpture inside or out was considered finished when the builder's men had done with it. Mural paintings were not thought of; if the decorator was called in at all, it was to work after the architect, not under his direction; while, as for the sculptor, he was seldom required. Now, if we read the signs of the times aright, our best men are more and more laying themselves out to ensure the decorative completeness of their work by associating with themselves the sculptor, the painter, the glass-painter, the mosaicist, and the enameller.

Sir Charles Barry in his secular work at Westminster, and Mr. Butterfield in ecclesiastical work, were pioneers in this movement; at any rate they were among the first to make extensive use of pictures, sculpture, and painted and inlaid colour; but we may now point—only to name at random one or two cases—to Mr. Scott's works at Wolsey's Chapel, Windsor, and the Albert Memorial, Mr. E. M. Barry's excellent decorative work in the Royal Gallery and St. Stephen's Chapel at Westminster, and to Mr. Burges's and Mr. Blomfield's decorations at Oxford, as showing the set of the current in a direction also pointed to by such exceptional works as the Royal Mausoleum, the various South Kensington buildings, and some at least of our recent theatres.

Our critiques on the Royal Academy, from the pen of an architect who has with his pencil worked more than most upon the association of architecture with the sister arts, are written, as our readers will have perceived, very much indeed from this special point of view—a point of view which those only occupy who understand best how truly all the Muses are sisters; or, in other words, how the painter, the sculptor, and the architect, ought to be associated in order to the production of a perfect work of art; and how much the productions of each lose when wrought upon with no reference to the others.

If it be really the case that a new school of artists is rising, including painters (and, let us hope, sculptors), who work with a view to the appropriate enrichment of architecture, and architects who will build so as to make paintings, coloured decoration, and sculpture, an integral part of their works, and if architects will render themselves competent to devise and superintend the execution of such works, then, indeed, there is hope for the arts of England, and a prospect lies before us hardly inferior to that which was open at any great period of art progress. To make sure of it we, perhaps, only now want a leader, as well as followers. Any ordinary school supposes not only scholars, but teachers; and the great groups of artists who have gone by the name of schools are few of them exceptions to this rule. We have the school of Giotto, of Luini, of Raffaele, of the Caracci; and though affiliation to some one artist is not the sole condition of combined progress or change, it seems to be a wonderful help. The English Gothic school will always owe very much of its force to the character of the Pugins, whose work and whose influence over numerous colleagues and pupils have served to no inconsiderable extent to give such character and compactness as it possessed to the earlier years of 'the Gothic movement.' We have at the present moment no one working among us who is such a moral force as Welby Pugin was, and we look with

some anxiety upon the disconnected and unequal efforts of various architects who are working honestly and diligently in one and the same direction, fearing lest their individual and separate courses should diverge too widely for the result to be vigorous and homogeneous.

THE SKETCHES OF THE ARCHITECTURAL EXHIBITION.

By EDWARD W. GODWIN, F.S.A.

THE collection of the late Rev. J. L. Petit's sketches, now on view in Conduit Street, gives singular interest this year to what may be called the archæological studies of the Architectural Exhibition. I do not propose to write on Mr. Petit's attainments in Archæology, or on the desirableness of architects studying in the same fields. The compound subject is very tempting, but my space is limited. I would, however, take this opportunity of putting the question—Whether it is wise, under any circumstances, and at any time, for an architect or archæologist to lose sight for a moment of his architecture for the mere sake of an attempt to produce a picture? It is quite possible that most of those works to which I have referred as 'archæological studies,' may have very little claim to be considered *studies* in any sense, and it is more than possible that what little study these works may claim, is to be found chiefly in the desire of their authors to do something pretty, oblivious alike of the historic and art-value of that architecture which has supplied them with subjects for sketching.

Thus, although Mr. Petit's drawings might, as the water-colour sketches of an amateur, claim a large share of attention, it must, I think, be conceded by everyone that they are about the last drawings in the world a young architect should look at in any light other than as a warning. We may all admire the rapid, effective, bold, even dashing character of the two hundred and ninety-four sketches now, for the first time, publicly exhibited, but we must be careful to avoid anything like praise from an architectural stand-point; and if students visit the Exhibition to gather suggestions as to style and method in sketching old buildings, they would do well to bear in mind that in this collection they have a lesson of how not to sketch reiterated more than two hundred times.

An examination of Mr. Petit's sketches reveals, amongst other things—First, a coarseness of paper, inexcusably extravagant considering the *scale* of the work; second, a prevalence of hot, vivid colours, regardless of place—'Shrewsbury' and 'Egypt' (206 and 202), the 'Isle of Man' and 'Baalbec' (175 and 180), are presented to us in tones equally brilliant and vivid; third, an impatience of detail which almost invariably leads to blotches and muddle (very markedly so in Nos. 129, 136, 140, 157, and 189). On the other hand, if the detail has been neglected, the perspective has received unusual attention; the leading lines, carefully sketched in pencil, may here and there be distinctly traced beneath the colour, when nothing else has been indicated. Very true in proportion and general effect are Nos. 79, 128, 203, 244, and 247. Boats and shipping appear to much greater advantage than architecture, as in Nos. 54, 78, and 210, which are the most satisfactory sketches in the collection. I should add to these, No. 9 for its simple broad rendering, and Nos. 100 and 152 for their clever treatment.

The sketches contributed by architects are this year very sketchy indeed. Those in colour worth notice are Mr. Street's 'Les Halles, Ypres,' and 'Whitby Abbey' (Nos. 1A and 1B), Mr. Spiers's 'Sketch of Tomb of Sultan Barkouq' (No. 6), Mr. Emerson's contribution (No. 221), Mr. Groom's work (No. 215), Mr. Florence's very pleasing sepia 'Sketch of the Château de Blois, Façade de François I.' (No. 227), Mr. Leonard's clever, quiet drawing of 'Preston Church, near Hull' (No. 67), and, above all, Mr. Allom's 'View of the Subterranean Palace Yere-Batan-Serai.'

Mr. Cole, as a painter in water-colours, exhibits four works, in two of which, 'Schloss Eltz' (No. 123), and 'Rouen Cathedral' (220), the colourist's power is fully shown.

The pencil and pen-and-ink sketches are, for the most part, examples of how not to do it. As pretty reminiscences, as illustrations for ladies' albums, or as pretences for staying abroad, they deserve the attention of shallow travellers, of ladies who keep albums, and of architectural idlers. There are a few worthy exceptions, as, for example, Mr. E. Sharpe's doorway; Mr. Watson's bay and figured details of St. Lazare, Autun; Mr. John Cotton's careful perspectives, where the detail, down to the section of small string-courses, is carefully defined; Mr. Spiers's conscientious, but dull, sketch of house at Ypres, and his more effective rendering of Cathedral at

Tournai. Although thankful to Mr. T. Hayter Lewis for some of his measured sketches taken in Algeria, still I cannot quite see what earthly good 'Dolmens' can render to the Exhibition, or why a few 'rough sketches' should swim in such an ocean of paper. As Mr. Lewis is a professor, might it not conduce to the advance of architectural education if he suppressed for the future sketches glaringly wrong in perspective as are those taken of Algerian capitals? To anyone who goes out of the beaten track and discovers pleasing, suggestive, and practical examples of our art, we must all be grateful. The old house near Halifax (133), illustrated by Mr. Seddon, is full of suggestions. It is to be regretted that Mr. Seddon could not have spared sufficient time to give a sketch plan and general measurements; for I am quite sure that our architecture is more likely to be improved by carefully studying buildings of reasonable—*i.e.*, useable magnitude—than by any amount of ecstatic admiration of mighty minsters and laborious measurement of long-drawn aisles. Few works can be more improving than to carefully measure up a bay of a really well-proportioned cathedral, to plot its details on the spot, to mark the joints, to survey its construction; but there is no need to be always doing cathedrals. Two or three well selected will teach all that is useful to know. We do not live in a minster-building age, but we do most emphatically live in a house-building age, and for all contributions like Mr. Seddon's we ought therefore to be eminently thankful.

NOTES FROM ABROAD, No. III.

By A CORRESPONDENT.

SAN FRANCESCO of Assisi has always been regarded as one of the chief points of interest to the lover of mediæval architecture in Italy. The churches still remain, and are pretty much in the same ruined state they always were; but the great monastery—the centre of the Franciscan order, and the principal monument of Francis Bernardone himself—is now silent and deserted: the monks are gone, and their property belongs to the crown—a few of them only remaining to take charge of the vast building and do the ordinary duties of the churches. These are two in number, built one above another, with a crypt beneath containing the tomb of the founder. The lower church, as it is called, is the richer in colour and effect, and contains a great number of chapels, full of interesting paintings: but the great objection to the whole of this church is that it is so dark—nothing can be properly seen. On the other hand, the upper church is full of light, and glaringly shows the decayed state into which the frescoes of Giotto da Pisa, Cimabue, and Giotto have fallen; those on the walls especially have suffered severely from damp: the ceiling being in a better state of preservation, owing to the roof which covers and protects it from the rain and snow of this mountain district. I have never been a particular admirer of this interior, and as to the frescoes, though very interesting in the history of art, they have, so far as one can see, little else to recommend them. There is a fashion in art, as in everything else; and it has of late years been the fashion to talk rapturously about the very early Italian painters, who, although possessed of great merits, are naturally a long way behind their more educated and able followers of the sixteenth century.

Their great charm is an unaffected rendering of nature, so far as they were able to effect it; and it has been not unaptly remarked by an able critic, that with these early painters it was all nature and no art, whilst with the later painters it was all art and no nature. But this must be taken *cum grano*, for Giotto's faces generally are purely of a conventional type, and as to Fra Angelico's angels and human beings, they are all exactly alike. There are, however, many points of interest more strictly architectural in both churches, and especial mention should be made of the marquetry work of the stalls in the upper church, which were executed by Domenico da San Severino about the middle of the fifteenth century. In the cathedral of San Rufino also are some splendidly carved and inlaid stalls of the early part of the sixteenth century; more effective even than those we have already described at Perugia. The façade of this cathedral dates from the earlier part of the twelfth century, although, like so many of the old Italian churches, it seems to belong to a much earlier period; the principal portal is very richly carved, and has the usual lion on each side, which in these cases, I believe, was always meant to symbolise the Church; one of them here is rendering the figure of a man with its claws, and is nearly identical in character with the lion as represented on several church entrances in the South of France; the figure which he claws is meant to represent a Pagan: in other instances he holds and protects a sheep or lamb or child, all as evidently meant to symbolise the Christian. Besides other good pieces of mediæval architecture in the town, there is a well-preserved portico of a temple of Minerva, now serving as the entrance to a church, and the ruins of a splendid castle on the hill overlooking the whole, and still noble and impressive, even in its decay. There is a custom which may be observed here and at Perugia, and other towns in Central Italy, and deserves notice: it is the insertion of small iron hoops projecting from the walls, and placed round the windows

of the common houses, in which the poorer classes insert their flower-pots. It is a cheap plan, and has a very pretty effect. I often remarked also plain iron brackets, placed each side of the windows, furnished with pendant rings, and was for some time puzzled as to their use, which is to receive a pole for hanging clothes on, or for lines to be attached for the same purpose—a practice very useful for families who live on flats, as they do in our modern model workmen's houses, or in Scotland. The next halting-place was Spoleto, the principal monument of the building art being the ancient aqueduct 'delle Torri,' the construction of which is ascribed to the Lombard Theodelapius, Duke of Spoleto, in the seventh century. It is a very remarkable work, built of small stones, about 700 feet in length and 273 feet high, resting on ten pointed arched piers, spanning the deep and rocky ravine which separates Spoleto from Monte Luco. If the date is correct, these pointed arches have more interest in the history of the arch than I believe is generally assigned to them. The cathedral is stated to have been also erected by the same Lombard Duke in the year 617, but its present façade is of the twelfth or thirteenth century, and its interior modern, with the exception of a very fine opus Alexandrinum pavement. One peculiarity is to be noticed in the arched portico which runs along the entire length of the front, and that is a well-designed projecting stone pulpit at each end, of excellent effect. In the cathedral square is to be seen also a very fine example of graffito work, a palace which bears the impress of Bramante's style, and is ornamented with friezes and panels containing triumphal processions of children, fables of antiquity, and other figure subjects, worthy of the best artists of the sixteenth century, the period to which it may be ascribed.

Although not strictly architectural, I venture to recommend all landscape, and even architectural painters, to take up their quarters in the district between this and Narni; the latter town, built on a high limestone rock, bristling with towers and battlements, in a most picturesque state of ruin. The whole valley of the Neva, with its river, rocks, and woods; and Terni, with its celebrated waterfall, will well repay exploring, and afford endless points of interest and beauty. From here to Rome, however, there is little purely architectural to detain the professional traveller; he comes gradually on to the Campagna, sees his first group of mounted Campagnoli pricking o'er the plain, goad in hand—most picturesque figures—and, finally, shooting rapidly past the vast remains of the Roman aqueducts and the Temple of Minerva Medica, finds himself descending from a railway carriage almost in the very centre of the venerable and still noble-looking baths of Diocletian, a characteristic monument of ancient and august Rome, the city of the Cæsars, of which I will speak in my next letter. W.

OBJECTS DISCOVERED IN PALESTINE.

THE members of the Palestine Exploration Fund have opened an exhibition at the Egyptian Gallery, Piccadilly, of the Photographs taken for the Fund during the years 1865-6-7, and of various objects, mostly antiquarian in character, which are the produce of the investigations and discoveries of the undertaking.

Collections of photographs are no longer the novelties which they once were, and it depends now more upon the claims of the locality illustrated than upon the quality of the photographs whether a gallery of them finds favour with the public. Serjeant Phillips's photographs, though not of very large size, have the merit of fairly uniform excellence as specimens of the art; but their subjects, frequently novel, are such as to possess a great charm for many, and on this account the Gallery well deserves a visit. Damascus, Kedes, Nazareth, Sebastiyeh (Samaria), Nablus, Ashkelon, Amman, Jerush, the Dead Sea, Hebron, Mounts Gerizim and Ebal, and Cesarea, are among the localities more or less fully photographed; while from Jerusalem, the focus of all Palestine explorations, comes more than a sixth of the whole number of about 350 photographs exhibited.

Plans of Jerusalem and its environs, a contour map, a contoured model, and a very considerable number of plans and sections showing the work performed and in progress, by Lieutenant Warren, are hung round the walls or displayed on the tables. A series of glass cases contain the collection of other objects. These are partly modern, but mainly antiquities discovered during the excavations. As is mostly the case where the ruin of an ancient city has been very complete, these consist almost exclusively of the most fragile materials. The paradox that glass and pottery may be expected to be found in localities where marble and metal have been destroyed or taken, was never better illustrated than in this collection.

The fragments of glass include some of the most brilliant and beautiful opalescent specimens we ever remember to have seen; and though a very large proportion of the glass which has been recovered is only in the form of broken pieces, there are a few lachrymatories quite perfect, and two large and fine upright glass vessels, unbroken, and remarkable for the presence *inside* them of upright glass tubes, carefully introduced and cemented to the bottom. The earthenware lamps are numerous, and so are small amphoræ, and other small vessels of simple forms for domestic use. Nearly all this fragile treasure has been met with in excavating at great depths; but though peculiar in colour—for a dull earthy tone replaces the bright red of Samian ware—there seem to be few objects in which the influence of the Roman occupation of

Palestine is not distinctly traceable; indeed the stone catapult balls, of which at least half a dozen are shown, must be traceable to the Roman sieges. We looked in vain for any marked examples of Assyrian character, though some fragments of coloured earthenware of Greek, or Greco-Phœnician character, are undoubtedly included in the collection.

A few good specimens of the jewellery now worn by the inhabitants will be looked at with pleasure by those who feel an interest in the gold and silversmith's art; and almost all visitors will know sufficient about the spirited cruises of the 'Rob Roy' canoe to feel pleased at seeing the modest equipment of that famous vessel. Her compass, cooking apparatus, medicine chest, &c., are stowed away in one corner of a case, which is enriched by the specimens and curiosities collected by Mr. McGregor during his last canoe voyage, which led him up 'Abana and Pharpar, rivers of Damascus,' and on to the sacred waters of the Holy Land.

We should like to suggest to the managers of this undertaking that it would be very desirable to hang up some good pictorial illustration of Jerusalem. Even a coloured print would be of service; but there exists at the Crystal Palace a carefully-painted bird's-eye view, which we think Mr. Grove would do well to transport to Piccadilly. A good map of Palestine having all the spots illustrated by the photographs marked out in red, would be an acquisition, and some effectively executed diagrams (those hung up being not telling in an exhibition room), to explain exactly but picturesquely the work done and doing at Jerusalem, might, we think, repay their own cost a hundredfold by winning subscriptions from visitors. We wish the Fund success, and congratulate the managers on the interesting nature of many of the objects which this compact little exhibition includes.

THE FRENCH GOVERNMENT AND THE FINE ARTS.

THE 'Annual Exposition of the State of the Empire' gives, amongst other information, a complete account of what was done during the past year by the Administration of the Fine Arts, including purchases of works of art, artistic education, and the erection and repairs of public buildings, and other monuments; and the list is a long and interesting one.

Amongst the commissions and purchases of works of art are a number of pictures for the gallery of Versailles, representing episodes in the French expeditions in China and Japan; a considerable number of works of the same class have also been finished: these relate to campaigns in Africa, the Crimea, Mexico, &c.

Decorative paintings have been executed in many public buildings, including a new church at Saint Cloud, two chapels in the Cathedral of Bordeaux, the hemicycle of the choir of Saint-Martin, Dunkirk, the apsis of Saint-Julien at Tours, the chapel of the Asylum of Sainte-Marie at Angers, and side chapels in the Cathedral of Notre Dame of Paris, the Cathedral of Agen, the Asylum of Matilde, and the ceiling of one of the courts of justice of Rennes.

Amongst the sculptural works undertaken or terminated, and purchased during the year, may be cited statues of Count Jean, grandfather of Francis I., for the Cathedral of Angoulême, of Saints Peter and Paul for the church of Roufaix, and one for that of Isore; two marble statues for the court of the old Louvre; one of Corneille and one of Molière for the Théâtre Français; a group of Saint Vincent de Paul, and several other groups and statues for various civil and religious edifices.

The following marble busts have also been commissioned. Those of the late Count Walewski, Achille Fould, Abbatucci and Thouvenel, for the Versailles Gallery; of Ponsard and Colin d'Harleville, for the Théâtre Français; of Cardinal Mazarin and the Duc de Lynes, for the Bibliothèque Impériale; of Hippolyte Flandrin, Duret, Rossini, and Hippolyte Lebas, for the Institut de France; and of Beethoven, Donizetti, Boieldieu, Hérold, Lesueur, and other composers, for the Conservatoire of Music.

The Administration also subscribed towards the execution of commemorative monuments of Vercingétorix, the Gallic opponent of Julius Cæsar, a colossal statue in copper repoussé, erected in the Department of Puy-de-Dôme, of Vauban for Avallon, and of Bella for Grignon, &c.

It should be mentioned that in addition to all these commissions, purchases and subscriptions, the whole of the money taken at the doors of the Annual Exhibition, or Salon, of the Fine Arts in Paris, is expended in the purchase of pictures and sculpture, which are afterwards placed in the galleries of the Luxembourg and Versailles, or in the museums and civic buildings of the Provinces.

Engravers received commissions for commemorative medals, of the Universal Exhibition of 1867, of the late artist Ingres, and of the Voyage of the Emperor to Algeria; and line and seal engraving was encouraged by orders of importance.

Fine art education was aided by the introduction of many improvements in the schools under the direction of, or receiving support from, the state; the collections of models and books in these schools were largely increased; and the result of these improvements, says the document in question, warrant the hope that they will be crowned with success.

A certain sum of money is set apart for aiding, by subscription, the publication of expensive and valuable works; amongst the works aided in this way in 1868 were 'Le Musée Napoléon III,' the 'Nécropole de Camiros,' 'La Renaissance monumentale,' 'Histoire de la Sainte Chapelle,' 'Œuvres de Bernard Palissy,' 'Les Évangiles,' 'Les Collections célèbres,' 'Les anciennes Tapisseries,' 'Grammaire des Arts du Dessin,' 'Architecture de l'époque de Louis XVI,' 'Peintures murales des chapelles de Notre Dame de Paris,' 'Scriptura de Musica Sacra Medievæ,' 'Bibliographie générale des Beaux-Arts,' &c. Subscriptions were also continued in aid of the follow-

ing works:—'Histoire des Peintres de toutes les écoles,' 'Voyages dans l'ancienne France,' 'Histoire de l'Art égyptien,' 'Architecture romaine du Midi de la France,' 'Revue Archéologique,' and 'Revue générale de l'Architecture.' Finally, under this head, a portion of the sum allotted was applied to various works completed during the year 1868, including, amongst others:—'Monuments modernes de la Perse, Ninive, et Assyrie,' 'Le Serapeum de Memphis,' 'Dictionnaire de l'Architecture française du 11^e et 16^e siècles,' 'L'Art chrétien,' 'Egypte et la Nubie,' 'Cités et Ruines américaines,' 'Églises de Bourges et Villages,' 'Architecture civile et religieuse en Syrie,' 'L'Art baroque aux 12^e et 18^e siècles,' 'Études sur la Musique grecque,' &c. The copies subscribed for, amounting to more than a thousand during the year, were distributed amongst the public libraries and schools.

The account of what has been done for the historical monuments and other public buildings in France has a special interest for the readers of *THE ARCHITECT*.

The very important restorations in hand of the church of Notre Dame at Leon and the remarkable edifice of Notre Dame at Dijon, the Château of Pierrefonds, the Chapel of the Château of Vincennes, and the Sainte Chapelle, Paris, have been carried on with as much activity as during former years.

The famous Château of Blois has been the object of important works; the restoration of the Louis XII. buildings has been completed, and that of the chapel approaches its termination.

The repairs of the great Amphitheatre of Nîmes have been carried on so as to consolidate the building, and to a considerable extent, as we can testify from personal observation during the spring of last year; and it is said that several interesting discoveries have been made there.

The repairs of the following churches have also been steadily pursued:—those of Meunon, Reuffac, Eau, Germiny, Saint-Sernin at Toulouse, and Saint-Étienne at Auxerre.

Government has also subscribed towards, and otherwise assisted, the restoration of the following churches:—Bénévent, that of the Collège of Saint-Raymond at Toulouse, of Vivoin, Saint-Yrieix, Saint-Eusèbe, at Auxerre, of St. Pierre-sous-Vasselay, Soissons, Braisne, Saint-Désiré, Tréguier, of the Abbey of St. Matthieu, the Tower of Constance, the churches of Montreuil, Senlis, Noyon, Saint-Leu-d'Esserent, Murbach, Guebwiller, the Abbey d'Abondance in Upper Savoy, and the churches of St.-Loup-de-Naud, La Chapelle-sur-Orcey, Poissy, Saint Maixent, Vaison, and Nieul-sur-Antioche.

The following is the account of work done in connection with important public buildings during the year:—

ARCHIVES OF THE EMPIRE.—The new wing of this establishment was terminated, and the most precious documents in the collection have been arranged in the new rooms, which occupy two floors.

CHATEAU OF SAINT GERMAINS.—The northern façade is completely restored and also the grand staircase, and the works are also well advanced on the eastern façade. The attempt to restore this old castle to as nearly as possible its primitive appearance is one of the most interesting works of the present time. The building, which was not long since a prison, is now devoted to the purposes of a Gallo Roman museum, which is already extensive, and will shortly be greatly extended.

ÉCOLE DES BEAUX-ARTS.—The great inner court of the building has been covered with a glass roof, decorated, and converted into a museum of casts from the antique.

THE LOUVRE.—Several of the antique sculpture galleries, and the fine gallery known as the *Salle des Empereurs*, have been completely restored and reopened to the public. Two grand staircases are in future to give ingress and egress to the public; one of these is already in use, and now forms the only entrance to the galleries of the Louvre above stairs. This portion of the establishment has not only been completely renovated, but increased by the addition of more than one gallery on the ground floor.

THE TUILERIES.—The works performed here are truly gigantic. As soon as the corner of the palace near the river, known as the *Pavillon de Flore*, was rebuilt, the gallery which connects that part with the beautiful building of Henry II. and those of Napoleon III., known as the *Galerie du Carrousel*, was demolished. This was only about two years since, and the whole of the new work has been finished and the gallery roofed in for some time, and the internal works got well in hand. This wing includes, besides a considerable section of the great gallery of pictures, a new *Salle des États*, to replace that in the Louvre of Napoleon III., and which is to be given up to the museum. The pictures are being re-hung in the new gallery.

SÈVRES MANUFACTORY.—The whole of this establishment is being rebuilt on a site near the old one. The offices are finished and occupied, and the museum, workshops, engine-house, and dependencies are progressing fast.

BIBLIOTHÈQUE IMPÉRIALE.—The great reading-room, with the library, in the midst of which it is placed, is, as the readers of *THE ARCHITECT* know, not only completed, but open to readers. The old buildings facing the Place Louvois are demolished, and the new façade commenced.

NEW OPERA HOUSE.—The main works of this building have not advanced much, the credit granted not being sufficient for the purpose. The money in hand has been expended principally in covering various parts of the building, so as to prevent injury to the work. The dressing of the outer walls has been continued, and the staircases and lobbies. The various works of art are being prepared in the artists' ateliers.

Such are the services which the State in France has performed for Art and her treasures in a single year!

Bodmin—Cornwall County Asylum.—The Commissioners in Lunacy in their latest report, speaking of the new building for private patients recently erected from designs by Messrs. Norman and Hine, Architects, Plymouth, say:—'The accommodation is of the most complete kind, and nothing has been spared to make it suitable to patients of the better and more educated class. We are not acquainted with any that would compare with it, supplied at such low rates of payment.'

ESTIMATES FOR PUBLIC WORKS IN THE PRESENT YEAR.

THE Estimates for the present year show a net decrease in comparison with the past year of 52,736*l.*; the total estimate for this year being 1,222,806*l.* Of this sum 30,535*l.* is allotted to the Queen's palaces, 3,416*l.* to palaces partly in the Queen's occupation, and the remainder to palaces not used by Her Majesty. The proposed new works include fire mains and tanks at Buckingham Palace, at a cost of 6,500*l.* At Windsor Castle the special works are new stores for furniture, making the passages in the Star Building fire-proof, laying oak floors in State Rooms, iron staircases to Plate Rooms, diverting the drainage of the Castle and buildings from the Thames, and a variety of smaller works. For the palaces not in Her Majesty's occupation, there is a vote of 4,500*l.* for diverting the drainage of Hampton Court from the Thames.

The Royal parks and pleasure grounds are estimated to cost 128,877*l.* This vote includes the completion of a river embankment at Battersea, and completing the new range of hot-houses at Kew, the proposed cost being 2,307*l.*; new iron railings and gates at Regent's Park, estimated to cost, when complete, 25,000*l.*; widening the carriage drive from Hyde Park Corner to Albert Gate, estimated at 1,020*l.*; extension of horse ride in Hyde Park, 2,017*l.* The following works are also included:—Gilding portions of the entrance gates at Hyde Park Corner and Marble Arch, 514*l.*; reducing the depth and purifying the Serpentine—a moiety of the cost, 13,125*l.*; new plant house, &c., at Victoria Park, 362*l.*

The estimate for the ordinary work on public buildings is 122,479*l.*, showing a decrease of 16,416*l.*; this vote includes rents for hired accommodation for public departments, amounting to 36,183*l.*, and 10,402*l.* for rates and taxes. There is also a vote for the erection of a new library for King's College, Aberdeen, a new house for the Astronomer Royal, at the Royal Observatory, and works at the Botanic Gardens, Edinburgh. The sum of 240*l.* is allotted for a new window in Parliament Hall, and 4,000*l.* for new record rooms in the Scotch capital.

The proposed charge for furniture for all the public offices, including the numerous hired offices, about 130 separate buildings, is put at the moderate sum of 13,245*l.*

In connexion with the Houses of Parliament there is a provision for buying property between the Victoria Tower and Millbank Street to the amount of 25,000*l.*, in part purchase of a block of buildings which was originally estimated to cost 150,000*l.*; and there is an estimate of 50,000*l.* for the Houses themselves. These proposed new works are for the central hall, increasing light and decorating walls, 8,900*l.*; Queen's robing room, 500*l.*; Royal staircase, 4,000*l.*; increasing light in rooms round central hall, 2,000*l.*; decoration of St. Stephen's Crypt, 500*l.* For warming, ventilating, &c., the estimate is 16,072*l.*; for works of art, 1,450*l.* This sum completes the estimate of 4,000*l.* for Herbert's 'Judgment of Daniel,' and 800*l.* balance of contract for a chronological series of sovereigns now in course of erection in the Royal Gallery.

For the acquisition of additional land for the new public offices in Downing Street a sum of 48,000*l.* is to be voted; the original estimate was 104,000*l.*, which now appears at 147,000*l.*; and for the new Home and Colonial Offices the proposed vote is 32,000*l.* The east wing of the new Record Office is estimated at 30,000*l.* for the present year, the total original estimate being 61,000*l.* For the restoration of the Chapter House at Westminster 3,635*l.* is to be voted, part of an original estimate of 25,000*l.* The enlargement of the National Gallery figures for 55,000*l.* in the present year. The original amount for the acquisition of land on the northern side of the present building was 128,000*l.*, but this has been increased to 142,575*l.* The new buildings for the University of London stand for 30,000*l.* during the present year, being the like amount to that voted last year; the original estimate for this structure was 72,000*l.*, but the revised amount is 89,000*l.*, to include bookcases, sculpture, &c.

The University buildings at Glasgow stand for 30,000*l.* in the estimates, being an instalment of 120,000*l.*, to which the aid from the public funds is limited. The Industrial Museum at Edinburgh is to have an allowance of 10,000*l.* for the extension of the halls and the completion of the western section of the Museum. Burlington House is to have a vote of 64,884*l.* for the erection of the new building on the site of the wings, for the accommodation of the learned bodies. The total of this estimate is 160,000*l.*, which includes a provision for the purchase of a portion of the Albany Chambers for the improvement of the site.

The vote for the Post Office and Inland Revenue buildings shows a large increase for the present year. The proposed vote under this head is 135,041*l.*, being an increase of 45,575*l.* over the estimate of last year. The amount required for the erection of the new offices in St. Martin's-le-Grand in the present year is 50,000*l.*, out of 150,000*l.*, the total estimate for the building; and the balance of the sum to be voted is to be spent on the post offices at Cardiff, Derby, Hastings, Sheffield, Preston, and other places. The harbours, &c. under the control of the Board of Trade are estimated to cost 69,475*l.* this year, being a reduction on the estimates of last year for this service of no less than 47,200*l.*; of the total sum 28,000*l.* is estimated for Dover, 22,000*l.* for Alderney, 16,000*l.* for Holyhead, 437*l.* for Portpatrick, and 5,300*l.* for Portland. This gigantic work appears nearly completed. The total estimate having been 1,049,125*l.*, and the amount already expended 1,023,526*l.* The total cost, therefore, appears to be less than the original estimate.

There is to be a vote for the Wellington Monument of 2,000*l.*, and of 667*l.* towards the original estimate of 2,000*l.* for a monument to Lord Palmerston.

The total estimate for works in Ireland is 145,455*l.* This includes the works for coast guard stations, new works at the law courts and offices, police and constabulary buildings, grants for new schoolhouses, model schools, and a model farm; also the cost of dredging and maintaining harbours and fishery piers. Lighthouses abroad are estimated to cost 31,810*l.*, including a portion of the cost of a new one at Inagua, and on the Bird Rocks at the Bahamas, each of which is estimated in total at 10,000*l.*

Another branch of the votes for these services is that for embassy houses

abroad; those at Paris and Madrid are estimated to cost 1,887*l.*, while those at Constantinople, China, Japan, &c., stand for 62,585*l.*, being a decrease of more than 10,000*l.* in the estimates of last year. Out of the sum to be voted this year, 35,000*l.* is for China and 10,000*l.* for Japan, the total estimate for the works in China alone being 179,382*l.*; there is also an estimate of 20,000*l.* for the cost of a mission-house at Tehran, of which 8,000*l.* is to be expended in the present year. In addition to this estimated outlay the staff of the Office of Works is estimated to cost 34,222*l.*, which includes a new officer, called the Secretary for Works and Buildings, who is to have the special charge of that portion of the office duties.

ANCIENT MAPS OF PARIS.

NEW HISTORICAL MUSEUM.

PARIS is already rich in Museums. Besides the magnificent galleries of the Louvre, there is the museum of the Hôtel Cluny, which contains one of the finest mediæval collections in the world. At St. Germain's is a new museum devoted to illustrations of the history of France, and another establishment is now being prepared for the reception exclusively of antiquities belonging to Paris itself. This new museum is placed in an old mansion, known as the Hôtel Carnavalet, in the neighbourhood of the Place de la Bastille. This mansion is famous in more than one respect: in the first place, it was originally decorated with sculptures by one of the greatest artists France has yet produced, poor Jean Goujon, who was brutally assassinated at the massacre of Saint Bartholomew (these works still exist, and have been carefully restored); and, secondly, it was for a considerable time the residence of the famous Madame de Sevigny.

Considerable collections of city antiquities are scattered about Paris, and will, doubtless, mostly find their way in time to the Hôtel Carnavalet; for in France, as in England, it is invariably found that a well-established public museum attracts donations from all quarters.

Maps of Paris will naturally form a department in the new gallery, and the following list of plans, already in possession of the city authorities, will interest many persons:—

1. A plan, in manuscript, found in the Abbey St. Victor, and showing Paris as it was in the year 1400. This map was engraved by Dheulhard in 1766.
2. Another original plan made from tapestry work, of about the same period. These are the oldest topographical records of Paris known to exist, with the exception of representations of some public edifices painted on the margins of an old manuscript presented to the city of Paris by M. Firmin Didot, the well-known printer, publisher, and bibliopelist.
3. A plan of Paris of the time of Henry II., 1560.
4. An Italian plan of the date of 1566.
5. The plan of Quesnel, in twelve sheets, in the reign of Henry IV., 1609.
6. A plan bearing date 1815, engraved by De Witt, of Amsterdam.
7. Another, engraved in Holland in 1620.
8. A plan, executed in 1651, but which shows only the streets.
9. The plans of Boisseau and of Gomboust, both produced in 1652.
10. Defer's plan, 1692.
11. The plan of Jouvin de Rochefort, 1697.

From the commencement of the eighteenth century to the present time the maps of Paris may be counted by dozens, the best known being those of Félibien, Turgot, Bonamy, and Verniquet.

This series of plans is curious, not only as showing the gradual growth of the city, but also the successive enlargement of the city boundaries, which originally included only the island on which stands the fine old church, now Cathedral, of Notre Dame, and are now represented by the grass-grown slopes, never, it is hoped, to be blackened by powder, of the fortifications which surround the city.

Attached to the Hotel is a large courtyard, and workmen were for the time occupied in setting up there the stones of a curious old arch, lately removed to make room for the new courts of assize built in the rear of the Palais de Justice. It is more than probable that as the demolitions of Paris proceed, other interesting relics will be found for the court of the new museum.

FERNDALE COLLIERY EXPLOSION.

A LOUD and terrible response has been given to the text of our article on Colliery Explosions printed on April 10. In the Ferndale Colliery (in which, in November 1867, 168 persons perished by the most fearful calamity that yet has devastated the underground kingdom) an explosion took place on the 10th current, in which it is feared that at least 60 miners have lost their lives. The works are of great extent, carefully ventilated, and divided into three separate portions, with such precaution that, when the shock occurred in the Duffryn part of the mine, the miners in the second division were uninjured, and those in the third were positively unaware of the occurrence. It would be difficult to imagine any circumstances more creditable to the general arrangement of the works or to the care exercised by the proprietors and managers.

The moral to which we pointed on the occasion above referred to is to be found repeated in a brief line of one of the telegrams describing the attempts to re-enter the mine. 'AN UNLOCKED SAFETY LAMP was found in the vicinity of the explosion.' How long will it be before such measures are enforced as will put it out of the power of any individual miner, by carelessness, by foolhardiness, or by stupidity, to produce such fearful calamity? Each miner should be searched and each lamp examined before being allowed to enter a mine, and unpickable locks should be used.

One wing of the new building at Dulwich College, capable of accommodating 360 boys, will be opened at Midsummer.

BUILDING CONTRACTS.

(THE LEGAL VIEW.)

THE difficulty of the English law at the present time, whether caused by the complex relations of modern society or by the way in which the law is created and promulgated, or whether it is owing to a combination of both causes, has undeniably this, amongst other results, that it is next to impossible for any one to understand the legal effect of his contracts or his other acts, unless he has given a considerable amount of attention to the study of the law. To give such attention requires, however, much more leisure than can usually be afforded by those who are not connected with the law as a profession, and most people are in consequence in a state of the most entire ignorance of the most elementary principles of the law to which they are subject, and which dictates their various rights and duties. One of the forms in which this ignorance shows itself is extreme carelessness in entering into contracts even when of the most important nature. Few persons pay any attention to the wording of the writings which they sign, and are often afterwards much surprised at the legal construction that is put upon expressions and sentences which they hardly noticed when they entered into the contract. The experience acquired by one individual in the course of a legal proceeding is seldom appreciated by others who are not directly interested in the question then at issue, and hence it is that documents are every day executed by people who are quite ignorant of their real effect, and who would be horrified if they knew the meaning which the law attaches to the engagements into which they so readily enter.

In former days the evil of reckless contracts was thought so great that the law sometimes gave relief simply on the ground of the hardship imposed on one of the parties. Bonds to secure the payment of money are the most familiar instances of this. By the plain construction of a bond in the usual form, if the obligor did not actually pay the money mentioned in the condition on the appointed day, he became liable to pay the larger amount mentioned in the obligatory part of the bond.

The Court of Chancery at a very early period interfered to prevent the obligor from suffering this hardship, and the obligee was compelled to be satisfied with the amount of the debt and interest and damages for the delay in the payment. Later still a statute of Anne gave the obligor similar relief at law. The same principle has been extended to other cases where a person contracts to pay a penalty (except where it is by way of liquidated damages) on the non-performance of a contract.

The tendency of the Courts at the present day is, however, to allow persons to contract as they like, whether the contracts are foolish or not. The old authorities relating to penalties are still followed, but the Courts decline to extend their principle any further. The mere fact of hardship imposed upon one of the parties to a contract is no ground for relief at law or in equity unless the circumstances come directly within the authority of cases already decided.

There is, perhaps, no class of contracts in which greater recklessness of consequences is shown than in building contracts. When the owner of land wants to build upon it, he generally chooses an architect in whom he has confidence, and then advertises for tenders for the buildings, and having chosen a contractor to do the work, he confides the superintendence of the erection of the buildings to the architect. One of the commonest terms in building contracts is, that the work is to be paid for by instalments as it progresses, on the architect giving certificates from time to time that the work is properly done. It is also generally stipulated expressly that no money is to be paid either during the construction or on the completion of the building, unless the builder obtains from the architect a certificate that the building is being built or is completed, as the case may be, to his satisfaction.

Such a stipulation as this practically leaves the builder entirely at the mercy of the architect, who is thus placed in the position of an arbitrator between the landowner and the builder. The effect of these stipulations in building contracts has more than once come before the Courts. In *Clarke v. Watson* (13 W. R. 345) the action was by a contractor against a landowner for payment for work done under a building contract which required (in the usual form) that the plaintiff should not be paid until the defendant's architect had given a certificate that the work was properly completed. The declaration averred that the architect withheld his certificate improperly, and claimed payment as if the certificate had been given. The Court held on demurrer that the declaration was bad, and that the improper refusal of the architect to give the certificate did not dispense with the performance by the plaintiff of the condition that he should get the certificate which was precedent to his right of action against the defendant.

This latter point arose in the case of *Davis v. Taylor*, in the Court of Exchequer last week. The action was by a builder, under a building contract in the ordinary form, against the architect. The declaration alleged that the defendant knew that the plaintiff had properly completed the work, and that without reasonable cause, and fraudulently and maliciously, and to injure the plaintiff, he withheld his certificate, whereby the plaintiff was unable to obtain payment from the landowner. There was a demurrer to the declaration, and the Court have reserved their judgment. *Clarke v. Watson* shows that if the architect, in such cases as these, chooses to withhold his certificate, however improperly, the builder is entirely without remedy against the landowner as he has not got the certificate, and it has hitherto been the general opinion that no action could be maintained by the builder against the architect, who is under no duty towards the builder either by contract or otherwise.

It would seem, from a dictum of Willes, J., in *Clarke v. Watson*, that if the architect refused to exercise his judgment, and declined to consider the matter at all, the proper course for the builder would be to call upon the landowner to appoint some other architect to act in the matter. If the landowner refused to do so, it is possible that the builder might have a remedy, as the landowner might then be considered as being in the position of a person who had never appointed an architect, and had thereby himself rendered the performance of the condition precedent impossible. If the landowner by any act of his own prevents the builder from getting the certificate, the absence of the certificate cannot be raised by the landowner as a defence

to an action by the builder. It has been decided (*Batterbury v. Vyse*, 11 W. R. 891) that if the architect refuses to give the certificate in collusion with the landowner, the builder is relieved from the necessity of obtaining it, and can maintain an action for payment without the certificate.

It does not often happen, however, that an architect refuses to come to an opinion on the subject of the works under his charge, or that a landowner can be proved to have caused his architect to refuse a certificate, or that it can be shown that an architect has acted maliciously in refusing a certificate. The ordinary case is (and it is one that frequently happens) that the architect, whether rightly or wrongly, has himself formed an opinion that the works are not properly done. The correctness of this opinion cannot in these cases be subjected to any test, as the builder has beforehand engaged that his payment shall depend upon the contingency of getting the certificate.

So far we have only dealt with the builder's rights at law, but in equity he is in no better position. In *Bliss v. Smith* (34 Beav. 508) it was held that a builder had no remedy against a landowner whose architect refused to give a certificate, unless there was either fraud or the accounts were too complicated to be taken at law. Practically, the builder's position is the same in equity as at law. The builder under an ordinary building contract is therefore entirely at the mercy of the architect, who is a judge from whose decision there is no appeal.

The chief objection to such a state of things depends not so much upon the fact that the builder must submit to the decision of the architect, because that is nothing more than is voluntarily accepted by every litigant who consents to an arbitration. The real hardship is that the arbitrator is the architect who is employed and paid solely by the landowner, and thus there may be a direct clash between the claims of the builder and the interests of the architect's employer. The architect is thus placed in a position which no one should occupy. It resembles somewhat the case of a man who is judge in his own case. Such a position renders it possible for an unscrupulous architect to do great injustice, and at the same time makes it difficult for one who is scrupulous to do his employer justice, and it ought, therefore, to be avoided. We do not for a moment mean to say that architects placed in this position do not generally do their duty and do it well. On the contrary, we believe that in the majority of cases they strive to do justice to both parties; but notwithstanding this they are necessarily open to suspicion on account of their position, which in itself is far more difficult than that of an ordinary arbitrator who is equally independent of both parties.

The simplest remedy for this evil would be to appoint some independent person who should, in case of dispute, be the ultimate arbitrator between the builder and the landowner. It would be easy to adopt a form of contract which should contain such a provision, and if builders were once thoroughly aware of the legal construction of their ordinary contracts it is probable that they would, in their own defence, insist upon the insertion of some such provision as we have suggested. In the meantime some good may be done by pointing out the objections that there are to the common form of building contracts which is now generally in use.—*Solicitors' Journal and Reporter*, June 12.

REVIEWS.

VILLA AND COTTAGE ARCHITECTURE. SELECT EXAMPLES OF COUNTRY AND SUBURBAN RESIDENCES RECENTLY ERECTED; WITH A FULL DESCRIPTIVE NOTICE OF EACH. London: Blackie & Son, Paternoster Row.

Example is better than precept, says an old proverb; and if this be true, Messrs. Blackie, by collecting 32 examples of the work of 19 architects into this handsome volume, may be supposed to have done more for those who build houses than they could have done by publishing an elaborate treatise. The value of such a book must always depend upon the excellence of the buildings given in it, the appropriateness of the selection for practical purposes, and the completeness with which the examples are shown. Sound judgment and knowledge of the subject appear to us to have been brought to bear on all that belongs to the descriptions and illustrations of the buildings selected, but the appropriateness and excellence of the designs chosen vary remarkably: the best are, of their kind, very good indeed; there are, on the other hand, some which it would have been a benefit to the volume and a kindness to their architects to have suppressed; and between these two extremes the bulk of the illustrations may be taken as fair average samples of what they profess to be—dwelling-houses of from 500*l.* to 2,500*l.* cost, executed from the designs of known architects, English and Scotch. The English contributors are—Messrs. Ayliffe, Banks & Barry; Ewan Christian; Darbishire; Hine & Evans; Kendall, jun.; Lamb; Paull; Speakman & Charlesworth; Truefitt; Walker; and Walters. The Scotch ones are—Messrs. Baird; Cousin; Gordon; Rothead; Shiells; A. & G. Thomson; and Walker.

The most striking designs in the volume undoubtedly come from Scotland; and we cannot but regret that the editor of a book which happens to furnish so good an opportunity of contrasting the peculiarities of Scottish and English work should have failed or neglected to obtain more houses built by the foremost men of the most active school of English architecture. It is true Mr. Ewan Christian is represented here, but we look in vain for any example of Mr. Scott, Mr. Ferrey, Mr. Street, Mr. Burges, Mr. E. W. Godwin, Mr. Somers Clarke, Mr. Blomfield, Mr. Waterhouse, Mr. Norman Shaw, or Mr. Nesfield; and we regret the absence of these names. Their best works would have illustrated the real adaptability of Gothic to domestic works of moderate size and pretensions, in a better manner than much of the doubtful Gothic which the volume contains. And we are English enough to wish that some South-country work had been introduced of as high a character as the fine and exquisitely wrought-

out designs of Messrs. A. & G. Thomson of Glasgow, who have shown again in the works they contribute to this volume, as they have shown elsewhere in various ways, that it is *not* impossible so to treat Greek architecture as to make it adapt itself to the rough materials and keen climate of a Northern country without losing its peculiar character and beauty.

We are permitted by the courtesy of the publishers to reproduce one of the plates (there are 80 in all), showing the plans and a perspective view of one of Messrs. Thomson's buildings—a pair of semi-detached villas.

The plate we have selected gives a fair example of the execution of the whole—pains-taking, distinct, well arranged on the page (in itself a great merit), but deficient in spirit, to an extent which is so far from setting off the designs that the engraver in some cases has barely done them justice. The most spirited plates considered as engravings in the book are No. 63, a villa by Messrs. Paull & Ayliffe; Nos. 55 and 56, representing Mr. Truefitt's own dwelling house at Holloway, the cheapness and compactness of which are not unknown to fame; and No. 24, representing a very original design for a park-wall and gates, by Messrs. Thomson. A little more of what the French call *chic*, even in these plates, and a good deal more of it in the remainder of the book, would have doubled its popularity, and that not so much by unfairly concealing defects as by bringing out the real play of light and shade.

Apart from this tameness, the getting up of the volume does great credit alike to the editor and the publishers. The explanations are lucid, useful, and not too long, and the selection of drawings made in those cases where all the plans or elevations of a house are not given is judicious.

Such a work as this may often furnish a valuable series of precedents to be looked over by gentlemen intending to build, and may furnish the basis of their instructions to their architects. The houses are not so given that it would be easy for an adventurous builder to attempt to reproduce them from these engraved plans alone; and for such a purpose the authors of the designs (which ought to be duly registered) would, of course, not have lent their plans. As a series of executed examples the work will often, no doubt, be serviceable to architects; and though here and there it may be cited in support of things which but few approve at the present day, that blemish need not seriously interfere with its present usefulness; while, should another edition be called for, a judicious and resolute use of the pruning knife might entirely remove it.

ILLUSTRATIONS.

DOUBLE VILLA AT LANGSIDE, GLASGOW.

THIS building has been erected from the designs of Messrs. A. & G. Thomson of Glasgow.

The clever mode in which extreme variety is procured by the simple expedient, suggested in this instance by peculiarities in the site, of reversing the plans of the two houses will catch the eye at once. It is open to the objection that one or other house is likely to have inappropriate aspects given to some of its rooms; but it is none the less highly ingenious. Some of the peculiarities of Scottish planning, notably the downstairs bed-room and the upstairs drawing-room, and the position of some of the conveniences, are illustrated on the plans.

The treatment is well adapted to free-stone, the material used, and appropriate to the square windows in familiar use in England. Special precautions have been taken to render the roof secure notwithstanding its flatness, and we learn that the lining of the walls in dining and drawing-room is almost entirely executed in wood, with a good deal of decorative treatment.

The cost of this pair of villas is stated at a few shillings under 2,250*l.* The date of their erection, 1856-7. This building is here illustrated by permission of Messrs. Blackie & Co.

ANCIENT METAL WORK.

THE examples of iron-work illustrated in the accompanying sheet are principally from the county of Sussex. The corner of an old chest shows some early metal work, binding the construction in a very strong manner; but, in spite of the precautions taken, it is now decayed and broken to pieces. This, as well as the lock, railing head, and chancel screen, are from Chichester Cathedral; the latter is a most curious instance of the use of stamped work, which the illustration shows full-size. In this method of ornamentation, the ends of the scrolls have been divided, beaten thin, then stamped on both the insides, and afterwards pressed together. How different this is from the indiscriminate use that is now made of stamped work! This description of work is certainly no apology for the modern pressed leafage. The leaves we now see are thin and brittle, being welded on near the beginning of the leaf (clumsily enough usually), and their designs are such that they look like stucco, or anything except stamped leaves.

Lately, a new chancel screen has replaced the old one; in many of its parts it is a copy of the earlier one, and is a praiseworthy effort on the part of a local tradesman. The contrast between this work and the more ambitious metal standards near is very great, the ornate elegance of the latter being quite out of keeping with an interior so grandly severe as Chichester Cathedral.

THE ROOF OF THE ROYAL ALBERT HALL.

WE gave, in the 'ARCHITECT' for June 5, an illustration of the wrought-iron roof which is being erected over this building, and we now give those descriptive details of its construction which we were then unavoidably obliged to omit.

The roof is domical and oval in plan, the major and minor axes inside the walls being 219 feet 4 inches and 185 feet 4 inches respectively, the oval being of such a form that it is a very near approximation to a true ellipse.

The principle of the roof is composite, there being a wrought iron flanged curb bedded on the top of the wall, and radiating curved and braced principals connected together and stiffened by trussed purlins, and two minor oval curbs at the crown of the roof connected together by diagonal bracing, and leaving a clear oval opening in the centre of the roof of 23 feet by 18 feet.

The materials in the structure are so disposed that the curved principals (acting as girders or trusses) are capable of carrying their own weight and the structural framework of the roof, including purlins, roof and ceiling rafters; and the main wall curb is capable of taking the thrust induced in the curved principals from the weight of the roof covering, ceiling, wind, and snow, so that no portion of the structure under the greatest estimated load would be strained to more than 6 tons per sectional inch. The strains on the principals and the wall curb are apportioned by means of folding wedge adjustments between the feet of the principals and the curb: thus by slackening or tightening the wedges the whole of the thrust can be brought on the curb or on the curved ties of the principals; but in every case of loading, the strains are communicated to the ties of the principals or the curb by means of the top flange of the principals acting as an arch, which is retained in the required position by means of the bracing and curved ties.

The illustration gave a general view of the principals, curbs, and purlins; the intermediate rafters, ceiling rafters, skylights, &c., not being shown.

The main wall curb is of a mean breadth of about 4 feet, and built up of a web plate $\frac{7}{16}$ " thick, flange plates 8" wide by $\frac{7}{16}$ ", connected to the web by 4 angle irons $3'' \times 3'' \times \frac{3}{8}$ " thick.

The principals are composed of built flanges of a T shape, composed of 2 plates 9" and 11" wide by $\frac{5}{16}$ " thick, and 2 angle irons $3'' \times 3'' \times \frac{5}{16}$ "; the radiating struts are 4 angle irons, each $2\frac{1}{2}'' \times 2\frac{1}{2}'' \times \frac{5}{16}$ ", slightly curved and connected together by cast-iron distance pieces and bolts; the diagonals are round rods of varying diameter, provided with screwed adjustment. At the feet of the principals the flanges are connected together and fitted into cast-iron shoes with curved bearings, which are provided with folding wedge adjustments for apportioning the strains on the structure.

The purlins are composed of double angle iron flanges, channel iron struts, and flat bar diagonal bracing.

The minor curbs, 2 feet 6 inches broad, formed of plates and angle irons, are connected to the upper and lower flanges of the principals, and to each other, by diagonal bar bracing; and the strength and detail of this portion of the roof are such that any unequal loading on the roof caused by snow or wind is transmitted generally, so as to prevent any distortion or disturbance of the equilibrium of the structure as a whole.

The work throughout is connected together by riveting, has been manufactured by the Fairbairn Engineering Company, and is being erected by the contractors, Messrs. Lucas, under the superintendence of Lieutenant-Colonel Scott, R.E.

THE LAW AND SCIENCE OF ANCIENT LIGHTS.

By HOMERESHAM COX, M.A., BARRISTER-AT-LAW.

(Continued from p. 305.)

PART I.

SECTION III.—The Degree of Obscuration for which Redress may be Obtained.

We come now to consider what degree of obscuration will entitle a plaintiff to legal or equitable relief. In this respect Courts of Law and Equity act on different principles, depending on the different kinds of redress which they respectively afford. A man may sue at law for damages on account of the injury actually inflicted; but if he seeks to prevent an apprehended injury, or the continuance of one already sustained, his usual course is to file a bill in Chancery. In other words, Law will give him compensation for the past; Equity will protect him for the future. Within the last few years the suits in Chancery respecting ancient lights have been numerous, in consequence of the erection of modern lofty buildings in London and other cities. The Court of Chancery may grant either an injunction to restrain the defendant from creating a threatened obstruction, or what is called a *mandatory* injunction, commanding him to pull down the building which causes the injury (*Beadel v. Perry*, 3 Law Rep. Eq. 465). The Court of Chancery has also a jurisdiction to decree a compensation in money instead of the *mandatory* injunction (*Senior v. Pawson*, 3 Law Rep. Eq. 330).

It results from this difference of procedure that the Common Law Courts will give damages for an injury which would not be sufficient to justify an injunction in Chancery. The legal rule is thus expressed in a case of *Back v. Stacey* (2 Car. & P. 466):—"In order to give a right of action and sustain the issue, there must be a substantial privation of light sufficient to render the occupation of the house uncomfortable, and to prevent the plaintiff from carrying on his accustomed business on the premises as beneficially as he had formerly done." In the late case of *Dent v. Auction Mart Co.*, Vice-Chancellor Wood observed, that "with the single exception of reading or for *and*, I apprehend that the above statement correctly lays down the doctrine in the manner in which it would now be supported in an action at law."

To entitle the plaintiff to an injunction, something more is requisite than that amount of injury for which damages might be recovered at law. This is laid down by Lord Westbury in *Jackson v. the Duke of Newcastle* (33 Law J. Ch. 698), where it is added that the injunction would be granted

'where the darkening of the ancient windows of a dwelling has materially injured the comfort of those who dwell in it,' and with respect to places of trade or business, where the obstruction 'renders the buildings to a material extent less suitable for the business.' The rule is expressed by Vice-Chancellor Kindersley almost in the same terms in *Martin v. Headon*, but is inevitably vague. What is meant by 'material' or 'substantial' or 'serious'? The mere accumulation of such adjectives will not give them precision; and it is only by looking at the circumstances of particular cases that we can form any idea as to the meaning attached to them by the Court.

In *Beadel v. Perry* (3 Law Rep. Eq. 465) Vice-Chancellor Stuart referred to a very distinct and definite rule, but unfortunately it is one which cannot be applied in the most critical cases. His Honour said:—"The Metropolitan Building Act is framed on the principle that the height of a building on the opposite side of the street should not exceed the breadth of the street. That is, if the street be 40 feet wide, the height of the buildings on the opposite side must not exceed 40 feet. I have had means of ascertaining from one of the most eminent judges in the Common Law Courts that, as a general proposition, the Courts of Law are now disposed to take this view. It has been clearly proved in this case that opposite to the plaintiff's ancient lights the defendant has built a wall very much higher than the distance between them and the wall, and to that extent the defendant must in my opinion take his wall down. There must be a *mandatory* injunction to that effect."

This was in effect a decision that the plaintiff was entitled to preserve all the light which entered his windows above a plane inclined at an angle of 45 degrees to the horizon. But it does not appear whether the angle was to be measured from the top or the bottom of his windows. The difference might be very material to the defendant, and involve the demolition of several feet of his new wall. It appears by the statement of the case that the plaintiff's first floor windows were opposite an old wall of the defendant's which was somewhat higher, but permitted the light to enter even at the tops of those windows at an angle of 40 degrees. The injury consisted in building a new and higher wall.

In the recent case of *Lanfranchi v. Mackenzie* (4 Law Rep. Eq. 421), Vice-Chancellor Malins seems to have decided that the title to relief must depend upon the question whether there is a material abstraction of the light required for ordinary purposes, and that the occupation of the plaintiff's house for a business requiring an unusual amount of light will not give him a special claim to an injunction. But the critical and difficult cases are where, by reason of obstructions more ancient than that of which the plaintiff complains, his right to light is much restricted, and the rule respecting 45 degrees is consequently inapplicable. For instance, in the case of *Martin v. Headon* (2 Law Rep. Eq. 425), not only the whole of 'sky-area' below the angle of 45 degrees, but a great deal more, was already shut out by pre-existing obstructions, for which the defendant was not responsible. The effect of the new building, of which complaint was made, was to decrease the already limited light by about 13 degrees measured horizontally, and 8 or 9 degrees measured vertically. This, the Vice-Chancellor Kindersley observed, would be but a trifling diminution if the plaintiff's windows had been previously well lighted; but when the sky-area already available was very limited, the diminution by even a few degrees became a serious matter. In this case it appears to have been proved that about one-half the sky-area which had been previously open to the plaintiff was shut out by the defendant's new building, and this was held to be an injury for which the plaintiff was entitled to relief. Again, in *Webb v. Hunt* (briefly reported in the 'Weekly Notes' of 1866, p. 165), the same Vice-Chancellor said 'he was of opinion that the effect of the new building was to deprive the plaintiff's windows of nearly half the amount of light which they enjoyed prior to its erection,' and decided in the plaintiff's favour.

These two cases supply something like a definite rule. It may be inferred that where the plaintiff's light is already scanty, the abstraction of one-half of it—and probably much less—will warrant the interference of the Court of Chancery.

SECTION IV.—Reflected Light and Direct Sunlight.

There remain only two other legal points to be considered as a foundation for the optical investigation. The first is, that the Court will not regard offers on the part of the defendant to supply reflected light; the second, that the Court regards, not direct solar rays, but the average illuminating power of the sky. On the first point, it will be sufficient to give an extract from the judgment in *Yates v. Jack* (1 Law Rep. Ch. Ap. 295). There the plaintiffs required light for the purpose of sampling goods, and the defendant produced evidence to show that there would be ample light for the business carried on, and that the screening off the direct rays of the sun would be a positive advantage. Referring to these witnesses, the Lord Chancellor said:—"Some of them go so far as to say, that for the purpose of sampling a strong direct light is not desirable, and that the erection of the new building, by screening the sun's direct rays, will improve the quality of the light admitted to the plaintiffs' windows. The evidence satisfies me that for some purposes of their trade it is necessary at times to exclude the direct rays of the sun; and that in what is called sampling a subdued light may be better than direct sunlight. But this is not the question. It is comparatively an easy thing to shade off a too powerful glare of sunshine, but no adequate substitute can be found for a deficient supply of daylight." On the second point, the following passage from Vice-Chancellor Wood's judgment in *Dent v. Auction Mart Co.* (2 Law Rep. Eq. 238) will suffice:—"Then, lastly, there was the suggestion of glazed tiles—often made and never listened to by the Court. A person who wishes to preserve his light has no power to compel his neighbour to preserve the tiles, or a mirror, which might be better, or to keep them clean; nor has he covenants for these purposes that will run with the land, or affect persons who take without notice."

(To be continued.)

A firm in Oshkosh, Wisconsin (U. S.), has contracted to make 1,000,000 feet of wooden tubes, to lay down in that city for gas pipes. They are made of timber six inches square, bored in the same way as pump barrels.

PARLIAMENTARY PROCEEDINGS.

Copyright of Designs Bill.

In the Lords, on the 11th inst., Earl STANHOPE presented the petition from the President and Council of the Royal Institute of British Architects, desiring Architecture to be included in the provisions of the Copyright of Designs Bill, which we give elsewhere, and moved that it be referred to the Committee on the Bill, which was agreed to.

The Preston Railway Station.

In the Commons, on the 10th, Mr. HARMON asked the President of the Board of Trade whether his attention had been called to the state of the railway station at Preston, owing to deficient platform accommodation for the traffic through that station; and whether he would lay upon the table the last report made by Colonel Yolland on the subject.

Mr. BAUER believed that many would agree with him in saying that the Preston station was one of the most inconvenient and disreputable in the country, when the amount of traffic which passed through it was taken into consideration. In 1866 Colonel Yolland made a report upon it, and it was forwarded to the companies concerned, and also to the Mayor of Preston; but nothing had been done, because, although the London and North-Western and the Lancashire and Yorkshire companies were anxious to have a new station, they had not hitherto been able to agree upon the proportion of the cost which each ought to bear. He was glad to hear from his hon. friend the member for York, who was a director of the London and North-Western Railway, that a plan which had been suggested by the London and North-Western Company was under the consideration of the Lancashire and Yorkshire Company, and that there was some reason to hope that the two companies would be able to come to an agreement, and so secure much better accommodation than had hitherto existed at Preston. As the subject was being considered by the companies, and was likely to be settled, perhaps the hon. member would not deem it necessary to print the report; but if he thought otherwise, there was no objection to produce it.

The New Law Courts.

Mr. BENTINCK asked the Chancellor of the Exchequer whether the Royal Commission for the Building of the New Courts of Justice had appointed a committee to examine all the questions of measurement and cost; and, if so, whether the Bill for acquiring the new site on the Thames Embankment would be delayed until the committee had reported; and whether the Honourable Society of Lincoln's Inn had renewed their offer made in 1860 to provide courts for the Equity Judges within the precincts of their Inn, and upon what terms.

The CHANCELLOR of the EXCHEQUER: It is true the Royal Commission have appointed a committee. I cannot state the exact terms of the reference, but in substance it is that the committee shall inquire into the measurements of Mr. Street's plan, and also into those of the plan circulated among the members of the House by the Incorporated Law Society, and so severely called in question by Mr. Street. It is not necessary that the progress of any measure through Parliament should be delayed on account of the appointment of that committee. I cannot say that the Society of Lincoln's Inn has made a formal offer of the kind referred to; but something to that effect was stated by Lord Justice Selwyn to the commissioners the other day, and no doubt he only said what he had a right to say. From the statement of his lordship, it appeared that the Society were willing to renew the proposal if they thought it was likely to be accepted.

South Kensington Museum.

In the Commons, on the 11th instant, Mr. DILLWYN asked why the report of the committee appointed by the Science and Art Department to inquire into the alleged deterioration of pictures belonging to the National Gallery deposited at the South Kensington Museum had not yet been presented.

Mr. W. E. FORSTER said the report had been delayed in consequence of experiments which scientific men had been engaged in making. He believed, however, it would be presented before the close of the present Session.

Statues in Palace Yard.

On the 15th, Mr. NEVILLE-GRENVILLE asked the First Commissioner of Works what had become of the statue of Sir Robert Peel, lately removed from Palace Yard; whether it was to be replaced; if so, where; and whether there were other statues or works of art warehoused in Government stores; if so, what were his intentions respecting them.

Lord ELCHO also asked the First Commissioner of Works whether there was any truth in the report that the statue of the late Sir Robert Peel, which was condemned as an eyesore and discredit to his memory by the late Parliament, was about to be erected within a few feet of the spot whereon it stood before it was removed by the vote of the House of Commons.

Mr. LAYARD replied that the statue of Sir Robert Peel was now in the Government stores. (Laughter.) As regards its erection, he was waiting a communication from the committee having charge of it. There were two other statues, one of Brunel and the other of Stephenson, in the Government stores. When he came into office it was proposed that they should be placed on either side of Canning, but beside the fact that it would be somewhat inappropriate to place engineers in company with statesmen in Palace Yard, he found that Canning's statue was 11 ft. high, Brunel's 8 ft., and Stephenson's 9 ft. (Laughter.) It had been proposed to place these two statues on the Thames Embankment, certainly an appropriate site for the statues of eminent engineers. He added that it had been proposed to place Lord Palmerston's statue on the outside of the railing of Palace Yard; but in order to enable people to judge of the effect of it, he had ordered a model of the statue and pedestal to be placed there before the site was positively determined on.

Municipal Government of the Metropolis.

On the 16th, Mr. C. BUXTON moved the second reading of his two Bills for remodelling, on a comprehensive scale, the municipal government of the metropolis, admitting, however, at the outset that, as the Home

Secretary had promised to deal with the subject, he did not propose to press them. The plan, as he sketched it, involved the creation of a regular municipal corporation—Mayor, Aldermen, and Burgesses, with all the official machinery—in each of the metropolitan boroughs, and also of a central corporation for the whole metropolis, elected by the ratepayers of the metropolis, and consisting of 135 Common Councilmen, Aldermen, and a Lord Mayor. The chief argument dwelt on by Mr. Buxton in support of his measure was the anarchy of the present system, of which he drew a forcible picture. He was seconded by Mr. MORRISON, but

Mr. C. BENTINCK moved the rejection of the Bill, though he admitted that London was the worst governed metropolis in the world. Mr. Buxton's remedy was utterly useless, and even mischievous. It was deficient, too, in all the requisites of municipal reform; it was opposed to the opinion of the proposed constituents, and it was a subject which the Government alone could deal with.

Mr. LOCKE also opposed the Bill, and sketched a plan of his own by which the whole of the metropolis would be brought within the scope of the City Corporation; and after some remarks from Sir H. HOARE,

Mr. BRUCE admitted that the Government alone could satisfactorily deal with the question, but declined to give any pledge as to time, alleging that they were already pledged for next Session to Irish land (not to mention the possibility of the Irish Church Bill coming back), education, licences, and local taxation, with local administration and sanitary reform behind. At the same time he pointed out some considerations against this particular form of remedy. For most of the functions of municipal administration a central authority would be necessary in London, and there would be nothing left for the local municipalities to do sufficient to justify their creation. Concentration of authority in large districts and the adaptation of existing powers he suggested as the leading principles of legislation, and he hoped, when he took the question up, to have the assistance of the Corporation of London.

Mr. BUXTON, after this, withdrew both the Bills.

LEGAL.

Court of Queen's Bench.—June 12.

(Sittings in Banco, before The LORD CHIEF JUSTICE, and Justices BLACKBURN, MELLOR, and HANNON.)

EX PARTE WALKER, IN RE GRAVES.

This was an application to amend a registry of copyright in pictures. The application was under 5 and 6 Victoria, cap. 45, sec. 14, that if any person shall deem himself aggrieved by any entry made under colour of the Act in the book of registry, he may apply to a court to order it to be expunged or corrected. The 25 and 26 Victoria, cap. 68 (which incorporated the former Act), provided for a registry of pictures, and under that Act the applicant had been convicted of piracy of some pictures registered by Mr. Graves, the well-known publisher of engravings. The entry related to an oil painting, 'A Piper and a Pair of Nutcrackers,' and two pictures by Millais, 'My First Sermon,' and 'My Second Sermon,' and three photographs, entitled 'Waiting for the Verdict,' 'The Acquittal,' and 'Finding the Text.' The main defect alleged in the entries was, that whereas Mr. Graves in each instance was an assignee, the assignor, or the party originally interested, had not registered—that is, that neither the author nor any subsequent owner or assignee until Mr. Graves himself had registered. The applicant having, however, been convicted upon the evidence of title afforded by these entries, and being under imprisonment for his alleged offence, now claimed to have the entries struck out, as not warranted in law, nor sufficient to sustain the case against him. The court had at first, on the supposed authority of the case of *Chappell v. Purday*, dismissed the application, upon the ground that the Act did not apply, except as to persons really interested in the copyright or the title, and not to mere strangers; but as upon another report of that case it appeared that it had been misreported, the Court granted the rule, which now came on to be argued.

The Court held that the entry of Mr. Graves's proprietorship was sufficient, and that there might be a copyright in a photograph from a picture, though there was no copyright in the picture. As to any defect in the description of the work, it might be amended.—Rule discharged.

Second Court.—June 14.

(Before Mr. Justice HANNON and a Special Jury.)
REG. v. LOVIBOND.

Mr. Serjeant Parry and Mr. Metcalfe were counsel for the prosecution; and the Solicitor-General, Mr. F. White, and Mr. Poland for the defendant.

This was an indictment instituted by the Metropolitan Board of Works against the defendant, a brewer, at Fulham, for erecting a building called the Tun-room, beyond the general line of buildings in the Lillie Road, North End, Fulham, contrary to the regulations of the Building Act.

Several legal points were adverted to and reserved for discussion hereafter before the full Court, and the only question on which the opinion of the jury was sought for by the defendant was whether in fact there was any general line of buildings in the Lillie Road.

The jury had had a view of the locality, and found that there was no general line of buildings in the Lillie Road.

A verdict for the prosecution was formally taken, subject to a case for the opinion of the Court, the finding of the jury to be inserted in the case.

Rolls' Court.—June 12.

(Before MASTER OF THE ROLLS.)
MALTBY v. WARE.

This was a light and air case. The plaintiff is the landlord of the Bix-in-Hand public-house, in High Street, Hampstead, for a term having eleven years to run, and the defendant is a grocer and cheesemonger, and lives next door. In June, 1868, the defendant pulled down and began to rebuild the outer wall of his premises, which abuts on a narrow passage between

the plaintiff's and defendant's premises, into which the plaintiff's tap-room window looks, with the intention of rebuilding it of a greater height than before. The effect of this, as the plaintiff alleged, was to darken the tap-room and seriously interfere with his business. The gist of his complaint was that many of his customers, who had been accustomed to be served in the tap-room, had refused to sit in it on account of it being so darkened, and insisted on being served in the parlour, the effect of which was to drive away the better class of his customers who frequented the parlour before. When the wall was nearly completed the plaintiff filed his bill to compel the defendant to take down the wall to its original height, and obtained an order upon motion accordingly. In August, 1868, the defendant's motion to dissolve this order was refused with costs, and the cause now came on for hearing.

His LORDSHIP, looking at the increased height of the wall, could not doubt that the tap-room had been materially darkened. The grounds of defence were that the plaintiff had acquiesced in the erection of the wall, and that his loss of light in one place had been compensated by gain in another. Compensation was always set up in these cases, but it was no real ground of defence; and it could not be said that the plaintiff had acquiesced in the wall being built, inasmuch as he had stood still after the representations of the defendant that there would be compensation; and when he found at last that such representations were incorrect, it was not too late for him to seek a remedy. Nor could it be said that the suit was a frivolous one, inasmuch as the plaintiff had several years of his lease yet to run. The plaintiff was entitled to a decree with costs, under which the defendant would be compelled to reduce the wall to its original height. This was dealing out hard measure to the defendant, as he had certainly acted on the belief that the necessary consent had been obtained to the wall being increased in height, and he should therefore suggest that the plaintiff should waive his strict right under the decree, and consent to his Lordship doing what, in his opinion, the Court had not jurisdiction to do unless he consented—viz., leave it to his Lordship to settle what compensation should be paid to the plaintiff by the defendant for the darkening of the tap-room, and thus, by avoiding an irreparable injury to the defendant, restore the good feeling which seemed until recently to have existed between the parties.

Court of Common Pleas.—June 14.

(Sittings at Nisi Prius, before Mr. Justice KEATING and Common Juries.)

AGER v. FARRAIR.

Mr. Powell, Q.C., and Mr. Daly were for the plaintiff; Mr. Day was for the defendant.

The defendant was an architect, and the plaintiff was a builder who had contracted for the erection of an hotel at Lord's Cricket Ground, and this action was brought to recover damages for slanderous words uttered by the defendant of and concerning the plaintiff in the way of his business. Some differences seemed to have arisen between the plaintiff and the defendant, which culminated in the latter saying, in effect, that the former would soon be in the Bankruptcy Court, and imputing to him that he was in insolvent circumstances.

Mr. POWELL said that he only wished for a public withdrawal of a slander which was totally without foundation.

This the defendant declined to give, on the ground that he had never spoken the words complained of, and the trial dragged along through the day without an atom of interest. In the end the jury found for the plaintiff, —Damages, 40s.; and the learned Judge refused to certify for costs.

SOCIETIES.

On Architecture Connected with Structures of Civil Engineering.

A lecture on this subject, was delivered on the evening of the 10th inst., before the members of the Society for the Encouragement of the Fine Arts, by Mr. Page, the late Acting-engineer of the Thames Tunnel, and the engineer for the bridges of Chelsea and Westminster.

Mr. Page pointed out that the subject is one of great interest to all who are jealous of the appearance of our public structures, especially the bridges over the Thames in the metropolis, which vary so much in character, and which number among them, between London Bridge and Wandsworth, five railway bridges, which might have been of a more architectural character than they appear to be. Mr. Page referred to kings and priests as the architects of the earlier ages, and to the great utilitarian structures of the Romans, especially the aqueducts and bridges, describing the bridge 'Alcantara,' built on the Tagus in the time of Trajan, A.D. 105, whose height from the bed of the river is 285 feet, 80 feet higher than the Towers of Westminster Abbey; also the Aqueduct of Theodoric, the Gothic King of Italy, at Spoleto, the height of which is variously stated from 82 metres, 269 feet, to 130 metres, which latter, although given by Gauthier, is not confirmed.

Describing the architectural features of these works and the bridge of St. Angelo at Rome, built by Hadrian, and rapidly referring to the various aqueducts, he then pointed out the mode of dealing with the architectural features of the works of the civil engineer, according to the magnitude and character of the design. Instituting a comparison between the delicate Water Gate of Inigo Jones and the grand structure of London Bridge, he pointed out that in the latter case, however beautiful was the dentilled cornice and the parapet, yet that the noble arches and piers were so impressive that the architectural details were almost lost in the vastness and majesty of the whole. Referring then to Southwark and Waterloo bridges, the works of those talented engineers, the Rennies, in terms of admiration, he described the beautiful bridge over the Wear at Sunderland, constructed in 1798; the Menai Suspension Bridge, by the great engineer Telford; and in a striking comparison between his own design for Blackfriars Bridge (the centre arch of which was drawn at 280 feet span) and the lighter structure and Gothic design of that built at Westminster, he illustrated the different architectural treatment of the two, so opposite to each other, and explained the principles of that treatment.

In bridges of Gothic design he recommended the study of the mouldings of various crypts, approved the simple mouldings of the style of Henry III.,

and, descending to the date of the Tudor Arch, gave the highest praise to the wonderful ceiling of the Chapel of Henry VII., stating that there had been no work executed before or after its date which could be compared with it in science, boldness of construction, and artistic embellishment.

Finally, Mr. Page asserted that the progress and perfection of great designs were the results of powerful and refined minds gifted with scientific, practical, and artistic knowledge, and that the operations of the mediocre practitioners (however wealthy) must ever tend to lower the standard of comparison, and to bring discredit on the age and country.

In speaking of the Lendal Bridge at York—a more ornamental bridge than that of Westminster—he mentioned the circumstance that the figure of the angel supporting the armorial bearings of the United Kingdom at the crown of the arch was taken from a royal princess, viz., the Princess of Wales, who, among her other titles, is the Angel of Lendal Bridge.

Sir Patrick Colquhoun, Dr. Davis, the explorer of Carthage, and other gentlemen took part in the subsequent discussion, and the meeting separated after votes of thanks to Sir George Bowyer, who occupied the chair, and to the author of the lecture.

DRESS AND HOUSE DECORATION.

Sir,—In this age the art of dress is almost entirely relegated to tailors and milliners, who are, as a class, not remarkable—as how should they be?—for high art notions; and those who consider themselves the wise and the practical of the earth would have us believe that dress is an art below the dignity of true man and woman, to say nothing of beings with immortal souls.

But the decoration of our houses is at present under the control of paper-hangers and furnishers; and if we are to have a revolution in the one case, so must we in the other. If our rooms are to be decorated by artists, so almost must those who are to inhabit them, and who form a very important part of the furniture, be decorated, if not under the supervision, at least under the inspiration of an artist.

Would it not be painful, most painful, to see the modern monstrosities of fashion moving about in rooms that in their smallest detail showed the care of a true artist?

So much may, I suppose, be taken for granted. I shall find few dissentients to the theory—the difficulty lies in the practice; but if your readers will follow me, I will try and show how I think the desired effect might, to a large extent, be obtained.

And I would not have it supposed that I am advocating a return to mediæval forms of dress—that, I hold, would be impracticable, and is false to all my ideas of true art; but there are even now many beautiful dresses in use: indeed the present style of dress at its best approximates very closely to a good style. Art and a love of art have, in the last twenty years, spread far and wide, and there are few circles now that are not to some extent acquainted with the art questions that are being agitated. There are few women, too, who have not a desire to make themselves look as well as possible, not only from feelings of vanity, but far more, if I mistake not, from an innate love of art. To woman, permission to strive at the beautiful in dress is conceded; all that remains is to direct her desires in the right way. The habit of copying fashions from Paris is, too, to a very appreciable extent on the decrease, and happily so, for all the credit French women deserve is that of dressing perfectly in a villainous style. Again, there can be no doubt that milliners and dressmakers do in their fashion display an immense amount of ingenuity and invention, and also of taste—misdirected it may be, but still of taste. Their course, to use a new simile, is like that of a rider on a bicycle who has learnt how to drive his machine, but not how to guide it; his journeying will not be of the most successful, though plenty of motive power is present. What is wanted is to convert this large army of inventors, ever on the search for something new, and not utterly devoid of taste, into an army of artists; the attempt may seem Quixotic, but I do not think that it is so.

First of all, it must be clearly understood that the attempt is not to subvert and restore, but to select and develop. The popular notion of artistic or mediæval dress is of something very extraordinary and fantastic, and this arises no doubt partly from the fact that the representations in most treatises and pictures give rather the out-of-the-way and extreme forms of dress than the ordinary costumes. It is as if a future historian of costume were to represent the present generation in the toilettes of flower-shows, picnics, or the seaside. What is first of all necessary is to correct this impression, and for this purpose illustrations should be provided of all those more moderate costumes that may appear suitable for the present day. We men have long got rid of the cumbersome gowns and long cloaks, and will not, I should think, be in a hurry to re-adopt them; and we shall hardly wish our ladies to appear in the extraordinary head-dresses of old times, picturesque as they may be, and much as may be said for them.

To give an instance of the differences of costumes at the same date: there are shown in portraits of the time of Queen Elizabeth numerous most charming dresses, though the popular idea of the dress of that time is of the horrible farthingale and the exaggerated ruff. At the present day ruffs of moderate dimensions seem to be coming in again, and very nice they look. There is, too, a very nice muslin dress that may be not unfrequently seen, somewhat similar to those introduced by Mr. Leslie into his pictures; and a dress similar to that most becoming one in which the Hon. Mr. Graves has painted several of his beauties in this year's Academy, seems simultaneously to have made its appearance everywhere; these are instances of the desire to adopt really good dresses when an idea for their development is acquired. I can speak from personal knowledge to numbers of ladies who spend considerable time and trouble in the devising and making of artistic dresses and accessories, and I have found nearly all ladies most ready and eager to listen to any suggestions on the subject.

As a means of spreading a knowledge of good forms of dress, I would suggest that the authorities at South Kensington, within whose province I think such a thing would properly come, should form a collection of figures showing the costumes of different dates; *not* the curious costumes, but those that are really beautiful and adapted to practical purposes. The collection should be formed exclusively with a view to presenting patterns and suggestions to our ladies and our dressmakers. I think there would be few more popular exhibitions, and I think few more useful. I should like to say a few words on the importance of the subject.

We can have no chance for art among the body of the people until we have overcome that slovenliness and carelessness that are so common. The man or woman who takes no interest in his or her own appearance will never take much interest in anybody or anything else's, while as soon as people have learnt to dress themselves nicely and carefully they begin to look for the same care in others, next to desire to see their rooms nice, then their houses and public buildings.

* Who would do great things must begin with small,
And art begins at home or not at all.*

If we are to develop taste in great things, we must begin by developing it in the small matters of every-day life that are always present to, and always calling for some action of, the mind.

It is vain for artists to lament over the unpicturesqueness of modern costumes, and indulge in bitter reproaches of the Philistinism of fashion. 'Noblesse oblige:' they who profess to lead art should take means to do so—not sit down and weep. If artists would unite to issue a cheap work, containing plates of different dresses of approved beauty adapted to modern times, they would be doing an excellent service to their art, and one that would not be unremunerative. I would also suggest that competent people, and there are surely plenty of such to be found, should deliver a series of lectures to milliners and dressmakers—nay, even to tailors. I do not think there would be any difficulty in drawing together large audiences, and it is most certain that if we would improve our art we must improve our art workmen. I commend this idea to Sir Francis Grant when he starts on his new sphere of usefulness. R. N.

ART v. ARCHITECTURE.

SIR,—The title of *THE ARCHITECT* informs its readers that the publication is intended to be 'a Journal of Art, Civil Engineering, and Building.' Will you allow me to put a question as to the exact meaning of this announcement?

I am not about to ask you to give currency to a criticism on a criticism; nor have I any wish to say a single word that can be ungrateful to an able contributor to your columns, who has both the courage to sign his opinions, and the candour to admit that he looks at the arts of the painter and of the sculptor exclusively from the standpoint of the architect.

But the prominence given in your pages to the criticism of Mr. Godwin is such as to raise the question whether a journal which has attained such rapid and well-deserved popularity as your own, aspires to become an authority on questions of art, or limits its range to the single department of architecture? It has been my hope that you entertained the wider and more catholic view.

The papers, however, to which I refer are the expression of the very strictest sect of professional *esprit de corps*. No painter, no sculptor, no man of taste who is not imbued with that spirit, can fail to take exception to such expressions as 'if easel pictures are to be painted,' or to the statement that two of the noblest arts that are competent to human genius 'ought, rightfully, to have no existence apart from architecture.' To speak of painting and of sculpture as mere subsidiary architectural decoration is as unjust as it would be to speak of the architect as the mere builder of a show room for the productions of pictorial or of plastic art. It is almost equivalent to ranking the poet below the writer of specifications.

It is worse than idle for the sculptor, the painter, and the architect to contend as to the respective dignity of their several arts. The Muses are sisters. In any case where architecture is structurally combined with either sculpture or painting, it will depend on the superiority of genius in the individual artist, not on the relative dignity of the arts themselves, to determine which element is 'supreme, and which subsidiary; and that artist will be likely to entertain the noblest appreciation of his own art who is most ready to yield the honour due to his professional brothers.

For these reasons it is my hope that painting and sculpture may be treated of in your columns according to their own canons, and dealt with after their own merits. It depends on your decision on this point whether *THE ARCHITECT* is to be considered as an Art Journal or as only a Building Journal. No doubt a public is to be found for either. But I think no one can deny that to take the wider range is also to occupy the nobler position. It will be impossible for any journal which allows painting and sculpture to be spoken of as mere decoration to occupy that position.

I write with candour, but also with real anxiety as to the choice on which you may determine. There have been articles in your pages which led many of us to hope that a great accession to the art education of the country was to be expected from your labours; but for this to be the case you must respect the just susceptibilities of the different branches of the artistic corps—of those who handle the brush, as well as of

June 8, 1869.

ONE WHO HANDLES THE CHISEL.

NEW BUILDINGS AND RESTORATIONS.

Sowerby Church.—Two windows of Norman character have been opened out in the east end of the chancel in this church, and filled in with painted glass from the studio of J. W. Knowles, of York. The subjects represented are 'St. Peter and St. John healing the Cripple at the Beautiful Gate of the Temple,' and 'The Incredulity of St. Thomas.' Under each window is a brass plate, on which are emblazoned the arms of the Buckle family, and suitable inscriptions.

New Church at Easington Lane.—When the parish of Hetton (Sunderland) was divided into two, a movement was at once commenced to provide the funds required to erect a new church, the foundation stone of which was laid a short while since at Easington Lane. The newly-formed parish is termed 'Lyons Ecclesiastical District,' and comprises the villages of Easington Lane, Lyons, and Elemore, with a population of from 3,600 to 4,000. The estimated cost of the church is nearly 2,600*l.* It will be in the Early English style of architecture, and consist of nave, north and south aisles, chancel, organ chamber, and vestry. The east end of the chancel will be of a semi-octagonal form. The plans have been prepared by Mr. Alfred Swan, architect, Newcastle; the contract for the mason work has been let to Mr. Harrison, Houghton-le-Spring; and for the joiner-work to Messrs. Rankin Brothers, Sunderland.

Bournemouth New Dispensary.—The opening of the new dispensary buildings, situate in Madeira Vale, a short distance from Holy Trinity Church, took place lately. The need of a commodious and suitable building for the reception of patients suffering from accidents or from diseases of a non-infectious character has long been felt, and the most active and liberal measures have been taken by the friends of the institution to supply this want. The new building was erected at a cost of about 1,000*l.*

A Handsome Building.—comprising commodious lecture-room, reading-room, library, a residence for the porter and his wife, a ladies' cloak room, and other offices—has been provided for the benefit of the increasing population of Westbury-on-Trym, through the munificence of Mr. H. St. Vincent Ames, of Cote House, Westbury. The cost of the structure, exclusive of the land, was upwards of 2,000*l.*

Tewkesbury Waterworks.—The first stone of the waterworks to be constructed by the Cheltenham Water Company for the borough of Tewkesbury was laid a few days since. The works appear to comprise two distinct parts—the tanks, filters, pumping-engines, &c., in the meadow by the river side, of which part of the walls and some of the earthwork have been done; and the water-tower on the eminence above, the foundation of which has been laid in very substantial brickwork upon a thick bed of concrete. The tower is intended to be ornamental as well as useful, and as it will rise 40 feet above the hill on which it stands, will be an object of considerable altitude, sufficiently so to give a pressure which will raise the water far above any building in Tewkesbury. It will bear a large cast-iron cistern on the top of the walls, to be surmounted by an elegant light iron palisade, to be reached by a spiral staircase in the centre of the tower.

The New Great Northern Railway Hotel at Leeds.

On and after 1st proximo visitors to Leeds will have the option of taking up their quarters at the above new hotel, which is of the Romanesque style of architecture, has four fronts, and occupies a site of 106 feet by 95 feet. The drawings and specifications were supplied by Messrs. M. E. Hadfield & Son of Sheffield. Among the arrangements are a covered way or corridor which gives access to the hotel from the Wellington Street station platform; and a hydraulic hoist from the floor of the Wellington Street entrance for passengers and luggage, which has access to each corridor to the top of the structure. The building rests upon a simple basement, which is indeed the plinth to the structure, and rises to a height of 130 feet. It is lighted with deeply recessed square-headed windows magnificently moulded and panelled, and at each corner are a number of beautifully carved figures which bear the Great Northern armorial badges, and were executed by Theodore Piffers of London. The principal entrance, which is in Wellington Street, is of polished granite of two colours, with oak doors which are studded with gilt nails. The whole of the interior is in keeping. The visitor on finding his way to the basement storey at once comes in contact with the restaurant and the kitchen offices, under which are a number of spacious cellars having direct access from the bar. The principal floor of the hotel is approached from Wellington Street by a large staircase. The entrance hall, which measures 23 feet by 28 feet, opens into a corridor 9 feet in width. On the right hand is a commercial room 43 feet by 26 feet, whilst the bar is placed nearly opposite. At the end of a nine-foot corridor are the smoking and billiard rooms, which occupy the north-east tower. Not far off is a servants' staircase, which communicates with every floor in that part of the building, and at the end of the corridor is a large coffee-room. The grand staircase, close at hand, is in extent 20 feet by 26 feet, composed of stone, and has an ornamental iron balustrade, in which is inserted the monogram of the Company. The contractors are Messrs. Shaftoe & Barry, of York. The tile pavements are by Maw, of Broseley, and the metal work in the staircase, &c., by Messrs. Longden, of Sheffield.

Evelina Hospital for Sick Children.—On the 15th inst. a new hospital, erected in the Southwark Bridge Road, for the reception of sick children, was formally inaugurated. The institution has been established by Baron Ferdinand de Rothschild, in memory of his wife, whose first name constitutes its distinctive title. The space occupied by the hospital is an irregular triangle. The façade of the building, which is a plain, unostentatious brick front, presents the aspect of the arc of a circle. In the basement there are two kitchens, larders, storerooms, a linen room, servants' hall, and cellars, with the domestic offices. A waiting-room, a clerk's office, and rooms for surgeon, house surgeon, physician, dresser, and matron, constitute the apartments on the ground floor, with the exception of the departments in which the operations of the institution as regards out-patients will be conducted. The principal wards on the first and second floors are about 100 feet long, nearly 20 feet broad, and 14 feet high. On each of these floors there are four other smaller wards, all of which have been included in the general plan for specific objects. Servants' rooms occupy the greater part of the attic storey, and these are complemented by a quarantine ward. In the front and back of each ward large windows, each consisting of three movable divisions, afford a stream of light, which can be modified as occasion requires, while the windows at the rear form auxiliaries for ventilation. The corridors between the wards and the outer walls will be for the children's playground. Mr. Marsh Nelson is the architect. Dr. Arthur Farre suggested the specifications and details, and Messrs. J. Myers & Sons were entrusted with the building. The hospital is capable of accommodating 100 beds.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Opening of the Architectural Museum.

The Council have decided to open the Museum with a public conversation on Wednesday, July 21, and cards will be issued by the President in due course.

The new premises built purposely for the reception of the magnificent collection of casts, &c., are now complete, and the work of arranging the collection is making rapid progress, under the superintendence of Mr. Wallis, the new curator. The casts which have been so long dispersed in various parts of the South Kensington Museum are now brought together again, and will be very shortly open for inspection and available for study. As a natural consequence, we already hear that offers of valuable additions to the collection are reaching the Council.

The new buildings are very near the southern side of Dean's Yard, Westminster, in Bowling Street. They are necessarily inexpensive in character, but have been solidly built, and possess excellent light. The contractor was Mr. R. E. Roberts, and the subscribers are indebted to him for the liberal terms on which he took the work. The honorary architects were Mr. Ewan Christian and Mr. Joseph Clarke.

Sale of Architectural Drawings.

Messrs. Christie, Manson & Woods sold, on June 16, the interesting and valuable drawings and sketches of the late James West, the well-known designer and illuminator.

The following were the prices of the more important of the architectural sketches:—

A volume, containing 138 leaves of sketches, in Belgium, Germany, Switzerland, Italy, and France; colours, Indian ink, and pencil, 1839	£4 10 0
A volume, 218 sketches, Essex, Berks, Sussex, Shropshire, Cheshire; half bound, russia, 1851	5 5 0
Another, 97 sketches, Sussex, Leicestershire, 1855; half bound, morocco	5 0 0
Another, with 195 sketches in North Wales, Essex, Sussex, the Rhine, Leicestershire, Derbyshire, 1853; half bound, morocco	4 12 6
Another, with 77 sketches in Normandy, 1865; half bound, morocco	9 5 0
Another, with 300 outlines and tracings; coloured prints of encaustic tiles	3 15 0
Another, with 600 tracings of Gothic ornaments, initial letters, &c.	3 10 0
Another, with 332 sketches and tracings of architectural decorations	8 0 0
Another, containing 140 very careful drawings, mostly coloured, of English mural decorations.	46 4 0
A volume, with 130 leaves, of drawings, tracings, and engravings, designs for borders, &c.	4 0 0
A Missal of fifteenth century, on vellum, with 18 miniatures, illuminated borders, and capitals	30 0 0
Holmwood Common (Birket Foster), water-colour drawing	12 10 0
A Scrap Book, containing about 3,000 book-plates, many by Cruikshank	1 11 6

There were some architectural and other books sold—as, Dallaway's Discourses on Architecture, Humphrey's Art of Illuminating, Shaw's Dresses and Decorations, Maitland's London, Christian's Skelton Church, Yorkshire, Tymms and Wyatt's Art of Illuminating, &c. All these works fetched a good price; but the great interest and value of the sale was in the numerous bound volumes of Mr. West's own architectural and other sketches, such as for their finished and varied character are rarely to be met with in an auction-room. There was also for sale a collection of Oriental and other porcelain, old carved oak furniture, &c.

Penny Wise and Pound Foolish.

The eminent auctioneers Messrs. Church & Rickwood, of Woolwich, have been appointed by the Guardians to prepare designs and superintend the erection of the New Woolwich Workhouse. It is supposed that the buildings, &c., will ultimately cost 40,000*l*. When will the guardians of the public funds learn that the persons whose business it is to sell buildings are not those to whom the erection of them can suitably be entrusted?

The Kirkdale Cave.

During the recent visit of the Rev. Canon Greenwell, of Durham, and other archaeologists to Yorkshire, it was determined that a scientific examination of the Kirkdale Cave should be made, with a view of determining if there was any trace of man having existed there contemporaneously with the extinct mammalia, whose bones, along with many of existing species, were found there in such numbers about half a century ago. The discovery of human remains in caves of a like class in Devon and elsewhere gave to the examination a peculiar interest. The floor of the cave is about 30 feet above the river Bran, and the entrance at the great discovery of 1821 was close to the stream; but it is now at a considerable distance, owing to extensive limestone quarrying, which has destroyed the best part of the cave—has, in fact, entirely removed that part which yielded the great bone-find. For several yards the cave is not larger than 2 feet high and 5 feet wide, many places being smaller, which rendered its exploration necessary on hands and knees—a matter of difficulty, considering that lights are necessary, and must be carried by each person. Eventually the cave opens to an extensive chamber, from which ramifications extend which are impracticable for examination by adults. Only in some two or three places was there hope of finding any relics, and these are left over to a dry season for excavation. The general opinion is, however, that no trace of primeval man will be found, the remaining part of the cave being so ill-adapted for habitation; and that if any traces of man ever were in the cave, they have disappeared with that portion, now destroyed, which yielded the bones

(split and marked) of the elephant, hippopotamus, tiger, hyena, &c., as described by Professor Buckland.

Stained Glass at Berlin.

The stained glass for the cathedral at Aix-la-Chapelle, now exhibiting at Berlin, is only a part of the whole design. The window is 86 feet high by 30 feet wide. To have exhibited the whole of this at one time would have been impossible without considerable cost. The present first instalment is only 16 feet high by the entire width (30 feet), and is the lower portion of the picture which is designed by Professor Techner of Berlin. The subject is the Virgin Mary as Intercessor. She is supported on clouds surrounded by angels, whilst below there is a group of persons, partly allegorical, partly historical, representing amongst the latter class the Emperor Sigismund and his Consort the Empress Barbara (both crowned at Aix in 1414), Frederick I. of Hohenzollern and Elizabeth, and other patrons and dignitaries whose histories are more or less associated with Aix.

Point de Pyrénées.

In these days of isthmus-piercing a scheme is announced, not indeed for the first time, of circumventing the guns of Gibraltar by cutting a ship canal from the Bay of Biscay to the Mediterranean. The work is estimated not to exceed the modest sum of 442 millions of francs, or seventeen and two-thirds millions sterling, and to require six years for its execution.

The only question, indeed, is the economical one, as the Garonne is navigable from Bordeaux to Toulouse, and the Canal du Midi connects Toulouse with the Gulf of Lyons. But the extension of works necessary to allow of the passage of ships would be considerable, as, indeed, is shown by the estimate. It cannot be expected that the project should be hailed by English shipowners with much enthusiasm. As a strategic measure it would be a noble French work. The sum named is nearly three times that asked for the St. Gothard Railway, namely 6,500,000*l*., which includes a tunnel 9½ miles in length.

The Saint Gothard Railway.

'Hannibal transibat Alpes summâ diligentia.'—Hannibal crossed the Alps on the top of a Diligence.—Napoleon did the same on horseback, but we of the second half of the nineteenth century look forward to reaching the sunny South by far more rapid means. The Mont Cenis Tunnel is but two-thirds completed, and already there is a second scheme for railway communication between Switzerland and Italy, namely, the proposed Saint Gothard line. It is supported by both Governments, and the Swiss Central and North-Eastern Companies have promised their active support. It is proposed to form one main and three branch lines; the main line from Goldau in Switzerland to Chiasso on the Italian side of the Alps, with the following stations: Goldau, Fluellen, Biasca, Bellinzona, Lugano, Chiasso. The total length of this main line will be 189 kilometres, or 117½ English miles, with an average gradient of 18.6 in every 1,000 feet. The branch lines will have a single line of rails only, and will be laid—*a*. from Bellinzona to Locarno; *b*. from Goldau via St. Adrian to Zug; and *c*. from Goldau via Immensee and Küssnacht to Lucerne. The length of these three lines will be 35½ miles, making a total of 153 miles. But the most formidable part of the scheme is the tunnel; and during the progress of this work, which, according to the report of the engineer—Signor Grattoni, one of the directors of the Mont Cenis Railway—will occupy from eight and a half to nine years, provisional steamboat communication will be provided on the Sea of the Four Cantons, between Lucerne and Fluellen; as also on the Lago Maggiore, between Locarno and Arona. The length of this tunnel through the St. Gothard is calculated at 14,900 metres, or 9 miles 450 yards, and will be perfectly straight, beginning at the village of Göschenau (canton Uri) and ending at Airolo on the other side. The gradient will be 21¼ feet in 11,000 feet, or 1 in 518 nearly; the greatest air-shaft will be at Andermatt, 993 feet high; and there will be no air-shaft at all for a distance of seven miles. The time now occupied in travelling from Fluellen to Biasca is twelve hours; the new line when completed will reduce the journey to less than four hours. The total cost is estimated at 156,000,000 francs, of which 26,000,000 are for the construction of the tunnel. The financial calculations as to probability of fair returns for this outlay are based upon an annual transit of 180,000 passengers and 270,000 tons of goods.

Aix-la-Chapelle.

A vexed question, which has puzzled our archaeologists here for the last four years, has now been settled by the declaration that it was a stupid hoax. In the course of some excavations made at the back of the Chapel of the Cross, which is a part of the 'Dom,' some old foundations were uncovered, in the *débris* of which a stone was found which seemed to point to this spot as the long-lost site of the tomb of the Emperor Charlemagne. The inscription was:—'In hoc sepulchro tumulata sunt ossa Caroli Magni;' but the material and the characters seemed suspicious, and a commission was appointed to enquire into its authenticity. It is now declared a forgery, and it is a 'public secret' that the foreman of the works buried the stone where it was found. As he was no Latin scholar, he certainly had an accomplice, and it is now generally believed to have been a hoax intended to mystify a certain learned archaeologist of the city. Such foolish jokes are reprehensible, to say the least. The cathedral here is undergoing a very extensive restoration, and no small aid has come from the Pope, who has sent a large quantity of marble for facing the piers and walls, and relaying the paving in the interior. The marble sent is from the almost inexhaustible store lately discovered on the banks of the Tiber.

Cologne.

The south portal of the Cathedral of Cologne is now adorned with statues executed by the cathedral sculptor, Christian Mohr. Of these there are altogether 107, thirty-eight of which are as large as life, and stand on carved supporting stones. Besides these figures there are eight groups in relief, illustrating the history of the Passion. The principal nave of the cathedral has also been embellished with statues from the chisel of the same artist.

General.

New Market for Marazion (Cornwall).—Recognising the awkwardness of the site originally intended for this building, the Corporation of Marazion has determined to pull down some houses in its neighbourhood, and thus provide an open space for the new market.

It is proposed to erect a bridge over the Trent, at Gunthorpe, and steps have already been taken to acquire the necessary funds.

Southsea Pier.—The present extension will cost upwards of 1,000*l.*, and consists of a platform (similar to that now in use), constructed on 8-inch iron piles, with joists 15 inches in depth, 4 feet apart, and 3-inch planking laid over them. The extension will embrace an area of 1,300 square yards. New baths and assembly rooms are proposed, and designs are in course of preparation.

A Monument, consisting of a block of polished granite, is to be erected over the grave of Dr. Epps, in Kensal Green Cemetery.

New Lighthouse.—The foundation-stone of a new lighthouse has been erected on Souter Point, a headland on the Durham coast, between the Wear and Tyne. It is intended to prevent wrecks from occurring, if possible, on Whitburn Steel, of which there have been so many complaints within recent years.

Llandrindod Wells.—The contract for building the new church has been entrusted to Mr. Gough, of Bishop's Castle, and the works will be commenced forthwith. The design comprises nave, north and south aisles, chancel, organ-chamber, sacristy, tower and spire, and north and south entrance porches, and has been prepared by Thomas Nicholson, Esq., F.I.B.A., of Hereford, the diocesan architect, under whose superintendence the works will be carried out.

Discoveries at Fimber.—Sir Tatton Sykes is about to build a new church at Fimber. For this purpose the old building—which possessed a fine Norman doorway—has been razed, and upon the site the excavations for the walls of the new structure have been made. In so doing it was shown that the church just destroyed was not the original one, but that a larger and earlier one had existed there—probably of Saxon date. Upon the floor of this earlier church was a large accumulation of burnt matter, impregnated to an extraordinary extent with lead—in some places the molten lead having predominated in the *débris*. There is no record, but it would seem that the first building had been destroyed by fire. A very interesting geological feature has also occurred. The foundations are dug to the chalk, through the 'feather' edge of an outlier of the purple or second post-glacial clay, which at this elevation of four hundred feet has escaped the Wold denudation, and which same clay is one hundred feet thick at Filey Brig. There is also a curious archaeological feature. At the western end both churches have stood upon a British tumulus. At a depth of five feet below the level of the late tower, two urns, a 'food vessel,' and a 'drinking cup,' two feet apart, with a fine flint axe, a large flake knife, and various chips of flint, with bones of the ox and hog, but no human bones, were found. Running due south was a bench containing vast quantities of animal bones, particularly the teeth of the ox. In the tumulus were a bone pin, a very large tusk of the wild boar, and much charcoal. The local antiquaries, Messrs. Mortimer and Fimber, have added the relics to their valuable Wold collection.

The *Press* of the 12th inst. states that Baron Haussmann has tendered his resignation, which has been definitively accepted.

ANSWER.

Rock Asphalte for Roadways.

Sir,—In reply to the letter of 'A Subscriber' in your issue of the 12th inst., enquiring as to the process of laying down roadways, &c., as just finished in Threadneedle Street, and expressing the opinion that it may become very slippery after a short time, we have to state that the paving in question is composed of a pure Rock Asphalte, obtained from the mines in Switzerland belonging to our Company. This Asphalte is unmixed with anything else, but being baked in revolving cylinders, is reduced to a fine powder, and in that state, while still hot, is laid on the street and compressed with iron rammers or rollers. Immediately on cooling it becomes a solid rock, of the same consistency throughout, and of the appearance now presented in the street which is finished.

Your correspondent need be under no apprehension as to its becoming slippery. Owing to its elastic nature, horses have a firmer footing than on granite, and the experience of from fifteen to twenty years in Paris shows that fewer horses fall on roads prepared as this sample is, than on any other kind. The data on which this fact was ascertained refer to all kinds of weather and all possible varieties of traffic.

We shall be most happy to afford any one interested in improvements of street pavements all information in our power.

Yours respectfully,

150, Leadenhall Street, London,
June 18.

CALENDER & AMOS.

FINE ARTS' COPYRIGHT ACT.

The following is a copy of the petition presented to the House of Lords from the Royal Institute of British Architects:—

TO THE RIGHT HONOURABLE THE LORDS SPIRITUAL AND TEMPORAL
OF THE UNITED KINGDOM IN PARLIAMENT ASSEMBLED.

The humble Petition of the President and Council of the Royal Institute of British Architects.

Sheweth,—That architects are liable to considerable injury in the piracy of their designs and inventions, and that other parties can and do copy and

appropriate to themselves such original ideas without any benefit or remuneration to the authors.

That it is, therefore, desirable to afford protection to architects for the copyright of their works, by including works of architectural art under the definition of works of fine art in the Fine Arts' Copyright Consolidation and Amendment Bill.

That such copyright should extend to their executed works or designs.

That the copyright of an architect in any work executed, or in a work proposed to be executed, should not pass to the employer except under special agreement, but remain with the architect; and that the design in the drawings and specifications prepared for the purpose should still remain so far the property of the architect.

That copyright of architects' productions should extend to the same period as to authors of other works of fine art.

Your petitioners, therefore, most humbly pray your Lordships, that in the Bill introduced in your Lordships' House for consolidating and amending the law of copyright in works of fine art, provision to the above effect be made for the protection of architects in a manner similar to that for authors and inventors.

And your petitioners will ever pray.

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

THE ARCHITECTURAL ASSOCIATION.—On June 25, at half-past 7 P.M., a paper on 'The Art Treatment of Iron' will be read by Mr. Lacy W. Bidge, V.P., A.R.I.B.A.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—The Annual General Meeting of the Society will be held at the Whittington Club, on Wednesday next, June 23, at 8 P.M. precisely.

APPOINTMENTS VACANT.

INDIA.—July.—Forty Appointments in the Engineer Establishment of the Public Works Department in India will shortly be open to public competition. W. T. Thornton, Secretary, Public Works Department.

ISLE OF ELY.—July 5.—A Resident Surveyor, Inspector of Nuisances, Superintendent of Highways, and Collector of the Rates for the District of the March Local Board of Health. Mr. T. T. Elliott, Clerk, March, Isle of Ely.

KENDAL.—Borough Treasurer to the Corporation of Kendal, Westmorland. Salary 50*l.* per annum. Mr. Thomas Harrison, Town Clerk, Kendal.

PESH.—As Assistant or Resident Engineer, to Superintend Works of Pipeage, Masonry, and Pumping Machinery. A knowledge of the German language desirable. Salary, from 400*l.* to 600*l.* per annum. W. Lindley, Engineer-in-Chief, Pesh.

COMPETITIONS OPEN.

ARRAS, FRANCE.—Architects are invited to send in designs for a Church to be erected at Arras. The building is to be 40 metres long, without the clock-tower, and 18 metres wide, and it is to have three aisles, three entrances, to be approached by a flight of five steps, and to be surrounded entirely by railings 1½ metre high; sub-basement of Belgian stone. The plans are to include a general one of the entire building, a fully-detailed description, and a careful estimate, with such perspective views and details as the artist may think fit to add to the former. The style of the building is required to be 'Decorated Roman of the last period'; and the sum to be expended, including commission, is 80,000 francs (3,200*l.*). The authorities do not undertake to adopt the prize plans, in which case the author of the best and second-best designs will receive 600 francs and 300 francs respectively. It is added, that the columns are to be of hard Belgian stone, and the rest of the building of Creil stone; the vaultings are to be real, and not in ceiling, or of wood with visible ties. The jury is composed of the Bishop of Arras, the Maire, a Canon, two members of the Municipal Council, an Engineer, the Secretary-General of the Museum, and the Vice-President of the Council of the Prefecture. The designs are to be sent by the end of July.

BELGIUM ACADEMY OF ARTS AND SCIENCES.—For best enquiry (essay) and report on the period at which Architecture in the Low Countries became affected by Italian influences. Premium, 1,000 francs, about 40*l.*

BRADFORD.—September 1.—Competitive Designs for the new Bradford Town Hall. To the Architect whose design is selected, 5 per cent. commission and the execution of the work; 2nd best, 200*l.* premium; 3rd, 100*l.* Mr. W. T. McGowen, Town Clerk, Corporation Offices, Bradford.

BRUSSELS, BELGIUM.—A competition is announced for the production of the best Water Meter. The inventor of the instrument offering the greatest advantages is to receive a reward of 200*l.*; the 2nd best, 120*l.*; and the 3rd, 80*l.* The Meters are to be sent in to the *Secrétaire de l'Administration Communale, Hôtel de Ville, Bruxelles*, before 12 o'clock on October 31 in the present year.

CONSTANTINE, ALGERIA.—Three prizes, of the value of 3,000, 2,000, and 1,000 francs, are offered for the best designs for a theatre to be built at Constantine. Programmes of conditions, accompanied by a sketch, may be obtained either at Constantine, at the office of the *Société Générale Algérienne, No. 13 Rue Neuve-des-Capucines, Paris*, at the *Prefecture of Lyons*, or the *Mairies of Marseilles, Bordeaux, or Oran*.

DONCASTER.—September 1.—The Building Committee for proposed new Wesleyan Chapel and Schools at Doncaster require Designs. The best to receive 50*l.* premium; second best, 25*l.* Mr. R. Wiltons, Sec., Magdaliens, Doncaster.

GLAMORGAN.—July 1.—Plans and Specifications for Restoration of Parish Church of Llantrisant. Rev. J. Powell Jones, Llantrisant Vicarage, Pontypridd.

LEYDEN MUNICIPALITY invites Designs and Models from Sculptors of all countries for a Statue of Boerhaave, in the costume of Professor of Leyden University. September 1.

LONDON.—June 28.—London and County Land and Building Company (Limited).—Plans of the best and most profitable way in which to arrange in building sites their ground in Camomile Street, City. First premium, 75*l.*; second, 50*l.*; third, 25*l.* Mr. R. B. Looker, 14 Clement's Lane, E.C.

PHILADELPHIA, PENNSYLVANIA, U. S.—September 1.—For Designs, Specifications, and Estimates for New Public Buildings. First premium, 400*l.*; second, 300*l.*; third, 200*l.*; fourth, 100*l.* For particulars, to H. C. Pugh, Secretary of Board of Commissioners, S.W., corner of Walnut and Fifth Streets, Philadelphia.

PLYMOUTH, DEVON.—For Designs for New Guildhall, Law Courts, Public Offices, &c. Premiums 100*l.*, 75*l.*, and 50*l.* July 14. Whiteford, Town Clerk, Plymouth.

ROYAL ACADEMY OF ARTS.—Burlington House. For the best Painting in Oil, or Model and Design in Painting, Sculpture, and Architecture, the Gold Medal and the Discourses of Presidents Reynolds, West, &c.; and for the best Copies of Drawings, &c., the Silver Medals, &c.

SAINT JEAN D'ANGELY, FRANCE.—The authorities of St. Jean d'Angely have decided on completing the Church commenced in the town by the Benedictines, but of which the works were stopped in 1789. Estimate 200,000 francs (8,000*l.*); the architect's honorarium to be equal to 4 per cent. The competition is confined to architects of Charente and the four adjoining Departments.

SALISBURY.—July 1.—Salisbury Municipal Charities.—The Building Committee are desirous of receiving Designs for Rebuilding Almshouses, for six aged Married Couples, and a Nurse or Matron. 10*l.* for the selected design. Mr. T. Harding, Canal, Salisbury.

VIENNA, AUSTRIA.—This Municipality require Designs, Plans, Estimates, &c., for the Erection of a New Town Hall. Open to all Europe. For Particulars, Austrian Consul-General, Paris.

WESTBROMWICH.—For Designs, &c., for a complete School Establishment for accommodating 400 children. Premiums: 1st and best Design, 50*l.*; 2nd, 30*l.*; third, 20*l.* Mr. H. Ward, Lombard Street, Westbromwich.

The Architect.

TO OUR READERS.

WITH the present number we reach the completion of the first half-yearly volume of THE ARCHITECT. The Title-page and Index belonging to it will be issued with our next number, the first of our second volume.* We feel it impossible to make this announcement without at the same time gratefully acknowledging in few words the kind and generous support we have experienced from the public, and the favourable reception which has attended our efforts. Our subscribers, our many and able contributors, artists, and correspondents, are entitled to special recognition for their valued co-operation and constancy.

It is not for us to pretend to judge how far we have succeeded in redeeming the pledges we gave on commencing this undertaking. In spite of some of the difficulties which beset every new work, we cannot but think that the continued support we have received proves that the public are satisfied with what has been done; and when we glance over our work during the past half-year, we feel that it has not been altogether unworthy of the approval which has been accorded it.

Our Illustrations have extended over a large variety of subjects, in Architecture, Art, and Civil Engineering. These subjects have claimed notice on account either of their importance, or their beauty as works of art, or both; and the execution of them, which we have made great efforts to render excellent, appears to us, in the majority of cases, to reflect very great credit upon the artists who have undertaken them. To this branch of our work constant attention will continue to be paid; important illustrations of various kinds are now in hand, and the standard reached is intended to be maintained.

The Literary portion of the Journal has been enriched by the contributions of many skilled writers. The signed articles, of which a large number have appeared, bear names most of them too well known to the public to need any commendation from us; and have enabled us on several occasions to place before our readers the independent opinions of writers deserving great consideration, and preferring to take upon themselves the entire responsibility of the views they express. Our other original articles have touched upon all the most salient topics of the day as they arose, and upon many matters of permanent importance. We have given considerable prominence to Public Works, and it is not without satisfaction that we refer to the series of articles and illustrations which have appeared in these columns relative to the Site for the New Law Courts and the Thames Embankment generally—articles which, as we have reason to know, have not been without effect on the public mind and in important quarters.

The large field open before us, from Construction on the one hand to High Art on the other, cannot ever be exhausted; but an effort has been made to occupy it in various directions. Some of the art papers contributed by Mr. Burges and others demand especial mention, as indicating the class of writing on art which we hope from time to time to secure. Our Reviews of Books have been numerous, and in each case, it is hoped, full enough to do fair justice to the subjects without exhausting the patience of the readers.

The series of original and picturesque descriptions of buildings, public works, and other kindred subjects which we have commenced under the head of 'Our Rambler,' and our Letters from Abroad, have included many papers which may, we hope, be of permanent value, alike from their literary character and the importance of their topics.

On purely practical subjects the Series of papers on House Building, and the papers on Contracts, with the correspondence they elicited; our articles on the Education of Architects, our Notes on Novelties of Construction and Contrivance, and many detached papers, show that attention has not been diverted from the wants of the practising Architect, Engineer, Surveyor, and Builder; and this has been also attested by the numerous letters on points of practical value which have appeared in our Correspondence columns.

The intelligence we have given has included both general Home

* It should be remembered that the double plates are not to be stitched in the middle. They should either be pasted on to guards, or stitched at one edge and folded.

news and much Continental information. The proceedings of Parliament, and cases in the Courts of Law bearing on building matters, have been fully reported; and if we have given less full reports of professional and technical Societies, it has been because we have known that they are easily to be met with elsewhere, and have felt that if we retain the Journal within its present compact and readable limits of size, our readers will thank us more for supplying them with original papers and intelligence.

The lists of Competitions and Contracts Open which we have been able to furnish have been most extensive, and have included a very large proportion of Continental Works, thus giving to energetic contractors and others who are willing to engage in Continental work unusual facilities for ascertaining what is being done.

In the volume which is about to be commenced the same excellent typography and illustrations of merit equal to those of the present volume will be given; and as on our part no endeavour will be spared to keep up and increase the efficiency of the Journal, we hope that our readers will continue to find increasing pleasure and benefit from the perusal of it.

A VOICE OF WARNING FROM FATHER THAMES.

UNMUSICAL and ill-omened growls are borne by the east wind up the Thames. It is not the first time that we have heard them. The ungenial temperature of the month is not the cause of the phenomenon. On the contrary, if the weather prophet of 'the Times,' who has been so remorselessly demolished by the uncompliant season, had been correct in his vaticinations, the ugly sounds might have been more imperatively audible. As it is, however, the portents of a storm have been sufficiently serious to induce the Home Secretary to send our respected contributor, Mr. Rawlinson, to inquire into the cause of the disturbance.

We referred, in THE ARCHITECT for March 13, to a flying and festive visit paid by certain persons, whom the Metropolitan Board of Works delighted to honour, to the Abbey Mills Pumping Station. It seems that more might have been learned by the visitors than they actually were invited to admire. Pumping is good, and drainage is good; but what becomes of the matter pumped and drained? London is, for the time at all events, relieved of a great source of evil. But the ugly question turns up—Have we removed our great midden heap far enough from our street door? Have we dealt with the most important question that can affect the habitability of the Metropolis in a thoroughly efficient manner? Have we gained, with all our enormous expenditure, more than a temporary respite from the great mischief of neglected sewage?

Our friends at Barking say that we have inflicted a nuisance on the portion of the Thames between Crossness and Barking Creek which is not only pestilential to the vicinity, but which will, in course of time, re-poison the waters of Thames so far as the tidal flow reaches. Without wishing to earn the character of alarmists, we must say that it is not easy to exaggerate the importance of this question; and while definite scientific information may be expected from the reports of the examining engineer, there are yet some facts, patent to every one, which are enough to show that the matter is not one to be neglected.

According to very moderate calculations, which will be disputed by no student of the subject, the sewage matter which is the direct product of the human chemistry of London amounts to about one million three hundred thousand tons per annum. This is without any allowance for the sewage incidental to animal life. It takes no notice of the results of any detergent process—of refuse of any description—of soot, of dust, of mud, of dilapidated and disintegrated stucco, mortar, or other building materials, of soap suds, of kitchen impurities, or even of the rainfall and artificial water supply. In a word, it is faecal matter alone and undiluted. If we consider that a tenth of this matter is solid, we shall most likely be within the mark; so that when the sewage of London is now, or will shortly be, all turned into the Thames, at least a hundred and thirty thousand tons of concentrated solid poison will have to be in some way dealt with by the stream within the course of the year. That this matter is already in a highly diluted state when it is mingled with the tidal waters of the Thames may, we should think, rather aggravate than diminish the evil. The effect of rainfall and water supply will be to ensure a more thorough incorporation of the objectionable matter with the water of the Thames.

Poison, we have said, to this definite and large amount, is thus constantly mingled with the Thames. It is only needful to add the

remark, that our merchant navy is employed, as regards a considerable amount of its tonnage, in importing from the Chincha Islands chemical elements identical with those which are now forming black and fetid mud in our great ocean highway. In accordance with the wonderful economy of organic life, that which is death to the members of the animal, is food for those of the vegetable kingdom. That which causes cholera, fever, or other forms of pestilence, if mingled, even in infinitesimal proportions, with the potable water of our wells and springs, not only becomes innocuous when filtered through the soil, but forms the wealth of the industrious farmer, and clothes the face of the country with verdure and with grain.

We have no intention of anticipating the statements or the recommendations of the Report. We wish only to bring before the attention of our readers unquestionable facts. The statistics we have cited are of the simplest description. They afford a sort of standpoint from which to regard the inferior limit of the question; but it is a standpoint much lower than that which would be assumed by any person who would take the trouble to multiply the disagreeable results of his own household economy by the number of households in London. From the harsh logic of the facts there is no escape. Neither, it seems to us, could a careful investigation of the subject have any other results than the conviction that, sooner or later, a great source of national wealth shall be applied to its proper and beneficent object, instead of being suffered to pollute the Thames, and to prepare future pestilence for some, if not for all, the inhabitants of the banks of the river within the reach of the tidal flow.

It has been with pride, as well as with pleasure, that we have called the attention of our readers, in the columns occupied by the descriptions of 'Our Rambler,' to the noble promise of the Thames. We have led them along the northern and southern quay walls, where the white granite of the parapets sparkles in the sun, but where the curved batter of the face of the wall between the high and the low water level is coated with a greenish slime which is unwelcome on such fresh masonry. We have spoken of the bridges which span the flow, and of the noble hospital in which the art of healing is to be raised into a beneficent apogee. We have, above all, striven to give to the future Palace of Justice the advantage of a river-side site.

Each of these expressions of admiration or of hope, however, takes one thing for granted. Thames is to be again a river—not a sewer. Those who are accustomed to make use of the most ancient highway from the City to Westminster are aware of the great improvement which took place some time ago in the state of the stream. They rejoiced to sniff, on the incoming tide, the veritable odour of the brine. But they cannot think that 1869 sees much, if any, improvement in this respect over 1868. The improvement was definite and most welcome; it is not progressive. A very much more pure and limpid stream would now flow through London, if no diluted sewage were borne up by the tide. And this is a matter in which, where the course of improvement is arrested, that of deterioration begins. We must repeat that there is no question concerning the architectural beauty, the habitable salubrity, or the future eminence of our great metropolis, that assumes more imposing dimensions, or calls more urgently for solution, than that of the purity of the Thames.

THE NEW LAW COURTS.

THE SOLICITORS.

A DEPUTATION, introduced by Lord Bury, M.P., from some of the principal legal firms of the City and West End of London, had an interview on Friday, the 18th instant, with the Chancellor of the Exchequer (Mr. Layard, M.P., the First Commissioner of Works, being present), to express their views in favour of the Thames Embankment as the site for the erection of the New Law Courts.

Lord Bury, in introducing the deputation, said the names of the gentlemen composing it, who were of all shades of political opinion, would show that the present was no party movement, or representation of party or personal interest. This deputation was called forth by the feeling of a large number of members of the legal profession, in reference to a deputation which had waited upon the Chancellor of the Exchequer a few days previously, purporting to be introduced under the auspices of the Law Institution and to represent the solicitors of London, but which in truth did not represent either the one or the other, but was convened by the Council of the Law Institution without the sanction of the members of that society.—Mr. ROBERT BAXTER (Baxter, Rose, and Norton) concurred in Lord Bury's remarks, and referred to a petition which had been laid before Parliament in favour of the Thames Embankment site. This petition was signed within a few days by upwards of 7,000 persons, of whom over 500 were practising lawyers, and about 500 lawyers' clerks and persons of that description, while 1,663 were gentlemen of note, among

whom might be named the Duke of Buccleuch, High Steward of Westminster, the Dean of Westminster, Sir John Lefevre, and others. He supported the Thames Embankment site solely on the ground that it was the most convenient to the great mass of persons frequenting courts of law.—Mr. VALLANCE (Vallance and Vallance) said that, so far as his firm were personally concerned, the Government plan would be most injurious, as it would turn them out of their offices; but he considered that in a question of this kind the public interests were paramount, and that too much weight had been accorded the private claims of individual members of the profession. No doubt, members of both branches of the profession were in the habit of resorting to the Chancery Courts at Lincoln's Inn, but they were no less in the habit of resorting to the Courts at Westminster and the Bankruptcy and other Courts in the City, and to these places also the general public were called to a much larger extent than to Lincoln's Inn. In the latter place the business was of a special and limited character, and the practitioners represented a class only; but it ought to be observed that the public were to the lawyers in the proportion of hundreds to units. To them the Thames Embankment site, from its more commodious access, was very preferable, and he trusted that their interests would be considered rather than the personal or pecuniary interests of those who constituted the opposition.—Mr. FRESHFIELD said he also represented the firms of Dawes and Sons, Cotterill and Sons, and Roy and Cartwright. He spoke in the interest of the City solicitors, and considered that he represented them. To these classes the access to the Carey Street site, along Ludgate Hill, would be in the highest degree inconvenient. On the other hand, the access along the Thames Embankment would be admirable.—Mr. ELLIS (Ellis and Ellis) said: Both the other Inns of Court were in favour of the Thames Embankment site, and so were the bulk of solicitors residing away from the precincts of Lincoln's Inn.—Mr. S. B. ROBERTSON stated that he also was authorised to represent Mr. Boodle, who was unable to attend through illness, but had addressed a letter to the Council of the Law Institution, denouncing in strong terms their conduct in assuming to represent the general body of that society. It should be observed that the Law Society comprised not more than one-fifth of the solicitors on the roll, so that even if the Council did represent their views, it would not count as that of a majority of the profession.

Mr. LAYARD said that the Government, in selecting the most appropriate site for the courts and offices of law, had been influenced mainly by the consideration so well referred to by Mr. Dudley Baxter—namely, to place them in a position to give most perfect fairness to all interested persons, and the utmost possible degree of convenience to the public at large. The Government had no preference for one site over another; they were influenced by no æsthetic considerations, as had been ridiculously urged against them. Such considerations were not altogether unimportant: but the primary questions upon which their opinion had been formed were, first, the convenience of access for all parties; secondly, the cost, which was by no means unimportant. After these came the question of beauty of design, which was not to be overlooked. Now, in reference to the question of cost, the Government had taken the very best opinions they could get from the persons most qualified to give them, and they had come to the conclusion that the construction of the courts and offices of law on the Carey Street site would involve a cost of not less than 1,000,000*l.* in excess of that resulting from the adoption of the Government site. In making this estimate he was admitting, for the purpose of argument, that the cost of the buildings would be the same, setting off the alleged excess of expense for foundations in Howard Street, which he thought would prove to be necessary, against the larger area on the Carey Street site, about which there was no question. He would, however, put the cost of construction in each case at 1,000,000*l.* Again, in respect of site, he would assume the cost to be about equal, setting the 900,000*l.* for the Carey Street site against the 600,000*l.* for the Howard Street site, but allowing the difference for assumed loss on resale, a loss which he did not believe would actually be incurred. But the real consideration in reference to cost, was that of approaches. No one who had looked at the Carey Street site would think that the public requirements would ever be satisfied by the existing state of the access. It was surrounded by a low neighbourhood, with narrow streets, through which the public would not long endure to have to pass. It would inevitably result that, before long, an additional sum of 500,000*l.* at least would be needed to clear away approaches, if it were only to get a suitable access for the Judges. But even this would not suffice to place the site in a state that would satisfy the public wants, and he believed that not less than two or three millions at least would have to be absorbed in making the site suitable to the business transacted upon it. At present the only access would be from the Strand, which was now overcrowded, and would then be so completely blocked, that a demand would be made for a new street along Carey Street, so as to make that available for traffic. This, besides the increase of expense, would have the effect of surrounding the Courts with the noisiest thoroughfares in London, and that on two sides. On the Embankment site the case was just the reverse. Excepting Essex Street, no part of that site would be a thoroughfare for traffic. The Embankment was not, in the nature of things, likely to be a noisy thoroughfare, and Howard Street would not be used for traffic at all; while the architect had so utilised the site as to place the offices by Essex Street and the Courts of Justice far away

in a most quiet situation—an advantage which practitioners in the Courts would best realise. Then there was the consideration of ventilation at Carey Street. This was necessarily bad on account of the low surroundings, and for that reason could not be made good, whereas on the Thames Embankment there would be the very best supply of light and air that London could afford, and it would also be surrounded by water and gardens and other objects of attraction, which, it had been well remarked, were matters of importance in regard to the health and convenience of suitors at the Courts. On all these grounds the Government were of opinion that they must not give undue weight to the alleged convenience or inconvenience resulting to practitioners at Lincoln's Inn. The interest of the public at large was paramount to this, and he was bound to say that, after giving the subject his almost incessant attention for several months, he had come to the conclusion that the Thames Embankment site was incomparably the best. But there was another consideration which, though it had been much used as an argument on the other side, seemed to him strongly in favour of the Government plan. No one could fail to notice the migration which had occurred within comparatively few years on the part of the Judges and principal legal practitioners from the old legal quarters in Bedford Square and thereabouts to the more immediate centres of their business. Now, the Carey Street site was already cleared and ready for the reception of a similar migration, and he did not doubt that the adoption of the Thames Embankment site, coupled with the fact of this space being left available for legal purposes, would facilitate a similar migration in the direction of this quarter, which could not but be of much benefit to the public at large.

The CHANCELLOR of the EXCHEQUER felt sure that all impartial persons would approve the Government plan, notwithstanding the great weight of influence which had been brought against it.

The deputation then withdrew.

THE ÆDILESHIP OF LONDON.

LORD ELCHO'S Committee has presented its preliminary report without one word upon the most important part of the subject submitted to it. The Thames Embankment is a matter of less weight than the permanent control of the Public Works of the Metropolis. The Society of Arts is almost the only public body which has attempted to influence Parliament in favour of a much-needed change in our practice in this respect. Amongst a people of our social habits the most successful reforms are those which consist in the timely supply of some pressing want, that at last appears to be intolerable. Such is the case in the present instance.

The committee appointed by the Society of Arts to investigate the subject report, in effect, that there was imminent danger of our losing the advantage of one of the finest public works in Europe, from the simple fact that there exists no machinery for its due protection. With reference to the architectural character of the building that will crown the Thames Embankment, there exists either no jurisdiction at all, or divided and inconsistent jurisdiction. The rights of the officers of the Corporation of the City of London march with those of the Board of Works somewhere opposite to the Temple. Neither functionaries appear to have any authority enabling them to repress the exercise of the great English privilege of freedom of public bad taste. Whether a graceful and appropriate façade shall form a noble frontage to the purified stream, or whether gas works, iron warehouses, or portentous, heaven-defying, shareholder-scorning, waggon-headed roofs, shall be allowed to dwarf every picturesque feature under the shadows of their monstrous extinguishers, no one seems to have any right to inquire. The Society of Arts, then, deserves the thanks of all men of taste for bringing the subject prominently and practically forward before it is too late.

We have had two great struggles already as to the ornamental utilisation of the Thames Embankment. We have, we hope and believe, escaped the erection, at a large cost, of a useless, hideous, and uncalled-for viaduct; but it has been a narrow escape, if, indeed, we are yet safe. Then, when we asked for appropriate architecture to rise on a neighbouring portion of this most noble site, we were offered a *réchauffé* of an unbuilt palace—Inigo Jones *à la Lowe*—in the economic adaptation of grandiose design to unfit ends. Men who thought little, and cared less, for matters of taste, have been forced to see that there is such a thing as an architectural question; and the demand for the State appointment of some one who should be responsible for the disfigurement of London, comes now in due time, and with irresistible force.

We are alone among civilised nations in our neglect of public decency in architecture. In no great capital can rampant barbarism flourish as it does with ourselves. How long would Leicester Square be allowed to disgrace Paris? We are no advocates for what has been neatly termed *Haussmanno-mania*, but we question whether even the tyranny of the Prefect of the Seine is not more endurable than the tyranny of the universal freedom of bad taste.

We need not be above enquiring as to the mode in which other civilised nations act in similar cases. Everywhere out of England we find that some sort of control is exercised, by the government of the country, to prevent the disfigurement of the capital or the desecration of national monuments. The destruction of Druidic remains, such as not unfrequently occurs in England, would be as impossible in Continental countries as it ought to be rendered in our own. The number of Ministers, or of principal divisions of the business of government, is, under one cause or another, almost identical in all nations of the first political rank, including the United Kingdom. Nowhere does there exist such a person as a Minister of Art or of Architecture. But nowhere, out of England, does there fail to be a department of one of the principal ministers devoted to the control or the culture of the arts. Differently distributed in different kingdoms, in

each Continental State one or more divisions or departments of some principal secretariat is thus allotted. In France, the tenth ministry includes the two departments of the 'Maison de l'Empereur' and of the 'Beaux-Arts.' In Bavaria there is a 'direction centrale pour les Arts, les Sciences, et l'Instruction.' Generally speaking the subject of art superintendence ranks as part of the attributes of the Minister of Public Instruction, an officer whose increasingly important duties may be said, like so many others, to be 'in commission' in our own country.

The result of the Continental experience appears to us to point to a course eminently suitable to the temper of our institutions. With us the chief minister of each department, Secretary of State, or whatever we may call him, is a political personage. He is liable to displacement from motives entirely foreign to the question of his personal fitness for the duties of his post. But government would become impracticable were this rule to apply to the real execution of the details of business. We have, therefore, permanent under-secretaries and heads of departments, who are vexed by no adverse divisions, and who carry on the business of the nation; under general parliamentary check, no doubt, but affected by casual and fleeting majorities.

The exigencies of art, therefore, in England are in harmony with those of our political habits. The Ædile of London, or whatever name may be given to the new and much-needed officer, should not be a political character. He will, when we are so fortunate as to get him, probably not be a Secretary of State or a minister of the first rank. But, as the permanent head of a department which requires to be consolidated rather than created, he will be clothed with that power, and hedged in by that responsibility, that will become an officer invested with such important functions. The Council will not be an *ad hoc* gathering of amateurs. The new functionary should not be obliged, on any new occasion, to summon academicians or artists to his council, as country magistrates have to learn the law from their clerks. His own character and standing must be such as to command respect. From the heads of his divisional departments—if they be the right men in the right places—he will receive that full information, on matters of fact as well as on canons of taste, without which no one can satisfactorily act. No tittle of the present public right to grumble, to criticise, and to complain, will be invaded. But there will be a distinct focus on which all this public spirit, now misdirected and wasted, will be taught to converge. Actual abominations will be rendered, we fondly hope, impossible. Any Ædile, for example, who had sanctioned the erection of the Peel statue in Palace Yard (which has now been recast into a statue of Palmerston) would have been unable to retain his position against the tempest of public ridicule. Every assurance that our institutions demand, or will allow, could be given to the nation that the power of such an officer would not be abused. That some such fountain, or centre, of administrative power, is a crying want, and that we are in daily danger, so long as such an appointment is deferred, of damage to the beauty, the convenience, and even the health of London, cannot, we think, be candidly denied. The Society of Arts have taken a practical step towards the settlement of this important question. We trust our own humble but earnest remarks may find the same distinct echo within the walls of Parliament that we have been gratified with observing on more than one former occasion, even during the brief space during which we have ventured to claim attention for views proper to THE ARCHITECT.

The text of the petition of the Society of Arts is as follows:—

'That your petitioners have lately appointed a Committee to report on the best way of dealing with the Thames Embankment, so that the opportunity may not be lost of making this noble site conducive to the embellishment and improvement of the metropolis.

'That such Committee consists of the following persons:—Lord Henry G. Lennox, M.P.; Lord De L'Isle and Dudley; Right Hon. W. Cowper, M.P.; Lord Elcho, M.P.; Baron Meyer de Rothschild; the Hon. Auberon Herbert; A. B. Beresford Hope, Esq., M.P.; William Boxall, Esq., R.A.; Sir William Bodkin, Assistant-Judge; Hyde Clarke, Esq.; A. Baillie Cochrane, Esq.; Henry Cole, Esq., C.B.; Lieut.-Col. E. F. Ducane; C. W. Dilke, Esq., M.P.; W. R. Drake, Esq., F.S.A.; Lieut.-Col. Egart, R.E.; Edwin W. Field, Esq.; Alderman Sir T. Gabriel; W. H. Gregory, Esq., M.P.; Earl Grosvenor, M.P.; C. F. Hayward, Esq.; W. Haywood, Esq.; John Locke, Esq., M.P.; Right Hon. Lord John Manners, M.P.; J. E. Millais, Esq., R.A.; S. Redgrave, Esq.; Lieut.-Col. Scott, R.E.; G. E. Street, Esq., A.R.A.; Seymour Teulon, Esq.; Sir Charles Trevelyan, K.C.B.; Richard Westmacott, Esq., R.A.; Rev. Henry White; Joseph Whitworth, Esq., LL.D.; Watkyn Williams, Esq., M.P.

'That, during the course of the proceedings of this Committee, it became their duty to inquire whether any and what controlling power over public works in the metropolis of this country is vested in, or exercised by, any public department.

'That it appears, from the proceedings of this Committee, that no such effective controlling power exists, and that the mode of dealing with the Thames Embankment, upon which the improvement of London essentially depends, has been left to the accident of the varying personal interests and tastes of the different owners of property on the Embankment.

'That, so far as any control whatever exists over the works of the Thames Embankment, it is subject to the divided jurisdiction of the Corporation of the City on the east of the Temple, and the Metropolitan Board of Works on the west.

'That such control is entirely confined to the conduct of works already authorised to be constructed, and is wholly ineffectual for securing the proper appropriation of public sites for the health, accommodation, and embellishment of the metropolis.

'That such Committee is strongly of opinion that it should form part of the duty of a responsible Minister to exercise a controlling power, within necessary limits, over all operations bearing upon public works in which the convenience and embellishment of the metropolis are concerned.

'That your petitioners entirely agree in the opinion of their Committee, and humbly pray your Honourable House to take such steps as may secure such responsible control as to your Honourable House may seem fit.

'And your petitioners will ever pray, &c.'

THE LAW AND SCIENCE OF ANCIENT LIGHTS.

By HOMERESHAM COX, M.A., BARRISTER-AT-LAW.

(Continued from p. 319.)

PART II.*

Optical Principles.

ACCORDING to the rules just laid down, Courts of Justice, in estimating the injury to ancient lights, consider the obstruction—not of direct solar rays, but of the general light of the sky. For the purposes of calculation it is ordinarily assumed that the sky is uniformly illuminated; and that hypothesis will be here adopted. It is obviously the most convenient assumption; it is also that which alone can be the basis of general rules. By supposing the illumination to be uniform, and neglecting the variations due to the position of the sun or clouds, we get a fair average result. The general problem to be solved may therefore be thus stated—assuming the sky to be a hemisphere equally illuminated in all parts, how much of its light will enter an aperture of given dimensions and in a given situation?

First, for the sake of simplicity, suppose that the aperture is a skylight or opening in the horizontal roof of a building with no obstructions above its own level. For a reason which will appear hereafter, we will also suppose that the opening is unglazed. In this case every point of it may be considered as the centre of an imaginary hemisphere of light of any arbitrary radius.

Next, consider the case of an unglazed aperture in a vertical wall erected on a horizontal plane—such a case as that of windows on the level of the sea and directly facing it. In this instance each point of the aperture may be considered to be the centre, not of a hemisphere, but of a quarter of a sphere of light. Let A, Fig. 1, be such a centre. It will obviously receive the light from a portion of the sky bounded by CED the vertical plane of the wall, and BCD the horizontal plane.

SECTION V.—Effect of Oblique Rays.

We have next to consider the effect of the obliquity of all the rays except those which are perpendicular to the plane of the aperture. We suppose all parts of the sky to emit equally intense rays, but it is manifest that those which are most direct have the most power. Those which are very oblique produce very little effect.

It is essential to the investigation that this diminution of effect should be measured accurately. At first we will suppose, for the sake of simplicity, that the aperture is not a large window, but is of indefinitely small dimensions. In Fig. 2, ABCD represents the section of a vertical wall with a

small aperture CB, and HBCK represents a beam of light composed of rays

* Addendum to Part I.—In the case of *Maltby v. Ware*, heard June 12, 1869, the defence was that the plaintiff had acquiesced in the erection of the wall which obscured his windows, and that his loss of light in one place was compensated by gain in another. The Master of the Rolls said that this species of compensation, though commonly alleged in such cases, was not a valid ground of defence, and he decreed that the wall should be reduced to its original height. He suggested, however, that the plaintiff should waive his strict right to the decree, and consent to a pecuniary compensation to be determined by the court. His Lordship was of opinion that this course could not be taken without the plaintiff's consent.

perpendicular to the plane of this aperture. The breadth of this beam is CB; but the breadth of a beam FCBE inclined at an angle ABC or ACF is not CB, but a less quantity, BH. By trigonometry, since BH is perpendicular to CH,

$$BH = BC \sin. BCH.$$

In other words, the breadth of the beam (and therefore its optical effect) is diminished in proportion to the sine of the angle at which the rays are inclined to the aperture. When the angle is small, its sine is small, and the optical effect is therefore insignificant. It will be easily seen from this that the value of what is called 'sky-area' rapidly diminishes as the rays become more and more oblique, and that rays near the zenith produce but little illumination of a vertical window.

(To be continued.)

MEMORIAL TO FARADAY.

ON the 31st instant a public meeting was held in the theatre of the Royal Institution, Albemarle Street, for the purpose of considering what measures shall be taken for the promotion of a memorial to Professor Faraday, whose voice was so often heard as a lecturer within those very walls. The chair was taken by his Royal Highness the Prince of Wales, who in a few well-chosen words expressed the pleasure which it gave him, both on public and on private grounds, to preside over such a meeting as the present, and reminded his hearers that, although he whom they had met together to commemorate had been dead for nearly two years, yet nothing had been done by the public to perpetuate his memory.

The first resolution, 'That it is desirable that measures should be taken to provide a public memorial to the late Professor Faraday,' was proposed in a short speech by General SABINE, who said that the Royal Society, over which he had the honour to preside, felt a pride and a pleasure in reckoning Michael Faraday as one of its members, and bore his testimony to the fact that out of all its long list of Fellows none had contributed such a valuable collection of papers to the *Philosophical Transactions*.

This resolution was seconded by M. DUMAS, Senator, Member of the Academy of France, and permanent Secretary of the French Institute. He proceeded with eloquence and perspicuity to touch in detail upon some of the scientific achievements of Faraday, and took occasion to observe that his genius in its various applications of science to practical purposes was distinguished by originality not less than by profundity, instancing his condensation of gas into liquids, his manufacture of steel and of glass, his magneto-electric currents, which encircle the world in the telegraph wires, and his magneto-electric light, to be seen in the most important lighthouses of England and of France. M. Dumas wound up his speech by expressing in a tone of deep emotion his own personal regard for a man who was singularly distinguished by his virtues in private life. There were many present who sympathised with M. Dumas when he added that the world at large had cause to lament the loss of Faraday as one of the greatest philosophers who ever shed light upon it by the force of genius, but that he himself had still greater cause to lament in his death the loss of a friend.

Sir HENRY HOLLAND moved the second resolution:—'That the following gentlemen be a committee to take the necessary measures for the provision of the said public memorial in honour of Faraday:—General Sabine, President of the Royal Society; Sir Henry Holland, President of the Royal Institution; Sir Roderick Murchison, President of the Geological Society; Dr. Williamson, President of the Chymical Society; Mr. George Bentham, President of the Linnean Society; Mr. T. H. Huxley, President of the Geological Society; Admiral Manners, President of the Astronomical Society; Dr. W. J. Hooker, President of the British Association; the Right Hon. A. H. Layard, M.P., Mr. J. Ferguson, Mr. Cassiot, Dr. Tyndall, Mr. Grove, Dr. Frankland, Mr. De la Rue, and Dr. Benze Jones, with power to add to their number.' Seconded by Sir Roderick Murchison.

Professor OWEN moved the third resolution, to the effect 'that a subscription, not exceeding five guineas in amount from any one person, be made for the provision of a public memorial to Faraday.' He prefaced this resolution by a few remarks, to the effect that the theatre in which they were assembled was redolent of Faraday, and seemed haunted by his spirit. Great and deep as was the learning which he displayed as a lecturer, still his profound and subtle generalisations were almost exceeded by that playfulness of wit by which he raised the intelligence of his hearers without lowering himself from the height of his professional dignity. Of his genius they had heard already from M. Dumas; but enough could scarcely be said of his personal merits, his singular modesty, and that unconsciousness of genius which is so often combined with genius of the highest order, as in Wellington. Like him, Faraday sought no honours, and the reputation of the philosopher, like that of the warrior, is reflected on his countrymen. Those, therefore, who are devoted to science have a right to call upon not only men of science, but Englishmen in general, to acknowledge and to pay the debt which we owe to Faraday. Let us think what will be the feelings of a future generation who will look back to him as we look back to Newton. His discoveries of the grand secrets of nature have added to our stores of wealth and ministered to our comforts, and hereafter there will arise the feeling that we have not done so much as we ought for one who has done much for us.—Dr. LYON PLAYFAIR, M.P., seconded the resolution.

The three resolutions were severally put to the meeting by His Royal Highness, and declared to be carried unanimously.

It is thought that the Faraday Memorial will very probably assume the shape of a monument in St. Paul's Cathedral. The Chymical Society have already established in his honour a medal, to be given annually to some foreign *savant* distinguished in the science of chemistry, and this year it has been conferred on M. Dumas.

Mr. Ernest Edwards, the inventor of the new mode of printing in carbon, is at present producing fac-similes of Albert Durer's engravings and etchings at the Burlington Fine Arts Club. The copies thus made are said to be with difficulty distinguishable from the originals, and to be imperishable.

ENGLAND IN 1669:

A RETROSPECTIVE REVIEW OF THE TRAVELS OF COSMO III.

(Concluded from page 304.)

And now, leaving science and scientific men, we will return to Cheapside. They saw nothing remarkable in the Guildhall. Adjoining Clothworkers' Hall there was a beautiful garden to walk in. In the Exchange there were four spacious galleries, in which were many shops of various kinds abounding with merchandise of every description, surpassing those in the New Exchange. London Bridge was even then difficult to cross on account of the number of carts that were passing and repassing. On it were many large buildings: some had been consumed in the fire, and those which had replaced them were of smaller size, the upper portions being used as dwellings and the lower as mercers' shops, all of which were abundantly supplied with goods of various kinds. Returning by the river, on which it is said there are ten thousand small boats to convey people up and down or to ferry them across, we come to Westminster. The greatest ornament of the Abbey is said to consist in its vast number of marble pillars variously arranged; as for the architecture, it is in no way more remarkable than other Gothic churches. The whole of the roof is vaulted; that of the middle aisle is the most open, but it has not more light than is necessary. Westminster Hall (over which old Noll's brave head was fixed), on account of its size, they inferred must have been originally a church. It is described as serving as a place for people to assemble who have business at the Law Courts, and for the accommodation of many moveable shops which are placed around it. The House of Commons was without ornament and surrounded with benches. The House of Lords was entered from the former by a door opposite the throne, and at a little distance from the door was a wooden rail, to prevent the Commons advancing too far when they appeared before the King. The walls were naked then, but during the sitting of Parliament it is said they were richly adorned with tapestry and painting.

And now we think we have glanced at all the references in the Travels to 'the memorials and the things of fame' that existed in London in 1669. The generality of the inhabitants are said to be proud, arrogant, and uncivil to foreigners, against whom, and especially the French, they entertain a great prejudice, treating such as come amongst them with contempt and insult. On the other hand, the French made fortunes in London, for, being more attentive to business, they can sell their manufactures at a lower price than the English, who would fain derive the same profits as other artisans, however little they work. As all things went on regularly, there was no want of anything in London. At every corner decent carriages were to be found, which were taken by time, charging so much an hour, with something extra for the first. The streets were lighted by night by large lanterns of various forms, fixed with great regularity against the doors, and boys were found everywhere to carry lighted torches. Some of the inhabitants were obliged to go the rounds and patrol the streets of their ward armed with halberds; consequently the City could be traversed and business carried on freely and securely at all hours.

During his stay the Prince was invited by the King to the races at Newmarket, an institution we owe to Charles, and on his return he visited Cambridge and Oxford, as well as some of the mansions that lay on his way. After leaving London, he stopped at Epping at an inn, the landlady of which was a relation of Cromwell's. He next visited Audley End or Inn, the celebrated seat of the Earl of Suffolk, and one of the finest houses in England. It was designed by Jansen, and although there was not much of the Italian style about it, it is easy to see that the travellers were impressed with its appearance. 'Descending into the valley below by an easy acclivity, we came to a spacious avenue planted with elms of considerable height, which terminated at the mansion. The entrance is into a quadrangular court, whose sides are surrounded by porticos of stone which, extending with perfect regularity to the distance of several bowshots, enclose a large meadow. The balustrade which runs round the court is formed, on the one side, of the letters which comprise the following words:— "Sapientia est in consilio fortunam semper habere," and on the other with those of the motto belonging to the arms of the Order of the Garter. The interior of the house consists of many apartments, well proportioned and judiciously disposed, and of a well-lighted gallery ninety paces or more in length, having a ceiling of stucco adorned with arabesque, and walls lined with wainscot, which is the custom in all the houses of the English nobility, as a protection against the cold. The architecture of the palace, although it was built only sixty years ago, is nevertheless not regular, but inclines to the Gothic mixed with a little of the Doric and Ionic. The materials of which it is composed are brick, the ornaments of all kinds are splendid, and entirely of stone, and the roof of lead. Upon the roof is a gallery, in the midst of which rises a small cupola containing a clock, the sound of which proclaims to a great distance the magnificence of this vast fabric.' The country towards Newmarket was thought to be delightful in appearance, enjoying not only a salubrious air, but a rich and fertile soil, so that there was some reason for Suffolk being considered as the most fruitful and agreeable of all the counties. It would not be in keeping with the method we have followed if we described the race, but it was a simple affair enough, as only two horses ran. The land about Newmarket belonged to Lord Arlington, who let it on a twenty-one years' lease at six shillings an acre, the rent payable half-yearly, and the tenant having full liberty to employ the land for pasture, to plough it, or sublet it. From Newmarket the Prince travelled to Cambridge, stopping at Chippenham, 'a villa,' belonging to Sir John Russell, and which 'would bear comparison with any country seat.' At Cambridge he was received with much ceremony. There was an oration in Latin delivered before him, but on account of the pronunciation he couldn't understand a word of it; and it was the same afterwards in Oxford. He visited the buildings, and of King's College Chapel it is said that although it was Gothic, yet it displayed the royal magnificence of the Prince who erected it, in the nobleness of the decoration—a courtier-like way of considering architecture. The houses in the town were not much admired, on account of their beauty or materials, the greater part being of wood, with an outward facing of brick. From Cambridge, Cosmo

went to Northampton, where the bells rang out merrily, and being well tuned they were agreeable, at least during the day; but unfortunately the ringing was continued during a great part of the night, to the interruption of his Highness's sleep. The houses are said to be in a respectable style of architecture, the greater part of them being built of earth and stone, a good deal ornamented. On his way to Oxford the Prince stopped at Althorp, which, as it is in the Italian style, receives no small praise. 'The whole edifice is built regularly, both as to its exterior and interior, and is richly ornamented with stone of a white colour, worked in the most exquisite manner, and which is dug from a quarry fourteen miles distant. If they could take off a certain natural roughness from this stone, and give it a polish, it would not be inferior to marble. The ascent from the ground-floor to the noble storey above is by a spacious staircase of the wood of the walnut tree stained, and constructed with great magnificence; this staircase dividing itself into two equal branches, leads to the grand saloon above, from which is the passage into the chambers, all of them regularly disposed after the Italian manner, to which country the Earl was indebted for a model of the design, and it may be said to be the best planned and best arranged country seat in the kingdom, for although there may be many which surpass it in size, none are superior to it in symmetrical elegance.' With all respect for his Highness's architect, there is not much in the exterior of Althorp to warrant this praise; but the contents can, beyond those in any house in the kingdom, make glad the heart of every lover of books or art; and of them there is no mention made except the vague description 'that all the apartments are sumptuously furnished.*' The Prince left Althorp in Lord Spencer's coach-and-six for Brackley, where he changed horses, and arrived at Oxford at one in the morning. 'He who can be proof against the strong emotions which the whole aspect and genius of Oxford tend to inspire,' says the German Huber, 'must be dull, thoughtless, uneducated, or of very perverted views. Others will bear us witness that even side by side with the Eternal Rome, the Alma Mater of Oxford may be fitly named, as producing a deep, a lasting, and a peculiar impression.' And it would seem that the Italians were no exception to the proverbial influence of its sweetness, for the tone of their criticism here seems to us to become entirely different. The private houses are said to be built with more magnificence than is usual in the kingdom, being for the most part of stone; but the public buildings exhibit 'a singular magnificence.' Lincoln College is 'of beautiful workmanship and exquisitely ornamented.' Exeter 'is in a very respectable style,' and so on. Wren's theatre, as an Italian building, was in any case object of approval. On his way back to London the Prince stopped at Billingsbere, then belonging to Colonel John Nevil, and in describing it we have this notice of rooks: 'the rooks are considered in England as preserved birds, the nobility priding themselves on seeing them in the neighbourhood of their villas, and looking on them as fowls of good omen, so that no one is permitted to kill them under severe penalties.' Cosmo next visited Windsor ('a populous town in the county of Berkeria, called by the English Berkshire'), than the castle of which he says the kings of England have not a more delightful residence. And from Kingston he returned by the river to London. Of Hampton Court (where he had been entertained with a deer hunt) it is said that 'it was commenced by Wolsey, and finished in the same Gothic style and with the same splendour of decoration; and though the more elegant orders of architecture are not to be found in it, so as to make it a regular structure according to the rules of art, yet it is on the whole a beautiful object to the eye;' and when the Prince expressed a similar opinion to Charles, he politely returned, 'that his Highness's affection for the things of this country made him regard it with partiality, but that it could not be compared or put in competition with those of Italy.' Having visited the English navy, Chatham, and Sheerness, Cosmo and his suite left London. On their way to Harwich they stopped at Thorndon, Lord Petre's house, and here, while they were at dinner, the chimney took fire. When it is remembered how much hospitality was forced on Cosmo, it sounds unpleasantly to hear this ill report following his last dinner in England:—'Their tables, though distinguished by abundance, are deficient in quality, and in that exquisiteness of relish which renders the French dishes grateful to the palate. This is particularly the case with the pastry, which is grossly made, with a great quantity of spices, and badly baked. There is also a great want of that neatness and gentility which is practised in Italy, for on the English table there are no forks nor vessels to supply water for the hands, which are washed in a basin full of water, which serves for all the company; or perhaps at the conclusion of dinner they dip the napkin into the beaker which is set before each of the guests filled with water, and with this they clean their teeth and wash their hands.' After leaving Thorndon they passed through Hennington, near which Lord Petre, they were told, held several estates as a fief of the Crown on condition of taking a leap in the King's presence every Christmas Day, besides some other ridiculous ceremonies, in acknowledgment of his tenure. Cosmo next visited, at Newhall, General Monk, Duke of Albemarle, who was then very ill (he died the following January); but he tried as well as he could to usher the Prince into a room where there was refreshment prepared, 'which had more the appearance of a parsimonious collation than of a handsome dinner.' Newhall is said to be a spacious and magnificent edifice, and although the architecture is not in that perfect style of modern buildings, yet it is by no means destitute of grandeur, owing to the size and elegance of the apartments. From Newhall the Prince travelled to Colchester, and thence to Ipswich, which is said to possess many handsome buildings, and its appearance, with its spacious squares, is very noble. The last town the Prince came to was Harwich, the houses in which are said to be mean and shabby; and on May 16 he embarked on board the vessel presented by the United Provinces to the King on his restoration.

* All the county histories and topographies we have met with state that Althorp was built in 1688. Baker, in his colossal History of Northamptonshire, says, more cautiously, it was 'restored' in 1688. From the above description we should say 1668.

A Fountain is to be erected in honour of John Galt, author of 'Sir Andrew Wylie,' 'The Annals of the Parish,' and other well-known works.

WORKS IN HAND OR SHORTLY TO BE EXECUTED IN FRANCE.

THE beautiful quaint old building of the Hôtel de Cluny is in the hands of the masons and sculptors, who are repairing the pierced gallery which crowns the walls of the building, and the ornamental work of the dormer windows, which had in parts fallen into a very insecure condition. All this sculptural work is of the end of the fifteenth and the early years of the sixteenth century, and is remarkably original and delicate in its execution.

The number of small animals introduced into the decoration,—dogs, squirrels, rabbits, lion cubs, monkeys, lizards, and birds,—and the grotesque gargoyles, are the delight of the *faneurs* of Paris, who have little taste for the beautiful lines and proportions of the building. We have no doubt that the old ornamentation will be replaced with the greatest possible care, but we recommend architects and students who find themselves in Paris to pay the old Hôtel a visit before the rich tint of time is removed off its face.

The Seine is about to be spanned by a grand new bridge, which will connect the recently-formed Boulevard Saint-Germain with the Place de la Bastille; the line of the new boulevard will cross both streams of the river at the point of the Isle St. Louis. The new bridge will be longer than the old Pont-Neuf, and, like it, will have the point of the island beneath it. This bridge will replace the old wooden structure, as well as the suspension bridge of Constantine, which now connect the island with the two shores.

A bridge is ordered to be constructed over the Yonne, near the hamlet of Laroche, in the Commune of Saint Cydroine. The work including the approaches will be heavy; a sum equal to 2,508*l.*, in addition to a toll to be laid upon the bridge is devoted to the undertaking, which will shortly be put up to public competition.

The following works have also been declared by decree to be of public utility, and will shortly be carried into execution by contract. A landing quay and small side dock on the canal of Ille and Rance Saint Gregoire, Ille-et-Vilaine. The increasing of the water in the canal of the Nivernais by means of a rigole from the river Aron; expense estimated roughly at about 20,000*l.* The rectification of the canal of Haute-Deule and the construction of a new lock on the same. The draining of the lake, or morass, known as the Flot de Vingles, in the departments of the Pas de Calais and the Nord.

Instructions have also been given to the Algerian engineers to draw up plans for the following improvements of the port and town of Bône: A swing bridge at the entrance of the Bondjunah, to connect the town and the south quay. Completion of the south quay. To dredge out the basin to the depth of 23 feet so as to let in large vessels. To reduce the width of the entrance of the outer harbour from 400 to 300 metres. To deepen the outer harbour over twenty acres, so as to receive men of war. To establish graving basins and slips; and, lastly, by dredging or otherwise to reclaim a large tract of land between Fort Cigogne and the Bavayaud jetty.

ILLUSTRATIONS.

THE LONDON ORPHAN ASYLUM, WATFORD.
HENRY DAWSON, ARCHITECT.

THIS building, of which we give a bird's-eye view, has been designed to receive 600 children, of whom 400 will be boys and 200 girls; and, as a glance at the illustration and the references at its foot will show, all the separate departments required for such an institution are included in the scheme.

The boys and girls occupy separate sides of the establishment, and their play-grounds are separated, as the view indicates, by the central mass of buildings. The boys are lodged in 'Houses' adjoining one another, but perfectly distinct; and each house is arranged to receive 50 boys. These houses surround separate quadrangles for senior and junior boys. In the centre of each quadrangle is the School, with a covered play-ground under it. The instruction will be given in class-rooms. The dormitories for the girls will also be arranged to receive 50 in each, but they are not to be placed in distinct houses like the boys.

The amount of cubic air space in each dormitory averages above 750 cubic feet per child.

The Dining Hall will have distinct entrances for the boys and girls, and distinct communications at each end with the kitchen departments in the basement. It is to have an open hammer-beam roof.

The Chapel will be built simultaneously with the other buildings, and its origin is one of the most interesting features of the whole undertaking, for it is to be erected at the sole expense of a lady who was formerly the head mistress in this very Institution, and was indeed herself brought up from a child as one of its scholars. Instances of good-will shown towards our various schools and other benevolent establishments by those who have been aided by them in early life are happily not rare; but we do not remember to have heard of any other case where circumstances had combined to render possible so graceful and so munificent a gift as this.

It is not at the present moment intended to accommodate more than 450 children—300 boys and 150 girls; but all the administrative and domestic buildings required for the full complement of children will now be erected. It is also intended to suspend the erection of

the Infirmary until sufficient funds are obtained. In the meanwhile it is proposed to appropriate one boys' house, and the top storey of the Central Building, as temporary infirmaries for boys and girls respectively. Even when the whole 600 are provided for, and the Infirmary built, there will still remain the option of enlargement, as the design has been specially arranged to admit of future extension.

An Artesian well has been sunk to a depth of 300 feet, and an abundant supply of pure soft water has been obtained.

The buildings will be brick-built, the main walling being executed in yellow bricks, with bands, arches, &c., of red brick, and dressings of Box and Farleigh stone; the roofs are to be slated, and the construction throughout simple, but substantial.

Their Royal Highnesses the Prince and Princess of Wales have signified their intention of attending on July 12, to lay the foundation stone of the new buildings.

NEW DOCKS AT GREENOCK.

WE give this week a bird's-eye view of the proposed new Docks at Greenock, designed by Mr. T. Claxton Fidler, C.E.

The Harbour Trustees invited designs for this work in competition, and in their instructions to competitors, stated that they proposed to construct docks capable of affording accommodation to vessels of from 3,000 to 4,000 tons, and to consist of a graving dock, the size of which was to be 500 feet long on floor, capable of extension to 750 feet; and 90 feet wide on top, with an entrance of 65 feet; and to be 18 feet deep at top of blocks; and either two wet docks or two tidal harbours.

They required the docks to be so laid out that any parts could be carried out in succession so as not to interfere with the traffic of any portion which had already been executed; and they were desirous that the graving dock, which was most required, should be so placed that its construction might be at once proceeded with, leaving the remaining portion of the ground free and undisturbed to be let off for temporary building purposes if they felt so disposed. It was of the utmost importance that ample railway communication should be provided between the docks and the Caledonian Railway close adjacent.

Sir John Rennie, in his admirable work upon 'Harbours,' in speaking of Greenock says—

Originally Greenock consisted of merely a few cottages, tenanted by fishermen and casual traders, scattered along the shore; and in the period between 1635 and 1639 it was a place of no importance. . . . The port consists of an outer and an inner harbour. The outer harbour is formed by the secure roadstead in front of the town, which may be considered to be additionally protected by a bank or shoal about 9 miles in length, running parallel to the shore at a distance of about 400 yards. The depth of the channel between the bank and the town varies from 10 to 26 and 29 feet at low water, so that the roadstead presents ample accommodation for vessels of almost any size at all times of the tide and in excellent holding ground.

The site for the proposed docks is the 'Garvel Park,' situated to the south-east of the present harbour, and projecting out rather prominently into the Clyde. It is situated exactly to the south of the 'Greenock Bank' above referred to, and lies to the west of the 'Cockle Bank.' A smaller bank appears to the north-east, and divides the main channel into two parts. The formation of this 'patch' and the consequent narrowness of the channel offer very strong arguments against any entrance to the docks at the eastern part of the estate, as the ebb-tide along this secondary channel would be constantly silting it up.

The Tidal Harbours Commission, in their Second Report in 1835, stated 'that their Committee found that one of the most important questions under their consideration was that relating to the additional harbour accommodation, and the cost at which such a demand could be supplied; and they further believed it to be desirable that in dealing with any plan for the extension of the harbours, wet docks should be included.' Mr. Rennie strongly advocated the construction of wet docks, and the Committee found that the great arguments in their favour were as follow:—

1. That the increasing trade of the port required additional accommodation.
2. That the quality of the harbour accommodation was inferior to that which wet docks would afford.
3. That the construction of wet docks at Port Glasgow rendered it necessary that Greenock should provide similar accommodation.

Strong arguments were offered against wet docks and in favour of tidal harbours; and at that time, when the tonnage of the largest vessel was not more than 1,200 tons, the popular impression was that the latter were most suited to the requirements of the trade, the range of the tide being comparatively small. But it must be remembered that the tonnage of vessels that will require to use the docks is from 3,000 to 4,000 tons, and it is of the utmost importance that proper and secure accommodation should be provided, which can only be effected by wet docks.

We now proceed to give some extracts from Mr. Fidler's descriptive Report which accompanied his design:—

The proposed works consist of a tidal basin with entrance from the deep-water channel, a double graving dock with entrance from the tidal basin, closed by a caisson, and an inner or wet dock connected with the tidal basin by an entrance with a single pair of gates, and, if necessary, also by a lock, as shown on the plan.

In order to secure the outer entrance from silt, it is placed as far from the

THE COURTS OF JUSTICE ON THE PROPOSED SITE BETWEEN THE THAMES EMBANKMENT AND HOWARD STREET, STRAND.
 GEORGE EDMUND STREET, A. N. ARCHITECT.

convex bend, and as near the concave bend, of the current as possible, consistently with allowing a sufficient offset on the south side to prevent entering vessels from interfering with those berthed along the South Quay.

The position of the outer entrance, while affording facilities for entrance and departure at all times, is arranged especially with a view to vessels entering a little before high water, and lies about in the direction that a vessel must take when moving ahead at about $1\frac{1}{2}$ knots, and being at the same time drifted laterally by the flood tide.

Direct access to the graving dock and north quays is provided by a swing bridge crossing the two entrances in one length, and centred in the middle.

The basin covers five acres, and affords on the north side 200 yards quay for discharging timber to timber stores, with a siding connected with the Low Level Railway; on the east side are the inner entrance, landing slip and boat stairs; and on the south side, 165 yards quay for general purposes, with a siding also connected with the Low Level line, and convenient road approach from Hamilton Street.

To the north of the graving dock there is more space than would probably be required for pumping engine, and repairing yard and sheds, which may be thrown into the area of timber store, or may at any time be utilised for the construction of a Morton slip as shown.

The inner dock, when completed, will cover $1\frac{1}{4}$ acres. It is partly divided at its widest part into two basins, west dock and east dock, by a jetty 350 feet long from the South Quay, and 100 feet wide, on which can be built warehouses with craneage for direct discharge, as shown.

Jetties afford the means of increasing the quay accommodation at an economical rate, but they must be spaced sufficiently far apart to allow free room for the manoeuvres of vessels, else their advantage disappears, and sufficiently far apart to leave between them such a length of main quay as to ensure that no large fraction of it should be unavailable, else their economy disappears also.

The Dock Road runs parallel to Hamilton Street the whole length of the ground.

The Low Level Railway falls from the Caledonian, runs along the whole south side of the wet dock and tidal basin, while a branch is carried round the north side to the graving dock and timber yard by a High Level line, which crosses Hamilton Street to the coal sidings: the coal traffic being kept entirely distinct on the north side.

The High Level embankment, 35 to 40 feet above H. W., will afford material shelter to the shipping in the docks from north and east winds.

The whole inner dock gives on the West, South, and East sides 900 yards of available quay length; on the North-West side 200 yards for shipping coal; and on the North-East side 290 yards of quay, which may either be used for general purposes or for extension of coal traffic, both railways being in proximity.

The scheme fulfils simply the first condition laid down, that, namely, of providing the greatest possible dock accommodation of all kinds that the ground admits of; the efficiency of any part is not, however, dependent upon the execution of the whole, so that the several works can be taken in hand from time to time when their execution may have become desirable.

PARLIAMENTARY PROCEEDINGS.

Clerks of the Royal Engineer Department.

In the Commons, on the 17th inst., on the order for going into committee of supply on the Army Estimates,

Mr. M. CHAMBERS called attention to the anomalous position of the clerks of works and clerks of the Royal Engineer department, and the denial of pensions to their widows, and moved, 'That in the opinion of this House they are entitled to, or should be granted, the same rights and privileges, according to their relative rank, as are extended to other non-combatants in the military service.' The hon. gentleman made a long statement in support of his motion.

Captain VIVIAN admitted that his hon. friend had stated the case from the point of view of those whose claims he had advocated, but he should remind him that in granting pensions and allowances it was necessary to draw the line somewhere, and make a distinction between different classes of officers. His hon. friend claimed to have the clerks of works and of the Engineer department placed on the same footing as other non-combatants, because they were exposed to the same casualties. But this was not so. The officers of the commissariat department and of the store department were, of necessity, obliged to deal with the army in the field, and exposed themselves to the danger of being shot; but the clerks of works had no such duty imposed upon them, and were not subjected to the same dangers. During the Crimean war there were only two clerks of works in the East at all, and they were at Scutari, many miles away from any firing. He could not concur that by the warrant of 1868 those clerks were placed in a worse position; most certainly such was not the intention of the framers of it. If the House chose to sanction extra pensions and allowances, it must be prepared for an increase in the estimates.

Mr. MAGUIRE supported the motion, and quoted the case of a Mr. Lacy, a native of Cork, who had died from the effects of a sunstroke while engaged in the public service in Africa, as one justifying a pension to his widow.

After some further conversation, the motion was by leave withdrawn.

Buckingham Palace Guard-Room.

Viscount BURY moved an address for copy or extracts of correspondence between the Board of Works, the War Office, and the Royal Engineers' Department of the Horse Guards, which has taken place on this subject

since August last. He contended that the place is most unhealthy, and altogether unsuited for a barrack-room.

Mr. LAYARD had no objection to the production of the papers. The motion was withdrawn.

The Ladies' Galleries.

Mr. H. HERBERT asked whether there exists any reason why the gratings in front of the Ladies' Galleries should not be removed?

Mr. LAYARD could not take on himself the very grave responsibility of removing the gratings. The reason why they have not been removed is that the general feeling of the House was against it. As regards the accommodation, he must confess that it was exceedingly bad, and, were it not for those whom it contained, he should be disposed to call it a chamber of horrors.

Mr. HERBERT gave notice that he would call attention to the subject on going into supply.

Ryde Pier.

In the Lords, on the 21st inst., Sir J. ELPHINSTONE asked the First Lord of the Admiralty if he would state the reasons which induced the present Board of Admiralty to reverse the decision of their predecessors and permit the extension of Ryde Pier to the westward; and whether the proposed extension was not the subject of inquiry by the late Board of Admiralty, and refused by them on the ground that it would interfere with the navigation of that part of the Solent.

Mr. CHILDERS.—There are two piers at Ryde, the property of a joint-stock company, and an application was made to the late Government to allow a considerable extension of one of them to the west in order to enable a ladies' bathing-place to be erected. This was strongly supported by the local authority of Ryde, but opposed by the owners of lighters and coasters, on the ground that it would interfere with their access in certain winds and tides to a small landing-place between the two piers where coal and other merchandise are landed. My predecessor refused the application. This year the same application was made to the present Board, and as I found much difference of opinion on the part of the officers I consulted, I took advantage of a recent visit to the Solent to inspect the locality with Sir Sydney Dacres and Sir Thomas Symonds; and I decided to sanction a modified plan, which, in their opinion, would not interfere with the navigation. From a naval point of view there is no objection to either plan.

Lord H. LENNOX asked whether the right hon. gentleman would have any objection to lay on the table of the House copies of the opinions on which the late Board of Admiralty had come to a decision on the question, especially of the opinion of the Master Superintendent of Portsmouth Dock-yard and his gallant friend the Director of Works to the Admiralty, both of whom had made a personal inspection of the site.

Mr. CHILDERS replied that his noble friend could, if he wished, have access to the enormous volume of papers on the subject. He did not, however, think it would be worth while to print the correspondence on a question which had been so fully considered by the Admiralty.

Ventilation of the House.

In the Commons, on the 21st inst., the Earl of ALBEMARLE called attention to the defective ventilation of the House. Last week, during one of the most brilliant debates on record, some of their lordships experienced great discomfort—indeed, he might say as to the elderly portion of them, some danger—from the intense cold rising through the floor. He would suggest that at least a portion of the floor should be rendered airtight for the benefit of members of the House, who, like himself, had arrived at the age of threescore years and ten, leaving younger and hardier lords to adopt such remedies as railway rugs and hot-water bottles, if they required them. (A laugh.)

Earl GRANVILLE hoped his younger friends would not be left altogether in the cold, if the noble earl's suggestion were adopted. On re-entering the House one night last week after a very short absence, he complimented the person who had the direction of it on the wonderful freshness of the air, considering the enormous number of persons present, whereupon he was informed that there was great difficulty in regulating the temperature of both Houses, and that, as an instance of it, a remonstrance had just been received from two of his colleagues on the Treasury Bench in another House, one complaining that the heat was intolerable, and the other that the cold was insufferable. (A laugh.) So much depended on individual temperament that if by any arrangement one part of the House could be kept cold and another warm, it would, no doubt, be very convenient.

The Earl of ALBEMARLE remarked that the luxury of sitting on the lower benches, after having sat on the upper ones, was inconceivable to those who had not experienced it.

The National Gallery.

On the motion of Viscount HARDINGE, an address to the Crown for a copy of the report of the trustees on the requirements of a new National Gallery was agreed to.

The New Law Courts.

On the 22nd, Mr. GLADSTONE, in reply to Colonel Wilson Patten, said the Government proposed to appoint a Commission to hear evidence as to the site of the new Law Courts, because it would not be in order to refer the Bill upon the subject to a Select Committee until it had been read a second time. He accordingly proposed that the Bill be not further proceeded with at present, and therefore it would not yet be necessary to ask any questions respecting it of the Standing Orders Committee. If the Bill was postponed for four weeks or some such time, that the Select Committee might have time to report, the Standing Orders Committee could hold over its report until that time.

Later in the evening, Mr. GLADSTONE, in moving the appointment of a Select Committee to inquire into the site and charges of the New Law Courts, explained his reasons for pushing the question into this new phase. Practically, there were now two new plans before the public—the Embankment and the new Carey Street site—for the old Carey Street plan, in all its extensive proportions, was now abandoned, or at least was reduced to its original dimensions; and admitting that Mr. Lowe's idea had not met

with the universal acceptance expected for it, the Government thought the fairest and most convenient mode of procedure would be to have a full inquiry by a Committee. At this period of the Session the House could not go at length into such a subject; and, moreover, the Standing Orders Committee objected to suspending the standing orders unless the House had given a very decided approval of the scheme.

Sir ROUNDWELL PALMER assented very reluctantly to the Committee, remarking on the delay, which cost the country 40,000*l.* a year in interest on money already expended. Much would depend on the manner in which the inquiry was conducted, and he urged, therefore, the importance of constituting the Committee impartially.

Mr. H. PALMER gave notice that he would ask that the proposal of Lincoln's Inn to provide Equity Courts be considered by the Committee; and Mr. WALTER asked whether the plans of the architects would be referred to the Committee, to which Mr. GLADSTONE replied that the designs would not, but that the general plan of concentration, &c., would naturally be part of the subject-matter for inquiry.

The Committee was then agreed to without farther discussion.

Suburban Commons.

Mr. COWPER obtained leave to bring in a Bill to make provision for the improvement, protection, and management of commons in the vicinity of cities and towns in England. Its main object he explained to be to arrest the impulse which was given by the machinery at the command of the Enclosure Commissioners to the enclosure of those commons and waste lands which, being in the neighbourhood of towns, furnished places of recreation and enjoyment for large numbers of people.

SOCIETIES.

Royal Institute of British Architects.

At the closing meeting of this Institute for the session 1868-69—W. Tite, M.P., President, in the chair—Mr. J. P. Seddon, honorary secretary, announced that the Report of the General Committee on Architectural Education had been considered by the Council, who had passed the following Resolutions, based on certain propositions contained in the Report:—

1. That a text-book or pamphlet should be prepared pointing out where and when (in addition to office instruction) courses of lectures, specially pertaining to the profession, can be attended, and giving a limited number of books in which the best information is to be had.

2. That a certificate be granted to all who pass the voluntary architectural examination established by the Institute.

3. That a preliminary examination be held at the Institute in elementary subjects, open to all students who have been at least one year in an architect's office, provided that it be not made compulsory on those who come up for the voluntary architectural examination.

4. That the Institute should assist the Architectural Association to carry out the drawing school which it was proposed by that Society to establish this session.

Mr. Seddon also announced that Professor T. H. Lewis and Mr. A. Waterhouse had been requested to prepare the text-book referred to in Resolution No. 1, which, when approved by the Council, would be submitted to the members at a general meeting next session; that a form of certificate had been prepared, and would in future be given to those candidates who pass the voluntary architectural examination; that the preliminary examination mentioned in Resolution No. 3 would be (with the approval of the general body) henceforth established in connexion with the annual voluntary architectural examination; and that the Council were prepared to assist the Architectural Association Drawing Class in accordance with Resolution No. 4.

Mr. Seddon added that, in regard to the other suggestions made in the Report of the General Committee, the Council desired to retain under the control of the Institute the architectural examinations above mentioned, but that they could not at present entertain the proposition that passing the examination should be made a condition of future membership.

The following Papers were then read:—

'A Description of the Tomb of Vitalis (an ancient Roman architect), in the Villa Volkonsky, at Rome; and of Some Remains in Palestine.' By Prof. Donaldson, P.P., Hon. Sec. F.C.

'On Abyssinian Church Architecture.' By W. Simpson, Esq.

Before the meeting adjourned the President announced that, in consequence of the engagements of many guests who had been invited on the 26th inst., the Council had reluctantly found it necessary to postpone the dinner which was to have taken place at the Crystal Palace on that day.

The conversations will be held at the Rooms of the Institute on Thursday the 1st of July.

Manchester Society of Architects.

ABSTRACT OF ADDRESS BY THE PRESIDENT TO THE LAST GENERAL MEETING.

'Following the routine of subjects named in the Report presented to the Annual Meeting on June 22nd last, I may remark upon the desired consolidation of all clauses affecting buildings now in force in this city, that no steps have yet been taken by the Corporation, so far as we know, to carry out this most desirable object. Its importance, however, is so great, and its usefulness so obvious, that probably only the pressure of other business has prevented its being attended to. For want of such consolidation, all parties are apt to be misled—builders, architects, members and officials of the Corporation alike; and if the City Council desire only to secure safe and wholesome house-building, there can be nothing gained by having a hazy atmosphere hanging round all the legislative enactments which are expected to be observed.

'The Town Hall competition was a double one; that is, a sketch competition, open to all comers, followed by a limited competition among a certain number selected from the first. This Society, by a vote all but unanimous, condemned this method, and endeavoured to obtain an alteration in the intentions of the Committee, but without success. We also recommended

certain restrictions as to the number and size of drawings: these were adopted with much satisfaction to competitors, and this useful result followed—that a sketch competition was shown to be amply sufficient to test the powers of Architects, and enable any qualified person to determine upon that one who ought to have the preference, thereby avoiding the utter waste of time, energy, and Art-enthusiasm which is the result of competitions as usually conducted.

'But then, members of the profession must be loyal to the conditions and towards their brethren. To this sketch competition were sent in some drawings lined like the finest steel engravings, and some that had occupied the spare time of many weeks to colour. Was this fair in a competition intended to be of sketch designs? Of course I do not advocate slovenly drawing, but rather condemn a load of mechanical and draughtsman's work taking the place of the more artistic touch of the master.

'One difficulty which we foresaw, and which influenced us in deciding against a double competition, was the impossibility of keeping the sketch designs unseen by those who were to engage in the second competition. This was felt by the Town Hall Committee also, and they issued a circular in which they said—"It has been determined that there shall be no public exhibition of such designs, and that under no circumstances will such designs be allowed to be seen by any competing Architect."

'You know what followed upon this most distinct and unqualified engagement. So soon as the selection was made, each unsuccessful competitor received a circular asking him to allow his drawings to be exhibited, and there was a public exhibition of those whose authors did not forbid it. Nearly all those Members of our Society who were so addressed at once forbade their being exhibited, unless in company with the selected designs; this was, perhaps, too crucial a test of the wisdom of the selectors to be agreed to, and our now useless drawings were immediately restored, and a doubly-maimed exhibition opened to the public. Now observe the curious result in any such case;—no competitor has any assurance that his designs were even seen by the adjudicator. I do not for a moment insinuate that such was the case in this competition. I am pointing out the inevitable evils of such a system. My own opinion is, that the whole of the designs should be exhibited so soon as received, and before any selection has been made. Let them stand the test of public criticism before any bias has been given, and let every man have the benefit of an open fight. Will this insure a fair adjudication? No, by no means; it did not in the case of the Law Courts in London; and nothing will; the whole system is rotten—root and branch. But it will do one thing—it will make the injustice of the decision so palpable that the victor will not gain his laurels, and the vanquished will feel themselves to be, though injured, not humiliated.

'The Exhibition closed—drawings returned to obscurity—fresh instructions went forth to the eight successful competitors, and then followed weary months of utterly vain and unprofitable labour to produce a number of pictures, many of them of great merit, but of no use to enable any man to come to a decision as to the best and most suitable design—any competent man, I mean. (Does any one suppose that such drawings were made for any of the great works of the middle ages?) Then came the tug of war, and finally the exhibition of these, professedly the choicest of 140 designs. Avoiding all question as to the final adoption of that design which is now being translated into stone and brick, I cannot hesitate to say that designs were there among the eight which no man of mature and impartial judgment would have selected as fit to be built; arrangement of plans that were entirely unsuitable, and external designs that were simply absurd as for the purpose intended. If what I aver be impugned, I appeal to the selected design itself; and I say that, accepting it as the type of what was required in plan and in architectural character, some of the remaining seven had not the shadow of a pretence to be there.

'What shall I say more? I have endeavoured to show that this plan of a double competition is to be condemned; that the architect might have been selected by the sketch competition; that the fruitless labour upon eight elaborate sets of pictures might have been entirely avoided; and I may add that the cost of that labour (2,400*l.*) might have been in great part saved, for one-tenth of that sum divided among ten competitors in the first competition would have better remunerated them than the 2,400*l.* did the eight in the second.'

Cork Cuvierian and Archaeological Society.

The last meeting of this society for the session 1868-9 was lately held in the Library of the Royal Cork Institution. Mr. T. R. Lane, President, in the chair. The paper read was 'On the Prehistoric Remains around Lough Gur,' by Professor Harkness, F.R.S. The author said the neighbourhood of Lough Gur, in the county Limerick, is one of the localities in Ireland which abound in prehistoric remains. It has furnished the museums of the Royal Irish Academy, the British Museum, and the Museum of the Society of Antiquaries, with many interesting relics, and several of the collections of private individuals contain implements of various kinds, which have been derived therefrom. Lough Gur is about three miles north of Bruff; its name, according to Mr. John Fitzgerald, of Grange Cottage, near its margin, is a corruption of Lough Argor, or the Lake of the Stone Circles, a term expressing the character of some of the prehistoric remains which are so abundant on its shores. Of these circles three occur near Grange Cottage, and one of these, which is composed of earth as well as stone, is very perfect, owing to the careful preservation of Mr. Fitzgerald. It is about 160 ft. in diameter, and, rising about 9 ft. above the ground which surrounds it, is 36 ft. wide at the base. Mr. Fitzgerald has recently discovered the entrance into this circle, which is on the E.N.E. side. This entrance consists of a passage about 2 ft. wide, lined on the sides with stones, and in this respect corresponding with the interior portion of the circle itself. The surface of the ground inclosed by this circle is considerably higher than that of the land outside the circle. The other two circles near Grange Cottage are composed exclusively of blocks of stone. One of these is imperfect, and has a diameter of 170 ft., and the other, which is perfect, is 55 ft. wide. On the eastern side of Lough Gur is a hill called Knockadoon, on which there are also stones and earth circles. These, as compared with those at Grange, are small in size, and have only a slight

elevation. About half a mile north-east of Knockadoon other stone and earth circles are seen. One of them is 155 ft. in diameter, and incloses another circle about 50 ft. wide. A few yards south of the outer circle a third occurs, 35 ft. in diameter, having the ground inclosed by it about 3 ft. above the level of the surrounding surface. In this respect this circle has considerable affinity to the large one near Grange Cottage. The neighbourhood of Lough Gur affords other prehistoric remains besides circles. Three cromlechs occur near its margins, one about a third of a mile from Holy Cross, and the other two about three-quarters of a mile to the south thereof. These cromlechs are locally known as giants' graves. Near Black Castle, on the S.E. side of Lough Gur, a large stone circle is seen, composed of flaggy limestone, the covering of which, to a considerable extent, remains. This also is known as a giant's grave, and the purpose for which it was originally designed was probably similar to that of the cromlechs, namely, as a place of sepulture. A very fine monolith can also be seen on the west side of Lough Gur. This is 12 ft. high by 7 ft. broad, and from 3 to 4 ft. wide. It exhibits no traces of sculpturing, nor are there any artificial markings upon it. Two hills which rise above the east and west side of Lough Gur have their summits covered with remains of ancient circular forts, built of large stones, but without mortar. These are the remains of structures similar to the Staigue fort, county Kerry, but they have here inclosed greater areas than their Kerry representative. Lough Gur has also yielded remains which belong to a more recent prehistoric period than the stone age. Bronze weapons of various kinds have come from it, and also some copper celts. In form these latter approximate more nearly to the stone celts than those of the succeeding bronze period; and they serve to connect the age of stone with that of bronze by implements of a ruder type, only of a less complex nature than those of the later prehistoric epoch.

Royal Geographical Society.

The Rev. F. W. Holland at a recent meeting of this Society gave an account of the late explorations in the Peninsula of Sinai made by officers and men of the Royal Engineers. The principal task undertaken by the party was the survey of a district 15 miles square around Mount Sinai and Jebel Serwal, on the scale of 6 inches to the square mile. Mr. Holland having explored the Peninsula on previous occasions, on foot, offered his aid as a guide up to the month of February, when he was obliged to return to England. The organisation of the expedition was all that could be wished. It arrived at Suez on November 8, and, Arab attendants being prepared beforehand, they were all *en route* for the Desert by the 11th. They kept along the eastern shore of the Gulf of Suez, as far as Wady Ghurundel, and then struck inland for Jebel Mussa, which they reached after a march of ten days. Tents were pitched at the foot of Aaron's Hill, all the Arabs were dismissed, and the work of the survey was commenced. So rugged was the country that it would have been hardly possible to carry the instruments to the more elevated stations, had it not been that they were aided by several Arab ibex hunters. The peaks of Ras Sufsafeh, forming the northern portion of Mount Sinai, were the central point of the survey; they rise precipitously from the plain to a height of 2,000 feet. In the valleys around and on the slopes the remains of ancient cultivation and reservoirs were continually met with, and great numbers of hermits' cells: the whole country, though now a desert, must have formerly been a blooming garden. The party moved to Jebel Serwal on January 1. During the survey Mr. Palmer and Mr. Holland copied more than 1,000 Sinaitic inscriptions.

Civil and Mechanical Engineers' Society.

At the last ordinary meeting of this Society held at their rooms, in the Whittington Club,—the President, Mr. B. Houghton, in the chair—a paper on 'Water Supply to Towns and Villages' was read by Mr. George W. Usill (Member of Council).

After tracing the history of man throughout all ages, the knowledge he has possessed both of the importance and the use of water as a means of existence, and the progress he has made in civilisation, from the earliest days, when crouching down on hands and knees and drinking from some running stream, until the present time when we find him constructing gigantic works to supply whole districts with this most important element; the author investigated at considerable length the phenomenon of rain-fall, its effect upon the earth, its amount, and the causes which produce greater quantities in some districts than others; he also expressed his opinion that the arguments that had been offered by eminent authorities, to the effect that a great many agents were at work to lessen the amount of rain-fall in England and elsewhere, in the way of improved cultivation, clearing away woods and forests, &c., were based upon good grounds. The author then treated the questions of evaporation and absorption, and their effect upon the collection of rain-fall for the supply of towns, &c., and exhibited in a tabulated form the results of experiments that have been made during the past century and a half by the most eminent scientific men of the period to determine the proportions of both evaporation and absorption, being of opinion that as yet very little had been done to enable us to lay down any fixed laws, as in every case so much depends upon the local characteristics of the district; though there is no doubt that the amount of evaporation from land surface is much less, whilst that from the surface of water is much greater, than the rainfall over a like given area. After glancing at the different works executed by our forefathers to supply themselves with water, the author passed on to the consideration of the various methods whereby towns and villages may be supplied with water, viz., from drainage or collecting areas, from rivers and streams, from springs and from wells, briefly noticing the primitive mode of collecting the rainfall from the roofs of houses, &c., as adopted by the ancient Jews and other nations, and which, in fact, is in use at the present time in many places in England and elsewhere which have not a supply of water.

With regard to drainage or collecting areas, the author stated that mountainous districts were most favourable for works of this nature, as the water falling upon the precipitous sides of valleys would have a natural tendency to flow rapidly off the ground, and therefore might be intercepted and conducted to impounding reservoirs; whilst if the locality is of a flat

nature, the expense necessary to render it available for collecting and impounding the rainfall would be considerable, added to which, great doubts might be expressed as to the quality of the water obtained. In hilly districts the water rushes rapidly off the ground before it has time to gather impurities, but if it falls upon flat ground it has greater facilities for taking up foreign matter. In every case the works should be so designed, that the rain might be collected as near the place upon which it falls as possible, as the greater distance it has to travel, the greater the chances there are of its becoming contaminated. The author then proceeded to consider the principles involved in a supply of water from rivers and streams, stating that there was no doubt that this was the most simple method of obtaining water, as was shown by the fact that people have congregated on the banks of rivers throughout all ages, and that if obtained close to the source it gave the purest water. But this was not always either practicable or advisable, because, as a rule, the source of a river at first is very small, its volume only increasing after traversing some miles, and, therefore, to take a supply of some million gallons per day from a point not far from the source would have the effect of depriving the stream of the natural tendency it has to preserve the channel and maintain a proper depth for navigation. The author repudiated the idea that rivers of large volume were much affected by the discharge of sewage, &c., into them, because they have the power of self-purification to a very large extent, adding that in the opinion of the most eminent men of the day, the water of a river, having sewage turned into it at a certain point, after travelling some few miles becomes entirely free from any impurities occasioned by its reception. At the same time the author did not for one moment advocate turning the sewage of whole districts into rivers, and he hoped the day was close at hand when this would be entirely prevented; nor did he advocate the supply of water to a town from a river if it were possible to procure it from a better source.

In consequence of the length of the paper it was deemed advisable to divide it into two parts, and thus the latter portion will be read early in the autumn session. A very interesting discussion upon the leading topics treated in the paper followed, in which the members and visitors took part. A vote of thanks was awarded the author.

On June 2, a new paper was read by Mr. Arthur Pain, C.E., on the principal building stones used in the metropolis. The author, after treating fully on all the different sorts of stone as they came into use chronologically, and illustrating his paper with a large map showing the position and distance of the quarries from the great centro, also a table compiled from various sources giving detailed information as to the weights, description, chemical analysis, prices, and other information of each sort of stone, drew the attention of the Society to the fact that nearly all the principal buildings in the neighbourhood of the various quarries were in an excellent state of preservation, while structures built out of the district and of the same kind of stone were more or less in a state of rapid decay. This, he believed, was owing to the architect, builder, and stonemason, in the first case, knowing all about the stone, and being able to reject the bad, while in the second instance they often knew nothing of its good or bad qualities, and the stone was put in without proper selection. He mentioned as an instance of the evil of non-selection the Houses of Parliament, the consequence of which was we had a building fast crumbling to decay; on the other hand, the Geological Museum, Jermyn Street, front built of the same stone, is in excellent preservation, because it was carefully selected. He did not blame architects, engineers, masters, and workmen for not knowing more about stone, because he knew the difficulty of obtaining information. In conclusion, he considered that the cause of technical education in that particular and important branch would be greatly advanced if the heads of the professions of architect, civil engineer, and the trades connected therewith, would appoint an architect, civil engineer, chemist, geologist, builder, and practical stonemason, and get the Government to make them Royal Commissioners, with the usual powers, to report on all the principal quarries in the United Kingdom, and collect specimens, such specimens and report to be placed in the public museums in every large town throughout the country. Until that was done he felt convinced that we should continue to build our public and private structures of good and bad stone mixed up together with the same miserable results.

Exeter Diocesan Architectural Society.

The last annual meeting of this Society was held in the College Hall, South Street, Exeter. The Ven. Archdeacon Freeman presided. The Secretary read the annual report, which stated that the Transactions for 1867 and 1868 were now ready, and the committee believed that the books would be found to be both very interesting and valuable. The effigies on the high tombs of South Devon, faithfully and most carefully drawn by Mr. Rogers, formed a very beautiful series of illustrations, and a hope was expressed that they would help to call forth a greater care and regard for the sculptures themselves than is now common. In many instances they are at present utterly uncared for. During the past year many plans have been reported on by the committee, and the grants made in the same period were eight in number. Having comparatively but a small sum to dispose of annually, the amount bestowed in such cases was not large, but the committee believe these grants are esteemed more as being tokens of good will and approval than for their money value. As the members of the Society increase, and a more regular as well as a larger income is supplied, this branch of the Society's work will doubtless increase too; the committee believing that in proportion as the real life of the church increased, so will be the work of restoration, and rebuilding, and founding new churches, this kind of work being one of the signs of renewed church life. A great change has already been brought about, but a greater change is hoped for, and it is through combined efforts like these that such change may be helped onward and directed. Nor should it be forgotten that another reason for such combinations of Churchmen may be seen in associations of an opposite and antagonistic character; when premiums for essays against church music and painted glass windows are advertised. To imply that the fine arts are not to be sacrificed to holy uses, is to imply that there are certain gifts and certain created things which are necessarily evil, or cer-

tainly will lead thereunto. The report continued: A point of great practical importance has been forced into notice in the new church of St. Michael, in this city. It is this: can any principle of acoustics be so applied that when a church is completed, it shall be found to have neither too little resonance nor too much of it, and that distinctness shall be secured which is really necessary in certain parts of the Church? Is there any principle, it may be asked, to guide us, or must we be wholly left to personal experience, or to a kind of intuitive faculty which brings things right without knowing the how or the why? It seems to be an admitted fact that a very great indistinctness is found in nearly all the services in the church referred to, and that the echo occasionally is really painful. A short pause at the end of a sentence brings back to the speaker word after word. The choir of the church is usually a large one, and though all sing loudly, the choir is not heard as it should be. Now why is this? The church is lofty, the congregation is wholly in the nave and in the broad transepts, the priests and choir are placed in the chancel, eastward of the transept, and on a level very considerably above that of the nave. The roofs are plastered in panels formed by principals, purlins, and ridge piece. There is not too little resonance, but there is either too much of it, or else the return of the wave of sound interferes at a wrong time with the wave caused by the action of the voice. Now is it not a mistake to suppose that our pulpits and choir seats cannot well be placed too high? Is it not a mistake to think that to be well heard, we may as easily be placed too much above our congregations, as well as too close to them? Sound ascends, and may we not be easily so placed that the first wave of sound shall not reach the ear before the echo wave interferes with it? It is probable that the ground plan of St. Michael—that of chancel, nave, transepts, and central tower—may in some degree be the cause of the evil complained of, but it cannot be all the cause, for it is stated that the Litany, said or sung at the Fald-stool, is well heard, although the ease to the priest in speaking is seemingly less than when he is in the choir or in the pulpit. Of the plans in aid of which grants have been recently made, St. Wenn, near Bodmin, and St. Mary, Tedburn, have been completed. The last-named church is within easy distance, and would well repay a visit. The contrast between things as they were, and as they are, in this case is very marked. The work of St. Mary's, Lynton, and in the Church of the Holy Trinity at Barnstaple, has made much progress. The unusually lofty and thin-looking tower of the last-named place has been much improved by the alteration which has been carried out. The pinnacles and the battlements have been set several feet lower down. In the church itself much has to be done, but when completed it will form one of the most effective churches in point of arrangement in North Devon.—The Treasurer then stated that there were a number of subscriptions due for 1868, and that copies of the Transactions would be sent on receipt of the subscriptions.—The Rev. G. W. B. Wills moved the adoption of the report, which was seconded by the Rev. W. Gray, who stated that a similar difficulty to that referred to at St. Michael's had been experienced at the Cathedral, and was obviated by laying down cocoa-nut matting.—Mr. White said he had never been in St. Michael's, but he thought it a mistake in a building of that form to have a long-fluted open roof, even if it was broken up by rafters. He had found great advantage in the use of a wooden block pavement for the floor; it was noiseless and firm. A bright floor was apt to send the sound back. Two very important points were the proportions of the building and the arrangement of the body of the church.—The Chairman said the question was a very important one, and our forefathers seem to have understood how to overcome the difficulty in building large churches. Anyone going into St. Michael's could not fail to be struck with the extraordinary amount of flat surface, with nothing to break the sound, but those who built our cathedrals seemed to know that fluted columns would have the desired effect.—The report was adopted, as was also the treasurer's report. The officers of the society were re-elected.—Mr. White then read a long and interesting paper on the use of colour and its abuse. He urged the employment in our churches and in our schools, unions, and asylums, and other public buildings, of decorative chromatic art. An appreciation of colour was innate in nearly every man, and even the most indifferent felt the coldness and discomfort caused by its absence. Colour, he said, was used in the middle ages to such an extent that scarcely any old parish church can be touched without some traces being found of colour. Perhaps the first step to be taken to encourage the more general use of colour was advancing the education of the large class of common house painters and such as can lay but little claim to the higher branches of art education, whilst they have to exercise some of the lower functions, and frequently carry into effect designs and instructions which, without a more thorough grounding in the art of colouration, as distinguished from painting, they are able but imperfectly to enter into or understand. The chief aim of all colouring of this nature should be repose, and if brilliant colours were used, the more perfect must be the harmony, and the more careful the gradations. Proper gradations of colours and shades were of the greatest consequence towards the avoidance of harsh and startling effects. It was to a want of care in this respect that the prejudice against colour was to be attributed. People preferred to be on the safe side to risking failure in so important a matter.—The Chairman, while agreeing with Mr. White as to the advantage of judicious colouring, said what the mind craved for in religion was reality; and while he would have as much marble in the church as possible, he thought parishes would object to colouring, because it would generally be present in an unreal and meretricious form. He thought colouring was found not so much in churches of the old English style, as in those of the debased Perpendicular. Mr. White said of course he should prefer richer materials for building, but all countries were not so rich as this in building stones. In all the early English churches which he had examined he had never failed to discover traces of the original colour. Prob. Mackarness thought that when colour was used, there must have been more local knowledge on the subject. A vote of thanks to the Chairman brought the meeting to a close.

The Society of Engineers.

The members of the Society of Engineers selected for the first of their trips in the present year to engineering works of note—the Limehouse Basin

Improvement Works. The improvements comprise a new ship entrance lock having two compartments. The length of the outer lock is 120 ft., and that of the inner one 230 ft., the width at the top being 60 ft. There are three pairs of lock gates, which are made of wrought iron, the lower portion of the gates being watertight. A very fine iron swing bridge 129 ft. long and 26 ft. wide carries a roadway across the lock near the river end. This bridge, the gates of the locks, the capstans, and the cranes are all worked by hydraulic power, the machinery for which, together with the whole of the ironwork, was supplied by Sir W. Armstrong & Co. The quay wall facing the river is 220 ft. in length; a timber jetty running out 64 ft. into the river is to be constructed. From the Limehouse Basin, the party proceeded to inspect the new extension works of the West India Docks; Mr. Hawkshaw, engineer; and subsequently the engineering works of Messrs. Westwood, Baillie, & Co., London Yard, Millwall, where they found much to interest them in some bridgework and screw piling for India. The members dined together in the evening at the Brunswick Hotel, Blackwall.

South Midland Institute of Mining, Civil, and Mechanical Engineers.

This new combination of mining, civil, and mechanical engineers, whose head-quarters are at Wolverhampton, was inaugurated at the School of Art there, on the 7th instant, by an address from the President, Mr. Henry Beckett, F.G.S. The rules are, generally speaking, founded upon those of the Northern Institute of Mining Engineers, and, like that Institute, seek the co-operation of all engineers in all parts of the country who are interested in the objects. Those objects are defined to be to enable its members, comprising mining, civil, and mechanical engineers, and other persons connected with or interested in mining, to meet together at fixed periods, and to discuss the means for the ventilation of coal and other mines, the winning and working of collieries and mines, the prevention of accidents, and the advancement of the sciences of mining and engineering generally. Papers are to be read, which, with the discussions upon them, are to be printed, as transactions.

The President's address was a lengthy document. Among other things he said:—When igneous rocks occurred in coal-fields, as marvellously developed in South Staffordshire and Shropshire, their singularly intrusive nature and ever-varying characteristics were especially deserving of study, as well as their atmospheric action on the coals and associated strata. In few other districts in the earth, perhaps, were those troublesome rocks more interesting to men of science, though sadly deteriorating in their effects, and fearfully expensive to sink through and otherwise traverse. Frequent outbreaks were found throughout the coal-fields, but none more remarkable than that explored and approaching exhaustion at Powk Hill, on the Earl of Lichfield's estate, at Bentley, near Walsall, which, until recently, was deserving of the most careful consideration, not only from its singular vertical as well as radiating columnar structure, but as associated with a tremendous east and west cross-fault which defined a most important change in the mineral constituency of our local coal-field. Great perplexity existed as to the period of igneous intrusion, and whether one or more centres of eruption may have existed in the South Staffordshire coal-field; as also whether or not such disturbance was contemporaneous with like intrusive action in the Shropshire, Forest of Wyre, and Warwickshire coal-fields. These difficulties would probably be removed if the members obtained accurate data connected with these localities, showing the relative position of undoubted central upheavings, the line base of the elongated horizontal expansions, and the accordance of their upward ramifications combined with the reciprocal peculiarities of the component rocks. Basaltic dykes were occasionally met with, and should be narrowly watched, as well as the localities where the metamorphic effects might appear to have been most powerful. In closing this exciting subject he must tell them candidly that he did not anticipate that any direct and unceasing igneous connection would be discovered between the four coal-fields alluded to, although the upheavings may have been and probably were simultaneous. He believed the outer faults in this district would limit the extent of the igneous action connected therewith—a fact observable near Esington, from which he induced the director of the Government Geological Survey to publish a new edition of that portion of the South Staffordshire coal-field, embracing also an analogous change on the opposite side of the same coal-field originally coloured as Permian. The address also dealt with the question of the ventilation of mines.

NEW BUILDINGS AND RESTORATIONS.

The New Charing Cross Theatre.—Few would recognise in the little theatre in King William Street, Strand, opened to the public on the 19th inst., the site formerly occupied by the Polygraphic Hall, made famous by Mr. Woodin. Little more than the walls of the original building are left standing. About the size of the Strand, the new house, probably, has not more seating accommodation than the Royalty, which may be accounted for by the absence of a gallery in the present case, the auditory consisting of stalls, pit, dress circle, upper boxes, and private boxes. The seats are covered in light blue leather, the box hangings and curtains are of blue satin damask with gold fringe, and the proscenium drapery in the same style, looped up with cords, sustained by female figures. The decoration is generally white and gold, raised on a groundwork of a salmon-pink colour, whilst the artistic portion and panelling, medallions, &c., are more predominant than usual. The figure panels are tasteful, and owe their origin to the brush of Mr. T. Ballard. An ornamental dome of light perforated tracery occupies the centre of the ceiling. The lighting of the auditory is by a powerful sun-burner suspended from the centre of the dome. The act drop, representing 'The Mall' in St. James's Park, in the time of Charles II., has been painted by the well-known artist, Mr. J. E. Meadows. To Mr. C. N. Foster is due the constructive portion of the work; the *carton pierre* is by Messrs. White & Co.; the design, decorations, fittings, &c., by Mr. E. W. Bradwell; Arthur Evers, Esq., architect, having had the entire supervision of the whole works. The size of the theatre is about 30 feet from front to front of box rest; the height from floor to ceil-

ing [about 40 feet; and a proscenium opening of 20 feet. All the staircases, &c., are either in stone or concrete, and in case of fire ample accommodation has been provided for speedy exit from every portion.

Alfreton.—The restoration of the parish church at Alfreton is very near completion. All the seats are put in, and the interior is decorated. It is expected to be ready for opening by July 20 next. It will be large enough to seat 500; and is to have a new organ.

Opening of a New Baptist Chapel.—On June 15, a new Baptist chapel, situate in Wellington Street, Stockton-on-Tees, was opened for divine worship. The building has been in contemplation for some time, and in November last was commenced. The plot of ground which the premises occupy measures 69 ft. by 68 ft. The structure is of the Classical order of architecture, and built principally of brick, with stone facings. The chapel in the interior measures 60 ft. by 40 ft.; and the school-room, which is beneath the chapel and approached from the back of the building, measures 40 ft. by 30 ft., and is 11½ ft. high. The pews are arranged with two aisles, with accommodation for 350 persons. There is no gallery at present, but the building is so constructed that one can be added at a future time if needed. The architect is Mr. George Fletcher, and the contractor Mr. John Craggs. The entire cost of the building will be about 1,650*l.*, towards which about 1,100*l.* has already been raised.

Opening of the Grand Pump Room Hotel, Bath.—Of the exterior it will probably be sufficient to state that it is in harmony with the Stall Street elevation of the Grand Pump Room and its colonnades. Entering the hotel by a flight of steps, to be guarded by a pair of lions, and through the large plate glass doors into the Hall, we find the manager's room immediately on our left, the grand staircase in front, and passages leading to the right and left. This hall is paved with encaustic tiles, some of which are glazed, laid to pattern; and is warmed by a double steam apparatus, which serves also as tables. Taking the passage on the left, we have a private drawing-room and the commercial room, with the communication to the baths; and the opening to the hydraulic lift. The lift will be sufficiently spacious to accommodate a wheelchair, which, with its occupant, can then be raised from the level of the baths to any floor of the hotel. Pursuing the passage to the right, and passing the ladies' coffee room, we enter the public coffee-room, the largest room in the building, occupying the whole of the northern wing, and which is 54 feet long and 21 feet wide, exclusive of a recess 20 feet long by 14 feet wide. It has two fire-places, and is lighted at night by four gaseliers of elegant design (by Wingfield), and the same pattern is to be observed in the more important suites of rooms. Attached to the coffee-room are well-fitted lavatories, and a washing-up room for glasses, &c. The mantel-pieces of this, and of all the principal rooms throughout the building, are of dove marble, relieved by red Devon, and form the least attractive features of the interior. Under this apartment is a billiard room; and adjoining are the needful conveniences, including a closet heated by steam. Close at hand is a smoking room, having a coved ceiling with massive cornices—in which provision is made for ventilation—and a cemented floor. The works have been executed under the direction of Messrs. Wilson and Willcox, architects. The opening dinner took place in the Coffee-room of the Hotel on June 16.

Re-opening of Pensford Church.—The parish church of Pensford, Somerset, was re-opened a few days since. It has been rebuilt, on the old foundations, of local stone, with Bath freestone dressings, in the decorative style of the fourteenth century. The church now possesses a very neat little north porch. A series of arches divides the chancel and nave from the south aisle, and one great peculiarity of the place is that it does not possess what is known as a constructional chancel. The windows, which were previously of a character quite opposite to the original design, have been harmonised with that of the fourteenth century, in accordance with the rest of the building. The roofs are of Bath stone, of the 'Somersetshire waggon head' or 'cradle form,' the timbers being exposed, while those of the chancel are richly coloured and gilded. The chancel screen is composed of low stone, surmounted by ornamental ironwork. The floor of the church has been raised, and is now paved with tiles, the chancel floor being covered with Maw's encaustic tiles.

ITEMS OF NEWS.

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Irish Antiquities.

In that division of the South Kensington Museum chiefly dedicated to loans, has been lately exhibited a small but highly interesting group of objects recently found by digging in a fort near Ardagh, on the property of Earl Dunraven. As, owing to previous engagements on the part of their noble owner, their period of exhibition in London must be very limited, it may be well to draw the attention of our readers to these objects, all of great interest, and one at least of which may be fairly termed unique. They are five in number, of which four are *fibulae* or brooches of the white metal (chiefly composed of silver and lead) known under the designation of white bronze. Three of these resemble in form the well-known Tara brooch; but even the best of the present specimens, though rich in interlaced work and of unusual size, is in delicacy of workmanship far inferior to that wondrous relic of past civilisation. The fourth *fibula* is of another type common among Irish antiquities, being penannular, with ends formed by the arbutus berry. The fifth object of this remarkable *find* deserves a more detailed description, as well from its beauty as from its extreme rarity. It is a two-handled goblet, possibly a chalice, although on this point authorities are at issue. The material is the white bronze above-mentioned; the form a simple and graceful segment of a sphere, with solid semicircular handles. Both the lip and foot have been set with flat stones or amber, and around the external rim is a ring of interlaced ornament with studs of opaque enamel. Similar bosses of opaque enamels form part of the decoration below each handle; but it is noteworthy that all the enamels, though

appearing on a casual inspection to be 'cloisonné,' are not really so: that is to say, they have not been applied to their respective *cloisons* in a state of fusion, but have been inserted when cold. This peculiarity, which was observable in the jewellery of an Egyptian queen, found by M. Mariette at Memphis, and shown in the International Exhibition of 1862, must have added greatly to the difficulty of workmanship, the mechanical accuracy of which is truly marvellous. The interlaced work surrounding the neck is also of surprising sharpness; and in fact the whole goblet is so incomprehensibly *new* in appearance, that at first sight one could hardly accord belief to its untempered antiquity, but that fortunately all doubt is set at rest by the declaration of its noble owner that it has been merely cleaned, and does not contain an atom of new work, except that one small piece of lead was quite decayed and has been replaced. On the outside of the bowl are very delicately engraved the names of the Twelve Apostles, in a peculiar rectangular Gothic letter, similar to that used in the Book of Durrow; and this fact aids us in ascribing to the goblet the date believed to belong to the book, viz., the seventh century. The conscientious care of the artist has led him to complete even the under part of the base with filigree work and a central crystal. Notwithstanding, however, the sacred character of some of the accessories, it may be permitted to doubt whether this vessel were actually a sacramental chalice. If it were so, its large size warrants us in assuming that its use must have been anterior to the refusal of the cup to the laity, while its numerous ornaments and consequent difficulty of purification show a less scrupulous consumption of the sacred elements than is now so strenuously insisted on by the Church of Rome. But we may safely leave doctors to disagree on these aesthetic-religious points, and content ourselves with admiring the delicacy of taste and perfection of workmanship which characterise this remarkable specimen of ancient Irish art.

Trafalgar Square.

The designs of Mr. Sang, the architect, at the Admiralty Board of Works for the proposed Army and Navy Memorials in Trafalgar Square, include suggestions for the improvement of this area. Mr. Sang would make use of the water supply of the existing fountains, and substitute two memorials, the one in commemoration of the valiant deeds of the royal army, and the other of the royal navy, of the Victorian period. The memorial consists of two large square fountains of well-proportioned dimensions, the sides of the basements of which are richly moulded and rest on a triple plinth, all of Sicilian marble, enriched with panels, intended to receive the names of the officers and men who fell or distinguished themselves at the various actions in their country's service. Out of one fountain rises a grand massive block of white marble, with four conspicuous high reliefs in antique bronze, representing the deeds of valour of the British warriors. This colossal pedestal is surmounted by a group of war trophies, and with its candelabra-shaped base of exquisite design forms the footing and hold of a Venetian mast or standard-pole, of a height and outline which leave the occupants of San Marco in point of grace and daring far behind. One of the most telling of the suggestions in the treatment of the square is the necessity of removing the dismal and squat dead granite walls and the substitution of terrace balustrades, with a grand flight of steps open along the entire width of the northern side of the square, immediately facing the National Gallery.

Pictures Purchased for the National Gallery.

At the sale of the Koucheleff-Besborodko collection at the Paris Mart the other day, a magnificent Ruysdael, known as 'The Sluice,' was purchased for our National Gallery for the sum of 26,800 francs, or, with the addition of the usual fees, about 1,125*l.*, which is not considered by connoisseurs to be more than it is worth.

It must also be noted that a Greuze, 'L'Ermite,' was purchased for the Empress for the sum of 55,500 francs (2,220*l.*!) while a Murillo, a Rembrandt, a Paul Veronese, and a magnificent Paul Potter were bought in at sums ranging from 700*l.* to 1,980*l.*

At the sale of the collection of the late connoisseur the Marquis de Maisson, Greuze's 'Madeleine blonde' was purchased for the National Gallery for 49,000 francs, or, with the fees, 2,058*l.* It is certainly right to have good examples of the French masters in our public gallery, but 2,000*l.* seems to us a very long figure for a Greuze Madeleine. The same painter's 'Madeleine brune' fetched 33,000 francs; the study of the head of the 'Madeleine blonde,' the relatively enormous sum of 9,999 francs; and the first sketch of the famous 'Cruche cassée' 2,600 francs.

In the same collection was a famous work by Pater, 'Le Concert Champêtre,' which sold for 100,000 francs (4,000*l.*); a Watteau, 'La Toilette,' purchased by the Marquis of Hertford for 13,000 francs; and the portrait of a Lady, by Sir Joshua Reynolds, which fetched 4,050 francs (162*l.*).

The Carey Street Site.

It is understood that overtures having been made to the Chancellor of the Exchequer for the purchase of the seven acres of land known as 'the Carey Street site' of the new Courts of Law, the negotiations have been suspended until the Bill for the acquisition of the new ground in Howard Street has been sanctioned by Parliament. The London and North-Western Railway Company are, we believe, not indisposed to treat for the site as a great central terminus to communicate with the Metropolitan District system.

New South Wales.

Our Sydney advices of April 25 state that nothing has yet been determined with reference to the design for a statue to 'Captain Cook,' to be erected in Hyde Park, Sydney; but since the colony lacks sculptors, it is probable that the commission will find its way to England or to Rome.—The keystone of the central arch of the new Post Office has also been laid, with great demonstrations of rejoicing.

Building at Walsall.

We hear that a considerable number of residences will, under the auspices of the Lichfield Building Society, be shortly erected on the Walsall Road. The demand there at present for houses in the neighbourhood gives great hope that it will prove a profitable speculation.

General.

The Tower Subway has now passed the nearest approach to the bed of the river, the top of the tunnel being 23 feet below the bed, and the engineer, Mr. Peter W. Barlow, jun., reports that at the present rate of progress the tunnel will reach high water mark on the Surrey side in ten weeks. The ground, it is said, is so dry that the New River Company's water laid on the works has to be taken from the shafts for the cement used in the tunnel. Air is supplied to the men by a steam engine at the shafts. Communication between the men at the face of the works and the top of the shafts is effected by an electric telegraph laid down for that purpose.

Proposed Workmen's Exhibition of 1870.—It is intended to hold this exhibition in the Agricultural Hall, Islington, in June next year. It is suggested also that local exhibitions be first held in each district, and that, to turn the event to the utmost possible advantage, the profits of such local exhibitions be set aside as a fund for the establishment or for the support of Schools of Art and Design, or for Night Classes for the teaching of those sciences which are connected with the various industries, and form the necessary groundwork of technical education. In addition to the ordinary purposes of other exhibitions, it is proposed that this should serve as far as possible the purpose of promoting technical education. In those manufactures in which division of labour prevails, workmen will be invited to exhibit specimens of that particular branch of work in which they are severally engaged. In the absence of those means which Continental artisans possess of improving themselves in their peculiar crafts, this plan of stimulating the productive capabilities of English workmen may, it is hoped, prove successful.

Restoration of Douling Church.—This ancient edifice, near Shepton Mallet, is about to be restored to its original beauty. It was built about 600 years ago, on the site of a former church, begun in 960, at the instigation of St. Dunstan, who visited Douling in that year and persuaded the people to replace the old wooden church by one of stone, to be dedicated to St. Aldhelm, bishop of Sherborne, abbot of Malmesbury, and first bishop of Salisbury, who died where Douling church now stands. The total cost of the work will be about 4,000*l.*, and will occupy about two years. In the mean time divine service will be held in the school-room. Major Paget, M.P., gives 1,000*l.*, and the Rev. J. S. H. Horner, the patron of the living, gives a similar sum.

At the last meeting of the West Ham Local Board of Health it was resolved that the footpaths in Bridge Road and Windmill Lane be paved with blue and red bricks, by way of experiment.

A large gymnasium for the use of the troops is being erected at the Huts Encampment, Pembroke Dock. The cost is expected to be about 1,000*l.*

Court of Common Council.—At the meeting of the Court of Common Council on June 17, the Lord Mayor presiding, the chairman of the City Lands Committee (Mr. H. A. Isaacs) brought up certain reports in reference to the purchase of property unfit for human occupation, and the erection of improved dwellings for the working-classes on the site. The subject was referred to this committee for consideration at the time of the last outbreak of cholera. The committee reported that as in the meantime the Artisans' Dwelling Act had been passed to meet this very evil, and as the Commissioners of Sewers had been appointed to carry out that Act, they considered the reference to them ought to be now discharged. Mr. J. T. Bedford strongly opposed this course, and thought the committee, considering the magnitude of the evil, had not risen to the occasion. Some discussion took place, but eventually the reference to the committee was discharged.

Metropolitan Association for Improving the Dwellings of the Industrial Classes.—The twenty-fifth annual meeting of the shareholders of this association was held on the 17th inst.; Lord C. Hamilton, M.P., in the chair. The Chairman, in moving the adoption of the report, took a retrospect of the history of the association during the past twenty-six years. They were told, at the outset, that it would not prove a success; but at the present time they had no less than 3,500 occupants of their tenements. The chairman likewise congratulated the society on the altered state of things from the time when they were compelled to spend 1,800*l.* on a charter, which was so much waste money, to the present time, when Government was advancing them money on easy terms. Their thanks were due to the Marquis of Westminster, who had not only encouraged building operations on his estate, but had also lent them money on favourable terms. That they had not been successful with regard to their tenements for single men was not their fault; and in future they would invest their capital entirely in family lodging-houses. His lordship concluded by drawing a very favourable picture of the future prospects of the association.

Opening of Southwark Park.—Southwark is a fortunate borough. It has for its representatives the First Commissioner of Works and Mr. John Locke, while the chairman of the Metropolitan Board of Works has always been particularly connected with that part of London. All three took a part in the opening ceremony of Saturday, the 19th inst. The sanction of Parliament was obtained for this undertaking in 1864 by means of an Act which provided for the purchase of about 62 acres of land in the parish of St. Mary, Rotherhithe. The Bill empowered the Metropolitan Board of Works to form and maintain a park, and also to sell or lease such portions of the land as they might not require for the purposes of a park. The land acquired by the Board under that Act is situated near the Spa Road railway station, and between Paradise Row, Rotherhithe, the Deptford Lower Road, and Rotherhithe New Road. It consists of about 60 acres, of which some sixteen are reserved for building sites. The rest has been laid out as a park. The cost of the freehold of the land was about 911*l.* per acre; the purchase of freehold and leasehold interests involved an expenditure of 68,398*l.*; the expense of entrance lodges, gates, enclosure railings, formation of roads, drainage, and planting amounted to 20,710*l.*; professional and other charges and wages to 5,330*l.*; the inevitable 'in-

cidental' to 722*l.* 19*s.* 2*d.*—making a total of 95,162*l.* and some odd shillings and pence. Mr. Vulliamy is the superintending architect. To such a neighbourhood as that lying between Rotherhithe and Deptford the place must prove a great boon.

APPOINTMENTS VACANT.

INDIA.—July.—Forty appointments in the Engineer Establishment of the Public Works Department in India will shortly be open to public competition. W. T. Thornton, Secretary, Public Works Department.

ISLE OF ELY.—July 5.—A Resident Surveyor, Inspector of Nuisances, Superintendent of Highways, and Collector of the Rates for the District of the March Local Board of Health. Mr. T. T. Elliott, Clerk, March, Isle of Ely.

KENDAL.—Borough Treasurer to the Corporation, of Kendal, Westmorland. Salary 50*l.* per annum. Mr. Thomas Harrison, Town Clerk, Kendal.

PESH.—As Assistant or Resident Engineer, to Superintend Works of Pipeage, Masonry, and Pumping Machinery. A knowledge of the German language desirable. Salary, from 400*l.* to 600*l.* per annum. W. Lindley, Engineer-in-Chief, Pesh.

COCKERMOUTH.—July 10.—From and after August 1 next, Surveyor and Inspector of Nuisances and Lodging Houses for the district of Cockermonth, at a salary of 50*l.* per annum. Mr. John Fearon, Clerk to the Board, Local Board Office, Cockermonth.

WILLESDEN.—Sewer Authority.—June 29.—Inspector of Nuisances. Salary 40*l.* per annum. Mr. W. A. Tookal, Vestry Clerk, Edgware.

COMPETITIONS OPEN.

ARRAS, FRANCE.—Architects are invited to send in designs for a Church to be erected at Arras. The building is to be 40 mètres long, without the clock-tower, and 18 mètres wide, and it is to have three aisles, three entrances, to be approached by a flight of five steps, and to be surrounded entirely by railings 1½ metre high; sub-basement of Belgian stone. The plans are to include a general one of the entire building, a fully-detailed description, and a careful estimate, with such perspective views and details as the artist may think fit to add to the former. The style of the building is required to be 'Decorated Roman of the last period'; and the sum to be expended, including commission, is 80,000 francs (3,200*l.*). The authorities do not undertake to adopt the prize plans, in which case the author of the best and second-best designs will receive 600 francs and 300 francs respectively. It is added, that the columns are to be of hard Belgian stone, and the rest of the building of Creil stone; the vaultings are to be of real, and not in ceiling, or of wood with visible ties. The jury is composed of the Bishop of Arras, the Maire, a Canon, two members of the Municipal Council, an Engineer, the Secretary-General of the Museum, and the Vice-President of the Council of the Prefecture. The designs are to be sent by the end of July.

BELGIUM ACADEMY OF ARTS AND SCIENCES.—For best enquiry (essay) and report on the period at which Architecture in the Low Countries became affected by Italian influence. Premium, 1,000 francs, about 40*l.*

BRADFORD.—September 1.—Competitive Designs for the new Bradford Town Hall. To the Architect whose design is selected, 5 per cent. commission and the execution of the work; 2nd best, 200*l.* premium; 3rd, 100*l.* Mr. W. T. McGowan, Town Clerk, Corporation Offices, Bradford.

BRUSSELS, BELGIUM.—A competition is announced for the production of the best Water Meter. The inventor of the instrument offering the greatest advantages is to receive a reward of 200*l.*; the 2nd best, 120*l.*; and the 3rd, 80*l.* The Meters are to be sent in to the Secrétaire de l'Administration Communale, Hôtel de Ville, Bruxelles, before 12 o'clock on October 31 in the present year.

CONSTANTINE, ALGERIA.—Three prizes, of the value of 3,000, 2,000, and 1,000 francs, are offered for the best designs for a theatre to be built at Constantine. Programmes of conditions, accompanied by a sketch, may be obtained either at Constantine, at the office of the Société Générale Algérienne, No. 13 Rue Neuve-des-Capucines, Paris, at the Professore de Lyons, or the Mairies of Marseilles, Bordeaux, or Oran.

CORPORATION OF MANCHESTER.—June 28.—For Designs and Tenders for the Internal Decoration of the Hulme Town Hall. Joseph Heave, Town Clerk, Hulme Town Hall.

DONCASTER.—September 1.—The Building Committee for proposed new Wesleyan Chapel and Schools at Doncaster require Designs. The best to receive 50*l.* premium; second best, 25*l.* Mr. R. Wiltons, Sec., Magdalens, Doncaster.

GLAMORGAN.—July 1.—Plans and Specifications for Restoration of Parish Church of Llantisant. Rev. J. Powell Jones, Llantisant Vicarage, Pontypridd.

LEYDEN MUNICIPALITY invites Designs and Models from Sculptors of all countries for a Statue of Boerhaave, in the costume of Professor of Leyden University. September 1.

LONDON.—June 26.—London and County Land and Building Company (Limited).—Plans of the best and most profitable way in which to arrange in building sites their ground in Cannon Street, City. First premium, 75*l.*; second, 50*l.*; third, 25*l.* Mr. R. B. Looker, 14 Clement's Lane, E.C.

PHILADELPHIA, PENNSYLVANIA, U. S.—September 1.—For Designs, Specifications, and Estimates for New Public Buildings. First premium, 400*l.*; second, 300*l.*; third, 200*l.*; fourth, 100*l.* For particulars, to H. C. Engb, Secretary of Board of Commissioners, S.W., corner of Walnut and Fifth Streets, Philadelphia.

ROYAL ACADEMY OF ARTS.—Burlington House. For the best Painting in Oil, or Medal and Design in Painting, Sculpture, and Architecture, the Gold Medal and the Discogress of Presidents Reynolds, West, &c.; and for the best Copies of Drawings, &c., the Silver Medals, &c.

SAINTE JEAN D'ANGELY, FRANCE.—The authorities of St. Jean d'Angely have decided on completing the Church commenced in the town by the Benedictines, but of which the works were stopped in 1789. Estimate 200,000 francs (8,000*l.*); the architect's honorarium to be equal to 4 per cent. The competition is confined to architects of Charente and the four adjoining Departments.

SALISBURY.—July 1.—Salisbury Municipal Charities.—The Building Committee are desirous of receiving Designs for Rebuilding Almshouses, for six aged Married Couples, and a Nurse or Matron. 10*l.* for the selected design. Mr. T. Harding, Clerk, Salisbury.

VIENNA, AUSTRIA.—This Municipality require Designs, Plans, Estimates, &c., for the Erection of a New Town Hall. Open to all Europe. For Particulars, Austrian Consul-General, Paris.

TOULOUSE, FRANCE.—The Consistory of the Reformed Church of Toulouse invites architects to send in Designs for a Protestant Temple to be built in that town. The plot measures about 950 square metres. The church is to contain from 800 to 900 seats. Four places to be contained in the square of 1 m. 30 c. (51½ inches). Attached to the Church is to be a Consistory, Library, and Porter's House. The drawings required are:—A General Plan, and Elevations of the Façade, Longitudinal and Transverse Sections on the scale of 0·01, a full Description of the Plan, and detailed Estimates of the Work. The total cost of the edifice, including Joiners', Iron, and all other work, so as to render the church fit to receive its furniture, is not to exceed the sum of 150,000 francs (6,000*l.*). The Plans are to be sent in to the President of the Consistory of Toulouse before July 31, who will also give all desired particulars. The architect whose plans are placed first by the judges will be entrusted with the erection of the building, and receive, by way of honorarium, 5 per cent. on the total expenditure, up to 150,000 francs. If the amount exceeds that sum, the architect will have no commission on the excess. The author of the second-best plan to receive 1,200 francs; and of the third, 800 francs.

LILLE, FRANCE.—The Society of Arts, Science, and Agriculture, at Lille, invites architects to send in Plans for an Edifice to be erected in that town, for the double purpose of exhibitions and public lectures. The plot of ground traced out measures from 177 to 179 metres in length, by 87 to 89 metres in breadth. One of the rooms is required to be of sufficient size to contain 3,000 persons at a ball or other party, and another is to be capable of seating 1,500 people. The candidates are left at complete liberty with respect to the style and arrangement of the building, but the cost is not much to exceed the sum of 60,000*l.* The drawings required are two Plans, two Sections, and the Lateral Façade, to the scale of 0·005, and a finished view of the Main Façade, with a Descriptive Note; but the candidates may add what other drawings they please. The prize is 1,000 francs. A certain number of plans are to be selected and exhibited for twenty days. There are no conditions mentioned relative to the Construction of the Building, and, in fact, no reference made to a practical result. The drawings and documents are to be sent to the Secretary of the Society, at the Hôtel de Ville, by October 15 at latest.
