THE
ARCHITECT.

A WEEKLY
ILLUSTRATED JOURNAL
OF
ART,
CIVIL ENGINEERING,
AND
BUILDING.

"DEVISE, WIT ; WRITE, PEN ; FOR I AM FOR WHOLE VOLUMES IN FOLIO."—*Shakespeare.*

VOL I.

JANUARY TO JUNE, 1869.

LONDON :

PUBLISHED AT 175 STRAND, LONDON, W.C.

18201-

THE ARCHITECT is intended to be a professional, artistic, and technical journal of the first class. Its pages will be open to all subjects connected with the art, the science, or the business of Building, taken in the widest sense. The Professional Architect and the Civil Engineer, the Builder, the Art Workman, and the Mechanic, will each find **THE ARCHITECT** treating upon subjects which are of importance to himself.

The examples which such persons require as objects of study, the opinions they desire to know, and the news which it will be their pleasure or their business to learn, will be supplied, so far as any journal can possibly do so, week by week, in the columns and by the illustrations of **THE ARCHITECT**. Nor will the general public be forgotten. The public at large is directly concerned in a thousand ways in matters relating to Architecture, Engineering, and Building. The interest in such subjects is happily on the increase; and it will be our endeavour so to conduct this journal that the general reader, as well as any of those to whom its title more directly appeals, shall find it attractive and agreeable, as well as instructive, and thus take part in that popularizing of a knowledge of the fine arts, and especially of Architecture, which is one of the great movements of the day. **THE ARCHITECT** aspires to take a first place among those journals which are quoted as authorities in the various branches of Science, Art, Literature, or Business; and those conducting it will spare no pains to secure the services of the most skilled writers, to illustrate the works of the best Architects and Engineers, and to supply the latest and the most authentic intelligence.

The practice of Architecture in the present day—alike at home and abroad—will probably claim a larger share of our space, and receive more constant attention, than any other topic; and here it is our firm determination to be the organ of no clique or party, and to refrain from all that can be termed personal in an offensive sense. We will fearlessly and as far as possible impartially state, and where necessary criticise, the views of all parties, both as to artistic matters

and points of professional practice. One duty of the public press, not always the pleasantest, yet probably almost the most important of any, is to criticise. Good, honest, dignified, unprejudiced criticism is always of the highest public advantage when directed towards its legitimate subjects, and written in the proper tone; and when occasion calls for it, it is hoped that writing of this stamp will always be forthcoming in **THE ARCHITECT**.

It is intended that select examples of ancient works—English and foreign—shall occasionally appear among the illustrations of architectural and constructive subjects; and a critical examination of old examples, as well as of works in progress, will form a feature of the journal. The illustrations will be uniformly chosen with a view to their practical value, and will be lithographed or cut by the best available engravers. Thoroughly good specimens of art workmanship in metal, wood, stone, and textile fabrics, and of all descriptions of decorative art of various styles and periods, will occasionally be selected both for description and representation.

Of the sister arts of Painting and Sculpture, such notices will be given as the space at command in a periodical which necessarily must be so much more than purely an art journal will permit.

General literature is unquestionably quite beyond our limits, but the literature of architecture, engineering, and building will be constantly and carefully reviewed. The varied and valuable publications issued on the Continent, and far too little known in this country, will be noticed, as well as those published in Great Britain; and it is our hope that not only will the pages of **THE ARCHITECT** contain an impartial and sufficient review of every work bearing on any of our subjects which shall appear from this day forward, but that occasionally the nature of some of the valuable stores contained in our forgotten books and important libraries may be so pointed out that students may be guided to unsuspected sources of knowledge.

Building as an art, and Engineering as a science, form another group of our proposed subjects,—including the nature and use of all building materials, the contrivances and appliances belonging to building, the art of construction, and the science of designing works of engineering. Good examples of arrangement and contrivance will be given among the illustrations, and the special structures which have to be designed for exceptional purposes will not be overlooked. Machinery and mechanical engineering generally lie outside our limit, except when designed specially to do the work of the builder; but all labour-saving appliances which may appear will be carefully noted. In fact all new inventions brought under our notice and which seem

really to merit being put to the test of experience shall be described, or at least pointed out.

Surveying—a link between architecture and building, when understood to mean the surveying of buildings, and an auxiliary to engineering when applied to land—deserves and shall receive notice. This will give occasion to consider many questions of varied natures which are in debate, as to the position and duties of building surveyors; and to collect and furnish information as to the value, the compulsory sale, and the tenure of house property.

The business of building, especially in these days of keen competition, is in a position which renders reliable and early information of great value; we shall be alive to the importance of securing and furnishing to our readers such intelligence.

Men, as well as work and art, claim space in the pages of *THE ARCHITECT*. The position and prospects of the workman, of the labour market, and of the various trade societies of the country; the status of the contractor, and the fair and equitable adjustment of differences between him and his workmen on the one hand, or his employers on the other; and the position, duties, obligations, and remuneration of professional men, form a series of subjects to which we hope to give constant attention. The fitting education alike of the operative and the art workman, the surveyor, the engineer, and the architect, is a kindred subject and one which presses for notice, and cannot, and will not, be long left in its present unsatisfactory condition. *THE ARCHITECT* will give its hearty and unwavering support to any wise measures for improving the technical education of the artisan, or for the systematic instruction of the student of architecture or civil engineering which may be brought forward.

The proceedings of various learned, professional, and other societies, will be reported in these columns so far as they are available, and come within the scope of the journal. These societies have done very much to raise the position of the professions which have founded them; and in that which remains for them to do, they will, we believe, only be successful when supported by the public press.

The columns of *THE ARCHITECT* will always be open to all legitimate correspondence; and readers are invited with brevity and distinctness to address communications to us on any points of importance that arise. Such letters as contain enquiries on points of a practical nature, we shall ordinarily treat as addressed rather to the readers than the conductors of the journal, and shall usually print without editorial reply, with the desire of receiving answers from our readers. The 'Notes and Novelties,' for which we reserve a column, will contain brief and miscellaneous accounts of whatever is newest and best; and for this column and our list of tenders, we shall always gladly welcome properly authenticated information. To furnish the general information of the journal, not only England, but the Continent, the Colonies, India, and the United States will be explored, and *THE ARCHITECT* will endeavour to give a constant succession of intelligence at once useful, reliable, and new.

The Editor has no desire in the conduct of this journal to intrude himself, his works, or his name on its readers. No one can feel more than himself the impossibility of carrying out unaided any portion, even the smallest, of the wide programme just sketched—a programme no wider, however, than the narrowest view of the meaning of such a title as *THE ARCHITECT* renders it necessary for him to lay down. He is happy, therefore, to be able to rely on the hearty cooperation of many friends and fellow-labourers as contributors and supporters. So many and so varied and so valuable are the sources from which it is possible to obtain contributions, that it is confidently hoped the result may be found to deserve, and will receive, a large share of public confidence.

T. ROGER SMITH.

Note.—The conductors of *THE ARCHITECT* consider it due to themselves and the public to say frankly that, in their opinion, the execution of the illustrations in the first number is not quite equal to the importance of their subjects—most certainly not equal to what they themselves consider it essential such illustrations should be. This arises principally from the difficulty of printing a very large number of copies within a very short time. The defect shall be remedied in the future; but not to have noticed it would almost have implied that we were not alive to it.—Ed.

THE ARCHITECTURAL AND ENGINEERING PROGRESS MADE DURING THE YEAR 1868.

THE year 1868 has been marked by political events of no ordinary magnitude. As regards its architectural and engineering character, it has no doubt been less memorable, although even in this respect its records are far from presenting a blank.

The absence of enterprise, and the continued embarrassment arising from the operations of finance companies, credit companies, and other associations formed for the purpose of giving an undue stimulus to the employment of the engineer and of the contractor, have continued with unexampled pertinacity. One after another, the boards of directors of some of the largest of our railway companies have been compelled to meet their shareholders with the confession that they have been in the habit of distributing dividends that were not actually earned, and that more money must be forthcoming to meet the demands of accumulated debt. In some cases the result of this long deferred confession has been to show that honesty was the best policy. Difficulties, when boldly looked in the face, have diminished or disappeared; and the cessation of aggressive warfare has been attended by a careful development of the true sources of revenue.

In other cases the attempt has been made to make the public pay for the extravagance and incompetence of the boards that had so far wasted the property of their constituents. The most signal instance of an aggressive policy of this nature appears to have resulted in failure. The Brighton, South-Eastern, and Chatham and Dover Railway Companies, failing in their attempt to push through Parliament a Bill that would have left the district which they were incorporated in order to serve, altogether at their mercy, have tried the unpopular experiment of a sudden and considerable increase of fares. The immediate cash results will be made evident at the next half-yearly meeting. Judging from the weekly returns, it will be eminently disappointing. The effect produced on the public feeling of the residents in the district is evinced by the Parliamentary notices for the construction of competing lines that have been deposited for the ensuing session.

Some slight indication of a revival, if not of confidence, at least of the anticipation that confidence may some day return, is to be found in the notices given for the needful, and long delayed, supplement to the railway system which is to be afforded by town tramways. It is inexplicable that this simple expedient should have been so long delayed. When once a well-selected and well-conducted experiment is carried out on an adequate scale, the experience of what has been done in this respect in America forbids us to doubt the great demand that will rapidly arise for this method of communication.

The wealthy and enterprising merchants of Liverpool have still allowed the formation of a railway tunnel under the Mersey to remain in the state of project, although Parliamentary power has been obtained for carrying out the scheme. The ample return that the actual traffic, so inconveniently carried on by the various ferries, would afford, even if the subway through the solid sandstone on which Liverpool stands should cost as much as that beneath the silt and mud of the Thames at Rotherhithe, is such as to ensure the completion of this scheme sooner or later. However, some effort is now being made to commence operations.

Of all the triumphs gained by the engineer during the year, and in some respects of all the most memorable and successful operations of the military branch of the profession, must be ranked the well-planned and successful march on Magdala. For the first time in our history the conduct of an important expedition has been committed to an engineer. For the first time has a great enterprise, under unexampled conditions, involving the exploration and the temporary military occupation of an entirely unknown country, been carried out with uninterrupted success.

While we have thus raised the credit of the engineers of this country abroad by their admirable discharge of an unprecedented duty, we have done much, not by origination but by progress, for the adornment of our capital at home. We have opened to pedestrian traffic a short and healthy route from Westminster to the Temple. The partial completion of the Thames Embankment is at once the addition of a noble architectural feature to London, a step towards the thorough internal service of the traffic of the metropolis by the opening of well-considered lines of thoroughfare, and a redemption of the Thames from a state altogether discreditable to the civilisation of the nineteenth century.

The work of demolition in other parts of London is preparing further additions to the convenience as well as to the splendour of the metropolis. Thirty months have not proved sufficient for the completion of the Holborn Viaduct—a grievous delay and waste of time and cost for which, we suppose, some explanation will be forthcoming. Enough is done to lead us to anticipate the opening of this important line of roadway with impatience. It will add some forty minutes to the day of each of the hundreds of thousands of persons who daily are condemned to pursue the present tortuous route from Oxford Street to the City. The changes and improvements in the neighbourhood, which cannot be fully appreciated before the completion of this great central improvement, are upon a scale that is actually colossal.

A further step in raising London to a level with other capitals has been taken in the construction of the new Meat Market.

A great improvement in the internal communication of the metropolis has been made by the completion of the Western extension

of the Metropolitan Railway. The Midland Railway Company have also opened their new terminal station near King's Cross, together with the line providing a separate and independent access to the metropolis. The immediate effect of this step appears to have been the transference of some 4,000l. to 5,000l. of the gross weekly revenue formerly included in the returns of the London and North-Western, Great Northern, and Great Western Railways to those of the Midland line.

The Abbey Mills pumping station of the metropolitan drainage system has been opened, not without the expression of strong local indignation against the costly character of the architectural decoration. The grave question of the mode in which the bed of the Thames is becoming obstructed by the discharge of the sewage of the metropolis into the stream at the new outfall has been raised, but, although it has been vigorously debated and disputed, it has not been set at rest.

The ordinary progress of minor architectural works throughout the country has been not a little checked by the paralysis that has struck engineering enterprise. Speculative building has been rudely checked. Each week has, indeed, contributed its amount of churches restored, repaired, or newly opened. Private houses of some pretension are increasing in number; but a general slackness of work has been felt both by architects and by builders. The decision among competing designs for a new town hall for Manchester has been one of the most important features of provincial building. The commencement of the new St. Thomas's Hospital has been marked with not inappropriate ceremony, considering the magnitude and importance of the building. It is a fact to be deplored, the significance of which should not be lost sight of, that the iron fittings for the building have been constructed abroad, and that foreign manufacturers have beaten English manufacturers by open tender.

In London we have also witnessed considerable progress in the general design for providing proper accommodation, of what may be styled a palatial character, for the service of the Imperial administration. The new Government offices which open on the Park form only a small portion of the buildings which are admitted to be necessary. The notices deposited in anticipation of the Parliamentary Session of 1869 provide for the clearing away of nearly the whole mass of private residences between the Horse Guards and Westminster Abbey. Great George Street itself is doomed, and a new and official Westminster is about to occupy this advantageous site. There is room for the hope that within a few years the vista and the details of the architectural works ranging from the church of St. Martin to the Abbey and the Palace of the Legislature will be worthy of the wealthiest city in the world.

Connected with this subject of site is the possibility that the question of the position of the New Courts of Law may yet be reopened. A large mass of building, in the vicinity of Chancery Lane, has been cleared away for this purpose. The time-honoured gate of Temple Bar appears to be doomed, from the inevitable march of innovation. Between the North Thames Embankment and the streets leading from the Strand a noble site is still awaiting the labours of the architect. Nor are these sites likely to remain long uncovered, as architects have been appointed by the Government for four most important public buildings—namely, the Courts of Law, the New National Gallery, the new Public Offices, and the new buildings at South Kensington. The only fear that suggests itself is, whether the simultaneous prosecution of so large an amount of building of the first class may not cause an inconvenient disturbance in the labour market. For the private rebuilding of London shows no symptoms of slackening. Banks, new club-houses, and churches emulate one another in richness of decoration. And the large estate of the Marquis of Westminster, the source of a revenue larger than that of many a sovereign prince, is being rapidly covered with buildings not unworthy of so wealthy a landlord.

Among provincial works one of the most important that has been commenced within the year 1868 is the new dock at Newport, which, when carried out to the full design, is estimated to cost 600,000l. A railway viaduct over the Mersey at Runcorn, containing three spans of 305 feet each, would have attracted much attention at an earlier period of our railway enterprise, and the Barnsley viaduct is a work of similar importance.

The water-supply question has not ceased to attract the attention of the public. To the project of bringing water from the Welsh or the Cumberland lakes to the metropolis is opposed the dictum that each great river basin should derive the supply necessary for its inhabitants from its own watershed. The manner in which the rainfall is for the most part wasted is insisted on by the advocates of this natural principle. It is evident that a final decision on the subject can only be arrived at in connection with the settlement of the cognate questions of sewage, and of the redemption of rivers from pollution. The Commission nominated to enquire into this subject has been reconstituted, and all that can be positively stated as to the progress made during 1868 towards the adoption of definitive normal rules as to water supply, defecation of sewage, manuring ground from this source, and restoration of inland fisheries, is the fact that the public mind is becoming slowly awakened to the extreme importance of these elements of public health and comfort. The most recent report on these kindred subjects—that of an officer of the Royal Engineers, consulted at the recommendation of the Government—has been noteworthy for its insistence on the necessity of keeping:

rainfall distinct from sewage; an arrangement which must underlie any economical method for at once utilizing the salts applicable to vegetable growth, and avoiding great waste of water.

The occupation of English engineers and of English capital abroad has not been a prominent feature during the past year. A great field for enterprise appeared to open in Spain, but it is yet premature to point to the Peninsula as a safe field for English enterprise.

The transit of our Indian mails has been accelerated by the opening of the railway over Mont Cenis, constructed according to the plan of Mr. Fell. The successful working of this railway is likely to lead to the opening of other lines of communication through the passes of the Alps. A summit railway, unless so protected by galleries as to lose almost every feature of economy in construction, is liable, it is true, to occasional interruptions by snow or by rainfall. It cannot compete with a tunnel. On the other hand the difference of expense in primary construction, as well as the saving of time as compared with that demanded for piercing a long distance, is considerable, and the advantage over the use of the diligence is so great as to leave no doubt that, in any case of adequate traffic, where a tunnel is not made, a line on Mr. Fell's plan will be adopted.

Meantime the French and Italian Governments are steadily at work in the bowels of the Alps. The latter has arranged for the transmission of the mails to Brindisi, and M. de Lesseps is steadily expending 200,000l. per month in the excavation of the Suez Canal, the opening of which much-debated route he promises by October, 1869.

The New World vies with the Old in its provision of a line of transit that is to be measured, not by miles, but by degrees of longitude. Of the 3,000 miles which intervene between the Atlantic and the Pacific Oceans, about one-half may be regarded as settled country. A modern town on the Missouri river, called Omaha City, is the westward frontier of American civilisation. This point is, of course, reached by railway. But the enterprising people of the States are unwilling to compel the travellers to California to go round by the Isthmus of Panama. They have already commenced a railway across the desert, haunted by no Indians, that intervenes between Omaha and Sacramento. At the close of 1865 the gap between these two points was one of 1,720 miles, with the slight deduction of thirty-one miles of railway constructed on the Sacramento side, and forty on that of Omaha. Since that time the rails have been pushed forward from Omaha to the distance of nearly a thousand miles—a feat without parallel in the history of internal communication, as it involves the construction of a mile of railways for every working day, Sundays alone being excluded, during the interval of three years. From Sacramento about 400 miles have been laid during the same time, and the engineers express confidence that before the close of the year now approaching the entire line from one ocean to the other will be open for traffic.

The progress of railways within the United Kingdom is tabulated to the close of 1867, the returns to the Board of Trade occupying eleven months before the public are informed of their results. During that year, the total paid-up capital of the railway companies in question was increased by about twenty millions sterling, or from 481,872,184l. to 502,262,887l. The length of line open was increased by 393 miles, from 18,354 to 14,247. The number of passengers conveyed increased from 274,295,668 to 287,688,113. The number of applications to Parliament for the session of 1869 are 78, those for 1868 having been 109. About one-eighth of these applications are for powers to abandon lines and branches, and about one-fourth are for obtaining extension of time. There are thirty-four notices for the incorporation of new companies, eleven of which are for the purpose of making railways or tramways in London or its suburbs.

MR. MARKS'S WORK AT THE GAIETY THEATRE.

By EDWARD W. GODWIN, F.S.A.

NO seriously-minded person ever expects to see architecture at the opening of a new theatre. Building a modern theatre is essentially a speculation in the worst sense of the word. It is not merely a speculation with money—it is not merely a question of cheap materials and cheap manufactures, but always associated with these we find a style of construction never found in lasting, durable buildings—a style irreconcilable with any art principles, and possessing no recommendations even to the theatrical speculator beyond the one and possibly the only recommendation it could possess for him—a narrow economy of money and of time. To build a theatre in three or four months may be a very noble ambition. The capital you expend does not long lie idle. You turn your money, as the phrase is, rapidly; your architect has no time to pause for thought; your painter and decorators have no time for study of effects *in situ*; your engineer has no time for experiments; your masonry and brickwork, if you have any, have no time for settlement. In a dozen rooms in a dozen different parts of the town men are working on the box-fronts, the ceiling, the proscenium, the act drop, &c. Your artist-in-chief, who paints your figures, has no time to talk about it. Thirty or forty life-size figures to be painted in two months is an order that makes any supervision of the ornament-painters, any consultation or any experiment as to position and light, simply impossible. That all these *disjecta membra* should be rattled together at last and form a satisfactory and complete whole is one of these things no one could have expected, and about which therefore no one can be dis-

appointed; but—it is a speculation. There can be nothing, then, left us but to sympathise with the unfortunate people who elect to take part towards the fulfilment of the theatrical speculator's ambition. That some artistic success may sometimes attend some portions of the work must be acknowledged, but it is hardly a question that such success must be of the nature of a fluke. I take it for granted every one knows the long frieze or space generally found over the proscenium, and which is occupied in some theatres by the principal (sometimes the only) figure subject in the building. This at the Gaiety, as at the Queen's, is the kernel of the whole structure. The buildings may or may not stand fire—that, of course, remains to be proved. The stage may be, and probably is, a capital piece of carpenter's work. The problem of entrances and exits may or may not have been completely solved; but as only a panic could satisfactorily test this, the arrangement, as we see it, may be open to question. The interior effect may be, as the *Pall Mall Gazette* says, 'most ornate,' whatever that may mean, and the building may be altogether a novelty in architecture—i.e., in the sense that adaptations from the French are novelties in dramatic literature. Whatever may be said, the art-work at the Gaiety is confined to Mr. Marks's work. This work consists—so we are told—of, first, a frieze or long panel over the proscenium; and, second, two lunettes over the stage boxes immediately adjoining the ends of the frieze, but at a little higher level. Now before entering at all upon the merits or demerits of these three paintings, it would be well to clear the ground a little of what might otherwise prove stumbling blocks in Mr. Marks's career as a wall painter. There are three points which it is desirable should be cleared up. First, the scale of the figures in the frieze; second, the difference of scale between the figures in the frieze and those in the lunettes; and third, the execution of the figures in the lunettes. If Mr. Marks is not responsible for these things, and if he wishes to become a wall painter and to work with architects, it is of the utmost importance that the amount of his non-responsibility should be well and clearly defined. As to the scale of the figures in the main subject, it is manifestly out of all proportion with the building, and is, to say the least, drollish. Now above these figures, and flush with the figure panel, is a large flat space, covered with gold fleur-de-lis on a blue ground, any portion of which space might easily have been added to Mr. Marks's panel. Who was it therefore who fixed the height of the panel? If Mr. Marks be the culprit, his reputation as a wall or decorative painter will suffer not a little; if any one else fixed it, why did not Mr. Marks protest, and if needs be, decline the work? The ridiculously small proportions of this the chief figure subject being fixed, how was it that the figures in the subsidiary subjects close by were increased in scale? I need not insult my readers by saying that the manifest effect of this is to still further dwarf the main subject, that was already far too small for its position. Now either Mr. Marks must have known that this would be so, and was thus deliberately guilty of what I shall take the liberty of calling a decorative impertinence, or he did not paint the lunettes at all. And it is just this latter conclusion to which any one must arrive who will take the trouble to use his binocular from the level of the upper boxes and compare the outlines with the outlines in the frieze. Who then did paint them? And who was responsible for increasing the scale of the figures? These are questions which Mr. Marks has an interest in having clearly answered, for the designs of the lunettes are as evidently by him as the work itself is evidently not by him.

Of Mr. Marks's three designs, as distinct designs, there is little or nothing to say in blame. Taken, however, together as decorative paintings, they have the defect of being unequal—unequal, that is, not merely as to scale, but as to that all-important element in decoration which may be described as space-filling; for if we are inclined for sumptuousness of decoration, the lunettes appear bald by contrast with the frieze, whilst if we go in for temperance and Spartan simplicity, the frieze appears crowded and over-rich by contrast with the lunettes. As compositions the lunettes are perhaps more complete, but then the space was so very much more easy to treat. Exceptions might be taken to the drawing; but as I do not believe Mr. Marks to have executed the work, and as the name of the real painter of Mr. Marks's designs has not transpired, it is hardly worth while to dwell any longer upon these subsidiary subjects. The chief, or frieze subject, represents a mediæval masque before a Royal party, and is thus arranged:—A little to the left of the centre of the picture is a throne with a double-stepped platform in front of it; behind this, two attendants and a group of six courtiers; seated on the throne are a king and queen; their little son stands on the platform just in front of them; lolling rather than sitting on the step in front of the boy-prince is the court jester; immediately in front of these, and occupying the centre of the picture, is a group of seven dancers 'making circles,' to adopt the technical phraseology of the ballet; beyond these a dwarf; then a group of players—a king, a queen, a knight in armour, and a second lady; beyond these a group of six musicians complete the picture. The back-ground is in two colours, divided horizontally; and Mr. Marks may thank his horizontal line for keeping his picture together, for without it there can be little doubt that the different groups would appear too isolated. Nevertheless, the composition on the whole is pleasing; the two extreme groups, viz., the courtiers and the musicians, are well put together, and both in colour and drawing are artistically managed. The two smallest figures, viz., the boy prince and the dwarf, are perhaps the best. That this may be in part owing to their isolation is very possible. Indeed I cannot help

thinking that under the conditions of site, the whole work would have been improved and more decorative had there been twenty-two instead of thirty figures. I am sure of this much—that it is not by a liberal use of figures in a given wall space that the artist is necessarily to produce good decoration. One figure with 'go' in it plus a few accessories with meaning in them would decorate a far larger wall space than is generally imagined. It is surprising how much space one really good figure will satisfy when well drawn with bright and lively colours. Had Mr. Marks fully realised this, we should possibly have had one figure to admire in the place of four which can scarcely claim that degree of consideration. Thus, the dancing-girls—very difficult to compose, still more difficult to draw—are ill-composed and ill-drawn; moreover, the mass of white dress in this central group is far too strong. For although every one will easily see that it has been the intention of the artist to get the conventional high light in the centre of the frieze, and balance right and left his lights and darks with a sternness almost geometrical, yet I cannot help thinking that the intention was not worth much, and that it would have been as well if Mr. Marks had defied this conventional rule, or, if this were too much to do at once, he might have subdued his high light to the lowest point compatible with academic propriety.

One word as to details. Of what use is the little embroidered shield on the back of the gold stick in waiting? It is a patch and nothing more. Why such a modern property shield in the hand of the player knight? Shields in the middle ages were as common as umbrellas are now, and players wanting a shield would surely have a real one, and not a piece of a 3-inch plank. I suspect, too, there are some people who might ask Mr. Marks disagreeable questions in respect to some few of the costumes; but where so much is good, I will leave this to more hypercritical pens. One thing I hope: that, whatever opinions or criticisms may be published, all will agree in giving Mr. Marks credit for having produced an admirable decorative painting under trying conditions, and every one must join in awarding no end of praise to the theatrical speculator who could entertain the question of an artist's commission being an item in his speculation. I should add that the painting is executed in oil colour with turpentine medium on canvas—a process which, to my mind, is not one to be encouraged.

THE CO-OPERATION OF ARCHITECTS AND ENGINEERS.

ALTHOUGH there is everywhere an abundant demand—notably in our shops and Exhibitions—for such of the skilfully contrived productions of our various industries as possess delicacy and minuteness, yet the popular mind seems to be reviving the old world taste for the gigantic. Our modern public works and projects excite little admiration now-a-days unless the prefix of *monster* can be applied to them. Conceptions of moderate, or even average dimensions, meet with little more than indifference. And this is observable in all the branches of enterprise on which the skill of head and hand is employed. We see works of various public interest growing in magnitude as if there were absolutely no limits to the scale on which they may be executed.

We have paused in awe before the stupendous piles of mediæval workmanship—such as our cathedrals have appeared to us—but now we hear of new edifices which are to dwarf the greatest of these. Public halls, of which our metropolis—itsself belonging to the monstrous—used to boast as grand and spacious, are to be thrown into the shade by a new monster which will leave these with no more reputation than mere meeting-houses in point of dimensions. Again we have the monster hotel rising around us as a familiar object, whose size reduces to the scale and appearance of private houses the large establishments of a few years ago. And in most appropriate conformity to this general rage for the gigantic, we have new railway termini rearing their mammoth forms, one after another, any one of which makes the largest stations of our younger days appear as so many coach-houses.

The ever-swelling proportions and the grand scale of the works we have already among us are undoubtedly to be referred to that wonderful development of engineering skill and enterprise which the last quarter of a century mainly has witnessed. The engineer, seizing on the bountiful products which men have been extracting from the bowels of the earth, has found in them the means of realising his most ambitious projects. Especially by the iron material so illimitable, apparently, in its capabilities for construction and in the scale of its combinations, the last and present generations have seen a new profession created, which before had scarce an independent existence. And by this same material not only has a new name been given to our age, but a disturbance made in all the old landmarks of building science.

While we seem to refer the revolution in the design and conception of our public works to the agency of the engineer, it is not to be supposed that the architect has been insensible to or unaffected by it. On the contrary, it is evident that he too has caught the infection of that thirst for the colossal which we have been speaking of. It is equally clear, however, that he has shown but small sympathy with it. He has given rather a passive than an active adherence to it. The age has been demanding—or, at least, greedily accepting, the novelties in

monster form which our engineers have been ready at any moment to supply for it. The architect, on the other hand, faithful always to the traditions of his art—grand and multifarious as they are—has been caring less for what *might be* than for what *has been*. He sympathises but little with the engineer, who cannot point to his iron models in antique or mediæval temples; and he knows that in the older times the architect reared his works by his own skill, whether we may view it as artistic or constructive.

While all this is historically true, it is a fact not to be ignored in these times, that the profession of engineering, as we now regard it, has come somewhat into collision with that of the architect. The engineer in frequent cases has now the exclusive possession of works which formerly the architect alone was supposed capable to deal with. Over and above all this—and it is a point not to be evaded, for it is the kernel of the subject—there has grown up in our day what some may prefer to call an indifference between the two professions, but which we think is more correctly described as an unexpressed, half-conscious sort of jealousy in each towards the other.

It is in this circumstance—not hitherto faced frankly—where the question of the greatest public interest arises. In all the works which proceed from the hands of our architects and engineers, there is surely something more than mere utility and sound construction to be demanded. For it is a consideration not sufficiently insisted on that these works are, in their nature, *public property*; and that, too, in an enormously wide sense. They differ in the widest possible manner, in this respect, from the other arts and sciences. For example, a man will paint a picture, or carve a piece of sculpture, which another will purchase; but the influence of such works in either case is comparatively of a private character. At the most their possessor confines them within doors, where if they be admirable, his friends and visitors only can enjoy them; or if they be otherwise, it is only these who have to endure them. But the case is very different when we come to the works of our engineers and architects. They span our rivers and line our streets, and the public have no escape from them. If they possess any beauty or interest, there is a public enjoyment in possessing them; but if they are ugly, mean, and untrue, as so many of our public works unhappily are, and that by popular verdict, what is to be said for them or done with them? There they stand, to bear the same offensive lineaments for generations. They are not only public, but permanent—too often, indeed, designed to be dreadfully permanent—and the public taste has to endure and suffer them from age to age. Can it be supposed that in this fact there is not matter of public moment? Is it logically possible that through one sense a man may have his physical life poisoned by a bad odour, and that his moral sensibility will escape unhurt from an ugly sight through another sense?

It must not be inferred from all this that it is the engineering of our day which has to learn everything from an alliance with architecture. There are equally grave faults of omission and of commission on both sides, and the two professions, rightly working, in ways we hope to illustrate hereafter, may mutually help each other to public advantage. In this view we are supported by a pretty general sentiment which is growing in both professions, and especially among their leading representatives. The two specialties must come together and work harmoniously if we are to have great works worthy of the age, and commensurate in historical value as monuments with the reputation of our civilisation, wealth, and power.

The kind of tacit estrangement which now exists between architecture and engineering imperils public interests, and results in the abuse of popular taste. The engineer can no more afford to work without the architect on his great works than the architect in similar case can dispense with the engineer. In the one case we are threatened with mere size and solidity without sightliness; and in the other, with works which promise an antiquarian rather than a true artistic interest as productions of our own day; while the art of the architect threatens to fail in its highest aim—the elevation of public taste and the excitement of popular sympathy—because it refuses to bend to the wants and discoveries of the time.

It is in no sense derogatory to the prestige and honour of either profession that the public should long to see the divorce between them annulled. Each has its special excellence and its special province; we only desire to insist that the intellect of both is essential to great and lasting successes in our public structures of every class. Life is far too short in our day, the competitive principle too active, and the exigent demand for speedy execution of our work too pressing, to allow of any one man achieving high excellence in the character of architect and engineer at once, as we now understand the high functions of the two professions. Your modern engineer can as little be expected to design a town hall or a cathedral up to any noble mark, as your architect can be asked to construct a suspension bridge or a railway station on a grand scale. There may be, and have been, here and there, eminent instances of men gifted with the rare combination of engineering and architectural talent; but they are so scarce and so far between as not to affect our argument. How many architects, for example, are there among us to-day who could, *de novo*, and without existing models, at once design and construct a Westminster Abbey or a St. Paul's Cathedral? Similarly, it may be asked, where is the engineer who could construct and design them? The architect may be able to design and the engineer to construct works of such a mark, but it is idle ever again to expect that either can do both unaided by the other.

This question of co-operation is of equal value to the architect and engineer. That the works of either one or the other, on the grand scale which has become common among us, would gain vastly by such conjunction of the two special talents, seems so much of a platitude that it needs hardly to be insisted upon. The practical advantage of this combination is a more important subject for discussion. The art of the architect, it must be urged, will gain greatly in public favour if he can be enabled to design his greater works entirely from the point of view which his artistic training and instinct naturally suggest to him, almost wholly unfettered by the more intricate calculations which belong to the science of the engineer. On the other hand the engineer would undoubtedly achieve greater popular triumphs if his larger works were put through the hands of the architect to be clothed with some feeling of imagination and artistic interest. We are well aware, from a tolerably intimate knowledge of the inner life of both professions, that the model engineer of our day treats with a comfortable indifference all æsthetic considerations as fantastical and unnecessary so soon as he has satisfied himself that his girders and rivets are all perfect. In some similar degree the architect too often sacrifices grand opportunities of effect and true principles of construction by a mere slavish adherence to shapes and forms, or by the false and extravagant use of materials.

In the discussion of this subject how much may one learn from a contemplation of the works of God! To take the highest and noblest of His creations—Man. Do we not find the simple skeleton constructed in perfection for all the purposes of rest and locomotion? But we are not left with merely perfect *construction*. Flesh and tissue are clothed over the perfect framework; and lineaments of beauty are so fashioned that no human taste can exhaust the admiration of them; the vital fluids of the body are made to course beneath their transparent surface, with hues of colour whose subtlety and variety defy the highest effort of the painter's art. And let it not be omitted, that while our beneficent Creator has designed His work in this almost incomprehensible beauty of form and structure, He has also endowed us with the still higher blessing of sensibility to its loveliness.

(To be continued.)

THE HANDY-BOOK OF HOUSE-BUILDING.

INTRODUCTORY.

A DWELLING-HOUSE is, in one sense or another, a matter of at least occasional concern to everyone; and no other sort of building exists respecting which so many persons require sound knowledge. We all live in dwelling-houses; almost all acquire at least that temporary ownership of one which comes from occupation of it as tenants; and many at one time or other buy or build houses for residence, or investment, or both. Of those whose profession or business it is to build, there are few who have not at least some part of their attention claimed by dwelling-houses, while very many architects and builders erect little else.

Although some valuable books have been written which treat subjects relating to dwelling-houses well, as also some of less value, it seemed, some years ago, to the present writer that there was room for a compact hand-book which should take a very practical point of view indeed; and the present series of papers was commenced. The work was laid aside mainly from the belief that it would be rendered unnecessary by a treatise which has since appeared. The very completeness of that treatise, which will no doubt long remain a standard book of reference, has, however, lifted it above the range of a hand-book. With regard to a large number of practical matters, such as arise during the conduct of all the operations preliminary to and during the building of a dwelling-house, the field is as free as it was before; and even with regard to such matters as are common to the intention both of the present papers and of the book alluded to, there seems scope for a condensed statement of their salient points. The work has therefore been resumed without hesitation, and in this series of papers it is hoped that every class of the readers of this journal may find something of practical value; for what is here stated will be the result of a varied and extended experience in the practice of house-building.

The course proposed to be taken is to furnish, in four or five short and separate series of papers, answers to such inquiries as the four following:—

1. What is meant by a good house?
2. What sort of house to build?
3. What will it cost to build?
4. How is building a house to be set about?

In answer to the first question, we intend to consider briefly those points in which houses suited to the requirements of the English climate and of modern life and manners agree; and those where they differ, according to variation in site, or size, or purpose; and to name some of the most prominent essentials for the comfort, convenience, health, and safety of households.

In answering the second question, it is proposed to divide dwelling-houses into groups according to their size, and to give illustrations showing a typical example of each group; also, to point out the mode of providing in each the essential requirements already indicated.

Under the third head, the approximate cost of the specimens, or typical examples, will be stated, and information upon the whole question of cost furnished.

The fourth head will contain advice as to the whole course of the planning and erection of a house, and will trace the mode of procedure from the commencement to the close.

Many general topics, which are almost equally admissible under any of

the above divisions, will arise. Some may be introduced, as seems most appropriate, in the body of the work; others (especially such as relate to stabling, outbuildings, and the other adjuncts of houses of large size) will remain for separate statement.

It remains only to remark that, though dwelling-houses built in towns differ widely in many particulars from houses built in the country, it has not been thought impossible to treat both at the same time. The country house is always the more completely unfettered of the two, and many desirable things have to be abandoned when building on an urban site. The course will therefore generally be taken of describing what should be done on a clear site, where no restrictions exist, and then of pointing out the modifications brought about by limitation of site, and the other circumstances peculiar to a city or its suburbs.

For a similar reason, a strict division into classes of house has not been attempted, except for the purpose of considering the question of cost. The simplest house, if fit for the occupation of a family of very moderate means, but of the ordinary habits of English gentry, contains the same essentials as the large family house or the manor. And consequently it has been thought that even those requiring to make their dwellings small and simple will be best directed how to make them good, if the practice where there is ample scope for expenditure, be laid before them, and be treated as being—what it really is—merely an elaboration of that which, in its more elementary form, belongs to their own case.

CHAPTER I.

WHAT IS MEANT BY A GOOD HOUSE?

A good house should be suited to our climate, and to the mode of life that modern English manners and customs have brought about. Its main essentials are convenience, comfort, privacy, and a pleasing appearance.

The simplest complete dwelling-house for a family must provide three sets of apartments for the purposes of (1) living, (2) sleeping, (3) service; internal communications; and at least two entrances. Frequently a fourth department (4) for children is required.

Living Rooms.

1. English habits require, in the simplest family house, two living rooms, one for meals (dining room), and one for receiving visitors (drawing room). As the house increases in size, it first happens that a second living room, known often as the breakfast room or morning room, is added—this becomes to some extent the peculiar domain of the mistress of the house; then a library, which, when there is no business room, is generally appropriated by its master, and, in other cases, often forms a morning room for gentlemen; and, as size increases, a small drawing room, a business room, a billiard room, a smoking room, a gun room, and an odd room may be added, in the order in which we have placed them. Each of these rooms requires to be of the right size for the family, of the right shape, and in the right place; it must be properly connected with the other parts of the house, and must in itself be such that the usual furniture shall be well accommodated in it, and that the occupants shall be free from discomforts, such as draughts, unequal or deficient light, cold, noise, or liability to being overlooked or to intrusion.

It thus appears that the designing of even a single room gives scope for skill, and leaves room for the possibility of grave errors; and when these are compacted together into a house, it is clear that the difficulty is not diminished by the necessity of fitting them all together. In endeavouring to give to each room an appropriate appearance, the dining-room may often be advantageously made rather long in proportion to its width, and a trifle formal in appearance, the recess usually provided for a sideboard being so treated as to give some little appearance of dignity to the room. If there are bay windows, they are often most suitably square—i.e., rectangular—on plan. Good lights for pictures, and suitable space for hanging them, are often called for in this room.

The drawing room, on the other hand, should have an aspect of grace and lightness. It had better be not quite so long in proportion to its width as the dining room, and ought to have a large allowance of window space; and if there are bay windows, they may be of more varied shapes. Sometimes some variety or play of outline can be introduced into the ground plan of a drawing room with good effect. In every good drawing room there must be at least one convenient place for a pianoforte. The small drawing room ought to adjoin the large one, and to communicate with it; but should be distinct, and with a separate entrance. It should combine something of the cheerful compactness of the morning room with the grace and elegance of the drawing room.

The library requires a large amount of unoccupied wall-space for book-cases, and should have an air of comfort and snugness. This is often promoted in a library as well as in a morning room, by giving it a certain squareness of proportion on plan.

The business room does not often require to be large, but must be well lighted, and if it can be approached direct from the lobby, or from the 'luggage entrance,' where one exists, by persons calling on business without their having to be shown into the hall, so much the better. A fire-proof safe is sometimes desired here.

The morning room requires to be bright and pleasant, warm, and not too large. These are the rooms which, in an ordinary dwelling house, form a cluster or group around the hall, the others that have been named being, when introduced, very often placed apart for various reasons.

(To be continued.)

ILLUSTRATIONS.

THE NEW BUILDINGS OF BALLIOL COLLEGE, OXFORD.

[Mr. Editor,—You have requested me to give you a short description of the work at Balliol, and to put my name to it. I do so with pleasure, believing it best that a description of this nature should be avowedly that of the architect himself, when it cannot be from the pen of an independent and unbiassed critic.]

The project of rebuilding a considerable portion of this ancient and

historically interesting College had been for many years in contemplation. Two designs had been prepared for the purpose, and, at a later period, Mr. A. W. Pugin filled a portfolio with beautiful studies for the same object, but was not enabled to carry any of his ideas into execution.

The munificence of a lady, Miss Brakenbury (the lineal descendant of John de Balliol, the founder of the College), who offered to rebuild that portion of the quadrangle facing Broad Street at her own expense, caused the work to be commenced in earnest, and the writer was requested by the College, in the early part of 1866, to prepare a new design embodying its present requirements. This being done, tenders were obtained, and that of Mr. William Brass, of London, amounting to about 20,000*l.*, accepted. The work of demolition began at the commencement of Easter Term last year, and the whole of the new buildings are now so far completed that, while the Master, the Rev. Dr. Scott, has been in possession of his house for some weeks past, the College-rooms will be in full occupation during the ensuing term.

The work consisted in the rebuilding of the south and east sides of the quadrangle, facing Broad Street and the fore court of Trinity College respectively, as well as of the Master's House, which looks into Broad Street on the south and into the College garden on the north, and is separated from the new College buildings proper by a small courtyard.

The old work which had to make way for the new was of little or no interest architecturally; its original character had been irretrievably destroyed by tasteless modifications during the last century, and the crumbling local stone of which it was put together made any attempt at restoration impossible; besides which, it was deemed of some importance to rectify an extremely crooked street line.

While thus two sides of the quadrangle are entirely new, the other two sides remain untouched, being all early work, with some slight exception in the way of restoration, and with the important exception of Mr. Butterfield's Chapel in the north-east corner. In the opposite, the south-west corner, the Oriel window of the dining-room in the Master's house has been, of course, religiously preserved; indeed, a feeling of the absolute necessity for its preservation has dictated the arrangement of much of the present plan, as, had it not been for the position of this Oriel, the hall would have been extended towards the south, and an urgent want thus adequately met.

The block-plan shows the general arrangement of the new buildings and their connection with those portions of the old which face the quadrangle on the one side and the garden on the other. The garden is shut in by the hall, the new residence of the Master, a long range of rooms built by Basevi, and a gateway and other buildings adjoining by Salvin; while, on the other side, the line of buildings formed by Mr. Salvin's picturesque kitchen and buttery, and the north fronts of the library and chapel, shut out the new buildings surrounding the quadrangle from view, except the summit of the new tower which rises above them.

The perspective view shows the Broad Street front of the new buildings, which are built entirely of Bath stone and covered with Broseley tiles.

Further particulars will be given in a future number.

The Francis Joseph Suspension Bridge - Prague.

R. M. ORDISH, ENGINEER.

12

(FRANZ JOSEPH BRÜCKE.)

SUSPENSION BRIDGE OVER THE RIVER MOLDAU AT PRAGUE.

THE work which forms the subject of our Engineering illustrations is the new Suspension Bridge over the river Moldau at Prague, which was opened by the Emperor of Austria, June 21, 1868.

This bridge is the embodiment of a new system of suspension as applied to bridges, which was patented by its engineer, Mr. Ordish, about ten years ago, more particularly with the view of adapting that principle to railway bridges of large span, as the acknowledged economy of the suspension bridge made the crossing of large rivers or chasms practicable for railways.

The total length of the bridge between faces of abutments is 820 feet, and the clear width between parapet girders is 31 feet, the distance between centres of towers is 492 feet, and the height from level of roadway to the crown of the arch in the towers is 50 feet. The parapet and cross girders are 'wrought-iron plate girders,' and are built and connected together on the ordinary system of railway bridge construction. The parapet girders are continuous between the piers and the piers and abutments, allowance for expansion and contraction being provided. They are supported, at distances of 82 feet apart, by means of straight chains, which in their turn are supported and retained in straight lines by means of a light curved chain (this curved chain being the main element in the improved system), thus enabling long compound ties of ordinary suspension bridge links to be retained in straight lines, and the deflection of bridges thus constructed being dependent only on the elasticity of the material, and not as is the case in an ordinary suspension bridge, dependent on the varying curve of equilibrium in the chains caused by unequal loads in addition to the elasticity of the material.

The carriage roadway is of an equal width on the whole length of the bridge, and is formed by 6" planking laid on the cross girders and wood block paving thereon. The footpaths are each 5 ft. 6 in. wide, and are formed by 4" planking, on which are laid 1½" oak wearing boards.

The whole of the suspension chains are of steel, and each link was proved by a tensile strain of twenty-two tons per sectional inch, without any permanent set, the specification for the links providing that each link should undergo such a test, and that the breaking strain per sectional inch should not be less than forty-eight tons.

The strength of the bridge is such that with a moving load of eighty pounds per superficial foot, in addition to the dead load of the bridge, there would be imposed a strain of six tons per sectional inch on the girder structure, and sixteen tons on the steel suspension structure of the bridge.

The bridge was tested on April 29 and 30, 1868, by placing sixty-five thousand bricks (weighing three hundred tons) on the foot-paths, from four to five courses deep, and with this load the deflection in the centre was 4½ inches; on the morning of April 30, sixty-four loaded vehicles of an estimated weight of 325 tons were driven over the bridge, the bricks still remaining on the footpaths; with the total load, equal to sixty-four pounds per superficial foot, the deflection in the centre was 7½, and on the removal of the load the permanent set was found to be ½".

As to the design of this important bridge, our readers will naturally judge of it for themselves, with the aid of the illustrations we present. We may, however, venture our own opinion that, as a civil engineering work, it shows more regard to recognised principles of architectural design than we have been accustomed to. Indeed, it aptly illustrates the conjunction of engineering and architectural skill which we have treated of in another column. The design of the piers has evidently been carefully studied, and carries a very elegant proportion. We ask our readers to note the treatment of the cast metal work, either in its ensemble or its details. The piers being constructed of castings, it is no small merit that they look so. As compared with other bridges of the same ambition as to design, it is also interesting, and—to the younger members of the profession—instructive, to notice that the metal work which performs the actual work of support and construction is also that which produces the external effect of the design. In a suspension bridge of this class, this is really almost a unique merit, for, as our engineering readers are aware, the real supporting piers which carry the chains in most bridges are made to look sightly only by casings of more or less elaborate design.

Messrs. Ruston & Co., of Prague and Vienna, were the general contractors for the bridge, and the whole of the ironwork was made in Austria. The steel suspension structure was made in Sheffield, and supplied and erected by Messrs. Howell & Co. The Emperor of Austria has awarded to Mr. Ordish the large Austrian gold medal of Arts and Sciences, and to Mr. Wessely, the resident engineer, the Austrian Gold Cross of Merit.

OUR RAMBLER

AT THE NEW INDIA OFFICE.

OUR Rambler—who, we hope, may become a very familiar acquaintance of our readers, and in whose company we trust they will enjoy many not uninteresting excursions—does not desire that we should say more in introducing him than this, that he is passionately fond of visiting places and scenes where works or buildings, drawings or paintings, men or things such as our readers may like to hear about, are to be found. What he sees he will plainly describe; where public interests call him, he will go; and where he thinks that public interests do not call him, no invitations will induce him to come. The papers which follow his name may possibly be so varied in subject and in treatment as to suggest that more pens and more pairs of eyes than one are at his disposal; but in this at least he will always be consistent—the visits he narrates will always be real ones; the things he describes will always be painted as he actually saw them, and not as he may be asked to suppose they might, under more favourable circumstances, be seen; and his accounts may be relied upon as *bona fide* narratives.

For several years past a large pile of buildings has been slowly rising in the neighbourhood of Whitehall and the Park, which most persons have described, not without truth, as 'the new Foreign Office,' by Mr. Gilbert Scott; but, like many statements that are loosely made and carelessly repeated, this is only part of the truth, the fact being that the new building contains not only the Foreign Office, but also the India Office, and that in fact these two buildings form but part of a greater block (obviously incomplete) of Government offices; the prosecution of which, it is understood, is about to be energetically proceeded with.

The buildings at present erected may be approximately described as forming nearly two sides and one end of a rather irregular oblong block. One end of this block is built, and is picturesquely broken at the north-west angle by the tower and semi-circular corner with which every one who occasionally walks in St. James's Park must be familiar. The opposite end remains to be completed, and the sides to be prolonged. In fact at the present moment the peep from King Street into the quadrangle is anything but striking; toothings, unfinished gables, and all the preparations for one day resuming work on an incomplete building which we familiarly see when a church has been carried up minus its towers, being from that side unpleasantly conspicuous. Towards the Park the building may be regarded as nearly if not quite brought to its final condition.

The India Office was confided by the Council of India to their architect, Mr. Matthew Digby Wyatt; and the problem he had to solve contained more conflicting and perplexing conditions than have often combined in a work of art.

The building was to be the seat of the administration of almost the wealthiest country on the globe, yet a mere office for transaction of business; palatial, without a single vast hall or state suite of rooms; business-like, yet not inferior to the dignity of our Indian Empire. Further to complicate the difficulty, the site was not too ample, and not lighted on all sides, and the opportunities for original architecture are all internal, as *the exterior was entirely the work of another architect.* That a failure, or at best a partial success, should have been the result, might well have been anticipated; and it is no ordinary praise, and marks Mr. Wyatt as no ordinary artist, to say the building is a brilliant success; that, having accepted this programme, he has so worked it out that it is a specimen of skilful disposition of plan and of structure, and an example of good Italian Renaissance, freely yet learnedly treated.

The India Office occupies the whole south frontage—that towards Charles Street—at present built. The plan of building may be very nearly represented by a capital P, only drawing the loop square instead of round. The stem of the letter will then represent the Charles Street block, the top of it the Park front, the open part of the P will stand exactly for the famous 'Sultan's' quadrangle.

Upon this simple outline the architect has proceeded with such a lavish expenditure of his skill in planning as to provoke a vast number of difficulties, of which, however, each one has been fairly met, and fully overcome.

Our Rambler, led by a guide whose means of obtaining information were the best possible, while his good nature in giving it was inexhaustible, entered the building from the quadrangle. The public entrance, at a lower level than that of the corridor of the ground floor, introduces the visitor at once to a vestibule nearly 40 feet square, the principal architectural features of which are four groups of marble columns (each group consisting of four shafts) supporting a coffered ceiling. The central panel of this ceiling is worked up into an octagonal groined vault, crowned with a lantern; and here, at the very outset, a specimen of the architect's method of giving apparent height by leading the eye upward meets us. Throughout the building the marble shafts, of which many are of British marbles, are surmounted by capitals in dark stone, avoiding the shock to the eye often felt where a white or very light-coloured cap is popped down upon a dark marble shaft. Here, as elsewhere, use has been rather fully made of naturally coloured materials, but polychromy has gone no further: the India Office must of all things look business-like; and arabesques, fresco, and mosaic are matters of luxury. Two charming marble chimnéées decorate the sides of this vestibule.

Before mounting the short straight flight that leads up to the ground-floor, our Rambler was led down into the basement; a clean, airy, roomy construction, splendidly dry and solid, and with a great deal of sagacious contrivance in it. Here is the purveyor's department, with a large kitchen, scullery, cellars, larders, and other appurtenances; several rooms for resident servants and others; the heating, the printing department, the carpenter's shop; but, above all, the storage of records. Fireproof throughout; partly vaulted, and partly covered on the 'Fox and Barratt' system, which has been used on the upper floors; this basement, not lofty, but excellently suited to the purpose, is fitted up with what look like the iron skeletons of wine bins or book shelves, for records (books and papers). These require to be dry, admitting air all round the records, no higher than a man can reach, and to be accessible throughout. Mr. Wyatt's frames have stiff angle irons for posts: braced with flat iron, and fitted with shelves of corrugated iron, they are strong, simple, and workmanlike. The more sacred deposits of valuables have two or three doors, each with its own lock; the outer one solid, the next pierced with openings, and the innermost an iron grating.

From the basement a hydraulic hoist ascends to the top of the building for the purpose of supplying coal to every floor.

Returning to the entrance hall, we were taken over the ground and upper floors. The departments to which the public require immediate access are near the entrances, and on the ground floor. The principal one (accountant's office) is, in fact, no other than a large, well-arranged banking-office, with its own cellars and strong-room. In the most remote, instead of, as is more usual, the most accessible corner, is placed the elaborate state staircase. At the foot of this stands Flaxman's fine statue of Warren Hastings, brought, like other statues here displayed, from the old India House, and here well lighted and well framed in an architectural recess.

This staircase, which is in stone, exemplifies fully the principle that Mr. Wyatt has followed in all the staircases. The stairs and their balustrades are kept within and independent of the larger architectural features which support the vaults and ceiling. This staircase is covered at the sides by a singularly disposed and somewhat wide-spreading flat ceiling, its centre being occupied by an octagonal dome, pierced by lunettes and having a central light. This dome is lavishly decorated with slightly conventionalised figures and rich foliage, excellently modelled in plaster. The State staircase gives access, with all suitable preparation of ante-room and lobby, to the Secretary of State's Room, an elegant, well-designed, oval apartment, about 26 feet long. The public may like to know that the room where the destinies of so many of our swarthy fellow-subjects are controlled by the Duke of Argyll is marked externally by the semicircular angle we have more than once alluded to. A private staircase descending from this apartment to an external door gives the Minister means of ingress and egress without observation.

The next most remarkable room is also on this (the principal) floor. It is the Council Room, and is square in plan, measuring 30 feet each way. Here, as in several other apartments, the walls are quiet in treatment, almost to plainness, but the finely panelled ceiling is connected with them by a deep cove pierced on the outer side by three openings; and here the quadrangle, the great glory of the India Office, best presents itself. The Council Chamber offers a most beautiful series of architectural pictures of it through its window openings. Nowhere has an architect such complete command of effect as when he can arrange that an interior shall certainly be seen from one point, and this advantage Mr. Wyatt has grasped and made all his own. The quadrangle at its highest part equals in size that of the Royal

Exchange (measuring 62 feet by 113.6 very nearly); but, being subdivided into a greater number of parts, it appears far larger. At the level of the ground and main floors a loggia of five bays and two small bays runs across each end, the sides having seven full bays and two small ones each, and the dimensions within the loggia being 60 feet by 80. The architecture recalls the work of the best Italian masters—such as Bramante—and enough use of coloured materials has been made to please the eye in an open-air quadrangle—hardly enough, we think, for a quadrangle enclosed, as all the world knows this now is, by a glass and iron roof. The ceilings of the loggias are in coloured tiles, the shafts of the columns in polished granite, and a frieze, with slightly coloured decorations, not in relief, runs round below the principal course. The effect of this is somewhat marred by the weather stains upon the stone, which, now that the quadrangle is become a vast hall, ought to be removed.

The glass roof over this court-yard is startlingly original. It is a skeleton panelled ceiling, with only the ribs and the centres of each coffer marked, and the flat ceiling itself removed, displaying above it an iron roof, glazed throughout, and abundantly ventilated. The lines which thus give the idea or symbol, so to speak, of a ceiling, are in metal, and worked into the construction of the roof, which, it may be well to add, Mr. Wyatt worked out himself, and not by deputy, as many architects are forced to do.

And here we must draw our account to a close, though our ramble extended over the entire building, through many rooms designed for and devoted to many different purposes. Everywhere there was the same abundant evidence of painstaking care and skill. Not an inch of space is lost, not a chance of getting light is thrown away; the corridor next the Foreign Office, which has a glass ceiling decorated by ornamental iron gratings, being the most noteworthy instance. Warmth is well diffused throughout; and at every corner, just out of sight, but conspicuously within reach, is to be found something like a gigantic leathern Catherine wheel. This is the fire hose, coiled up snug in a neat recess provided for it, but ready for instant use.

The main points of the building are, in our opinion, these—the importance of the corridors, and internal spaces abutting on the corridors, the staircases, the quadrangle, and the principal entrance. Varied as they are, these features all have a common character, and they all bear marks of that freedom in subjection to strict rule which is the secret of spirited Renaissance architecture. In many places the work is elaborate to the last degree, and narrowly perhaps escapes the character of appearing laboured; but it does escape. In the plainer portions, which depend upon proportion and correctness mainly, the eye is charmed and satisfied. A remarkable number of 'points of view,' or little pictures, occur—arranged by the architect as such, and purposely studied. At very many points the eye escapes upward—now up a staircase, now into a charmingly groined vault, with a series of star-like openings admitting light—now into a recess. In walking through, the abundant and equable distribution of light is so satisfactory that it was not till the difficulties, structural and otherwise, in the way of obtaining it were pointed out, that we became aware of the great pains taken to secure light.

Our last visit was to the drawings of the building; and they are truly remarkable. Every portion of the work was drawn out most conscientiously: not a moulding but was drawn full size; not an enrichment (and enrichments occur profusely throughout) but was also drawn full size—not merely sketched, but *bonâ fide* drawn. Most of them were then modelled, and carved or worked from the model. It may serve to give the initiated some little idea of the labour, time, and pains expended, if we say that there are supposed to be about 1,500 sheets of general and working drawings; not a few of them manuscript drawings and studies of the architect. For the benefit of the uninitiated we may add that a usual average size of these sheets seems to be two feet by four, which mounts up to 12,000 superficial feet, or more than a quarter of an acre of fine paper covered with draughtsmanship! That there was practical sagacity, as well as prodigal devotion of time and labour, the whole building evinces thoroughly; and in nothing is this more shown than in the fact that, if we are rightly informed, the bill of extras was one of the smallest ever known for a work of such magnitude. Messrs. Smith and Taylor were the contractors, and their work is thoroughly well done.

In his walk home the Rambler, musing on what he had seen, was forced to admit that, though that small section of Gothic architects who pride themselves on being able to see no beauty in Renaissance would probably not have felt the gratification he had felt, the public generally would not share their feelings. The work is good Italian Renaissance in its essential elements, and yet so freely treated as to be thoroughly original, and eminently English in those points where English habits of building differ from the Italian. It is full of picturesque beauty, as well as of care and symmetry. It appears impossible to find a corner where everything that required to be provided for has not been foreseen and arranged. If the building errs, it is on the side of too great elaboration; it even seems fairly possible that here and there as good a result might have been obtained with a less expenditure of means. But with all this care, spirit, life, and grace are not lost or overlaid; the work is a work of genius most patiently and conscientiously worked out, and constitutes a large item in a long series of claims on public gratitude, which all will be happy to see appropriately recognised.

SANITARY ENGINEERING.

A COURSE OF FIVE LECTURES ON MAIN SEWERAGE, DRAINAGE, AND WATER SUPPLY, delivered in the month of November, 1868, before the Royal Engineers, at their establishment, Chatham, by ROBERT RAWLINSON, C.B., Civil Engineer, F.G.S., &c. &c.

I.—INTRODUCTORY LECTURE—METEOROLOGY.

In the construction of many important works, engineers frequently find that they have to contend with the hostile action of the elements. Consequently it is not desirable merely, but absolutely necessary, that the technical education of engineers should include a study of METEOROLOGY—the science which (in addition to other phenomena) treats of the evolution of heat and moisture, of evaporation and condensation, of wind and rain, of ocean waves, river currents, and land floods.

For the purposes of this lecture, it appears desirable to omit detailed notices of abstruse meteorological questions concerning the origin of storms and electric phenomena, such as the formation of cumulous clouds, hail, tornadoes, water-spouts, &c. Considerations such as these, which are powerfully affected both by general causes and by local influences, would, on the present occasion, have a tendency rather to bewilder than to give information. To certain specific facts, accordingly, connected with the science of Meteorology, this introductory lecture will be devoted; and these facts will be set forth in simple language, my purpose being to lead you onwards, from first principles and elementary facts, to those conclusions which eventually I shall place before you.

This earth consists, on its surface, of ocean and dry land, the relative areas of the two being about in the proportion of 7 to 3. Assuming, therefore, the entire surface of the earth to be 200 millions of square miles, then the ocean has an area of about 140 millions of square miles, leaving an area of about 60 millions of square miles to the dry land.

Thus constituted at its surface, the terrestrial globe is enveloped with an atmosphere composed of oxygen and nitrogen gases, nearly in the proportion of two atoms of the latter gas to one of the former; and in combination with these two gases there also exists a fractional percentage of carbonic acid gas. In this atmosphere water is present in the form of vapour.

The one main source of heat to the earth and atmosphere, and probably of electric action also, is the sun. By the action of the sun, consequently, is produced all those phenomena of Meteorology which we have to consider.

Again, that great reservoir of water, the salt ocean, contains the prime fountain head of all fresh water, wherever and however it may be present, either upon the surface of the land, or within the stratified crust of the globe. And it is through the process of evaporation that all 'sweet' or fresh-water is obtained from the salt-waters of the ocean.

If the heat emitted from the sun were, year by year, uniformly the same, there would, necessarily, also be an annual uniformity of evaporation; and this would imply a prevalence over the entire surface of the globe of a corresponding annual uniformity in precipitation of vapour in the form of dew, snow, hail, or rain. On the other hand, the reverse of these statements is equally true: that is to say, irregularity in the emission of heat from the sun must be attended with a corresponding irregularity in the volume of ocean-water evaporated, which last irregularity must also in the same degree affect the volume of fresh-water obtained by precipitation. Whether the heat of the sun be year by year uniform in its degree, or whether it is periodically subject to fluctuating variations, it may be assumed as certain that the heat-giving action only varies within certain limits, and so conforms to every other known operation of nature. For, taking the entire earth into our consideration, we observe the grand phenomena of the elements obeying a law which, out of apparent irregularity and inequality, brings forth practical equality and order—just as the pendulum ever beats true time in its swing, however great or however slight be its motion. Such is the variety that pervades nature's working; and such may be the variety in the transmission of solar heat to this earth; that so, in a series of years, an average temperature will be determined, to which may be referred all those complex and wonderful changes that are perpetually taking place on the surface of the globe.

The leading facts to be recognised by engineers are these: Evaporation from the ocean being caused by the heat of the sun, necessarily depends upon it; and in proportion to this heat is the volume of water that in each year is evaporated. The vapour, whatever its volume, that is carried up into the atmosphere, must again be precipitated in the form of fresh water. These grand evolutions of the elements can be brought under control by no human power; and, therefore, engineers should consider themselves bound to act under the guidance of a knowledge of their true character, and with a consciousness that their works must be subject to them.

While mindful of the existence and the operation of the law of compensation, engineers will feel that it rests with them to provide against the diversified variations and violences of natural incident that mark the course of time. Engineers, in other words, have to make provision to meet conflicting contingencies, such as droughts and floods. We will proceed to consider certain of these which a study of meteorology will press forcibly on their attention.

Experience has demonstrated that in different countries and climates the annual volume of rain which falls is subject to very considerable variations. In the equatorial regions, for example, where the sun's heat is greatest and most powerful, evaporation is necessarily most copious and the rainfall is heaviest; and, as we approach either pole, with decreasing solar heat evaporation decreases and the rainfall exists in a proportionately diminished volume. But in no region of the earth's surface does evaporation cease. Evaporation, vary as it may, is general and constant. It takes place incessantly, wherever the ocean extends. Even icebergs and the broad floes of the polar oceans evaporate. In tropical regions as well as in the colder zones of the earth's surface, vapour is constantly passing into the atmosphere, again to be condensed and to become fresh water. And at all temperatures (boiling or freezing) this act of evaporating water implies the absorption of latent heat, which heat is again given out, some-

times accompanied by lightning and thunder, when invisible vapour is condensed into water, whether as hail or rain.

Again, the fall of rain is not only determined by the amount of invisible vapour which is carried up into the atmosphere, but it also is materially affected by terrestrial causes, such as latitude, the relative position of land and water, plains, valleys, and mountains, which all act and react upon the process of precipitating vapour into rain. This may be illustrated simply by what takes place year by year in our own country. In England the annual average fall of rain is from 30 to 36 inches. The distribution of this rainfall, however, appears to be singularly arbitrary, as the average fall of rain in one portion of the Lake districts is not less than 150 inches in each year; and even 300 inches of rainfall has been experienced at Styhead. In contrast with this, on a portion of the eastern coast of England the average yearly fall of rain does not exceed 20 inches; and, in a dry season, it sinks down to 14 inches. In the Thames valley, the average yearly fall is from 25 to 30 inches. On the western coast of England, as also on the southern, the rain which regularly falls year by year, considerably exceeds in volume the rain fall on the eastern coast. This result is produced by a greater local prevalence of the south-west wind, which brings in the vapour-laden atmosphere from the Atlantic Ocean (influenced by the Gulf-stream), and the mountain ranges; so that much of this vapour, as it sweeps towards and over the backbone ridge of our island, becomes condensed, and precipitates heavy rains in the districts that lie towards the south and the west.

Again, during the actual descent of the heaviest rain over any area of fall, the process of evaporation is maintained in operation. Recent researches have led to the discovery that, in England, the amount of constant evaporation is greater than previously had been supposed. There do not appear to exist any certain data which may be accepted as determining accurately the comparative amount of constant evaporation in the tropics. But, if we take the valley of the Thames, which contains an area of about 5,000 square miles, and where the yearly average rainfall amounts to 25 or 30 inches, here we find something nearly approaching to two-thirds of the entire fall of rain evaporates and passes again, in the condition of invisible vapour, into the atmosphere. That is to say, in other words, about two-thirds of the entire volume of the rain that falls upon the area of the Thames valley, and is there measured in the rain-gauge, is not measurable in the river or in any of its numerous springs and feeders; nor could this large proportion of the whole yearly rainfall be admitted by an engineer into his calculations for any works to be constructed by him for water-supply in the valley of the Thames. He could really rely only upon one-third of the true rainfall, and of that third one-half would pass away in floods, and the other half by perennial river flow. Once more: take the valley of the Lee, a tributary of the Thames, having an area of 500 square miles. Here four-fifths of the rainfall is not measurable to the river—a fact which has been determined by accurate gaugings taken during the last twenty years. It has been demonstrated that four-fifths of this rainfall passes away through re-evaporation.

I now desire to direct your attention to some important considerations in connection with 'averages.' In questions of water-supply engineers have been in the habit of considering that they have to deal with averages. It is necessary that you should distinctly understand when and how averages are fallacious. An average is useful and valuable when an appeal is made to it to indicate the general difference that exists between one district and another district. But if averages of annual rainfalls in any particular locality, for however long a period taken, should be accepted and adopted as giving the true basis upon which either sewers or works for providing a water-supply should be projected, subsequent experimental test of use and supply would be certain to show that the engineering works had been designed and built upon misleading data. The engineer, in such a case, would find that the averages, to which he had trusted, had misled him. This arises from the fact, that his averages had made no provision for encountering and dealing with occasional excesses—excesses, probably, which may occur only at long intervals, but which, when they do occur, are both sudden in their appearance, and violent in their operation. Averages extending over a period of from fifty or more years would be required, in order to secure their including and accounting for occasional excess; and even then an average would fail to indicate the amount of precaution that would be required to meet and provide against the recurrence of a maximum excess.

The average fall of rain for the entire surface of the earth may be assumed at 150 inches; and if we apply the rule of $\frac{1}{3}$ less for a dry season, and $\frac{1}{3}$ more for a wet season, the dry season would give 100 inches, and the wet season 200 inches. If any such variation can be even approximately settled, we may then conclude that there is a corresponding annual variation in the heat and evaporating power of the sun.

Large districts of the earth's surface are rainless, and other districts are exceptionally wet. Some mountain ranges are so lofty as to prevent vapour passing over, whilst other ranges and groups of mountains act as condensers, attracting the moisture-laden atmosphere around to precipitate it in almost unceasing rain. Africa presents examples in the Great Desert for drought, and in the sources of the Nile for rain.

I must here advert to another fact that bears upon our inquiry at the present point. I constantly hear assertions to the effect that *something* has taken place in the course of events, which has caused an alteration in the character of the seasons. It is certainly true that cultivation modifies climate over tracts that have been cultivated; but it is asserted, further, that in various parts of the world, through cutting down forests, and in consequence of certain other operations, the works of man, climate has been so far modified as to have its character absolutely changed—'The Thames is not now frozen over as in times past,' &c. If by assertions such as this it should be intended to be implied that any works of human hands have actually altered the current course of nature, I must meet every such allegation with a positive denial. The most stupendous of human works can affect only the comparatively small and narrow space of the earth's surface upon which they may have been executed. Evaporation has only an indirect and incidental reference to the land—its real dependence is on the great ocean, and the infinitely greater sun. And so, while

man may exert an influence upon climate over the little area of his operations, his works can avail nothing to affect the grand features of nature, or to disturb the majestic scale on which she accomplishes her purposes. Meteorology is unaffected, and must continue to be unaffected, by human agency. The powers of man can never seriously modify sunshine, cloud, rainfall, or climate, as these have reference to the world at large. All statements, therefore, which would assign cosmical atmospheric effects to the cutting down of forests, to land drainage, cultivation, and such like agencies, must be treated with practical disregard. The climate of the world is not altered, cannot be altered by its human inhabitants. Floods will continue to occur in time to come, as they have occurred in time past; it will be precisely the same with droughts, and other natural phenomena. These are possible or probable incidents for which the engineer must make provision; or, rather, they are incidents certain to recur, the conditions of their recurrence, and the periods also, alone remaining uncertain; and, as such, the engineer must regard them. Indeed, he must learn to comprehend the elements when in their wildest moods, and to be prepared to encounter them when in such moods as at once his duty and his privilege. Hence, when an engineer finds himself placed in some new country where he is required to erect works, if it should be possible for him to ascertain that in that country, at certain periods of the past, the elements had exhibited strange and anomalous excesses, he may rest assured, unless some cosmical change has intervened, that no decided and permanent modification of climate has been produced by whatsoever cause, which has power to prevent the recurrence at some time or other of similar excesses. If there have been devastating floods, similar excesses must be prepared for; or engineering works built in disregard of such warnings may not be competent to withstand meteorological excesses, but will be liable to serious damage: such works may even be swept away before the eyes of their constructors. About two years ago this truth was exemplified under my own observation in a remarkable manner. At that time I was instituting official inquiries concerning the pollution of rivers in the West Riding of Yorkshire. Persons who appeared before me for the purpose of giving evidence connected with the inquiry, and who were questioned on these points, were unanimous in rejecting the idea of there occurring any such floods in those rivers as were well known to have occurred there forty or fifty years before. They were positive in their evidence that no such incidents could possibly ever take place again; and the reason for so decided a conviction they declared to rest on the changes that had (as they considered) unquestionably been wrought in their climate by drainage and cultivation. Before my inquiry had, however, been brought to its close, while I was sitting at Halifax a heavy rain commenced, which continued for two days, and it proved to be at least as serious in its effects as any of its predecessors. The whole range of the valleys of the Aire and Calder was flooded; streets in towns were laid deep under water, mills and houses were inundated, bridges were washed down, cattle were drowned in their pastures, and human lives were also sacrificed; and the losses inflicted upon property in the district, arising out of this two days' rain, were variously estimated to amount to from half a million to a million sterling. Here was a startling practical comment upon the popular theory, that climate and rainfall had been subjected to fresh conditions through the intervention of land draining and cultivation.

While thus the truth remains that, on a grand scale, man is powerless to affect the elements, observant care and forethought may accomplish much to protect property from such injuries as are occasioned by sudden but natural occurrences. Had the local authorities been careful not to obstruct and ill-use the streams, and had they as carefully avoided the erection of various structures by which the free course of flood-waters was necessarily impeded, the valleys of the Aire and Calder might have been saved from the most serious consequences of the sudden heavy rainfall to which I have just adverted. In one great establishment in the Calder valley, where the flood-waters had risen four feet above the mill-floors, and had submerged carding engines, looms, web, warp and cloth, I was informed by the proprietor that this was the fourth occasion of the recurrence of a similar catastrophe. And yet nothing had been done, and apparently no effectual course of action was in contemplation, which might anticipate another flood, and prevent a fifth destruction of a similar character.

(This Lecture will be completed in our next number.)

THE LATE REV. J. L. PETIT, M.A.

BY ALBERT HARTSHORNE.

THE literary and archaeological world has experienced a great loss in the lamented and unexpected death of the Rev. John Louis Petit. He was son of the Rev. John Hayes Petit, by Harriet, daughter of Mr. Astley, of Dukinfield Lodge in Lancashire, and was born at Ashton-under-Lyme in that county, May 31, 1801. The family is, as the name implies, of French extraction, and has its origin from the 'Petit des Etans,' of Caen in Normandy. The revocation of the Edict of Nantes was the cause of their removal to this country, where the immediate ancestor of the present family was a brigadier in the army of William III.

Mr. Petit was educated at Eton, where he acquired such distinction as to become a contributor to the *Edinburgh*, in conjunction with Præd, H. N. Coleridge, Moultrie, C. H. Townshend, and other men of high mark. From Eton he went to Trinity College, Cambridge, where he had a successful career, and took his B.A. degree in 1823, when he was twenty-fourth senior optime in the mathematical tripos, the same year that Airey, the Astronomer Royal, was senior wrangler, and the year before the classical tripos was established.

It may be almost said that he began sketching as soon as he was

able to hold a pencil. His early drawings in pencil and Indian ink are very delicate and correct, and the vast number of sketches which he made through a long series of years are evidences of his zeal and energy. It was with no selfish motive that he devoted his time and thoughts to art; his numerous and valuable publications show a masterly knowledge and appreciation of the subject, and are replete with illustrations from his own drawings, while his graceful language added to his facile pencil make the perusal of his works as much an intellectual as an architectural treat.

From the very first his favourite subjects were old churches, and he was well acquainted with, and had sketched, the best examples in England before travelling much on the Continent. His first extended tour was in 1839, and his first published work on Church Architecture, which appeared in 1841, amply testifies to his labour in France, Germany, and Italy, and his thorough acquaintance with the matter.

The foundation of the British Archaeological Institute at Canterbury in 1844, at which he assisted, opened a wide field for his exertions, and the pages of the Institute Journal from that time are well stored with his valuable contributions to architecture, all profusely illustrated from his own drawings.

Among these may be mentioned an Architectural description of the beautiful church of Tong, published in 1845; in the following year appeared an account of the Cathedral of St. German's, in Peel Castle, in the Isle of Man; and 'Remarks on Beverly Minster.' In 1847, Architectural notes in the neighbourhood of Cheltenham, a valuable local contribution. In the same year 'Remarks on Wimburn Minster;' and in 1848, 'Remarks on Southwell Minster,' with copious illustration worthy of such a subject. In 1849, 'Architectural Notices relating to Churches in Gloucestershire and Sussex.' In 1850, 'Architectural Notices of the curious Church of Gillingham in Norfolk,' with complete illustrations; and in the same year appeared a learned account of Sherbourn Minster. In 1852, an Account of Brinkburn Priory; a paper upon Coloured Brickwork near Rouen, and careful notices of Ecclesiastical Architecture in France. In 1853, the 'Architectural History of Boxgrove Priory.' In 1858, 'Architectural Notices of Buildwas Abbey.' In 1860, on the Architecture of Shiffnal Church. In 1861, Notes on Circular Churches, besides Notes on Irish Abbeys, on Mediæval Architecture in the East, and many others. Mr. Petit's principal work, 'Architectural Studies in France,' which appeared in 1854, is a learned production, full of sound judgment, and embodies his extensive range of observation in that country. It is charmingly illustrated by woodcuts of the finest kind, and by fac-similes of his own anastatic drawings. His 'Account of Tewkesbury Church' is one of his best architectural works, and his lecture on 'Architectural Principles and Prejudices' is conspicuous from its beauty of thought and language.

But it was as an accomplished artist that Mr. Petit was best known. It is impossible to speak too highly of the beauty of the vast number of sketches from nature that he has left. With a correct eye for proportion and colour, and a rapid hand, he invariably finished his drawings on the spot, and the power and breadth that they display have been seldom equalled, for he represented a school that unfortunately has had but few followers.

In the presence of such a number it is indeed difficult to particularise any of them; but those of Lichfield, Tewkesbury, and St. Paul's may be mentioned as perhaps among the finest; the sketches from Italy and Greece are from the hand of an acknowledged master; and some striking drawings—the result of a tour in the East and on the Nile in 1864-5 can hardly be passed over in silence. They each alike display an unusual vigour of handling and an intimate knowledge of colour and perspective. His numerous drawings of shipping are admirable productions; the etchings on copper which have appeared in most of his published works are from his own hand, and are full of delicacy and refinement; and his drawings in pen and ink are well known for their great boldness and effect. His paintings in oils are, comparatively speaking, few, and are not generally known; they partake much of the character of Turner, and have considerable grandeur of colouring.

Mr. Petit was a Fellow of the Society of Antiquaries, honorary member of the Institute of British Architects, a member of the Archaeological Institute, and of many other learned and archaeological societies; a member of the Athenæum, a Governor of Christ's Hospital, and a liberal supporter of very many charitable institutions. That he was a scholar of refined taste is evidenced by his writings; and his good deeds bear ample testimony to the benevolence and generosity of his disposition. Those who had the advantage and privilege of his intimacy mourn the loss of a genial companion, and of a kind and constant friend; and it will be long before the void can be filled which the sad event of his death has occasioned. He entered into his rest December 1, 1868.

ROYAL ACADEMY PRIZES.

ON Thursday, December 10, the Royal Academy held its annual distribution of prizes, and considerable interest was excited by the circumstance that this was the last time that this ceremony would take place in the present building, and also by the competition for the travelling studentship, for which two out of the competing works—viz., 'The Last Song of the Girondins,' and 'The Day after the Funeral,' the former by Mr. Calthrop, and the latter by Mr. Holl, a son of the engraver—were works of more

than average merit. The students and visitors having proceeded to the lecture-room, and the President and members having taken their seats, the various prizes were then distributed. The travelling studentship was awarded to Mr. Holl, and the announcement was received with much applause. The prize for the painting from the life went to Mr. Stocks, the clever son of Mr. Lumb Stocks, A.R.A. Mr. Britton received the prize for the best drawing from the antique; whilst a lady, Miss Aldham, carried off the copying medal.

This part of the ceremony being concluded, the President addressed a few remarks to the students. He informed them it was the last time they would meet in that room for such a purpose, and enlarged upon the advantages which would accrue to the students in their future home. He further urged them to prosecute their studies with ardour and attention, as they might expect in future a greater amount of competition, arising out of the establishment throughout the country of so many local schools of art. After a few other observations he closed his speech, and the proceedings terminated.

Later in the evening the members of the Academy assembled in Willis's Rooms, to sup together, in celebration of the centenary of the Academy's foundation. Several able and eloquent speeches were made during the course of the evening. The President, in proposing the toast of 'Success to the Royal Academy,' took occasion to express the hope that the members would endeavour to enter as good an appearance as possible at the next exhibition at Burlington House. The festivities were prolonged to a late hour.

On the same evening the students held their annual supper at Simpson's, and on this occasion over a hundred students, past and present, were assembled. There were also present several visitors, among whom we noticed Messrs. Marks, Prinsep, Wynfield, Montgomery, Rankine, &c. The usual loyal and complimentary toasts were duly proposed and acknowledged, amongst them being the toasts of the evening, the successful and the unsuccessful candidates, the former responded to by Mr. Brock, and the latter by Mr. Calthrop. The proceedings were enlivened by the delivery, by some of the students, of songs, humorous or sentimental. The company broke up shortly after one. The following is a full list of the awards of the evening:—

Restoration from the antique	Mr. Brock.
Travelling studentship	Mr. Holl.
Drawing from the life	Mr. Haines.
Painting from the life	Mr. A. Stocks.
Drawing from the antique	Mr. W. Britton.
Model from the antique	Mr. Brock.
Premium drawing	Mr. Westlake.
Copying medal	Miss Aldham.
Architectural travelling studentship	Mr. H. Marshall.
Perspective and sciography	Mr. Block.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

The Southern Thames Embankment.

Although the Embankment on the Surrey shore differs from that on the Middlesex, in not being one of the lions to which eminent personages and foreigners of distinction are introduced, it is an undertaking of great magnitude, a valuable public improvement, and a very interesting engineering-work; and although it is not so elaborate and costly a structure as the Embankment of the northern side of the Thames, the fact of the new St. Thomas's Hospital being built on the land reclaimed by it from the foreshore, and opposite to the Houses of Parliament, gives an interest to this part of the river second to no other portion of its course.

The new roadway at the back of the hospital, from Stangate to Vauxhall, will be shorter by above 1,000 feet than the present tortuous route through narrow back streets, and will afford very great accommodation for the heavy traffic from Nine Elms to the City and Southwark, as well as the general light traffic, by supplying a good road, and reducing the distance so much.

As an engineering work the southern Thames Embankment does not offer so many examples of special construction (such as landing stairs, water-gates, &c.) as the northern, but may be said to be an almost unbroken length of river wall from end to end, except that there is a landing stairs at Westminster Bridge for small boats, and the Lambeth steamboat pier, which will be modified to suit the new state of things. There are four openings in the new river wall above Lambeth Bridge, for entrances to private docks, &c., three of these having lock gates. The fourth is a public draw dock from Broad Street down to a barge bed on the foreshore in front of the wall. The road and footways are carried across these openings on cast iron girders and brick jack arches.

The special feature in which this Embankment differs from the northern is, that whereas the latter is continued for its whole length along the foreshore and in the river, the line of the southern Embankment runs along the foreshore from Westminster Bridge to Lambeth Bridge, beyond which it gradually cuts into the land opposite Millbank for a length of about 1,100 feet, the part outside the new wall being removed, and the foreshore dredged to low water mark, and the river consequently widened to the extent of 100 feet. The additional area given to the river will be nearly two acres. This space was formerly covered with rickety waterside premises and rotten dwellings, besides other abominations, such as bone and soap boilers' works, &c., which are now cleared away.

The wall itself may be said to be built of concrete faced with granite; for although it was designed to be a brickwork backing with counterforts at intervals, the spaces between which were to be filled in with concrete, these rick counterforts and backing were abandoned, and the whole constructed

in Portland cement concrete, in the proportion of six of ballast to one of cement by measure. By this system there will be a considerable saving in the cost of the whole work, amounting to several thousand pounds, and there is no doubt but that the concrete is as good if not better for the purpose required than the brickwork as originally intended. Some of the arches under the Westminster Bridge landing stairs, and also those under the boundary wall between the hospital and the river promenade, were constructed by M. Coignet in his *béton aggloméré*. The materials composing the *béton* are cheaper than the constituents of the Portland cement concrete (6 to 1), and when set, the *béton* is smoother on the face and looks better; but the labour necessary in mixing and moulding to the required form, by ramming, &c., over the centering caused the *béton* to be considerably more expensive than ordinary concrete, which was employed in the construction of the adjacent arches, and found to answer the purpose equally well, at about two-thirds of the cost.

Although it is intended to terminate this embankment at Gun House Alley, near the works of the London Gas-Light Company, we trust we may see it extended at some future day to Vauxhall Bridge.

Important Legal Decision.

A legal question of interest and importance to the architectural profession of Germany has recently been decided at Cologne. In illustrating a work describing the Cathedral of that town, the author, a Mr. Franz Schmitz, made use of and published certain drawings belonging to the 'Dombau Verwaltung' (or Executive Committee entrusted with the completion of the Cathedral), without authority or permission to do so. The consequence was that they brought an action against him for 'art piracy,' and judgment being given against Mr. Schmitz, all copies of his work which were found unsold at his publisher's have been seized and destroyed.

Opening of the Team Valley Railway.

The new line of railway from Newcastle to Durham has recently been opened for public traffic. In itself no very great undertaking, it becomes important when considered as part of the future main line from York to Edinburgh. This will not be the case till the further extension from Durham to Ferryhill is completed, which will probably take two or three years; but after that time the long and circuitous route by Leamside will be left principally for goods traffic, and the principal passenger trains will pass over the new line.

The portion already opened—known as the Team Valley—leaves the present main line immediately after crossing the far-famed High-level Bridge at Newcastle, and, turning sharply to the west, passes into a richly-wooded country, and at a short distance from Ravensworth, Lambton, and Lumley Castles, and from the fine old church of Chester-le-Street. From Newcastle to Chester-le-Street the line passes over level country; but, at the latter place, three deep valleys have necessitated viaducts of considerable dimensions—the largest consisting of eleven arches, each of 60 feet span and 20 feet rise. The extreme height of this viaduct is 90 feet. The arches in all three are semi-ellipses, the materials used being brickwork in lime for the piers, and in cement for the arches. The whole of the work is very plain, and without any particular architectural character; and, from the peculiar curve adopted in the arches, has by no means a pleasant effect—very different from the really grand viaduct on the old line at Durham. The stations are plain, but commodious, and, with the exception of the one at Gateshead, are of red brick. A new system of points and signals has been laid down at the junction with the main line at Gateshead, and was highly approved of by Captain Tyler, the Government inspector. The whole line has been constructed from the designs of the North-Eastern Company's engineer, Mr. Harrison Hodgson, Mr. Bailey being resident engineer.

Poplar and Stepney Sick Asylum Competition.

The managers of this asylum district have now arrived at a decision on the designs which were received, on September 26, in response to their invitation. The competitors were Messrs. Giles & Bevan, Wilson, Bresssey, Hill & Fletcher, Worthington, G. G. Scott, jun., Blashill, Hammack & Lambert, Morris, Harston, and Bracebridge. The estimates showed somewhat more than the usual diversity, ranging from 33,000*l.* to 72,000*l.*, no material difference in the amount or style of accommodation being apparent to account for so wide a difference. After having employed a surveyor to assist them in coming to a decision, the managers have accepted the design of Messrs. Harston as being the most suitable for their requirements, that of Mr. Wilson being placed second. The second competitor receives a premium of 60*l.* Those whose designs have not been selected will receive 40*l.* upon the condition that the drawings are to remain the property of the managers. There is, however, good reason for believing that this condition will not be insisted on.

As considerable interest has been expressed by the profession in the mode of payment proposed by the managers of the various poor law asylums now about to be established, it will be useful to note that the commission of 3½ per cent. upon the work, which is to be paid to the selected competitor in this case, added to the sum of 420*l.* which has been paid to the other competitors, will amount to near 4½ per cent. upon the anticipated cost of the work. This consideration, coupled with the fact that several pavilions would be all but exact copies of one model, doubtless influenced the architects invited in their acceptance of the terms proposed to them. The competition seems to have been conducted throughout with a creditable desire on the part of the managers to avoid unwise restrictions and to deal fairly with the competitors.

Rotherham Hospital and Dispensary Competition.

The particulars of this open competition have been issued. There are to be prizes of 75*l.*, 50*l.*, and 25*l.* for the three designs placed first, second, and third in order of merit. Amongst the thirty-three conditions of the competition (many of which are formed on the model of those generally adopted in the Metropolitan Asylum competition) the only clause referring to the payment of the selected architect stands as follows:—

'The successful competitor shall carry out the work for a percentage on the outlay, less 50*l.* of the prize sum.'

It will be obvious that this clause leaves it open to the hospital authorities to bargain with the architects for a rate of remuneration lower than that usually accepted by the profession, and that the result of this course would probably be to place the recipient of the first prize in a position which might be anything but successful. It is to be hoped that the authorities will, in their own interest, see the propriety of at once modifying this objectionable clause, so as to make it clear that they intend to pay the full usual commission of 5% per cent. on the outlay, especially as the proposed cost of the building—4,000*l.* to 4,500*l.*—is so small that no repetition of parts can be anticipated. It remains to be seen whether any architects possessed of proper qualifications will notice this competition as it now stands.

Competition for the new Hôtel de Ville of Vienna.

The architects of all countries are invited to send in designs for a new Hôtel de Ville for the Austrian capital. The municipal council of the city offers twelve prizes, namely, four of 4,000 florins (about 400*l.*), four of 2,000 florins, and four of 1,000 florins. The jury is to be composed of five members of the council and five architects, Austrian and foreign, not taking part in the competition, under the presidency of the burgomaster or the sous-préfets; and, besides awarding the prizes, will draw up an approximate estimate of the cost of the best design and submit it to the municipal council.

When the council has accepted the plan to be executed, the author of it will be entrusted with the work on terms to be settled between him and the council, and he will be bound to make such modifications as the council may desire.

The prize plans will be exhibited publicly for three weeks, and remain the property of the municipality.

The conditions of the competition are as follows:—The plans are to be sent in to the municipal council of Vienna not later than twelve o'clock on the first day of September. The general plans are to be drawn to a scale of half an inch per *toise*; * the views of the exterior façades and of the courts to a scale of $\frac{3}{4}$ inch; and the chief details to the scale of two inches to the *toise*. The sections, details, dimensions, and descriptions are required to be very full and explicit. Full particulars, with plans of the site, are to be obtained by application to the Consulat Général d'Autriche, 21 Rue Laffitte, Paris.

The structure will be very large, consisting of four separate buildings, each containing four or five storeys. The following extracts from the programme will give an idea of the amount of accommodation required:—The number of halls and offices to be on the ground floor is more than forty, and amongst these are a public hall to hold at least 500 persons, with about 200 square yards of superficial area; a large office, with an area of 640 square yards; four other apartments of about the same size as the first-mentioned; and ten others, varying in area from 80 to 160 square yards. The plan includes, besides public halls, offices for all departments of municipal administration, residences for numerous officials and servants, stables, coach-houses, and offices of all kinds, nine apartments for libraries and record offices, a museum with an area of 1,000 square yards, a chapel, a suite of seven rooms for grand fêtes and receptions, covering, with the necessary offices, a space of 2,320 square yards, and a large hall for the municipal council.

General.

The South Kensington Museum are now exhibiting daily, at the galleries overlooking the Horticultural Gardens, the Meyrick collection of armour, the Townshend bequest of British and foreign pictures, the collection of British arms and ordnance, naval models, and designs for fans, executed by female students in competition for prizes.

During the last twelvemonths, the number of houses erected in the parish of Chiswick has amounted to 52, an average of one per week. Building had been at a standstill in this parish for many years previous. For the forthcoming year, estimates for 500 houses are out.

It is reported that the Prince of Wales has taken Chiswick House, adjoining the Horticultural Society's Gardens, for his children.

According to a report recently read before the St. Nicholas Restoration Committee, Newcastle, it was stated that the Town Council had agreed to levy a voluntary rate of 3*d.* in the pound for the new works, in conformity with the plans and specifications of Mr. G. G. Scott.

Archbishop Manning has issued an appeal on behalf of the proposed new Roman Catholic Cathedral at Westminster. The site will cost 36,000*l.*, of which 15,000*l.* has been paid; the donations and promised subscriptions by the end of 1874 reach 14,000*l.*, and a deficit of 7,500*l.* remains. The style will be the Early English. Mr. Clutton is to be the architect.

The Company formed for building a bridge across the Straits of Dover, on the system of M. Boutet, being desirous of erecting a model bridge in or near London, have made an offer to the vestry of St. Pancras to build a bridge over the Regent's Canal near Gloucester Gate, at one-third less cost than any other system, and without interfering with the traffic.

The Building Fund for the new Infirmary at Kidderminster now reaches the sum of 5,400*l.* Nearly 7,000*l.* will be required.

The Society of Painters in Water Colours has resolved to cooperate in a scheme for the creation of a grand School of Fine Arts in the metropolis, and thus taking advantage of the legacy bequeathed by Mr. Slade for encouraging the study of the Fine Arts.

A Church Spire fell at Colchester on Monday last. The church is quite a new building, having been erected only about five years ago, at a cost of 5,000*l.*

A New Church has just been erected at Somers Town, London, from the designs of Messrs. Newman and Billings, architects. The entire cost of the church and schools adjacent is nearly 15,000*l.*

The plan of imposing a sewer tax at Rotterdam, which lately gave rise to some disturbances, has been withdrawn by the municipality, and replaced by an increase in the port dues and trade licenses. The committee has, moreover, fixed ten years, instead of five, for the execution of the works connected with the junction in that town of the Moerdyk Railway with the Dutch and Rhenish lines.

Fall of a Bridge near Gateshead.—The bridge over the river Derwent has fallen. The accident has been caused by the strong and rapid flow of the river in consequence of the heavy rains.

Westbromwich Hospital.—The plans of Messrs. Martin and Chamberlain, of Birmingham, have been adopted. The site of the proposed building will be on the Lodge Estate, Westbromwich, in Edward Street, at right angles to Lombard Street, and the ground contains 6,000 square yards. It is hoped the excavations will be commenced in March. The building will cost between 5,000*l.* and 6,000*l.*

A New Gauge.—It is proposed, among the schemes for improving London traffic, to make an open railway, with a three-foot gauge, from Islington to the Moorgate Street Station of the Underground Railway.

Engineering Projects for Uniting Liverpool and Birkenhead.—Since the project of tunneling the Mersey, explained by Sir Charles Fox at a meeting held in Liverpool the other day, has been before the public, Mr. J. Patterson, the President of the Liverpool Chamber of Commerce, has received a communication from Mr. Grainger, proposing a scheme for increasing the dock accommodation and bridging the Mersey by utilising the existing sandbanks, forming, in fact, islands of docks and warehouses, and using the red sandstone, which forms indisputably the bed of the river, as foundations for the warehouses and for abutments of bridges.

We regret to hear that the restoration of St. Mary Redcliff is partially suspended for want of funds.

A new iron bridge, of light and elegant structure, has been erected at Sterne Mills. It springs from solid stone abutments, and is supported in the centre by two hollow iron columns.

The Contract for building the nave and aisles of the new church for St. Swithin's parish, Lincoln, was signed on Tuesday last, by Mr. Lovelee, the contractor, and the members of the Church Building Committee. The contract price for this part of the work is 4,295*l.*

The First Protestant Church on Spanish soil has lately been opened at Mahon, in the Island of Minorca. The municipality of Barcelona have offered the Protestant community the privilege of founding a church in that city.

Four Thousand Miles of Railway have been completed in Hindostan, and one thousand more are projected or commenced.

The restoration of the parish church at Kendall has been recently completed. The works have been carried out from the designs of J. S. Crowther, Esq., architect, of Manchester, at a total cost of upwards of 11,000*l.*

Fall of a Church Tower.—The new tower of the parish church of Moirans, France, has fallen to the ground, doing considerable damage to the roof and nave. The cause of the disaster was the elevation of the structure without means being taken to strengthen the base, which at last gave way beneath the additional weight.

New Baptist Chapel at Oakes, Lindley.—A new chapel has been erected at Lindley, near Huddersfield. The total cost of the building is 5,500*l.*

It is proposed to construct an iron promenade pier, similar to that at New Brighton, at Douglas, Isle of Man.

A Chapel Blown Down.—A new Wesleyan Chapel, at Littlemoor, Pudsey, has been blown down. The foundation stone was laid on May 2.

A beautifully-designed sarcophagus, of Greek style, designed by M. Baltard, architect, has been placed over the grave of Ingres in Père la Chaise. M. Broussieu's bust of the painter surmounts this work.

A Modal Mortuary.—The Vestry of the parish of Marylebone erected a large public mortuary in the burial ground, Paddington. The building has been erected by Messrs. Temple and Forster, of London Street, Paddington, from drawings prepared by Mr. Browning, the Vestry Surveyor. In the interior, ventilation seems to have been a primary object, and decorous ornamentation also seems to have been well studied, as there is a row of four ornamental cast-iron columns down each side, which not only help to support the iron bearers fixed into the walls to hold shelves for the reception of a large number of dead bodies, but they also sustain the girders which uphold a very handsome roof, from the centre of which the room is lighted with gas on a new principle.

A Church in course of construction at Linière, in Luxembourg, fell to the ground a few days back, killing one workman and seriously injuring four others. The pillars had been made too weak for the superstructure.

The following particulars as to the works in progress at the Cathedral of Cologne have been recently given:—A steam-engine of 8-horse power will be used from the commencement of next spring to raise the stone for the tower instead of the crane hitherto employed. The calculation is that a block weighing 4½ tons can be raised to the height required by means of this machine in four minutes. The tower is expected to be terminated in seven years and a half. But an important question still remains to be solved as to how the finial, which is to complete the spire, should be arranged. Probably a hard stone will be employed, in which case the ornament will necessitate the construction of a scaffolding 525 feet in height.

A market and baths are about to be erected near the 'Royal Oak,' Paddington; at least, a bill to that effect has been filed.

The Monument to the memory of Ponsard has been designed by M. Viollet-le-Duc. It is to consist of a bronze statue, to be erected in front of the Hôtel de Ville, in the dramatist's birthplace, Vienne (Isère).

* The *toise* of Austria is equal to six feet, and the Austrian foot is longer than the English in the proportion of 31,611 to 30,479.

Meetings of Learned Societies.

THE GAZETTE.

PARTNERSHIPS DISSOLVED.

J. & W. Bland, Keighley, machine makers—Todd & Kitson, Bridge End, Mold Green, near Huddersfield, joiners—Snelling & Derby, Edgcombe Road, Cambwell, builders—Wallen & James, Queen Street Place, Southwark Bridge Road, architects—Stowe & Slocombe, Cardiff, cement merchants—Henry Collyer & George Adams, Weyvil Road, South Lambeth, timber merchants—Sampson Godden & Edward Webb, Upper George Street, Bryanston Square, builders—Robert Griffith & George Gedge, Moray Road, Tollington Park, Holloway, builders—Ned Marsden, Joseph Haigh, & Edward Marsden, Dewsbury, Yorkshire, builders.

BANKRUPTS.

LONDON.—George Godbolt, King's Road, Chelsea, builder, Jan. 7, at 11—Charles Blackmore, late of Oxford Street, decorator, Jan. 20, at 1—Robert Bragg, St. James's Road, Holloway, dealer in building materials, Jan. 7, at 1—Thomas Eames, Benfield Street, York Road, Battersea, builder, Jan. 20, at 2—Charles Gideon Jeffries, Myddleton Road, Hornsey, builder, Jan. 7, at 12—John Charles North, Thurlow Villas, West Dulwich, Surrey, builder, Jan. 7, at 2—William Bicombe, late of Beaumont Mews, builder, Jan. 14, at 2—John Collins, late of Norfolk Street, contractor, Jan. 25, at 11—William Henry Hammer, East Dulwich, builder, Jan. 13, at 12—William C. Livermore, Victoria Park Square, builder, Jan. 14, at 2—Samuel Stuart, late of Stanley Street, Battersea, contractor, Jan. 25, at 11.
 To SURRENDER IN THE COUNTRY.—Joel Bromfield, Wilmington, builder, at Honiton—John Price, Newport, Monmouthshire, builder, Jan. 8, at Bristol.

DECLARATION OF DIVIDEND.

M. Topsham, Wigzel, manufacturer of the patent double-acting ventilator, further dividend of 11½d., on any Tuesday or Friday, at Mr. Carrick's, Exeter.

EDITORIAL NOTICE.

No communication can be inserted unless authenticated by the name and address of the writer, not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such enquiries.

PUBLISHER'S ANNOUNCEMENT.

Advertisements cannot be received for insertion later than 2 P.M. on Thursdays.
 Temporary Office, 3, Monument Yard, London.—GILBERT WOOD, Publisher.

Tenders.

Sanatorium for Durham Grammar School. Accepted tenders. Mr. C. Hodgson Fowler, architect:—
 Taylor, mason £897 10 0
 Gradon, joiner 399 0 0
 Laidler, plumber 95 6 0
 Hodgson, painter 47 10 0
 Mole, plasterer 104 10 0
 Rule, slater 88 4 0
 Dennett & Co., fire-proof floors 80 0 0
 Chisman, smith 95 10 0
 For Sewerage in new Streets, in the parish of Stoke-upon-Trent, for James Dimmock, Esq. Messrs. Robt. Scrivenor & Son, architects and surveyors:—
 Smith £298 17 0
 Hodgkinson (accepted) 250 0 0
 For Sewerage on Penfold Meadow Estate, in the borough of Hanley, for Joseph Clementson, Esq. Messrs. Robt. Scrivenor & Son, architects and surveyors:—
 Bullock £239 0 0
 Fox 236 5 9
 Smith (accepted) 231 7 6

BOLNEY, SUSSEX.—For Stable, Coach-house, and Coachman's residence, for Mr. H. Huth. Mr. Holloway, architect. Quantities not supplied:—
 Norman £2,350 0 0
 Deacon (accepted) 1,200 0 0
 CAMDEN TOWN.—For alterations to House in Delancey Street. Mr. F. Johnston, architect:—
 Kelley, Brothers £1,385 0 0
 Axford 1,380 0 0
 Manley & Rogers 1,270 0 0
 Scrivenor & White 1,239 0 0

LONDON.—For rebuilding warehouse, Houndsditch, for Messrs. Lazarus and Bozenfelds; Mr. H. H. Collins, architect.—Messrs. Stuart and Bennett, 1,584; Mr. Cohen, 1,020; Messrs. Ball and Russell, 967.

SUTTON.—For Hotel, Stabling, and House adjoining, for Mr. John Ruck. Mr. E. Nash, architect:—

Eaton £1,000 0 0
 Deards 2,881 0 0
 Cooper & Cullum 2,880 0 0
 Cuff and Potter 2,618 0 0

LONDON.—For repairs and additions to Nos. 64 and 66, London Road, for Mr. E. W. Rolls:—

Eustace £480 0 0
 Cooper & Cullum 478 0 0
 Lindfield 448 0 0
 Falkner 439 0 0
 Yates 378 0 0

KENSINGTON.—For alterations, corner of Young Street, for Mr. Stevens. Messrs. Berriman & Sons, architects:—

Bassett £297 0 0
 Dennis 269 0 0
 Perkins 219 0 0
 Butt 205 0 0
 Hockly 203 0 0
 Gibbs & Son 185 0 0

APPOINTMENTS VACANT.

CITY OF LONDON.—Office of Gas Examiner. Salary, 600l. per annum. January 4. — Woodthorpe, Town Clerk's Office, Guildhall, E.C.—Salter's Company. Require a Local Agent for the management of the Company's Estates in Londonderry, Ireland. On May 1, 1869. Applications may be sent in up to January 16 next. W. Martin, Clerk, Salter's Hall, St. Swithin's Lane, E.C.

INDIA OFFICE.—Trained Young Men for the Maintenance and Conservation of the Government Forests in India. Eight will be selected. In February, 1869. Salary to commence at 300l. per annum, rising to 1,000l. by promotion. Apply January 8, 1869, Under Secretary of State, India—H. Merivale.

METROPOLITAN GAS WORKS.—Superintendent of Works. Salary not less than 250l. per annum, residence, &c. Messrs. Waterlow, Birchin Lane, E.C.

NEWINGTON, SURREY.—Surveyor of Sewers. Salary, 200l. per annum. January 8, 3 o'clock, p.m. H. and F. Chester, Joint Vestry Clerks, Vestry Hall, Walworth Road.

COMPETITIONS OPEN.

BELGIAN ACADEMY OF ARTS AND SCIENCES.—Best Essay on 'The Period at which Architecture in the Low Countries became affected by Italian influence.' Premium, 1,000 francs.

BILBOA, SPAIN.—Designs for a House of Mercy for lodging the poor. Premiums, 200l., 100l., and 50l. each. F. di Liyardt, 124 Cannon Street, E.C.

DUMFRIES, N.B.—Designs for the Erection of a New Infirmary. Premium, 50l. Mr. Symons, Writer, Dumfries.

CONTRACTS OPEN.

METROPOLITAN BOARD OF WORKS.—For Construction and Maintenance of Brick and Iron Sewer (about 680 feet in length), Deptford Lower Road, Plough Road, &c., Rotherhithe. January 8, 1869. J. Pollard, Clerk to Board, Spring Gardens.

CHILI.—The Government of this Republic require Tenders for Cast Iron Columns, Roof Posts, &c., Cast Iron Work for 27 Bridges, and 1,700 Squares of Galvanised Corrugated Iron Roofing, &c. The Chelsea Legation, 18 Gloucester Gardens, Hyde Park.

MADRID, SPAIN.—For Construction of the Tow Market. January 20, 1869. G. Petano, Spanish Legation, London.

ERECTION OF AN IRON BRIDGE. J. C. Lanyon, Gresham House, Old Broad Street, E.C.

HARTLEY WONTNEY, HANTS.—Erection of New Church. Mr. Wetherall, Hon. Sec., Winchfield, Hants.

CAVERSHAM, BERKS.—For the Purchase of Materials of Caversham Bridge. 141 Cannon Street, E.C.

GREAT NORTHERN RAILWAY.—For 5,000 tons double-headed iron rails; 120 tons fish-plates; 2,500 tons cast-iron chairs, &c. January 4. H. Oakley, secretary, Terminus, King's Cross.

RADNOR COUNTY GAOL, PRESTIGNE.—For alterations, &c. January 7. Town Hall, Prestigne. R. Banks, Clerk of Peace.

DERBY.—Improvement and Hotel Company.—For the Erection of a new Hotel, Shops, &c., in the Corn Market. January 7. W. C. Watson, secretary, Wardwick, Derby.

WESTMINSTER.—St. James's.—For the Erection of a new Institution in Jernyn Street for the Royal Society for the Prevention of Cruelty to Animals. January 11, 3 o'clock, p.m. T. Colam, secretary, 173 New Bond Street, W.

ADMIRALTY.—For English Elm Timber, at R.M.'s Dockyards, Woolwich, Chatham, Sheerness, Portsmouth, and Devonport. January 12, 2 o'clock p.m. Antonio Brady, Registrar, Somerset House.

LITCHFIELD, DERBY, DRAINAGE WORKS.—18th Jan.—For the execution of certain Works required in the Drainage of their district. Wm. Whitton, jun., Clerk to the Local Board.

DONCASTER.—11th Jan.—For the Laying Out of 37 acres of Land on the Carr, for the purpose of Sewage Irrigation and for Forming Subsidising Tanks, alteration of Outfall Sewer, and other Works, for the Board of Health for the Borough. Mr. B. S. Brundell, Civil Engineer and Surveyor, 1 Princess Street, Doncaster.

ABERAVON.—For the Work of completing the building of Aberavon Church Tower. Hon. Sec., Mr. W. Jackson, Port Talbot, Talbach.

ULVERSTON DRAINAGE.—Jan. 4.—For the supply of materials and the construction of the various works required in sewerage the said town. Contracts No. 1 and No. 2 will include the construction of brick and cast iron sewers and drains, together with sewer outfall tanks, manholes, storm outlets, ventilators, flushing sluices, and other works. The length of sewers in Contracts No. 1 and No. 2 will be about 6 miles. Contract No. 3 will include the supply of earthenware sewer and drain pipes, inverts, junctions, junction-blocks, and other earthenware materials. Contract No. 4 will include the supply of iron pipes, manhole covers, ventilating grates, foot-irons, and other castings. Jno. Poole, Clerk to the Committee, Ulverstone.

GLOUCESTERSHIRE.—Jan. 4.—For the erection of a Police Station, at Westbury-on-Trym, near Bristol. Mr. J. Medland, County Surveyor, Clarence Street, Gloucester.

EAST DEBENHAM.—Jan. 20.—Designs for Two Chapels and a Porter's Lodge, to be erected in the Burial Ground of the said Parish. G. S. Tinkler, Clerk to the Board.

NORTHAMPTON IMPROVEMENT COMMISSIONERS.—Jan. 6.—For the construction of a Culvert in Herbert Street, in the town of Northampton. A. B. Markham, Clerk to the Commissioners, 2, Dergate, Northampton.

LEOMINSTER.—Jan. 6.—Great Western and London and North-Western Railways.—For the following Works at Leominster:—

1st.—An Iron Bridge, of Two Spans of 28 feet, on the square, with an Embankment 115 yards long on each side of the Bridge.

2nd.—An Iron Foot Bridge, of 40 feet Span.
 J. Wait, Secretary, Birkenhead.

BACUP CEMETERY CHAPELS.—4th January.—For the several works required to be done in the erection of Three Chapels at the above cemetery. Gay & Swallow, architects, &c., Exchange Buildings, Bradford.

THE METROPOLITAN BOARD OF WORKS.—Jan. 7.—For the construction and maintaining in complete repair for twelve calendar months from their completion the following Works; that is to say, a Brick and Iron Sewer, 1 mile 580 feet in length, or thereabouts, with other works in connection therewith, in the following places, viz. commencing in Deptford Lower Road, from thence along Plough Road, Swing Bridge Road, and Trinity Street, in the parish of Rotherhithe, in the county of Surrey. John Pollard, Clerk of the Board, Spring Gardens, S.W.

PETERSFIELD (HANTS).—Jan. 9.—For the restoration and refitting of the Parish Church of East Moon, near Petersfield, Hampshire. Architect, Mr. Christian, 8A, Whitehall Place, London.

RADNOR COUNTY GAOL.—Jan. 7.—For effecting the proposed alterations in conformity with the Prisons Act 1865, to be made to the County Gaol at Prestigne. Richard Banks, Clerk of the Peace.

ROTHERHAM.—March 15.—For Plans, &c., for erecting a Public Hospital and Dispensary. A prize of 75l. is offered for the best design; 50l. for the second, and 25l. for the third. John Barras, hon. secretary, Rotherham, December 15, 1868.

RANDELL & SAUNDERS have much pleasure in informing their friends, and the Building Trade generally, that to facilitate building operations during the winter season, they have provided a large stock of well-seasoned Corsham Down Block Stone.—Bath Stone Office, Corsham, Wilts.—[Advt.]

W. W. SPRAGUE & Co., Lithographers, PRINTERS, & STATIONERS, 14 Sherborne Lane, King William Street, London, E.C.

BILLS OF QUANTITIES, SPECIFICATIONS, REPORTS, Copied or Lithographed with rapidity and care.

Now Ready.

SPRAGUE'S POCKET DIARY and MEMORANDUM BOOK, for the use of ARCHITECTS and SURVEYORS.

The Tables, Memoranda, &c., have been compiled by an experienced surveyor, and will, from their compactness, be found very convenient to the profession. In Roan Wallet, 7s. 6d. The Tables, &c., only, in Paper Cover, 1s.

BENHAM & FROUD,
 MEDIEVAL AND GENERAL METAL WORKERS
 TO THE TRADE,

Chandos Street, Charing Cross, W.C.
 * * * See Large Advertisement on page xii.

GENERAL JOINERS' WORK, STAIRCASE and HANDRAILS, LICENSED VICTUALLERS' BAR FITTINGS. Estimates given for all kinds of Joiners' Work, Shop Fronts and Fittings.—Address A. & J. SUTTON, 48 Roman Road, Grove Road, Victoria Park.

TO BUILDERS AND OTHERS.—Several Sums to LEND on MORTGAGE of FREEHOLD or LEASEHOLD PROPERTIES, at 5 per cent., or on DEPOSIT of LEASES for short terms. Large houses not quite finished not objected to. No preliminary fees.—Apply personally to Mr. WILLIAM TOY, Surveyor, 49 King William Street, London Bridge, City.

ONLY SILVER MEDAL,
PARIS, 1867.

GOLD MEDAL,
BERAR EXHIBITION, 1868.

ALLEN RANSOME & CO.

MAKERS OF ALL KINDS OF MACHINES FOR WORKING IN WOOD,

Beg to call attention to the following Machines that are especially adapted for Builders' and Contractors' purposes.

THE GENERAL JOINER.

This exceedingly useful Machine performs nearly all the various kinds of work usually done by hand in a Joiner's Shop, such as SAWING, PLANING, and THICKNESSING; MORTISING, TENONING, CROSS-CUTTING, and SQUARING OFF; TONGUEING, REBATING, MOULDING, BEADING, CHAMFERING, BORING, WEDGE-CUTTING, and many other operations.

With a little practice two lads will be found capable of doing the work of at least fifteen skilled Joiners.

RANSOME'S
PATENT SELF-ACTING SAW-BENCHES.

These benches are made of various sizes, and are peculiarly adapted for Builders' or Contractors' purposes, being equally suited for sawing either timber or deals. The Patented improvement consists in a simple variable feed, which is boxed in by the framing of the machine, and renders it at once the most perfect and economical Saw-bench ever produced.

FRASER'S PATENT EQUILIBRIUM DEAL FRAMES.

SOLE MAKERS,
A. RANSOME & CO.

These Frames possess the following great advantages over all other Deal Frames yet offered to the public:—

1st. They will do more than double the work in a given time of any other Deal Frame yet produced.

2nd. The work they turn out is of the best possible quality.

3rd. They cost less than any ordinary first-class Deal Frame.

A. R. & Co. guarantee every Fraser's Patent Deal Frame to be capable of sawing fifty 12-ft. by 9 in. by 3 in. deals, with three cuts in each, in one hour.

A. RANSOME & CO.'S IMPROVED SAW-SHARPENING MACHINE.

The Machine Gullet, Tops, and Bevels the Teeth of Circular and Frame Saws, so as not to require touching by a file. It is easily adjusted so as to produce any required form of tooth; and effects a saving equal to 500 per cent. in wages, and the total cost of the saw-files used when sharpened by hand.

PERIN'S PATENT FRENCH BAND-SAW BLADES.

ALLEN RANSOME & CO. having completed very advantageous arrangements with M. Perin for a renewal of the sole Agency for the sale of his Saws in the United Kingdom over a considerably extended period, are enabled to supply their customers with these celebrated Band-Saw Blades at VERY REDUCED PRICES, from a large stock of all sizes, which they keep set and sharpened ready for use.

CAUTION.—It having come to their knowledge that certain parties are supplying French Band Saws as "Perin's," which are of a very inferior quality, A. RANSOME & CO. beg to state that Perin's Saws can be obtained only through them, and strongly advise intending purchasers to send their orders direct to the Works—304 KING'S ROAD, CHELSEA, S.W.

New Illustrated Catalogues, with full particulars of the above and other Machines for Sawing, Planing, Moulding, Mortising, Tenoning, &c., may be had on application to

ALLEN RANSOME & CO., SAW-MILL ENGINEERS AND WOOD MACHINISTS,
No. 304 KING'S ROAD, CHELSEA, S.W.

SNOXELL'S PATENT IRON SHUTTERS.

33 OLD STREET, LONDON, E.C. References to 30 years' daily use.

LEATHER MACHINE BANDS, FIRE BUCKETS & HOSE, Manufactured by WEBB & SON, COMB'S TANNERY, STOWMARKET.

Awarded: several First-class Medals, several Honourable Mentions, and one Commendation. Price Lists on application.

PARIS EXHIBITION,
1867.

The only English House who took
Honours for FIRE GOODS.

The Silver Medal for TERRA
COTTA.

WORTLEY,

ESTABLISHED 1795.

NEAR
LEEDS.

LONDON.
1862.

Prize Medal for FIRE-CRAT
RETORTS.

Honourable Mention for DRAIN
PIPES.

London Agent—MARCUS BOURNE NEWTON, KING'S CROSS GOODS STATION, N.

DEPOT FOR
BLUE STAFFORDSHIRE WARE, ADAMANTINE CLINKERS, & WHITE GLAZED BRICKS.

THE "PROFESSIONAL,"

A FIRST-CLASS SHIRT FOR GENTLEMEN,

At 5s. 6d. and 6s. 6d.

In English or French Materials. Samples of Cloths and Measuring Directions on application to

Wholesale and Retail Shirt Manufacturers, Clothiers, Outfitters, Agents and Clothing Contractors,
171 FENCHURCH STREET. Manufactories—15 & 16 BLOMFIELD STREET, E.C.

The Architect.

ARCHITECTURAL EDUCATION.

SO great a cry for education is now making itself heard throughout the country that its influence seems towards being leading to the revival of the very important question chosen for the subject of this article. We say revival, because the absolute inadequacy of our present system has long been a source of reproach to the profession. Often has the subject been taken up, and as often allowed to drop, apparently from the great difficulty of either starting any new and well-defined scheme of education, or grafting on some existing scheme such modifications and improvements as would render it more decidedly effective. With whom the fault lies it is perhaps difficult to say. It is evident that, with a Government like ours, which allows perfect freedom of agency in the administration of all its institutions, any progressive movement must not only originate with those for whose benefit it would be specially intended; it must also be developed in all its details, tried, and pronounced fairly effective, before it can be expected that any recognition of its value could be made either by Government or by the public.

It has been remarked, with perhaps somewhat less of strict justice than of smartness of expression, 'that amateurs generally understand very little about painting, still less about sculpture, and nothing about architecture.' Whatever degree of truth there may be in the foregoing general remark—of the various qualifications that an architect should possess, and of the peculiar training necessary to give him those qualifications, the outside world and amateurs generally can unquestionably know nothing. The problem of architectural education rests, and must rest, entirely with the profession. Hitherto, with a few honourable exceptions, it is students alone who have taken any decided steps to supply the wants that have been felt by them so long and so severely. It must be evident, however, that students, while constrained to act by themselves, can effect but little for their own advancement and benefit; and, on the other hand, it is certain that no really great results can be fairly expected until the principals cordially accept and faithfully fulfil the duty of providing for architectural students a sound professional education. This implies, it must be added, that professional architects feel and admit that for their own benefit, as well as for the general benefit of the profession, in the matter of architectural education an essential and thorough reversal of all existing ideas is absolutely necessary. In fact, in this matter of architectural education the profession has to begin at the beginning.

The time, happily, has now at length arrived when movements in favour of primary and technical education have become both so general throughout the country and so decided in themselves that it will not long be possible for the leading members of any profession to maintain a quiescent attitude. Not to take a part in the prevailing advance will soon be shown to amount to a practical resistance to it. It has been affirmed that, at the present day, 'the architect may be called upon by the intelligent part of the public to show cause even for his existence.' This is, indeed, a strong expression; but it has a basis of truth. To the great detriment of the architect's profession, and even in a higher degree to the injury of the country, it has become the custom to entrust to engineers works in which architectural features constantly play no unimportant part. Thus, here in our own country, the architecture of engineering works is commonly placed in the hands of engineers; but in India the aspect of things is still more serious, since there the designing of architectural buildings is permitted to rest with engineers almost entirely. In America (as Mr. Ware informed the Institute some two years ago), in consequence of the absence of any architectural education whatever (for pupilage and premiums had been long discarded as unsuited to the temper of the time, and no other system had taken its place), the profession in many cases was at a far lower ebb; for the client there addressed himself to an agent, who upon receiving instructions as to the accommodation and style of the building required, together with the intended expenditure, made his arrangements with an architectural draughtsman on the one hand to make the design, and with a contractor on the other hand to carry it out; thus treating the whole affair as a mere speculation, and without any recognition whatever of the profession; 'and in many cases' (Mr. Ware added) 'this had been found to work well, there being *less trouble and no extras*.' Fortunately, however, this system is dying out; and the establishment of an Institute of Architects and the formation of a school with a regular academical education in architecture (ably aided by our new American contemporary) will, we believe, be the starting-point of the architectural history of America.

To return, however, to the main subject at issue—'architectural education in our own country.' Although it does not by any means follow that any system of education which might have been efficient thirty or forty years ago would be of any value at the present day, still it will be well to notice in the first place what kind of education was given at that time, and to compare with it the degenerate substitute that now exists in its stead. Thirty years

ago, a period of six years' pupilage was the strict rule, as it is now wholly the exception. With a course of six years, it was considered to be possible to acquire a sufficient knowledge of architectural design and drawing, and also of practical work, to become an efficient practitioner, the amount of knowledge then demanded being comparatively small. Drawing—and it was very good drawing—was taught during the first two years. By the working out of the five orders, and the copying of the drawings in the office, the pupil was first thoroughly grounded in the use of his instruments, and in the principles of what then was almost the only style recognised and practised. The style of drawings in those days was very different from what architectural drawings are now. Then they were carefully lined, with an exactitude excelled only by engineers' drawings of the present day, with the shadows traced, and with flat tints of Indian ink or colour laid on, and this careful delineation was found not only in the more artistic drawings, such as elevations or sections, but in all the details, constructional or otherwise; and the flashy coloured perspectives which now grace, or too often disgrace, the walls of our exhibitions, would then have been scouted by the profession as mere tricks and shams, having no other object than to deceive clients. The style of architecture then prevalent was one that had been gradually worked out and developed; and any tendency in it towards change was one which inclined to even greater refinement. This was the effect on the standard style produced by the publication of Stuart and Revett's 'Athens,' and of other works of the same class, and by the productions of the Dilettante Society. Practical details also ran in a well-defined and long-established groove; iron construction in architectural buildings was in its infancy; and the search for the 'truthful in art' had not yet troubled the minds of the students.

It is not our purpose here to discuss whether this state of affairs was healthy so far as art in architecture was concerned; it existed then, whereas now everything is changed. Numerous publications and photographs of the works of all nations and periods are at the disposal of every student. Science has made such rapid progress as to require the most constant attention to keep pace with it, even as connected with the profession of the architect. The employment of iron, again, as a building material has almost changed the fundamental principles of construction; and the various problems relating to the strength of materials have been reduced to the most exact formulae.

Thus, what the student of architecture has to learn has trebled in quantity; but the time set apart for learning it, as a pupil in an office, has been diminished to one-half of what it was formerly—the student now is articulated for three years instead of six. What has been the result? The idea of attempting to teach the pupil has been generally abandoned, and he must obtain his information where and how he can. One of the evil consequences of this change has been the introduction of a meretricious style of drawing injurious in its effect upon art. Connected with this is a carelessness which has to be remedied by elaborate specifications, and a complete absence of knowledge of design or proportion, coupled with a very superficial acquaintance with the numerous scientific and practical questions that have reference to building. What has just been said relates, of course, only to the general professional character of the students of the present day at the completion of their articles, when compared with their predecessors of thirty years ago. We are inclined, however, to suspect that in nine cases out of ten our account is not exaggerated, since now it is almost universally acknowledged that at the end of his pupilage the student finds he has everything to learn. He has had no training whatever in design, in the theory of construction, in a knowledge of materials, or even in drawing. If he has been working in the evening (which is the exception and not the rule) or attending classes, all such studies as these have been entirely works of supererogation on his part; and indeed it is well known that only a very trifling proportion of pupils ever do continue their studies during the evening hours. Having just left school, where they have studied only during the time allotted, the pupils of architects are but too generally disposed to regard the new course of their professional studies in precisely the same light; and they therefore pursue their new studies only during the seven or eight hours laid down as office hours. Accustomed also to a vacation of three or four months, the brief fortnight or three weeks given by the principal is barely sufficient to enable architectural students to recruit their strength; any possibility, therefore, of their seizing the occasion to learn true architecture by the careful measuring and delineation of old buildings is almost entirely out of the question.

If a true picture has here been given of what, at the present time, passes for architectural education, there can be but little doubt as to the justice of the assertion that in such an educational system as this a radical change is a matter of imperative necessity. Assuming, then, the necessity of such a change, hereafter we shall endeavour to show by what means it may be effected. The Report of the Delegates of the Architectural Alliance on the subject of 'Architectural Education,' which was read before the Architectural Association towards the close of last year, is a clear, outspoken, and significant document; and the manner in which that Report was received by an institution which numbers amongst its members the majority of the architectural students in London is conclusive both as to the prevailing sentiment among the students themselves, and as to the certainty that success would attend their earnest, hearty, and united efforts to improve the present educational system.

(To be continued.)

BALLIOL COLLEGE, OXFORD.

THE edifices that happily have come down from the middle ages to our own times, and now take rank amongst the glories of our country, almost invariably, in a greater or a lesser degree, are characterised by palpable tokens of their having been reared at successive periods. The great architects who flourished in those days were content to build parts of cathedrals, leaving to those who should follow after them the gradual completion of their works; or they themselves either carried onward or completed structures that had been begun and advanced long before by their predecessors. Occasions also arose which required them in part to reconstruct, or possibly altogether to rebuild, edifices that had been shattered by accidental injuries, or even then had yielded to the destroying influences of time. Thus to a terrible conflagration we owe the noble works of the two Williams, one a Norman and the other an Englishman, at Canterbury. At Ely, it was the fall, for a while apparently so disastrous, of the great central tower that eventually led to the erection of the exquisitely beautiful western bays of the choir, and which also inspired Alan de Walsingham with the conception of his unrivalled octagon. And, again, in that venerable museum of mediæval architecture, the Abbey Church of St. Alban's, we see how the advancing development of the art of architecture constrained successive abbots to demolish the comparatively rude relics of earlier ages, in order that they might be enabled to build up portions of their grand church afresh in the greater magnificence of their own eras.

Of late years the work of architectural restoration for the most part has been applied in a different direction; and, but too frequently, in the very act of preserving ancient remains, it has defaced, or even obliterated, the original evidences of their antiquity. At the present day, however, a far more conservative spirit has distinguished the operations of restorers, so that in their hands the terms 'Restoration' and 'Destruction' have ceased to be convertible; and, indeed, really good service of late has repeatedly been done by works of restoration, which have faithfully preserved noble early buildings that were ready to fall into decay, without stamping upon them a modern impress. While thus it is a matter of constant occurrence that the application of a general restoring process to many of our old buildings either is found to be really necessary, or is considered to be so desirable that it is accepted as being necessary, our living architects, whose ability to design and erect works that are altogether new is displayed on every side, are rarely called upon to remove, and subsequently to rebuild from its foundations, some important integral part of a dignified early edifice. The two old Universities of Oxford and Cambridge form decided exceptions to this rule; since, besides the occasional addition of fresh buildings (as within a few years took place at Christ Church, Oxford), various circumstances frequently combine to require the rebuilding of a part or parts of some college. Not many years have passed, for example, since their Chapels were rebuilt at Exeter and Balliol Colleges, Oxford, the former by Mr. G. G. Scott, R.A., and the latter by Mr. Butterfield; and at St. John's College, Cambridge, Mr. Scott is now completing a new Chapel on a scale of no ordinary grandeur. In addition to these rebuildings of collegiate chapels, at the present time two Colleges, one in each University—Balliol at Oxford, and Caius at Cambridge—have important new buildings in different degrees of progress towards completion, both of them erected from the designs of the same able architect, Mr. A. Waterhouse.

At Balliol College, indeed, the new buildings may almost be considered to have been completed already, since only certain interior fittings yet remain to be fixed to render the edifice ready for habitation; and, in fact, one very important portion of these new buildings—the Residence of the Master—is actually occupied by the family of that gentleman, the Rev. Robert Scott, D.D. Balliol College consists of one fine quadrangle or rectangular court, of which the front faces towards Broad Street, together with an irregular range of other buildings of considerable extent, which on two sides complete the enclosure of the College itself, without forming any other enclosed quadrangle. With the exception of some few remains that are beneath the surface of the ground, to which probably an early date may be assigned, none of the existing buildings of this College can claim an age reaching back more than four centuries; and, indeed, it is only one beautiful relic, that well-known gem of Oxford, the oriel window in the dining-room of the Master's residence, with some portions of the adjoining walls, and the College Hall and Library, that are able to advance any pretensions to an existence extending over more than half that space of time.

The old buildings which formed and surrounded the quadrangle of the College for many years had been in so dilapidated a condition, that on several occasions the Master and Fellows had seriously reflected on the propriety, amounting almost to a positive duty, to rebuild them, before, at length, a final decision was adopted and carried into effect. Of that final decision the result is the new building that forms one of our illustrations, and which we presently proceed to describe. The engravings which appeared upon the Oxford University Almanack for the years 1742 and 1810 gave views of two designs, that at those periods were proposed for the rebuilding of this portion of Balliol College; but, fortunately, considering what those designs are proved by the testimony of the almanack engravings to have been, the project as well of 1810 as of 1742 was abandoned. More recently, the authorities of the College were again induced to resume the consideration of this matter, when a plan was once more

formed, and a design prepared by an architect of a very different order of genius from his predecessor of 1810, the late Augustus Welby Pugin; but circumstances arose which denied to the new buildings proposed for Balliol by that eminent man any other existence than they enjoyed in his own elaborate and beautiful drawings. This was to be the last of these futile efforts. Two or three years ago the subject of the rebuilding was revived in a thoroughly earnest spirit. Mr. Waterhouse was appointed to be the architect. And the commencement of operations was rendered practicable without any delay by the munificence of a lady, Miss Brackenbury (herself a descendant from the original founder, John de Balliol), who provided the means for the rebuilding the Broad Street front of the College, including the tower with the entrance gateway. The remaining portions of the new buildings, which comprise the end of the Quadrangle adjoining Trinity College towards the east, and towards the west the residence of the Master, have been erected at the cost of the College.

The friable nature of the stone of which, in common with so many others of the colleges in the University of Oxford, the old buildings at Balliol had been constructed, irrespective of other considerations, would have required the complete demolition of the earlier fabric as a preliminary to the operations of Mr. Waterhouse. The old buildings, accordingly, with the exception only of parts of the Master's residence, were removed, and the new structure has been erected on the same site that had previously been occupied by them. The works consist of the rebuilding of the entire range of the front of the Quadrangle towards Broad Street, with a lofty tower near its centre, which surmounts the main entrance, and has been placed as nearly as possible opposite to the entrance to the Chapel. From Broad Street, at right angles to the front, runs a return wing, extending northwards till it abuts upon Mr. Butterfield's beautiful new chapel; externally this wing, which forms the eastern enclosure of the College Quadrangle, faces towards the fore-court of Trinity College. In the other direction towards the west, to the westward of the College Quadrangle, and partially detached from the main building by a court-yard, is the residence of the Master. This last building faces towards Broad Street on the one side, and towards the College gardens on the other, and is in the same line with the Broad Street front of the College Quadrangle. Thus at Balliol Mr. Waterhouse has rebuilt from their foundations very important portions of this distinguished College; and his works we regard with unqualified satisfaction, in the first place, because no historical associations were connected with the buildings that have been pulled down, nor did they possess a single feature of either architectural or archaeological interest; and secondly, because, after a careful personal examination and study, we are enabled to declare the buildings that have just been erected in their stead to be an honourable accession to the long array of noble edifices that adorn the face of our country, while at the same time they raise still higher the architectural renown of the famous University on the banks of the Isis.

The style that has been adopted is what may be distinguished as Collegiate Gothic; and this style, equally happy in its association with memories of the past and in its consistent applicability to every requirement of the present, the architect has handled with masterly ability. While yielding a becoming allegiance to early artistic traditions, in his thoroughly original design (original, and yet significantly suggestive of what had been characteristic features in the demolished buildings) Mr. Waterhouse has at once exemplified the plastic elasticity of Gothic art, and has vindicated both its intrinsic excellence and its present vitality. Architecture is seen in the new buildings at Balliol in its true character as a great Art. Also, if there be suffused throughout this pile a feeling in harmony with the sentiments of the early Gothic masters, in its perfect adaptation to existing usages and requirements, and in its easy conformity with modern habits of thought and of life, this building evidently belongs to our own times. We are not able to refrain from dwelling upon this point. Whatever the style in which new edifices now may be erected, whether a style that grew up grandly in the middle ages or one that during a more remote antiquity flourished in severe magnificence—if any such style be adopted by living architects, and if in such a style, or in conformity with its practice, buildings be designed and erected for the use of the existing and of succeeding generations, we hold that Architects are bound to treat the style they are employing as a style of their own, and to use it with reference, not to ages long passed away, but to that one particular age which is in the act of leading from time present to time to come. We may take our architecture from whatever past era we please; but, when we have taken it, in our hands it must be assimilated to our own era. Building for use in our own day, we are to build what will be practically most useful. And the art of our architecture is to be governed by the same law which governs its utility—the two, indeed, are inseparable, and have a reciprocal dependence on one another. Circumstances may have deprived us of the faculty and also of the opportunity of originating an architectural style of our own, and of developing it at our pleasure from birth to maturity; yet we are left free to select from existing styles one or more of their numbers which, having become our own architecture by either adoption or inheritance, it is incumbent upon us to adapt to the existing condition of things through the agency of some compound process of modification and development. Too long have many of our architects treated their art as if excellence in it were attainable only by a retrogressive movement towards some

exalted eminence, far away in the distance of ages. Cherishing a remembrance of that eminence, it is full time for architects to look around them and before them, to deal with architecture in a well-disciplined independence, and to show that their reverence for true art in others has inspired them to become true artists themselves. For a while, in the middle of this nineteenth century, it may have been well, and indeed it may have been necessary, that our architects should have aspired to qualify themselves for a successful professional career, had their lot been cast five or six centuries further back in our own era, or about as many centuries before our own era had commenced. What our architects have now to do, is to keep in remembrance that while they are practising their art in their own era, their success will be determined and estimated by what they may accomplish for their own era. These are sentiments that are beginning to be recognised in a hearty manner by the profession; and it is to be hoped that a cordial recognition of them will soon become universal. In his New Buildings at Balliol College, and not by any means in them alone, Mr. Waterhouse has shown that to him architecture is a living art. When lately dealing with an ancient classic style in the interior of the new Foreign Office, Mr. Scott has been successful, in like manner, in infusing into the old style an energetic present vitality. For the Foreign Office, again, Mr. Skidmore has produced gas-fittings, that in their proper capacity of providing the means of illumination by gas are simply perfect; and, nevertheless, they are without fault as examples of modern metal-work, executed in strict conformity with both the spirit and the practice of pure Greek art. Mr. Hart's metal-work at Balliol College may be described in somewhat similar terms: it is thoroughly Gothic, and the style harmonises in it perfectly with its application to the uses of to-day.

What may be regarded as the most beautiful architectural feature of Balliol College is that oriel window of the master's dining-room, looking into the quadrangle, to which reference already has been made. The oriel has been preserved intact, and it still forms the east end of the room: some early heraldic glass, however, has been removed from it to the new south window of the same room. The preservation of this window has given the key to many of the arrangements of the New Buildings. It would have been comparatively easy to have lengthened the hall—an addition to that by no means unimportant part of a college which was almost a matter of pressing necessity. But the claims of the oriel were felt to be irresistible; and it was wisely determined that any plan, otherwise however advantageous, which would imply its destruction, would involve an act of architectural sacrilege. The oriel, therefore, which on its corbels has the arms of William Grey, Bishop of Ely (A.D. 1458), uncle to the first husband of Queen Elizabeth Widville, and may be assigned to about 1470, is safe; and, as of old, it looks into the quadrangle near its south-west angle, in the same line with the eastern windows of the hall; and thus the western side of the quadrangle is formed by the hall itself, with the master's dining-room abutting upon its south end. This dining-room, according to some College traditions, has sometimes been supposed at an earlier period to have been the chapel: this supposition, however, does not appear to rest on any substantial foundation; and, in fact, it may be confidently assumed that the room was originally designed for its present use, to which it appears invariably to have been applied. At some early time there existed communications (traces of which still remain) between the dining-room of the master's residence and the College hall and buttery. Many years ago these communications were closed up; and the buttery was transferred to its present position at the other—the northern—end of the hall.

The new master's residence, having a frontage of 82 feet, is an excellent first-class residence of a high order of architectural art, thoroughly convenient and comfortable, and in every particular qualified to fulfil with becoming dignity the purposes for which it has been constructed. It is both spacious and compact; and the most has been made of certain necessities of the site. For example, no ordinary skill has been called into play in order to accomplish what has been done with the space at the disposal of the architect for the entrance-hall and staircase. The latter, with its graceful iron gas-standard on the lower newel, is a master-piece of arrangement. The cornices and all the architectural fittings of the rooms throughout the building, which have been designed with special reference to their respective positions and uses, are constructively true to the style, yet always most happily adapted to existing sentiment and usage. The cornices and ceilings at present are awaiting colour. The wood-work of the doors, &c., is everywhere pine, which has been varnished in the most effective manner, the wood itself having been left to display its natural grain, with little or no staining. The fire-places demand special notice. Next to their innermost steel-work is a border of coloured tiles, set on a receding slope; beyond this is the marble of the chimney-piece; and, in its turn, this is enclosed within an outer framing of carved oak. The effect is admirable. It must be added that this arrangement has been modified in its details in conformity with the sizes and uses of the different rooms. In the rooms of the New Building of the College this same arrangement obtains, iron and stone-work taking the place of steel and marble. All the new doors and other wood-work, conforming in like manner to the plans prevalent in the master's residence, are of varnished pine.

The collegiate portion of the New Building, of which the front extends from east to west 130 feet, contains 28 sets of rooms, all of

them very complete and commodious. This number includes 3 sets of 4 rooms each, many of them spacious, for the Fellows. There is also a large lecture-room, and close to the entrance in the tower is placed the porter's house. In common with the master's house, the whole of this building displays a marked breadth and freedom of treatment, which are consistently carried out in a system of construction that is free from excessive refinement. The stone-work everywhere shows the traces, not of sandpaper, but of the chisel. The carving is particularly effective—on the whole sparingly introduced, but telling well wherever it appears. The foliage of the capitals, and all the capitals are foliated, is very happy—well studied, judiciously adapted to its appointed duties, and cut with a free, bold hand. The shields of arms and other devices of heraldry, which are introduced in sufficient numbers to give an heraldic tone to the edifice, have recorded their own proper chronicles after their own proper fashion; and the only thing connected with them that we noticed with any other feeling than approval, is the indication in them of the tinctures of the fields and charges by shading—a practice that seems inconsistent with blazoning by means of a chisel. We observed, too, the initial B (of Brakenbury or Balliol) thrice repeated on so many small shields, which would have been better in cusped panels, the shield of heraldry being to be reserved without exception for true armorial blazonry. We should have preferred to have seen the Brakenbury badge instead of the Brakenbury crest, or the device of the crest treated as a badge—a simple modification that would have been expressive, and in good keeping with the fact that the college from

first to last has been built through the munificence of a *Foundress*. The Tower, with its angle stair-turret, is a commanding feature in the Brakenbury front. As it appears in the architect's drawing, the masonry of this tower is finished above by an embattled parapet; but the actual structure, as we have represented it in our engraving, drawn from a photograph taken expressly for our use from the building itself, is crowned with a far better and more effective parapet, seventy-two feet above the ground, pierced with open arches under an unbroken line, and carried by a corbel-table, which enriches the building and looks quite strong enough for even something more than its work, without suggesting (as modern corbel-tables and cornices sometimes do) even the semblance of undue massiveness. The corbelling under the eaves of the whole pile, we may here observe, is simple, has a meaning in it, and is in perfect good taste. On either side of the oriel of the Tower on its exterior face is a canopied niche, and a third similar niche placed between them rises above this oriel: the three niches at present are unoccupied by statues. The quartered shield of Brakenbury has its proper place below the oriel, and immediately over the entrance. This same shield is also several times repeated in different parts of the Brakenbury portion of the New Buildings, under the crest, on the diapered splay below one of the oriels on the exterior, and in the interior, over the several entrances to the staircases, and in glass in the windows of the Lecture-room, thus emphatically declaring the range and also the limits of the works which are the result of the munificence of Miss Brakenbury. The face of the Tower next to the Quadrangle has another fine oriel window, without niches; but, on the corbeling of

its base between two shields, one charged with a *Catherine-wheel* and the other with a *bell*, the insignia of the patron Saint of the College, and of an early benefactor; a third shield displays the arms of the Bishop of Lincoln, who officially is visitor of Balliol College. The entrance-archway, leading through the Tower from Broad Street into the Quadrangle, is constructed in two vaulted bays with rich groining, the springing and the intersections of the ribs being marked by bosses sculptured with foliage. Our Initial Vignette shows this gateway as it is seen from within the Quadrangle: this wood-cut has been drawn from a photograph taken for that purpose.

On the east wing (which is 119 feet in length), at its extremity adjoining Mr. Butterfield's Chapel, in order to obtain additional space for the uppermost rooms, two small oriels set diagonally at the angles of the building, which did not form parts of the original design, have been thrown out with signal success. The Gothic, when properly handled, always permits that to be done with good effect which is required to be done for a good purpose.

We cannot pass over without notice and commendation the exterior metal-work, consisting of water-pipes, rails for the window-balconies, and finials of gables and turrets: all are good and strictly appropriate. The ridge-crests of the roofs, which in its details has been improved since the architect's drawing was made, is another feature to be mentioned with approval.

The contemplation of the chapel of Balliol College, which has taken the place of another building that had been erected upon the same site in 1529, and of the still more recent works that have formed the subject of our present consideration, necessarily leads to the hope that the rebuilding of this college may be completed at no distant period of time. Whatever remains, indeed, of the buildings that were erected early in the eighteenth century are still standing, adjoining Broad Street and to the westward of the Master's House, are impatiently awaiting the appearance of a third Devorgilla. Since they were built—the one during the reign of Henry VI., and the other a little later (for it may be held to be coeval with the original Master's Dining Room and its justly celebrated oriel)—both the library and the hall have undergone changes which have not tended to exalt their architectural character; the parapet of the hall, for instance, with its heavy embattling, has been raised, and the roof has been flattened. In addition to these earlier structures, the College possesses buildings that extend from the south-west angle of the Broad Street range in a northerly direction to St. John's College. These buildings were erected in part (and this part is altogether devoid of any architectural character or pretension) by Basevi, whose fatal accident in the great western tower of Ely Cathedral will always be remembered with regret; and in part, with his customary feeling for a castellated style, by Salvin. The Buttery was also erected by this last architect, and, like his other works, it has good and characteristic features. Thus—besides the builders of the library and the hall, and also of some part of the Broad Street front, and the accomplished artist to whom, did we but know who he may have been, we gladly and reverently would assign the Master's Oriel—the Balliol College of to-day has been built by Basevi, Salvin, Butterfield, and Waterhouse.

(To be completed in the next Number.)

THE SWISS LAKE DWELLINGS.

AMONG the many subjects which claim the attention of the archaeologist, a few are of greater interest than the discoveries of the last ten years or so on the shores of the lakes of Switzerland, and to which the explorations of Herculaneum and Pompeii are as the relics of but yesterday. We can understand how an awful calamity, such as that which befel those cities, served, from the very nature of that natural catastrophe, to preserve down to our own day not only the forms and outlines of the dwellings of a by-gone nation, but even the colour and detail of ornamentation in which the wealth and effeminate splendour of the Roman of the first century after Christ loved to delight. But in the strange remnants of stranger habitations which, after tens of centuries, are now made known to us—the medium which, as it were, hermetically sealed up the evidences of years to be counted by thousands was not a quick and sudden one, as a deluge of ashes, but slow and gradual; and hence the interest for the subject, upon which we propose to set down a few notes, is greater, involving as it does the contemplation of the gradual march of Nature upon the puny efforts of Man, whilst bringing us, as it were, into the daily life of a people whose very name has passed away unknown.

The idea of people living in houses built upon piles driven into swampy ground is familiar to us. Our geography books have taught us how Amsterdam, parts of Rotterdam, and parts of Hamburg are built upon such structures, and the traveller upon the Mississippi boats has seen the huts of outlying settlers and hunters similarly constructed. We are told of an African tribe establishing itself upon a lagoon to seek shelter from the attacks of King Dahome; and Mr. A. R. Wallace, the naturalist, lived for days in one of the quaint villages of the Papuans in New Guinea. The floors of the huts are 'supported on piles carved into rude human figures, seeming to stand upon the water—rows of grotesque and somewhat disagreeable savage Caryatides.' Going back further still in the history of such dwellings, we find Christian fishermen living in huts on piles in the lakes formed by the Orontes in the thirteenth century; and, finally, we arrive at the earliest record of all in the pages of Herodotus, who mentions 'a certain people of Lake Prasias in Thrace (in the sixth century before Christ), living in houses built on boards fastened to piles driven into the lake, with a bridge to connect them with the shore.' To provide against overcrowding,

every man had to contribute towards the gradual extension of this settlement by driving three piles for every wife he married, 'they having many wives.'

Among the many Lacustral villages discovered in Switzerland of late years is *Robenhansen*, situated on a peat moor not far from the small lake of Pfäffikon, between Zurich and Chur. The lake was once double its present size, and in it, about a mile from the shore, but connected by a pier on piles, stood a village of considerable extent. The intelligent owner of this property began by very carefully clearing downwards, and soon found that what at first sight appeared a hopeless confusion of matter was in reality a clearly defined chronicle of the history of this settlement. He found that the first settlers had driven piles of unbarked fir deep into the bottom of the lake, had covered them with planks, and upon these had constructed their wooden huts. But one night a fire broke out; a strong south wind (still the dread of the Swiss to this day, and known as the Föhn wind) blew at the time, sending the burning embers far into the lake to the northward, and soon reducing the village to a heap of ashes. But the inhabitants went diligently to work and rebuilt their huts, driving in fresh piles and greatly extending the place. Here they lived long enough to allow of a layer of peat to grow over the *débris* of the first conflagration, but again a fire broke out, and the village was again burnt down to the water's edge. In no way disheartened by these two calamities, the former of which certainly none then alive could remember, they rebuilt the settlement again, this time employing oak split into lengths instead of fir, but the rubbish and peat under them had by this time accumulated to such an extent that the new piles never reached the bed of the original lake at all. Here they continued to live, until the peat growing around them gradually converted the lake into a mere swamp, and the village was deserted and abandoned. One by one the huts fell, the materials disappeared beneath the advancing peat, and now, after perhaps two thousand years, the careful investigations of Dr. Keller and Herr Messikomer supply us with the facts here briefly told.

Nor is this settlement, now known as *Robenhansen*, the only instance of such pile-built villages. On the lakes of Geneva, of Zurich, and of Neuchâtel, remains are still found, sometimes clearly visible at a depth of eight or ten feet below the surface, and some 500 feet from the shore, as at Morges; sometimes at a distance of 800 yards from the lake, and now on dry ground, as at Chamblon.

But there was a second less laborious, though less substantial mode of construction in vogue, and this was employed in situations where comparative security from storms upon the lakes could be expected, as in lagoons or in large bays. Artificial islands were constructed in such localities by means of faggots loaded and sunk by stones, sand, or gravel, as, for instance, was done at Niederwyl, near Frauenfeld. When the heaps of faggots had reached the surface, they were covered with rough flooring, upon which the huts were erected, a thick coating of earth being laid on the flooring to prevent the damp from rising. But this construction by means of faggots was not common, and was only employed in quiet and swampy situations.

Much ingenuity has been displayed in the endeavour to assign a *period* for these lake dwellings; and, whilst every test and every new fact cannot but add to the faint light which at present illumines this question, many more tests and still more facts must become our own before the date of these constructions can be even approximately fixed. Monsieur Troyon, of Lausanne, in his '*Habitations Lacustres des Temps Anciens et Modernes*,' calculates the date of the settlement at Chamblon, near Yverdun. Yverdun was on the shores of the Lake of Neuchâtel in the time of the Romans, when it was called Eburodunum; it is now 2,500 feet away from the lake, and hence Mons. Troyon argues that, if the lake retreated at the same rate before the time of the Romans as it has done since, then the Lacustral village of Chamblon must be 3,300 years old. That some of these villages existed in the time of the Romans is probable, from the fact that a few coins have been found in them; and it is not at all unlikely but that the invasion of the civilised bands from the south side of the Alps induced the natives to abandon their water villages, and to seek a safer refuge in the mountains.

But though inferior to the Romans in point of civilisation, the inhabitants of the villages we have described were by no means savages. We learn, for instance, from the remains at Robenhansen, that they were an agricultural people; the successive strata of the burnt *débris* are intermixed with wheat and barley, which they crushed with rude stones and baked into bread, some of which has also been found! They kept pigs, sheep, and goats upon their islands, probably driving them to the pastures on shore by day, but taking them home for safety at night. They also cultivated abundance of flax, as is testified by the hanks, cords, and nets found in the peat at Robenhansen, and this they worked up into cloth by means of looms, one of which was actually found sufficiently preserved to enable a Zurich weaver to construct a probable restoration of the original. Professor Oswald Heer shows that these people lived in these water villages all the year round; he found cherrystones which would have been thrown away in June, then blackberries, and lastly hazel and beech-nuts which ripen in winter.

Returning to the question of the date which may reasonably be assigned to the Lacustral villages of Switzerland, there seems to be little doubt but that they existed in the latter part of the flint age, and that they survived the bronze age here and there. The implements found are chiefly of stone; spears of obsidian, stone hatchets and saws, flint arrow-heads and knives were common, whereas articles in bronze are found but comparatively seldom. Yet a few celts, crucibles and moulds have come to light, whilst a pair of bracelets of bronze, taken from among the piles in the Lake of Geneva, shows that the new art had made tolerable progress among the people before they relinquished their amphibious existence. Reverting, in conclusion, to the motive which could have induced this ancient people to live on such laboriously constructed islands as we have described, we naturally infer that it was for the sake of greater safety. Was it then fear of wild beasts or of enemies? We know that the mammoth, the hyena, and the cave-tiger no longer existed, and the bear was hardly seriously dangerous to men armed with weapons such as we know they possessed. It was, therefore, the fear of man which prompted the construction of the

Lake Dwellings, and this opinion seems further supported by the fact that cattle and horses were not kept on shore, but on the island, where, in case of sudden attack, they were secure from being driven off.

Those interested in the subject which we have briefly touched upon above will find much to learn in the work by Mons. Troyon to which we have alluded, as also in a recent account of the Lake Dwellings, not of Switzerland only, but of those discovered in other parts of Europe, by Dr. F. Keller, President of the Antiquarian Society of Zurich.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN Ordinary General Meeting of this Institute was held on Monday evening, the 4th inst., at 9 Conduit Street, Hanover Square, Mr. J. Edmeston in the chair. Mr. J. P. Seddon, the honorary secretary, made the usual formal announcements. He also informed the meeting that the Society had received news of the death of Mr. John Clarke (Fellow), of 2 Great James Street, Bedford Row, who expired at Hong Kong, on October 16 last. The donations announced included a Description of the New Metropolitan Meat-market, designed by Mr. Horace Jones, and copies of the plan and sections according to which it is proposed to build the new Law Courts, from Mr. Street. The first number of the new journal, *THE ARCHITECT*, was presented amidst some applause. Mr. Seddon then read a letter, received recently from Professor Donaldson, giving an interesting account of his travels in the Holy Land, of which we append an extract.

On the Archipelago, en route from Athens to Trieste, Dec. 21, 1868.

We took occasion to go down the Suez Canal about half its length, from Ishmaela to Port Said, which is completely executed, with the sea-water in it. The southern portion between Ishmaela and Suez is excavated to half its depth only, and the harbour at the mouth has to be completed. It is a marvellous realisation of a prodigious project, and does justice to the daring of its projectors. As you steam along its channel, 300 feet wide, with sufficient depth to receive the largest merchant vessel, you cannot but feel impressed with the extent of this great sea channel. But its maintenance will be the greatest difficulty of all; to preserve the depth from being choked up by the sands, whether along the canal itself or in the port, is even now a matter of anxiety and care. While we were on the spot a French vessel of war was expected, and they were employing many gigantic dredgers to secure a channel. In the basin of the harbour there were several vessels of considerable size. The piers to enclose the harbour of Port Said are constructed of enormous concrete blocks, a couple of metres or more in each direction, thrown over and left to take their place 'pêle-mêle'; but it has been found that this will not do, for the waves force themselves between the crevices and interstices with such force as to move them, and they are now considering how to produce more cohesion between the blocks than by their mere weight; and if they are obliged to adopt the regular combination of the masses by regular construction, as in our Dover Pier, it will cause an enormous expense, for the dykes or piers extend out miles into the Mediterranean. The town, if I may so call it, of Said is composed of rapidly-built stores, one or two storeys high, like all settlements in new colonies; and the inhabitants consist chiefly of Maltese, Greeks, the refusa of the Levant, with very few respectable French. One who held a not very high position in the public service there said it was quite as an exile, without any society.

From Port Said an Alexandrine steamer took us on to Jaffa. These Egyptian coasters are fine vessels, chiefly built in Scotland.

We reached Jerusalem in a day and a half, but were not able to see its walls till after sunset. The ride was through a hilly, wild country, Kirjath-Jearim alone presenting a fine old church of the time of the Crusades, with pointed arches, and paintings still traceable on the walls, though long since abandoned and unoccupied. There is a nave and side aisles, divided by three or four square pillars on each side, and apsidal recesses at the east end. Jerusalem itself caused me the greatest disappointment and pain. It is a vast store for religious traffic, occupied by religionists of every shade of Christian doctrine, scrambling and fighting for the pre-eminence, and as to which can offer the most numerous and attractive localities and objects for superstitious reverence.

Jerusalem is, as you know, situate on the rapid slope of hills which rise from the valley of Kedron up to Zion. Its sanitary condition is the worst possible, for it is without sewers, and is supplied from cisterns which receive the surface waters, and too often impregnated from cesspools and drains; the streets narrow, and one-fourth arched over to gain space; and with occasionally a malignant air, it is not surprising that European residents denounce it as very unhealthy. A great part of the city is occupied by the religious communities, which are numerous. Various new buildings have been erected of late years, as monasteries, churches, nunneries, hospitals, and schools. The ambitious Russians cover several acres outside the Jaffa Gate, upon a rising plateau which commands the city, with a large church not yet completed, residences for the clergy and others, '*hospices et hospitaux*,' in detached masses, and surrounded by gardens. There is room to receive all the Christian population, if needs be, within the precinct. The structural part of the new Dome to the Holy Sepulchre is nearly completed, and the interior of it decorated with paintings, which, however, are of too pale a tone to be effective. The modern building that pleased me most was the Armenian Church, which, although evidently designed by an inferior mind, is effectively decorated in the interior with coloured tiles and fine iconostasia. But no edifice, old or new, equals in effect the Mosque of Omar. Simple in design, and treated in detail with majolica tiles, and a sombre effect truly impressive, so far does the Turk outdo the Christian. The Holy Sepulchre itself is a most dramatic as-

semblage of churches, chapels, oratories, and sanctuaries; some on the general level, others going up, several going down into the rocky caverns; and, what with the ceremonies of the various religionists carried on at the same time, with their processions and visits to every one of their twenty or thirty altars, with their chaunts and tapers and vestments, litanies on one side, chaunts on the other, the mind becomes bewildered, and one wonders whether this can be a true temple for the worship of the living God, or a very Babel or House of Baal for the sacrifices of superstition; and the silent, impassive Turk keeping order, smoking his pipe, and sipping his coffee.

The Valley of Jehoshaphat is the only spot containing remnants of the classic times, Greco-Roman, but I saw nothing of decorative detail that could be called Jewish. Some enthusiastic minds seem to connect with that period some walls of fine construction, and large blocks of stone between 12 and 20 feet long and 4 or 6 feet high; but what are these to the stupendous courses we have seen at Baalbec, 60 feet long, and upwards of 12 feet high and 10 or 12 feet thick, of the time of the Antonines? The Wailing Wall of the Jews is a noble specimen of construction, but cannot, I think, be referred to an earlier period than the Herodian epoch. A mistaken technical expression is used by Lieutenant Warren and other non-architectural writers in describing the blocks of some construction as with bevelled edges, whereas they are not bevelled or splayed at all, but have a slightly sunk margin 2 or 3 inches wide, and sunk $\frac{1}{4}$ or $\frac{3}{8}$ of an inch from the general face. As I was riding along with Lieutenant Warren, I observed about little more than half of a pure Greek Doric capital on the ground, reversed, and something like those of the tombs in the Valley of Jehoshaphat. He had not observed it before, and I called his attention to it, and he had it taken to his house. It is about 2 feet diameter, and I took the section, with the dimension, to ensure accuracy of the profile, and left the sketch with him. He has discovered a new channel some 1,200 feet long, about 5 feet high, and 2 feet 6 or 3 feet wide. It has several shafts, with steps leading down to it, about 20 or 30 feet underground; he cannot exactly explain its use, but thinks it served the purpose of a water conduit for the area of the Temple. It appeared to me that the ancients, having traced out the line of the conduit, sunk stairlike shafts, and then worked right and left till they met, and thus were able to have several sets of men at work at one and the same time.

Up above the ancient town of Caesarea Philippi, about two hours off, and perched upon the top of a rocky, precipitous spur, is a very grand mediæval castle of the Saracens. Two of our party went up to it, and describe it as of considerable extent, with large courts, keep, towers, and other suitable erections. Two days' ride from this brought us to Damascus, one of the world's paradises of the Turk and Moslem.

You may imagine the way-worn traveller or pilgrim coming from the Arabian deserts when Damascus, with its glittering spires and minarets, bursts on his view, surrounded by groves and gardens, extending a couple of leagues one way and a couple of miles the other, watered by the abundant stream of the Abana, backed by a fine range of rocky mountains, and snow-capped Hermon rising above all, as a mighty protecting genius. Can we not, then, sympathise with the ecstasy of the wanderer seeing Damascus *ab externo*? Seen within, it yields to Cairo, I think, as to the nobility of its mosques, its fountains and schools; but is superior in its bazaars, and khans, and street pavement—here of stone, there of mud. Some of the columns that lined the street which was stated in the New Testament to be called Straight, and ran from one end of the city to the other, still remain; and others of a transverse direction, 4 feet in diameter, of the time of the Constantines. We saw a very fine specimen of a Turk's house, with marble courts and fountains, orange and lemon trees, vines and fig trees, beautifully designed and carried out in all its Arab details, and I hope illustrated by Coste, who must have been here, surely. We also paid a visit to Abdel-Kader, who received us most kindly. He is sixty-one, but appears older, unwell, and full of care, though with a mild and winning expression of countenance.

We thence visited Baalbec, crossing Anti-Lebanus, at the foot of which it lies, in the plain which divides Lebanon and Anti-Lebanus. I shall never forget the impression produced on our minds by the examination of these gigantic, powerfully, and grandly conceived groups. The execution is at once Titanic and exquisite as to finish. The study of Roman architecture is incomplete without a visit to these temples.

Professor KERR said that, before proceeding to the other business, he thought it necessary to ask as to the new Building Act, what steps had been taken by the Council; and he hoped that before anything was done, the Council would report to the members of the Institute.

The CHAIRMAN assured the learned Professor that the subject had received due attention from the committee appointed on the Bill. The Council awaited the result of an interview with the President (Mr. Tite, M.P.), and there was now some hope of a modification of the objectionable clauses in the new Bill.

Professor KERR was glad to hear that action had been taken, remarking that this was a matter of vital importance to district surveyors, who relied upon this Institute to watch their interests.

The CHAIRMAN then called upon Mr. White, F.S.A. (Fellow), to read the paper of which notice had been given—'A Descriptive Sketch of the new House at Humewood, County Wicklow,' erected from Mr. White's plans, and under his superintendence, for Mr. W. Wentworth Fitzwilliam Dick, M.P. for the county of Wicklow. The paper was illustrated by a most complete series of plans and working drawings, which included nearly, if not quite, every detail of the building.

Mr. WHITE (who was received with applause) proceeded to describe, at some length, the new building, and explained that, having carefully studied the requirements of the locality, he had endeavoured to incorporate with the old Scotch baronial hall certain Irish peculiarities, combined with such modern improvements as might, in his judgment, be necessary. He had not lost sight of the position in society of the family for whom the mansion

was being erected, and the heraldic devices would be exhibited appropriately in various parts of the building. As regarded the work itself, it was at once simple and massive; but it had been made good of its kind; and looking at the work generally, he must say he had not seen a better piece of granite work or joinery. The granite work was executed under the supervision of a British foreman, and the joinery work had been sent over from England, it being exceedingly good. Mr. White referred to the sketches with which one of the walls of the hall was hung, and which had attracted great attention and admiration during an early part of the evening, explaining that in designing the house at Humewood he had endeavoured to make it both convenient and handsome, though he had not allowed anything to stand in the way of the former idea. The exterior of the house was entirely of granite, and great care had been taken in its construction. There were no pinnars, but the granite was packed piece by piece to fit each other, so as to avoid pinnars. The joints were indented so as to throw off the rain. The building was lined with brick, held together with iron clamps, and the general arrangement was one of great strength. The new house stood from 80 to 100 feet in advance of the old building, and commanded beautiful views of the Wicklow mountains. The offices, which were extensive, and the servants' rooms were on the basement; and this he considered desirable. It was necessary in the country in which this house was built to make a mansion secure from possible attack, and he had carefully considered this point. The windows of the servants' rooms were protected with massive iron bars. The means of protection afforded to the principal entrance were also of an effective character, as would be seen by the plans exhibited. Beneath the carriage entrance there was a vaulted porch leading down to the basement, and having regard to the space, he considered that he had thus arranged the rooms satisfactorily. The stairs were furnished with a separate run for taking up the dinner. There was a lift, but he considered that a lift arranged for dinner was apt to let the steam of dinner over the house. In the still room was a small hatch for serving tea to parties on the lawn. The lift was near one of the entrances. It would take luggage and coals to the top of the house. In reference to the interior of the house, Mr. White showed drawings of the panelling, displaying the great care that had been taken in the intermixture of the wood, as would be seen by the drawings in the room. The chimney flues were so arranged that they might be swept from the basement, but probably they would require the use of a shuttle and cord, so that they might be swept from the top. The stables were 130 feet long and 100 feet wide, and they were approached by a covered way from the front, while there was a back entrance to the stable yard. The windows opened as casements, the larger ones inwards and the others outwards; the top lights of the windows, being hung to the head and opening outwards, were very available for ventilating purposes; and any ornamental glass in them still remained visible when open. The window-frames were of oak and the casements of mahogany, which had a very substantial and, at the same time, handsome effect. The gutters were of solid Staffordshire gutter bricks, and there was over them a snow-board, to prevent the gutters being clogged in bad weather. The down-pipes were of glazed Staffordshire tile built into the wall, and, to provide against any chance of stoppage, there was an overflow pipe at the top and at the bottom to carry off the water, and the roofs were covered with plain brown tiles. Along the mullions and jambs he had introduced a very slight moulding. He had relieved or softened down the edges of the granite work, not agreeing with those who preferred leaving the granite with the sharp edge. (For the information of the meeting, a series of reduced plans, showing the general arrangement of the rooms, was handed round. These drawings attracted a great deal of attention and were much admired, being executed in photo-lithography, reduced from an eighth-scale drawing. Mr. White said that they were printed in the first instance plain, and subsequently coloured in his office. Mr. Bessant, of Essex Street, Strand, was the printer, the ten or twelve copies costing 28*l.*)

In answer to questions addressed to him, Mr. WHITE explained by means of diagrams the construction of his tile gutters, which presented very unusual peculiarities difficult to describe without a drawing. He also explained the construction of an extensive flat, which was laid with slate and several thicknesses of tile, cemented, and carried on wooden joists, instead of the lead flats in ordinary use. He considered that lead flats were a very great nuisance, and led to constant annoyances; for when a lead flat got out of repair, there was frequent plundering on the part of the plumbers' servants and labourers, who either could not or would not withstand the temptation. He greatly preferred the tile flat, as it was permanent. The whole cost of the house was 15,000*l.*

Mr. SEDDON then proposed a vote of thanks to Mr. White for his able and interesting paper, for which he was sure the Institution was much obliged.

Mr. ROGER SMITH, in seconding the motion, spoke of the excellence of the drawings that had been exhibited. As regarded the treatment, he thought it was an advantage to an architect to work in granite, as he was compelled to be very simple, and avoid excessive ornament. The modern buildings in Dublin include good examples of the use of granite. At Mont St. Michel in Normandy he had been much struck with the simple beauty of some of the grand structures, executed in granite almost without mouldings. Referring to the offices being placed in a basement floor, he said there was a difference of opinion amongst professional men upon this point. For his own part he should like to know how the system worked, and to elicit some expression of opinion.

Professor KERR considered that the subject of the offices being placed in the basement was one open to much discussion. Some gentlemen objected to it, and others approved of it; but he did not like it at all—the objection to it being that it destroyed the privacy of what is called a garden front to have it overlooked by the windows of the offices. As to the window openings, in this climate he thought

it must be conceded that the sash window was the only known contrivance to keep out the weather. In his works he always introduced sash windows, even where there were mullions and transoms, and they never had an unpleasant appearance if the reveal were sufficiently deep. The construction of a tile and slate flat upon timber joists he regarded as very new and startling. He had an opinion that a tile and slate flat would not keep out the wet, but as Mr. White said it did, it must be taken for granted that such was the case. Mr. Kerr alluded generally to the ironwork and to the mouldings, which he did not altogether approve; but he considered that they were all indebted for the care with which Mr. White had brought the matter before the meeting, and for the beautiful drawings now exhibited. (Applause.)

Mr. C. F. HAYWARD did not attach much importance to the presence or absence of a basement. In his opinion all depended upon the site, and if the position warranted it, the offices could be placed in the basement. The whole matter of the arrangement of the basement was one of convenience. He had a belief in a tile flat in opposition to a lead flat, but that which made this particular flat remarkable was its apparently great size. [Mr. WHITE: It is 60 feet by 10 to 12 feet.] The difficulty in the way of using casement windows was the curtains and blinds, and the position of these ought always to be provided for in designing a window and its joinery.

The vote of thanks was put from the chair, and in acknowledging it,

Mr. WHITE said, in answer to some inquiries, that the basement was a necessity in this particular instance for various reasons. It was the most convenient place for the servants' offices, and therefore had been appropriated to that use. As regarded the overlooking, many of the windows of the offices did not overlook the grounds; and as to the others which did overlook the terrace garden, he admitted that he adopted the barbarous expedient of putting rough plate-glass to a sufficient height to prevent any overlooking. Upon the subject of sashes or casements he averred that he had seen and felt as much rain and bad weather drive through sashes as through casements, and he had seen casements that let in no wind or rain at all—that it was entirely a question of excellence of workmanship. He greatly preferred casements, for a casement once thrown open left the whole height of the window clear to look out at, which sashes do not. With reference to the down-pipe, his own was 6 inches in diameter, and built into the outer wall only, and this was free of the inner casing. As to mouldings, it was an artistic question. It was impossible to define exactly why one moulding pleased more than another, though an artist could feel the difference; and he had done what he felt suited the case. Mr. White concluded by thanking his friends for the attention with which they had listened to his descriptions.

The CHAIRMAN announced that the next meeting would be held on the 18th instant, when Professor KERR would read a paper on 'A Development of the Theory of the Architecture of Jade.'

THE PRUSSIAN WAR-HARBOUR OF JADE.

SOME ten years ago, and before matters in North Germany had assumed the character which they eventually did, Prussia bought the bay known as the 'Jade Busen' with hard cash from the Duchy of Oldenburg, to which principality the bay with its surrounding territory belonged. This was in consequence of a want, long felt by the Government at Berlin, of some harbour on the German Ocean to which, in time of war as well as of peace, the Prussian fleet might repair without violating the laws of neutrality, and in order to obviate the tedious journey round into the Baltic. Since that time, works, which were begun soon after the transfer had been formally made, have been continued without interruption, in order to convert the open and defenceless bay into a very formidable stronghold, in the centre of which are large docks. These consist of a small outer dock 273 yards long and 137 yards wide, communicating at one end with a lock leading to the bay, and at the other end with the large inner dock, which is 410 yards long and 257 yards wide. The chamber of the lock above mentioned is 144 feet long by 70 feet wide, enclosed at either end by a pair of powerful sluice gates, each leaf measuring 35 feet in width. The walls of the lock are formed in solid masonry 20 ft. at foot, and rest on a bed of concrete 10 feet deep. The outer channel leading to this lock is also enclosed by embankment walls of solid stone, and is 240 yards long by a width of 69 yards. Here are the houses and sheds of the arsenal, in which much activity constantly prevails. And beyond this the bay opens out to a considerable width; the navigable channel is at first only some 656 yards wide by a depth (at high water) of 32 feet; but it soon enlarges to a width of about 1,400 yards, thus making it easy for the largest men-of-war to enter and leave the docks.

Chiswick House, Chiswick, is taken by the Prince of Wales. In our last we were only able to state that such was a report.

A prospectus has appeared of the General Accident and Guarantee Company (Limited), with a capital of 50,000*l.*, in shares of 5*l.* each. The Company is projected for the purpose of carrying on general accident and guarantee business, and among other advantages offered is the granting a policy, without profits, for 300*l.* in the event of death by accident, or 2*l.* per week in case of total disablement by accident, for the annual payment of 1*l.*, with reduced rates for architects, surveyors, and civil engineers.

THE CO-OPERATION OF ARCHITECTS AND ENGINEERS.

(Continued from page 5.)

THERE is an obvious objection which will be raised to the line of remark we took up in the first article on this subject. It may be asked, pertinently enough, why so much importance should be attached to the conjunction of the professions of engineering and architecture; to the harmonious action of two *separate* branches of constructive science, when it is fair to assume that there may arise in either profession men who will possess the necessary talents and master the special processes of the other, and so combine the desirable results we have treated of in individual practice. It may therefore be objected that our argument so far tends directly to discourage all effort towards this dual excellence.

The answer to both objections is to be found in the almost impossible or impracticable nature of the prospect held out to us. It has already been admitted that there may occur individual instances of great excellence in architectural and engineering skill—just as it is possible enough to conceive that a man might construct a violin to rival the finest Cremona, and also be able to perform on it with the genius of a Paganini or a Joachim. But such an individual would be regarded as a prodigy, and prodigies are never plentiful. The fact remains that instances of constructive genius and high artistic instinct, combined in one mind, are not likely to be ever so numerous as to affect the argument we have been following up.

We may also ask whether it is at all likely that in the increasing magnitude and multiplication of the works to which our architects and engineers are for the future to devote themselves, the conjunction of the two specialties is more probable than it now seems. There are several weighty considerations which tell strongly against any such probability. The eager competition for works of design and construction is an admitted fact in our own time, and it is not likely to diminish if our public works expand in the same ratio which the last twenty years have witnessed. With the mere fact of this expansion, and the knowledge that the standard of professional study is proportionately rising, before us, does it not seem something like a mere truism to say that the actual working life of either architect or engineer must become practically briefer than it now is, and therefore that neither can be expected to achieve more than he now accomplishes?

The natural and obvious tendency arising out of these considerations is to create and multiply *specialists* among professional men in our day. We see this tendency illustrated in every class of professions. Medical men are divided into specialists; lawyers have their various and distinctly defined classes of legal practice; painters, sculptors, and authors have their favourite lines of study and work, in which lies their only chance, in this age of bustling intellectual activity and competition, of achieving eminence in any art. So it is with the architect and the engineer. We have the civil engineer and the mechanical engineer, each having a sharply defined province of action. One engineer is eminent in railway work, with which are associated some of the most remarkable building achievements of the age. Another is eminent for skill in bridge building, a special class of work which meets a pressing demand in these days of rapid communication and the growth of population. Others again there are who embank our rivers, construct the harbours which house our ships, and rear the lighthouses which avert the perils of our seamen.

So among our architects we have men of various repute in special phases of the art. One man by concentrated study becomes famous in ecclesiastical work; another in secular; and so, in all the different styles into which the history of the art divides itself, we have men who rise to high repute by their special devotion to one or other of them, according to their predilections.

It seems idle, therefore, to dream of ever reuniting the different phases of engineering and architectural work in individual practice. The whole tendency of our times is not only to separate them as distinct professions, but to subdivide each into various specialties.

It is not the least interesting peculiarity of all art and science, that the more they are pursued, so much further seems to recede the destination of absolute knowledge; the deeper we descend into them, the more profound do their depths become. So illimitable are the secrets and the phenomena of nature; so incomprehensible the capacities of mind!

The first step towards co-operation between the two professions of Architecture and Engineering is to recognise at once the essential distinction which now exists between them. The next is to discover for ourselves by actual observation of the works of each profession whether there is not in their quality as works of design and construction sufficient to justify a plea for more harmonious action between engineers and architects. This is the practical issue of our whole subject.

And such a subject, introduced in a journal which addresses itself largely to men practically acquainted with it, is best dealt with by leaving mere theories as soon as possible, and resorting to those everyday examples of architectural and engineering work in which not only professional but popular interest is concerned.

If, in pursuing such a course, we are led into criticism of any public work, it will be allowed to us that such strictures as may occur to one honestly and impartially considering his subject are not less required by public necessities than in the interest of the authors of such

works themselves. For, whether we be architects or engineers, we must be all aware that in social life we daily meet with intelligent and significant criticism of our public works, which it is as much the duty of the journalist to chronicle as it is for the professional reader to weigh and profit by.

For the last twenty years, during which the public interest has largely revived in the two great artistic and scientific branches of building science, much has been said and written as to the *rationale* of architectural and engineering work; and it is mainly under this head where the sins of omission and of commission in regard to such work are to be discovered. For every intelligent critic will readily admit that there is no lack of talent among us, both artistic and constructive, to which we owe many noble works of great interest and attraction. But it is just the knowledge and consciousness of that fact which incites one to criticism of the many things done which ought not to be done, and the things left undone which might have been done.

To come to actual examples, let us take the case of a building now in progress of erection, and likely to prove very popular in the metropolis ere long—one of the gigantic and ambitious projects adverted to in our former article: The Albert Hall of Art and Science at South Kensington. If we are rightly informed as to the features of its design and construction, there is much to be deprecated in it. We regret this all the more after what is to be seen of similar work already accomplished at South Kensington. The Museum buildings, in their permanent shape, are such as the country may well be proud of. As far as we are able to discover, they seem to be no less honest in the spirit of their construction than they are effective and (to our modern London notions) original in their design. If the colossal Hall now being erected in immediate proximity is to fall short of that character, the deficiency will be matter of more than merely local regret. It emanates from a source at which the soundest modern principles of art and engineering might naturally be expected to find their fullest realisation. And yet, in close proximity to the future home of our art collections, there is some reason to apprehend that this new building may sin grievously against the very canons of sound artistic and constructive design which South Kensington has for years been promulgating. In a work of such magnitude, the agency of the engineer must naturally have been called in, particularly for its main feature—the roof. It is no easy task to cover an elliptical space measuring something like 240 feet by 180 feet; and hence we believe an iron roof, forming the real covering of the Hall, is designed for it. But what can be said as to 'true principles' of design and construction when it is known that this iron construction is neither a ceiling inside, nor a roof outside the building? It seems to be a mere go-between, in real earnest meant to do the work both of ceiling and roof, and yet is not visible as either!

We entertain a sufficiently high respect for the authorities—professional and other—by whom this extensive and interesting work is being conducted, to believe that an honest criticism on any of its parts will be respected and not resented by them. It is in this spirit they may turn on us the natural inquiry, what other method is feasible by which to cover a space so capacious as this Albert Hall, which would be at once slightly and effective, internally and externally? And if our criticism on works as they are is to possess any practical value at all, we frankly admit that we are bound to meet such questions in intelligible and practicable forms. Accordingly we do not hesitate to assert that a roof, even for such an area as the Albert Hall, might have been constructed, not only in material which would have been capable of the highest artistic treatment, but would have been, in its design and construction, at once a ceiling to the hall internally, and the shell for the external covering. It will not surprise any engineer who may be acquainted with the capabilities of the material when we say that in a roof, constructed almost entirely of pottery, and treated in the majolica or the Lucca della Robbia manner, a system of simple arched construction could have been adopted. This would only be following the wonderfully vaulted roofs of our Perpendicular Gothic style, such as we see in King's College Chapel, Cambridge, Henry VII.'s Chapel at Westminster, or St. George's Chapel, Windsor. These, at least, will be recognised as respectable precedents to follow.

Assume the radiating or vaulting ribs to be formed in metal, a material of our own time for all such constructive purposes, and nothing can more naturally follow than to 'fill in' the gores with hollow cubes in the pottery material, modelled and coloured (though probably not glazed) on the under side or ceiling surface, and filled in the hollow or outward surface with a cement largely impregnated with sand, whereby a ground work for tile or slate would be formed, and security be gained for proper acoustic effects in the hall internally.

Such a treatment would not only be illustrating that conjunction of the two branches of building science which we are treating of, but would be thoroughly in accord with the use and treatment of ceramic material, which forms one of the most striking and interesting features in the general design of the building.

Many works of public interest and importance offer opportunities for strictures of this nature; and if we hereafter refer to them, it will be less for the mere purposes of criticism than to deduce from them practical and every-day illustrations of that divorced action between the artistic and constructive professions which we earnestly desire to see annulled.

(To be concluded in our next.)

ILLUSTRATIONS.

THE CATHEDRAL OF TOURNAI.

THE Cathedral of Tournai, the largest Romanesque building in Belgium, is one of the most complete and remarkable examples of this style in Europe, and is also peculiarly interesting as affording a comparison with the Abbaye-aux-Hommes at Caen, both being in course of erection at the same period. The Cathedral consists of a nave and aisles, which were dedicated in 1066 A.D.; of a transept, with apsidal ends, dating from 1146 A.D.; and of the choir, aisles, and chapels, which were added a century later. The apsidal ends of the transepts are the finest features of the church, and are, with the single exception of the church of Sta. Maria in Capitulo at Cologne, unique examples of this form of apsidal termination, with aisles running round. The architecture of their interior consists of a series of arches of two orders, circular headed and stilted, which, carried on lofty circular piers, divide the aisles from the nave; and a triforium gallery above, with similar arches to those below, the piers being smaller and of half the height only; both aisle and triforium gallery are of the same width, and lighted by circular-headed windows. Above this second row of arches comes the real triforium, which consists of an architrave, or 'plate-bande,' supported by small stunted columns and piers. The vaulting is carried by plain ribs converging to a point, and is penetrated by circular-headed clerestory windows. The architecture of the exterior of this apse is seen in the illustration which we have chosen, taken from the north-west end of the Market-place adjoining the Cathedral. It is extremely simple, and the decoration is confined to the capitals of the small columns on each side of the windows. This Cathedral is the only church in Belgium which has five towers; they are all most picturesquely grouped in the centre of the building; the central tower, which is somewhat low, being situated in the intersection of the nave and transept. Of the other four, the south-east tower is pure Romanesque; the other three seen in the illustration belong to the Transition period.

R. PHENÉ SPIERS.

MANSION AT POSSINGWORTH, SUSSEX.

THE Mansion which forms the subject of our illustration has been recently completed from the designs of M. Digby Wyatt, and is carried out with unusual care and completeness in every detail. We shall have another opportunity of illustrating this work, and defer till then a descriptive account of it. The proprietor is Mr. Louis Huth.

OUR RAMBLER

AT SOUTH KENSINGTON.

A BRAVE place for a ramble!—none better. Most attractive to those who go most often, and full of the work of the artist and the craftsman, is the South Kensington Museum. The library is no doubt already the best art library in the kingdom, and daily additions of books are raising its value from week to week. The collection of the Commissioners of Patents includes the germs from which all our manufacturing greatness has sprung. The loan collections throw open from time to time the best ornaments of private galleries to the inspection of all comers. The building materials and educational gallery, and even a museum of articles used for food, are laid out to attract the sober and the practical; while the Vernon and Sheepshanks pictures; the water colours; the photographs; and the matchless and priceless cartoons of Raffaele, are open to delight the lover of pictures.

For the moment let us put all this aside, and glance at that which, to the practical eye of THE ARCHITECT, may be supposed almost more attractive than any one of them—the buildings in progress. Few persons seem fully aware how much building is being carried on at the present hour on the South Kensington sites, or how extensive those schemes are which are now in course of execution. Fewer still are fully aware that novelties are being here introduced, especially in the decorative treatment of the new buildings, such as no architect or even builder who desires to keep up with the times can afford to neglect or ignore.

A ramble round the works in progress, and through the completed portions, does not afford so good an opportunity of explaining what the whole is to be as may occur hereafter. Perhaps, too, it would be almost unfair to make such a visit the occasion of any attempt to examine critically the architectural style and treatment of the portions already done. At any rate, this will not be attempted now, and we shall simply ask to be conducted over what is being done that is new or striking.

Of a recently naturalised branch of manufacture—that of terra-cotta—very remarkable specimens are abundantly used here. The works in progress in the Exhibition Road, the portions already completed of the great Quadrangle, and the works of the Albert Hall, all display excellently well the capabilities of terra cotta as a material for external decoration. Mr. E. M. Barry has used terra-cotta in the Charing Cross Hotel, and that at Cannon Street, for the decorative parts of his work; and here it may be said to serve as a substitute for stone, or a material intermediate between stone and Portland cement. Mr. Charles Barry, at Dulwich College, has largely em-

ployed very carefully made terra-cotta dressings, and he has in his building made use of the general forms of Lombard architecture. His terra cotta is, however, finished by hand before burning, and in this process receives treatment which straightens its arrisses, supplies undercutting to the enrichment, and altogether assimilates the material rather to artificial stone than to enriched brick. At South Kensington, on the other hand, we found a much less carefully prepared material in use, the arrisses have not been corrected, nor the enrichments touched by hand after moulding, so that the blocks, which are not of large size, have been burnt since they left the mould, and are built into the work as received from the kiln.

The most remarkable specimens of this terra-cotta work here to be seen are the columns designed by the late Godfrey Sykes (and almost his last work). These were intended for, and are used in, a large internal quadrangle, of which a portion only has been yet built.

These columns have enriched shafts divided into lengths by bands encircling them, and in this way a column of large size has been built up from pieces of really manageable dimensions. The enrichments on these shafts are very cleverly contrived in such a manner as to break the outline at many points, and thus, while adding beauty (for they are most artistically modelled), they conceal the irregularity of line which always occurs to a greater or less degree with terra-cotta, burnt as moulded—a circumstance which renders the material less suited for a plain shaft than for any other description of work.

Of the works in progress, one of the first to challenge attention is a new staircase. This staircase is of almost the simplest known form, the rise from one floor to the next being obtained by two parallel flights of broad stairs, with a spacious square landing on the half-space. The stairs are enclosed by side walls; a raking barrel-vault, or soffit, forms the ceiling of the flight, and a little domical vault covers the landing. A window is pierced through the wall at the half-space. When fully completed, this simple staircase will have its walls profusely decorated with panels of glazed majolica, set in mouldings of Parian or some similar cement. The richly-moulded panels of the ceilings will be decorated with mosaic pictures, and the window filled with stained glass.

The mosaic is, at present, for the most part represented by paintings of the subjects, and may not all be fixed for some time; but of the majolica decorations, a sufficient number are in place to show the adaptability of this durable material for the purposes of the wall-decorator. Panels of considerable relief, sparkingly bright in effect, and introducing colour, are here provided, which will wash, can hardly be destroyed, and can be produced in great variety. This appears an appropriate and very valuable application of a manufacture eminently English, and perhaps one which fortunately received from its early founders the most artistic impulse that England has yet seen given to any branch of her industry.

In our rambles—while endeavouring to form some idea of the general scheme of the Museum as it is to be among marks of change and alteration, temporary buildings, and expedients of all sorts, mixed up in apparent confusion with portions of the completed structure—our Rambler came upon a collection of sundry slaty greyish slabs, looking not unlike very large thin paving stones that had been washed in Portland cement, and learned, not without surprise, that they were mosaics (only lying face downward) for the decoration of the Royal Albert Hall. This building is to be of an elliptical outline, and round it, at a height sufficiently great to demand bold treatment, will run a frieze, boasting the magnificent dimension of 800 feet long by 6 feet 6 inches high, enriched throughout by figure subjects. This continuous girdle is to be executed in mosaic, and as it has been determined to obtain designs of a high order of merit, several of our best artists have been employed to furnish them.

The process followed is this. The drawing is made with a bold black outline, one tint of buff and one of chocolate being the only colours, except black, employed. By an enlarging apparatus somewhat akin to a magic lantern, the image of a magnified copy of this outline is thrown on to a sheet of continuous cartridge, and there traced. The full-sized outline so obtained is then corrected by the artist whose work it represents; and from this the separate outlines of portions (of a convenient size for working) are obtained and distributed among the mosaic workers, into whose room we will follow them, pausing only for a moment to admire the great beauty of a vigorous outline by Mr. Marks, which at the time of our visit was in process of reproduction in this manner.

The mosaic is almost entirely worked by young women, and it is no small advantage that a new field for the labour of women seems in a fair way to be opened by their employment on this work. The room we visited, a bright and tidy *atelier*, contained a considerable number of mosaicists. Each has the paper on which is drawn an outline of the portion she is to execute on her table, and before her lie small trays of tesserae of the three colours named. The tesserae are little hard lumps of baked earthenware made by Minton, and closely resembling his paving tiles in quality. A hammer and chisel for chipping them where small pieces are required seem the only tools needed, and thus furnished, the mosaicists proceed to arrange the pattern; the back of their work being seen by themselves, while the face, which remains covered with the paper, is unseen. This work is light, and seems pleasant, and is rapidly done.

This *atelier* was not, however, confined entirely to mosaics of this simple character; some of the figures for the decoration of the south court (the part of the building best known to general visitors) were

in progress there, and two uncommonly clever heads, one of Mulready, the other of Michael Angelo, were shown us. These are after paintings by Mr. Barwell and the late Mr. Godfrey Sykes. Even though seen at the disadvantage that the roughly executed back, and not the face of the work could be inspected, these heads, like much of the mosaic work actually fixed in place in the south court, showed great mastery over the material.

To return, however, to the mosaic for the long frieze of figures. The portions when completed in sizes sufficient to be suitable for transport and framing, are consolidated by simply adding Portland cement at the back of them, into the slabs which we saw at entering, and to which a slight curve is given to enable them to fit the work accurately. In that condition they will be fixed in the building, and it may be fairly expected that they will prove as imperishable as they undoubtedly ought to be charming.

The mosaics in the south court, the painted lunettes, and other art-work of the structure, must, like the whole of the contents of the Museum, be passed by here. We will conclude our ramble by passing across Cromwell Road, up under the incomplete arcades of the Horticultural Gardens, and taking just a glimpse at the works of the Albert Hall.

Among important works in progress in this country, the Albert Hall must appear in the first rank, alike on account of its great size and of the very long time that has elapsed since any important building has been erected in Europe in the category to which it belongs. It is startling to find rising in our fashionable quarter a building which, however it may differ in details, is in the main a Roman amphitheatre,—not, indeed, equal in size to the best known of such examples, but at any rate approaching them sufficiently near for comparison. The width of the Albert Hall within the walls of the highest gallery may be roughly stated at fully two-thirds the width of the well-known amphitheatres at Nismes and at Arles, its length being something more than half that of either of these examples.

Such a building cannot fail to exercise a remarkable influence whenever it comes to be seen by the public. At present it is not completed in carcase, though much of the brick and terra-cotta work has been fixed. The vast sweep of its lines—the spacious interior occupied by a perfect forest of scaffolding—the large surfaces decorated with terra cotta of the sort already described, surprise and astonish the spectator who visits the works for the first time; and a glimpse at the plans and models of that large part of the work yet remaining to be done is fully as interesting as a peep at the accomplished work. To this building our Rambler hopes to return at a future day; but it is not necessary to put off till then the statement that the general outline of the design was by the late Colonel Fowke, and the building is being built from the plans of Lieutenant-Colonel Scott, R.E., and is being carried out by Messrs. Lucas under the superintendence of Colonel Scott, assisted by Mr. Gilbert Redgrave.

SANITARY ENGINEERING.

By ROBERT RAWLINSON, C.B., CIVIL ENGINEER, F.G.S., &c. &c.

(Continued from page 10.)

It is not my intention to introduce into these lectures many tables because books of tables—such, for example, as Beardmore's—are ready at hand for reference; but, instead of tables, I shall state the results of my own observation and experience. Records of rainfall are obtainable by engineers, for Great Britain, the Continent of Europe generally, parts of India, China, Africa, and Australia; for New Zealand, North and South America, and many islands. In all these documents annual variations will be found to have been recorded; and in all there are dry seasons, and there are wet seasons. Parts of India have been deluged with rain, while other parts have been burnt up with dry heat. America has been wet when Europe was dry; and so, in like manner, it has been in other places and in other countries. There is no such thing as any general return of a season being either wet or dry over the whole surface of the globe.

The annual variation in falls of rain generally prevalent appears to be about as 1 to 2. That is, in different parts of Great Britain in one year the rainfall may be 20 inches or 40 inches, and in the next year it may amount to 40 inches or 80 inches; hence averages of 30 inches and of 60 inches result. Now, in any new district which may claim your attention (unless local facts establish any other conclusions), when you have obtained tables of the recorded averages of rainfall extending over a certain series of years, if you deduct one-third from these averages, it will give the driest year, and if one-third be added, it will give the wettest year. Thus in the Thames valley, with an average rainfall of 30 inches, the fall in any very dry year may be estimated at 20 inches, and in any very wet year at 40 inches. This calculation gives an average of approximate, but not of exact, accuracy; still, this may be accepted as a rough workable average. At the same time, it is most important always to take into consideration probable excesses, in either direction, above or below this average. In the construction of waterworks, when the engineer has to rely on water which he has to gather from the earth's surface, he must ascertain both the maximum and the minimum volume of such supply; for the elements will assuredly bring him to the test of that minimum as well as of that maximum. Nature does not give wet and dry seasons either alternately or in accordance with any fixed law. It may be now as in the days of Pharaoh, seven dry years may follow in uninterrupted succession. In India, where the professional services of the Royal Engineers are called into action, excessive variations of rainfall are but too well known. There also, where human life is so prolific, the means of sustaining that life (if there are no stores of water and means to use it) depend directly

upon the amount of rain that falls, and also in some degree upon the regularity of its falling. Hence has arisen the imperative necessity for devising works of irrigation based on strictly correct principles, of which some have been carried out on a grand scale, while others of equal magnitude have been projected. Since dry seasons invalidate averages, engineers who may work in India must keep in view the facts; and I desire to direct your particular attention to two other circumstances arising out of diminished rainfall, which will seriously affect the volume of water that the engineer might have at his disposal. These are, first, an increase of heat, the result of a diminished rainfall; and, secondly, in consequence of this increased heat, a greater proportionate amount of evaporation from the heated surface of the earth. Thus a diminished rainfall in such a country as India acts directly in causing an increased diminution of water, and engineers, consequently, must be prepared to experience droughts reduced in a much greater degree than two-thirds of any average fall of rain.

In England, from 2 to 5 inches of rain is the ordinary month's fall; and, as a general rule, such falls are sufficient to feed our rivers, streams, and springs; but in the course of last summer (that of 1868) a fall of 2 inches in seven days descended at such intervals upon the heated ground, that the whole volume of water was forthwith again evaporated, without having left any flow whatever to touch any waterworks. Similar causes would produce similar results, but under a far graver aspect, in India.

When about to form plans for waterworks, engineers will consider that they have to take into their calculations the elements, the physical aspect of the country, the substrata and the surface-area with which they have to deal, and the amount of reservoir storage that must be provided. And here I must add another word of caution, lest any engineer should be deceived by averages. The minimum supply is the one only true and reliable authority. This determines what volume of water may be regarded as certain even in very dry seasons. Such a guide as this, therefore, unlike ordinary averages, will send the engineer further afield than otherwise he would have gone, will cause him to enlarge the scale of his works, and induce him to store up more abundant supplies.

The aqueous vapour which forms rain, itself depending upon evaporation caused by the sun, is accumulated in clouds. These clouds drift away with the different currents of the atmosphere; and in their course they discharge a portion only of their rain upon the land, much of it falling from them back again into the ocean. Now, rain that falls from the clouds does not represent the area of the ocean's surface from which the water has been evaporated; consequently, in particular seasons, in accordance with the nature of atmospheric currents by which the clouds are carried away, a great accession of wet must take place in some one district and some one country, coincident with a great drought in other districts and other countries. This is what took place under our own immediate observation in the last summer, which certainly will long be remembered by meteorologists as a summer of extreme contrasts. In England, as also throughout the greater part of Europe, the spring and summer seasons have been exceptionally hot and dry; but in other parts of Europe, in many parts of India also, and of America, this same spring and summer was cold, cloudy, and exceptionally stormy and wet. These phenomena may be traced to a tendency which exists in nature to repeat excesses through a certain cycle. For example, if, from any special cause, the wind and clouds set in over any particular region where condensation and precipitation commence, these operations have a tendency to attract vapour from all sides to the same spot, and to repeat the condensation there until a change is brought about either through a process of exhaustion, or in consequence of the more powerful antagonistic action of some other natural agency.

The average volume of rainfall in England I have already stated to be about 36 inches. In some parts of India the average is as high as 300 inches; and this heavy fall takes place during the monsoons, which occupy about three months in each year. The actual full weight of the entire volume of the rain, however, falls within a single month. During the last year, in some parts of Bengal 135 inches of rain fell in twenty-four days. This was in the month of June, on the 21st day of which month 16.4 inches of rain fell. In Bombay the lower parts of the town were flooded to the depth of 4 or 5 feet; so that, even if there had existed main sewers as large as railway tunnels, they would have been filled for a time without materially lessening the surface water. Such sudden and violent excesses of rainfall, it must be observed, are not exclusively restricted to the tropics. They occur also in our own country, notwithstanding the comparative smallness of our yearly average. We have just seen how in Bengal on the 21st of June last there was a rainfall of 16.4 inches. This fall occurred within the space of the twenty-four hours of a single day; but in England, during a thunderstorm, as much as 2, 3, or even 4 inches of rain have been known to fall in a single hour. In the consideration of this question of rainfall for all practical purposes of engineering, there exists the truly terrible contingency of a sweeping destruction being brought about by a sudden storm, unless engineers extend their calculations beyond averages to maximum excesses. And, from the neglect of such calculations, most serious mistakes have been made in modern engineering, in our own country, in Europe generally, and in the East. In the wet season in Yorkshire, to which I have already referred (November 1866), two days and nights' rain swept away a large masonry viaduct, belonging to the Midland Railway, which could not have been erected at a cost of much less than 200,000*l.* or 300,000*l.* When this viaduct was constructed, the engineer had not contemplated, as a possible contingency, that the small river which flowed through a wide valley might swell into a devastating torrent; and, consequently, when the great storm came his foundations were carried away, and the whole viaduct became a heap of ruins. In other parts of the world, and particularly within the tropics, engineers have to contend with floods of a much heavier and more destructive character than the worst that have been known to occur in England.* In England, some of

* Inundations have taken place during the past autumn (that of 1868) of the most terribly destructive character, in Switzerland, and especially in the cantons of St. Gall, Grisons, Tessin, Valais, and Uri. Upwards of seventy human lives are known to have been lost; 25,000 acres of cultivated land have been covered beneath heaps of debris; more than 100 bridges have been swept away, and a still larger number of houses

our rivers—as the Eden at Carlisle, the Ouse at York, and the Thames in its upper branches—rise, from their dry water-bed to their flood-water height, 20 feet vertical; but in South Africa the rise of rivers is not less than 60 or 70 feet. In Australia, some rivers have actually risen 120 feet; in Italy, and in Spain, roaring torrents rush furiously along where, in the previous year, there existed only dry ravines. We have all lately learned that similar excessive changes from dry valleys to the beds of sweeping torrents occur in Abyssinia. If engineers desire to construct works that will prove safe and enduring, these excesses must be taken into their calculations. Meteorology, indeed, is to engineers a study not only of infinite value and importance, but one that is absolutely necessary.

Whether local written records of heavy and exceptional floods be or be not obtainable by engineers for their instruction and guidance in new countries or districts in which they may have to construct works, or to direct military or other operations, it is always an important part of an engineer's duty to examine and study with care the physical aspect of the scene of his future action, with a view to ascertain what Nature herself may have recorded, after an expressive and significant fashion peculiar to herself, concerning her own operations. Nature rarely fails to write her own story, either of uninterrupted quietude, or of occasional floods, on the sides of mountains and hills, and along the course of valleys and ravines; so that watchful and intelligent observers may derive from the visible memorials of the past the most valuable suggestions for their own present guidance. I remember well a painful illustration of what has just been said, which took place before my own eyes in the Crimea. At Balaklava, the Sardinian army took up a position in a valley where some of our own works of a temporary character were also constructed. On one of the Sundays in the month of May, 1855, a sudden flood swept through this valley, carrying with its waters the ruins of the works that impeded its progress, and causing both the sacrifice of many lives, and the destruction of property of very considerable value. Now, the possible occurrence of such an event ought to have been foreseen, by the aspect of the locality itself, and the occupation of that valley ought to have been prevented. The bare mountain sides, and vast masses of disintegrated soil and rock so palpably had been washed down during storms of rain from higher ground, that they told significantly, not only of floods that had taken place there, but of the unquestionable probability of future repetitions of similar destructive incidents.

When I come to treat of the construction of waterworks, I shall have to revert to what has been said on the subject of excesses above averages, and it will be my duty to impress upon your minds the absolute necessity of forming a correct estimate both of the area that is to be brought under control, and of the maximum volume of water with which you will have to deal. It is well for the engineer to make himself master of all details connected with rainfall; but, at the same time, he must remember that he has not to apply his knowledge of such matters upon a uniform principle on every occasion—he is not to make a rule-of-three proposition of area, rainfall, and flow of water from the ground, and then act systematically upon the result, be the circumstances and requirements what they may. The engineering treatment of water differs essentially, when the object in view has reference to sewers and drains, from what may be necessary in connection with waterworks. In countries where there may be a rainfall of 16 inches in twenty-four hours, it would be mere folly to contemplate the construction of sewers which would be capable of carrying away, beneath the surface of the ground, such vast volumes of water. In cases of this kind engineers have to provide means for safely conveying away, over the surface of the ground, whatever flood waters may have fallen. Sewerage and drainage, while in some degree affected by rainfall, are of a different character from waterworks. Main sewers must be projected and constructed on principles that have a direct bearing upon their own offices. It will be understood, therefore, that I now am strongly pressing the necessity of studying and acquiring a sound knowledge of the excesses that are committed by nature, in order more especially to introduce the consideration of one of the two great practical questions that will be discussed in the following lectures—the question, that is, of waterworks, both for impounding rainfall waters so as to provide for water supply, and also for controlling flood waters and preventing their destructive operation. In subsequent lectures I shall be able to apply, and I hope with advantage, the elementary information contained in the present lecture.

The conclusions to be drawn from the foregoing remarks may be summed up as follows:—

1. Civil and military engineers ought to study meteorology, as liable to affect sanitary engineering works.
2. Main sewers, drains, and waterworks are affected by rain, both in drought and when in excess.
3. Evaporation from the salt ocean produces fresh-water, which forms springs, streams, rivers, and lakes.
4. The volume of rain which falls in any one year may be described as due to the evaporation and condensation of that year.
5. The fall of rain is influenced by terrestrial and other causes, and man only interferes with such causes in a fractional degree.
6. An engineer, before commencing works, should study the geology, aspect, contour, and other peculiarities of a country, and learn, as far as may be practicable, the extent of meteorological excesses to be expected in that section to be dealt with.
7. Rainfall varies from an average of 300 inches annually at the tropics, to twenty inches annually, as on the east coast of England. Averages must not, however, be relied upon. A tabulated list of excesses, both of drought and of flood, will be of more value to engineers, civil and military, than ordinary records and averages deduced from them.

destroyed, or seriously injured; many miles of road also have been broken up, and the railway of the Rhine Valley has not been in working order for more than thirty days. This wild outbreak of the elements, while it declares that the powers of nature are not less terrible now than in past ages, warns engineers not to rest content with calculations based on ordinary averages. It must be added, that at the time of these fearful inundations in Switzerland, the waters of Lago Maggiore rose 18 feet above their customary level. As another instance, bridges recently erected in the colony of Natal, at a cost of some 40,000*l.*, have been swept down this autumn (1868) because the engineers had failed to provide for such a flood.

8. Although the annual fall of rain is so wide apart as 300 inches at the tropics, and twenty inches in England, a thunderstorm in England may, for a short period, be as violent as in the tropics, and comparatively as destructive.

9. Seasons are very little modified in their meteorological character by any works of man. The rays from the sun acting on the ocean, and causing the great ocean and aerial currents which generate and move vapour and cloud, can only be affected and modified by cosmical changes.

N.B.—The permanent gases of the atmosphere are nitrogen, oxygen, and carbonic acid. The first two are always found in nearly unvarying proportion of 80 per cent. of nitrogen and 20 per cent. of oxygen, with carbonic acid in a fractional proportion—from 3·7 to 6·2 in 10,000 parts.

NEW CANAL AT AMSTERDAM.

THIS work is intended to ensure a direct communication between the narrow part of the Zuider-See, called the 'Y,' opposite the harbour of Amsterdam, and the German Ocean. It is expected that by this means the journey by water will be shortened by at least twenty-four hours, and the undertaking is looked upon by the Dutch as one of no small advantage to their chief commercial city, inasmuch as the Zuider-See by no means affords either sufficient safety or depth of channel enough for large ships. The works undertaken as yet consist in the erection of enormous sluice gates both in the 'Y' and at the other end of the future canal, in the embankment of the sea of Wijk, in the cutting of the canal itself through the low-lying districts of Velzen and Beverwijk, as also in the construction of a harbour at the junction of the canal with the German Ocean. The total length of the canal will be 23,000 metres (or rather less than 8½ miles), by a width of 197 feet at the level of the surface of the water, and a depth of 24 feet (the latter equal to that in our East India Docks). The sides of the canal are being very carefully built in large blocks of a sort of coarse granite, the earth forming the backing being carried to the site by a narrow-way railway, specially constructed for the purpose. The total cost of harbour, canal, embankment, and sluices is estimated at 27 millions of Dutch guilders (85,000*l.*), of which the Government pays down 2½ millions, and guarantees an interest of 4½ per cent. per annum on 2½ millions more. But the chief portion is capital subscribed in England by a company, who will become the proprietors of all lands reclaimed by the works we have described. The entire distance, forming, as we have shown, a short cut from Amsterdam to the sea, will probably be ready for traffic in 1875.

THE HANDY-BOOK OF HOUSE-BUILDING.

CHAPTER I.

Continued from Page 6.

LIVING ROOMS.

THE situation of the Billiard Room is often a little remote from the main house, partly because it is often smoked in, and the smell of smoke is unwelcome among family rooms; partly because the players may prefer their game to be to a certain extent undisturbed; but chiefly because no ingenuity can easily convert a room encumbered with so large a piece of furniture as a billiard table in the centre of its floor into a useful reception room, as one of a suite. This room ought, if possible, to be on the ground floor, in order to secure a solid support for the legs of the billiard table. If it is on an upper storey, an extra strong floor must be provided. A top light, free from shadows, and interfered with by no other window, is required. A recess, with a bench in it for spectators, is useful in this room, and it will be advantageous for the floor of this recess to be one or two steps above the general floor-level. 18 feet by 24 feet is the smallest room in which a full-sized table can stand with perfectly sufficient space round it for the players. A dressing room ought to be appended to the billiard room, unless a cloak room adjoins it, and is provided with convenience for washing, &c.

A Smoking Room should be cosy and snug, warm and well ventilated. It is best to detach it well from the other parts of the house, but not so as to oblige those who resort to it, to go out actually into the open air. Sometimes, if a good view is obtainable from some rather secluded room on an upper storey, the necessity for going up stairs will be tolerated by the smokers; but such a situation is not to be preferred for the smoking room.

The Gun Room is required only in country houses; it should be close to one of the secondary entrances to the house, and requires to be fitted up with an abundance of racks and cupboards for guns, fishing-rods, &c., and washing apparatus, and conveniences for cleaning guns. It forms a kind of link between living rooms and rooms for service, and is best placed when between those two portions of the house.

The Odd Room has claims which ought perhaps to have earlier procured it notice, for it rarely can be spared, even by families who can readily dispense with several of the other rooms in our list. In fact, it often replaces one or even more of them. The uses for such a room vary with the favourite amusements or occupations of different families; in one case it is required for a workshop, with a turning lathe or a bench; in another for a museum; in a third it is a children's play-room. Often it serves all these purposes in turn, and in addition, discharges occasionally the functions of business room, or gun room, or both. A smallish apartment will ordinarily suffice; and when there is a second, or luggage, entrance, the odd room should be approachable from thence.

It is not proposed here, while treating of ordinary living rooms, to notice those which rise out of exceptional circumstances or wants, or those which are solely devoted to state receptions. The list of these rooms includes the private chapel, ball room, orangery, sculpture gallery, picture gallery, music room, private theatre, state, and drawing and dining rooms. For whatever has to be said about any of them, an appropriate opportunity shall be found hereafter.

The Conservatory is closely connected with the series of living rooms, and is an appendage which adds ornament and pleasure to the smallest as well as the largest house. It is more pleasant to enter the conservatory direct from one of the living rooms than from a corridor, or even from the hall; and when it opens out of the drawing-room, it is more ornamental and useful than it can well be in any other position. It is very unfortunate for this appendage to be so placed that it cannot be entered from any part of the house without going into the open air. In cases where plants grow in the conservatory and are brought forward there, a sunshiny aspect and much light are indispensable. In establishments where there are other green and hot-houses a constant supply is kept up of plants in pots or tubs, grown elsewhere and brought here when at their best, and only retained so long as they retain their full beauty. For such purposes the receptacle ought not to have too much sunshine, need not even have a southern aspect, and may be only partly of glass. In either case shelter from the prevailing wind, protection against snow, plentiful ventilation, sufficient heat well under control, good stands for displaying plants, and, what is very often neglected, sufficient space of path to walk among the flowers without inconvenience, are the requisites of a good conservatory.

The Hall is the link between the living rooms of the house and the corridors and communications. In a large country house it is often a room as spacious and almost as comfortable as the dining room or library. In a small town house it is nothing but a short and not very roomy corridor. In a house of formal disposition of plan it may be appropriately termed the saloon. In some Elizabethan mansions it is either replaced or supplemented by an ample corridor known as the gallery.

Following the course laid down, and considering first the case of a country house without limitation of site, we usually find the hall of such a house spacious and comfortable, giving access to most of the principal living rooms, and ordinarily used as a kind of lounge, while on grand occasions it does duty as a banqueting room or ball room. The hall is always best when roomy in proportion to the size of the house. To a town house nothing gives a greater air of dignity than a spacious entrance hall, and in a country house this is often expanded to become—as it was in the Gothic and Elizabethan mansions, which have to a great extent formed our models—one of the most important apartments of the house, and is used to some extent as a lounge as well as for access. As soon as the hall begins to take anything like the character of a room, it ought to have an open fireplace, and to be in some way screened from the entrance door by a lobby.

The principal staircase, to which we shall recur presently, is sometimes placed actually in the hall, sometimes opening out of it. A billiard table is also sometimes placed there, but can seldom be well enough lighted in such a position.

Close to the hall in large houses there ought to be a cloak-room, with fittings for washing, and adjoining conveniences; this ought to be directly accessible from the outer lobby if there is one.

The hall may almost be regarded as the lungs of a house. It is usually essential both to the comfort of a dwelling-house of any size and to the preservation of it from injury through damp, that an efficient warming apparatus be provided. This will best fulfil its purpose if it be caused to heat the air in the hall, staircase, and adjacent corridors, an office very inadequately performed by an open fire; for though nothing can replace the cheerfulness and direct glow which such a fire imparts, to the great comfort of those actually using or passing through the room, it does little towards spreading an atmosphere of warm air throughout the whole house. An apparatus in which water at low pressure circulates through iron pipes will best heat the air if properly constructed. The high-pressure systems, in which the pipes at times attain an extraordinary degree of heat, are highly objectionable for this purpose, as they injure the quality of the air; and on the same ground a hot-air apparatus, though on some accounts superior to the high-pressure hot-water, is generally found decidedly less pleasant than the low-pressure hot-water systems.

The putting of living rooms together so as to secure good access to each, and suitable aspects for all, often taxes the ingenuity of the architect to the utmost. In a house of considerable size, and where the choice of aspects is tolerably unfettered, a satisfactory arrangement is to secure a south-eastern frontage for the dining room, with the drawing room on the adjoining or 'return' front, namely, the front which looks south-west. The living rooms will then form an L-shaped block, and may come in this order:—at eastern end of south-east front, morning room; at centre of same, dining room; at angle, drawing room, with one side south-east and the other south-west, and windows in both; beyond that, library, with windows to the south-west, and also north-west. An example of this plan, omitting all the remainder of the house, will be given hereafter; and—though often much modified by circumstances, and of course out of the question in ordinary town houses—the arrangement of rooms here shown may be regarded as the normal modern English arrangement, access being given from a central hall. For each principal living room there is a suitable aspect, or, as the Scotch call it, *exposure*, which secures sunshine at the right time of day.

In ordinary situations an eastern or south-eastern aspect is best for the windows of a morning or breakfast room, which then catch the earliest sun; a south-eastern or southern aspect suits a dining room, which ought to be sunshiny in the morning and at lunch-time, but in shade at the ordinary hour of late dinners. The drawing room requires the afternoon sun most, but is benefited by the morning sun as well, and is therefore best suited by a south-western or a southerly aspect. For a library a good north light is desirable in case painting or drawing be practised, or a microscope much studied in it; but such a room ought to have, in addition, light from a sunshiny quarter.

No living room, except a billiard room, and sometimes a hall, ought to be so situated that the direct sunshine does not at some time of the day enter it.

Before discussing the modifications in living rooms, and their arrangement, which a town site necessitates, it remains still to notice sundry considerations relating to comfort, and to consider the general question of *treatment*—that is to say, of all that relates to the appearance of each room as an architectural feature. (To be continued.)

Correspondence

'OUR RAMBLER' AT THE NEW INDIA OFFICE.

SIR,—In your 'Rambler's' description of the New India Office, there are, I cannot help thinking, several points on which he bestows somewhat indiscriminate praise.

I therefore venture to make the subjoined remarks, in a spirit, I hope, of the most fair criticism, feeling that amongst so very much that is admirable, the features of the building to which I would call your attention are really open to question. I refer, more particularly, to the principal staircases.

I cannot but think that the staircase is one of the chief architectural features of a good interior, as it is there that the greatest heights and open spaces are generally to be found, and a successful treatment and combination of the raking and horizontal lines is one of the proofs of artistic and architectural skill. But in the India Office every difficulty of this sort has been evaded by simply building a well, with arcades, &c. round it, and then, on a huge frame of iron girders, carrying the steps, cutting the architecture in all directions, and producing the most discordant lines.

Entering with 'The Rambler' from the great quadrangle, let us notice the first staircase we come to. The first landing is carried on girders, supported by a wonderful pile of stone-work, and the upper flight cuts the arches, from which it is not distant more than a few inches, in a most unpleasant manner.

Exception may also fairly be taken to the balustrade, which is anything but pure in style, far more like plaster than stone work.

There is a smaller staircase at the south-west angle of the Sultan's quadrangle, running up without the least connection with the walls, and treated in this apparently temporary manner.

But it is in the great staircase that this peculiar treatment is the most prominent.

Everything here seems built up within the staircase walls, and not designed *with* them. The octagonal dome does not appear to be in the centre, as there is, at a great height, a sort of gallery running across, cutting off a part of the ceiling; and, of course, the effects should all be studied from the ground and first floors, as very few persons would mount to the top floor to find out whether the dome might really be in the centre or not.

The iron girders are here most unpleasantly prominent, and carried on all sorts of little heaps, some of them decidedly pretty designs in themselves, but slightly suggestive of cenotaphs.

There is one girder running right across, a little above the level of the first floor, which has the most unpleasant effect of hitting the heads of persons coming upstairs, and in no case do any of these girders, so far as I remember, show themselves to be girders. They are all cased or plastered.

The balusters of this staircase also struck me as being so far apart as to give one a sensation of insecurity.

There is one thing more to which I should like to refer, and that is the imitation granite pilasters in the corridors round the interior quadrangle. One would think a great public building could do without this, and what has been so lavishly expended in carving would have well paid for real granite.

If your 'Rambler's' wanderings should take him into the Foreign Office, I trust he will compare the very coarse panels carved on the piers of the grand staircase in that building with the beauty and delicacy of the Raffaelsque panels in the India Office.

I am, Sir, yours obediently,
LONDON, W. SCRUTATOR.

FALL OF A SPIRE AT COLCHESTER.

DEAR MR. EDITOR,—It is currently reported that the spire, which you state in your last number was blown down at Colchester, was that of the Congregational Chapel in the Lion Walk, and not that of a church. It would be interesting to have some particulars of this occurrence, and of the causes, if the architect could discover, and would favour you with them.

It is to be hoped that this is not one of those occurrences due to the insane desire for cheap magnificence, which led Pugin to the indignant remark of—'Say 50*l.* more, and have a tower and spire.' If this be so, it is a lesson important to be learnt by chapel-building committees.

I AM, &c., COLCHESTER.

THE APPROACHES TO WESTMINSTER BRIDGE.

SIR,—I am anxious to direct your attention to the present condition of the gradients of the road and footways that form the approaches to Westminster Bridge, in the immediate neighbourhood of which, as you are well aware, I happen to have been for some time established.

I should have continued to suppose that these approaches still were, as they so long appeared to have been, in an unfinished state, had not the intention to leave them as they now are been suggested to me by the erection of the new railings on the south side of the Middlesex approach, and between it and New Palace Yard. These railings have evidently been adjusted to the footway at its existing level; but, at the same time, their position suggests that the important question as to whether the surface of the footway is or is not at a right height with reference to the bridge, of which (being a part of one of its approaches) it forms a part, has not been taken into consideration.

Westminster Bridge, as seen from its own roadway, is undoubtedly one of the finest structures of its class in existence; but, to make the approach on the Middlesex side worthy both of the bridge itself and of the position which it occupies, it appears to me that it will be absolutely necessary to carry the roadway at one uniform slope from the abutment of the bridge down to the crossing at Parliament Street. Now, in order to accomplish this, the new railings would have to be taken down, as a preliminary to making arrangements for their being fixed again at a different level; for, if the approach to the bridge were to be made on the plan that I have pro-

posed at the end of the roadway nearest to the clock-tower, the masonry upon which the railings now rest would either be buried altogether or very nearly so, while at the Parliament Street end this same masonry would stand disclosed to its full height. My suspicion that it is the intention to leave matters in their present condition has been strengthened by the circumstance that the northern footway, which had been taken up in consequence of the works of the Underground Railway, has been replaced, and again thrown open to the public in a state which shows even a greater disregard to levels than is the case with the southern footway. For what reason, real or apparent, the northern footway was not raised to its proper level before it was given back to the public, I am altogether unable to surmise. The carriage-way of this approach partakes of the faults of both the footways, and, accordingly, in addition to imperfections of its own, it has one side higher than the other to suit the several footways. I may give a more clear explanation of the state of this approach to Westminster Bridge as follows:—If longitudinal sections were taken along the carriage-way and each of the footways, the parts of these sections on the bridge would show slightly convex profiles; then, when abreast of the clock tower, all three sections would exhibit a sudden dip; and, finally, from thence to the crossing at Parliament Street, each one of the sections would be found to give a different irregular concave profile.

Whilst in the neighbourhood of the clock tower, I may as well point out to you (assuming that you have not already observed it) the peculiar arrangement of the steps which, immediately at the foot of the tower, lead down from the bridge-approach towards the Houses of Parliament. These steps are generally shut off from the footway by two iron gates which, in the act of opening (for they are intended at times to be opened), roll on wheels into recesses, one on each side of the gateway-space. The wheels which thus carry the gates traverse a raised iron rail placed directly across the opening, and at a few inches from the edge of the uppermost step, and consequently in the best position possible for expediting the descent of the steps by tripping up unwary passengers and sending them down headlong. How far the use of these steps, with the attendant privilege of descending them after the fashion I have just described, may be available by the general public, I am not certain; but I presume that the iron gates will always open at the bidding of any member of either House of the Legislature, and I hope that by inserting in your columns what I am now writing, you will enable me to give to noble lords and honourable gentlemen a warning which may save at least some of them at the commencement of a new Session from *taking a false step* that might lead to very serious consequences.

I am, Sir, faithfully yours,

Westminster.

A CIVIL ENGINEER.

CONCRETE BRIDGES.

Sir,—I have seen in a late newspaper article some account of the extraordinary Concrete Bridge, of 75 feet span and 7 feet 6 inches rise, lately erected for the Metropolitan District Railway over the cutting between Gloucester Road Station and Earl's Court Road.

I observe that the writer of the article in question remarks that a similar bridge of inferior material, erected on the same site, after a short time proved its utter worthlessness by yielding under its own load when the centres were struck, while the existing bridge has borne a strain of 15 tons 2 cwt. per foot.

Having lately had occasion to experiment upon the materials and proportions of concrete for some sea defences, which I am now superintending at Margate, I should be glad to know whose cement has been used in these remarkable concrete bridges, and the nature and source of the ballast employed.

W. LANE SEAR, Architect.

Ramsgate, January 6, 1869.

REVIEWS.

LES ARTS DÉCORATIFS À TOUTES LES ÉPOQUES. Par Édouard Lièvre. Folio. Paris: A. Morel.

The first series of a work which is to form, when complete, two volumes, each containing sixty plates, to be published in ten quarterly parts. The plates are mostly printed in colours, and are all executed in the best manner by the well-known firm of Mercier et Cie., of Paris. The following list of the principal plates in this first series will indicate the general scope of the work:—Pattern of Genoa velvet, 16th century; book, with pierced metal mounting, German work of the 16th century; an exquisite little enamelled casket, of the same period; a curious faience plate, of the same century; a Sicilian vase, 4th century B.C.; a carved door, with case complete, 16th century; a square tray, of Rouen ware, 17th century; an Urbino tazza; and some beautiful patterns of French and Venetian textile fabrics of the 16th and 17th centuries. The work, if completed as well as it is commenced, will form a rich portfolio of ornament.

LES FRISES DU PARTHÉNON. Par PHIDIAS. Twenty-two plates reproduced by the Phototype process of M.M. Tessie du Motay and Maréchal, by G. Aroza & Co. Folio. Paris: A. Morel.

A charming portfolio, prefaced by a short notice of Phidias and his works by M. Charles Yriarte. The portions of the frieze represented are those which were detached by Count Choiseul-Gouffier, when ambassador of France at Constantinople, from the Eastern façade of the Parthenon, and are now to be seen in the original, or in the form of casts in the Antique gallery of the Louvre.

The plates are admirably executed, the colour being of a neutral tint or warm grey, and the tone excellent, the shadows being generally dark enough for effect and no more. The portfolio presents the best collection that we have seen of artistic reproductions by the phototype process.

The figures are about eight inches in height, large enough to give the smallest details with effect. The originals have suffered considerable damage from the effect of time, but they are less injured than the majority

of the specimens in the British Museum, while some few are almost as perfect as they were left by the marvellous sculpture twenty-two centuries ago. Amongst the least injured are several groups of two or three horsemen, in which the injuries are confined to one or two spots, the whole of the heads and limbs, both of men and horses, being intact; a group of two men on foot, an old man supporting himself by means of a crutch, which presents the peculiarity of being placed beneath the left arm while the lower part is held by the right hand, and a fine figure of a youth half naked; an exquisite group of two virgins and two young men, in which the heads have not suffered the slightest injury, and present types of great beauty, the other parts of the work, even to the beautiful taper fingers of the young women, being all but perfect; and lastly, a group of four vestals, whose heads are in a complete state of preservation, but, unfortunately, the shadows in our copy are somewhat too dark about the faces, a fault that only exists in a few instances. The beauty of the modelling, whether of the human figure or of the drapery, in these two last-mentioned examples can scarcely be surpassed, and artists and connoisseurs will certainly hail these charming reproductions with delight.

ART EXHIBITIONS.

THE French authorities have just issued the regulations for the Paris Salon—the Annual Exhibition of Works of Art for 1869. There are but few changes made in the conditions, and these are certainly improvements. The first of these changes is the exclusion of paintings on enamel, china, or faience, whether original or copies, serving as decorations for usual objects, such as cups, tazzas, vases, and plates, these being considered as belonging to industrial art. The second is the confirmation of a change made last year, on the suggestion of the editor of the *Moniteur des Arts*, namely, that artists absent from Paris may vote by letter for the members of the jury. The principle of popular election has now been thoroughly tested, and, in spite of the anticipations of many persons, has been found to work admirably. Two-thirds of the members of the juries are elected by the votes of artists who have already received medals or honours, whose works have been admitted to previous exhibitions, and even those who have sent in works for the coming exhibition; but each artist votes only in his own section of painting, sculpture, architecture, or engraving. The juries thus elected decide not only on the admission or rejection of the works sent in, but on the award of all the medals, with the exception of the two great medals of honour for painting and sculpture. The administration nominates the remaining third of the jurors.

The effect of this artistic suffrage has been to place the very best men in France on the juries, and to put an end to complaints which under the old system of nomination were numerous, if not always well founded. It is to be remarked, however, that the principle is one of very questionable application in the case of international exhibitions. It was tried at Havre the other day with this result, that although, to our knowledge, the names of several eminent Englishmen were sent in for election at the request of the Commission, only one, we believe, was elected! In at least two sections of that exhibition—those of Naval Construction and Chronometers—England was pre-eminent, yet her proposed jurors were rejected. This was, to say the least of it, not right, and furnishes a warning for the future.

Another and very liberal rule introduced for the first time this year is that not only every exhibitor will receive his card of admission, but also all those who have obtained prizes at former salons, although not contributing to the coming one; the works of such artists are always admitted without examination, and it has been complained that some of these were evidently sent with no other object but to obtain free admission. The last point to be noted is, that the administration binds itself to expend in the purchase of works exhibited a sum equal to the gross total received for admission.

The *Union Centrale des Beaux-Arts appliqués à l'Industrie*, an active private Society, patronised by the Government, which has its library, museum, and lectures, and has already organised one splendid exhibition of art manufactures ancient and modern, announces another to be held in the Palais de l'Industrie in August, and to remain open for three months. The scheme includes not only industrial art in every form of the present and past times, but also works of art intended for reproduction, models and designs for artistic productions, and the works of all the drawing-schools of Paris and the departments. The collection of porcelain, faience, enamels, carvings, and other productions of past ages at the last exhibition of this kind was magnificent, the finest probably ever brought together in one place, and there is little doubt that the coming exhibition will be equally remarkable. The directors desire, in their own words, to bring together examples of all decorative arts of past epochs with a view to the instruction of artists and students of the present time; and with the same view they invite contributions of original models for objects of art, decoration, &c., left by the old industrial artists. The Society possesses in its library and museum, in the fine old square known as the Place Royale, an excellent collection of old designs for decorated fabrics and other ornamental productions. Lastly, the exhibition is to include a gallery of old portraits, to illustrate the history of costume. The Society has published a long programme of its views and intentions, to which, probably, we shall have occasion to refer at a future time.

Architectural Drawings.

The very excellent exhibition of 'Sketches and Studies' by members of the Society of Painters in Water Colours, that for several weeks has been open to the public in the gallery of that Society in Pall Mall East, contains a small group of four of the views that Joseph Nash, now a veteran in his art, delights to paint of the fine old mansions of England as we may consider them to have appeared with all the appliances and associations of their own olden times. We notice these four excellent drawings, to record with cordial satisfaction their presence in the exhibition which they adorn.

PRACTICAL COMPENSATION.

AS there is no subject upon which professional men are so apt to differ as that relating to the effects of compulsory removal upon house or landed property, it may be thought that we have adopted a somewhat premature title for this article; but we are led to follow out an idea under this heading in consequence of more than one significant and important compensation case heard in the Lord Mayor's Court during the past week. We need hardly premise that at all events our London readers are perfectly *au fait* as to Holborn Valley improvements that have been made by the Corporation, and we will suppose that gentlemen afar know by report of the vast alterations that have attended the City scheme, while the great contests that have been held over the profits of compensation are too notorious to need either notice or comment at our hands on the present occasion. It will be sufficient for our purpose then to state shortly that on Monday was commenced the hearing of the first of a series of claims for compensation against the Corporation of the City of London for compulsory removal and consequent loss of trade, all the cases arising from one house. In the first case, Mr. Abrahams, the claimant, was a glass cutter and paper hanger, of 88 Skinner Street and 1 Farringdon Road, and he held a twenty-one years' lease of these premises, dating from 1857; the annual rental being 150*l.* He had let off a portion of the house to Mr. Sydney Butcher, a tobacconist, a second claimant, who had sold his business to Mr. Coombs, a third claimant; and there was yet a fourth in the person of Mr. George Butcher, who carried on the business of a coal merchant. Now it is not our intention to go through the evidence called in these cases, inasmuch as it must be patent that Mr. Abrahams, as the holder of a lease that would not expire until 1879, was entitled to compensation for being turned out of his premises. We shall simply state that Mr. Lloyd asked the jury to give his client something very much like 10,000*l.*; and in support of his proposition he called Mr. Samuel Green (the well-known surveyor), who valued the lease alone at 5,803*l.*; Mr. E. Fox, who put it at 5,530*l.*; and Mr. J. Young, who considered it to be 5,622*l.* Of course this was upon an improved rental, based on the increased value of property, and the supposition of a great influx of business had the Corporation left the Holborn valley in its original condition, but of greater consequence to tradesmen by reason of adjacent alterations and new traffics. To the evidence of the professional witnesses we have only to add that of Mr. Cape, the accountant, who gave details of the sales and stock in trade for five years, carrying out the net profit at 97*l.* per annum. In short, the net claim was, as we have stated, as near 10,000*l.* as possible, and it was this sum that was left by Mr. Lloyd to be picked to pieces by Mr. Hawkins, Q.C., who, declining to call any technical evidence on the part of the City of London, proceeded to demolish the figures so imposingly set up in column by his adversary, and the practical result was that the jury found that the claimant was only entitled to 4,598*l.*—not so much as he was offered by the Corporation—at least, so we were informed; and here we leave the first case. The second claim was that of Mr. George Butcher, the coal merchant, who asked for 3,514*l.*; and in support of his demand he called Mr. Booth, who valued the lease at 2,042*l.*, Mr. Rowley and Mr. S. Green reducing it to 1,164*l.* 10*s.*; but to these figures must be added trade compensation; and yet the jury only awarded 702*l.* 3*s.* 6*d.* In the third case Mr. Sydney Butcher asked about 2,000*l.*, Mr. S. Green and Mr. Booth assessing the lease at 1,127*l.*, Mr. Farmer giving 1,161*l.* Here the defendants departed from the beaten track, and called Mr. Pownall and Mr. Trist to show that the claim was out of all reason, the result being a verdict for *nothing*. The fourth case was that of Mr. Coombs, who had bought Mr. Sydney Butcher's tobacco business, who gravely told the jury that he intended to pay for it out of the proceeds of this claim, and who admitted that his expenses were in excess of his income. Mr. Coombs claimed 1,400*l.*, and the jury awarded 155*l.*

It will thus be clearly perceived that theoretical compensation, amounting in all to 16,914*l.*, was reduced by a practical jury to 5,450*l.*; and this one glaring fact is far more important than all the 'large-briefed' forensic eloquence of the compensation bar of England. We confess that we totally disagree with a great deal of the system now prevailing; and in the first instance we would urge that the idea of sending the jury in calfs to view property, so that a correct judgment of value may be formed, is the acme of idle and useless ceremony. If the jurymen find the property surrounded by dismantled walls, huge beams of timber, half-finished arches, or deserted 'shells,' they will come to one of two conclusions—the first, that the property is valueless; or the second, that those who have caused such a temporary destruction of trade should pay for the damage handsomely. Very few men can so, as it were, localise their ideas as to be able to look through a mental vista, and recall the exact position of a certain object that has been altogether removed from the reality of the situation; and we think that most of us, if suddenly placed in the middle of the great confusion now governing the works at the Holborn Valley, would find it extremely difficult to recall with any idea of accuracy the particular situation or value of any house or shop; and thus we hold to the argument that sending a jury to view is both waste of time and waste of money, especially when the whole secret of compensation is an appeal to the sympathies of the arbitrators. Passing from this, and coming to compensation of a practical and equitable character, may we not ask if a great deal of this assumed increased value of property is not utterly out of place? Surely the value of a house, of land, of shops, offices, of any holding in fact, may be best gathered from the assessment of the owner himself; and mere speculation as to how much property will bring in the event of certain improvements taking effect is calculated to hamper periodical beneficial alterations in the arrangements of our great thoroughfares, to render them more suitable to the requirements of the public and of the growing traffic. We are aware that occasionally great wrong is done by the compulsory removal of old established firms; but we also know that when schemes are advanced, there is too frequently a system of speculative adventure in house and landed property, which does at times—and we are glad to believe it—recoil upon the promoters. Nothing can be fairer than to award a tradesman, who is making a comfortable living, substantial compensation when he is removed by the strength of the law;

but when a holding is shown to be a loss, it is the very height of impropriety to put upon it a fictitious value, based upon the hypothesis of something neither tangible nor reasonably positive. We can advance little beyond this, for the road has been well beaten during the past few years, and yet it is painful to see how exaggerated claims destroy the value of real losses, and recoil with irresistible force upon those who build upon such uncertain foundations.

LAW.

Compensation.—In the case of Messrs. Thorn & Co., contractors, against the Metropolitan Board of Works, heard at the Guildhall Police Court before Mr. Alderman Finnis on Monday, the claim was made under the Lands Clauses Consolidation Act, for compensation for compulsory removal from offices which the claimants rented, and which were required for the Thames Embankment and the new street to the Mansion House. Mr. Murphy, instructed by Messrs. Brandon, appeared for the claimants, and Mr. Philbrick, instructed by Mr. Ward, for the Metropolitan Board of Works. The claim put in was 1,500*l.* for the loss on the men's time by want of supervision, 40*l.* for increased rent, 20*l.* for fixtures, 20*l.* for reinstatement, 16*l.* for the loss of clerks' wages during removal, and 5*l.* expenses of removal, making a total of 1,601*l.* Mr. Alexander Thorn was examined at great length, and maintained that the fact of not being able to see his men at work from the window both by night and by day had such an effect upon them that they idled their time away. From the evidence of Mr. Alden, an extensive builder; Mr. Bryant, the resident engineer to the claimants; Mr. Watson, engineer to Peto and Betts; and the reports of Mr. Lumley, of Chancery Lane, and Mr. Spillman, of Bell Yard, surveyors, it appeared that if men had not a proper supervision over them, half of them would idle their time away to the extent of 9*d.* or 1*s.* per day per man, and that from 5 to 7*l.* per cent. was a reasonable charge for loss so sustained. Since the removal the supervision had not been so efficient as before, but the claimants had put on no extra foreman, although they estimated their loss at 25*l.* per week. For the defence, Mr. E. N. Clifton, architect and builder, said he had constructed buildings such as Gresham House and East India Avenue, and paid about 3,000*l.* a fortnight for wages. Supervision from a window such as that spoken of was not supervision at all, and the want of it could make no appreciable difference in the profits of a contract. There was no value in Mr. Thorn's interest in No. 13, for he paid a rack rent; but where a tenant was compelled to move it was customary to give him a year's rent. Mr. Trist, of the firm of Norton, Trist, and Watney, thought that 150*l.* would cover every expense and liability of the Board of Works, and be a liberal allowance.—Benjamin Cook, foreman to Mr. Webster, the contractor for the Thames Embankment, said that no supervision could be of any value unless the master went on the works amongst the men. He did not agree with Mr. Alden that the men would idle their time away.—Mr. Boag, clerk of the works to the Board of Works, corroborated the previous witnesses; and Mr. R. Chadwick, a surveyor, valued the fixtures, including removal, reinstatement, loss of time, &c., at 20*l.*—Mr. Philbrick and Mr. Murphy then severally addressed the Court, and the latter gentleman accepted the 150*l.* as valued by Mr. Trist, and left the other question of loss by want of supervision to be settled by the magistrate. Mr. Philbrick contended that the claimants were not entitled to more than 150*l.*—Mr. Alderman Finnis retired with Mr. Martin, the chief clerk, to consult on the matter, and on returning into Court awarded Messrs. Thorn 400*l.* compensation, and 50*l.* costs.

NEW BUILDINGS AND RESTORATIONS.

St. Luke's New Schools, Gloucester.—The building, which is proposed to be erected in and facing the Stroud Road, will consist—on the ground floor of boys' school room 70 feet by 20 feet; girls' school room, 60 feet by 20 feet; and infants' school room, 65 feet by 20 feet, with class rooms attached to each, and separate entrances, affording accommodation for over 450 children. A conveniently-arranged house for the master is attached to the school, with offices, parlour, and kitchen on the ground floor, and three bed rooms on the first floor. This portion of the building (though entirely separate from the schools as far as communication is concerned) has been, by careful and judicious arrangement, made to form a somewhat important feature in the group, and tends very materially to the general effect of the whole. Open and spacious playgrounds are provided. The schools and class rooms will be 12 feet high to the wall-plate from the floor, and the timbers of the roof, which are to be exposed to view, are to be stained and varnished. The building is intended to be constructed of red brick, with bands of ornamental coloured bricks. The design was prepared by Mr. Alfred William Maberly, architect, Gloucester. The estimated cost is 2,000*l.*

Preston New Workhouse.—These buildings, which were recently opened, are designed in the Italian style of architecture, and are erected of the best brickwork, with Longridge stone dressings. The ground and basement floors of all the buildings are partly flagged and partly boarded. The staircases are of stone, and all the corridors of the ground floors are of brick and flagged. The building is designed to accommodate 956 inmates, and the cost estimated by the architect was 30,000*l.*, exclusive of the purchase of the land.

Laying the Foundation-stone of a New Church at Gatesgill.—The foundation-stone of a new church at Gatesgill has been laid. The new church will be built in the Early English style of architecture, and will consist of a nave 45 feet by 24 feet, with centre aisle, and a chancel 21 feet by 14 feet, adjacent to which will be a side chapel, vestry, and organ chamber. The principal entrance will be by a porch on the south elevation. The north and side elevations will be adorned with coupled lancet windows, with projecting buttresses, relieved with gables to vestry and organ chamber. The west gable will be pierced with large circular and lancet windows. The belfry will be erected at the south-west angle of the west gable, with gilt terminal 42 feet high. All the gables will have moulded

stone copings terminating with enriched crosses and gilt terminals. The roof will be of high-pitch, with open framed principals, and covered with slates of varied tints, and ornamented with enriched ridge cresting. The chancel will be raised four steps above the nave, and paved with encaustic tiles. The aisles will be flagged. The church will be heated and ventilated by means of the apparatus of Messrs. Haden and Co., of Tunbridge. Mr. John Lowe, architect, of Manchester, has supplied the design for the building. The contractors for the building are Messrs. Bragg, Wilson, and Baty, of Gateskill. The church will be built of stone from quarries in the neighbourhood.

Proposed New Church at Bowling.—It is proposed to erect a new church at Bowling, near Bradford, to the memory of the late Mr. Charles Hardy, of Low Moor, who was one of the most steadfast friends of the movement to erect new churches in the town and vicinity.

The Church of St. Mary, Saxlingham, has been considerably enlarged, and has also undergone restoration. The old building consisted of nave, chancel, west tower, and south porch. An aisle of the same size as the nave has been added to the north side, and a commodious vestry has been built to the north of the chancel. A lofty arcade of four arches divides the nave and aisle. The nave roof has been raised and re-modelled, as much as possible of the old wood-work being retained; the principals of the nave and aisle roofs are framed with tracery work in the spandrels, and spring from carved bosses. The unsightly old pews and gallery have been cleared away, and the seating is of low oak benches, with moulded ends and carved poppy heads, and traceried backs in the aisles. The pulpit, reading desk, and altar rail are of carved oak; the pulpit standing on a carved stone base. The tower arch has been raised so as to admit of the new west window being visible over a carved oak screen, which divides the ringing chamber from the nave. One of the windows of the new aisle has been filled with stained glass. The whole of the church is paved with black and white encaustic tiles. The style throughout is rich Perpendicular Gothic, and has been carried out at a cost of about 1,400*l.* The architect was Mr. J. S. Benest, of Norwich, from whose designs the works have been executed in the most excellent manner by the contractors.

Brierley.—The New Church.—The new church in course of erection at Brierley is making rapid progress towards completion. It is now partly roofed, progress is being made with the spire, and it is expected that it will be opened early in the spring.

An Extraordinary Number of Competitors.—A new chapel is about to be erected at Melbourne, Derbyshire, from the designs of Messrs. Wilson and Willcox, architects, Exeter. The committee had no fewer than eighty designs sent them for competition.

Frankfort Cathedral.—The Town Council has just decreed the restoration of the Cathedral, which was partially destroyed by fire on August 15, 1867. The delay has arisen chiefly from a wish to effect a restoration which should do honour alike to the artistic feeling of the age and to the associations connected with this venerable pile, in which many, nay most, of the German emperors were crowned. The fire broke out in a building adjoining the 'Close,' and a strong east wind blowing at the time, extended the conflagration to the cathedral, the roof of which was soon in flames; the roofs of the nave, chancel, and transepts were destroyed in an incredibly short space of time, when the fire was seen to have reached the tower also. This was at length completely gutted; the heavy old bells fell with a crash upon the vaulting of the first floor; nothing could be done beyond restricting the fire to the church, and next morning all was a complete ruin. Since then the Frankforters have not been idle; professional advice was called in from all parts of Germany, whilst architectural, archaeological, and other learned societies proffered such substantial aid as they were able to collect in their several cities, for it was felt that this was a national question, and no doubt more than one florin was subscribed in the hope that the old 'Dom' might yet witness the coronation of another German Kaiser. The Cathedral and adjoining college were insured for about 98,000*l.*, and this sum is to be devoted to the proposed restoration. Besides this, the council accepts the donations offered from sundry quarters, and has decreed an annual sum of 1,000*l.* for the salaries of the architect and a competent staff of assistants. With such funds at command, we may hope to see a satisfactory restoration; let us add also the hope that all the *Rococo* and other incongruous Vandalisms may be swept away; a better opportunity will never occur again.

ITEMS OF NEWS

FROM OUR
SPECIAL CORRESPONDENTS AND OTHERS.

The Student's Corner.

A Faculty of Fine Arts is proposed to be created at University College, London, and the draft of the Act of Parliament by which it is proposed so to alter the constitution of the college as to embrace, along with other changes, the introduction of this novel and most important field of study, lies before us. The portions of the Act which refer to this subject run as follows. In the preamble occurs this passage: 'And whereas it is expedient that the objects of the college should be extended to the advancement and promotion of the fine arts as well as of literature and science.' In the re-incorporating clause the institution is described as now to be 'for the purpose of affording at a moderate expense the means of education in literature, science, and the fine arts, &c.:' and in the clause prescribing who may be life governors one of the qualifications runs thus: 'Persons distinguished in science, literature, or art.' Here we have the desirability of extending the education given in this college to fine arts—the enactment that it shall be so extended—and the provision for including among those who direct the proceedings persons eminent in art sufficiently, though briefly, provided for. There can be little doubt of this Act becoming law; and when it does so become law it is difficult to exaggerate the importance of the step, for it is well known that the means exist of efficiently carrying out the

proposed change. That is to say, the necessary money, the mainstay of art as it is the sinews of war, is provided by the munificent bequest of the late Felix Slade. This gentleman left a sum of forty-five thousand pounds to be employed in founding 'Slade professorships of Fine Arts' at Oxford, Cambridge, and London; and of founding six scholarships of 50*l.* each, the latter to be in connection with the University of London.

It can hardly be doubted that the college—which for so long has provided a school of drawing and civil engineering, and has furnished in the lectures, first of Professor Donaldson and later of Professor Hayter Lewis, excellent systematic instruction in architecture as an art and science—will embrace eagerly this opportunity of advancing in this direction. It is understood that a programme of the most extended, not to say ambitious, proportions has been at least sketched, and privately circulated. The nature of the intended scheme shall be laid before our readers as soon as it can be with propriety made public property. Meantime we heartily welcome the prospect of a centrally situated well endowed Art School; and we do so the more readily because we believe that the ultimate relation between literature and fine art—not enough recognised perhaps among ourselves in the present day—may be better illustrated in an art school grafted into a literary foundation than in any other way.

The Classes of the Architectural Association are to receive an accession to their number—at least, at the next meeting of the Association a proposal to that effect will be made by a sub-committee appointed to consider the question. This proposal will no doubt be adopted, and therefore we may fairly expect the immediate opening of a Class of Elementary Design and a Class of Elementary Drawing. The Drawing Class is to be under an experienced teacher: the Class of Elementary Design is to be superintended by a committee of five visitors. The names of the gentlemen who are understood to have provisionally accepted these positions are a guarantee for the efficient conduct of both the classes. We are informed that it will be proposed to appoint as visitors Messrs. Phéné Spiers, Lonsdale, Watson, Edgar, and Perry, and Mr. Michael will be proposed to instruct the Class of Elementary Drawing. We can hardly imagine any step more likely to extend the usefulness of the Architectural Association or to benefit students, and we heartily wish success to the new Classes.

Botherham Hospital and Dispensary Competition.

We remarked in our last issue on the unsatisfactory clause as to the ultimate payment of the successful competitor, who (say the printed Instructions) 'shall carry out the work for a percentage on the outlay;' and this week we learn from a correspondent who has inquired whether or no this percentage will be the 5*l.* per centum recognised by the profession, that, in the opinion of the Secretary, the Building Committee are likely to select an architect who will offer to do the work for 4 per cent., in preference to another who, with only an equally good design, may ask a commission of 5. This is just what we had anticipated. We do not blame the non-professional public, who make up our competition committees. Doubtless, if 3 per cent. were the established commission, they would see no harm in setting architects to reduce it by a scramble to 2 per cent., and so on *ad infinitum—essimum*. But where, we will ask, is this kind of thing to end? Few architects are found rolling in carriages—nay, gigs—with even 5 per cent. How then is it that the outside public have lately (as recent hospital cases indicate) discovered that the usual 5 per cent. is too much to pay? It is well known to be too little in all buildings under 2,000*l.* in cost; and yet architects rarely, if ever, demur to it in such cases. The public are the real gainers by the system of charging by commission on cost; and truly, recent events would seem to be fast bringing the entire system into desuetude. Perhaps it may one day occur that the eminent and the *mediocre* among architects will not always, as they now are, be had at one uniform price. The subject deserves very serious consideration. Let architects either receive their usual commission, or let them abandon payment by percentage altogether.

India.

Engineering.—The principal point of interest in connection with railways in India is the opening of the Punjab and Delhi line, between Meerut and Umballah, on November 13, by the Viceroy in person. The surveys for the extension of the Bombay, Baroda, and Central India Railway, from Guzerat, through Rajpootana, to Delhi and Agra, have been completed, and the results submitted to Government. The long vexed question of how to carry the East India Railway across the Hooghly into Calcutta has at last been settled. Instead of taking the railway to the traffic, it has been determined to carry the traffic across to the railway by means of an ordinary road bridge.

The municipality of Madras have applied to Government for a loan to enable them to carry out a project for the supply of water to that city. The chairman of the Bombay Commissioners has forwarded to that Government, with his recommendation, a scheme by Captain Tulloch, R.E., for the drainage of the city, and utilisation of the sewage for agricultural purposes.

The utilisation of the old bed of the Sutlej, which is being rapidly accomplished under the exertions of Major Minchin, is an undertaking of inestimable value to Bhawalpore. The works at the mouth of the channel were completed in June 1867, and the sterile waste of Bhawalpore was leased for Rs. 4,840. As the course of the river was exceedingly tortuous, it has been necessary to dig a new canal, using the Sutlej bed where possible. The works are being pushed on as fast as funds can be provided.

Architecture.—Measures have recently been taken by the Government of India for the preservation and photographing of ancient architectural remains, and a competent staff has been appointed for this purpose. This same desire has also, we learn, communicated itself to Ceylon, where a committee has been appointed for inquiring into the history of the ruins or the cities, palaces, and temples which are scattered over the island, with a view not only of ascertaining their past history, but of preserving those remains from destruction.

On October 30 last, the foundation stone was laid for a new church at Galle, to be called 'All Saints.'

Statistics of Railways in North America.

According to *Morgan's British Trade Journal*, the total length of all railways in North America did not exceed 1,098 miles thirty-three years ago. Now they amount to no less than 39,244 miles, laid at a cost of 390 millions sterling, or an average of about 9,750*l.* per mile. The shortest length opened in one year was 159 miles, in 1843; the longest was 3,643 miles, in 1856. In the first year of the late war, 621 miles were opened for traffic. From the commencement of the railway system in 1830 to the annexation of California in 1848, the average length of line opened annually was 316 miles, the total length up to that period being 5,996 miles. From that time to the commencement of the late war, being a period of twelve years, 24,639 miles of railway were constructed, giving an average of 2,051 per annum. From the year 1860 down to the present time, 8,587 miles more have been constructed, showing a decrease in the average of almost 50 per cent., namely, 1,227 miles per annum. Twenty-eight years ago there were 7,415 inhabitants to every mile of railway throughout the United States; the proportion at this day is only 905 to every mile.

Transformation and Embellishment of the City of Cairo.

The Viceroy of Egypt has taken a lesson from Louis Napoleon, and is occupied with the transformation and embellishment of the famous and interesting city of Grand Cairo. The vacant ground is being converted into vast squares and public gardens, and broad streets are being pierced across masses of houses only intercepted at present by tortuous streets, or rather lanes, which are totally unfit for modern carriage traffic, and, which is much worse, quite insufficient for the ventilation of a city which, like Cairo, is subject to terrible visitations of fever and other afflictions.

The Viceroy, happily, is not about to destroy the characteristics of the fine old city. The old mosques and monuments, which are being restored, will form the chief ornaments of what will be the Grand Square of Roumalia; and although great changes will be made in the mass of buildings which formed the old residence of the Mamelukes, the bazaars which have for ages formed one of the chief attractions of Grand Cairo are to be preserved in their entirety, so that artists and travellers will not be deprived of one of the most thoroughly Oriental sights which present themselves on the line of one of the great thoroughfares of the world. The new structures will be of the type so well illustrated in the *Parc* of the International Exhibition in the Champ de Mars in the summer of 1867, so that the artistic eye will not be shocked, as it often is elsewhere, with a heterogeneous mixture of Eastern and Western architecture—Greek, Roman, Gothic, Saracenic, and Renaissance, presenting no more harmony than the costumes at a fancy ball.

General.

The New Foreign Office is now accessible to strangers every Thursday between the hours of twelve and three, until further notice, on delivering their cards to the porter at the principal entrance, on the north side of the quadrangle.

The Town Council of Brighton have advertised for the loan of 20,000*l.* for the drainage works, and received several offers. The Finance Committee recommended at the meeting on Wednesday that the offer of the Atlas Assurance Company be accepted. The rate of interest is 4½ per cent. per annum, and the principal is repayable in 30 equal annual instalments.

Manchester.—A circular calling attention to the relative position of builders, brickmakers, and bricklayers has been issued. The persons and firms by whom it is signed include some of the most influential in Manchester. Their complaint is:

The arbitrary laws of the unionists unwisely shorten the hours of labour; limit the quantity of work to be performed in a given time; advance the rate of wages; increase the cost of all building without improving the workmanship; keep down the skill and condition of the workman; augment the difficulty of his becoming a master; and injure most the very class supposed to be benefited. To remedy this evil they suggest the employment of non-unionist workpeople and members of the Free Labour Registration Society; and that they themselves be encouraged to take apprentices from the unemployed youth of our large towns; by which means they would have an opportunity of adding considerably to their weekly wages, and thus a constant and well-regulated supply of labour would always be available, and contribute much to the general good of the public as well as to all parties connected with the building trade.

The persons appending their signature add:—We hold the opinion that with a free exchange of labour there would be abundance of employment for every class of workpeople, and that it cannot be right for trades unionists to prevent the labouring population bringing up their children to the trade they like best. We therefore respectfully request that you will give a preference of employment to non-unionist workpeople or members of the Free Labour Registration Society, and we on our part undertake to give a preference to those master builders who offer the greatest encouragement to free labour.

It is intended to lengthen the Elgin Gallery in the British Museum, in order to obtain room for the public exhibition of the remaining portion of the sculpture from Halicarnassus.

Signs have at last appeared of the lighting of Highgate. About a fortnight ago spots were marked out for lamp-posts, but up to the present time no lights have appeared. Where are the authorities?

The Church of St. Mary, Illingworth, near Halifax, has just been enriched by the insertion of a beautiful stained glass window, the gift of the Ramsden family, of Jumps House. The artists are Messrs. Ward and Hughes, of London; and the subject is the raising of Lazarus.

Mr. Layard is to be the Commissioner of Public Works and Buildings. If we do not mistake Mr. Layard's leanings, the Liberal Government will be identified with the Italian school of architecture: the Conservative certainly was with the Gothic.

A drill shed is in course of construction in Becket Street, Derby; it will be a very handsome and commodious building, and will allow room for the drilling of a battalion 1,000 strong. There will also be an armoury, orderly-rooms, adjutant's room, reading-room, companies' meeting room, quarters for two sergeants, stables and outhouses, and good yard. The total cost, including the site, will be 5,000*l.*

The First Stone of the New Harbour works at Carnarvon has been recently laid. Mr. Frederick Jackson, C.E., supplied the plans. The contractors are Messrs. Bugbird & Jones. Estimated cost, 50,000*l.*

Active preparations are being made for the erection of a new tower at the western extremity of the Castle facing Broad Street, Cardiff. The tower will be considerably taller than the one at the eastern end.

One of the Results of the recent storm in the North has been the partial destruction of the new harbour works at Wick. No less than 250 feet of sea-wall have been destroyed. It is calculated that the amount of damage cannot be less than 10,000*l.*

The Parish Church, Crickhowell.—The extensive alterations and repairs to this church are now being rapidly carried on by the contractors, Messrs. H. P. Bolt and Co., of Newport, who are carrying out the designs of Mr. West, the architect.

Further Fall of the Bridge over the Derwent.—The temporary erection in the place of the bridge over the Derwent, which fell a short time ago, has given way, bringing with it half of the central pillar and many tons of masonry work, which were cast into the water.

Greet Church, Tenbury Wells.—Memorial Window.—A memorial window has been erected in commemoration of the late Captain Edwardes. It consists of three lights. In the centre is our Saviour, and on the side lights are St. Matthew and St. Mark. The whole is nicely coloured, and in keeping with the ancient character of the church. The work was executed by Mr. John Robinson, of St. Alkmund's Square, Shrewsbury.

Opening of a New School at Todwick.—The school is a substantial and handsome building, and has been erected by the exertions of the rector, aided by many friends, both in the parish and at a distance. His Grace the Duke of Leeds gave the ground, as well as a handsome donation and other valuable assistance.

Restoration of St. Nicholas Parish Church, Grosmont, Monmouthshire.—It is proposed to commence the restoration of this noble Early English church with the first favourable turn of the season, as sufficient funds have now been raised to secure a beginning. This church is of great extent and elaborate character. It is a cruciform structure consisting of a spacious nave, side aisles, chancel, transepts with parallel aisles, side chapel, and central octagonal tower on massive piers supporting an elegant octagonal spire. The entire building after a lapse of six centuries has fallen into a deplorable and dangerous state of decay, which threatens at no distant period to become a ruin. It has been carefully surveyed by Mr. Seddon, architect, London, and its substantial restoration has been estimated to cost 3,000*l.*

St. James's Church, Thornton.—A new church is to be erected after plans supplied by Messrs. Hedley & Co. The building is estimated to cost 4,000*l.* The style will be French Gothic. The interior will be fitted with plain oak pews.

An interesting sale of pictures is announced at the Hôtel Drouot of the celebrated gallery of M. Gabriel Delessert. Most of the paintings are of the Dutch school, but the great attraction of the sale will be an authentic Raphael.

Fine Art Exhibition at Bordeaux.—The exhibition of works of fine art is announced by the Bordeaux Society of the Friends of Art to take place early in March next.

Electrotype Ornaments.—The galleries of Greek and Roman sculpture in the Louvre have been largely increased and embellished of late by the introduction of a number of bas-reliefs, round bosses and allegorical figures, covered with a coating of metal, the work of M. Cossinus. The effect of these electrotype bronzes is extremely rich, while the cost is trivial compared with real bronzes.

We are informed that the splendid collection of engineering models, belonging to the late Professor Gillespie, of Union College, Schenectady, United States, has been purchased by that institution. It is probably the finest collection of engineering models and instruments in the United States.

A Report from America states that the Czar of Russia has sent two engineers to inspect the Pacific Railroad, with a view to utilising whatever information they may obtain in the construction of a road from St. Petersburg to Chinese Tartary.

A grand Wesleyan church is to be opened at Washington on the Sunday preceding the inauguration of General Grant as President. The preachers on the occasion are to be Bishop Simpson and the Rev. W. M. Punshon. This magnificent building is to cost 45,000*l.*, by far the greatest part of which has already been secured.

MEETINGS OF LEARNED SOCIETIES.

- ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Monday, January 18, at 8 P.M. Prof. Kerr on some Developments of the Architecturesque.
- THE INSTITUTION OF CIVIL ENGINEERS.—Tuesday, January 12, at 8.
- INSTITUTION OF SURVEYORS.—"Arterial and Agricultural District Drainage, and the Laws connected therewith," by R. B. Grantham, C.E., F.G.S. Monday, January 11, at 8.
- ROYAL SOCIETY.—January 14, at 8.30 P.M.
- ROYAL GEOGRAPHICAL SOCIETY.—Monday, January 11, at 8.30 P.M., at Royal Institution, Albemarle Street. Sir R. I. Murchison, Bart., in the chair. Paper to be read by Douglas W. Freshfield, Esq.:—"Journey in the Caucasus, and Ascent of Kasbek and Elbruz."
- ROYAL INSTITUTION.—Meetings for the ensuing week: Tuesday, at 3, Fine Art, Mr. Westmacott; Thursday, at 3, Protozoa, Mr. Rupert Jones; Friday, at 8, Chemical Rays and Molecules, Professor Tyndall; Saturday, at 3, Hydrogen and its Analogues, Prof. Odling.
- LINNEAN SOCIETY.—January 21, at 8 P.M.
- SOCIETY OF ARTS.—Wednesday, January 13, at 8.
- ASSOCIATED ARTS INSTITUTE.—January 9. Paper by H. Ellis Woodridge, Esq., on "The Cultivation of Artistic Feeling."
- LONDON INSTITUTION.—On Modern Artillery, Iron Fortifications, and the recent Experiments at Shoeburyness, by Dr. William Fole, F.R.S. Monday, January 11, at 6.

EDITORIAL NOTICE.

No communication can be inserted unless authenticated by the name and address of the writer, —not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such enquiries.

PUBLISHER'S ANNOUNCEMENT.

Advertisements cannot be received for insertion later than 2 P.M. on Thursdays.

Temporary Office, 4, Monument Yard, London.—GILBERT WOOD, Publisher.

THE GAZETTE.

PARTNERSHIPS DISSOLVED.

James Bass and John Grainger, Saint George's, Wrockwardine, Shropshire, builders—William Cargey and Benjamin Ward, Elswick, Newcastle-upon-Tyne, fire brick manufacturers—Frederick Dowler and James Gradwell, Bold Street, Liverpool, cabinet makers—Samuel Waterhouse, James Ramden Brooks, John Paldgett, and Alexander Kerr, Stanningley, near Leeds, Yorkshire, engineers—Thomas Lowe and Henry Lowe, Woodford Green, Woodford, Essex, builders—August Ludwig Roosen Runge and Nicolaus Friedrich Jacob Cornelisen, Manchester, civil engineers—Herbert Charles Maudslay, Joshua Field, Thomas Henry Maudslay, Tilford Field, and Walter Henry Maudslay, East Greenwich, engineers; so far as regards Herbert Charles Maudslay—William Birdseye and William Edward Stoner, Cheapside, City, surveyors—John Maitland Smith and John Smith, Jan., Chippenham, Wiltshire, builders.

DECLARATION OF DIVIDEND.

Llewelyn Lloyd, Beckbury, Salop, timber merchant—first dividend of 8d. any Thursday, at Mr. Kinnear's, 17 Waterloo Street, Birmingham.

BANKRUPTS.

William Heatley, late of Wilmar Cottages, Holloway Road, Leytonstone, Essex, builder, Jan. 18, at 12—Henry Baxtor, Great Wild Street, Lincoln's Inn Fields, builder, Jan. 18, at 11—James Brown, late of Nelson Villas, Wandsworth Road, builder, Jan. 18, at 11—Charles Edward Pandry, late of Barnsbury Road, Islington, lithographic draughtsman, Jan. 18, at 1—Thomas Sherwood Young, Frampton Park Road, Wall Street, South Hackney, late builder, Jan. 18, at 11.

TO SURRENDER IN THE COUNTRY.—Henry Brunger, Park Road, Faversham, Kent, wood dealer, Jan. 12, Faversham—Philip Pritchard, Cwmrwyf Lower, Monmouthshire, builder, Jan. 18, Abergavenny—Zachariah Hugh Thomas, Portrack Lane, Stockton, Durham, builder, Jan. 18, Stockton-on-Tees.

SCOTCH SEQUESTRATION.

James Wilkie, London Row, Leith, builder.

TENDERS.

BOLNEY, SUSSEX.—For Stable, Coach-house, and Coachman's residence, for Mr. H. Huth. Mr. Holloway, architect. Quantities not supplied:—

Table with 2 columns: Name and Amount. Norman: £2,250 0 0. Deacon (accepted): 1,200 0 0.

Villa at Putney. Accepted tenders. Mr. G. H. Page, architect:—

Table with 2 columns: Name and Amount. Caston Brothers: £1,387. Lathey Brothers: 1,330. Aries: 1,264. Mirrett & Ashby: 1,231. Bass: 1,190.

LONDON.—For alterations and repairs to No. 15 King Street, Cheapside, for Mr. Gabriel. Quantities by Messrs. Pain & Clark:—

Table with 2 columns: Name and Amount. Webb & Sons: £1,591 0 0. Simpson: 1,486 0 0. Henshaw: 1,451 0 0. Ebbis: 1,287 0 0. Conder: 1,279 0 0. Bracher: 1,229 0 0.

LONDON.—For the erection of a Model Lodging House, Stables, and Vanits beneath, in Catherine Wheel Alley, Bishopsgate Street, E.C., for G. Barker, Esq. Messrs. Tolley & Dale, architects:—

Table with 2 columns: Name and Amount. Henshaw: £3,454 0 0. Smith: 3,430 0 0. Johnstone: 3,282 0 0. Tully: 3,210 0 0. Rivett: 3,188 0 0. Fawcett: 3,173 0 0. Newmann & Mann: 3,165 0 0. Hearle: 3,054 0 0. Langmead: 2,967 0 0. William & Son: 2,938 0 0. Ramsey: 2,978 0 0. Manley & Rogers: 2,970 0 0. Watts: 2,967 0 0. Ashby & Son: 2,947 0 0. Howard: 2,933 0 0. Ennor (accepted): 2,930 0 0. Piper & Co.: 2,930 0 0. Wright (too late): 3,185 0 0.

LONDON.—For the erection of a Shop and Dwelling, and alterations to the Ten Bells, Spitalfields. Mr. W. E. Williams, architect:—

Table with 2 columns: Name and Amount. Langmead: £645 0 0. Scrivener & White: 636 0 0. Hyde: 628 0 0. Maris: 524 0 0.

LONDON.—For alterations, Nos. 49 and 50, Houndsditch. Messrs. John Young & Son, architects:—

Table with 2 columns: Name and Amount. Cohen: £586 0 0. Hoops: 487 0 0. Ashby & Merritt: 419 0 0. Hart: 408 0 0. Read & Son: 400 0 0. Chessum: 385 0 0.

HIGHGATE.—For alterations and additions to Whittlebury House, for Mr. C. H. Frewen, Messrs. W. G. Habersham & Pite, architects:—

Table with 2 columns: Name and Amount. Hemmings: £1,800 0 0. Cubitt & Sons (too late): 1,640 0 0. Dayes: 1,550 0 0. Fincher & Martin: 1,450 0 0. Salter: 1,450 0 0. Carter: 1,440 0 0. Crockett: 1,400 0 0. Davies: 1,400 0 0. Jackson: 1,359 0 0. Blackmore & Morley: 1,265 0 0. Kendall: 1,260 0 0. Brown & Sons: 1,249 0 0. Bennett: 1,210 0 0. Pethick: 1,170 0 0. Turner: 1,170 0 0. Baker & Constable: 1,075 0 0.

LOUGHBOROUGH.—For Village Roads and Sewers. Mr. A. R. Pite, architect:—

Table with 2 columns: Name and Amount. Wigmore: £1,999 10 0. Harris: 4,989 0 0. Johnstone: 4,800 0 0. Potter: 4,450 0 0. Strickson: 4,344 10 0. Turner & Cole: 4,339 0 0. Cowland: 4,187 0 0. King: 4,148 0 0. Crockett: 4,000 0 0. Kelk: 3,920 0 0. Reid: 3,744 0 0. Crofts: 3,740 0 0. Gardiner: 3,679 0 0.

DERBY.—For the erection of New Buildings in the Iron Gate, for Mr. John Smith. Quantities supplied. Mr. Benjamin Wilson, architect:—

Table with 2 columns: Name and Amount. Humphreys: £3,140 0 0. Gadsby: 3,100 0 0. Wood: 3,000 0 0. Thompson (accepted): 3,000 0 0.

HULL.—For Painters Works to be erected by the Corporation. Mr. R. G. Smith, architect:—

Table with 2 columns: Name and Amount. Muggave: £873 0 0. Hutchinson & Son: 830 0 0. Simons & Frorr: 815 0 0. Stanley: 806 0 0. Habbershaw: 738 0 0. Beckney & Liggins: 684 0 0. Jackson (accepted): 680 0 0. Lowest of the separate tenders: 730 0 0.

APPOINTMENTS VACANT.

INDIA OFFICE.—Trained Young Men for the Maintenance and Conservation of the Government Forests in India. Eight will be selected. In February, 1869. Salary to commence at 300l. per annum, rising to 1,900l. by promotion. Apply January 8, 1869, Under Secretary of State, India—H. Merivale.

HUNDRED OF WERRAL, CHESTER.—District surveyor. Salary 160l. a year, and will be required to reside within the district of the Board, and to give his whole time and personal attention to the duties connected with his office. Applications to be sent to William Henry Churton, Eastgate Buildings, Chester, on or before Monday January 25.

COMPETITIONS OPEN.

BELGIAN ACADEMY OF ARTS AND SCIENCES.—Best Essay on 'The Period at which Architecture in the Low Countries became affected by Italian Influence.' Premium, 1,000 francs.

BILBAO, SPAIN.—Designs for a House of Mercy for lodging the poor. Premiums, 200l., 100l., and 50l. each. F. di Llyard, 124 Cannon Street, E.C.

DUMFRIES, N.B.—Designs for the Erection of a New Infirmary. Premium, 50l. Mr. Symons, Writer, Dumfries.

ROTTERHAM.—March 15.—For Plans, &c., for erecting a Public Hospital and Dispensary. A prize of 75l. is offered for the best design, 50l. for the second, and 25l. for the third. John Barris, hon. secretary, Rotherham, December 18, 1868.

VIENNA, AUSTRIA.—This Municipality require Designs, Plans, Estimates, &c., for the Erection of a New Hotel de Villa. Open to all Europe. For Particulars, Austrian Consul-General, 21 Rue LaFitte, Paris. (See ARCHITECT, Jan. 2, p. 12.)

SOUTH METROPOLITAN SCHOOLS, SUTTON, SURREY.—For Designs for the Erection of an Infant Establishment adjoining the present Schools. Premiums of 40 Guineas each for the three designs considered the best. February 2. J. Burgess, Clerk to the Managers, Vestry Hall, Walworth.

CONTRACTS OPEN.

EAST DEKENTHAM.—Jan. 20.—Designs for Two Chapels and a Porter's Lodge, to be erected in the Burial Ground of the said Parish. G. S. Tinkler, Clerk to the Board.

ABERGAVENNY.—Erection of a town hall, with shops, offices, and other buildings, and the reconstruction of the general market place, with other works, Jan. 25, 1869. J. T. Rutherford, Abergavenny.

KRIGHELY.—Erection of warehouse, with offices, entrance to general works, &c. William Sugden, architect.

CHILE.—The Government of this Republic require Tenders for Cast Iron Columns, Roof Posts, &c., Cast Iron Work for 27 Bridges, and 1,700 Squares of Galvanised Corrugated Iron Roofing, &c. The Chilean Legation, 18 Gloucester Gardens, Hyde Park.

WANTAGE.—Erection of new brewery, Jan. 19, 1869. Managing director, Wantage Brewery Company, Wantage.

MONMOUTH.—For erection of new workhouse for the Monmouth Union, Feb. 5, 1869. Edwin Richards, clerk to the Local Board, Monmouth.

KENDAL.—Erection of a residence for H. Arnold, Esq. Mr. J. Brintley, architect, Old Town Hall Chambers, Kendal.

KENDAL.—Erection of a villa residence for William Williamson, Esq., Jan. 11, 1869. Stephen Shaw, architect, Kendal.

HEVEESHAM.—Rebuilding tower of St. Mary's Church, Jan. 23, 1869. Faley and Austin, architects, Castle Hill, Lancaster.

TERRINGTON, YORKSHIRE.—Restoration and refitting of the parish church, Terrington, Yorkshire, January 23, 1869. Mr. Christian, architect, 8a, Whitehall Place, London, S.W.

BOROUGH OF SALFORD.—For the Ironwork, Woodwork, and Paving required in the formation of Cattle and Sheep Pens for the extension of the Cattle Market. Surveyor's office, Town Hall, Salford. Wednesday, January 13. Mr. S. Brett, Salford.

BURY BURIAL BOARD.—For supplying and fixing about 700 yards of Wooden Posts and Iron Rails for the roads from Manchester Road and Gigg Lane to the Cemetery. January 11. Mr. James Farrar, Architect, No. 12, Market Street, Bury.

BURY IMPROVEMENT.—The Bury Improvement Commissioners are prepared to receive Tenders for a supply of Glazed Sewer Pipes, Tiles, and Junctions of various sizes and descriptions, Cast Iron Sewer Grates, Set Stones, Flags, Edging Stones, and Channel Stones, up to December 31, 1869. To be sent in by January 11. William Harper, Clerk to the Commissioners.

RADCLIFFE LOCAL BOARD.—Tenders are invited for a supply of Glazed Sewer Pipes, Tiles, Junctions, and Invert Blocks, of various sizes and descriptions, up to December 31, 1869. Jesse Haworth, Water Lane, Radcliffe.

WARRINGTON BANK QUAY SEWERAGE DISTRICT.—Contract No. 2. Apply to Mr. B. P. Coxon, Surveyor, &c., Bank Chambers, Horsemarket Street, Warrington.

LEEDS.—For the various works required in the erection of a good house in Victoria Road, Headingley. James Charles, Infirmary Street.—For any portion of the works required in the erection of two houses on the Newton Green Estate. David Drury, architect, Britannia Buildings, Town Hall.—For the various works in fourteen houses in Hogg's Field, Holbeck. Richard Towse, architect, Dewsbury Road, Leeds.—Floor boards wanted, about 1,100 square yards; the best white, 1 inch thick, and very dry. Thomas Clapham, Royal Park, Leeds.

BOWLING CHAPEL.—For the erection of Prospect Wesleyan Chapel. C. E. Taylor, architect, Commercial Bank Chambers, Bradford.

STANNINGLEY STATION.—For constructing a mill, shed, warehouse, engine bed, boiler-house, chimney, reservoir, &c., near Stanningley Station, Tuesday, January 12. C. E. Taylor, architect, Commercial Bank Chambers, Bradford.

WEST LONDON RAILWAY.—London and North-Western and Great Western Railways.—For the Enlargement of the Passenger Station at Kensington. January 14. J. West, Secretary, Euston Station.

PLAISTOW.—St. Pancras Schools.—For Construction of Iron House and Buildings. January 14. J. Moore, Clerk to Guardians.

KINGSTON UNION, SURREY.—For Erection of Receiving Wards, Tramp Wards, &c. January 18. R. F. Barthram, Clerk to Guardians.

RANDELL & SAUNDERS have much pleasure in informing their friends, and the Building Trade generally, that to facilitate building operations during the winter season, they have provided a large stock of well-seasoned Cornham Down Block Stone. Bath Stone Office, Cornham, Wilt.—[Adv.]

STONE BROTHERS are now supplying Cornham Down Stone—well seasoned, fit for immediate use, and of the best quality.—Box Ground Stone—Unequaled for even texture and durability.—Fair-ly Down Stone—Matchless for good quality and large size.—Cumbria Down Stone—Fine in texture, free working, and very durable.—Prices, and cost of transit to any part of the kingdom, on application to the Bath Stone Office, Bath.—[Adv.]

W. W. SPRAGUE & Co., Lithographers, PRINTERS, & STATIONERS, 14 Sherborne Lane, King William Street, London, E.C.

BILLS OF QUANTITIES, SPECIFICATIONS, REPORTS, Copied or Lithographed with rapidity and care.

Now Ready.

SPRAGUE'S POCKET DIARY and MEMORANDUM BOOK, for the use of ARCHITECTS and SURVEYORS. The Tables, Memoranda, &c., have been compiled by an experienced Surveyor, and will, from their compactness, be found very convenient to the profession. In Roan Wallet, 7s. 6d. The Diary and Tables in Paper Cover, 2s. The Tables only, 1s.

TO BUILDERS and OTHERS.—Several Sums to LEND on MORTGAGE of FREEHOLD or LEASEHOLD PROPERTIES, at 5 per cent. or on DEPOSIT of LEASES for short terms. Large houses not quite finished not objected to. No preliminary fee.—Apply personally to Mr. WILLIAM TOY, Surveyor, 40 King William Street, London Bridge, City.

WM. OLIVER & SONS, MAHOGANY, WAINSCOT, DEAL, AND TIMBER MERCHANTS, 120 BUNHILL-Road, LONDON, E.C. The most Extensive Stock of every kind of Wood, in Planks and Boards, dry and fit for immediate use.

The Architect.

THE SITE OF THE PALACE OF JUSTICE.

OST Englishmen have a characteristic repugnance to the re-opening of a question that has once been settled. This indisposition forms a feature of our practical conduct. In the press of daily business, we feel that we have no time to be always looking back. What our neighbours call accepting a *fait accompli*, is, in our case, a condition of progress. Our laws, our language, and our habits of thought, are all opposed to the rehearing of a cause on which judgment has once been delivered.

There are, however, exceptions to this general and salutary rule. When information that was in the first instance suppressed has come to light, when a new and essential witness has come forward, or when it has been shown that a decision had been arrived at in ignorance of some main fact, our sense of fair play leads us to overcome our dislike to hark back upon our steps. In such cases we have a new trial.

On such grounds, many of those who take the warmest and the most enlightened interest in the architectural beauty and dignity of the metropolis, claim that the question of the site of the new Palace of Justice shall be re-considered. Sir Charles Trevelyan has brought the matter before the public with much force, and has adduced, as a plea for being heard, the reason that 'the Embankment site NEVER HAS BEEN CONSIDERED.' When the Commission which selected the Carey Street site was appointed, in 1858, the Thames Embankment Act had not passed. It was not passed until four years afterwards; and the question of a river frontage was not even alluded to in the report.

Such being the facts, it is clear that the case is one which ought to be fully investigated. It is no anticipation of the results of such an investigation, to bring forward the arguments of the advocates of the Embankment as the best site. They are such as to establish, to say the least of it, a good *prima facie* case in its favour.

Step by step London is being rebuilt. A change, as great as that which was brought about by the memorable fire of 1666, is silently taking place throughout the whole area of the metropolis. The enormous extension of a cluster of cities and towns, which doubles its bulk every forty years, is enforcing that piercing of the mass by straight, broad, lines of communication, which the genius of Sir Christopher Wren desired to accomplish. Amid all our questions and hesitations as to style—Classic, or Gothic, or Victorian—costly, and often noble piles of building spring up as if by natural growth. And, chief of all improvements, that silver stream, which we had turned into an offensive and pestiferous sewer, has been so far redeemed from the consequence of long neglect, that salmon now run above the bridges; and that, only last week, a school of porpoises (so strange a set of visitors as to be spoken of by the observers as a *drove*) have been seen disporting in the water, and have given to the inhabitants of Westminster and of Lambeth the excitement of a miniature whale fishery.

The Thames, thus restored, to some extent, to its proper functions as an ornament, a highway, and a source of health and of pleasure to the citizens grouped on its banks, is being girded with appropriate quay walls. One of these, a work of which any city might be proud, now reaches from Westminster nearly to Blackfriars, and affords the most direct line of communication between the two central points of the metropolis—the head and the heart. From the Palace of the Legislature, and the vicinity of the Court and of the Ministerial offices at Westminster, to the Bank, the Exchange, and the centre of commercial London, the direct route lies along the Thames Embankment.

Sir C. Trevelyan is, perhaps, carried away by the enthusiasm of the advocate, when he says that, 'without exaggeration, the Thames Embankment is the finest site in Europe—perhaps, all the circumstances considered, in the world.' Without endorsing a statement which will find many opponents, no further from us than Paris, we can have no hesitation in assuming that, architecturally considered, it is one of the finest sites in London; and that, viewed as a question of convenience, it is unrivalled. A large façade erected on that broad highway will be SEEN. Simple as the statement may seem, it is one on which to ponder. To lay out a large sum of money in erecting a highly ornate building on a spot where it is so penned in by streets and houses that no fine view can be obtained of its proportions, is an absurdity. If a large edifice is fated to be constructed in a position where 'the lofty pile of King's College Hospital would overlook it;' where 'a sordid and infectious neighbourhood' would flank it to the west and the north-west; where any front, but that turned to the Strand, would be imperfectly seen; and where the façade, at which a sidelong glance could thus be cast, would not be combined in one general view with any other buildings of any architectural pretension; common sense would enjoin us to waste no money upon ornamentation. The warehouse style of elevation, with plain large windows,

craving as much of the obscured light of heaven as opposite building^d did not impede, is that which is most suitable for a structure reared on such a site.

On this pent-up situation, we are further reminded, the rise from the Strand is so considerable, that no judge could be set down from his carriage at the door of his Court! The steps, from the Strand side, will rise about 80 feet. Judges, barristers, solicitors, and witnesses, condemned to this perpetual treadmill, will no doubt bless the wisdom that has provided them with the occasion of such constitutional exercise. The spectators are to have a further advantage of the same equivocal nature, as the number of steps they would have to mount in reaching the galleries provided for them approaches one hundred. Even if the additional feature of a corkcraw staircase should be modified, it is clear that the convenience of the public is the last thing that is studied by the advocates of the Carey Street site.

On architectural grounds, it is undeniable, there can be no question as to the selection of site. The happy accident of the time at which the Thames Embankment was undertaken, has presented us with a noble area of open ground, on which the highest efforts of the successful architect will meet with what is not elsewhere to be obtained—a pictorial situation. Thus considered, the question between Carey Street and the Embankment is the question between a Palace of Justice, worthy of the age, and a pile of inconveniently crowded buildings, the style and ornamentation of which are of the less importance, because no one will be able fairly to look at them. Economy *might*, it is true, be effected by abandoning all architectural pretension; but it would be a mean and unworthy economy. And, moreover, it is not designed to attempt it.

As regards convenience, the question is hardly less one-sided. We have referred to the subject of thoroughfare.

The Embankment site adjoins a public road, 100 feet wide. A railway runs underneath that roadway, and the Thames beyond furnishes an open space which it is impossible should ever be blocked up. The bridges give ready access to the southern banks of the river; the steamers, constantly plying, would be available for a large part of the metropolitan population. The Strand, disencumbered to a great extent of its present choking traffic, by the two *storeys* of river sideway, would give access to the rear. The Temple is close by. A direct northern line of access must form a feature of the treatment of the large area now cleared, and in course of clearance, between the Strand and Holborn. The convenience of the Bench, the Bar, and the Suitors, is equally provided for, by the selection of that site which, in the artistic point of view, is unique.

Why should we not secure these undeniable advantages? Is it because they have only offered themselves in the nick of time? Such, put in its true colours, is the main argument for Carey Street. Is it because the site which was selected when the Embankment was not in existence, has been purchased? But no one argues that the public will sustain any loss by the re-sale of that valuable area; as to which, moreover, much addition would be requisite, were it devoted to the erection of the Law Courts. To the 800,000*l.* already expended, the Commissioners report, that an addition must be made, amounting to 700,000*l.* In other words, only half of the inferior site is yet purchased. Is it not worth while to pause before we lay out the required three quarters of a million, to extend a site which commands no single line at once of vision and of approach?

Mr. Tite has given the weight of his judgment and experience to the support of the views of Sir C. Trevelyan. While gracefully refraining from the use of any argument that might defer the realisation of the much-admired design of a brother architect, he has directed attention to an important feature of the case. The main object of the concentration of the Courts of Law is the convenience of the Bench and of the Bar, as much as that of the suitors and witnesses in the courts. The loss of time incurred between Guildhall and Westminster has been a national loss. The litigant who had paid his fee to secure the services of the ablest counsel, has often had cause to regret the distance that separated the two sets of ill-constructed Courts. But while the argument for the concentration in one building of all the business that is transacted by the aid of the same set of barristers is conclusive, it by no means extends to the limit of all legal occupation. The Probate department is a case in point; the arrangements proper for the storing of wills, and for giving due and undisturbed access to the persons who have to consult them, are not only entirely distinct from those of the tribunals of Justice, but no good reason can be given for uniting them under the same roof. We may go further, and say that the lofty halls and spacious galleries which are requisite for the course of public law, are so distinct, structurally speaking, from the vaulted rooms and fire-proof communications proper to the Record Department, that they can hardly, with any advantage, be architecturally combined in the same building. Mr. Tite proposes that the Tribunals should be erected in Carey Street, and the Probate Court, and other offices, on the Embankment. The more natural arrangement would appear to be the reverse. Why not place the quiet and spacious offices frequented by private practitioners in the less conspicuous station, and secure the light, the air, and the free access of the Embankment, for the lofty courts that will be thronged by the public?

It may be said that we proposed only to open the pleadings, and that we have adopted the language of advocacy. We think it is rather the case that we have, unawares, been led on step by step, by the irresistible logic of truth. We have taken no retaining fee on behalf of the

Embankment site. We are conscious of no motive, save that which we hold in common with every observer of architectural taste who takes an interest in the future grandeur of London. On the eve of laying out three or four millions sterling in a national work that is intended to be permanent, we are desirous that the best site should be selected, and that it should be worthily occupied. We would neither see a noble building crammed into a spot where it could never be properly seen, nor a magnificent site appropriated to any other than national purposes.

Among the advocates of the Embankment site, Mr. Layard, now the First Commissioner of Works, has distinctly enrolled himself, as will be remembered by all who heard him speak on a recent occasion at the Institute of Architects. We must not, on that account, presume on the support of the Government on behalf of a reconsideration of the question, unless a change be loudly urged. There is a weakness, common to many honourable men, which leads them, when in positions of official responsibility, to give to their own friends, or to their own private opinions, less weight than is their due. They are afraid of being thought partial. They are suspicious of being suspected of favouritism. To avoid the risk of this imputation, they err in the opposite direction. It requires a certain largeness of heart in a man, where newly called to office, to think only of the future results of his stewardship, and to give to his country the full benefit of his best and unbiassed judgment. Seen through official spectacles, objects are wont to appear very much alike to the most short-sighted and to the most long-sighted politicians. Let no one, therefore, think that the question can be permitted to settle itself, or that any pause is to be allowed in the exertions of those who are anxious to secure a result which members of the Government, in their private capacity alone, have admitted to be highly desirable.

The argument that there is no time for reconsideration will hardly survive the operation of being put into definite form. The finest hall in London is nearly 800 years old. The Abbey is in its sixth century; St. Paul's is at the close of its second. When we are about to lay the foundations of a building that we hope will take its place alongside of these venerable structures, are we to have anything but that which is certainly the best, because it may cost two or three years' delay to secure, or to ascertain what the best really is? Such an argument is on a par with that of the man who would begin a lofty building on an insecure foundation, in order to save the time involved in going down to the rock.

When we remember what London was in the last Georgian reign; when we recall the stucco-faced grandeur of Regent's Park, and the character of the street architecture of the era; when we think of the humiliation experienced by the Englishman of taste on his visit to Continental capitals, ancient or modern, when he contrasted them with his own: we cannot but feel a sympathy with those who are now anxious that London should become what it may well be made. From the Palace of Westminster and its sacred companion to the fine open area of Trafalgar Square, all that is paltry and squalid is about to be swept. From Hyde Park and St. James's, through the picturesque streets of Piccadilly and Pall Mall, by the quaint towers of St. James's, we shall have an unrivalled sweep of park and palace down to the river. Along the noble quay, by the varied and graceful bridges, including in the line the grand river front of Somerset House, the range of Imperial buildings will continue, till it closes in that structure, of which an eloquent voice, only just hushed, has said, 'What eye trained to all that is perfect in architecture does not recognise the inimitable beauty of its lines, the majestic, yet airy swelling of its dome, its rich, harmonious ornamentation?' It is as a feature of this grand architectural range that we wish to recognise the new Palace of Justice.

SIR MATTHEW DIGBY WYATT.

MR. M. DIGBY WYATT has been knighted by Her Majesty, and there can be little doubt, either among members of his own profession or the public at large, that he has fairly earned the honour. The departments of art and science to which a successful architect may be led by individual taste or by the force of circumstances to direct his attention are various and manifold; and should he be of a literary turn, there is really no end to the subjects which, if they have not already entered into the scheme of his special education, are so intimately allied with its purpose as at once to invite his research and derive enlightenment from his mature experience during what intervals of leisure he may snatch from his busy calling.

Of Mr. Wyatt's untiring industry in such pursuits we have abundant proof in the numerous and handsomely illustrated volumes which have from time to time issued from the press under his direct superintendence, and for which he has supplied the descriptive text. Among these we may mention the splendid work which has placed on record the condition of industrial art in Europe as it was represented in the Great Exhibition of 1851. When we remember the comprehensive range of subjects treated in these pages—how every branch of design and of refined handicraft, ceramic and textile, as well as in the precious metals and the various branches of decorative art, was discussed and described in turn, not only from an antiquarian and critical, but also from a technical point of view, it is impossible to ignore the beneficial influence which English manufacture must have derived from such conscientious and exhaustive labour. This influence has acquired additional force from the fact that Mr. Wyatt

has been a prolific designer as well as an illustrator in the field of industrial art.

And what Mr. Wyatt thus did in a collective form he has done elsewhere with special attention to individual subjects. His treatise on Mediæval Metal-work was long the text-book of students and the delight of amateurs, representing as it does the well-selected examples of an art to which, at the time the book was published, no adequate attention had been directed in this country. Again, his 'Notices of the Art of Sculpture in Ivory,' his contributions to the 'Art Treasures of the United Kingdom,' and to the Grammar of Ornament, to say nothing of his interesting and careful essay on Illuminating, which was appended to the series of specimens illustrated by Mr. Tynnes, are all valuable additions to that department of literature with which his name has been for years past so creditably associated. Nor must we forget those more intimately connected with his own profession, on 'Mosaic-work,' on Polychromatic Decoration, and a host of other subjects, which have at various periods enriched the Sessional Papers of the Institute and the published Transactions of the Society of Arts. Occasionally we have found him occupying the field of biography—as in his notice of the late J. Britton, and his 'Architectural Career of the late Sir C. Barry;' and, in short, it would be difficult in these columns to find space even for a brief description of all that has been accomplished by the happy union in Mr. Wyatt of an accurate judgment, a well-directed industry, and a facile pen.

But we should hardly be doing justice to his reputation if we did not bear in mind that, while following his literary bent, he has not allowed it to interfere, as some professional writers have done, with the more practical duties of his calling. More than twenty years ago he was consulted on the embellishment and re-decoration of the Adelphi Theatre. In 1850 he assisted in arranging the plan of the Great Exhibition Building, which was raised in the following year; and shortly afterwards he was associated with Mr. Brunel in designing the Paddington Station and other works on the Great Western Railway. When the Crystal Palace first reared its glassy vaults on the hills of Surrey, to Mr. Digby Wyatt, in conjunction with Mr. Owen Jones, were entrusted the superintendence and decoration of the Architectural Courts, which, criticised as they have been both by *cognoscenti* and amateurs, have, nevertheless, familiarised the British public more with the 'frozen music' of past ages than we could have hoped to do by any other means. In the field of domestic architecture, the mansions of Compton Wynyates, Warwickshire, Isfield Place, Sussex, and Castle Ashby, Northamptonshire, bear evidence of Mr. Wyatt's skill when devoted to the renewal and modification of ancient work; and it was his diligent archæological researches, no less than his other attainments, which no doubt induced Her Majesty to entrust him with the restoration of North Marston Church. In our last issue we gave a perspective view of the large mansion of Posingworth, Sussex, recently erected for Mr. Louis Huth from the designs of Mr. Digby Wyatt. For the Royal Engineers he designed the Creman Memorial Arch at Chatham. His Oriental connections have been useful to him in many ways, and secured his services for the old East Indian Museum; a design—not, we believe, yet carried out—for the Post Office at Calcutta; the Barracks Chapel and Hospital at Warley, Essex; and several minor works, before he was appointed joint architect, with Mr. G. G. Scott, for the New India Office, in the execution of which work, or, to speak more correctly, that portion of it which was committed to his care, he has acquitted himself in a manner worthy of his name and reputation.

That reputation had indeed been acknowledged and recognised in this country, as well as on the Continent, long before it was proposed to confer on him the well-merited honour which he has just received. So long ago as 1840 he was sent by the Society of Arts to Paris and to Florence for the purpose of preparing a report on French and Italian industry, and the following year found him Secretary to the Executive Committee of the Royal Commission for the Great Exhibition of 1851, the advantage of his services in this direction having been previously tested by his appointment as a 'Royal Commissioner for Preliminary Inquiries.' He received, in recognition for those services, a donation of 1,000*l.* with a set of medals from the Commission, to which his Royal Highness the late Prince Consort graciously added his Private Gold Medal. We may add, that in connection with the subsequent International Exhibitions of 1855, 1862, and 1867, Mr. Wyatt served as a British Juror. He has been decorated by two eminent private societies—namely, by the Royal Institute of British Architects, who, in 1866, conferred on him their highest honour—Her Majesty's Gold Medal, annually awarded to a distinguished architect or *savant*—and by the Institution of Civil Engineers, from whom he received the Telford Medal. Finally, Mr. Wyatt is a Chevalier of the Légion d'Honneur, and wears the Cross of the San Maurizio and Lazzaro Order.

After these distinguished marks of Royal and private appreciation both at home and abroad, the modest title henceforth prefixed to his name can add but little to the very creditable position which he has won for himself in the world of art and letters. We should be glad to hope that Mr. Digby Wyatt is only the first of a long list of eminent professional men whose services the Government of this country are prepared to recognise in, at least, as worthy a manner. The distribution of such favours has been until lately a matter of some perplexity to those who would arrive at some fixed principle on which the powers that be have been guided in their choice both of honours and recipients. Posterity may be amused to learn that during the reign of good Queen

Victoria, while it was the custom merely to knight presidents of the Royal Academy, the dignity of a baronetcy was conferred upon a successful tradesman who chanced, as Lord Mayor, to entertain a foreign potentate at a Mansion House lunch. Yet after all, the true value of these distinctions lies not in their social importance, but in the individual merit with which they are associated. It is something for Mr. Digby Wyatt to have received this honour; it is more to feel that he has deserved it.

CHRIST CHURCH CATHEDRAL, DUBLIN.

By GEORGE EDMUND STREET, A.R.A.

(From the Architect's Report to the Dean and Chapter.)

IT is impossible for me to go very deeply into the documentary evidence (so far as any exists) by which the age of the various portions of this fabric may perhaps be precisely determined. I can only give here a very general résumé of what has been already published by Sir J. Ware and others, though at the same time I must express my earnest hope that the interest which the contemplated restoration will doubtless excite may induce those who have the opportunity to prosecute, in a more careful and exhaustive way, the inquiry which those writers have only commenced; that so, with the aid of the facts which the building itself tells us, the foundations may be laid for a complete history of what is in my opinion one of the best and most refined works of art of the thirteenth century of which Ireland can boast.

The main facts as to the erection of this Cathedral, which I gather from Sir James Ware, and the other writers* whose works I have had an opportunity of consulting, may be summarised as follows:—

Christ Church, though now less valued in popular estimation than the Cathedral of St. Patrick, is nevertheless the older and more interesting of the two. Its original foundation appears to date from the beginning of the eleventh century, and its first dedication seems to have been in honour of the Blessed Trinity. Donat, Bishop of Dublin (1038-74), is said to have built part of the church for secular canons. The portion attributed to him is 'the nave and wings of the Cathedral,' and he is said to have 'erected from the foundation the chapel of St. Nicholas on the north side of the church.' Of his work no trace now remains so far as I can see. After him, Laurence O'Toole, Archbishop of Dublin, Richard, surnamed Strongbow, Robert Fitz-Stephen, and Raymond le Gros, undertook to enlarge the church, and at their own charges built the choir, steeple, and two chapels, one dedicated to St. Edmund, King and Martyr, and to St. Mary, and the other to St. Laud. Another chapel was subsequently built on the south side of the choir, which, having first of all been dedicated to the Holy Ghost, was dedicated to St. Laurence O'Toole after his canonization. Archbishops Comyn (1181-1212), De Loundres (1213-28), and Luke, also an Englishman (1228-55), are reckoned among the principal benefactors of this Cathedral, and, as will be seen, with good reason, inasmuch as it must have been during their time that the greater part of the existing fabric was erected. Finally, Archbishop John de St. Paul (1349-62) is said to have built a little before his death, at his own charge, the whole of the 'chancel,' together with the Archiepiscopal Throne as it existed in 1858.

From Brewer's 'Beauties of Ireland' I gather that in A.D. 1283 (January 11), the steeple, chapter-house, dormitory, and cloister were destroyed by fire, and that on the vigil of the feast of St. Edmund the King, 1316, the steeple of the cathedral was thrown down by a violent storm of wind. Subsequently, in 1562, the stone vault of the nave fell and carried with it in its fall the greater part of the south arcade and of the south aisle. This is recorded by an inscription which was inserted in the wall when it was rebuilt, and which still remains. It is as follows:—'This . wal . fel . down . in . an . 1562 . the . bilding . of . this . wal . was . in . an . 1532.'† The work seems to have been long in hand, as in 1585 the then Lord Deputy, Sir John Perrot, gave a portion of a fine inflicted on one Maguire towards 'rebuilding the walls' of Christ Church.

The date of the erection of the chapel of St. Mary on the north side of the choir does not seem to be recorded. It was used until within about fifty years, since which time it has been desecrated, and converted into dwelling-houses, &c.

In 1831 considerable alterations were again made in the church. It was at this date, I believe, that the complete transformation of the old choir into its present condition was accomplished—a much to be regretted work, as it seems to have concealed or destroyed almost every relic of the original architecture of this part of the church, with no compensating advantage of any kind.

This Church seems not only to have had a succession of English archbishops, but to have derived some solid advantages from its English connection, inasmuch as in 1216 King John granted to it the Deanery of Penkrige in Staffordshire, and several villages connected therewith, and by a bull of 1260 the Archbishops of Dublin appear to have been made Deans of Penkrige.

* Rev. Dr. Jebb's account of Christ Church, in a paper read before the St. Patrick's Society for the Study of Ecclesiology.

The Works of Sir James Ware concerning Ireland, edited by Harris, Walsh and Whitelaw's History of Dublin. Poole and Cash's History of Dublin. Brewer's Beauties of Ireland.

† In Brewer's book this last date is given as '1570.'

In 1541, while Archbishop Brown was in possession of this see, King Henry VIII. converted and changed (as the charter saith) the Prior and Convent of the Cathedral of the Holy Trinity into a dean and chapter, and from about this time it has generally been called by the name of Christ Church.

On the south side of the nave and transept were extensive remains of the old buildings of the Priory, and possibly of the Archbishop's Palace. These had been converted, before they were removed, into Courts of Law, and a plan and account of them (partly based on personal recollections) are given by Dr. Jebb in his paper read before the St. Patrick's Society for the Study of Ecclesiology in 1855.

No trace remains of these buildings now; and, in the interests of archaeology, this is very much to be regretted. Some old views exist showing the church as it was before the buildings were removed, and these are mainly interesting in showing that the existing south doorway of the transept is a modern insertion, having been removed from some other portion of the building.

I need extract no more from the writers to whom I have referred, because, in truth, they have not gone far in the attempt to find documentary evidence, and have almost altogether neglected the study of that which, after all, if rightly studied, affords as much information as any document; I mean the fabric of the church itself.

I cannot find that this has ever been deemed worthy of special notice by architectural critics. Yet I am at a loss to understand how this can be, for ever since I have known Dublin I have always regarded it as the greatest architectural treasure of the city; and, as is usually the case, the more carefully I have studied its architectural details the more have I been impressed by their value and beauty.

In all cases where a crypt exists under any portion of an ancient building, it is there that the architect, who wishes really to study the history of its erection, will commence his investigation. The alterations above ground did not, by any means, always involve alterations below; and as the use of crypts was never very great, and had a tendency to decrease, they were usually left alone wherever alterations in them could be avoided. So, even when such great works as the reconstruction of choirs, or the erection of towers, were undertaken, we constantly find that the crypts were, if necessary, broken into in order to provide the necessary walls and foundations, but otherwise left completely in their old state.

It was with no little satisfaction, therefore, that I heard of the existence of a large crypt under this Cathedral, and with delight that, upon investigating it, I discovered here the whole architectural history of the fabric written in a very clear and unmistakable way. So far as I can learn, the plan of this curious crypt has never been remarked on, and the singular planning of its eastern limb never seems to have been noticed or studied to the extent which it deserves; if, indeed, it has ever been noticed at all.

It is not a little curious how completely different the plan of the choir of the church is from that of the crypt. But the latter, in spite of the alterations above ground, shows exactly what the outline of the old choir must have been before Archbishop John de S. Paul altered and enlarged it.

(To be continued.)

THE NEW LAW COURTS.

By J. P. SEDDON, F.R.I.B.A.]

THE block-plans and sections which have been prepared by Mr. Street since his appointment as architect to the new Law Courts, and which have received the approval of the Courts of Justice Commission, were presented to the Institute of Architects at their ordinary general meeting on the 4th instant.

As might be expected, they show many important deviations from his original design, with some new features, and others which appeared in the plans of some of his fellow-competitors. Still, in the main, the design now put forward is distinctly Mr. Street's own, and founded upon his former one.

Looking to the block-plan, the buildings are confined within the main parallelogram of the site, and do not extend beyond it westward over the area of Clement's Inn. So far the space dealt with has been even more restricted than that allowed in the competition; on the other hand, the awkward intrusion of Pickett Street into it has been ignored.

The structure is arranged with the outer zone of offices bounded by the Strand, Carey Street, and a proposed new road through Dane's and Clement's Inns on the south, north, and west sides respectively. On the east, a spacious court with entrance gateway is opened, opposite the centre, to Chancery Lane, and a road southward of this substituted for Bell Yard; but, northward, the Law Institution and a fire insurance office adjoining it are left. It is so evident, however, that these cannot be suffered to remain, that it may be assumed that the building would have streets of sufficient width all round it. Indeed, I hear it is contemplated to remove the houses which would intervene between it and New Square, Lincoln's Inn; and if such be carried out, a noble frontage to the north would be secured. King's College Hospital would then not long be permitted to stand in such unpleasant proximity as to compel an angle of the Law Courts to be shaved off for its avoidance.

The main structure containing the majority of the Courts with

their appurtenances is so placed within the outer zone as to leave a spacious internal street around three sides of it, but this central block touches the zone at the eastern end. The open space is approached through two wide gateways on the Strand side, and one on that next Carey Street, and is spanned by several bridges of communication.

Ample light and ventilation to the buildings of the outer zone are thus secured, but a glance at the plan of the central block shows that Mr. Street has been cramped by the limited nature of the site, just as all the competitors were in the first instance; and that unless more space for expansion be allowed both to the east and west, and if possible to the north also, the site is not sufficient for the proper requirements of the building, and that it would be far better to seek another on the Embankment.

Seriously, it is essential that this whole question be regarded now in its entirety, and that petty economy either of time or money should not prevent the best possible arrangement of this whole legal portion of the metropolis being carried out. There is at present no need to regret any step that has been taken, and the purchase and clearing of the site now proposed for the Law Courts, far from being wasted, should the building be moved southward of the Strand, has only rendered practicable such a disposition of the surrounding neighbourhood as would previously have been thought Utopian. What is the necessity for the retention of any portion of the legal quarter northward of Holborn? Surely no special value attaches to the miserable structures of Gray's Inn, and yet it seems in their interest alone that the consideration of the site on the Embankment is demurred to, since the removal of the Law Courts southward could only benefit the Temples, and be of slight moment to Lincoln's Inn. In a parallelogram bounded laterally by Chancery Lane, and a wide road formed parallel with it to the west (giving the communication between the north and south so urgently needed by the public), and by Holborn and the Strand, room might be found for accommodation for the occupants of Gray's, Clement's, and Dane's Inns, infinitely better than they possess, and the ground vacated beyond Holborn might with advantage be secured for the erection of dwellings for the working classes, the want of which in London is one of the crying evils of the day.

As far as the first impression conveyed by these confessedly incomplete drawings goes, it would appear that the practical accommodation has been fairly and satisfactorily worked out by Mr. Street, considering the limited nature of the site. Many difficulties are, however, still not surmounted, simply because it is impossible to do so for want of space and of convenient difference of level. The first of these may be remedied (by the extension of the present site, as already pointed out), but the latter cannot be, whereas the Embankment offers an easy solution to both.

A central hall forming the feature of the building in Mr. Street's present, as in his former plan, shows that a decision, in my opinion a wise one, has been arrived at upon that vexed question. Around this hall are grouped, mostly in pairs, twenty-one Courts, as follows:—The three Queen's Bench, the three Common Pleas, and three Exchequer Courts, on the Strand side; the Admiralty and Probate at the western end; the Equity Courts and spare Ecclesiastical, and the Exchequer Chambers, on the north side. Room is found for three others—the spare Common Law, the Appellate and Bankruptcy Courts, in the outer zone.

The disposition of the offices is as follows:—On the north side next Carey Street are the Registrars in Chancery, the Accountant-General, and the Record and Writ departments, with the Taxing Masters, and Vice-Chancellors' Chambers. In the north-east angle opposite King's College Hospital is the Appellate Court and its appurtenances. The western side is occupied by the Probate and Divorce department; the south-western angle by the Admiralty and Bankruptcy departments; the south side by the several Judges' chambers and their appurtenances; and the south-eastern angle by the Crown Office; while the eastern façade of the zone, which, as described, touches the main central structure, is occupied by the principal entrance and accommodation for the Bar, and in this lies the principal feature of the present design as distinct from Mr. Street's former one, as well as all those submitted in the competition.

The Court arrangements are as follows:—The court floor is the second floor above the Strand; and herein is the main defect imposed by the present site, whereas the Embankment would offer facilities for placing the court floor on the level of the Strand, without detriment to those below.

The witnesses' rooms are beneath, with strong rooms again under them.

The level of the central hall is below the court floor and level with that of the witnesses' rooms.

The judges' rooms and corridor are on the outside, at the level of the bench in the courts; that is to say, on the highest floor of all, for there are no rooms above them. Access to their department is by staircases from the internal street, and by bridges from the outer zone. Other staircases are provided for masters and officers of courts, to prevent the use by any but judges of their own corridor. This accommodation for the highest dignitaries and oldest men in the profession is the most difficult part of the problem to be solved, and the height to which they are made by the present plan to ascend is an objection which seems to be necessitated by the proposed site. The barristers are well provided for: their corridor is on the inner

circuit, beneath the galleries for the public and on the floor of the courts, and they have their rooms for consultation and witnesses wanted immediately on the other side of their corridor, between it and the central hall. This arrangement has been only slightly modified from that proposed by Mr. Street in his first design, and though objections were made to it at the time, its advantages have since been recognised. There are special bridges of communication through the hall for the use of the Bar, from the courts on the one side to those on the other.

The public are admitted to their galleries only by circular staircases, which are double, one for ascent, and one for descent, each being provided with a turnstile: they are entered from the ground level in the internal street. As the public are to be ignored as much as possible, it would seem that they should not be admitted into this internal street at all, as they could only be in the way there. This might be managed by making them pass under it and the outer zone through tunnels to their staircases.

Attorneys and their clerks have their own rooms, and their corridor is below that of the judges, with separate staircases and bridges to the offices in the outer zone.

The central hall is 330 feet long, 55 feet wide, and about 100 feet high, with quadripartite vaulting, in one span, without columns or piers, as in Mr. Street's former design. It will be a noble hall, but the bridges across and within it, as they appear to have been treated in the section, would mar its effect; they doubtless are capable of improvement with more matured study.

One great feature in Mr. Street's former plan, the great Will Tower advanced into Clement's Inn, is no longer seen; but in place of it are two towers, quatrefoils on plan, within the internal street, and four square towers are shown placed near the angles of the building, I presume for heating and ventilating purposes. It does not seem to me that any of the towers have been placed where they would produce much effect in the external views of the building, while they would be almost too important features in the limited space within the zone. In my opinion every tower should, if possible, be advanced to form a portion of the outer zone, or its effect as an architectural feature will be wasted. Were the structure placed upon the Embankment, it might be different.

Little of the artistic treatment of the building is to be seen in these preliminary drawings, and it would be premature, therefore, either to describe or give an opinion with regard to it. The arrangement of the plan is, however, calculated to afford ample scope to Mr. Street's powers of design, both in dealing with it as a whole, and in producing picturesque effects in parts; and the internal space will evidently give numerous opportunities for such happy groupings as are expected of him.

In concluding this slight and general description of these amended plans for the proposed New Law Courts, I would remark that, having been one of the competitors myself, I should not have undertaken the task had I not been urgently requested to do so. I could not but feel that there was some truth in the representation made to me, that one who had endeavoured to master all the details of so complicated a subject might be better able to deal with it than one who had not; and it seemed to me that at this preliminary stage any very critical survey of the work would not be expected. So vast a problem must need longer time for its solution and for the development of its details than has yet been possible to devote to it. The suggested change of site to which I lean in the interest of the public may, I fear, increase its difficulties by the consequent delay and modification of plan; but I am confident that Mr. Street will not grudge any additional labour that may tend to perfect the great national work he has been worthily chosen to design.

OUR RAMBLER

AT ST. MICHAEL'S MOUNT ON THE SEA.

IT was an hour or two past noon on the hottest day of a summer hotter than had been for many years known, when a rickety chaise, driven by a good-humoured, cheery fellow in a blouse, and dragged by a sorry horse, might have been seen labouring across heavy, unsheltered sands. The pelting rays of the sun beat upon the two occupants of the vehicle—two hardworked architects, escaped from the pressing claims of practice, and delighted to find themselves fellow-students once more. Behind them lay miles of sandy road, noteworthy only for a curious village church; on the left were low hillocks; on the right, open sands stretching away to the distant, indistinct sea line; in front rose, solitary and grand, the mount dedicated to the Archangel Michael—not the one best known in England by his name, but its still more interesting French namesake, 'Mont St. Michel en mer,' the island fort of Normandy.

Nothing can exceed the power of riveting the gaze and filling the eye and the mind with wonder that hangs about this solitary granite rock—rising abruptly out of a dead level, which twice in the twenty-four hours is unbroken sea, and twice an endless plain of sand. This peak is not so overpoweringly grand as the Matterhorn, but there are few other solitary rocks in Europe more impressive—none, perhaps, so full of interest to the artist as well as to the general tourist.

The general aspect of Mont St. Michel as seen from the south is

an irregular pyramid of rock fringed at its base with a level line of fortification, and its summit crowned by the many pinnacles of a florid church, and the nobler and simpler forms of an earlier conventual building and a fort. The sides of the rock are scarped artificially below this fort, and at their feet, nestling behind the enclosing wall, cluster the few poor houses which go to make up the little town.

We reach at last the feet of the old walls, which date from the early years of the fifteenth century, and are of beautiful masonry and very perfect; and entering by a well-contrived and perfectly preserved gate we find ourselves in what is no doubt as exact a realisation of a street in the middle ages as can now be found in France. Nothing obtrusive, nothing new looking, every house small, the road narrow, very narrow, very far from clean, and winding, and everywhere to be read—on almost every stick and stone and corner—the unmistakable and happily the *unrestored* handwriting of the middle ages. The aspect of the bare-legged fisher-people was not sufficiently modern to dispel the illusion; one thing, however, and that one of no small importance to us, had marched with the times: the 'cuisine' of M. Poirier, our brave old host at the Hôtel Mont St. Michel, was good, and his house, though very homely, was clean.

The rock on which we have alighted is of granite, about half a mile in circuit, of an irregular oval shape, measuring about 300 yards by 250, or thereabouts, and about 200 feet high to the base of the very lofty buildings that tower above it. It is only towards the south that there exists space on which to plant houses. On the opposite side the precipices rise almost sheer out of the sea. The one street of the town makes nearly a quarter circle as it ascends towards the fortress. On either hand are houses, and behind them, on the left is the steep crag, and on the right the old wall, the 'chemin de ronde' of which forms indeed the pleasantest path up.

The little parish church and its graveyard offer less attraction to the archaeologist than usual: the houses however, simple as they are, continually claim his notice. Their general build presents two massive party walls of granite, corbelled over boldly at each storey, and filled in with plain half-timbered work. The granite work has an aspect of great antiquity, but it is hardly likely to be really quite so remote in date as its extremely bold simplicity would lead one to guess. At the backs of many of the houses remarkably clever projecting staircases may be found, and there are few of them devoid of the ornament in almost every room of an original granite 'cheminée' of good design.

The building which we approach as we leave the straggling little town behind us was at once a fortress and a monastery, and contains a striking church. As early as the middle of the 12th century this was a valuable stronghold, and it was the only one in all Normandy which held out against us after Agincourt. A very picturesque gateway, flanked by two towers and attributed to the end of the 14th century (though portions of its work seem earlier), gives access, up an immense number of steps, to the interior of the fortress, and the visitor here finds himself under the shadow of the ape of the church, having on his right a vast and regular pile, commonly known as La Merveille, and on his left a range of less remarkable and irregular buildings. The nook in which he has landed gives some wonderfully picturesque combinations of thirteenth century domestic work with later additions; and in this part some interesting problems as to the date of various changes and alterations might be easily found. The two important buildings, however, the church and the Wonder (La Merveille), are all we can hope to describe.

The church has a short nave of four bays, a choir of two bays, and an apse; transepts, aisles to the nave and choir, and apsidal chapels. The nave and transepts are of very ancient round-arched work; the foundation of the church dates from the year 1020, and nearly all the unaltered portions of this part of the church must date at least as far back as the twelfth or the earliest years of the thirteenth century. The nave is said to have been shortened, which is very possible, as the west front is comparatively modern. This part of the church is very noble, has an unusual air of height and intricacy, and though partially restored seems to have been less injured than many French churches to which this process has been applied. The apse, as we now see it, is of the fifteenth century, executed in granite, very elaborate, and as a piece of construction very interesting, but not to compare with the earlier work for beauty. Its roof and pinnacles, however, and the high pyramidal roof which surmounts the crux, form a most appropriate summit to the whole pile of rock and buildings as seen from the sea.

The building, half monastery and half fort, to which we have more than once made reference under its local title of 'the Wonder,' adjoins the church: it is a tolerably regular rectangular gabled block, its greatest length being parallel to the church; and in all views of the rock taken from the usual points, the east or south-east, its immense height is well seen, and its domestic-looking gable, strengthened by a mighty central buttress, and flanked by an octagonal staircase turret with a pyramidal roof, tells out well a little lower than the apse of the church and to the north of it. The side wall overlooking the sea rises clear of all surroundings, for a length of rather more than 200 feet and to a height of about 108 feet, and is strengthened by 14 long buttresses. The building presents three main storeys, each of which is divided into two portions, one generally supposed to have been occupied by military, the other by the monastic occupants of the old fort.

The lowest storey is a crypt of great dignity of treatment. Its eastern portion, divided into two naves by a central row of six circular

columns, is almost unique for its grand simplicity. The columns themselves resemble classic ones a good deal more than is ordinarily the case, and the sharp square angles of a plainly groined, quadripartite vault, of a slightly pointed outline, without a single moulding of any sort, spring from their square abaci. To this hall—measuring about 33 feet by 117, and of which the columns are about 12 feet high and 26 inches in diameter—tradition assigns the name of 'Salle des Gardes' (guard-room). The western part of the crypt—not quite so long, but wider—is divided into three naves by two lines of shafts. It is, like the last, seven bays long; but the proportions of the whole architecture are more slender, and the treatment less decidedly masculine. Its appropriation is variously stated: sometimes it is called the Stable of the Knights, sometimes the Monks' Cellar; probability is in favour of the latter. Much of this crypt seems to have been carved out of the live rock; and in memory of an unsuccessful attempt made by one Montgomery in 1591 to seize the fortress, these crypts—which his men actually gained—have been called 'Les Montgomeries.'

Ascending a storey, we gain the level of two striking halls, among the most noble, and, without doubt, the best preserved, which France possesses. In these we may form some idea—remembering all the difficulties of site and material which existed, for all is here of granite—how large-minded and energetic were the Frenchmen of the thirteenth century.

The eastern hall, like the crypt below it, is divided into two naves. The columns are cylindrical, of slender proportion, and with good, but very simple carved caps. The vaulting, quadripartite as below, has here simple ribs, and very nearly, if not exactly, the rise of an equilateral arch, an enormous 'cheminée,' possibly not the original one, with a sloping cap, runs quite across the western end of the hall, embracing both naves. At the opposite end, and in each bay, windows with mullions and heavy transoms give light and view. This hall was the monks' refectory. A suite of small rooms, accessible from this and also from the adjoining hall, exist, which were probably those for guests. The western hall, divided as before into three naves, and with a recess which in the centre causes it to be four bays wide, exhibits a curious, almost capricious variety of design. Its vault ribs are more richly moulded than those of any other portion of the fabric, and its capitals are perhaps better carved; but the general proportions are comparatively low, as if it were intended to produce that effect of intricacy to which a low roof always contributes when the space is occupied by many columns. This fine room is called the Knights' Hall, 'Salle des Chevaliers'; it has two fireplaces at one side, both of great size, and a little more ornamental than those in the Refectory; these are probably original.

We ascend once more. This time the eye has to lean on the imagination before forming a correct idea of the eastern half of the highest storey. This is called, and probably was, the monks' dormitory. It is a room about 20 feet in height, having the same dimensions as those (already given) of the crypt two storeys below it, and with a flat ceiling, and derives its chief architectural character from a singularly elegant treatment of the side walls. Each bay is divided into four tall and narrow lights, flanked by slender attached shafts and with arched heads. In the thickness of the wall on the south side a kind of recess has been formed, having a charming groined roof; and were it not for the unlucky fact that a modern floor and some partitions have been inserted, it is doubtful whether this room would not equal in beauty, if not in magnificence, those before visited, while totally different from them in design.

From the windows of this dormitory a splendid bird's eye view of the whole rock, backed by an extended landscape of sea and distant land, is to be had; and one of the days of our visit chancing to be the fête of the Emperor, we witnessed from here the solemn procession of country folk proper to that occasion. We saw all the rustics, clad in their best, and headed by the priest and acolytes of the parish church in their vestments, and bearing incense and banners, and attended by some young girls in white, come winding up the steep street. They were now seen, now lost among the houses, till they emerged into the steep and rugged path which led them below the very spot whence we were looking up to the castle gates. The spacious portal received them all one by one, and long after the last had disappeared from view their monotonous chant still rung through the arcades and corridors of the empty pile as they wound their way to the church of the Archangel, where mass was to be said. Had it not been indeed that the scene was so extended, and almost too picturesque for the comparison, this incident was far more like an episode of an opera than one in real life.

The western portion of this the topmost storey of La Merveille remains to be visited. Here it is startling as well as pleasing to step into a singularly perfect and gracefully elegant cloister, measuring about 80 feet by 60 within the boundary walls, and having an open central space clear of the arcades of about 60 feet by 40. The peculiarity of this cloister is that instead of the single row of columns from which the arcade usually springs, there are two rows of very slender shafts, so ranged that a shaft in the inner rank always comes opposite an opening in the outer. This simple device introduces an air of intricacy, to which the slenderness of the shafts themselves, and the great beauty of their capitals, add the element of grace. The local authorities state the number of columns here employed at 220. They and their capitals and bases are of varied materials; and almost, if not quite, for the first time in this building, we here find a softer stone than granite introduced. The distance of the centre line of the outer

row of shafts from that of the inner is about 19 inches. The columns are about 3 feet 3 inches apart, and the height from the path behind them to the crown of the arch which springs from them is barely 7 feet. So that the scale adopted is almost the very smallest that could with safety be used.

The spandrels between the arches of this arcade are filled in on the side next the quadrangle with circular panels of uncommonly rich and varied workmanship. Illustrations of two or three good specimens of them may be found in Mr. Nesfield's book; but that artist, though he has happily given the general aspect of Mont St. Michel, and some of the details of its buildings, has failed to convey any adequate idea of this elegant and very unusual cloister. The date attributed to this work is 1228, and the style of the mouldings and decorations certainly points to the early part of the thirteenth century.

It is impossible to prolong this description, notwithstanding that, although the best has been told, very much more, and of great interest, remains unnoticed. Few places in France are more attractive to the architectural sketcher; none are more unreservedly thrown open to him; and the occupation of these buildings as a prison, to which purpose they had for many years been appropriated, having recently ceased, they are—or lately were—entirely empty and vacant, and open throughout to inspection. It may not be that every visitor will derive so much pleasure from a short stay at Mont St. Michel, or will work so hard, as our Rambler and his friend; but the place is one which it is barely possible that any architect, antiquary, or painter could visit without gratification.

So picturesque a ramble deserved an effective ending, and this did not fail us. We remained to the very last minute possible, and left at the close of a stormy day, the moment the second flow of the tide had receded far enough to render crossing the sands possible with the aid of an experienced guide. It was nine o'clock, an hour at which almost all the simple townfolk were abed and asleep; the moon was bright, and the wet glittering sand was so heavy as to render progress painfully slow. Soon the clouds began to rise, the moon was partly overcast, and the sand and sky assumed more and more an uniform ashen hue, till at last they grew to be entirely undistinguishable. No horizon line could be detected; and amid the grey gloom there hung, just as if suspended in the air, the vast pyramidal rock, suffused with a general silvery grey brightness; its many pinnacles and spires were faintly illuminated, and still traceable against the leaden mass behind; its houses and buttresses and crags were barely to be perceived, but the white house of our friend the good 'cure' shone clearly out, and the gleam of light from his study window was the solitary sign of life in the place. The whole scene was like a vision; and as we slowly moved farther and farther off, and the heavy bank of clouds crept gradually higher and higher over the moon, the Mount seemed to fade away, retreating into dimness and darkness, till it disappeared entirely from view, and left us belated and lonely to face the broad wastes of sand and the impending storm.

A RETROSPECTIVE REVIEW

OF

SIR HENRY WOTTON'S ELEMENTS OF ARCHITECTURE.

[WE propose sometimes to notice rare and curious books upon the subjects to which this journal is devoted, and also some that may be considered as belonging to that class of books Lord Bacon recommended to be read by deputy.

We have selected as a commencement a work that was long ago esteemed the 'Elements of Architecture,' by Sir Henry Wotton, and published in 1624. As his 'Life,' by Izaak Walton, is very popular, it is not necessary to say much concerning him. He was born in 1568, at Bolton Hall, Kent; educated at Winchester and Oxford; and after studying civil law, spent many years in travelling. On his return he became attached to the unfortunate Earl of Essex, on whose downfall he escaped to Italy, and lived at Florence. James the First made him ambassador to Venice. Although he rendered many services to James, he does not appear to have received many favours in return, and was glad to accept the Provostship of Eton, which he held till his death in 1639.

The book would be interesting if it were only as evidence of the extent of architectural knowledge in the earlier part of the seventeenth century, when the Italian style was growing fashionable, and 'judicious eyes' were turning away from the old Gothic. The principles laid down are derived from Italian practice, and even the description of the Orders is founded on Roman and Italian models rather than Grecian. There are many things mentioned which must appear now-a-days curious and amusing, such, for instance, as the employment of steam as a cure for smoky chimneys; but there is much which will be at all times true.

As the book treats of Architecture in general, we have thought it better to give an epitome of it by condensing the greater portion, instead of detached extracts, even although much of the charm of the original style has to be sacrificed.]

PART I.

As there is no need to celebrate the subject of architecture (for it can want no commendation where there are noble men or noble minds), let us first speak of those from whom our knowledge of it has been gathered. Our principal master is Vitruvius. It was his felicity to write at the time when Rome had attained the summit of power; for in growing and enlarging times arts are commonly drowned in action. On the other hand, it is to be regretted he did not express himself more clearly; and of his Italian commentators it may be said that some who were mathematicians

wanted grammar, and the grammarians wanted mathematics. The first who was qualified for the duty was Leon Battista Alberti, but he studied more to make himself an author than to illustrate his master. Perhaps the best editions are those of Philander and Gualterus Rivius. The latter laments the scarcity of corresponding technical terms in German, and this is true also of English—languages for the most part in terms of art and erudition retaining their original poverty, and rather growing rich and abundant in complimentary phrases and such froth.

There are two ways to treat the subject of architecture—either by a description of the principal constructions, or by casting the rules and cautions of the art into some method; which latter way is not only the shortest and most elemental, but also the soundest. For, although every complete example may bear the credit of a rule, yet rules should precede, that we may be fit to judge of examples.

The end of architecture is to build well, and well building has three conditions—convenience, firmness, and delight. To attain these, the subject may be considered under the heads of (1st) the site, (2nd) the work. With regard to the *selection of a site*, various precepts have been given, such as to be cautious that the air of the place be not too gross nor too penetrative, nor subject to fogs from fens or marshes, and that the place itself is not under malign influence, but is well watered and fuelled, easy of access, and near a river or arm of the sea. But these are often rather wishes than precepts. In the seating of ourselves, which is a kind of marriage to a place, we should be as circumspect as wooers; and one caution may be enjoined—by no means to build too near a great neighbour; which were, in truth, to be as unfortunately seated on the earth as Mercury is in the heavens—for the most part ever in combustion or obscurity under brighter beams than its own. Next, as regards the *laying out of the divisions of a building*. We find in our own bodies that the heart, the fountain of life, is placed about the middle, for the more equal communication of the vital spirits; the eyes are seated aloft, so as to have the greater circle within their view; and the arms projected on either side for the sake of reaching—the place of every part being determined by its use. If, then, from natural structures we turn to artificial, let the principal chambers of delight, all studies and libraries, be towards the east, for the morning is a friend to the Muses; all offices that require heat, as stillatories, stoves, rooms for baking, brewing, washing or the like, towards the south; all cellars, pantries, butteries, and granaries to the north. In the same direction ought also be placed all galleries intended for pictures or other works of art. It was the custom with the Greeks and Romans to place the fronts of their houses towards the south; but every nation is bound in the first place to provide against its own inconveniences, and a good parlour in Egypt would perchance make a good cellar in England.

With regard to the work, the architect ought, as well as the philosopher, understand the properties of stone and wood, as that fir, cypresses, cedars, and such aspiring plants, are fittest for posts and pillars, or upright use; that oak and like true-hearted timber, being strong in all positions, may be trusted for cross work, for summers, or girding and binding beams: nay, he ought even examine the sand and lime and clay. However, the *choice of the materials* might be considered by some as more proper to be undertaken by a special superintendent rather than by the architect, whose glory doth more consist in the design and idea of the whole work, and whose truest ambition should be to make the form triumph over the material.

Alberti wishes that all the timber to be used in a building should be cut from the same forest, and the stone out of the same quarry; Philibert de l'Orme goes further, and would have the lime made out of the stone used in the work. Without going so far as this, it must be confessed that the English practice of making lime from unselected materials is wrong, and differs from the Italian and ancient practice, in which the finest stone, and sometimes fragments of marble, were used.

Care should be taken that sufficient materials and money are at hand before beginning; for when work is built by fits, it dries and sinks unequally, and the walls become full of chinks and crevices.

For the *form of a building* the circle has many fit and eminent properties: it is the most capable; it is the strongest, as being the most united in its parts; and as it resembles the celestial orbs and the universal form, it is the most beautiful. It seems also to have the approbation of Nature when she worketh by instinct, which is her secret school, for birds build their nests spherically. But, notwithstanding, it is a most unprofitable figure for private fabrics on account of its expense and the proportion of space that is of no avail when the rooms are laid out. The same objections apply to the oval and other imperfect circular forms; so there remain to be considered, angular and mixed forms. It is a true observation, that architecture does neither love many angles nor few, and therefore the triangular form is the most condemned, and figures with many angles are more fitted for military architecture. The precepts and practice of the best builders unite in adopting the rectangle as a mean between too few and too many angles. It is not determined whether an exact square or a long one is better, though, possibly, most symmetry is obtained when the length exceeds the breadth by about one-third. Mixed forms, partly angular and partly circular, participate in what has been said of simple forms, with the additional objection that they offend against uniformity.

In Architecture there may seem to be two opposite affectations—uniformity and variety, which nevertheless admit of reconciliation. For as in our bodies we have each side agreeing with the other in the number, quality, and measure of the parts, yet at the same time some parts are round as the arms, some flat as the hands, some prominent and some more retired; so the limbs of a noble fabric may be correspondent enough though they be various, provided we do not run into extravagant inventions. Enormous heights of six or seven storeys, as well as irregular forms and low distended fronts, ought to be avoided.

All the parts of a building, according to Alberti, may be comprised under five heads: the foundation, the walls, the apertions or overtures, the comparison, and the cover. Of these the *foundation* requires the exactest care; for if it happen to dance, it will mar all the mirth in the house. Therefore there ought to be not only a diligent, but even a jealous examination of what the soil will bear. How deep the foundations ought to be built is not

determined, as depending perhaps more upon discretion than rule: Palladio advises a sixth part of the height of the fabric. Some recommend that the wells and cisterns should be first formed, as in doing so the nature of the ground would be better ascertained before the superstructure is commenced. It is necessary that the ground be precisely level on which the foundations are laid, and for this purpose the Italians commonly lay a platform of good boards. The lowest courses of masonry ought to be closely laid without mortar, which is a general caution for all parts in a building contiguous to board or timber, because wood and lime are insociable. The breadth of the substructure ought generally to be double that of the insistent wall, or more or less, as its weight would require; and the materials ought to be laid as they grow in the quarry. The walls should be exactly perpendicular to the groundwork; for the right angle is the true cause of all stability both in natural and artificial positions; a man standing firmest when he stands uprightest. The heaviest materials to be lowest; the work as it rises to diminish in thickness proportionally; courses or ledges of more strength than the rest to be interlaid like bones, to sustain the fabric from total ruin if the under parts should decay. Lastly, that the angles, which are the nerves of the edifice, be firmly bound with quoins.

The intermissions of walls are either by pillars or pilasters. There are five orders of pillars, which agree in being round, in diminishing according to their heights, and in having their undersettings or pedestals a third part of the column, and their architraves, friezes, and cornices a fourth part. The *Tuscan* is a plain, massive rural pillar, resembling some sturdy, well-limbed labourer homely clad. The length, six diameters of the lowest part (the most natural of proportions, since the foot of a man is the sixth part of his body), the intercolumniation four diameters, and the contraction above one-fourth of the thickness below.

The *Doric* is the gravest that has been received into civil use, preserving in comparison with those that follow a more masculine aspect. Its position ought to be set lowest, being better able to support. Length seven diameters, intercolumniation three diameters, contraction one fifth. The *Ionic* represents a kind of feminine slenderness, yet not like a light housewife, but in a decent dressing has much of the matron. Length eight diameters, intercolumniation two diameters, contraction one sixth. Is best known by the trimmings, for the column is perpetually channeled like a thick plighted gown. Capital dressed on each side not much unlike women's wires in a spiral wreathing, cornice indented, frieze swelling like a pillow.

The *Corinthian* is lasciviously decked out like a courtesan. Length equals nine diameters, intercolumniation two and a quarter diameters, contraction one seventh. The capital is cut into the beautifullest leaf that nature doth yield. The *Composite* Order is nothing in effect but a medley of all the precedent ornaments, making a new kind by stealth, and though the most richly tricked, the poorest in this—that it is a borrower of all its beauty. Length ten diameters, intercolumniation a diameter and a half, or less than two, contraction one eighth.

Where there is *superposition* of the orders, there must be an exquisite care to place the columns precisely, that solid may answer to solid, and vacuities to vacuities, as well for beauty as for strength. Vitruvius says that the columns above should be a fourth part less than those below. It would be more in accordance with his own principles to make them one fourth greater, because the eye itself doth naturally contract objects according to the distance. In the same way he says pillars that are channeled ought to be more slender; but as they are truly weakened in themselves, they ought to be in sound reason not more slender, but more corpulent, unless appearances preponder truths. A third rule is that the projecting parts, especially of the lower orders, project not over much, as otherwise they hinder the light within, and detract from the front view, as in the Grimani palace at Venice. *Pilasters* must not be too tall and slender, lest they resemble pillars; nor too dwarfish and gross, lest they imitate the piles and piers of bridges. Smoothness does not so well become them as a rustic superficies, for they are more at state and strength than elegance. In private buildings they ought not be narrower than one third, nor broader than two parts of the vacuity between them, but to those standing at the corners more strength may be allowed.

(To be continued.)

REVIEW.

PERSONAL RECOLLECTIONS OF ENGLISH ENGINEERS, AND OF THE INTRODUCTION OF THE RAILWAY SYSTEM INTO THE UNITED KINGDOM. By a Civil Engineer, Author of 'The Trinity of Italy.'

'The introduction of the railway system into the United Kingdom' is a phrase which sounds strangely, almost startlingly, to the ear of an Englishman of the present day. To those who are in the prime or decline of life it must recall their earlier years, when England was a very different country from what it is now. To the young these words point to a far-off time beyond their personal recollection, and seem to shadow forth a state of things beyond their power to imagine. The circumstances of a United Kingdom without railways seem almost as remote from those in which we live at the present day as those of the times when men fought in armour, lived in castles, and shot with the long bow.

No such rapid revolution as that effected by the railway system had ever occurred before. The introduction of printing, of gunpowder, and of the stationary steam engine have each of them formed great epochs in the history of modern civilisation; but no one of them so swiftly altered men's habits of life or modes of thought as did the railroad, with its twin invention, the locomotive.

A picture of English life in some quiet nook invaded by the railway, of the sudden introduction of this utterly new and strange thing, of the struggle between old and new modes of travelling, and those who waged it on both sides, and of some of the leading engineers who planned and carried out the system which performs to modern life much the same func-

tions that veins and arteries do to the life of the human body, ought to be drawn, if attempted at all, by an eye-witness, while such remains. Such a topic deserves a chronicler capable of narrating with graphic power the humorous as well as the serious incidents of so stirring a time. The narrator before us fulfils these conditions. The author appears to have commenced his professional career under the auspices of Mr. Stephenson at an early stage in the formation of the London and Birmingham Railway, and to have seen service in England, Wales, and Ireland. Of his ability to do justice to the subject, those could have little doubt who, like ourselves, had read his sketches of Italian life and manners, published some short time ago; and the volume contains many proofs of a familiar acquaintance with the most important bearings of sundry questions connected with railways, some of which still remain unsettled, while others are unhappily settled beyond the hope of recall.

The line from London to Birmingham was begun at what may be called the turn of the tide. The earlier efforts of George Stephenson, at Darlington and on the Liverpool and Manchester line, had been made in spite of the most overpowering burden of opposition, uncertainty, distrust, and prejudice. The public had, however, been convinced, by the inexorable logic of facts, that a mode of transit was at their disposal more swift, punctual, and economical than could previously have been thought possible; and rapidly town after town, district after district, and county after county, came to wake up to the fact that, whether they approved it or no, they must go with the times. 'Railways were the cry of the hour,' says our author, 'and engineers were the want of the day. If they were not to be found ready made, they had to be extemporised, and so they accordingly were;' but neither the extemporised railway engineers nor their equally extemporised directors and chairmen, least of all the departments of the Legislature to which it belonged to regulate this gigantic movement, were fully alive to all the necessities of the case. They were not aware of the magnitude to which that which they had in hand would grow, nor were they equal to the task of directing it into the best channels.

'The six hundred millions which we have spent on our own railways, although, on the average, yielding a fair return on the par price, have been lavishly and inconsiderately spent. If the fourth part of that sum, which we may reckon, without exaggeration, as having been made into ducks and drakes, were now forthcoming for the necessary development of the feeders and ramifications of the great trunk and branch lines, an immense impulse to our national prosperity would ensue. There may be wisdom, then, as well as relaxation in looking back to inquire how the chief industry of the last thirty years came to start in a *wrong groove*—how it was that the service of the public was injured for the benefit of private individuals, and that a false direction was given to an industrial development of such unparalleled importance. The most sanguine ideas of the most sanguine speculators never contemplated the enormous traffic developed and created by the railway system. This gigantic and unexpected excess over the estimated traffic has been claimed by the projectors of railways as a set-off against the enormous excess over the estimates of their construction. The balance has been fortunate, and of course, to some extent, unexpected traffic has caused unexpected outlay. But those familiar with the subject know that comparatively little of the actual waste is thus to be justified. That our present traffic might have been conducted as conveniently, and more conveniently than is actually the case, while at the same time it should have been weighted with some ten millions sterling per annum less of interest to be paid out of profits, probably few persons qualified to form an opinion will doubt. It may therefore be a service to the conductors of the public works of the future to open an unrecorded chapter of the history of those of the present, and to point how from small beginnings, and from natural and neglected causes, arose part of that present state of suspicion and of hesitation which is paralysing so much of the energy of the world.'—(p. 57.)

We feel compelled, somewhat unwillingly, to pass over without extract the picturesque description of England and our best modes of travelling before the railroad times. These will be read with pleasure, as will the pleasantly written descriptions of the mode in which works were carried on, and the men by whose skill they were designed, or whose energy carried them out. Perhaps the general reader will derive more pleasure from the personal sketches—a little after the graphic manner of Mr. Kinglake—of great engineers and their less known subordinates than from any other part of the work. Take the following as a specimen:—

'Robert Stephenson, in those days, almost lived on the line; and the first occasion on which he visited the portion in question, after the contracts were let, accompanied by the Secretary and by four or five of the Directors, was the twelfth time that he had walked the whole distance from London to Birmingham. The personal appearance of that fortunate engineer is not unfamiliar to many of those whose eyes never rested on his energetic countenance, frank bearing, and falcon-like glance. It is rarely that a civilian has so free and almost martial an address; it is still more rare for such features to be seen in any man who has not inherited them from a line of gently-nurtured ancestors. In the earlier days of Robert Stephenson he charmed all who came in contact with him. Kind and considerate to his subordinates, he was not without occasional outbursts of fierce Northern passion, nor always superior to prejudice. He knew how to attach people to him: he knew also how to be a firm and persistent hater. During the whole construction of the London and Birmingham line, his anxiety was so great as to lead him to very frequent recourse to the fatal aid of calomel. At the same time his sacrifice of his own rest, and indeed of necessary care of his health, was such as would have soon destroyed a less originally fine constitution. He has been known to start on the outside of the mail, from London for Birmingham, without a great coat, and that on a cold night; and there can be little doubt that his early and lamented death was hastened by this ill-considered devotion to the service of his employers, and the establishment of his own fame.'—(p. 22.)

As a pendant to the above portrait, we give a part only of our author's description of a less generally known man—one, however, whose character merited record:—

'Short and compact of stature, with a keen eye, a resolute nose, a com-

plexion bronzed by the sun and storms of many a campaign, General Pasley possessed all the courage of Ney, with much more of the aspect of a Captain. His utter disregard, or apparent non-perception, of danger while prosecuting any scientific investigation, recalls the biography of Maurice of Nassau, who, like the English officer, so well knew the importance of the spade as a military weapon. But an instance of his perfect sang-froid when exposed to the danger of another element, to which a soldier may be supposed less accustomed than to perils of fire or of earth, may perhaps give a more vivid impression of his imperturbable courage and self-command.

Pasley had descended with a junior Engineer officer in a diving-bell, at a time when he was giving attention to submarine experiment. By some misfortune the apparatus became deranged, the chain was entangled with the air tubes and signal line, the supply of air became strangled, and the water slowly and steadily rose in the bell. It was impossible to creep beneath its edge in order to dive out and float to the surface, for the bell rested on the bottom of the sea, and that was an inclined plane, so that the close dome was tilted considerably to one side. Death appeared inevitable; a question of moments or of inches, as the water slowly crept up the limbs of the two officers, who were thus utterly unable to make any effort for escape. "I confess," said the junior, "that I felt a very considerable alarm; but Pasley never changed a muscle: he continued talking in the quietest manner on indifferent subjects, and watching the rise of the water, as if it were an experiment he was superintending in the ordinary routine of duty. The water had risen to our breasts, when the people above, receiving no signals, became alarmed, and drew up the bell. I cannot describe my feelings, but Pasley took it all as the merest matter of course."—(p. 299.)

The conduct of works and the difficulties of preliminary survey, of actual carrying out, and of pecuniary settlement, are again and again illustrated in narratives of which the scene is laid in various parts of England, in the sister isle, and in the Principality. At a moment when Ireland is attracting a share of public attention which she has not received for years, it may not be out of place to point the reader to two chapters on railway work in Ireland, which contain some statements that may help him to comprehend why the investment of English capital in public works in Ireland has not gone on as rapidly as the well-wishers of that country could desire; but for this we prefer to send our reader to the volume itself. Passing over a most interesting chapter on Railway Finance, where the leading points of this great subject are set forth in a masterly way, we prefer to give an extract from the concluding chapter, which is on a subject that possesses for many of our readers a personal interest.—'The Future of Engineering.'

'The profession of the civil engineer,' observes our author, 'is under a cloud. Offices are closed, public works are discontinued, and many are eagerly asking, Will this state of things continue? Whence has it arisen; whither is it tending?' The opinions here set forth, with much ability though great brevity, are reassuring on these points. That the main lines of communication are now supplied with the grand trunk railways which their importance demanded, and that innumerable branches have covered the country, does not exhaust the possibilities of profitable engineering work even in the single article of means of transit.

'Our English railways have cost 42,000*l.* per mile. Branch lines may be grafted on the system at a cost, taking foreign experience as a basis, of 3000*l.* per mile, or a fourteenth of our actual mean outlay. That the country would find so large an economy in the use of railway branches, constructed at anything approaching to such a minimum price, as to demand the prompt completion of such a supplement to the more costly trunks and arteries, there can be little doubt, if the injudicious and detrimental exactions of Parliament were set aside.'—(p. 423.)

But our author looks further, and sketches a noble programme for the future efforts of the scientific constructors of England.

'The water supply of cities and towns, pure, ample, and efficient in case of fire; the removal and disposition of sewage; the redemption of our rivers and brooks from a neglect that is rapidly converting them into pestilent sewers; the application to agriculture of that mass of chemical fertilising power with which we now poison rivers and estuaries; the drainage of land, both main and subsidiary; the storing-up of that precious water, of which we are either anxious hastily to get rid, or helplessly destitute; and the production of fertile and certain crops by irrigation; all these are but so many features of one department of the duty of the engineer—the proper distribution and utilisation of the rainfall!—(p. 427.)

With one more extract, containing an enlarged view of the possible future of this profession, we take leave of a volume equally instructive and entertaining:—

'We consider the profession of the Civil Engineer to be that on which, if it is rightly considered and followed out, the progress of humanity and of civilization, at least for the remainder of the present century, must principally depend. The sword, and the pen, and the lancet will be needed so long as war, and ignorance, and disease prevail on earth. The instrument by which these evils can be most efficiently checked—the instrument that would be held in honour, if the earlier weapons of violence and of oppression were superseded, is the spade. When we first hear of the introduction of man upon earth, when earth was described as a garden, the occupation of the noblest terrestrial form was to dress it and to keep it.'—(p. 431.)

THE NEW CATHEDRAL OF ST. FINBARR AT CORK.

BY WILLIAM BURGESS.

SOME time at the commencement of the seventh century, St. Finbarr, one of the more celebrated Irish saints, obtained a piece of ground on the south bank of the river Lee. This piece of ground was the gift of a man named Aed, and upon it the saint appears to have constructed a cathedral, to which were attached a clergy house and a cemetery. In the Latin 'Life of St. Finbarr,' edited by Dr. Richard Caulfield, we are told that wonderful events marked the selection and

consecration of the spot upon which the new cathedral is now being reared. Thus 'the angel of the Lord came to the holy man and led him with his disciples to the place where now is the city of Cork; and said to him, "Remain in this place, for here will be your resurrection." Then the holy Barr fasted for three days and prayed continually, wishing to bless the place with prayer and fasting. Then a plebeian man named Aed, seeking a fugitive cow, came to the place where the man of God was with his disciples. The cow went up to the holy men and dropped a calf.'

'The man seeing this asked them what they were doing there. St. Finbarr replied that they were looking for a place on which they might pray God for themselves and for him who might give it to them.' To somewhat shorten a long story, it may be sufficient to say that the field belonged to the man who had lost his cow, and who forthwith made a present of both field and cow to the Saint, receiving in return his benediction.

The legend then relates the miraculous consecration of St. Finbarr and S. Maccuirp (his master) by Angels. This took place in the church which we may presume St. Finbarr had caused to be built. The occasion was also illustrated by a miraculous emission of oil from the ground near the altar, the supply of which was so abundant that it flowed over the feet of the assistants.

'After these things, on the same day, the holy bishop Barr, and the holy bishop Maccuirp, and the rest of the clergy, marked out the cemetery of the church of St. Barr, which is called *Cork*, and afterwards they consecrated it, promising, in the name of God, that whoever shall be buried in the ground of this cemetery, the gates of hell shall not be shut on him after the day of judgment.'

'Then the holy Bishop Maccuirp prayed that he might be the first to be buried in the cemetery, and his prayer was heard; for immediately being seized by pain he died happily, and was buried the first in the cemetery by the venerable Bishop Barr and the other holy clergy.'

'The holy Barr remained in that place up to his death, and there, in his honour, a very great city sprang up, which is called by the same name, *Corcach*.'

The Saint actually died at Cloyne, whither he had gone to visit his friends. His remains were brought back to Cork, and there buried. Afterwards his reliques were enclosed in a silver shrine, the history and fortunes of which have unfortunately escaped the researches of Dr. Caulfield.

In process of time other abbeys and other cemeteries grew around the church of St. Finbarr, until the whole hill must have been one vast necropolis. Doubtless the special promise given to those who should be buried in the cemetery first marked out by the saint and his master had much to do with this extension. To the east was the graveyard of the Church of the Holyrood, where the stone fort now stands; to the west was that belonging to Gill Abbey, then there were also those of the Red Abbey, of St. Nicholas, and of St. John of Jerusalem. Tradition says that the Danes burnt the city which sprang up around the cathedral, and built another town on the north branch of the river Lee, on account of the greater facilities of navigation. At present we have no documentary history of the material fabric of the church beyond the burials of sundry bishops, until the partial destruction caused by the cannon of Elizabeth Fort. Cork was the last place that held out for James II., and the besiegers took advantage of the tower of the Cathedral to annoy the defenders of the fort. This naturally caused the latter to retaliate, and the consequence was the partial destruction of the building. It, however, appears to have been patched up sufficiently to allow divine service to be performed; for we read of the dean and chapter giving 30*l.* towards a bishop's throne, and also of their ordering the purchase of an eagle to put the church Bible upon—to be made of the brass branch in the chest in the chapter-house.

In 1735 Dr. Robert Clayton was translated to the see of Cork. The ruinous state of the Cathedral determined him to set about a rebuilding, and he persuaded the Corporation to devote the first five years of the coal tax to this object. He did not, however, live to see it finished—an event which took place during the episcopate of his successor, Dr. Jemmett Browne, when the present beautiful peal of bells were cast. Still later must have been the erection of the spire, for I have seen a copperplate, in a work of the last century, showing the tower without the steeple.

The old views and maps of Cork show the churchyard as containing sundry other buildings besides the church, among them a certain 'spirical' building, and a round tower, all traces of both of which are now quite lost.

Possibly we should not be far wrong if we suppose the ancient arrangement to have been this. The original cemetery contained, like so many other Irish ones, sundry small ecclesiastical buildings, including the mother church—with small detached chapels or churches, a round tower, and perhaps clergy houses. Round this cemetery, and joining it, were other burial places, each containing its church or churches, and conventual establishments, the whole forming a vast necropolis, interspersed with numerous small ecclesiastical buildings. Many of these latter suffered during the Reformation. The highest part of the hill, formerly occupied by the church of the Holyrood, was taken for Queen Elizabeth's Fort. We know for certain that the cathedral group of buildings sustained great damage during the civil war between William III. and James II. The last century saw the cathedral rebuilt, and the town increasing in prosperity. Then the precincts of the cathedral became fashionable as residences, and the

sites of the old churchyards were gradually encroached upon by buildings; the walk under the south wall of the cemetery being used as a fashionable promenade.

Then the times changed. Other localities were found to be more agreeable, and the precincts of St. Finbarr ceasing to be fashionable, the houses fell into decay, and were occupied by a very humble class of tenants; manufactories and breweries were erected on the banks of the river, and the whole exhibited the appearance of an ugly church in a painfully overcrowded churchyard, surrounded by sad and squalid dwellings.

The first move in the right direction was the demolition of the old cathedral, and the erection of the new one; the next, the closing of the churchyard, and the consequent prohibition of burials; the third desideratum, viz., the rebuilding of the surrounding houses, has yet to be undertaken, although a commencement has been made by the dean and chapter, who have bought up and demolished several of the tenements.

The first stone of the new building was laid by St. Finbarr's successor (the Right Rev. John Gregg, D.D.) on January 12, 1865. The demolition of the walls of the old building ensued, and a certain amount of material evidence was obtained which to some degree enables us to supplement the very meagre documentary history of the Cathedral. Although even that material evidence can hardly be considered as conclusive, inasmuch as it is quite possible that the builders of the eighteenth century church may have employed fragments from the ruins of the surrounding buildings: thus, for instance, there has always been a tradition that the doorway of the tower originally belonged to the Dominican Abbey of St. Mary of the Isle, and it is not unlikely that sundry carved heads in the same western wall of the tower had a similar origin.

Apart from these doubts, the remains discovered in the walls would point to the existence of two distinct buildings, one of the twelfth century, and another of the fourteenth. The former is represented by sundry well-executed corbel heads, and the latter by a good many moulded stones, exhibiting sections of mouldings of the Edwardian period. It is a curious fact that both the twelfth and fourteenth century work is executed in an oolitic stone, not unlike that from Caen, only of a more yellow colour, but no such stone is found anywhere near the locality. The eighteenth century cathedral was faced with the local limestone, not, however, of the best quality, for sundry portions of it had evidently decayed, giving the walls an appearance of having been whitewashed. The only ancient portion of the late building was the eastern arch of the tower, with its little staircase-doorway on the north side; but they only presented plain chamfers, and may probably be assigned to the fifteenth century. The discovery of a tombstone to the memory of W. Woodcock, who died 1610, in the north-western angle, will probably give an approximate date for the erection of the rest of the tower. It is not unlikely that it was greatly shaken by the fire from the fort at the end of the seventeenth century, and partly rebuilt with the first materials that came to hand—its masonry being very inferior to that of the last cathedral.

Before describing the materials of the new building, it should be observed that the river Lee divides the City of Cork into two, geologically as well as physically. On the north side we find red sandstone, and on the south side limestone. The former makes excellent rubble, while the latter, if well selected, supplies equally excellent ashlar, the only objection being that, like all good limestones, it is rather difficult to work.

The new building being situated on the slope of a hill, there was naturally considerable variation in the depth of the foundations. The greatest depth attained from the bottom of the plinth was at the angle of the north-western tower; it amounted to 27 feet 9 inches: the least depth—10 feet 11 inches—was at the south-east of the ambulatory.

In digging the foundations for the south transept the excavators came upon an immense boulder, over 2 tons in weight, and containing about 27 cubic feet. This solid piece of white limestone was about 9 feet below the surface, and there was some 3 or 4 feet of earth between it and the native rock. The latter, which is of the same material, was properly stepped and levelled, and a good bed of mortar applied before the foundations were put in. The foundations and the walling of the building are built of red sandstone, principally from the Brickfield Quarry, at Glenmire. This stone is sometimes used as a species of ashlar, but is exceedingly difficult to saw, and still more so to work the cross way of the grain; hence it is occasionally used the wrong way of the bed, and is then apt to shale off and flush. The limestone which is used for the ashlar and all the external mouldings comes from the Ballintemple Quarries, which have the reputation of producing the best stone in the locality. The drawback is that large stones are very difficult to obtain, for which reason the gutter-course and the columns have been worked in a limestone from a quarry near Kilkenny, which, however, in wet weather, assumes a rather darker tone than the Cork stone.

It is very true that the Shanbally Quarry, near Cork, does produce large stones; but the slightly laminated grain disqualifies it for gutters and columns, while it adds to its value in cases where it has to support any considerable weight—the Ballintemple stone having the opposite reputation of being slightly brittle.

The great piers which support the central tower are built of solid masonry of Stourton stone upon a solid limestone foundation, but box-ground Bath-stone is used for the rest of the internal dressings.

It should be observed that an old foundation was discovered on the

north end of the new cathedral. It extended from the transept beyond the eastern end; it went about 12 feet below the surface, was 3 feet thick, and showed no traces of any buttresses.

At the present time the new building has been raised to the level of the triforium, and a little higher in the transepts, so that the heaviest portion of the work may be considered as done. As the contractors (Messrs. G. Cockburn & Sons, of Dublin), according to their contract, are to finish the building in September, we may naturally assume that the present year will see divine service again celebrated in the spot hallowed by so many associations, and where, according to the legend, the 'Holy Bishop Furseay beheld a golden ladder close to the tomb of the Man of God (St. Finbarr) to convey souls to the celestial regions, and the top of that ladder reached heaven.'

The present contract, unfortunately, does not provide for the erection of the towers or spires above the level of the clerestory parapet; but situated on a hill, and overlooking the whole city, it is hardly likely that the citizens of Cork will fail to carry out the triple spires, which may possibly symbolise the golden ladder which reached from the tomb of the first bishop to heaven itself.

My authorities for the archaeology of the above notice have been entirely derived from my friend Dr. Caulfield. The following is a list of his published works bearing upon the subject:—

'The Episcopal and Capitular Seats of the Irish Cathedral Churches,' illustrated by Richard Caulfield, A.B. Cork: H. Riddings, 1853.

'A Lecture upon the History of the Bishops of Cork and the Cathedral of St. Finbarre,' delivered January 25, 1864, by Richard Caulfield, B.A. Cork: Purcell and Co., 1864.

'The Life of St. Finbarre, first Bishop and Founder of the See of Cork.' Edited from MSS. in the Bodleian Library; Oxford, Archbishop Marsh's Library, and Trinity College, Dublin. By Richard Caulfield, B.A. London: Russell Smith, 1864.

To these I must add—'Nine Views of the late Cathedral of St. Finbarre, Cork,' photographed by Thomas R. Lane, Esq. Cork: published at the request of friends, 1866.

I ought to add that the committee have very wisely ordered sketches for all the stained-glass to be prepared, with prices, &c., so that the general scheme of iconography and colour shall not be hereafter left to chance; also that the Freemasons have presented the sculpture of the four Evangelistic Beasts which surround the western rose window, and that in these days, as in those of St. Finbarre, the Bishop of Cork is a most zealous cathedral builder.

PROPOSED TUNNEL UNDER THE MERSEY.

(SIR CHARLES FOX AND SONS, ENGINEERS.)

AN effort is being made to resuscitate the scheme of a railway under the river Mersey, in order to effect a direct connection between Liverpool and Birkenhead. An Act of Parliament was obtained in 1866 to authorise this undertaking, which, however, it is unnecessary to add, has not been carried out. Whoever has any acquaintance with Liverpool, must be aware of the very large traffic that is constantly being carried on across the Mersey, as well as of the great inconvenience experienced by vast numbers of passengers in stormy weather. In the year 1850 the number of persons who crossed by the several ferries amounted to nine millions. In the year 1864 the number had more than doubled, being stated at upwards of twenty millions. Further provision of some kind for the increasing traffic is becoming imperative, and, if the uncertain service of the steam ferry boats is to be maintained, it is asserted that it will be necessary to extend and greatly improve the approaches to the landing-stage on the Liverpool side—a work that would involve a very considerable outlay.

With respect to the financial prospects of the scheme, no exception can be taken on the side of the traffic estimates. Only half the present number of ferry-boat passengers is assumed to be carried by the railway, and that at the moderate fare of 2d. per head. Working expenses are set down at 50 per cent. Nothing can be simpler, and, judging from the experience of the Metropolitan Railway, nothing can be more fair and moderate.

The only question, therefore, as to the advisability of the undertaking, is that which has regard to the adequacy of the estimate. This question, in point of fact, is not so much engineering as geological. If the sub-fluvial strata are of that solid sandstone which the Engineers expect to meet with, the undertaking will be one of only ordinary difficulty; but if some unexpected channel, lying *perdu* beneath the silt of the present bed of the stream, should dip down to the level crossed by the tunnel, the engineers would be compelled to have to revert to the experience gained at Rotherhithe by Sir M. I. Brunel. It is therefore not without sound reason that the conductors of the undertaking propose to adopt an expedient which that great Engineer bitterly regretted having been induced to omit from motives of false economy.

To save expense, and still more for the purpose of diminishing as far as possible the descent of the approaches to the railway, the line of rails is designed to dip from either terminus towards the centre of the river. The practical inconvenience follows, that all the water which percolates the tunnel will collect at this spot. To obviate this difficulty, the Engineers propose a method which will secure the double advantage of draining the tunnel when complete, and of keeping it free from water during the progress of the works. Further, it will give, not absolute, but very closely approximate assurance as to the character of the strata to be pierced by the main tunnel.

It is proposed that a heading, or driftway, some 1,300 yards in length, should be run below the level selected for the tunnel; and this heading is to fall, in either direction, from the centre to the extremities, so that the tunnel and the headway, when complete, would present to each other the convex sides of circles of very large radius. The water, of course, would be pumped out from wells sunk at the extremities of the driftway. It is necessary to have had the personal experience of the cost and the danger of a wet tunnel, and to be aware of the immense relief which is afforded, in such

cases, by the opening of a channel through which the water can freely escape, instead of being allowed to encumber every portion of the faces in course of opening out, and to block up every working shaft by the barrels and iron work of the pumps, in order to appreciate the service that the preliminary execution of an adequate drain renders to the workmen engaged in the definitive work. It is probable that the cost of the 1,300 yards of driftway would be saved again and again during the construction of the tunnel. To render excavators and bricklayers entirely independent of that constant weeping which they must expect (unless, indeed, Father Mersey broke in on them in force), it would be only necessary to sink small shafts, at intervals, from the floor of the tunnel to the crown of the heading. The water would take the readiest mode of exit, and the pumping service from the heading wells or reservoirs might be exactly proportioned to the actual influx, without in any way interfering with the convenience of either miners or masons.

A scheme in itself so desirable, and indeed so necessary, and which has been subjected to such careful and judicious consideration, can hardly fail for want of the support of the princely merchants of Liverpool; and we shall have great pleasure in opening our columns to the full discussion of this important subject. It will be observed that the Parliamentary capital exceeds the sum which was expended in the completion of the Thames Tunnel, although a considerable part of the excavation of that noble work was conducted under the most unfavourable circumstances as regards the soft and unreliable soil which had replaced the stiff clay indicated by the borings. A driftway, in the first instance, was commenced under the Thames, and carried to the length of 1,040 feet. After the indications thus obtained of difficulties to be met with in the passage, nothing short of the undaunted resolution, and the unexampled mechanical genius, of Brunel would have led to the completion of an undertaking which, in all civilised countries except Great Britain, is justly held to be one of the noblest triumphs of the science, the energy, and the perseverance of the Engineer.

THE CO-OPERATION OF ARCHITECTS AND ENGINEERS.

CONCLUDING ARTICLE.

FOLLOWING up the line of criticism entered on in our last article, it may be said that the engineering mind in our time is seriously committed in public esteem by its persistent, and almost ostentatious, disregard of anything like *art* in its conceptions. We know what it can accomplish in all that includes *science*. Other ages of the world have reared stupendous piles which excite our astonishment by their mere dimensions; but in our own day the civil engineer has achieved, and where opportunity offers or occasion demands can yet achieve, marvels of construction which may not only rival in dimensions the colossal structures of Luxor or Karnak, but which attest a far higher, and—if we may so phrase it—a more civilized era of construction by presenting us with the maximum of *size* with the minimum of *mass*. It is in this respect—and mainly, of course, by the agency of metallic materials—that our modern engineering rises supreme over that of all other epochs of constructive science. But there is one aspect in which this pride of comparison must suffer a reverse. The older monuments of the world have not merely arrested the eye by their scale, they as often satisfy the mind by their design and proportion. It is much to be feared that nineteenth century engineering will not be credited with this double merit in after times. Mere constructive excellence is a quality which our engineers have given us every reason to admire. But the popular taste is scarcely gratified by the assurance, however ample, that our greater works are strongly built and ingeniously constructed. A certain element of art—which implies the co-operation of the engineer with the architect—is surely demanded in the works which continually meet our eyes; and if this be wanting, the mere fact of perfectly sound construction is but small comfort to the mass of men, who judge our works rather by their external effect than by their intrinsic or technical merit.

While we thus treat in general terms of the necessity for combining science and art in our public projects, we are not unmindful of the circumstance that special examples of note may be cited in which the attempt at a co-operation of engineering and architecture has been made. Among these the Crystal Palace at Sydenham is probably the most conspicuous in our time. There may be various opinions entertained as to its artistic merit, but no one will deny that in its *ensemble* it presents a splendid illustration of design influenced by the nature of material. It is no secret that the conception is due to architectural rather than engineering skill, while it is equally certain that no mere architect in modern practice could have been equal to the construction of such a work.

If we mistake not, some such co-operation of engineering and architectural skill occurred on the Great Western Station at Paddington, between Brunel on the one hand and Sir Digby Wyatt on the other.

It would be as unfair as untrue if we were to throw the whole burden of our subject on the engineering profession. In the everyday practice of architecture there are sufficiently grave defects to complain of. The manner in which so many architects sin against the clearest lights of building science is a matter of constant criticism in the engineering world. It is no doubt very agreeable to the popular taste when pleasant forms or agreeably decorated features of design are placed before it, but the more cultivated intellect will too frequently discover that many of these are purchased at no small sacrifice of the *rationale* of construction.

There is a conspicuous illustration of this assertion to be found in a practice which, for the last few years, has been almost rampant in

architectural design. It has become a fashion among architects to employ the granites as materials for external display. Whatever may be said for or against those highly polished and jelly-like surfaces which are now so familiar in our streets, there can be little said by way of justifying the prevalent method of mixing the more ordinary of our building materials with the granitic ones. Columns, formed out of this almost metallic substance, are most frequently constructed on bases of ordinary stone, and are made to carry capitals equally inferior in point of strength and value. A moment's reflection is hardly necessary to discover the obvious absurdity of such a combination of material for structural purposes. It is true, no doubt, that the objection may be evaded by the argument that granite in these cases is not so much employed structurally as ornamentally. If this is all that can be said for it, there is surely equal room for criticism on fashionable material. When one considers the inevitable effects which time and atmospheric influences must produce on our buildings, it is not a little curious to speculate as to the part which these polished granite surfaces will perform a hundred years hence. Recommended as it so frequently is by the fact that it will never decay, and that its polish is enduring, this 'beautiful-for-ever' material will surely produce some strange effects hereafter, when the natural processes of decay and weathering have passed over the other surfaces which usually surround it in our buildings.

The ordinary architectural treatment of metal is a subject which of itself almost deserves a separate article. This class of materials is of necessarily common use in our day; and with its immense capabilities of artistic treatment, it is not a little singular that so little original thought should be expended on the rational employment of it. The two broad divisions of *wrought* and *cast* metal suggest distinct modes of design as appropriate to each. It is not uncommon, however, to see castings drawn from the sand which appear to have been designed as if they were the work of the hammer and anvil; and, similarly, though not so commonly, wrought metal work is treated in forms which suggest the process of moulding. The truest specimens of castings in metal are certainly to be found in our engineering works. The systematic regard for mechanical processes which the engineer usually keeps in view often preserves him from errors in design and treatment, while the more elaborate fancies of the architect as often lead him into them. One of the new iron bridges recently erected over the Thames in the City, and in connection with one of its termini, is a sufficiently creditable example of the employment and the proper treatment of cast metal. In its *ensemble*, however, the agency of the architect is painfully conspicuous by its absence. The pairs of cannon-balls which crown the pedestal over each pier, and the row of pillars or cylinders which form those piers, with the continuous abacus stretching itself over them, are features which mar a work in many respects admirable as an iron construction. It seems an apt illustration, as it stands, of the many public works which demand but have not received that hearty and harmonious combination of constructive and designing skill which it has been our task to treat of.

Such examples, indeed, might be multiplied to profusion if only selected from the metropolis itself. A new erection, in the form of an enclosure, lately placed round the north-western angle of the Houses of Parliament, while it evidences great skill, and, we should also imagine, great study as to design, is constructed with such a combination of materials as any engineer of repute would ever have hesitated to employ: a tastefully designed railing, admirably wrought, is placed in bays between meagre and somewhat inferior stone piers; while these are again surmounted by metal pillars, which do duty as standards for public lamps. One would have thought that stone, so employed, was entirely a needless interpolation of material. An engineer, while he might probably have fallen very far short in point of design and architectural character, would certainly have made the whole work in the simple and single metal material.

There can be nothing invidious in pointing to works of such a class, in which every member of the community is entitled to take a personal interest, and on which there is the public right to pass independent criticism. It would be easy to enumerate many more of probably greater significance as to their bearing on our subject, if enough had not already been said to point its moral.

The one remaining and most practical issue is that with which we would conclude. The subject we are treating is far from being one of mere theory, though enough might be said on that aspect of it. The question which remains uppermost is:—How, in the modern training of the youths who are hereafter to design and carry out our great engineering and architectural works, are they to be educated into the necessary skill which the public interests demand of them? A careful and frequent study of this vital question has suggested no more practical solution than that which we now offer, nor one which is likely to be more effective. Let the student or pupil of the architect, on a recognised and accepted system, be engaged to pass one year of his articles in the office and under the care of a practical engineer; and, *vice versa*, let the engineer's pupil be required to devote a year of his professional training in the office of an architect.

From such a process for educating the young beginners of the present who are to give us the works of the future, another generation may certainly expect a class of men who, while practising each in his special department of building science, will have a hearty and thorough sympathy with each other, and so realise by their actual works the duty and advantage of that co-operation of architects and engineers which we have been so earnestly advocating.

ARCHITECTURAL EXHIBITION SOCIETY.

THE annual Exhibition of this Society is arranged to open, as usual, on May 4 next, and all drawings must be sent in to the Society's Rooms, No. 9, Conduit Street, on Monday or Tuesday, April 5 and 6.

Looking to the increased importance that architecture, as an art, is taking in the world at large, and to the fact of its being eminently desirable that an Exhibition such as this should be continued and carried on as a means of furthering the knowledge and importance of the profession, and that the limits of the Royal Academy do not permit of any but an exceedingly small exhibition of architectural works, we need scarcely urge upon our readers the desirability of giving their best support to this Exhibition, as one specially instituted for, and tending to bring together, the public and the profession.

Notwithstanding that the new rooms of the Academy will probably be ready by April next, it is exceedingly unlikely that the space given to architectural drawings will in any way be sufficient to meet the demands; when such can be done, it may become a matter for consideration whether the Architectural Exhibition might not with advantage be connected with that at the Royal Academy. As the case now stands it would undoubtedly be unwise to attempt to do this, and if architects generally would only unite in supporting the Society, there is little doubt that it would soon be able to dispense with any 'eleemosynary' subscriptions.

When any united effort of the profession is required for the support of any given object such as this, there is a lukewarmness and apathy much to be regretted. We have, besides the Academy Exhibition, many other opportunities of seeing the annual progress made in painting and sculpture; and why not one, at least, in the sister art of architecture? Is it that architects fear to exhibit their designs for public criticism, or do not care to take any trouble in making drawings; or is it that the public care little or nothing for their works; and, valuing architects as they do their tradesmen, care to have little or nothing to do with them or their works, except when absolutely obliged to do so? It remains with the profession, then, cordially to unite in assisting the Council by giving the Society their firm support; and by contributing, as far as practicable, each year, something that may fairly represent them in the Exhibition.

ROBERT W. EDIS.

SOUTH KENSINGTON PRIZES.

ON December 18th last, we were present at the distribution, by the Lord President of the Council, Earl de Grey, of the medals and other prizes won in the 'National Competition' by the students of the Art School attached to the Museum at South Kensington. This school may be regarded as the representative art school of the Science and Art Department, and the one in which its programme of study is most fully carried out. The future masters of the provincial schools are trained here, as well as some who will have to assist in public and private schools in England and the Colonies. As these endeavour as far as is practicable to imitate and reproduce its principles of art, the school thus influences not only the numerous pupils that immediately belong to it, but also those of the empire and elsewhere; and as the majority of the students bring their education to bear upon our arts and manufactures, it may be safely stated that this school is not surpassed by any similar institution in its power for good or evil. It must therefore at all times deserve attention.

From the address delivered by the head master, Mr. Burchett, we learned that there were in the schools nearly six hundred students (exclusive of masters in training), about two hundred and fifty being females. One hundred and fifty paid no fees, being exempted on account of winning 'free studentships,' or from belonging to the corps of Sappers or the assistants attached to the Museum. The remaining students comprised artisans and designers, as in the provincial schools, besides a larger proportion than are to be found elsewhere of those who study art simply as a branch of general education.

Of the students of the school, thirty-three obtained awards in the national competition. Some of their names are given below. One of the students also carried off an Alexandra scholarship, value 25*l.*, which, with another of 11*l.*, are given annually 'to the two students who, being females, have taken the highest prizes of the year in the national competition of all the schools of art.' There were also several prizes which had been offered by private individuals for designs for textile and metallic manufactures, paperhangings, and for plaster decoration. The last was from the Worshipful Company of Plasterers, and it would be well if the other City companies in this respect imitated them. Some of the designs were for manufacture in France, and we saw some silk and paperhangings produced from them. This is a pleasing evidence of our progress, which a few years back would hardly have been credited as possible. However, when it is remembered the amount of patronage French designers have received here, it is but fair Englishmen should receive a little in return; but the day is, we fear, far distant when English designs will be much sought for in France. We need hardly say that we do not advocate that manufacturers should look to these schools for the supply of designs. That prizes should be occasionally offered by them is, we think, praiseworthy, as in this way opportunities are given for testing the fitness of the students' work for manufacture or construction. To do more than this, however it might be desired by some people, would be to alter the province of the school, and is not considered desirable by the authorities.

The successful drawings comprised designs for ironwork, architecture, carpets, muslin, lace, wall decoration, figures from life and from casts, groups in water colour, fruit and flowers. When the position in art of the examiners is taken into account, it would be absurd in any one to regard the drawings otherwise than creditable to the school. It ought to be mentioned that in this school there is a class for etching and one for painting on porcelain for mural decoration, both of which were in satisfactory progress, although from their special character they were precluded from the competition.

Many people believe that the course of instruction carried out in these

schools is more extensive than is necessary for ordinary industrial design. Artisans, manufacturers, and others have fancied that it is possible to have a system from which art sufficient for 'practical' purposes could be derived without having to toil through so many stages. This, we think, arises from having a low opinion of the object of industrial design. Most branches of knowledge are related in various ways to others, and it is not easy to see why the analogy should not hold in the present instance. Any designer who is much above a machine needs the power to delineate many kinds of forms, and we think it is much to the credit of the Department that it has not drawn a line, separating what is to be acquired by the industrial designer (who has to apply, as well as to represent beauty of form) from that by the painter, but has allowed all branches of art to be available to the student if he is competent to study them. A carpet designer may never have occasion to represent the human form, but if his study of it has given him greater freedom of hand and power to form more beautiful outlines, the time spent ought to be considered as well laid out. There are many things, such as furniture, railings, gates, stores, which may be correctly designed if regarded alone, but which ought and would be different if the designer was possessed of architectural knowledge, and was able to apply it, by establishing a relation between them and the structure to which they belong.

When all the advantages are considered which this school possesses as compared with the others, it is not easy to award the students the credit they are entitled to, or to be satisfied with the proportion of them that are successful in competitions like the present. We own that we were glad when, after the head master had drawn a flattering picture of the condition of his school, Mr. Redgrave, who is the Inspector-General of Art, affirmed that in many things some of the provincial schools were at least equal to the chief metropolitan school. Long may they be so! This school has the aid of a museum such as never before existed for the benefit of art students, an extensive and well-selected library, and a numerous staff of teachers, and is, it may be said, surrounded by an atmosphere of art; but what do all these avail against will and application? It seems so unequal a contest when the students of this school enter into competition with those in other parts of the kingdom, that we hope we may be often enabled to record that the chief prizes have been borne away by the latter.

This system of art education has become so elaborated that any officials connected with its administration might be pardoned if they regarded it as sufficient in itself, and requiring nothing outside it to form an artist. It was therefore gratifying to find the Lord President, when addressing the students, recommend them not to be satisfied with the objects of art that were around them, but to go forth and study nature. This advice, although it is often given glibly, is only proper when, as on this occasion, those who receive it have undergone a certain training, and are acquainted, to some extent, with the theory of art. To study nature is worth little practically unless right conclusions are drawn from it. In the natural sciences, and in the arts and manufactures founded on them, this is comparatively easy, as any ideas we may have can be tested to any extent by experiment. In architecture, for instance, if we erect an edifice and neglect the laws of gravitation, ventilation, or acoustics, the error is made manifest, and nature informs us what is right with as much certainty as if the truths of physics were proclaimed with trumpet tongue. But the case is different in questions of taste or art. Here, as in graver things, to all inquiries of what ought to be observed, we are met by the awful silence of nature. In painting, which—as it might be supposed to consist in a representation of nature—ought to present little difficulty, there are as many different theories how far nature is to be followed as there are schools. In industrial design the question becomes still more involved, as here we have not merely to represent, but to select. We may support heavy entablatures on delicate leaves, form jugs in the likenesses of illustrious individuals, represent lions and tigers on our carpets, and there is no manifestation of nature to indicate that we have offended against any of its laws; and in spite of inherent ideas of taste, many worthy people would be found who would give substantial proof that they considered such things useful, beautiful, and agreeable. The question, we know, is attempted to be solved by establishing the principle that in representations for such purposes natural forms must be 'conventionalised,' but to what extent still must be determined by the artist. He may adopt one or more of the theories on the subject, and by its aid adapt natural forms to his purpose, but to do this necessarily involves previous knowledge. Then Nature becomes a treasury that in suggestiveness exceeds even that at South Kensington, and the Lord President's counsels to study it may be carried out without restriction.

The following are the students of the South Kensington School who obtained medals in the national competition:—

Gold Medals.—Maria Brooks, George Claussen.

Silver Medals.—William Kirkham, W. W. Oliver, T. L. Patchett.

Bronze Medals.—Emily Armstrong, Edith Edlenborough, Alice P. Freeman, Mary Mason, R. M. Bowser, W. H. Arnold, Joseph Harris, E. C. Slocombe.

NEW BANK BUILDINGS IN BIRMINGHAM.

THERE are no less than four new banks in course of erection in Birmingham. These bank premises are being erected simply for the purpose of affording increased accommodation to the public, the old premises having proved inadequate to the requirements of the present day. In two of these instances new sites have been secured for the erection of bank buildings, but in the other cases it has been considered advisable to retain the site of the old premises.

The Midland Bank, whose new premises are in Stephenson Place, New Street, boasts of one of the most prominent sites in the centre of the town. The frontage to New Street does not exceed 60 feet, but advantage has been taken of the open space alongside to extend the length of the building to the depth of Stephenson Place. The whole of the entrance floor is devoted to the banking room, 92 feet in length. In addition to the flood of light

which will be admitted from the spacious round-headed window on the two sides, a soft light will be transmitted through the ceiling by means of a large glass dome. The entrance is from New Street, under a projecting portico, supported by fine polished granite columns. In the basement and core of the building, the usual ballion and strong rooms will be enconced in walls of great thickness. The introduction of quoin blocks rising through the balustered line, cresting the cornice, is most effective as a relief. The awkward angle which the front elevation makes to the line of New Street is attributable to the increased rounding off of the angle of Stephenson Place as set out by the Borough Surveyor. The erection of the new bank was commenced eighteen months since by Mr. Creswell, but it will be nearly Midsummer before it can be fully finished. The total cost of the building is set down at 25,000*l*.

The **Town and District Bank** is in gradual course of re-construction. Already the new banking room has been opened for business, and the front portion of the premises now remain to be remodelled; but as the new building has to be erected on the site of the old one during the time the business of the firm has to be carried on, the progress of the work is considerably delayed. The banking room, of which we will speak first, lies far at the back of the present premises. It is a well-lighted and pleasant room, 65 feet long, 32 feet wide, and about 30 feet high. A range of circular-headed windows, 15 feet in height, runs round the left side and the end of the room. The ceiling is panelled, and artificial light is obtained by means of unlights set in the ceiling. The basement comprises a clerks' room, and well-constructed strong and bullion rooms, the latter being plated with iron nearly one inch in thickness. The front offices, now in the course of erection, are not of great extent. The elevation consists of a two-storeyed building. On the ground floor there will be two entrances on the left, private, the bank entrance being on the right; the intermediate space being occupied by the windows of the directors' and manager's rooms, which en-gross the ground floor. In dimensions the elevation is 58 feet in height, with a frontage of 48 feet. The space on the first and second floors will provide ample accommodation for private and other rooms. The style of building is Italian, with a tendency to degenerate to the florid. The front will be carved in Bath stone, under the supervision of the builder, Mr. J. Hardwick. It will be quite September next before the architect, Mr. Yeoville Thomason, sees his design fully completed.

The **National Provincial Bank** has wisely vacated its branch office, Bennett's Hill, during the time that the work of re-erection is going on. Within the space of three months the ground has been cleared of the old buildings, the foundation put in, and the walls carried up to the level of the ground floor. The banking room, 69 feet long by 32 feet wide, will occupy nearly the whole of the ground floor. It will be lighted from the sides, the frontage to Waterloo Street possessing six bold windows. Entrance will be gained, as formerly, at the angle of Waterloo Street and Bennett's Hill, where a few steps lead into the round vestibule, through which access is obtained to the banking room. On the left of the entrance, and looking into Bennett's Hill, the manager's room and general offices will be placed. The upper floor, which is altogether subsidiary to the bank, will be apportioned to the use of the resident officers. The elevation of the building is of an average height of 45 feet, the frontage to Waterloo Street is 98 feet, and that to Bennett's Hill 54 feet. The design is of the Italian character. The ground floor windows possess moulded architraves of simple design. Between these windows pilasters, based on panelled plinths, rise to the height of the upper floor windows. Surmounting the entrance is a group of statuary, and the name of the bank will be carved in legible characters running round the front of the building. A pleasing warm tinted Wrexham stone is being used in the construction of the bank. The design is from the studio of Mr. John Gibson, the architect to the bank. The amount of the contract is 13,000*l*. It is expected that the banking room will be finished in September next, and the work completed at the close of the year. The contractors are Messrs. Webb, of Birmingham.

Lloyd's Banking Company are about to erect new premises in Ann Street, at the corner of the new passage, Eden Place, lately opened into Edmund Street. The present branch in Cherry Street (late Moilliet's) will be removed to these new premises when erected, and provision will be made for the ultimate enlargement of the Ann Street building when necessary.

THE NEW READING-ROOM OF THE BIBLIOTHÈQUE IMPÉRIALE, PARIS.

THE new reading-room of this library, the largest in the world, has recently been opened. The authorities have adopted a suggestion long ago made with respect to the British Museum, and have created two reading-rooms, or rather they have added a second to the one already existing: the old one is open to all the world, without tickets or any other formality; the new one is for students or literary men only, and is called the *Salle de Travail*, and admission is only to be obtained by special application to the director of the library, who, as far as our own experience tells us, places no unnecessary obstacle in the way.

The general plan resembles that of the noble reading-room of the British Museum, but the form of the apartment is different— it is a parallelogram, with four columns placed in a square, and equidistant from the walls on each side; from these columns to corresponding half-columns against the wall spring semicircular lattice girders, forming nine compartments, and each of the latter is vaulted, and has a circular skylight at its apex, so that the room is very well and equally lighted. At the upper end of the room is a semicircular addition, as wide as the room, and which is screened off below by a barrier, behind which is the desk of the director of the room and his assistants, and from which the distribution of books takes place.

The whole of the sides of the reading-room, as well as the semicircular portion, are filled with books ranged in three storeys, with iron galleries to the upper portions. The reading-room is shut off from the library by means of dwarf cases, which contain a certain number of works of reference,

placed at the disposition of the readers, including encyclopedias, biographical and general dictionaries, statistical publications, the annals of scientific societies, and a few other works, such as Montfaucon's *Antiquities*, making altogether rather more than a hundred sets of works, some of which contain a large number of volumes—still a very small library of reference compared with that which lines the walls of the reading-room of the British Museum. There is little doubt, however, that the directors of the library will increase the number, as every oft-required book placed within the reading-room saves the labour of the attendants.

The readers' tables are placed in two parallel rows, leaving a passage up the middle of the room, and each table has places for ten readers on each side with plenty of room; there are seats for more than three hundred persons.

The method adopted with respect to obtaining books is nearly identical with that in operation at the British Museum. Small forms are provided on which the reader is required to inscribe the names—Christian as well as surnames—of the author of the book he desires to consult, together with the title of the work, its place and date of publication, and the form of the volume. And here arises the inconvenience of the want of catalogues. There is no alphabetical catalogue placed at the command of the readers; there is a portion of a printed catalogue raisonné of works relating to French history, and another of books appertaining to medical science; for all the rest the reader must trust to his own knowledge or to a bibliographical dictionary. But it is not likely that the authorities who have constructed such a noble place of study will halt in their good work; and all the literary world knows the time and money required to produce an exact catalogue of even a small library.

As in the Patent Library in London, a record is kept of the works consulted by each reader. On entering the room you are presented with a printed form, on which the assistants inscribe all the books with which you are supplied, and before quitting you have to deliver up this document with your name and address attached. If intended only to protect valuable books from injury, this is a wise precaution; for a reader, however unprincipled, would scarcely venture to illuse a book when such a document as that referred to stood in evidence against him. There is another application of this document which we venture to suggest, namely, that any book, if not unique or even rare, which occurs often in these lists, should be placed on the shelves of the reading-room to the reader's hand.

The library is very rich in works on architecture, and, indeed, on all branches of art; and this, we believe, will give the present notice a special interest in our readers' eyes.

The new *Salle de Travail* is a special boon to foreigners residing in Paris, and, as one of that body, we beg to tender our hearty thanks to the Government and the direction of the magnificent Bibliothèque Impériale.

COMPETITION.

EATON SUBURBAN CHURCH, NORWICH.

A short time since designs were invited to be sent in competition for the above, and in reply to those who responded, the Committee have sent the following circular:—

Estate Auctioneers and Surveyors,
London Street, Norwich, January 8, 1869.

DEAR SIRS,—In this competition we had the pleasure of receiving seventeen sets of drawings from gentlemen residing in various parts of the kingdom. From this number the Committee selected four sets—two from London, one from Edinburgh, and one from Norwich; and at a meeting of the Committee at our offices yesterday, it was determined to adopt the design of Messrs. Browne & Pearce of Norwich.

Yours truly,
(Signed) HEWITT & CAPON.

NEW BUILDINGS AND RESTORATIONS.

It has been determined to thoroughly restore the ancient parish church of Cradley, near Malvern.

The beautiful chancel of Wilford Church, Nottingham, has just received an addition of two stained glass windows, the work of Messrs. A. & W. H. O'Connor, of Berners Street, London. The east window has been erected to the memory of the Rev. Thomas Thorp, late rector of the parish. The south window possesses special interest on account of its being a memorial of the poet Henry Kirke White. The subject is 'The Star of Bethlehem.' In addition to this window, a medallion, bearing a profile of the poet, by W. T. Hale, Esq., of Baker Street, London, medallist of the Royal Academy, has been placed in the church a few days ago, under the personal superintendence of the artist.

A New Congregational Chapel has been erected at Dovenby, near Cocker-mouth, from the designs of Mr. T. L. Banks, architect, of Cocker-mouth, and is in the Gothic style of architecture.

A New Church is to be erected in the Uxbridge Road, Shepherd's Bush.

The First Protestant Church was dedicated at Hankow by the Bishop of Victoria, November 7.

The Ancient and Beautiful Chancel of St. Mary de Lode Church, Gloucester, one of the oldest ecclesiastical edifices in the kingdom, has just been restored at the expense of the Ecclesiastical Commissioners, under the direction of Mr. Christian, architect to the Commission. The whitewash has been removed, the stone has been restored, and a border of enamelled

tiles has been carried round the walls inside the Communion-rail. The chief part of the colouring of the tiles is chocolate, with a bordering; and the work presents something of the appearance of drapery. The floor has been lowered and relaid, the vaulting has been cleaned, and the exterior renewed.

The Erection of a New Church near the Leyland Railway Station is contemplated.

A New Church is to be erected in Carlisle, from the designs of Messrs. Habershon & Brock, Architects, London.

A New Town Hall, and also an Opera-house, are to be erected at Leicester.

Extensive Alterations and additions to the Church of Emmanuel, Clifton, have just been completed. Mr. Norton of London was the architect.

Competition for the Proposed new Church of St. Mark's, at Sunderland.—At a meeting of the committee for the erection of this church on January 7, it was decided to ask six architects in Sunderland, and two out of the town, to send in competitive designs and estimates for a church, to hold 600 persons.

Jedburgh Abbey is now to be restored. Three plans of restoration, costing from 900l. to 4,000l., have been given in, and are at present under consideration.

A New Hotel was opened at Bristol on Thursday last. It has been built from the designs of Messrs. Foster and Wood. Some idea of the size of the building may be gathered from the fact that it contains not less than 200 rooms.

A New Congregational Chapel is to be erected at Acton in Middlesex.

The New Public Buildings at Abergavenny.—Abergavenny is setting an excellent example to provincial towns. Its Board of Commissioners have not only provided efficient drainage and water services, and an excellent stock market, but they have obtained possession of the gas-works—a desideratum which is so much wanted here and in many other towns; and now they are about undertaking the reconstruction of the general market for the sale of butter, poultry, and other commodities, and the erection of a town-hall, with shops and offices necessary for public use. The plans of Messrs. Williams & Wilcox, of Bath, have been accepted, and it will be seen from our list of contracts open, that tenders are now invited.

The Old Cathedral of Ratisbon is undergoing thorough—and let us hope judicious—restoration; the spires, too, of both towers are in process of erection, 85 feet out of 130 feet having been completed during the last year. A temporary bridge has been thrown across from tower to tower, a distance of 80 feet, at a height of 320 feet from the ground, and a stationary engine lifts the material, as at Cologne. The chief alteration in the Cathedral itself is the rebuilding of the gable of the south transept, it being the intention to raise both transepts to the same height as the nave. Ratisbon Cathedral is one of the finest Gothic edifices in Germany. It was begun in 1263, but little of it is of that early date, the chief portion being fifteenth-century work. Until some thirty years ago this interior was crowded with many abominations in the worst taste of the last century, when, thanks to old King Lewis, who gave the modern painted glass windows, a clean sweep was made of all that disfigured the church and concealed its beauties.

ITEMS OF NEWS

FROM OUR
SPECIAL CORRESPONDENTS AND OTHERS.

Berlin Cathedral Competition.

The names of the jury deputed to decide upon the merits of the designs to be sent in this spring are now published; and although they are those of men of undoubted ability, yet much dissatisfaction is felt at the selection. It is thought—and we are glad to find that our views are shared by many abroad—that the character of the jury is not sufficiently *international*, only one foreigner, a Frenchman, appearing in the list, whilst the competition has from the first, and throughout, been invested with an international character. The following are the names of the gentlemen alluded to:—Mons. Viollet-le-Duc, of Paris; Prof. Schmidt, of Vienna; Mr. L. Gruner (Author of 'Specimens of Ornamental Art'), of Dresden; Prof. Temper, of Zurich; Baurath von Egle, of Stuttgart; Prof. Dr. von Ritgen, of Giessen; Baurath Engelhardt, of Münster; Baurath Hase, of Hanover; and Messrs. Salzenberg, Struck, Hitzig, Herrmann, and Erbkam, of Berlin.

Notes for Connoisseurs.

Few facts are more remarkable in connection with the Beaux-Arts than the increased value of pictures, sculpture, and other artistic productions during the last few years, and we believe it will interest our friends to have presented to them from time to time what we may call the state of the Art market.

Paris stands preeminent for its sales of pictures, and of late years prices have been at least as high there as in London. The present is the high season of the Art sales, and although trade in general is flat, pictures fetch high prices. Amongst the interesting items lately noted are the following:—A bust in marble of the celebrated artist Madame Lebrun, by the sculptor Augustin Pajou, purchased at the sale of the collection of M. Olmade of Toulouse, by Baron Alphonse de Rothschild, for a sum equal to 400l. At the same sale was a Loutherbrough, whose pictures rarely appear in Paris; subject, a 'Party of Pleasure going on board a Ship of War,' which sold for little more than 21l. At another sale a small picture by Decamps, 'Shooting with a Mirror,' fetched 148l.; this work formerly belonged to the late Duc de Moray, and afterwards to Kalil-Bey, and has thus been sold publicly three times within a short period. Decamps' works are rapidly increasing in value: a view in the environs of Smyrna was bought

at the same sale by M. Narischkine for 920l.; a small picture of 'A Wounded Dog' fetched 61l.; and another small work, 'An Old Woman and Child,' picture known as the 'Faggots,' 148l. There were in the same sale three minor works of Eugène Delacroix which sold well, namely, 'Arabs near a Tomb,' formerly in the Orleans Gallery, 440l.; 'Woman Bathing,' 1854, 312l.; a finished sketch in grey monochrome, for one of the pendentives in the library of the Corps Législatif; subject, 'Numa Pompilius and the Nymph Egeria,' 160l.; and a 'Combat of Cavaliers,' a very small work, 81l. Delacroix's works are declining in public estimation as rapidly as those of Delacroix are advancing; a picture of 'Christ in the Garden of Olives' was knocked down at 40l. Two little canvases of Géricault sold well, the 'Trumpeter' for 54l.; and the 'Cuirassier' for 144l. A second-class, but well-known and charming work by Meissonier, the 'Painter at his Easel,' sold for 280l.

One of Madame Harriett Browne's works came under the hammer the other day, namely, the well-known 'Sisters of Charity;' it was won in a lottery a few years since by an agent de change, and was sold to M. Gambart for the sum of 1,320l. At the same sale 'Christ bearing the Cross,' by Delacroix, was sold to Mr. Warren for 320l. Two works by Diaz, 'Venus and Adonis' and 'Nymph and Cupid,' fetched, respectively, 108l. and 144l. 'A Setting Sun,' by Jules Dupré, 392l.; and 'A Landscape,' by the same, 156l. A charming small work by Fromentin, 'The Ambuscade,' 224l. 'Episode in the Sacking of Rome by the Constable de Bourbon,' Robert-Fleury, 240l.; and two of the late Theodore Rousseau's landscapes, small, but brilliant works, 'Autumn' and 'The Forest of Fontainebleau,' 400l. each. Some drawings and water-colours fetched remarkable prices at the same sale. A sketch of 'A Lion before his Prey,' by the sculptor Barye, nearly 37l.; and a drawing by Rosa Bonheur, 'Cattle in Repose,' bought by Mr. Gambart at the high price of 96l. 8s.

Stockholm Junction Railway.

This city has hitherto had two railway termini, one being that of the Northern, the other that of the Southern main lines, and both situated at the extreme ends of the capital. So great have been the natural difficulties which intervened in the short space between the termini, that it has taken Mr. Erickson, the engineer in chief of all Swedish railways, not less than three years to accomplish the formation of the short line which is intended to connect the two main lines now terminating at Stockholm. The Southern Railway enters the city by crossing the Orsta-Wik, and running through the quarter known as the Södermalm, enters the station on the Torg (market) Dessin. Here the new Junction Line commences by entering a tunnel bored through solid granite, and describing a slight curve on plan. This tunnel is 1,500 feet long and 32 feet wide by a height of 19 feet, and passes under a very populous part of the city. Then follows a cutting 2,400 feet long, the retaining walls on either side being 30 feet high, executed in solid masonry. Next comes a bridge across the Söder, after which the line traverses the 'Stad' quarter, then crosses the Riddaneholm Canal, and lastly joins the Northern Railway over a high embankment east of the Nija Kungsholmbron. Considering the short distance, perhaps no line in the world has presented greater difficulties to the engineer, and it is only in Sweden that this could have been effected at so low a cost, namely, about 61,000l. The granite in the tunnel was blasted by means of nitroglycerine, 30,000 lbs. being used in the operation. The works were superintended by Mr. Erickson and Lieutenant Unge of the Swedish Royal Engineers, assisted by Lieutenants Dahlquist and Engelblom.

Preservation of Wood from Decay.

Dr. L. Feuchtwanger, of New York, states that for the past thirty-six years his attention has been directed to the subject of defending every species of wood from decay, and also to make it incombustible or fire-proof. Beside making thousands of experiments, he has assisted others to institute them, and has watched the progress made by the various patents issued for this purpose, such as kyanizing by the use of bichloride of mercury; the Burnett process (chloride of zinc); the Earl process (protosulphate of iron); Behr's plan (solution of borax); Heinemann's patent, by the use of resin; the carbolic method, the subject of two patents, one for cold carbolic acid, and one for hot acid; the tar and petroleum method as used in the Nicolson pavement, and many others, which have been brought out from time to time, but without having achieved permanent success. The Doctor claims the first application of silicates in their various forms to all organic substances, such as woody fibre, paper, pasteboard, &c., for preventing the attack of the *teredo navalis*, fire, and water, and shows that by applying, by double chemical affinity, the silicate of soda and lime water, he converts the woody fibre into a mineral substance. Dr. Feuchtwanger's method, described years ago, is simply to steam the timber, then inject a solution of silicate of soda for eight hours, and then soak the wood for the same period in lime water.

A New Lamp-post in Paris.

The municipal authorities of Paris have made immense improvements in the illumination of the streets, squares, and promenades of the city. The old lamp-posts have almost entirely disappeared, and are replaced by elegant iron pillars, bronzed by the electro process, with the exception of the courts of the Louvre and Tuileries and the refuges for foot passengers, which are lighted by means of very elegant lamps and candelabra in fine bronze.

A new kind of lamp-post has just been introduced for narrow pavements. The post is very slender, and is set very close to the walls of the houses, the lamp being supported on a bracket mounted on the top of the post, and overhanging the pavement about eighteen inches. The object in view is the removal of obstruction from the footway without interfering with the houses. The post and bracket therefore stand clear of the wall by an inch or two, and the gas pipe is contained within the former. The light is about nine feet above the ground. It is intended to adopt these new lamp-posts for all streets less than thirty-six feet in width.

A method of illuminating the numbers of the houses at night has been recently tried in the Avenue Victoria, near the Hôtel de Ville. The numbers are painted on ground glass, behind which is a gas jet. Of course this plan answers perfectly; but it is costly, and the light serves no other

purpose than the illumination of the number, and, to adopt a French saying, the game is scarcely worth the candle. Another plan has therefore been introduced, by way of experiment, in the Rue d'Eylau, in which the number is painted on a small gas globe fixed against the gate post of each house, so that when the gate is open the vestibule is illuminated by it.

After all, the rendering visible of the house numbers is simple enough. If the figures were placed at a height of not more than six feet or so from the ground, all pedestrians would be able to read them without difficulty; and if the number of each house opposite a lamp were painted upon the glass, coachmen would find the house they wanted immediately. We recommend this system to the authorities of other cities besides Paris.

A paper was read at the weekly meeting of the Architects and Engineers of Prague last month on the 'Ventilation of Stables.' The lecturer, Mr. Nosk, proposed a new system introduced by him with much success. It consists in carrying the vitiated air, not upwards, but downwards, by which means perfect ventilation is effected, and the rooms over for grooms, &c., are perfectly free from the smell which usually pervades them.

A large Metropolitan Cattle Market is being erected at Berlin, covering an area of about 30 acres. The central building in the group contains the offices of the inspectors, police, brokers, &c.; round this are ranged six large 'halls' for the sale of the cattle, capable of accommodating 2,500 bullocks, 1,500 calves, 8,000 sheep, and 4,000 pigs. Slaughter-houses will also be added in the future. It is expected that the market will be ready for occupation by the autumn.

A Canal is projected, destined to connect the cities of Berlin and Dresden, the object being to compete with the railways in the conveyance of heavy goods and merchandise, which, from their bulk and cheapness, can ill afford a high rate of freight. There is already a very roundabout water route between these places, and the barges plying upon it are chiefly laden with coals and sandstone from Saxony, as also in a great degree with fruit from Bohemia, the journey occupying an average time of three weeks. The canal now proposed will shorten the voyage to only four days; it will leave the Elbe a little below Dresden, and will enter the Spree just above Berlin, being a distance of about a hundred miles. The projectors depend for the success of their scheme mainly upon the hope that in their case the Government will allow steam to be used; the law in Prussia forbidding the use of screw or paddle-wheel on all canals, on account of the destruction caused to the banks by the wash of the water.

Cement Tiles.—This material is gradually getting into extensive use in Germany, after having been employed in some parts of Bavaria for the last twenty years. They are found to last exceedingly well, and being half the weight of slate roofing, much economy in the construction of the roof is the result. These tiles are made 1 foot wide by 18 inches long, and half an inch thick; and there are two flat corrugations in the width, rising only half an inch in the middle. The monotony of the grey colour has been objected to, but this may easily be remedied by giving the roof surface a coating of tar and Portland cement. Roofs may be laid at one-third pitch with perfect safety, and the price, we are informed, is 12*l.* per thousand at Prague, Carlsbad, &c.

Grand Duchy of Baden.—The chief Government authority for all matters connected with State buildings was hitherto vested in one person, and Director Fischer (Hon. Mem. R.I.B.A.) held that office when he died early last year. It has now been decided that the post shall be held by three architects, forming a court. The three gentlemen appointed are Messrs. Berckmüller, Lang, and Leonhard.

Angostura, the capital of the Republic of Guayana, in South America, has of late received the official name of Ciudad Bolivar, in honour of the man who did so much for that state fifty years ago. To his memory a statue is now about to be erected in that city, modelled by Tenerani of Rome, and cast in bronze at Munich. The figure, which is in European dress conventionally treated, is 6 feet 10 inches high, and will stand upon a pedestal of Carrara marble measuring 7 feet 2 inches each way, by a height of 16 feet 4 inches. The front of this base carries the simple inscription, 'Al Libertador Simon Bolivar, el Estado de Guayana, año de 1868.' One side bears the sculptured arms of the Republic, whilst the other contains a group of warlike trophies. Simon Bolivar was born at Caracas in 1783, and died in 1830, after effecting the independence of Guayana by the Battle of Boyaca in 1819.

General.

The Appointment of Secretary to Her Majesty's Office of Works is an important post at all times; but especially so at a time like the present, when many public buildings of the first importance are projected or in progress. Mr. Austin, who has for some time filled this post, having resigned the appointment, it has been offered to and accepted by Mr. Fergusson, a gentleman well known as the author of the 'Handbook of Architecture,' and of other illustrated works of great literary value. In appointing an architect and a man of considerable experience of business to this post, Mr. Layard has taken a step which will be satisfactory to the profession generally, and is likely to be of advantage to the public service. Whether Mr. Fergusson's employment in this department is not wasting talents, which would have done better service had they still remained devoted to the subjects upon which they have been so long usefully exercised, is another matter. We are inclined to doubt this. It would have been more easy to find an able administrator for the Board of Works than it will be to find a suitable successor to Mr. Fergusson in those literary labours which, we believe, have never been better directed, or more happily successful than in the splendidly illustrated work from his pen which the Council of India is about to publish.

The Site of the new National Gallery is being purchased. Archbishop Tenison's Library and School has been acquired for that purpose for 9,000*l.*, and the parochial school for 7,500*l.*

The Graphic Society.—The third meeting of this Society for this season took place in the rooms of University College on Wednesday evening last, when there was a numerous attendance of artists and amateurs, amongst whom were seen Carl Haag, T. Woolner, W. W. Dean, James Ferguson, W. Mocatta, A. Waterhouse, J. Holland, Professor Westmacott, and others. Amongst the drawings and sketches exhibited were some charming watercolour sketches by Jas. Holland, some paintings by C. W. Nicholls, J. Mogford, and others, and some of the principal perspective views of the New Manchester Town Hall, by A. Waterhouse. At the last election of members, Messrs. F. P. Cockerell and Robert W. Edis were unanimously elected to the two Architectural vacancies.

Artists' General Benevolent Society.—This Society has lost a valued friend and an indefatigable Honorary Secretary by the death of Mr. Henry Wyndham Phillips, who died suddenly a few weeks ago. At the last Council meeting, Mr. J. E. Millais, R.A., was unanimously nominated to fill the post thus lamentably left vacant.

At the Meeting of the Durham Quarter Sessions, a report was read from the county architect (Mr. W. Crozier) on the county bridges, which contained the following recommendation respecting the Rowland's Gill Bridge:—'PROPOSED NEW TEMPORARY AND PERMANENT BRIDGES.—I have to recommend that a temporary wooden bridge, with a roadway 10 feet in width, be erected on the west side of the remains of the old bridge (as per plan produced), and a new bridge, of two arches of 36 feet span each, and with an 18 feet roadway, be erected on the site of the old bridge. The wooden bridge could be completed (under favourable circumstances) in about one month from this date, and at an estimated cost (including the gearing for erecting permanent bridge) of about 800*l.*; and the new permanent stone bridge by about September 1 next, at an estimated cost of 2,500*l.*, including the raising of the road 2½ feet, the improving of the gradients and approaches, and making the roadway 5½ to 6 feet wider than the old bridge.'

Fall of the Wesleyan Chapel at Kenton.—The roof of the above chapel has fallen in, the outer wall falling into the roadway. The building became a complete wreck; it had lately been painted and decorated. The walls gave no warning of the approaching catastrophe; a cracking and crashing was heard, and in a moment the whole became a complete ruin.

A New Baptist Chapel has been erected at Potter's Bar, near Barnet.

St. Martin's-on-the-Hill.—A new stained glass window has just been added in the south aisle of this church. It is the gift of T. Marshall, Esq., of Harford Beach, Cheshire, in memory of his mother, the late Mrs. Marshall, who resided for some time in St. Martin's parish, and died there on January 3, 1868. The window represents the 'Three Marys' of the New Testament. The mother of our Lord is shown in the centre light, holding in her hand a bunch of lilies. In the light nearest the east end is shown Mary Magdalene, who is represented as holding the alabaster box of precious ointment. In the third light of the window is a beautiful figure of Mary the wife of Cleopas, with a rose in her hand. The window is the workmanship of Messrs. Morris and Co., of Queen Square, Bloomsbury.

Braintree.—The Parish Church.—The east window of this church has just been filled with costly stained glass, at the expense and in memory of the late Richard Lucy, Esq. The window consists of five lights, each divided into two parts; the upper containing a full-length figure surmounted by canopy work; the lower, on a smaller scale, the representation of some scene in the life of our blessed Lord or of the holy apostles. The work has been admirably carried out by Messrs. Clayton & Bell.

Roman Catholic Church of St. Joseph, Gateshead.—Three beautiful stained glass windows have just been placed in the chancel of this church. The subjects are large figures representing St. Patrick, St. Cuthbert, St. Edward the Confessor, St. Henry (Emperor of Germany), St. Joseph the Carpenter, and the Virgin Mary bearing the child Jesus in her arms. These figures are supported on elaborately ornamented bases, and surmounted by canopies of a highly decorated character. The effect of the colouring is very rich. All the figures are well executed and exceedingly natural, and the faces finely finished. The windows have been executed by Mr. Henry M. Barnett, at the Victoria Stained Glass Works, Gateshead.

St. David's, Merthyr Tydfil.—The restoration of this elegant edifice now approaches completion. The new mode of lighting, the additions for egress and ingress, with the arrangement for the choir, are great improvements.

The death is announced of Mr. Edward Goodall, engraver, famous for his reproductions of Turner's middle and later styles, especially 'Caligula's Bridge,' 'Cologne,' and 'Tivoli,' also for Rogers's 'Italy,' and 'Poems,' with Turner's 'Southern Coast,' and an immense number of small works. Mr. Goodall was a native of Leeds, died at seventy-six years of age, and was the father of Mr. F. Goodall, R.A.

One of the best painters of Rome, Cesare Fracassone, has just died, at the early age of thirty years. His remains were accompanied to their last resting place by all the artists of Rome, the Pope having on this occasion relaxed the law against funeral processions. Fracassone's greatest work was the 'Martyrs of Garinchem.'

The Monument to be erected in Belfast to the memory of the Rev. Dr. Cooke is to take the form of an Assembly Hall, and a statue on a pedestal.

Stained Glass Windows in St. Mary's Church, Nottingham.—Two very handsome stained glass windows have just been erected in the south side of the chancel of St. Mary's Church, Nottingham.

Marble Busts of the Prince of Wales and Richard Cobden, sculptured by Mr. M. Noble, have been presented by Mr. Benjamin Armitage to the International College, Turnham-green.

A Good Suggestion.—It is suggested that the proposed memorial to Sir Richard Mayne, which is to be raised by the subscriptions of the police, should take the form of a large and commodious school for the sons and daughters of the men in the force, in whose welfare Sir Richard had always expressed the greatest interest.

The Royal Commissioners appointed to inquire into the sewage of large towns have not, it is understood, been able to prosecute their inquiries further, owing to the replies to the written queries which they submitted to the authorities in the Lake districts, during their late preliminary investigations into the alleged pollution of English lakes, &c., not having all been answered. It is, however, anticipated that by February certain reports will be laid before Parliament.

The Railway Companies using the station in the Russell Road, Kensington, have at last decided on throwing a bridge over the line at this point.

The Operative Masons.—Some of the operative stonemasons of Bradford have renewed the old struggle against the introduction of machinery in their trade. The men in the employ of Messrs. Beanland, of that town, a short time since protested against the use of machinery in dressing stone to a greater extent than suited the men themselves. The employers terminated the dispute by agreeing that some stones dressed by machinery should be re-dressed by hand. A difficulty having again arisen as to the extent to which the machinery has been employed, the masters resolved that the men should dress the stones entirely by hand. It appears, however, that the work would not be remunerative to the men unless machinery is partially used, and another strike has taken place.

New Bridge over the Taff.—A new iron girder bridge is in course of construction on the Penarth Road, over the Taff, at Cardiff.

The School of Art.—On Thursday night the annual meeting of the Bradford School of Art was held in the High School. From the report, it appeared that this useful institution has made considerable progress during the past year. Some interesting speeches were delivered, and there were various expressions of an opinion that the instalment of the school in a new and handsome building of its own is not very far distant.

The West India Docks on the Thames are to be considerably enlarged. A new dock is now being constructed, and will be of similar length with the old canal, and the lorth wall of the former corresponds with the north bank of the latter. The area, however, is to be so increased that, when completed, the new South Dock will comprise an area of about thirty-two acres in extent. It will extend across the Isle of Dogs, and will be shut off from the river by dock gates. This is an improvement which has long been needed.

Andrew Marvel's Cottage.—One of the oldest houses in Highgate, near London, has been pulled down and removed. We allude to the cottage in which rumour affirms Andrew Marvel lived in the time of the Commonwealth.

The "Rocks," Gloucestershire.—We are informed that the Messrs. Cotterell Brothers, of Bath and Bristol, are entrusted with the restoration and decoration of this ancient and noble residence, formerly the seat of Serjeant Wrangham. The drawing-room, which is said to be one of the finest in the country, will no doubt afford scope for the decorative taste of this well-known firm.

Thrapston Parish Church.—It has only just been decided to light this edifice with gas. Mr. Eunson, of Northampton, is the consulting engineer. It is proposed to commence the work immediately.

One hundred and seventy pounds have been subscribed for the purpose of raising funds for inserting a memorial window into Christ Church, Todmorden, in the memory of the Rev. A. J. Plow, who, it will be remembered, was one of the victims in the 'Todmorden murder.'

St. John's Church, Cardiff.—A stained glass window has been placed in this church in memory of the late E. P. Richards, Esq., who was the confidential agent of the late Marquis of Bute. It is beautifully painted by Mr. J. Bowles, High Holborn, London.

An Art-Pupil.—That eminent sculptor, Mr. Gibson, told Mr. Layard that one day he went into his study, and there found an American physician and his daughter, who, the father said, used to be getting hands and feet from his dissecting-room and modelling them, and at last insisted on going to Rome, and studying under Mr. Gibson. Now that gentleman did not take pupils; but he told the lady to call next day, when he set her to model in clay a bust of Medusa. Next day he went and found an uncommonly good copy; but he thought, 'If I tell her it is "an excellent copy" I shall turn her head.' So he said, 'Not bad, but you can do better—try again,' and defaced the copy. Next day she did better, and the advice and defacing were repeated. The third day he really was surprised to see what she had done, and took her as a pupil, on account of her spirit of perseverance and willingness to be thorough. She is now a distinguished sculptress—Miss Hosmer—and occupied a favourable position in the competition for the design of the national monument to the late President Lincoln.

The late Mr. Felix Slade, in his life-time a devoted lover and generous patron of Art, has bequeathed a considerable sum of money for encouraging the study of the Fine Arts, and for founding six scholarships for Fine Art students. With reference to Mr. Slade's bequest, on November 30 last, the Society of Painters in Water Colours adopted a resolution to the effect that, in the opinion of the Society in question, 'an opportunity is thus afforded for the creation of a grand School of Fine Arts in the metropolis.' And, further, in carrying Mr. Slade's intentions into effect, the same Society 'offer their services and co-operation should they be desired.' This is a matter not only to be placed in a prominent position before the eyes of all who have the cause of Art at heart, but also to be kept there.

In his 'Architectural History of Ely Cathedral,' Mr. Stewart states that, amongst other materials for the construction of the famous octagon and its lantern, white glass was purchased, and such agents as were used for staining it in various colours; from whence it is evident that the Ely architect had a school of 'artists in glass' at work on the spot, preparing the stained glass for glazing his windows, who may be assumed to have worked under his own general direction and supervision.

It was with much pleasure that we observed, amongst the recent lists of 'Christmas Books,' an announcement of a new and revised edition of the Rev. J. G. Wood's 'Homes without Hands.' In that charmingly illustrated volume the author has dealt most happily with a subject, in the choice of which he has been singularly fortunate. We should welcome any number of editions of a work that describes in so becoming a manner the marvellous ingenuity, and the exquisite skill, with which the multitudes of handless constructors execute their appointed masterpieces of the architecture and engineering of instinct.

Enlargement of the Barnsley Workhouse.—At the last meeting of the Barnsley Board of Guardians, which was held on Tuesday, it was resolved that the dining-hall should be enlarged, and plans were ordered to be prepared at once.

Statue to Henry Grattan.—A movement has been set on foot for the erection of a statue in College Green, Dublin, to the memory of Henry Grattan.

The Mosque of Foudoukly, at Constantinople, has, by order of the Sultan, been lit with gas, and the other Mussulman places of worship in that city are to be similarly improved.

The Anglo-French Railway Bridge.—Mr. Henry Stead, honorary secretary of this undertaking, writes with reference to our communications with France:—M. Boutet has not abandoned his bridge project, which has met with the high approval of the Emperor of the French. In addition to His Majesty's approval, the system invented by M. Boutet has been pronounced feasible, and suitable for the purpose intended, by several of the highest engineering authorities in Paris; and it is somewhat significant that, out of the number of those persons who have subscribed and paid 4,000*l.* for the erection of a large model (now in progress at Calais), there are no less than twenty-five engineers. The word 'buttresses' used in your article might imply solid masonry, which probably would meet the fate described; but it should be borne in mind that the piers on which the arches are to be supported will be skeleton frames, composed of cylinders of iron braced together in a suitable manner, and offering little or no resistance to the action of the wind and sea. In addition to this, calculations have been made, and each pier will be of such weight and strength as to render the structure capable of resisting thirty-six times the force of the heaviest gales; and an idea may be formed of the size of the pier by the rough statement, that the erection, when completed, will have dimensions something like those of St. Paul's Cathedral. Plans are being prepared, by the request and at the suggestion of the Emperor, for a bridge of thirty spans in lieu of ten, as was originally designed, a proof that the project is still receiving His Majesty's cordial support. Several engineers of eminence in England, whose names will be published at the proper time, have also expressed their approval of the scheme, and I am in possession of documents which show that the Anglo-French Railway Bridge is far from being a dream of the past.

A New Telegraph to America.—We learn from New York that a movement is being made to establish another Transatlantic Telegraph between the United States and Belgium, to be called the 'People's Cable.' The American Atlantic Telegraph Company, who, it is said, have obtained from Congress an exclusive privilege for landing the cable on the coast of the United States, except on the coast of Florida, have taken up the matter in earnest, and have already made most satisfactory arrangements for obtaining a concession of land in Europe. The amount of capital required is estimated at only 500,000*l.*, one-half of which it is proposed to raise in New York, the other half in Europe.—*Canadian News.*

The Wood of Telegraph Poles put up in Kentucky withstood the elements as follows: the chestnut rotted first, the cedar gave way next, whilst the locust, at the expiration of five years, was nearly sound.

Proposed International Exhibition at Utrecht.—The Government of the Netherlands has decided to hold an exhibition of 'articles for daily household use' at Utrecht, in the months of August or September, 1869. Goods sent to the Exhibition are to be admitted duty free, and arrangements will be made with the railway and steamboat companies for their conveyance at low rates of freight.

The finest private collection of paintings in America was recently destroyed by fire at the house of Mr. John Huck of Chicago.

The Chicago River Tunnel.—The tunnel under the Chicago river, known as the Washington Street Tunnel, connecting the south and west divisions of the city by a solid and permanent roadway, has just been completed, and was opened to the public on New Year's Day. The contract price was 328,500 dollars. The length of the work is about 1,605 feet; of the retaining walls of the open approach on the west side, about 320 feet, and 275 feet on the east side. The length of the main archway, or covered way, is 932 feet. There are three archways leading through the tunnel; one is for foot passengers, and two for teams and horses.

MEETINGS OF LEARNED SOCIETIES.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Monday, January 18, at 8 P.M. Prof. Kerr on some Developments of the Architecture of Greece.

THE INSTITUTION OF CIVIL ENGINEERS.—Tuesday, January 19, at 8 P.M.

THE INSTITUTION OF SURVEYORS.—Monday, January 25, at 8 P.M. Adjourned discussion on Paper, by R. B. Grantham, C.E.—'Parochial Assessments,' by Edward Hyde.

ARCHITECTURAL ASSOCIATION.—Class of Design. Friday, January 15, at 8 P.M. "Rose Window."

ROYAL SOCIETY.—January 21, at 8.30 P.M.

ROYAL INSTITUTION.—Meetings for the ensuing week: Tuesday, at 3, Fine Art, Mr. Westmacott; Thursday, at 3, Entozoa, Mr. Rupert Jones; Friday, at 8, on the last Eclipse of the Sun, Prof. Herschel; Saturday, at 3, Hydrogen and its Analogues, Prof. Odling.

ASSOCIATED ARTS INSTITUTE.—Monday, January 23, at 8.30 P.M. Sketches. Discussion. "Question." Does General Mental Training tend to develop Art Power?

LINNEAN SOCIETY.—January 21, at 8 P.M.

SOCIETY OF ARTS.—Wednesday, January 20, at 8.

EDITORIAL NOTE.

We are compelled, for want of space, to postpone the second part of our article on Balliol College, and the continuation of the Handy-book of House-building, to our next number.

No communication can be inserted unless authenticated by the name and address of the writer, —not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such enquiries.

PUBLISHERS ANNOUNCEMENT.

Advertisements cannot be received for insertion later than 2 P.M. on Thursdays.

Temporary Office, 4, Monument Yard, London.—GILBERT WOOD, Publisher.

THE GAZETTE.

PARTNERSHIPS DISSOLVED.

O. J. & J. Showell, Darlington, surveyors—J. Cox & W. Cascoyne, Beckenham, brickmakers—Simpson & Lynam, Nottingham, architects—Jarratt & Gregory, Sheffield, brickmakers—Maudslay, Sons, & Field, Lambeth and E. Greenwich, engineers, as far as regards H. C. Maudslay.

BANKRUPTCY ANNULLED.

Augustus Salem Dimsdale, St. Paul's Road, Ball's Pond, builder.

BANKRUPTS.

To SURRENDER IN THE COUNTRY.—Wm. Pickles, Wakefield, contractor, January 23, Wakefield—Aquila Edwards, Halifax, contractor, February 2, Halifax—James Gardner Martin, Liverpool, builder, January 25, Liverpool.

LONDON.—Peter Brand, Francis Street, Tottenham Court Road, builder, January 20, at 12—Joseph Culter, Bonneworth, builder, January 20, at 11—Barnett Matthews, Thomas Street, Waterloo Road, builder, January 21, at 2—Philip Brannon, Shanklin, Isle of Wight, architect, January 25, at 12.

TENDERS.

MANCHESTER.—For the Brickwork and Masonry in the basement storey of the New Town Hall:—

Clay (accepted) £16,325 0 0
 LEWISHAM.—For making Roads and Drains on the Springfield Estate, Lewisham, Mr. H. O. Martin, Alliance House, Adam Street, Adelphi, surveyor:—

Hilton	£292 14 0
Hutchings	741 13 0
Treverton	600 0 0
Jones	288 13 4
Phillips	660 0 0
Reed	510 0 0
Blackburn	500 0 0
Crockett	495 0 0
Chadwell	484 0 0
Major	458 14 9
Harris	448 0 0
Thompson	422 15 10
Kint	415 0 0
Wignore	380 0 0
Hill	376 0 0
Turner & Cole	370 0 0
Oscenden & Carter	368 0 0
Pizzey	355 0 0
Pearson	350 0 0
Bloomfield	349 0 0
Rose	340 0 0
Strickson	330 0 0
Johnson	328 0 0
Young	310 0 0
Parker	295 0 0
Gardner	287 0 0
Beard	200 0 0

Detached Villa at Calne, Wiltshire, for G. Harris, Esq., Mr. John Watson, Torquay, architect:—

Bladwell	£9,128
Pinnegar	8,286
Call & Pethick	6,518
Light and Smith	6,484

New sewers for Metropolitan Board of Works in Plough Road, Swing Bridge Road, and Trinity Street, Rotherhithe, and the diversion from the river of the sewage from the Durand's Wharf:—

Turner & Sawyer	£25,450
Neve & Fry	18,500
Webster	18,100
Pearson	17,717
Kirk	16,870
Nicholson (accepted)	14,750

CHICKEN.—For Five Houses and Shops in Sloane Square, Chelsea, for Mr. Oakeshott. Mr. J. W. Penfold, architect. Quantities not supplied:—

Eboral	£10,269 0 0
Piper	9,584 0 0
Belham	9,297 0 0
Turrell	8,611 0 0
Richardson	7,995 0 0
Wilson	7,300 0 0
Wilson	6,884 0 0

* Subsequently an amended tender for the same sent in and accepted.

BEDFORD.—For the erection of a Villa Residence on the Bromham Road, Bedford, for Mr. James Edward de Gruchy. Mr. John Usher, architect. Quantities supplied:—

Edey & Wildman	£1,165 0 0
Smith	1,133 13 0
Moore	1,146 0 0
Day	1,133 10 0
Dickens	1,124 0 0
Cunvin	1,115 0 0

APPOINTMENTS VACANT.

HUNDRED OF WIRRAL, CHESTER.—District surveyor. Salary 160l. a year, and will be required to reside within the district of the Board, and to give his whole time and personal attention to the duties connected with his office. Applications to be sent to William Henry Churton, Eastgate Buildings, Chester, on or before Monday January 25.

EPSOM, SURREY.—Local Board of Health. Surveyor and Inspector of Nuisances, G. White, Clerk to Board, Court House, Epsom.

COMPETITIONS OPEN.

ROTHESHAM.—March 15.—For Plans, &c., for erecting a Public Hospital and Dispensary. A prize of 75l. is offered for the best design, 500l. for the second, and 25l. for the third. John Baynes, hon. secretary, Rotherham, December 15, 1868.

VIENNA, AUSTRIA.—This Municipality require Designs, Plans, Estimates, &c., for the Erection of a New Hôtel de Ville. Open to all Europe. For Particulars, Austrian Consul-General, 21 Rue Lafayette, Paris. (See ARCHITECT, Jan. 2, p. 12.)

SOUTH METROPOLITAN SCHOOLS, SUTTON, SURREY.—For Designs for the Erection of an Infant Establishment adjoining the present Schools. Premiums of 40 Guineas each for the three designs considered the best. February 2. J. Burgess, Clerk to the Managers, Vestry Hall, Waltham.

KINGSTON-ON-THAMES.—March 1.—Design for new School and Master's Residence. Cost not to exceed 5,000l. F. Gould, Esq., Kingston-on-Thames.

PETERBOROUGH.—Feb. 3.—Plan and Estimate for Addition to the Corn Exchange. S. C. W. Buckle, Peterborough.

KIDDERMINSTER.—Feb. 9.—Designs, Plans, Specifications, &c., for an Infirmary and Dispensary. E. Morton, Hon. Secretary.

DOVER.—Feb. 20.—St. Mary's Burial Board. Designs for laying out 94 acres, for the purposes of a new Cemetery. Premiums 500l. and 200l. G. Fielding.

LEAMINGTON.—Feb. 10.—Royal Pump Room Gardens. Designs for a Memorial Fountain. A. S. Field, Leamington.

CONTRACTS OPEN.

NORTHAMPTON.—February 16.—For the supply and erection of a Gasholder, 100 feet diameter by 30 feet deep, with columns, girders, &c. John Enson, jun., Northampton Gas Company, Northampton. See Advertisement.

SPAIN.—March 1.—For Submarine Telegraph Cable. Urbano Montego, 155, Feuchurch Street, E.C.

PARISH OF ST. MARYLEBONE, LONDON.—January 21.—For Construction of Sewer in the Parish of St. Marylebone. J. Gaul Browning, Court House, Marylebone.

TORQUAY.—Jan. 21.—For erection of New Gas Works, in the district of St. Mary's Church, near Torquay, Devon. Grant Wollen, Clerk to the Local Board.

BIRMINGHAM.—Feb. 17.—Erection of Schools to accommodate 300 Boys, with Dining Hall, Workshops, Apartments for Masters and Teachers, and other Buildings. Martin and Chamberlain, Christ Church Buildings, Birmingham.

DULWICH.—Jan. 16.—For the erection of a Pair of Villas at Dulwich.

OVINGDEN WOOD, NEAR HALIFAX.—Jan. 20.—Erection of a Villa Residence. John Hogg, Architect, Corporation Buildings, Halifax.

HALIFAX.—Jan. 18.—Erection of Workshops and Warehouses. W. H. D. Horsfall, Architect, Northgate, Halifax.

SOVERBY BRIDGE.—Jan. 19.—Erection of Villa Residence, &c. Samuel Uttley, Architect, Halifax.

WARRINGTON.—Jan. 25.—Tenders are invited for construction of 2,000 yards of Brick and Pipe Sewers. It. Vawser, Borough Surveyor, Warrington.

GLOUCESTER.—Jan. 28.—For erection of New Buildings in connection with Gloucester Infirmary. A. W. Maberley, architect, 1 Brunswick Road, Gloucester.

BOLTON.—Jan. 18.—Erection of Industrial Schools. Cunliffe & Freeman, architects, 13 Wood Street, Bolton.

HORWICH MOOR (near Bolton).—Feb. 6.—Erection of Primitive Methodist Chapel. Peter Butterworth, Horwich Moor, near Bolton.

DARLINGTON.—Jan. 19.—Erection of a Villa Residence. J. P. Pritchett, architect, Darlington.

KIRBY LONSDALE.—Jan. 22.—Erection of a New Mansion from the designs of Mr. Alfred Waterhouse, of New Cavendish Street, London. Tenders are invited for the whole of the works, or for separate trades. Mr. Alfred Harris, Ashfield, Bingley.

GREAT HORTON.—Feb. 5.—For erection of Great Horton Church. Messrs. J. H. & F. Healey, architects, Bradford.

TRAPALGAR ROAD ESTATE.—Old Kent Road.—For 450 Feet 15-inch Pipe Drain. W. Smith, 12, Copthall Court, E.C.

STRAND UNION.—Tanner's End, Edmonton.—For the Erection of a new Workhouse and Subsidiary Buildings, &c. Feb. 9. By order. 6, Bow Street, Covent Garden.

STRAFORD-ON-AVON.—For Curbing Stone for Footpaths, &c. Jan. 23. T. Allen, Local Board of Health.

GREAT GIDDING, HUNTINGDONSHIRE.—For the Restoration of the Parish Church. Jan. 30. T. Fowler, Louth, Lincolnshire.

EAST DREKHAM.—Jan. 20.—Designs for Two Chapels and a Porter's Lodge, to be erected in the Barial Ground of the said Parish. G. S. Tinkler, Clerk to the Board.

ABERGAVENNY.—Erection of a town hall, with shops, offices, and other buildings, and the reconstruction of the general market place, with other works, Jan. 25, 1869. J. T. Rutherford, Abergavenny.

KEIGHLEY.—Erection of warehouse, with offices, entrances to general works, &c. William Sugden, architect.

CHILL.—The Government of this Republic require Tenders for Cast Iron Columns, Roof Posts, &c., Cast Iron Work for 27 Bridges, and 1,700 Squares of Galvanized Corrugated Iron Roofing, &c. The Chilean Legation, 18 Gloucester Gardens, Hyde Park.

WANTAGE.—Erection of new brewery, Jan. 19, 1869. Managing director, Wantage Brewery Company, Wantage.

MONMOUTH.—For erection of new workhouse for the Monmouth Union, Feb. 5, 1869. Edwin Richards, clerk to the Local Board, Monmouth.

KENDAL.—Erection of a residence for H. Arnold, Esq. Mr. J. Bintley, architect, Old Town Hall Chambers, Kendal.

HEVERSHAM.—Rebuilding tower of St. Mary's Church, Jan. 23, 1869. Paley and Austip, architects, Castle Hill, Lancaster.

TERRINGTON, YORKSHIRE.—Restoration and refitting of the parish church, Terrington, Yorkshire, January 28, 1869. Mr. Christian, architect, 8A, Whitehall Place, London, S.W.

RADCLIFFE LOCAL BOARD.—Tenders are invited for a supply of Glazed Sewer Pipes, Tiles, Junctions, and Invert Blocks, of various sizes and descriptions, up to December 31, 1869. Jesse Haworth, Water Lane, Radcliffe.

WARRINGTON BANK QUAY SEWERAGE DISTRICT.—Contract No. 2. Apply to Mr. B. P. Coxon, Surveyor, &c., Bank Chambers, Horsemarket Street, Warrington.

LEEDS.—For the various works required in the erection of a good house in Victoria-Road, Headingley. James Charles, Infirmary Street.—For any portion of the works required in the erection of two houses on the Newton Green Estate. David Drury, architect, Britannia Buildings, Town Hall.—For the various works in fourteen houses in Hog's Field, Holbeck. Richard Towse, architect, Dewsbury Road, Leeds.—Floor boards wanted about 1,100 square yards; the best white, 1 inch thick, and very dry. Thomas Clapham Royal Park, Leeds.

BOWLING CHAPEL.—For the erection of Prospect Wesleyan Chapel. C. E. Taylor, architect, Commercial Bank Chambers, Bradford.

KINGSTON UNION, SURREY.—For Erection of Receiving Wards, Trump Wards, &c. January 18. R. F. Barthron, Clerk to Guardians.

STONE BROTHERS are now supplying Corsham Down Stone—Well seasoned, fit for immediate use, and of the best quality. Box Ground stone—Unequaled for even texture and durability. Farleigh Down Stone—Matches for good quality and large size. Combe Down Stone—Fine in texture, free working, and very durable. Prices, and cost of transit to any part of the kingdom, on application to the Bath Stone Office, Bath.—[Advz.]

STONE BROTHERS have much pleasure in informing their friends, and the Building Trade generally, that to facilitate building operations during the winter season, they have provided a large stock of well-seasoned Corsham Down Block Stone. Bath Stone Office, Corsham, Wilt.—[Advz.]

ADVERTISEMENTS.

W. W. SPRAGUE & Co., Lithographers, PRINTERS, & STATIONERS, 14 Sherborne Lane, King William Street, London, E.C.

BILLS OF QUANTITIES, SPECIFICATIONS, REPORTS, Copied or Lithographed with rapidity and care.

Now Ready.

SPRAGUE'S POCKET DIARY and MEMORANDUM BOOK, for the use of ARCHITECTS and SURVEYORS.

The Tables, Memoranda, &c., have been compiled by an experienced surveyor, and will, from their compactness, be found very convenient to the profession. In Roan Wallet, 7s. 6d. The Diary and Tables in Paper Cover, 2s. The Tables only, 1s.

TO BUILDERS and OTHERS.—Several Sums to LEND on MORTGAGE of FREEHOLD or LEASEHOLD PROPERTIES, at 5 per cent. or on DEPOSIT of LEASES for short terms. Large houses not quite finished not objected to. No preliminary fees.—Apply personally to Mr. WILLIAM TOY, Surveyor, 49 King William Street, London Bridge, City.

WM. OLIVER & SONS,

MAHOGANY, WAINSCOT, DEAL, AND TIMBER MERCHANTS, 120 BUNHILL-RROW, LONDON, E.C.

The most Extensive Stock of every kind of Wood, in Planks and Boards, dry and fit for immediate use.

The Architect.

THE CAREY STREET SITE FOR A PALACE OF INDUSTRY.

HAT there are two sides to every question is an opinion which few will attempt to contradict, and in any public discussion we commonly find, with Sir Roger de Coverley, 'that there is a great deal to be said on both sides.' Notwithstanding this, since the appearance of Sir Charles Trevelyan's exhaustive statement of the argument in favour of the Thames Embankment as the site for the Palace of Justice, nothing seems to have been advanced which gainsays or contradicts the general principle that for this exceptional building the exceptional site which the Board of Works has won from the Thames should be adopted. Points of detail have been dwelt on, difficulties have been enumerated, heavy expense has been prophesied, and obstacles have been rather referred to than described; but yet at present the *main question* seems to us to remain one of which the other side (if such a side exists) has not been considered by its advocates worth bringing forward—a medal with its reverse blank.

If this be so, why is it that a kind of lingering, hesitating, half-hearted adhesion seems all that has been yet accorded to the proposed removal of the site of this building? The very men who admit that the river side gives greater space, better access, easier levels, freer light, fresher air, nobler aspect, hesitate about transferring thither the whole proposed structure; and while they own that concentration is a good thing, and heartily admit the Thames bank to be the best site for any given portion of the whole scheme, yet timidly advocate some proposal which stops short of complete concentration on the Embankment, and equally fails to provide for entire occupation of the available Embankment site. The proposals for a divided structure to which we here refer vary. Now it is Chancery Courts on one site and Common Law on the other, and by and by it is Courts on one site and Wills on the other; but in principle the proposals retain the same complexion, whatever their details.

The reason of this is not far to seek. The land now known as the Carey Street site—but for which, in our opinion, a better title in every sense would be the Temple Bar site—has been cleared expressly for the purpose of the Law Courts. The old association between this clearance and that proposed building makes it anything but easy to dissociate the two, and to look upon the large plot of land north of the Strand as entirely available for other purposes. This difficulty is not diminished by the fact that no claimant for the site has been brought forward. We suppose that our existing public buildings and our present schemes, when matured, will provide a local position for each of the leading departments of our complicated modern polity and government; and what more do we want?

We have lodged the Legislature at Westminster, and the Government in Whitehall; Commerce reigns in the City; Art occupies South Kensington and Trafalgar Square; the Academies hold Burlington House; Science has several lodgings; Literature and Antiquities enjoy the British Museum; and if now Justice is provided with a permanent and a central home on the banks of the river, we may think it time to pause and contemplate the result of our labours with satisfaction. But is the circle complete? Are we not making a great, nay, an unpardonable omission? What is it that has raised us to the position of wealth and supremacy which at this moment we enjoy? How have we been enabled to multiply the products of the spinning-wheel and the loom ten thousand fold, to cover our country with iron ways, and to make them busy with the daily journeys of the many thousands of trains which transport a traffic without parallel, at a speed and with a security undreamt of till now? Our telegraphs, our steam-presses, our iron and coal mines, our factories, our mechanical works, and, in fact, all that supplies our commerce with materials for its exchange, and renders our country rich, prosperous, and active, flows from our scientific industries; and yet Industry alone, of all the great moving powers of the present day, has no home, and for her alone are no preparations on foot. The Temple Bar site affords an opportunity such as may never occur again for the erection of A PALACE OF INDUSTRY.

Some central institution is at the present moment urgently needed for the scientific training of all those whose callings belong to the higher branches of industry. This is as evident, if the state of the case be once fairly judged, as it was in 1851 clear that the art in our manufactures needed that development for which the school at South Kensington has since so largely afforded the means. We have enjoyed extraordinary natural advantages in our coal and iron fields, and in the great energy of our national character; and from the time when steam first began to supersede manual labour till lately we have kept the lead in almost every department of Industry; while the highest attainments of our first scientific men have been freely pressed into the service of the industrial arts. But between

original inventors and the actual producers of work there has been too little in common; and now that Continental nations have seen our error and corrected it in their own practice, we are being beaten on every hand.

Our iron-masters are being undersold in our own markets. French, Belgian, and Prussian manufacturers compete with us, and throughout the markets of the world, and even on our own shores, and only too often do so successfully; the prestige of English industry is endangered; its supremacy is well nigh a thing of the past. And all this is mainly due to the superior culture of the Continental mechanic and artisan. The foreman and the manager rise in Prussian or Belgian factories from the ranks, as they mostly do in Great Britain; but they thoroughly understand the *principles* upon which their work proceeds, while with us the men occupying analogous positions are only familiar with *practice*. No wonder that the cry of the hour is for technical education; it is not raised a day too soon—it is not heard a tone too loud. This is, perhaps, the most pressing want of the time; and to a building adequate to afford the means of inciting this urgent necessity we would appropriate the site now cleared for the proposed Palace of Justice.

The Palace of Industry should be arranged on the model rather of the Paris Conservatoire des Arts et Métiers than of any institution known here. That institution comprises a large museum of models and specimens of inventions and machinery, a good technical library, lecture-rooms, class-rooms, machines in motion, and, in a word, all that is necessary to facilitate the studies of those who are preparing to fill places in the industrial establishments of Paris, and indeed of all France. A large staff of professors is appointed, many students attend, and much good is done. What occurs in Paris occurs equally in other capitals and centres of industry in the great manufacturing districts of the Continent, and it is incumbent on us, if we would not recede from our present position, to do no less than they.

There are not wanting among ourselves the elements which would readily combine into a grand Industrial Institution of similar character.

The Society of Arts has for long done most energetically all that a private society can do to promote the spread of sound knowledge on all points connected with our arts, manufactures, and science, and ought to take a leading part in any such movement as is here proposed.

The Commissioners of Patents have collected a curious and valuable museum of inventions, which, if properly displayed, would prove serviceable as a means of technical education, and which, if suitably housed, could be extended almost indefinitely at but a moderate cost. They have an excellent library of such works as are most needed in technical education, and by their publications they have shown their willingness to aid in the most effective manner in the diffusion of information. To name only one other element, we have Mr. Whitworth's noble benefaction, by which a series of scholarships to be held by practical students of mechanics have been founded. These students must be provided with the proper means of study, and with a suitable place for instruction.

More might be added, but enough has, we hope, been said to show the need for an institution which should have technical education for its object, and the existing nucleus round which the materials for working such an institution could easily collect. It remains to say a few words on what is perhaps more appropriately our subject—the Site and the Building.

No better position than the Temple Bar site could be selected for this purpose, and that on many accounts. It fronts on one side the busiest thoroughfare of the metropolis, ensuring a sufficiently conspicuous position, and yet it in part abuts on property sufficiently remote to admit of the neighbourhood of those workshops and yards without which practically useful technical instruction can hardly be given. It is within easy reach of many of the manufacturing districts of the metropolis, of the scientific societies and the British Museum, and it adjoins the locality where the Patent Office Library has made a commencement in the work.

After providing for the direct thoroughfare northwards, which has been strongly advocated, and is no doubt much needed, there would remain two separate plots of ground. One of these, it seems certain, must be occupied as chambers for solicitors, and, if well constructed, such chambers would prove a mine of wealth. The most westerly block would probably suit best for this purpose, as it would face the position of the New Law Courts.

The eastern block—bounded by the new street on the west, the Strand on the south, Carey Street on the north, and Bell Yard on the east—would be the one most appropriate to the Palace of Industry, and this site would probably suffice for an ample museum, library, class rooms, lecture rooms, and offices, and yet might leave a large internal roofed quadrangle which would form a suitable locality for periodical exhibitions of our technical progress; and the further acquisition of property proposed by the Commissioners might be given up. The building should be worthy its destination. The name we suggest is perhaps an ambitious one, but our manufactures and our skill surely deserve a palace quite as much as our litigation and our losses. The Palace of Industry should be spacious and dignified; it need not be elaborate or vast; but it certainly should not, having regard to the value of its objects, be insignificant either in dimensions or in architectural character.

If this proposal were adopted, it would at once remove all hesitation as to the complete and entire abandonment of the present site

for the Law Courts and all their adjuncts, and it would enable that concentration which has been generally admitted to be essential to be carried out completely. The Courts with all their offices and all the records, the Probate and Will departments not excluded, ought to be all together. A saving of public time and money that is simply incalculable depends upon this. These buildings ought all to be on the Thames Embankment. No other decision will satisfactorily meet the circumstances of the case. If these two points be but frankly accepted, and carried out to their full result, the Temple Bar site will be left entirely unoccupied, ready to be appropriated, as we suggest it should be appropriated, to a worthy public purpose.

Lastly, the Architectural public would gladly see in the appropriation of the Temple Bar site to a Palace of Industry an available opportunity of effectually redressing a great wrong that has been committed. There are many who feel, and feel justly, that though the appointment of Mr. Street as architect to the Law Courts is one upon which the Commission may be congratulated in the most unhesitating way, yet the long period during which Mr. Edward Barry's name was associated with Mr. Street's before the public, coupled with other circumstances which it is needless here to recall, have rendered the position of that architect one of great hardship. As, however, Mr. Street is appointed and at work, it would only be aggravating the evil, even if the present legal buildings should be divided as has been proposed, to take a portion of them away from Mr. Street and give it to Mr. Barry. No such course ought to be thought of, or is in fact, however strongly advocated, likely to be taken seriously into consideration. But if a new building, for a different purpose, and erected under new control, were proposed, and one, too, that should occupy the site of the intended Law Courts, nothing could be more appropriate than that it should be placed at once in the highly competent hands of Mr. Edward Barry, whose design for a Palace of Industry is not likely to be inferior in convenience of arrangement to the one he proposed for the Palace of Justice; while, if he but adopt the style with which he is most familiar, and in which his best works have been designed, it would be easy for him in this new building to surpass altogether in artistic merit the designs for the Law Courts which he submitted, and which have been so favourably referred to by the judges.

We shall, of course, be met by the question of expense, and no doubt this proposal would entail considerable original outlay, but even here there may be room to doubt. The probable cost of a site on the Embankment has been stated at one and a-half millions. The cost of as much land as is required on and round the Carey Street site has been placed—by a high authority—at not less than 2,300,000; and as the purchase of two valuable buildings and their sites would be necessary, and is not included in this calculation, it seems that two-and-a-half millions, at least, will be the cost of site in the present position. If these figures be correct, one million of money will be saved by moving the Palace of Justice to a better position. Out of this the nation could well afford to pay for a Palace of Industry. But however this may be, the wealthiest country in the world is not apt to hesitate about expenditure if it can see the money's worth for the pains, and no better investment can be made by the nation than one calculated to foster and promote the growth of our sources of national wealth. For the support of such an institution as we have suggested, it is probable that the revenue obtained by the country from fees paid for patents would amply suffice. This tax upon inventions is felt by many to be a grievance. Such an appropriation of the proceeds would go far to justify the continuance of the impost.

BALLIOL COLLEGE, OXFORD.

(Continued from Page 16.)

BALLIOL COLLEGE, in the University of Oxford, was actually founded after the death of its nominal founder, John de Balliol, by the widow of that powerful feudal noble. The direct descendant in the third generation from Bernard Balliol, of Bernard's Castle, where he himself also sometimes resided, in the year 1264 John de Balliol took an active part in support of Henry III. against his rebellious barons, and especially against Simon de Montfort. The customary residence of John de Balliol appears to have been the castle of Fotheringhay, in the county of Northampton, long an appenage of the Scottish Crown, and held by the Earls of Huntingdon of the royal race of Scotland. Fotheringhay became the home of John de Balliol in right of his wife, Devorgilla, daughter of Alan of Galloway, great-grandchild of Fergus of Scotland, and a descendant also from the great Earls of Chester. This illustrious lady and her husband were the parents of that second John de Balliol, their second son, the successful competitor who became King of Scotland.

It was certainly the purpose of John de Balliol to carry fully into effect that project for founding a college at Oxford which his death in 1269 caused him to leave still incomplete. In either 1267 or 1268 it is recorded of him that he did 'exhibit' certain poor scholars at Oxford, until such time as he should provide for them an habitation—until, that is to say, he should be enabled to found his proposed college. After a while, his widow, the Lady Devorgilla, was induced to carry out the wishes of her deceased lord in respect to the college at Oxford. In the first instance she hired a dwelling for her late husband's 'poor scholars;' and then, in the year 1282, she gave them twelve statutes

under her seal. By the fourth of these statutes she commanded the scholars to choose from amongst themselves a Principal, who should rule and direct them; and, by the sixth, they were enjoined to pray before their meals for the soul of John de Balliol, and for the 'Procurators' of the Lady Devorgilla herself. The original charter of the foundress, still in an excellent condition, is preserved in the college; it has her seal appended, and it is addressed to Hugo de Hertipol and others, her 'procurators' in the management of the establishment that was soon to become her college. This singularly interesting document bears the date of this same year, 1282—'in octavo assumptionis gloriose Virginis Marie anno dñi. M^o CC^o octogesimo secundo:' and she styles herself 'Devorgilla de Galweda, dña. de Balliolo.'

In the year 1284 the Lady Foundress purchased a tenement in the city of Oxford, whither, after she had improved and enlarged it, the 'poor scholars' forthwith repaired, with their Principal, Walter de Foderinghaye—an appointment doubtless judiciously made of some family dependent on the founder in his great Northamptonshire lordship. At that time each of the sixteen scholars received daily, on the week days, 1d., and 2d. on the Sundays; and, consequently, their annual cost then amounted to 27l. 14s. 8d. of our present money. Upon her society thus established the Lady Devorgilla settled certain lands; and, in the same year, 1284, her foundation was confirmed by Oliver, Bishop of Lincoln, and by her son, Sir John de Balliol, afterwards King of Scotland.

Of the very curious and eminently characteristic seal of the foundress, the Lady Devorgilla de Balliol, with its counterseal, we have been enabled to give the annexed engravings by the kindness of the Master of Balliol, the Rev. Dr. Scott, who placed at our disposal for the use of the engraver photographs of the original impression under his charge. In keeping with the usage prevalent in her times, upon her seal the illustrious lady has caused to be portrayed her own effigy, arrayed in a long and flowing tunic, a mantle, a wimple and coverchef. In her uplifted hands she holds, in the right, a shield of De Balliol, the arms of her husband, and in her left a shield of Galloway, her own arms, and those of Alan de Galloway her father. Also, on either side of the effigy, a conventional tree has been introduced, sustaining from their *guiges* two other shields; the one to the dexter, charged with *three garbs*, the ensigns of the earls of Chester, and the other to the sinister, bearing *two piles in point*, a device considered to have been borne for the earldom of Huntingdon, long closely connected, as we have already noticed, with the Scottish Crown. The

SEAL AND COUNTERSEAL

OF THE LADY DEVORGILLA DE BALLIOL, FOUNDESS OF BALLIOL COLLEGE, OXFORD: FROM THE ORIGINAL IMPRESSION APPENDED TO A CHARTER, BEARING DATE A.D. 1282, AND NOW PRESERVED IN THE COLLEGE.

counterseal displays, suspended from a tree, a large shield of the arms of the founder and foundress, united by the process (then recently introduced) of dimidiation: the dimidiating, however, affects only the Balliol half of the shield, for in those days they did not dimidiate rampant lions vertically; and above this shield are two others of much smaller size, attached to branches of the tree, which severally repeat Chester and Huntingdon. The legends of the seal and counterseal respectively are:—s' : DERVORGILLE : DE : BALLIO : FIL : ALANI : DE : GALEWAD : and s' : DERVORGILLE : DE : GALEWAD : DNE : DE : BALLIOLO.

On the exterior of the Master's house, below the new oriel in its face towards Broad Street, are sculptured the arms of the Master—Scott of Harden, or, in chief two mullets and in base a crescent azure, quartering Johnston of Hilton in the Merse, argent a saltire engrailed sable, and on a chief gules three cushions or; and, in the gable above this oriel, in a richly diapered panel, is the letter S, the initial of the Master's name. Within this truly delightful residence, in the dining room so often mentioned, the early shields of arms blazoned on glass that have been removed to the new south window from the

oriel are three in number, and with them are grouped two other achievements blazoned on squares, and a sixth that is on an oval panel. The arms on the two square panels are severally *Montacute* and *Monthermer* quarterly, quartering *Neville of Salisbury*; and *Beauchamp of Warwick* and *Newburgh* quarterly. The principal shield, charged with *France modern* and *England* quarterly, differenced with a *silver label of three points*, is ensigned with a large and rich arched crown, and environed with four white roses. It would seem to be probable that this shield may have been designed to represent the hapless Edward V., during his father's life-time. The white roses will scarcely permit the shield to be assigned to either of the two sons of Henry VII., who successively bore the same differenced arms, or to the son of Henry VIII., by whom the same shield was also borne. This shield has commonly been ascribed, it appears, to the Oxford benefactor, the good Humphrey, Duke of Gloucester; but he differenced with a silver bordure, not with any label—most certainly not with a plain silver one—and he assuredly would not have displayed the Yorkist roses. The crosses which heighten the circlet of the crown that ensigns this shield are much enriched, but they are not crosses patée.

The other two shields in this glass bear—I. Quarterly: 1. *Argent, a chevron gules, between three unicorn's heads erased azure*; 2. *Paly of six sable and argent*; 3. *Ermine, within a bordure engrailed three fleurs-de-lis gules*; 4. *Azure, a chevron gules (sic) between three pheons or*. II. Quarterly: 1. *Argent, a chevron between three birds's heads erased sable*; 2. *Ermine, impaling azure, two lions rampant argent*; 3. *Bendy of ten, azure and or*; 4. *Azure, three lions rampant argent*. And on the oval panel there are marshalled these Coats: 1. *Russell*, quartering, *azure, a tower argent*; 2. *Gules, three lucies haurient argent*; 3. *Sable, crusily fitchée, a gryphon argent*; 4. *Sable, three chevrons ermine, cantoning a crescent or*.

In the new lecture room, which is the most important apartment of the Brakenbury building of the College itself, Mr. Waterhouse has placed in the heads of the six windows as many shields, of which series each one in its due order blazons one of the quarterings that are borne by Miss Brakenbury marshalled on a single shield. These shields, accordingly, bear—1. (next the quadrangle) *Argent, three chevrons interlaced sable*; 2. *Sable, a chevron or, between three swords erect argent*; 3. *Barry of six argent and sable*; 4. (next Broad Street) *Argent, a lion rampant gules*; 5. *Argent, a chevron sable, between three crosses crosslets gules*; 6. *Argent, on a chevron sable, three stag's heads cabossed of the field*. The heraldic treatment of this glass is scarcely equal to what it might have been—to what, as we are disposed to consider, it ought to have been.

Having left the lecture room, of which it may be said without any hesitation that it is second to none in the University, and passed through the gateway under the tower into Broad Street, we now enter the fore-court of Trinity College, that we may be enabled to give a faithful description of the rich sculptured heraldic panel which has been introduced upon the east end of the Brakenbury range with the same felicitous effect that characterises this fine building throughout. Facing towards Trinity College, and placed near the south-east angle of the new building of Balliol, this panel takes a part with the niches of the tower, and with the other heraldic accessories of which it forms the culminating point, in relieving the prevailing severity of the design; and, at the same time, it worthily commemorates the original founder and foundress, in exact accordance with what it may even be assumed would have been their own personal wishes. With the happiest consistency in his panel, which is arched at its head, the architect has reproduced the composition of the counter-seal of the foundress, which we have already described, and of which we have given an engraving. This same engraving of the counter-seal of Lady Devorgilla clearly indicates the composition of Mr. Waterhouse's panel; but it does not actually represent the panel, because in it the subject has undergone a more artistic treatment than the old seal-engraver could have accomplished; the foliage and acorns of the oak in the panel are substituted for the conventional tree of the seal, and the shields of arms are disposed with more of freedom and elegance. To the heraldry of the early seal, however, the modern artist has rightly and faithfully adhered. This implies the marshalling, in the sculpture of the panel, of the dimidiated shield of the founder and foundress, with the arms of the husband on the sinister, and those of the wife on the dexter side—a disposition that reverses the places which they ought correctly, and with due significance, severally to occupy. That the counter-seal of a personage of such importance as the Lady Devorgilla de Balliol should display, either deliberately or by an accidental oversight, a grave heraldic error, cannot be admitted without much hesitation; nor can it be supposed that on the original counter-seal the shield was marshalled with Balliol to the sinister, heraldic rule and usage notwithstanding, in order deliberately to assert a precedence for the living lady over her deceased lord. The seal disposes of any such idea, by showing the lady herself holding the Balliol shield in her right hand, that of Galloway being in her left. It is barely possible that the anomalous aspect of this shield may have arisen, at that early era in marshalling, from some attempt to adjust the marshalling in this instance to the condition of a counterseal. If this be the true explanation, the attempt, it must be admitted, proved to be only in part successful; and even that partial success could never have been accepted as a precedent. Indeed, it is highly probable that this very shield is the first experiment in marshalling by dimidiation that was tried by the artist who executed this counterseal. The shield in

question is upon a counterseal; and the impression of a counterseal was to be taken *at the back of a seal*; that is, at the period under consideration, the impression of a pendant seal, regarded as a single complete seal, in reality was a double impression taken from two matrices; and thus the heraldic compositions of the seal and the counterseal were *adversed*—stamped back to back. Now the seal, or obverse, being the more important, and giving the dominant impress, the impression of the reverse or counterseal might have been considered to *counterchange* the sides of the shield—to cause 'dexter' and 'sinister' to change places. If an impression of our two engravings be cut out and folded back to back, and then be held with the seal uppermost at such an angle that the counterseal can be seen below it, the dimidiated arms of Balliol will appear on the counterseal to be in their right position on the dexter half of the shield; still, in this case, the Galloway lion faces to the sinister instead of to the dexter, and the Chester and Huntingdon shields have their relative positions on the seal reversed.

Over the entrance gateway in the tower, on the exterior of the structure, interposed between the shields of Balliol and Galloway, is this same semi-dimidiated shield of those two united houses, Balliol as before being marshalled to the sinister. The tinctures of these arms are blazoned thus:—*gules, an orle argent*, for Balliol; and for Galloway, *azure, a lion rampant argent, crowned or*. Again, over the eastern exterior oriel, a crowned lion rampant, sculptured boldly in full relief as a single supporter—an usage not without good authority in early Scottish heraldry—holds a shield of Galloway, displaying a blazoned image of himself.

Two other armorial compositions, both on the new eastern wing of the quadrangle, remain to be noticed. In the arched head of the uppermost window in this wing nearest to the chapel, and facing the quadrangle, is a shield charged with four crosses crosslets fitchée upon an engrailed saltire—the arms of the late much respected Master of Balliol and Dean of Wells, Dr. Richard Jenkyns. The corresponding window on the outside, facing towards Trinity College, has a shield in a similar position to commemorate a benefactor to the old buildings of the college, Sir Edward Turner, Baronet, who married a niece of Dr. Theophilus Leigh of Adlestrop, Master of Balliol from 1726 to 1785; the arms are, a mill-rind impaling a cross engrailed which cantons a lozenge.

We once more return to the principal entrance gateway of the college at the base of the tower. The bosses of the vaulting of the old entrance gateway displayed some heraldry of uncertain authority, which, with sound judgment, has not been reproduced in the same place; but the old bosses themselves have been carefully preserved. The new gateway bosses, as has been said, are sculptured with foliage; had it been decided to have made them heraldic, after the manner of the vaulting of the south porch to Canterbury Cathedral, the following series of shields might have formed an heraldic chronicle in keeping with true architectural expression, and well suited to the *genius loci* and the *genius temporis* also:—1, central, between the two bays—The Queen; 2, 3, severally to the west and the east of No. 1, and in the same line with it—The Archbishop of the Province, and the Bishop of the See; 4, in the centre of the south bay—King Edward I; 5, in a line with Nos. 1, 4, towards the south—Balliol and Galloway impaled (Balliol to the dexter); 6, 7, to the west and east of No. 5, and in the same line with it—Balliol and Galloway separate, for the first founder and foundress; 8, in the centre of the north bay—The Prince of Wales; 9, in a line with Nos. 5, 4, 1, 8, and 10, to the north of them—Brakenbury, for the last foundress; 10, 11, severally to the west and east of No. 9—Stanley, Earl of Derby, and the present Master of the College. This group of boss-shields is a suggestion only; and yet it is a suggestion that involuntarily presents itself. But higher in this fine tower there is work yet to be done which, when accomplished, may mark with becoming honour as well the period of this present rebuilding as that of the original foundation of the College. We have seen that a group of three canopied niches is there, awaiting the coming of the statues, for which they have provided a dignified shelter; and these statues, we trust, will represent John de Balliol, the Lady Devorgilla, and Her Majesty the Queen. Then only are niches the perfection of architectural accessories when they rightly discharge niche-duty; and of these niches the becoming duty is obvious. To take our leave of Balliol, we ascend still higher than the final of the canopy of the central niche, and we now stand upon the summit of the tower leaning against the pierced parapet; we have the whole College spread out before us, close to our standing-place; and when we raise our eyes, and look around, we feel that it would indeed be difficult to describe the encircling panorama in too glowing language.

THE ARMS OF BALLIOL COLLEGE.

THE TEMPLES OF ATHENS AND THE CHURCHES OF MAGDALA.

An opportunity has been recently afforded, and is still to some extent available, for an architectural comparison of an unusual and instructive character. The invaluable aid of photography enables the English student to glance, at the same time, at the expressions of the structural ability of different countries and of different ages. The fruits of laborious and expensive travel may be reaped by the 'tarry-at-home traveller' for a few shillings. Of all the many uses of photography, feeble as is our present attempt to realise the comprehensive range of the infant art, none is as yet more striking than that which regards architecture. Buildings are represented by the camera with a fidelity and minuteness that render good photographs even more valuable than the memory of an actual visit to the scene; unless such visit has occupied much more time, and been accompanied by much more labour, than have been consumed by the photographer himself.

Another great advantage of the photographic portfolio is the permanence of its contents. Until recently, this was the last advantage to which sun pictures could lay claim. A certain incomprehensible caprice has baffled the best artists. Whether it were the paper, or the water, or the chemical apparatus, was unknown, but no one would guarantee the permanence of the most exquisite photograph. No one could tell whether it was better to expose photographs to the light, to leave them on the table, to frame and glaze them, or to keep them carefully laid by in the portfolio. No one could assure you that, in the latter case, you might not, some years later, find merely a blank sheet of paper, or an indistinguishable smudge.

The carbon process has removed this difficulty. We are not about to enter, at this moment, further into the subject of the new photographic methods which claim the attention of the artist, than to say that it is now possible to obtain architectural representations, which are more accurate than any effort of the draughtsman, and may prove more permanently durable than are the buildings of which they form the memorials. While stone and marble crumble beneath the action of the elements, the portraiture of ancient and famous structures, which the photographer is now everywhere obtaining, bids fair to last as long as any product of human civilisation.

It is under these impressions that we have been led lately to compare, or to contrast, the photographic representations of certain structures which may be regarded as almost the extremes of the builder's art. Nor is the impression produced on the imagination less profound from the fact that the comparison would seem rather to denote human decadence than human progress. We look at one moment on the highest architectural expression of refined taste, and of correspondent manual skill; we look, in the next, at a series of structures hardly more artistic than are those of the nest-building ape—certainly less remarkable, as indications of forethought and of skill, than the dam of the beaver. Yet the first are two thousand years old—the second are contemporary edifices. The first were reared to solemnise the rites of pagan and polytheistic worship; the second are called Christian Churches. The first are the ruins of Hellas—the second are the actual palaces, forts, and churches of Abyssinia.

At Messrs. Colnaghi's show-rooms in Pall Mall, the reader may examine a very beautiful series of photographs of Greece, taken by M. le Baron des Granges. They are only produced by the process hitherto ordinary, so that their absolute permanence may be doubtful. There is the more reason to lose no time in examining them, while yet in their perfection. And it is much to be desired that positives should be produced from the original negatives, by some indestructible process.

As it is, however, we must observe that a very peculiar beauty of representation attaches to these (and indeed to many other) photographs of limestone rocks and of marble buildings. The metal which is chemically deposited on the paper gives to the eye, even under the English sky, the very shimmer of the Mediterranean sunlight. It is hardly conceivable that so vivid a resemblance to nature should result from the application of any non-metallic pigment. Through the half-closed eye a lustre and a sparkle are apparent, which lead the observer, familiar with the scenes, or with the climate, almost to listen for the dash of the waves. One of the landscapes, taken in Arcadia, is one of the most exquisite representations of fine natural scenery that the art has produced.

The excellent workmanship, and careful bedding, of the Athenian masons, may be studied in these photographs almost as minutely as by a visit to the spot. The actual condition of the famous and noble Temples, reared, in the palmy time of Grecian art, to Jupiter and to Minerva, of those named after Victory and after Theseus, is brought distinctly to our apprehension. And these grand relics of a past civilisation are represented from so many, and such distinct, points of view, that the architect may obtain from the photographs almost all the information that he can require.

The Abyssinian views are contrasts to the Greek photographs in almost every respect. As works of artistic beauty they are not for a moment to be compared. Not that we have any right to complain on this score. On the contrary, there are many of those, whose souls are unenlightened by the sacred and ennobling fire of art, who would be apt to grumble at any evidence that our active and indefatigable sappers and miners had been spending their time in the preparation of exquisite photographs. What has been done is admirable, if regarded from the proper point of view—that of military utility. As a simple method of obtaining, and of preserving, military information of the first importance, the camera is now as necessary a portion of the equipment of an Engineer company as the field telegraph, or (as ought to be) the field balloon. To survey a new country is the indispensable duty of every civilised commander. No survey can now be considered complete that excludes the use of photography.

As rough, military, sun-pictures of some of those grand natural barriers that an Engineer general surmounted with an exactly proportioned exertion of force, without example in the military history of the world, these Abyssinian photographs (which were exhibited at Conduit Street, and are hereafter to be displayed at South Kensington) are fitted to excite the most lively interest.

The simple table of heights surmounted may give to the engineer a more exact and definite idea of the actual difficulties of the march than he would derive from any pictorial representation; but it is far otherwise with the public in general. The deep and perpendicular ravines, the insurmountable mountain scarps and curtains, the toil and the perplexity that met the armed explorers of these tropical ranges, find a feeble shadow in the productions of the field camera.

Amid all the wild magnificence of nature, where nature has displayed her own method of military engineering, nothing can be more miserably contemptible than the evidence of the works of man. The owner, Imperial as he called himself, of the most impregnable fortress in the world, had reared within it, as the scene of the display of his regal pomp, and as the citadel of his military power, a few of the bettermost kind of pigsties. Thatched roofs and wattled partitions—they cannot be called walls—sheltered the stores and the harem of Theodore. His palace would have fallen a ready prey to a box of lucifers.

When we consider the great antiquity of Abyssinian civilisation; the mystery that so long shed a halo round the name of Prester John; the fact that Egypt, at least, and, if we can trust tradition, Abyssinia also, were highly civilised at a time when the ancestors of the present European nations were squatting, almost like frogs, around the creeks and bays of the Mediterranean; the independent line of apostolical tradition claimed by the patriarchs of the Abyssinian Church—we have ample ground for a feeling akin to awe in regarding these savage relics of a lost political and religious eminence. There may, possibly, be room for a difference of opinion, when we compare the Athens of King George with the Athens of Pericles. We may be destitute of adequate elements of comparison between the Magdala of the barbarian Theodore, and the forgotten capital of his famous ancestress (according to his claim), Balkis, Queen of Ethiopia, who bore the founder of the Ethiopian line of monarchs to Solomon the Wise. But when we compare the ruin of the Parthenon with the actual state of the cathedral of Magdala, we fail to distinguish the signs of that advance of mankind in civilisation, in art, and in morals, which is so generally assumed to have been the result of the historic changes and convulsions of the last two thousand years.

SOCIETIES.

Royal Institute of British Architects.

An Ordinary General Meeting was held on Monday evening last, the 18th January, Mr. Charles Barry, Vice-President, in the chair. The most important of the donations announced was 'Tree and Serpent Worship, or Illustrations of Mythology and Art in India,' by Mr. James Fergusson.

The CHAIRMAN stated that the Council had heard, with sincere regret, the intelligence of the death of Mr. Ashpittel, Fellow, which had taken place that day.

Sir M. DIGBY WYATT referred to this event in suitable terms, and expressed the hope that at an early meeting a memoir of Mr. Ashpittel would be read by one of those who knew him best.

Mr. CHARLES FOWLER enquired what was the exact position of the Institute with reference to the proposed new Building Act. He had sat on a committee which had carefully considered the draft of the Bill, and had reported on its provisions to the Council. Had the report of that sub-committee been adopted, and was it intended to communicate it to the general body? The Metropolitan Board of Works was understood to have recently written requesting an expression of opinion from the Institute with reference to the draft of the Bill.

The CHAIRMAN explained that though the Council had adopted the Report of a Special Committee on the Bill, that Report had not yet been forwarded to the Board of Works. A Special General Meeting might, of course, be summoned to reconsider the subject if it was thought advisable to do so, but the Committee had held several meetings, and their Report was the result of a long and careful examination of the Bill.

After some further conversation, it was resolved, on the motion of Mr. D. Brandon, seconded by Sir M. D. Wyatt, that the next Ordinary general meeting (that of Monday, February 1) be made special for the consideration of this subject, and that in the mean time the Report of the Committee alluded to be printed for circulation among the members, and that the notes upon the proposed Bill, prepared by the District Surveyors' Association, be appended to the Report.

The CHAIRMAN then called upon Professor Kerr to read his paper on 'The Architecturesque.' We are compelled to defer any extended report of this paper, which was one of great brilliancy, and was delivered almost entirely *vis à voce*, and illustrated by diagrams. The scope of the paper may be briefly stated as assuming that it is desirable to have a definite word to express exactly that essence or quality of art which raises any structure from a mere building to a work of architecture. To express this form of art the Professor proposes to employ the term which stands as the title of his paper. The chief part of the evening was occupied by illustrations of the so-called architecturesque, a column and entablature, and an arch, being selected as specimens; a rude and simple form of each was considered to represent mere building; and the varieties of each were held to be architectural because 'the architecturesque' has been added to that form.

At the close of the Professor's paper, which was listened to with marked attention, and frequently applauded, the Chairman remarked

that it would be hardly possible to discuss it at any length that evening; and accordingly, after the usual vote of thanks, the subject was allowed to drop, and the meeting adjourned.

Institute of Surveyors.

A meeting of the Institution of Surveyors was held at the rooms, No. 12 Great George Street, on Monday, January 11, the President in the chair. Several new members were proposed. Mr. R. B. Grantham then read a paper entitled 'Arterial and Agricultural District Drainage, and the Laws connected therewith.' A discussion ensued, in which Messrs. Ryde, T. Marr Johnson, and others took part. The next meeting will be held on Monday, January 25, when the discussion on Mr. Grantham's paper will be resumed, and a paper will be read entitled 'Parochial Assessments,' by Mr. Edward Ryde.

The Architectural Association.

A special meeting of the Architectural Association was held on Friday, January 15, at their rooms in Conduit Street, Mr. W. White, F.S.A., President, in the chair, to discuss the special Report of the delegates to the Architectural Alliance on the subject of architectural education.

The Report of the sub-committee on new classes, to which we referred in our number of the 9th inst., was first read.

Mr. SPIERS, in moving the adoption of the delegates' Report, suggested that in its discussion this evening the members should confine themselves more especially to the remarks contained under heads 4 and 7. There might be differences of opinion on them, which the delegates would be glad to hear and correct; but any attempt to discuss the question of Governmental aid in the foundation of an architectural university could scarcely now lead to any result; and as the opinions on that head expressed in the Report had been framed rather as suggestive than as of immediate necessity, it would be well to accept them as such.

Mr. ALDRIDGE, in seconding the motion, remarked that the Report seemed in every way worthy of adoption, and well calculated to assist, if not to meet, the difficulties of the case.

Mr. KING, did not think that any such system as that adopted in the French school would meet with much approval in England, more especially as it happened that the architect who was held in the highest admiration here, M. Viollet le Duc, was not a member of that school. He objected to memorialising such a body as the Royal Academy, because, being composed chiefly of painters and sculptors, they were not, and could not be, judges of architectural requirements.

Mr. MATTHEWS remarked that the Report seemed to favour *external* as well as *internal* education, and he was inclined to think that all our education ought to come through ourselves; that any external instruction could only be theoretical, and theoretical education could have reference only to artistic training. What was wanted to be done was to show the pupil what he had to learn, and what he might learn if he chose to make good use of his time; and that he should be grounded in the elementary parts first. He then suggested that on two afternoons in the week the student might attend lectures, as also on four or five evenings in the week. He was greatly in favour of examinations, which he thought might be held more often by the Institute; and if they would not hold them, then by the Association; but we had no right to expect that other societies or bodies should afford us instruction.

Mr. EDIS, while testifying to the great utility of the Report, and thanking personally the delegates for its composition, did not believe that students entered into the profession with so small a knowledge, either of drawing or of mathematics, as the reporters seemed to infer; he thought, and eleven years of experience as a principal had taught him, that it was in consequence of a *fancy for drawing* that many boys on leaving school were placed by their parents in architects' offices. With reference to French instruction, Mr. EDIS—quoting some remarks of the Report which stated that even the winners of the 'Grand Prix' knew little of elementary construction—said he could not agree that we should better ourselves by adopting such a system as that of Paris. The system of premiums might or might not be bad, but he thought that education and examination ought to be compulsory, and that the Institute might refuse to admit architects as members who had not passed through their articles. Although unwilling to propose an amendment, yet he ventured to suggest that, if a sub-committee could be appointed to confer with the delegates and amend the Report, they might more easily come to some agreement; but he (Mr. Edis) should be sorry to see the Report, as it was now framed, sent up to the Alliance as embodying the opinions of the whole Association; and this more especially as the delegates themselves did not all agree.

Mr. SPIERS said that he should be satisfied if the meeting would simply receive the Report; at the same time he thought that if a committee were appointed, it should consist essentially of students; because, as all the other societies were composed of principals, it was very necessary that the Association, a body of students, should express a student's view of the case.

Mr. REDGRAVE agreed with the opinions expressed in the Report; he was unable to see why we should not avail ourselves of the opportunities for instruction afforded by the Royal Academy and South Kensington.

Mr. HANBURY advocated the system of examination, but thought it ought to be made compulsory, as in the case of the Pharmaceutical Society.

Mr. RICKMAN explained that this was not the formal Report of the delegates as such—it was a voluntary contribution on the part of the delegates to assist the Association in their discussion of the subject of architectural education; and that the ordinary Report had already been read at a past meeting, and would be adopted in the usual way at the May meeting of the Association.

Mr. SPIERS in reply said that his opinions and policy were more or less identified with those contained in the Report, and he should confine himself to a reply to the various points raised. In fact, he observed,

Mr. Redgrave had already replied upon some of those points, especially the objections urged by Mr. Ridge against the Royal Academy. He (Mr. Spiers) was unable to see where Mr. Matthews's opinion substantially differed from his own, except that his system of two lectures a week in the afternoon, and four in the evening, would be marvellously incomplete. Mr. Matthews had indeed objected to our utilising external assistance; but as it was very evident that the members of the Association and of the Institute could not be expected to be able to give long series of lectures on the subjects necessary to be studied, either in the afternoon or evening, it would be necessary to go outside the profession to obtain lecturers. And as to grounding a pupil in elementary work, and teaching him what he might learn and had to learn, it was the very absence of such a system which had called forth the Report, and, indeed, the whole movement; and it was rather presumptuous to imagine that if the Institute had had the greatest difficulty in finding examiners, this Association could do so offhand. Mr. Spiers could not agree with Mr. Edis that pupils having taken a fancy to drawing at school had thereby been led to architecture as their future profession. He (Mr. Spiers) thought that it could be shown that the drawings done at school were, as a rule, absolutely worthless, and gave them but little, if any, additional facilities in learning architectural drawing. With regard to the 'Grand Prix' students, Mr. Spiers said that he did not quite advocate the French system as it stood; the remarks in the Report were, perhaps, somewhat exaggerated, for the knowledge of construction possessed by the French students was based on intimate theoretical and applied acquaintance with descriptive geometry, such as prevented their making mistakes in general construction, though the economical applications of it, as to the scantlings of timbers, &c., were sometimes disregarded. He added, that, in his opinion, the Institute would be very glad to lay down such a rule as that mentioned by Mr. Edis, if it were likely to benefit them; but he (Mr. Spiers) maintained that they could not at present take as their standard of excellence the rotten and defective system of pupilage as it now existed; that all the societies in the kingdom would oppose them, and a rival Institute would be formed if they attempted such a step. The best thing to be done would be to raise the standard of education, lay down curriculums of study, unite with other bodies to promote architectural education in a proper spirit; and then, when sufficient power had been obtained, and the good actually done was adequately recognised by other Architectural Societies, it would be time enough to establish compulsory education, and lay down the laws for any system of instruction preferred, provided it worked well.

The Report on Education was received, but the lateness of the hour did not admit of the meeting taking up the question of the new classes, which was adjourned to a future meeting.

The London and Middlesex Archaeological Society.

The first of the series of evening meetings for the session of 1869 was held at the rooms of the Society, No. 22 Hart Street, Bloomsbury, on Monday evening last, J. W. Butterworth, Esq., F.S.A., in the chair, and was numerously attended. A large collection of interesting objects was exhibited, the majority of which, viz., a square wooden cist, a large square glass bottle, two urns, and the remains of a small wooden keg, were discovered in the excavations recently made in Moorfields, and were exhibited by the kind permission of J. W. Baily, Esq.

Mr. PRICE, the director of the evening meetings, explained the objects of antiquity exhibited. The Roman remains on the table, as a series, comprised, perhaps, one of the most complete of the many instances of Roman interment that have been from time to time discovered in the Metropolis; they were found upon a spot, formerly the site of a religious house, known as a priory of canons, founded in 1246, by Simon Fitzmary, Sheriff of London. In olden time this district comprised extensive moors and fens without the City walls, and, like Smithfield and other open sites round London, was often selected by the Romans as a place of sepulture. The interment under consideration seemed to be one after cremation, as there were no appearances of the existence of entire bones. Most of the vessels contained fragments only, but all bore evidence of fire. The wooden cist Mr. Price pointed out as being extremely curious, but since it had been exhumed its appearance had much altered by shrinkage from exposure to the atmosphere: it had very much of the form and size of the tile tombs of which an example was found at Windsor some time since, and was presented by Her Majesty the Queen to the British Museum. Over the cist was found a thick lid or cover of earthenware, slightly domed. Adjoining it was a large amphora 14½ inches in diameter, and flat at the base, of a form not usually met with. The urns are of the usual coarse pottery of a familiar type. It was also stated that the large square glass bottle exhibited is an object extremely rare in London discoveries. It contained bones, and was covered by a small lid of earthenware. With reference to the small wooden tub, its use, and the cause of its position in the interment, must for the present be left to conjecture. It represented an object which Mr. Price might almost venture to say is now noticed for the first time. It is on a small scale, and much after the model of a cupa mentioned by Pliny and other writers as a cask, or butt, with wooden staves, and bound with circuli or hoops of iron, and employed by the Romans in the keeping or transportation of wine, vinegar, or other fluids.

Mr. MILBOURN, Architect, the indefatigable Hon. Secretary of the Society, subsequently read a paper on the Church of St. Mildred the Virgin, Poultry, in which he proceeded to give an elaborate history of the Church from very early times. St. Mildred was the first Abbess of Minster, in the Isle of Thanet, the daughter of Mervald, son of Penda, King of Mercia, in whose honour it is supposed by some of the early chroniclers to have been dedicated; he stated that a shrine or tabernacle to the honour of the Saint existed in the Church as late as 1500, in which year Christopher Lulioke bequeathed five marks to the gilding of the said tabernacle. The earliest evidence of a presentation to the Church occurs in 1325. In 1420 Thomas Morsted, Alderman of London, and surgeon to the kings Henry IV., Henry V., and Henry VI., gave a plot of land to the Church for a burial-ground, and not long after a parsonage house and

priests' chambers were erected on this plot of ground, on posts and pillars, with cloisters under for the burial of the dead.

The first church becoming decayed, it was taken down, and the rebuilding commenced about 1456. Mr. Milbourn gave some very interesting extracts from an inventory of the goods and ornaments of the church, temp. Edward VI.

Some account was given of the ancient Chapel of the Blessed Mary, of Conyhope Lane, now Grocers' Hall Court, afterwards called the Chapel of Corpus Christi and St. Mary; and also many extracts from the early registers, and, among others, that of the baptism of an African Prince in 1610; and the burial, in 1588, of a prisoner who is stated to have stolen the Queen's gloves.

He then proceeded to give an interesting account of the steps taken by the parishioners to rebuild the church after the fire of London, and concluded his paper on this church by a description of the present building and pulpit, illustrated by drawings from the pencil of J. P. Emslie, Esq., one of the members of the Society. An animated discussion followed, and the proceedings of the evening closed by a unanimous vote of thanks to the chairman.

Society of Civil Engineers.

On Monday night this Society held their first meeting for the season at Exeter Hall. The minutes of the last meeting having been read, Mr. Harris, the secretary, introduced to the members Mr. F. W. Bryant as the newly-elected president. Mr. Orlick rose and said he thought all present would join him in bearing witness to the energetic and able manner on which the late president, Mr. Baldwin Latham, had transacted the affairs of the Society during the time he was in office, and moved a vote of thanks to that gentleman, which was cordially accorded. Mr. Bryant then came forward and said, in taking his place for the first time as president of the Society, he thanked them from the bottom of his heart for the high honour they had conferred upon him. It was more than ten years since he had joined the Society, and he had much to thank it for in enabling him to glean a great amount of information in various branches of his profession. He congratulated the members upon its general advance of numbers, which had increased quadruple since he was a member. He next dwelt upon the considerable depression in all business caused by the late money panic, particularly in the engineering profession; and remarked that at the present time some people are apt to say there is no work for engineers at home, but he would ask if all our rivers are bridged over—all the docks, harbours, piers, and lighthouse defence of shores completed? Surely, then, with the return of public confidence to properly matured schemes, he expected that the engineers of Great Britain would find that there is yet something to do in their native country. He next commenced to enumerate the gigantic engineering works that drew towards a finish during the last year, which would certainly mark the present engineering era for generations to come; and mentioned amongst them the Thames Embankment, the Main Drainage works, the new Blackfriars Bridge, the Metropolitan railways (inner and outer circle), the East London Railway, the Millwall Docks, the West India Docks, the Holborn Valley Viaduct, and others of less importance. In his opinion, however, there was one improvement very much needed in London across our crowded thoroughfares, and that was a foot-bridge of light structure. Out of London, too, there had been many engineering works of interest carried on, the principal amongst which are the bridge over the Mersey at Runcorn, and the viaduct over the Solway; there were also a bridge over the Trent at Nottingham, and the Chatham Docks, the new docks at Hull, and the Sunderland Docks. On the Continent, he told us we must not forget the most remarkable railroad of modern times—that over Mont Cenis, which, in spite of differences of opinion, must be considered a great engineering achievement. He drew attention to the vast field India presented to the engineering profession; and, after giving an account of the advanced state of the Suez Canal, he brought his inaugural address to a close by recapitulating the great strides which telegraphy had made of late. The meeting was concluded by Mr. Orlick moving a vote of confidence in the new president, which was seconded by Mr. Nursey.

THE HANDY-BOOK OF HOUSE-BUILDING.

CHAPTER I.

(Continued from page 23.)

Comfort.—The well-judged planning of each individual room is essential to comfort. Few persons who are either observant of the wants of others, or at all sensitive to their own comfort, can have failed to notice that, in some rooms, even very small ones, there seems space for all the furniture and a sufficiency of places where to sit free from draft, and within reach of the fire and of the window; while in other rooms which are no smaller, there is absolutely not space for half the requisite articles of furniture; and even when the apartment is furnished, there is not one comfortable spot in it. To a good architect there is little mystery in all this—the one room is well planned, the other not; and the smaller the room, the more essential to comfort are several of the points of good planning which we are about to state.

The fire is best placed in the centre of the long side of a room; next best (if the room be nearly square) in one corner; worst at one end, unless where there are two fires. The introduction of two fire-places into one room, even if a large one, should be, where possible, avoided. There is always risk of smoke. If they must be employed, they should be put as far apart as practicable. The door should be placed remote from the fire: the best position is in the wall that faces the fire-place, and not far from a corner; not quite so good a position is when the door is in one of the walls at right angles with that in which the fire-place itself is, but near a corner. The third best position is in the same wall as the fire-place. A door exactly facing the fire is in a bad situation, but the worst of all is one which allows the draft to blow directly across the hearth. The opening of a door so

placed rarely fails to draw down a gust of smoke from the chimney. It is worth while to add that the smaller the room the greater the need for care in fixing the relative positions of the door, the window, and the fire; where space is ample, the very distance between these features is sufficient to diminish discomfort from drafts. In such a room sufficient space for sitting within reach of the comfort of the fire, or the light from the windows, is easily to be procured.

The window or windows are best placed in that or those walls which are not occupied by either a fireplace or a doorway; though sometimes a very pleasing effect is produced by having a window directly over a fireplace, or two, one on each side of it. Windows for this situation ought, however, to be very wind and weather tight, or they will destroy the comfort of the fire-side. An oblong room is seldom quite as well aired and lighted by windows at the end as by windows at the side. An even number of windows in the side or end of a room is never so satisfactory as one, three, or five; but it is often difficult, especially in houses built in streets, to avoid both end light and a central pier. Where a room can be thoroughly lighted from one side, it is often prudent not to introduce windows in the adjoining side, even though it be an external wall; cross lights are almost always objectionable, and windows in more than one wall sometimes interfere with warmth.

The shape appropriate to a room in order that it be used with the greatest comfort varies with its purpose. In a dining-room the chief purpose of the room is sitting at a dinner-table, and therefore, as custom in this country enlarges our dining-tables only in one direction, that of their length, a dining-room ought rarely to be much wider than is required for a dining-table, a double row of guests, and ample space for service; but if entertainments on a large scale are contemplated, it may fairly be of considerable length. In smaller houses, the width remaining nearly the same, the length will be much shorter, and the room will be brought near the proportions most pleasant for an ordinary family living room, where a family circle, and not two long rows of guests, are to be provided for.

The Morning-room is always intended for a group surrounding that cheerfulest of tables—a family breakfast-table; and it is on that account that a tolerably square proportion is, as has been already observed, most appropriate to it. As the breakfast party in a family house is rarely so large as that at dinner, and does not require much waiting upon, a much smaller room than the dining-room answers for this meal, and is sufficient for the morning occupations of those who remain to use it during the forenoon.

The Library is more devoted for the use of one or two studious persons where it is really a library, and for occasional use as an additional sitting-room, suitable for business purposes, where books are not much collected, is rather more open to variation than the other rooms. A very large collection of books ought to have a long room with many windows on one side. Perhaps the idea of the room, where not unusually large, ought to be that every book on its shelves shall, as far as possible, be equally accessible to one person, for whom a warm and well lighted seat is provided. This implies a room that approaches a square or circular form, with much wall space for book-shelves. A projecting bay large enough to contain a reading table is a pleasant addition to a library, and if the library be very large indeed, such a bay may have a fire-place in it. A very cheerful example of this feature occurs in the library at Windsor Castle.

Lastly, a Drawing Room requires, if there is to be dancing, both plenty of length, and a few such nooks and flirting places as bay windows, balconies, and a conservatory afford. It will often, however, be filled by persons walking about in groups, and on such occasions it is desirable to give as free circulation as possible. For this reason it is that greater width in proportion to its length has been prescribed for the drawing-room than the dining-room requires. It is not a bad expedient, when designing an important house, to make a plan of the drawing-room with all its usual furniture, in order to make sure that there is an appropriate space for every article and room for guests beside. In any case, as has already been said, this must be done for the pianoforte; and even in a small house, the possibility of that instrument being a grand piano, which it will be if the inmates are very musical, must be provided for. In planning town drawing-rooms, such as can be used as a suite, the circulation of a crowd of guests from room to room, and, if practicable, back another way, should be attempted to be provided for.

Actual size is one of the greatest and most important elements of comfort. It is, perhaps, rather less unsatisfactory to have rooms too large than too small, but there are great disadvantages in both faults. It is manifestly impossible to lay down any rule as to what size will be found satisfactory in any given case. All that can be done is to point out that empty rooms, still less rooms in process of construction, are no safe guide. Those who propose to build or buy or take a house, and wish to have rooms of the size which they will permanently like, can only with safety follow one rule. The new rooms must be the same superficial area, and very nearly the same dimensions, as rooms with which their intending occupant is already familiar, and which, furnished and in use, are such as he would wish his own to be. The soundness of the precaution of going to see, at any trouble, a furnished room of the size and shape of each important apartment that it is intended to build will, it is hoped, be obvious; it is one that can never be safely neglected. In a town house, as a rule, larger living rooms are required in proportion to the number of bedrooms than in a country house, because most visitors in the country are guests sleeping in the house, while in a town house this sort of visiting is comparatively rare.

Warmth is essential to comfort. To secure this, a sufficiently powerful fire, well placed, must be seconded by well-fitting doors and windows (also well placed) and thick walls, which, if external, will be all the better if they are double. Excessive window-space diminishes warmth very much; plate-glass in windows is, however, warmer than thinner glass, and is also more cheerful and more *recherché* in effect. Rooms on the ground-floor, with no basement under them, should be protected by forming a rough ceiling below their floors, or, at least, should have fillets of wood nailed under the joints of the floor; this will promote warmth by preventing the blowing in of cold air from below through cracks in the boards. Brown paper pasted over the floor boards partly serves the same end. Several ingenious inventions exist for obtaining more heat from our coal fires than

the very small proportion actually irradiated, by heating air in chambers behind the fire, and letting it enter the room. The use of some of these will, no doubt, promote warmth.

We have spoken of freedom from smoke as an essential element in the comfort of a house. This may be promoted by carrying the chimneys high above the roof, and building a separate external chimney shaft to each flue, but depends more upon the careful building of the flue than aught else. Both smoke and drafts are likely to be diminished if a special air supply be brought to the fire by means of a flue and a grating in the hearth. This air supply will, however, interfere with the efficiency of the fire as a ventilator. If living rooms be small, or whatever their size if gas be burnt in them, special and efficient provision for their ventilation is essential to comfort.

ON THE PROGRESS AND PRESENT CONDITION OF THE ENGLISH SCHOOL OF ART.

THE Royal Academy of Arts has just completed a century of existence; and now that it is about to enter upon a new home, and, we hope, a new career of progress and prosperity, it may be well briefly to sketch the history of the development and the present condition of the English School. For the National School is coeval with the National Academy. It is true that in former years there have been English artists practising their profession in this country; but they confined their attention almost exclusively to portraiture, or to what they were pleased to consider as decorative art. And as, moreover, in both these departments they showed themselves either the imitators or disciples of the great Continental artists of the day, they evinced no national characteristics, and certainly led to the foundation of no national school.

The first English artist impressed by the spirit of his country and his age was Hogarth, and it was by one of his contemporaries that the Royal Academy was founded. Hogarth gave a decided and permanent bias to English art, a bias we consider beneficial; and we say this advisedly, knowing well that there are some artists and critics amongst us who assert that Hogarth mistook his vocation in becoming an artist; that, in fact, he was a satirist or preacher, who made art the medium for conveying moral sentiments and opinions. Now, we think that this adverse opinion cannot be sustained. If we examine the essential requirements of Art, we shall find that Hogarth complied with them. A picture appeals to two things: the sensuous and the mental perception. To satisfy the former it is necessary that a picture should possess beauty of some sort; beauty of form, of colour, or of chiaroscuro, &c.; so that it should be a pleasant thing for the eye to dwell on, apart from any interest we may feel in its subject: whilst to satisfy the latter it is necessary that the subject should be evident without literary help; although, being evident, it may be illustrated by the additional interest which a knowledge of the individuality of the characters represented, or of the scene, may convey. And it is further necessary that we should feel that the motive of the picture is one that could not have been better realised by literature, the drama, or any other mode of expression. If, then, we apply these tests to Hogarth's works, we shall find that the majority of them, certainly of those which we have seen, are full of artistic beauties of form, composition, colour, &c., and even of execution; indeed, in this latter respect, we think they might be advantageously studied by our younger painters; at the same time the subjects are clearly evident, if anything rather too much so, and we feel that no description, however vivid, and no dramatic representation, however forcible, could compete, in the intense realisation of the subject, with the creations of the artist.

The aim, to realise intensely the subject of the picture, an aim in which Hogarth was so successful, seems to us one of the distinguishing features of our school. Doubtless it is shared by some of the modern Continental painters; and some of the ancients, the Dutch especially, worked in the same direction; but can it be said of any of them that they succeeded like Hogarth or Wilkie?

The influence of Hogarth was not felt for some time after his death, the taste of the day being too much opposed to him to excite imitation; and the school generally was more affected by the efforts of Reynolds and Gainsborough, and the charm of sentiment which they infused into their works. But in fact, after the death of these great men, English art fell for a time into a dreary condition: the painters of the day, men whose names are now forgotten, indulged in the representation of mythological or Shakespearian subjects, without any perceivable aim whatever, and with a corresponding success. It is not until we come to Wilkie and his colleagues (unless we except here and there a genuine name) that we find anything like a decided advance. And what men these were!—Wilkie and Turner, Leslie and Constable, to say nothing of men of lesser note. Wilkie seized upon the throne left vacant by Hogarth, and added to its possessions the wealth of greater achievements in the principles of artistic beauty and of technical excellence. He carried finish, indeed, to an extent which has powerfully influenced not only the efforts of our painters, but also the tastes and demands of the public. Leslie succeeded in realising as great a charm of sentiment as we find in the works of Reynolds or Gainsborough, and added to it a delineation of character and a freshness of individuality to which they did not attain; whilst Turner and Constable (the former of course pre-eminently) carried landscape painting to an unparalleled height—a height which it would be difficult indeed to equal. We are surprised, however, at the great falling off in this department of art which has occurred since the death of these two men, and also at the little appreciation of Constable which exists in this country, seeing how much the French school of landscape (so superior to the English) is founded on his works. We confess we wonder also at the remark which certain critics have lately been fond of making—viz., 'That it is a shame that landscape art is not more largely represented in the ranks of the Academy'—though they always omit to tell us who should be its representatives: indeed, after making this remark, they generally proceed to find fault with all the landscape pictures of the day. Certainly the Academy has not for some time received any accession of members of this speciality; but the explanation is simple. Unless we class

G. Mason as a landscape painter, there has hardly existed for some time any one of sufficient talent or ability to deserve the honour. We trust our younger landscape artists will look to it, and abandon that exclusive imitation of fact, that attempt to produce coloured photographs in which they seem to delight, and pay a greater attention to the higher qualities of their art, and study more closely the works of the French masters and of their own great dead.

Wilkie and his contemporaries placed English art on a sound and healthy footing. If in the works of their immediate successors there was too great a distance between the observation of nature and the necessary conventions of art, that was a fault soon to be protested against by the next movement of the school, the movement known as Pre-Raphaelitism. The original doctrine of Pre-Raphaelitism—that the works of the early Italians were superior to those of Raphael and his successors—is sufficiently absurd, and need not occupy our attention here, as it was very soon abandoned; but the practice of Pre-Raphaelitism—the close study of fact, a study carried at first to an objectionable and injudicious length—has nevertheless proved of lasting benefit. It may be doubted how far this movement would have been successful had it not been headed by a man of such unquestionable genius as Mr. Millais; for of all the ardent spirits who first enrolled themselves under its banner, only two, Messrs. Millais and Rossetti, have since shown that they were men of genius. Some people may think that we ought also to include the name of Mr. Holman Hunt: this we are unable to do. We consider that much after which Mr. Hunt strives, when tested by the rules laid down above, will be found unfitted for pictorial representation; whilst he has so blindly followed after the letter of Nature as effectually to destroy her spirit. The honour that is due to an intellectual mind and to patience and hard work we are ready to allow him; more than that we cannot at present grant.

The working of the Pre-Raphaelite movement brings us down to the art of the present day; and here we see everywhere around us efforts being made to develop qualities of art to which attention has not yet been sufficiently directed. Thus we find Messrs. Watts, Leighton, and others aiming at style and the higher requirements of classical art. Mr. Leighton especially deserves respect for the conscientious devotion which has led him to restrict so much of his attention to the illustration of a class of subjects eminently suited to the attainment of the artistic objects he has in view, but eminently unsuited to popular tastes and demands. Whenever an artist sets himself the task of endeavouring to achieve perfection in any particular quality of art, he is naturally apt to be blind to the advantages or necessities of other qualities, and inclined to be indifferent to public criticism. If he is successful in the task which he has undertaken, the public may be disposed to make allowances for his shortcomings; but as these ought not necessarily to exist, it would be well that he should study the opinions of others, lest the fervour of enthusiasm should lead him astray from the dictates of common sense and reality. For without common sense and reality no work can be really great or enduring, and the great men of old were especially remarkable for possessing these qualities.

We would apply the foregoing remarks especially to two of our younger painters, Messrs. Legros and Whistler, whose efforts to obtain breadth, correctness, and simplicity of tone are eminently successful, but whose works are marred either by the absence of other excellences or by a deficiency in common sense or reality. The effort for breadth is one of the most noticeable features of the school at present, and especially in relation to the work of Mr. Millais, who, abandoning altogether the practice of his earlier days, has adopted a style which we think will lead to a great future, though it has excited the surprise and somewhat bewildered the judgment of the public. The subjects which our artists now treat are marked by a greater refinement and absence of vulgarity. In the domain of history they evince a much truer and stronger historical feeling, and are much more accurate in the rendering of the scene. Religious art is the only one in a state of decadence: this may be partly owing to the unsettled state of religious opinion. What little is done in this way is a mere repetition of the forms and mannerisms of the old masters, but lacking that clear faith in the conception of their subjects which they possessed.

The great want of the day in our opinion is education, and it is becoming a pressing need. Every thoughtful observer must have noticed that whereas in an exhibition of French or Continental works there is a prevalence of the results of education—sound drawing, good execution, &c., &c.—these are the very things most conspicuously absent from an English Exhibition. Now we do not wish to see the healthy individualism of our artists swamped in a universal system, but an average amount of knowledge we do require, and we especially demand that our students should receive a good preliminary education. We were surprised to learn how many of our younger painters—such men as Messrs. Calderon, Leighton, Welles, Yeames, Mason, &c.—have enjoyed the benefits of Continental study, and only hope that our future artists may not have, like them, to seek abroad for good instruction. As the foreign 'atelier' system does not seem to be favoured in this country, we must look to the schools of the Royal Academy to remedy existing deficiencies. We think that a more careful and thorough supervision on the part of the visitors (and we are happy to hear that the Associates also are in future to be eligible for the office), and the engagement of first-class permanent instructors, would do much to alleviate the present state of things; and as the Academy, we are told, will in future have ample accommodation for their schools, and we believe, also, ample funds at their disposal, we have no doubt this matter will receive prompt and proper attention. Perhaps the urgent necessity of good education will not be thoroughly felt till we have a greater demand in this country for decorative art, but that is a demand which is said to be on the increase; certainly there is a large field for its employment in the great public buildings which we are everywhere erecting. The efforts of the South Kensington Museum to develop the practice of decorative art are highly commendable, and we shall hope to examine these efforts more fully in a future article.

On the whole we consider that, looking at the progress and present condition of the English School, we have reason to be gratified with what has been and is being done, and to expect that in its new home the art of this country will continue to make satisfactory progress.

ILLUSTRATIONS.

THE PLOUGH BREWERY, WANDSWORTH ROAD.

The accompanying engravings represent a building which has been recently erected in the Wandsworth Road for Mr. Thomas Woodward, on the site of the old Clapham Brewery, from the designs and under the superintendence of Mr. C. J. Shoppee, architect, Doughty Street, Mecklenburgh Square; by Messrs. Jackson & Shaw, contractors. Messrs. H. Pontifex & Sons were the engineers and copper-smiths, and Messrs. J. Hurrell & Son the back and vat makers.

The most recent improvements have been adopted by Mr. Woodward. The brewery is a ten-quarter, but capable of extension to twenty quarters. It is not of large dimensions, and is built with a view to save as much manual labour as possible. By reference to the section, it will be observed that hops and malt are conveyed to the top of the building, and thence removed by their own weight to the place designed for their reception. With some breweries the opposite is the case, but only those which have been enlarged, not rebuilt; in these the grinding of malt is conducted in the basement, and the material is conveyed by Jacob's ladders to its destination.

The site presented some difficulty, the ground falling 16 feet from front to rear. A basement has been constructed over the entire area, which is vaulted in groined brickwork from massive cast-iron columns, fixed on Bramley Fall stone bases, with similar stone springers. This vaulting is concreted, asphalted, and the surface, where used for yard and sheds, paved with granite.

The basement comprises—arched stores and vaults, boiler rooms, coal vaults, cleansing room, and tun room. Access to the basement is by a stone staircase leading from the ground floor. The well is at foot of the basement stairs.

The ground floor comprises—entrance gateway, the height of two storeys, with flapways in ceiling, and sack tackle for hoisting malt and hops, clerk's office, engine house and entrance to brewery, coolers, hop back, and refrigerator, yard in rear, dray shed on east side of yard with lift for casks from basement, cask shed on west side of yard, coopers' workshop, men's water closets, &c.

From the yard an incline leads to the stabling, &c., which is built on the level of the ground in the rear.

The first floor comprises—private office, brewer's office, wort copper, under back, store room, and spaces over coolers, &c.

The second floor comprises—hop room, grinding room, mash tun and stages, liquor copper and stages.

The third floor is entirely for malt store. The cold liquor tank forms the roof covering over portion of second floor.

The buildings are of the most substantial character, the facing bricks being the Burham Company's white bricks, with York stone window sills, Portland stone bases to gateway, box stone dressings to rustic jambs of gateway, and voussoirs, and keys of arch, and tablet over.

The roofs are slated, with lead gutters and flashings, &c.

The columns to dray and cask sheds of cast iron.

The yard, sheds, &c., are paved with granite, and granite spur stones are fixed wherever needed.

The engine shaft is 73 feet high above ground line, with Portland stone offset, base, and head.

The entrance gates are 4 inches thick, with raised panels below, and ornamental iron panels above, and scroll capping, and wrought iron monogram in centre.

The iron railing towards the Wandsworth Road is wrought; with wrought iron gates, and cast iron standards, on York stone bases.

A RETROSPECTIVE REVIEW

OF

SIR HENRY WOTTON'S ELEMENTS OF ARCHITECTURE.

PART I.—(Continued from page 35.)

The subject of *arches and vaults* may be resolved into a few theorems.

(1.) All solid materials free from impediment descend perpendicularly downwards. (2.) Bricks of ordinary shape, if laid in a row between supporters sustaining the two ends, will necessarily sink even by their own natural gravity: therefore to make them stand we must either change their posture or their figure, or both. (3.) If bricks moulded or stones shaped wedgewise be laid in a row with their ends supported, none of them can sink till the supporters give way. But as the supporters are subject to much impulsion, especially if the row be long, this form is seldom used but over windows or narrow doors. (4.) If the materials figured wedgewise be disposed in form of some arch or portion of a circle, pointing all to the same centre, neither the pieces can sink downwards, nor the supporters or buttments suffer so much violence as in the precedent flat posture, for the roundness will always make the superincumbent weight rather to rest upon the supporters than to shove them, whence may be drawn an evident corollary, that the safest of all arches is the semicircular, and of all vaults the hemisphere. (5.) As semicircular arches are the roundest and securest, so those are the gracefulst which, keeping the same height, shall yet be distended one-fourteenth part longer than the diameter. Upon these five theorems all the skill of arching and vaulting is grounded. As for *pointed arches*, both for the na-

tural imbecility of the sharp angle itself and for their very uncomeliness, they ought to be exiled from judicious eyes, and left to their first inventors, the Goths or Lombards, amongst other reliques of that barbarous age.

The next to be considered are the *aperions*, which comprehend doors, windows, staircases, chimneys, or other conducts—in short, all inlets or outlets. To which belong two general cautions: (1.) That they be as few in number and as moderate in dimensions as may possibly consist with other due respects, for all openings are weakenings. (2.) That they do not approach too near the angles of the walls, for it were indeed a most essential solecism to weaken that part which must strengthen all the rest.

Doors and windows (the inlets of men and of light) are coupled together because their due dimensions are brought under one rule by Leon Alberti, who, from the school of Pythagoras, doth determine the comeliest proportion for breadths and heights, reducing symmetry to symphony, and the harmony of sound to a kind of harmony of sight after this manner. The two principal consonances that most ravish the ear are, by consent of all nature, the fifth and the octave, whereof the first riseth radically from the proportion between two and three, the other from the double interval between one and two or between two and four. Now if we shall transport these proportions from audible to visible objects, and apply them as they fall fittest (the nature of the place considered)—namely, in some windows and doors, the symmetry of two to three in their breadth and length, in others the double as aforesaid, there will indubitably result from either a graceful and harmonious contentment to the eye. A frank light can misbecome no edifice, temples only excepted, which were anciently dark, as they are likewise at this day in some proportion, devotion more requiring collected than diffused spirits. Yet we must take heed not to make a house all eyes, like Argus, which in northern climes would be too cold, in southern too hot: besides, there is no part of a structure more expensive than windows, or more ruinous, not only as being exposed to all violence of weather, but because, consisting of so different and unsociable pieces as wood, iron, lead, and glass, and those small and weak, they are easily shaken.

Staircases.—To make a complete staircase is a curious piece of architecture. The vulgar cautions are these:—That it have a very liberal light, against all casualty of slips and falls; that the space above the head be large and airy; that the half spaces be well distributed at competent distances for reposing on the way; that to avoid encounters, and besides to gratify the beholder, the whole staircase have no niggard latitude; that the breadth of every single step be never less than one foot or more than eighteen inches; that they exceed by no means half a foot in their height; that the steps be laid somewhat sloping, that so the foot may in a sort both ascend and descend together, which, though observed by few, is a secret and delicate deception of the pains in mounting; lastly, to make the staircase of this proportion:—three for the perpendicular from the stairhead to the ground, four for the ground line, and five for the whole inclination or slope in the ascent.

The Italians, who make very frugal fires, are not perchance the best counsellors on the subject of *chimneys*. From them we may better learn how to raise mantels within the rooms, and how to disguise gracefully the shafts of chimneys abroad. Philippe de l'Orme observeth very soberly, that who in the disposition of any building will consider the nature of the region and the winds that ordinarily blow from this or that quarter, might so cast the rooms that he should little fear the incommodity of smoke; and therefore he thinks that inconvenience to proceed from some inconsiderate beginning; or, if the error lay not in the disposition, but in the structure itself, then he makes a logical enquiry, that either the wind is too much let in above at the mouth of the shaft, or the smoke stifled below, or there is a repulsion of the fume by some higher hill or fabric, or the room must be necessarily both little and close, so as the smoke cannot issue by a natural principle, wanting a succession and supply of new air. In these cases he will have us provide two hollow brass balls of reasonable capacity with little holes open in both for reception of water, when the air shall be first sucked out. One of these we must place with the holes upwards upon an iron wire, that shall traverse the chimney a little above the mantel at the ordinary height of the sharpest heat or flames, whereof the water within being rarefied, and by rarefaction resolved into wind, shall break out and so force up the smoke which otherwise might linger in the tunnel. With the other ball we may supply the place of the former when it is exhausted, or for a need blow the fire in the meanwhile. Palladio observes that the ancients warmed their rooms with secret pipes that came through the walls, transporting heat to sundry parts of the house from one common furnace; and it might be preferred before our own fashion, if the very sight of a fire did not add to the room a kind of reputation, as old Homer doth teach us in a verse.

Touching conducts for the sillage and other necessities of a house (which, however base in use, yet, for the health of the inhabitants, are as considerable and, perhaps, more than the rest), art should imitate nature in those ignoble conveyances, and separate them from sight into the most remote and lowest part of the foundation, with secret vents passing up through the walls to the wild air aloft, for the discharge of noisome vapours.

Before entering on the subject of compartition, or the casting and contexture of the whole work, a few general precautions may be given:—

1st. Let no man settle his fancy upon any draught of the work on paper, however exactly laid down, without a model of the whole structure, and every parcel and partition in pasteboard or wood. 2nd. That this model be as plain as may be, without colours or other beautifying. Lastly, the bigger this type be the better. For a fabric of some forty or fifty thousand pound charge, thirty pounds at least ought to be laid out in an exact model.

By *compartition* is understood a graceful and useful distribution of the whole ground plot. The gracefulness will consist in a double analogy—first, between the parts and the whole, whereby a great fabric should have great partitions, great lights, great entrances, great pillars or pilasters—in a word, all the members great. Next between the parts themselves, as regards their length, breadth, and height. The ancients made the length of their rectangular rooms double the breadth, and the height one-half of the breadth and length summed together. When the room was square, they

made the height half as much more as the breadth. Modern architects have varied these dimensions sometimes by squaring the breadth, and then making the diagonal thereof the measure of the height—sometimes more, but seldom less, than the full breadth itself. The second point is usefulness, which will consist in a sufficient number of rooms of all sorts, and in their apt coherence, so that all may appear airy and spiritous, and fit for the welcome of cheerful guests, about which the principal difficulty will be in contriving the lights and staircases. The former we must overcome by some open form of the fabric, or by terracing any storey which is in danger of darkness, or by perpendicular lights from the roof, of all others the most natural. The casting of the staircases is in itself no hard point, but only as they are incumbrances of room for other use.

The Italian architects distribute the kitchen, pantry, bakehouse, washing rooms, and even the buttery itself, under ground next above the foundation, or sometimes level with the floor of the cellar, raising the first ascent into the house fifteen feet or more, which, besides removing such annoyances out of sight, doth also, by elevation of the front, add majesty to the whole aspect. But, though all the other petty offices may well enough be so remote, yet, by the natural hospitality of England, the buttery must be more visible, and we need for our ranges a more spacious and luminous kitchen than the aforesaid compartment will bear, with a more competent nearness likewise to the dining rooms, or else, besides other inconveniences, some of the dishes may straggle by the way.

There are two extremes to be avoided in the roof—that it be not too heavy, or it will press too much on the underwork, nor too light, as it serves not only as a defence, but as a band or ligature, and therefore would require to be of a reasonable weight. Next, there must be care that the edifice be not pressed on one side more than the other. The Italians are precise in giving the roof a graceful slope, dividing the whole breadth into nine parts, whereof two serve for the elevation of the top from the lowest part; but in this point the quality of the region is considerable: those regions that fear the falling and lying of much snow ought to provide more inclining pentices, and comeliness must yield to necessity.

PART II.

Every man's proper mansion house and home being the theatre of his hospitality, the seat of self fruition, the comfortablest part of his own life, the noblest of his son's inheritance, a kind of private principedom—may, to the possessors thereof, an epitome of the whole world—may well deserve by these attributes, according to the degree of the master, to be decently and delightfully adorned. For which ends there are two arts attending on Architecture, like two of her principal gentewomen, to dress and trim their mistress—Picture and Sculpture. In the garnishing of fabrics sculpture must have the preeminence, as being of nearer affinity to architecture itself, and consequently the more natural and suitable ornament.

Touching *painting*, there occurs a very pertinent doubt, which has been passed over, not only by some men, but by some nations, namely, whether this ornament can well become the outside of houses. It is true a story well set out with a good hand will everywhere take a judicious eye; but withal, it is as true that various colours on the outwalls of buildings have always in them more delight than dignity, therefore no paintings ought to be admitted but in black and white, nor even in that kind (if the space be capable) under nine or ten feet high; which will require no ordinary artist, because the faults are more visible than in small designs. In unfigured paintings, the noblest is the imitation of marble, of architecture itself, as arches, friezes, columns, and the like.

For the inside, grotesque and antique work, such as satyrs and centaurs, ought to be confined to the ornament of friezes and borders. For storied works upon walls, our climate is too yielding and moist to allow of it. In disposing of pictures, no room should be furnished with too many, unless it is a gallery or repository for art. The best pieces ought to be placed, not where there is the least, but where there are fewest lights: therefore, not only rooms windowed on both ends, but with two or more windows on the same side, are enemies to art; as no painting can be seen in full perfection but (as all nature is illuminated) by a single light. Thirdly, that in the placing some care also be taken how the painter did stand in the working (which an intelligent eye will easily discover), as that posture is most natural; hence Italian pieces will appear best in a room where the windows are high, because they are commonly made to a descending light. Lastly, that they are properly bestowed for their quality as fitly for their grace; that is, the cheerfulest paintings in feasting and banqueting rooms, graver stories in galleries, landscapes in open terraces or summer houses.

Sculpture ought not to be too general and abundant, which would make a house look like a cabinet; and in this point moral philosophy, which tempereth fancies, is the superintendent of Art. That there be a due moderation of this ornament in the first approach; if the great door be arched, it is sufficient to have some brave head cut in fine stone or marble for the key of the arch, with two incumbent figures gracefully leaning upon it towards one another as if they meant to confer, with two great standing statues on each side of the approach; that the niches, if they contain figures of white stone or marble, be not coloured in their concavity too black, for our sight is not well contented with sudden departures from one extreme to another; that fine and delicate sculpture be helped with nearness, and gross with distance; that in placing standing figures we must set them in a posture somewhat bowing forward, because the visual beam of our eye extended to the head of the figure being longer than that to the foot, must necessarily make that part appear farther; so, to reduce it to an erect or upright position, a due allowance must be made.

There are also ornaments without the house, as gardens, fountains, groves, conservatories, of which a word or two may be said. There is a certain contrariety between building and gardening; for as fabrics should be regular, so gardens should be irregular, or at least cast into a very wild regularity. Groves and artificial devices under ground are of great expense and little dignity. In aviaries of wire to keep birds of all sorts, the Italians, though no wasteful nation, do in some places bestow vast expense, so that the chanterettes may live long before they know they are prisoners.

It is almost harder to be a good critic than a good architect, because the working part may be helped with deliberation, but the judging must flow from an extemporal habit. Therefore whoever examines any noble work ought first examine himself, whether the sight of many brave things before have not made him apt to think nothing good but that which is the best—for this humour is too sour. Next let him inform himself of the age of the work, and if he find the apparent decay to exceed the proportion of time, let him conclude that either the materials were too slight or the site was unfitted. If the house be found to bear its years well (always a token of a sound constitution), let him suddenly run backwards from the ornaments to the more essential members, till at last he is able to form this conclusion, that the work is commodious, firm, and delightful, which are the three capital conditions required in good buildings by all authors ancient and modern.

REVIEW.

HINTS ON HOUSEHOLD TASTE IN FURNITURE, UPHOLSTERY, AND OTHER DETAILS. By CHARLES L. EASTLAKE, Architect. London, 1868. Longmans, Green, and Co.

'It is unfortunate for the interests of Art at the present time, that in civilized countries it has come to be regarded as the result of theories utterly remote from the question of general taste, totally distinct from those principles which influence manufacture and structural science, and independent of any standard of excellence, which we might expect to be derived from common sense.' Such is the language in which Mr. Eastlake introduces to our notice his 'Hints on Household Taste,' and very accurately does it describe the popular belief. Fortunately the number of those who hold sounder and more correct views is on the increase; indeed, the appearance of such a work as this, and the success with which it has already met, are in themselves evidences of the spread of more enlightened opinion.

In the opening pages of his work Mr. Eastlake deplures the prevalence of ignorance, or erroneous ideas, as to the principles of art and design; but the general indifference on these points is far more lamentable. Rarely, if ever, do people exercise their own judgment at all. We profess indeed, as Mr. Eastlake sarcastically observes, 'to know what we like,' but we seldom really endeavour to obtain it. Sometimes we enact the farce of pretending to make our own selection; that is, we visit the shops or establishments of manufacturers, and purchase what we are told is the 'right' or the 'fashionable' thing. But this cannot be correctly termed an individual choice. It must be admitted, however, that there are many difficulties in the way of obtaining what is correct and good in domestic furniture. The manufacturers who make it their specialty are limited in number and not very generally known. The supply of such articles is therefore small, and the price consequently greater than it should be, and nothing but an increased demand can afford the requisite remedy. Nevertheless, many of the cheapest objects of domestic use are, as Mr. Eastlake points out, amongst the best in construction and design.

All the principles of artistic design on which our author enlarges may be summed up into two: 1st. That every article should be thoroughly adapted to the use which it is intended to fulfil; and 2nd, that it should be so constructed as to bring out the proper characteristics of the material of which it is made. Very little reflection will suffice to prove to us how seldom we find these conditions really aimed at or attained: both are sacrificed for the sake of cheapness, or a pretentious and vicious style of ornamentation. Thus we have, for instance, uncomfortable and brittle chairs, tables, sofas, &c., and wall-papers, carpets, &c., which are unpleasant to the eye, and indicating in their designs the effects of aerial perspective, instead of the flat surfaces which they ought to present.

The first point of detail into which Mr. Eastlake enters is that of 'Street Architecture;' but we need not dwell here, as it is almost hopeless to expect any reform on this subject for some time to come. How bad the state of affairs is, we most of us practically know. We all remember the wail which Mr. Carlyle, in his 'Niagara' essay, raised about the badness of London house building, and Mr. Eastlake enlarges on the same theme; but as long as the present conditions of leasehold tenure exist, it is not to be supposed that the building speculator will do other than consult what he believes to be his own interests. If, unfortunately, we have little influence over the construction of the outsides of our homes, we have at any rate more control over their interiors. And here we shall find the 'Hints on Household Taste' an excellent vade mecum to assist us in our efforts. We are shown the true principles which should guide us in the selection of carpets and papers, decorations and furnishings of all sorts and degrees, with illustrations of several designs and specimens of existing productions. We must confess ourselves somewhat disappointed, however, with Mr. Eastlake's observations about paper-hangings. His views are sufficiently correct, and the designs which he gives are in accordance with them, though not very remarkable; one indeed—a green with gold pattern—is positively bad in colour, if it be fair to judge from only a book sample. But it is to be wished that Mr. Eastlake had set his face against the taste for white papers so very prevalent. White paper (except in a large room where distance from the lights gives an acquired shade) always has the effect of depriving even our fairest friends of any beauty of colour or complexion whatsoever; while it also makes the furniture stand out in tone with a harsh silhouette, and thus causes the least

interesting part of the room to attract most attention from the eye. Delicate neutral tones will produce a far more harmonious effect.

One point on which Mr. Eastlake is particularly emphatic is the condemnation of all kinds of shams and deceptions, imitation woods, marbles, &c. Leaving morality out of the question (though in truth imitations very rarely do deceive), we shall nearly always find that an article which is not genuine fails to give us satisfaction. Doors painted in imitation of wood never look the real thing, and, moreover, have a 'cheap' appearance; whilst if they are painted in flatted colour, they look much pleasanter, and also more costly. We do not, however, carry our objections so far as to disapprove of articles the surfaces of which are at any rate real, such as plated goods, gildings, or veneered furniture, though the latter is never very good in construction, the veneer being apt to split and disclose the inner nature of the object. Still we ought not to resort to any of these things except when considerations of wear and tear, liability to accident, or expense, are paramount.

It is not proposed to follow Mr. Eastlake into all the details on which he discourses. All who are interested in the subject ought to read the work for themselves. If his observations are not very deep, they are perhaps all the more practical. Certainly they will well repay perusal, accompanied as they are by references to, and illustrations of, what is good in ancient art. And while noting the value of excellent examples, let us endorse the eulogium passed on the authorities at South Kensington for the interesting and instructive collection which they have formed, illustrating as it does the connected history of art and manufacture, and forming one of our most valuable art treasures.

One point on which we are disposed to differ somewhat from Mr. Eastlake's conclusions is with respect to uniformity of style. Not that we wish to see every room in a house different, but a boudoir ought not to resemble in character a dining room or a study. In fact, the different uses to which rooms are to be put necessarily implies a difference of aspect. In addition, therefore, to a variation of material, we also require some modification in design.

Now all the illustrations of furniture of his own designing which our author gives are more or less alike, and indeed, to our thinking, are in some instances too simple and archaic. We cannot expect to revert to the exact types and forms of even the best periods of artistic taste, nor would any such course be desirable; but what we may expect is, that whilst, in the construction of domestic objects, the comforts and requirements of modern life are fully consulted, we may also have a due attention to correctness of principle and the realization of the beautiful.

Artists, architects, and in a word all students of art, are fully alive to the importance of the subject under our consideration; for they know how essential to the just comprehension of any work, however great, is the constant exercise of the faculties by which alone it can be judged. Yet how can we expect the public to appreciate the merits of a fine building or a beautiful picture when we know that their daily surroundings are replete with so much that is false and hideous? But Mr. Eastlake's remarks on this point are so good that we must quote them verbatim:—'The most formidable obstacle which lies in the way of any attempt to reform the arts of design in this country is, perhaps, the indifference with which people of even reputed taste are accustomed to regard the products of common industry. There is many a connoisseur of pictures and of sculpture, many a virtuoso now haunting auctions and curiosity shops with a view to gratify his particular hobby, who would stare if he were asked to pass his opinion on the merits of a door-knocker or set of fire-irons. By such people—and they represent a very numerous class—art can only be valued as an end in itself, and not as the means to an end. . . . What should we think of a musical amateur who, while fully competent to appreciate the performance of a Joachim, could listen with indifference to the machine-made melodies of a grinding organ, or hear with approval a pianoforte played out of time and tune? Yet this is exactly what people do who applaud the works of Leighton and Millais at the Royal Academy Exhibition, and go straightway off to the shops to buy and fill their houses with articles of manufacture which are distinguished not only by an absence of real beauty, but by the presence of much definite ugliness.'

Let us hope that such a condition of things will no longer prevail, and trust that the tendency to improvement which is now manifest is the dawn of a brighter day in the history of the manufactures of this country: it is the public alone that can make it so. Our artists and architects are quite capable of guiding and directing any movement of this sort, and our artisans and manufacturers are fully competent to the carrying out of their designs. All that is wanted is an increased popular demand. And to those who may be interested in this subject, we can heartily commend as a sound and practical guide in their efforts Mr. Eastlake's 'Hints on Household Taste.'

Dover Priory Estate Competition.—The first premium of 50 guineas has been awarded to Mr. F. A. Klein, of 110 Cannon Street, for design 'London No. 1,' the second premium of 20 guineas to Mr. A. G. Hennell, of 22 Southampton Buildings, Chancery Lane, the author of design '£ s. d.' Seventy-five plans were sent in, which were submitted to Mr. Clutton, of Whitehall Place, by whom the award was made.

THE IRISH RAILWAY REPORT.

IT is always matter for regret when an important subject is approached from the wrong point of view. The treatment is sure to be inadequate; and not only so, but efficient treatment is, by this means, indefinitely postponed.

Such, it appears to us, is the case with Irish railways. The series of blunders, of quarrels, and of swindles which has depreciated the whole of the grand net of railway communication through the United Kingdom by some thirty-three per cent. of its natural value has raised the question, in the minds of many, as to whether the ownership and superintendence of the State might not be advantageously substituted for the caprices of conflicting boards of directors. The present Government, when in office before, so far evinced a disposition to assume the responsibility of a general control of the traffic arrangements of the country as to appoint, with some degree of flourish, a Commission to investigate the subject. The weak and inefficient Report of that Commission was so destitute of weight as to swamp the matter for the time.

The general subject of railway management being in this position, there can be no great want of judgment in directing especial attention to the question of Irish railways, which have been recently the subject of special official investigation. The amelioration of the condition of that island is the central difficulty of the Imperial policy; an inquiry into the condition of Irish railway enterprise must thus be regarded as eminently desirable.

By June 30, 1867, rather more than twenty-six and a half millions sterling had been expended on 1,900 miles of Irish railways, at the rate of 14,000*l.* per mile, being exactly a third of the cost per mile of the English lines. The gross receipts on these railways amounted to 1,870,000*l.* The working expenses were 52 per cent. on the receipts, leaving a net income of 890,000*l.*, which was an increase of 32,000*l.* for the year. The gross income thus amounted to 7 per cent. on the paid-up capital, while that of the English and Scottish railways may be approximately stated at a little over and a little under 8 per cent. This return was derived, in almost equal proportions, from passengers, and from goods, minerals, and live stock.

Ireland is a sparsely peopled agricultural country, with a population of 171 persons to the square mile. That population decreased from 8,193,000 in 1841 to 5,557,000 in 1867. The mineral traffic of Ireland amounted, in 1866, to only 123,000 tons of coal and 25,000 tons of iron. While, then, there is the grand advantage possessed by the railways of Ireland of economical construction, it is apparent that the case is not one in which an unbounded impulse can be given to the development of traffic by the mere expedient of lowering the fares. With the general increase of Irish prosperity, the net revenue of its cheaply constructed railways will ultimately sympathise; but the means of galvanising that prosperity, by an inordinately low rate of conveyance, do not exist in a country of that description, in the same way that they are to be found in one which is more industrial and more densely populated.

It therefore seems singularly ill-judged that the experience of a country of which the condition is as opposite as can well be found to that of Ireland, should have been indicated to the Commissioners as the basis of their comparisons. Belgium has a population of nearly three times the density of that of Ireland, being 442 to the mile. The area of the former country is only about a third of that of the latter. The proportion of length of line to population is nearly alike in the two countries, being a mile to every 2,858 persons in Belgium, and a mile to every 2,893 persons in Ireland. The cost of those of the Belgian lines which were constructed at the expense of the State may be taken at about 20,000*l.* per mile. But the distribution of these lines is not in proportion to the relative area of the countries. The State railways run, for the most part, through a level country, connecting busy and populous towns, the condition being thus that which of all is most favourable for stimulating traffic by reducing fares.

In the southern part of Belgium, where the towns are fewer, the people more sparse, and the country more expensive for the operations of the engineer, the State has conceded the railway to a company which has chiefly been formed by means of English capital. It is this part of Belgium which alone can in any way be compared to Ireland, and in this part the means of comparison fail.

The question of the mode of dealing with Irish railways must be investigated on its own merits alone. The facts which will be useful for comparison are those of similar districts, not those collected under opposite conditions, with no possible connection except in the fact of State management, and reduction of fares to a level that private companies cannot afford, even though, in the long run, such reduction may prove to pay. Thus the first portion of the Treasury minute of October, 1867, which directs the Commissioners to inquire into the result of assimilating the principles of the charges on which fares on the Irish lines should be levied to those adopted in Belgium, is simply bewildering and delusive.

The two other points reported on by the Commission are, the saving to be effected by the concentration of establishments under one or more administrative departments, and the diminution of charge to be effected by giving the guarantee of Government to the debenture capital. The saving under the former head is estimated at 32,000*l.* per annum; that under the latter at 88,000*l.* per annum. It would be difficult to pay a higher compliment to the character of the management of the Irish lines than is implied by these two modest sums.

If on an expenditure of 982,000*l.* per annum, incurred by the officers of thirty-nine distinct companies, large and small, it is only considered possible that a saving of some three and a quarter per cent. is to be made by concentration of management (bearing in mind that we have on one hand actual, and on the other only estimated, outlay), the managers of the Irish railways deserve unusual respect and commendation. With a natural distribution of the island into three great railway alliances—the Great Southern and Western, the Midland Great Western, and the Ulster Companies—buying, leasing, or otherwise working all the minor lines, it is probable that a larger economy would be effected without risk.

Again, with regard to the debenture capital. It has been pointed out with unanswerable force, that union, or at least alliance, between the various lines, would suffice to place this portion of their capital on a sound and satisfactory basis. So valuable is the property of the railway companies taken in block, that it may be doubted whether Government could borrow on better terms than a syndicate of the various lines would command.

The comparison of the Irish and the Belgian lines is a mere experiment upon the patience, or the ignorance, of the public. When Irish industry emulates Belgian industry; when Limerick and Cork display to the visitor in their streets the decent municipal care and thrift of the 'senate and people of Ghent;' when mining and manufactures divide the Irish soil with pasturage; and when the neglected and ill-saved crops of oats, that form so much of the arable produce of Ireland, are replaced by the carefully weeded and tended harvests of the Belgian fields, it may be instructive to compare the railway statistics of the two countries. At present, such a comparison, unless made to point a contrast, is simply ridiculous. The other conclusions of the Report are unexpectedly bare and inefficient.

Into the larger question, at which the late Report only nibbles, it is not our present intention to enter. The case of the Irish railways is only a portion of the general question of the best method of providing for the internal communication of the country. The great secret of English non-success in Irish matters is this:—It is our habit to frame rules inapplicable to the condition of the country or to the genius of the people, and then, as these rules lead to trouble, to make continual exceptions. Every Irish evil has thus been intensely aggravated. The opposite course is the only remedy—to make provisions adapted to the nature of the country, and to the habits and genius of the people, and to allow *no exception whatever* to rules thus made. If we leave English railways alone, and leave Scotch railways alone, and take Irish railways on our back because they are earning three-quarters per cent. less than the Scotch lines, we shall find that such a proceeding is a fatal precedent.

If it be (we do not deny the possibility) decided upon as a matter of Imperial importance to aid the Irish railways, this may be done at once in a far safer and in a far more complete manner than by making experiments on Government amalgamation. Power and facility should be given to the companies to amalgamate among themselves; and as inducement and encouragement to do so, let the aid of Government be frankly rendered to the completion of the Irish system of railways by cheap light branches. The expenditure of some six millions sterling, in addition to the twenty-six or twenty-seven millions already spent, would be enough to nearly double the actual length of available railway, and to bring the wilder and more inaccessible districts into organic connection with the capital and the ports. For Government to aid the great companies in thus augmenting the bases of their traffic would be (if jobbery be excluded) at once a safe and a statesmanlike measure.

It is not by reduction of fares to an extent without precedent under circumstances bearing the least resemblance to those of the Irish railways, that any healthy 'impetus to the intercommunication of the inhabitants and the moving of goods from place to place' can arise. By pushing light branches into the rural districts, and avoiding the expense of cartage, of time spent in going to and fro, and of re-loading, a stimulus will be given to the existing traffic, which may be proved even to compare with that which the original introduction of locomotive railways gave to the commerce of the country at the period of their formation. Not for Irish railways alone, but for all the railways of Europe, here is the true mine to be remuneratively worked. The man who does this for Ireland will deserve to be named with the same respect as that which attaches to the memory of William Dargan or to that of George and Robert Stephenson.

ACCIDENTS TO BUILDINGS.

It has seldom happened that so many accidents to buildings have been crowded into a short space of time as have occurred within the last few weeks. Our column of General News has almost resembled the shipping intelligence of a daily paper after a period of prolonged storms; and if serious accidents have been so numerous, it is perfectly certain that the number of lesser mishaps has been proportionately large. Though this has been the case, there has existed no adequate disturbance of nature to quote as its cause. No earthquake has devastated our towns; and if high winds have raged and wet weather has prevailed, it seems hard that buildings put up as a protection against wind and weather should not be able to withstand a moderate attack of either. Here, however, lies the solution of the problem. There can be no doubt that many buildings now

erected are not sufficiently strong, or put together with sufficient care and skill, or built of good enough material to be safe or suitable for occupation.

Even within the area of the metropolis, where the operation of the Metropolitan Building Act may be supposed to check, to some extent, the practice of using inferior materials, but too much use is made of bricks which are only dried dirt, and mortar which is little better than moistened mud. In country towns, where the spirit of cutting competition has risen high, and has called forth no efficient official supervision, we have reason to believe that these evils exist to a greater degree than in London.

There can be no doubt that most of this inferior building work done is in dwelling houses of moderate or small size, and that the habits of bad building which exist almost all take their rise from bad house-building. Any remedy that can be brought to bear upon the construction of our dwellings will raise the quality of such builders' work as is executed at cheap rates to a great extent.

This remedy, we take it, lies mainly in the hands of the public themselves. As long as a speculating builder finds that tenants care for nothing save rooms of a certain size, well lighted, conveniently put together, rather showy, and at a low rental, so long will he confine himself to the supply of these called-for essentials, and these only. Why should he spend his money on rendering his house durable, strong, healthy, or comfortable, since tenants will just as readily take a dwelling that has no one of the elements of comfort, health, or safety about it, as one that is in these respects well built, if only the first be as roomy or as attractive looking as the other?

We are endeavouring to diffuse sound information on this subject in our pages, and shall hail it as a great advance if the public begin to call, in ever so small a degree, for improvements in the construction of the houses they consent to dwell in.

There are other points, however, in which the present practice of building is at fault. Competition is carried to excess, and prices, as a consequence, are often too low to yield any return upon good work. Builders' estimates are frequently made on the most carelessly prepared bills of quantities, and with a haste that renders careful consideration out of the question. The short terms for leasing building land, the usual arrangements for advancing money on leasehold buildings in progress, and the leniency of the Bankruptcy Court, all combine to promote bad workmanship, by causing its consequences to fall on the head of some one other than the real culprit.

In all these respects a reform is needed; and we should be glad to know that the general body of builders, who include a number of the best men of business and most honest traders in England, were disposed to promote, as they only effectually can, some movement for raising the general standard of work and materials throughout Great Britain, and thereby preventing the recurrence of such accidents as we referred to in the opening sentences of this article.

PRACTICAL COMPENSATION.

THE LIVERPOOL CORPORATION WATERWORKS.

The Corporation of Liverpool are extending their works at Rivington Pike by constructing a new reservoir from the designs of the late Thomas Duncan, Esq., C.E. They have just received the award of the umpire (Mr. Pownall) in two of the compensation cases; and as illustrating the wide difference between the ideas of the claimants and the actual payment awarded, we give a summary of each case.

CORPORATION v. PARK.—Awards of Witnesses for the Claimant:—Mr. Thomas Lever Rushton, 22,055*l.* 14*s.* 3*d.*; Mr. Edmund Ashworth, 35,000*l.*; Mr. James Eden, 35,000*l.*; Mr. Edward Thomas Woods, 26,875*l.*; Mr. Joseph Clayton, 24,311*l.*; Mr. Thomas Statter, 26,872*l.* 16*s.*; Mr. Elias Dorning, 27,570*l.* 15*s.*, assuming, as was contended by the claimant, that the water could be used for washing purposes; Mr. Edward Garlick, 26,075*l.*; Mr. Edward Nicholson, 25,000*l.*; Mr. Joseph Brierley, 21,812*l.* 6*s.* 8*d.*; Mr. Samuel Collet Homersham, 31,050*l.*

Awards of Witnesses for the Corporation:—Mr. Joseph Jackson, 2,883*l.*; Mr. Richard Radcliffe, 2,887*l.* 10*s.*; Mr. George Hunt, 3,326*l.* 8*s.*; Mr. J. G. Blackburne, 3,750*l.*

Amount of award, 5,882*l.*

CORPORATION v. RODGETT.—Awards of Witnesses for the Claimant:—Mr. Thomas Statter, 15,892*l.*; Mr. Elias Dorning, 10,410*l.* 13*s.* 6*d.*; Mr. Joseph Brierley, 14,557*l.*; Mr. Edward Garlick, 12,000*l.*; Mr. Edward Thos. Wood, 12,000*l.*; Mr. Edward Nicholson, 15,624*l.*; Mr. Joseph Clayton, 16,531*l.* 17*s.* 10*d.*; Mr. Samuel Collet Homersham, 4,740*l.*, as the cost of replacing water power by steam power only, in addition to the works being damaged to the extent of two-thirds of their value, which the witness does not estimate in money, but which would be at least 7,000*l.*; Mr. Thomas Lever Rushton, 12,480*l.*

Awards of Witnesses for the Corporation:—Mr. Joseph Jackson, 3,072*l.*; Mr. Geo. Hunt, 2,830*l.* 10*s.*; Mr. Richard Radcliffe, 2,735*l.*; Mr. John G. Blackburne, 3,038*l.*

Amount of award, 3,936*l.*

All the other cases (14 in number) have been satisfactorily arranged by negotiation. The two disputed claims were merely for use of water.

LEGAL.

Extensive Robbery, and Serious Charge of Receiving by a Large Contractor.

On Monday, at the Marylebone Police Court, Robert Manning, aged 25, residing in Stainsbury Street, Bethnal Green, was charged with stealing, during the past two months, from the Kentish Town Wharf, between 30,000 and 40,000 of bricks, the property of Mr. William Henshaw, in the parish of St. Pancras. Thomas Croft, aged 53, of Burreleigh Road, Kentish Town, contractor on a very extensive scale, was charged with receiving the same, well knowing them to be stolen.

Mr. George Lewis, jun., prosecuted, and Mr. F. H. Lewis (barrister) defended Crofts.

Mr. George Lewis, having opened his case, called

Mr. William Henshaw, builder, carrying on business at 13 and 15 Wharves, City Road Basin, who said he had a contract from the parish of St. Pancras for the erection of an infirmary at Highgate, and it was necessary to have a large number of bricks supplied. For this purpose he had contracted with Messrs. D. & C. Rutter and Mr. Wakeley, brickmakers, as well as Messrs. Pickett & Sharpe, to supply him. The bricks were to be delivered at the Kentish Town Wharf. In October last (said witness) I entered into a contract with Messrs. Pickett & Sharpe for carting bricks to Highgate, where the Infirmary is building. All the bricks that were to be delivered came to the Kentish Town Wharf. The prisoner Manning had been employed by me for twelve months past to tally the bricks as they were loaded into the carts. His duty was to see the bricks carted, and to give the carman, after entering the number in a book, a ticket. The ticket had the counterfoil on it. After delivering the bricks the ticket would be signed by the gatekeeper, and the counterfoil receipted and brought back to the master. I do not know the prisoner Croft. I will not swear that he was not engaged as sub-contractor, but I have seen bricks in Croft's carts. He had no knowledge of my arrangements with Messrs. Pickett & Sharpe. Manning had no orders to send bricks anywhere but to my own jobs, other than at Highgate or Crouch End. The lowest price I pay to Messrs. Rutter for bricks is 28s. 6d. per 1,000. The bricks are branded with a 'crown and a figure.' On Saturday, from information I received, I caused Manning to be taken into custody. I had given my managing foreman notice to keep a sharp look-out.

Ebenezer Lawrence said: I am manager to Mr. Henshaw. On Saturday I had some conversation with the prisoner Manning, and enquired of him when he came to the office if he had brought his tally books. He said he had not. I asked why he had not brought them. He said he did not always bring them on a Saturday. He was asked who was the last man he loaded from the barge, and the names of the carmen. Manning mentioned the names of three men, but I did not hear the name that I enquired for, and asked what time he loaded Davis's cart. He said, as near as he remembered, about half-past three in the afternoon. Then he said he went up to Highgate to get his money, but not getting it, he went back to the wharf, and loaded several carts ready for starting on Monday morning. I asked him whether he gave the carters their tickets. He said he gave no tickets to anyone after his return from the Infirmary at Highgate. I said, 'Have you never given tickets to anyone only upon the wharf to carmen?' He said 'No.' I said, 'Did you not give one that morning outside a public-house opposite the wharf?' Manning then said it was no use mincing the matter to me. I told him that he must be aware that the firm had lost a large quantity of bricks, and we knew where the property had gone to as well as he did. When he found I knew something of them, he said he would speak the whole truth. He said Mr. Croft had had the bricks. I asked him where they had gone to, and he said the larger portion to Hornsey Rise, where Mr. Croft is building, and a quantity to Highgate Cemetery, where Mr. Croft has a job. He also said there was a stack of bricks stacked up in the prisoner Croft's yard, on the wharf. The bricks ought never to have been carried there. Manning said he saw the bricks stacked on Croft's wharf. I asked Manning what consideration he got for the bricks, and his answer was, 'A little beer.' I said, 'Do you mean to say you were such a fool as to sell yourself and your master for a few pints of beer?' He then said he had license from Mr. Croft to get as much beer as he liked from the public-house opposite. I said 'I cannot believe that you did it for beer only.' He again said he would tell me the truth. Manning then said that Croft sent his foreman to him to ask him to let him have 500 bricks. Manning said he replied to him, 'What do you mean? I cannot sell drink.' He then said Mr. Croft's foreman took him to a public-house and gave him something to drink, after which he let him have the bricks and he would give him 5s. a thousand. He let him have them. After this he said Croft arranged to pay him 4s. a thousand, and did pay him himself.

Mr. George Lewis: I wish to draw your worship's attention that my client pays 28s. 6d. a thousand for bricks, and 5s. 6d. for cartage, which makes in all 34s.

Witness continued: I asked Manning how long he had been at this game, and he said quite two months. And what number he had ordered to be taken to Hornsey? As near as he could tell about 20,000. How many to the Highgate Cemetery—the two places where Croft had jobs? Manning said about 5,000. How many stacked at Croft's wharf? 12,000 or 13,000. He said he was convinced that there were these quantities. He was then given into custody.

Mr. F. H. Lewis and the prisoner Manning declined to ask these witnesses any questions.

George Wise, general foreman to prosecutor, said: I went late on Saturday night to Kentish Town Wharf; I went to a place near some stables belonging to Mr. Croft, and found a stack of bricks of Wakeley's and Rutter's make. I counted them, and found 6,250. Before going there I had been to Highgate Cemetery, and whilst there saw one of Croft's carmen, named Davis, come up with a load of bricks. I believe Croft has a sub-contract there to supply another contract. I looked at the bricks, and found Rutter's mark on them. I looked further, and saw a stack in the Cemetery bearing Rutter's and Wakeley's marks on them.

Cross-examined: I do not know whether Croft is a large contractor for bricks. Do not know that he has some thousands of bricks from Messrs. Rutter and Messrs. Wakeley every week. Do not know whether Rutter supplies him.

Thomas Pound, a carman in the service of the prisoner Croft: On Friday last I took a load of bricks to Hornsey Rise, from Kentish Town Wharf, by order of Croft's foreman. I did not see where they were loaded from, as they were loaded up on the over night. I took them to the front of Croft's buildings, and set them down there. On Saturday there was a cart already laden, and I took it to Highgate Cemetery. Three more carts were loaded up from the stack by the stable on the wharf, and they were taken to Highgate Cemetery by order of the foreman of Mr. Croft. Mr. Croft was there when I went there at dinner time. It was the third load when I saw Croft's foreman. Croft gave me no instructions. He saw me leave the premises. Croft has not given me orders at other times. I do not know that he has been present when orders have been given to me.

In reply to Mr. D'Eyncourt, witness said: Mr. Croft's name was on the carts. They were his own carts and horses. Had taken bricks to Mr. Henshaw's place. Sometimes been up to Highgate for Mr. Croft. Could not say how many times.

M. F. H. Lewis said: My client has about eighty carts, and it was impossible for him or his men to say where they could have been at stated times, as the carts were all over London.

The Witness re-called said: I asked Manning where he had the load of peculiar bricks from and where taken to. He said from the wharf, and up to Croft's place at Hornsey. I went to Hornsey, and there found in a stack a number of bricks. They were Wakeley's make.

Mr. Lewis said he must ask for a remand.

Both prisoners were remanded, and Mr. D'Eyncourt refused to accept bail.

A witness was here brought forward, who said that he could prove that some red bricks found in front of Mr. Croft's building belonged to the prosecutor.

The case was remanded.

THE DECAY OF STONE IN PUBLIC BUILDINGS.

For many years I have looked with grief upon the decay of stone in several of our large buildings, especially in such noble buildings as the Houses of Parliament, and many others which are ornaments to our metropolis. It seems a pity that after so much pains, anxiety, and expense have been bestowed upon these, they should, in so short a space of time, crumble to decay—so much so that in some instances the place that now knows them will soon know them no more, except as a mass of ruins.

Now, as this decay must result from some cause, it is necessary that the exact cause be arrived at. It has been said on good authority, and by some of the greatest men of the present day, that it is the smoke of London acting on the stone which causes it to decay.

The principal object of this communication will be to show that the decay of stone does not result from this cause; and in order to substantiate this, I will mention a few plain facts which will tend to show that the smoke does not act upon the stone in sufficient force to decay it.

I have been to a great many quarries in various parts of Great Britain, and therefore have had the opportunity of noticing the stone on the spot from where it is obtained, and I find there is a certain portion of stone that will perish in its own native air and on its own soil, away from all smoke and soot: for instance, I have seen the Cheshire, Yorkshire, Lancashire, and Derbyshire stone, also the Glasgow white stone and granites at various quarries, all perish in their own native air, and at most of these places there has been no smoke or soot to act upon them. Again, there was a large building erected in the West of London, and one of the late eminent judges of stone was appointed to examine the quality of the stone, and I think he was also appointed at the Houses of Parliament. Now, after this gentleman had passed the stone for the West End building, a great quantity of these stones perished before the roof was on. This must at once prove that it is not the soot that causes the stone to decay in our public buildings, but the inferior quality of the stone that was used.

If the above proofs are not sufficiently convincing, allow me to mention one or two still more so. If we will but take the pains to look at some of our buildings, we find in many instances a sound stone adjoining a decayed one. How can this be accounted for? If the smoke had such an effect upon these stones that are decayed, why did it not act in the same manner upon the adjoining ones that are sound? Thus, we again see that an inferior quality has been mixed with a good.

I have myself removed the accumulated soot from the face of stone, and on examining found it to be quite sound and perfect. These simple facts ought to convince any practical man, and also our geologists, that the smoke is not the cause of the stone decaying.

The stone used in the largest quantity in London is Portland. I have walked through the quarries and examined the stone at this place, and found it to perish there in large quantities (remember this stone has not been subjected to the smoke). This stone is brought to London and used in the construction of buildings, and as may be expected, before the roof is fixed will be found to be in an advanced state of decay; and not only before the roof is fixed, but even after the stone has been fixed only two or three months, and then our great and scientific men say it is the smoke acting upon the stone causes the decay, whereas if proper judgment had been used and the stone of the right quality, the smoke would have had little or no effect upon it.

A great quantity of the Portland stone used in London perishes far

sooner than the Bath stone. As a proof of this I will refer to the entrance gateways to the Park at Hyde Park Corner; these are of Portland stone, and nearly all this stone has perished, and is still perishing as fast as time will permit. The adjoining building to these gateways, Apsley House, is of Bath stone, and the stone of this building stands far better than the Portland at the gateways. The exterior of the Grosvenor Hotel is mostly of Bath stone, and has been erected some seven or eight years, and not a single piece of this stone is decayed, and why? because it was carefully selected: if this had been of a bad quality, it would have perished before now; and thus while this Bath stone building stands, some Portland ones have perished. The stone, then, that decays is simply an inferior quality, which, if placed in any building, whether in town or country, will decay. For instance, many large buildings in the city of Oxford were erected out of the stone obtained in the neighbourhood, without any regard being paid to the quality of that stone; and the result was, as might have been expected, in a few years these buildings went to decay. Had this stone been of a good quality, it would have remained sound and perfect; in fact, some stone of good quality, obtained from the same neighbourhood, was used the same time as the above, and is as perfect now as when used. The above example must not be confined to Oxford only, for it is the same with our noble Houses of Parliament. It appears to me that two qualities of stone have been used in this building, a good and bad. Here, again, the fault is want of judgment in selecting the stone; because, if stone be carefully selected, I am confident there will not be that decay there now is.

When we take into consideration the various kinds of stone that are sent to London, all differing in quality, it becomes even more clear that careful judgment ought to be exercised in the selection of the stone. There are six distinct sorts obtained from Portland, five from Bath, and fifteen from Yorkshire and Derbyshire. In the neighbourhood of Penryn there are about sixty or seventy granite quarries, the granites differing in a great many of them both in colour and quality.

We also obtain eight different sorts of granite from Aberdeen and its neighbourhood, three from Peterhead, two from Mull, five from Dalbeatti, and three from the North of Ireland.

The judgment which ought to be exercised in the selection of the proper quality has not always been correct; for instance, the before-mentioned judge of stone condemned two barge loads of Portland stone at some works of a well known contractor. I stated at the time that this stone was good and would stand the weather, and the statement proved true, for the whole of these two barge loads of stone were afterwards used at the same works, and up to the present time not a single stone has perished.

It has also been mentioned that the perishing of the granite at Waterloo Bridge, passing under the same process of decay as other stone, is caused by the smoke. This is not the cause, for it is well known that the granite that was brought to London at the time Waterloo Bridge was being built was of an inferior quality compared to the granite that is used at the present day. I have seen granite almost as soft as grit stone, and possessing all the elements of decay. I have also seen granite in the neighbourhood of Aberdeen decayed in the inside of a new building where it has been screened from the smoke and weather.

Thus I have endeavoured to show, in the first place, it is not the soot that decays our stone; and, secondly, this stone that decays is of an inferior quality.

It must not be supposed from the above that there are no buildings in London of good stone, as several are now passing before my mind; but time will not permit me to offer any comment on these.

WILLIAM CROSS,
Manager of Prince Consort Memorial, Hyde Park.

THE RAMSGATE SURVEYORSHIP.

SIR,—An instructive episode of public Boards' dealings with their surveyors has lately occurred here, and the attention of the profession may profitably be called to it. I shall state the bare facts of this case as appearing in the local newspapers, and refrain from any comment thereon.

'WANTED AN ARCHITECT'

was the heading of an advertisement in the *Times* (it did not appear in any professional paper) last month, 'to act as Surveyor and Inspector of Nuisances to the Local Board of Ramsgate. Salary 150*l*. Whole time to be given to the duties of the office.'

Here was a noble opening! a prize! At least such appears to have been the opinion of about one hundred members of the profession, from whom (I quote the *Kent Coast Times*) applications for the office had been sent in.

But the most curious part of the matter was that the advertisement in question startled no one more than it did Mr. G. M. Hinds, the resident surveyor, who is, and has been in office since January, 1854, up to which date the late Mr. Wildish had been surveyor at a salary of 70*l*.; Mr. Hinds then undertook the duties at a salary of 70*l*. (nominal), but 40*l*. per annum was to go to Mr. Wildish as a superannuation during his lifetime, so that the remuneration (I cannot say 'salary') of the surveyor was 30*l*. only, and this continued for four and a half years, when, on the death of Mr. Wildish, Mr. Hinds, so to speak, succeeded to the full salary of 70*l*.; but the Town Commissioners, fearful lest the sudden accession of fortune might turn his brain, kindly and promptly mitigated the danger by reducing the salary to 60*l*.

In July 1867 the Town Commissioners were superseded by the Local Board, who raised the salary to 150*l*., which was to include all and all manner of work and services required. 'For this salary,' says Mr. Hinds, in a letter appearing in the *Thanet Guardian* of Dec. 19, 1868, 'I have been greatly indebted to my son, who has assisted me, for it would have been utterly impossible for any one person to have done all the work required.'

But at the early part of last month some members of the Board, not feeling quite satisfied with the attendance or attention of the surveyor, acting under the dictum of their chairman, that by 11 & 12 Vic. c. 63, s. 37 (The Public Health Act) the Surveyor of the Board is removable at pleasure, i.e. at a moment's warning, and without any formal notice, issued the advertisement above referred to; and at the meeting of the Board in our Town Hall on the 22nd ultimo, the Committee, whose province it was to consider the applications for office, reported that they recommended the following candidates, viz., 'Names of candidates recommended for the office of Surveyor and Inspector of Nuisances:—Henry G. B. Hayward, Thomas N. Laslett, Cecil George Norman, Edward Cross, Thomas G. Bell.' These gentlemen, says the *Kent Coast Times* of the 24th ult., 'had been requested to attend, and many of them had come from long distances.'

Before these gentlemen were admitted to the august presence of the Board a general wrangle appears to have taken place in the Council chamber, the Chairman asserting that as a Local Board 'they had no power to give notice to their Surveyor,' but 'having elected his successor, all we have to do,' said he, 'is to pay Mr. Hinds his salary, and say to him, Here are your wages, and we don't want you any more.' The result of this scene appears to have been that 'The five candidates were then called into the room and informed that the election would not take place at present!' And from another, and I

believe authentic source, I learn that Mr. Hinds has consented to a reduction of his salary to 120*l*. per annum, that the testimonials of the various candidates have been returned by book post and without comment, and that the matter is now at an end. Let us of the profession learn wisdom. I am, Sir, yours faithfully,
RAMSGATE, January 18, 1869. W. LANE SEAR.

QUESTIONS.

To the Editor of 'The Architect.'

SIR,—As you kindly intimate in your paper that questions of professional and practical nature will receive solutions, would you kindly favour me with answers to the following queries?—

1st. Presumed, that a clerk of works sanction the use of certain materials upon a job; after they have been fixed the architect's attention is drawn to the inferior nature of the materials and workmanship, and he orders the substitution of better, in accordance with the terms of the specification: is the clerk of works responsible for the amount of extras consequent upon the condemnation of the materials he had previously sanctioned?

2nd. In the case where a clerk of works is not engaged, the architect of course superintends and sanctions the use of materials upon a job; but in the opinion of the proprietor and a competent surveyor they are inferior, and not according to the terms of the specification: is the architect responsible for extra cost in substituting proper materials and workmanship?

Yours very truly,
SURVEYOR.

January 20, 1869.

[N.B.—We do not undertake to supply answers to such enquiries as the above, but we shall gladly insert suitable replies if furnished by correspondents.—Ed.]

NEW BUILDINGS AND RESTORATIONS.

Opening of a Co-operative Hall at Bury.—A fine new building, which has been erected by the Bury Co-operative Society, to serve the purposes of warehouse and public hall, has just been opened. The building is situated in Knowsley Street, and is a plain but substantial brick erection. It is between 60 feet and 70 feet high, and the internal space is 480 square yards, the building itself being nearly square. The cellaring extends under the whole of the building. On the basement storey there are offices and a passage for waggons right through the building, built on iron beams and brick arches, on each side of which is the platform of 150 yards area, the warehouse being of an area of 350 yards. On the first floor are committee rooms and an ante-room to the large hall above, which is 74 feet by 60 feet, and has a gallery of 74 feet by 17 feet down on one side. This hall is 30 feet high, and is enriched with deep mouldings, and a frieze round the walls, and with ornamental painting; it is lighted by three sun-lights.

Proposed New Church for South Lambeth.—A new church has been opened for the accommodation of the residents in that portion of the parish of St. Mark's, Kennington, which is called South Lambeth. The freehold of South Lambeth Chapel, and the land adjoining it, have been secured at a cost of 1,600*l*.; and the existing building has been altered and adopted for the church of the new district.

The New Buildings for the Royal Academy, Burlington Gardens, are now so far advanced that the apartments will very shortly be put into the hands of the decorators. No doubt exists as to the holding of the next Royal Academy Exhibition in the new place.

The Junior Carlton Club is now nearly completed, and its members hope to be able to move from Waterloo Place into their handsome new house, between St. James's Square and Pall Mall, early in the approaching summer.

A new Corn Exchange and Flait Halls were opened on Monday at Luton by Earl Cowper, the Lord-Lieutenant of Bedfordshire. The buildings, which have cost 15,000*l*., have been raised by the energy of the people of the town and district.

A new and very handsome Theatre, to be called the Academy of Music, has been completed in Montreal. The exterior is Tuscan in architecture, and the interior florid Renaissance. It is calculated to seat sixteen hundred spectators.

A new National School has just been opened at Narberth, in Pembroke-shire. The architect was Mr. David, of Laugharne. The style is Gothic.

The New Militia Barracks at Aberystwith.—These barracks have been built from the plans of Mr. J. W. Szlumper, architect. Mr. Thomas Davies, Aberystwith, contractor. Local stone of a darkish blue colour has been used in the work, and the roof is covered with the Aberlefeny slates; the dressings are of white Ruabon brick, and freestone. The style of architecture is somewhat after the Italian. There is a frontage of 248 feet; in the centre, over the arched gateway, is a strongly-built square tower, with castellated top of white stone. At each end of the front is a wing, running back some 30 feet. A drill shed, 136 feet long, running parallel to the front, completes the enclosure. At each of the four corners is a small square fort, with castellated top. The two sides and the back are protected by a strong stone wall, seven or eight feet in height. The entrance is through a pair of wooden gates topped with iron spikes. The estimated cost was 3,700*l*.

The New Opera House at Vienna is approaching completion. It will seat 3,000 people. The stage is unusually spacious. The orchestra is designed to hold eighty performers. The crush room is spoken of as a splendid apartment, but of those who have seen the house itself many are disappointed. The cost up to the present time has been about 4,700,000 thalers, or upwards of 700,000*l*. of English money.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

The New City Hotel, Bristol.

Bristol, the 'Capital of the West,' has recently been making rapid progress in her public buildings, and in no class of structure has this march of improvement been more striking than in the larger class of hotels, of which some three or four have been erected within the past two years. The Clifton Down Hotel in the neighbourhood of the Suspension Bridge, and the Royal Hotel, College Green, in the vicinity of the Cathedral, stand out prominently as specimens of the improved architectural taste of the enterprising inhabitant of 'ye ancient city,' and in the still more centrally situated building, the City Hotel, opened on Thursday the 7th inst., we have a noble structure, though not so ornate in appearance as its rivals. The building has a frontage of 110 feet, and it runs back a distance of 136 feet. It is in the Italian style, and the architects, Messrs. Foster and Wood, have obtained a plentiful supply of light by erecting the chief portion of the structure on three sides of a rectangle. The building is marked by an absence of elaborate ornamentation; it is crowned by a deep overhanging roof cornice supported by carved brackets. On the vestibule and entrance hall a good deal of decoration has been lavished. The entrance hall, which is 70 feet long, is covered with an arched glass, and Raphaellesque ornaments, with elaborately executed figures emblematic of the seasons, are here introduced, partly on a positive dark and partly on a light ground. Serpentine and black marble columns add to the harmonious effect of the whole of this unusually rich decoration. The artist of this portion of the work is Mr. Sang. To the right and left of the entrance hall are situated the commercial room, 70 feet by 40 feet, and decorated in the Italian style, with a panelled ceiling; and the coffee room, 55 feet by 35 feet. Further on, to the right of the entrance hall, is the public bar, flanked by service rooms, and opposite is a large restaurant, or public luncheon room, 60 feet by 40 feet. At the extreme end of the hall is a commodious billiard room, 42 feet by 24 feet, furnished with table and necessary appliances by Thurston. Next to the commercial room is the main staircase, of Portland stone. On the first floor there is a ladies' coffee room. A continuous corridor communicates with the several rooms on this floor and the three floors above. The hotel, which belongs to a limited liability company, has been constructed to a considerable extent of Bath stone. The foundations and work up to the ground line were executed by Mr. Baker, a local contractor. After some delay, the remainder of the contract was given to Messrs. Warburton Brothers, of Manchester, in the meantime the original plan having been somewhat reduced. The work was commenced in November, 1867, the term of the contract being that the structure should be finished by January 1, 1869. That period was subsequently extended. February 14, 1869, was then named as the day of completion of the contract. Wishing to see the work out of hand as soon as possible, the directors ultimately made a proposition to Messrs. Warburton, offering them a douceur of 500*l.* if they would have the building ready for the furniture by October 31, 1868, three months in advance of the specified time. The contractors accepted, and, favoured by the protracted dry weather of June and July, carried out their engagement, and received a cheque for 500*l.*, though there were necessarily innumerable details to be completed between that date and Thursday the 7th inst., when the handsome building was formally opened.

Technical Education Conference in Germany.

The system upon which the Polytechnic Schools of Germany are conducted is probably sufficiently well known to our readers, many of whom have possibly taken advantage of the scientific and practical instruction which these excellent institutions afford. We mention them to-day, because we are informed that a Congress of Professors engaged in these schools will in all probability take place next year, to consult and to compare notes as to the various requirements and objects of Polytechnic schools, to exchange experiences of teaching, and to take such steps as will ensure that such teaching shall always continue to keep pace with the march of the sciences. The idea emanated from Stuttgart and Karlsruhe, and answers accepting the invitation have been received from Prague, Dresden, Munich, Graz, Vienna, Brunswick, and Brünn: the authorities of the more important colleges, however, namely, those at Berlin, Zurich, and Hanover, have declined for the present to take part in the proposed Conference.

Railway Bridge over Holland Deep at Moerdyk.

This will be one of three large bridges required to be built to connect the railways of Belgium with those of Holland in a direct manner between Moerdyk and Rotterdam.

The piers for the bridge are in progress, and the contract for the superstructure has been taken by a large firm in Holland. The bridge will be for one line of rails, and consist of fourteen spans of 105 metres from centre to centre of piers, the girders being 12 metres deep at the centre, and 6 metres at the ends, with curved top-flanges, and the bracing composed of vertical struts and diagonal ties. The construction of this bridge will require 6,000 tons of wrought iron and 600 tons of steel, and is to be completed by the spring of 1873. We hope to give illustrations and further details of this work in an early number.

Courtesy the Best Policy.

The practical results of the method in which the directors of the London, Brighton, and South Coast Railway have placed themselves in opposition to their customers, the residents and travellers on their line, have been brought to a pecuniary test. The increase made in 1868 over the second and third class fares ranges from 20 to 75 per cent., the lower rate obtaining in only one instance, which is that of the second-class fare from Brighton to Victoria, which was raised from 10*s.* to 12*s.* The average increase on

the fares to twelve stations is 40 per cent. During the 26 weeks ending the 27th December last, the traffic receipts of that Company amounted to 699,995*l.*, against 702,241*l.* in the corresponding 26 weeks of 1867, showing a decrease of 2,246*l.* Comment is superfluous.

On eleven of the principal lines of railway, the increase for the last half of 1868, over the corresponding term in 1867, was 255,007*l.*, or about 2.04 per cent. The only exception to the general improvement, besides that which is the case with the Brighton line, has been a falling off to the extent of 5,194*l.* in the income of the London and South-Western. It will be remembered that the complaints as to the want of portage, station accommodation, and decent respect to passengers, on this line have been loud and persistent.

Railway managers and directors will in time learn that the discourteous and negligent man of business, or rather man not of business, drives away his customers.

The Ex-Queen of Spain

Has bought the 'Hôtel Basilewski,' at Paris, for her residence in that city. It is situated in the Roi de Rome Avenue, near the corner of the Rue Pauquet, and is approached by two light wrought iron gates, the house itself standing a little back from the road. It was built three years ago by Count Basilewski, a Russian nobleman, who gave *carte blanche* to his architect and sculptor to do whatever they liked. The result was a two-storeyed façade in modern French Renaissance, five windows wide, and flanked on either side by a slightly projecting wing, the whole being surmounted by the usual steeply pitched French roof. The sculptured frieze is ornamented with warlike implements and accoutrements, representing the various military branches of artillery, cavalry, and infantry, whilst the centre bears the arms of the Basilewskis. The central vestibule is of the purest white marble, divided into panels by fluted pilasters. The Hotel is at present untenanted, but it is expected that the King, Don Francis of Assisi, will inhabit one wing, and the young Prince of the Asturias the other 'pavilion,' whilst the Queen will occupy the central block. The entrance gates from the street into the fore-court are flanked by massive piers, surmounted by boldly conceived and well executed allegorical trophies, by Bloche, representing Europe, Asia, Africa, and America. Altogether, though not the Escorial, this little mansion is not altogether unworthy of being the retreat of dethroned royalty.

Discovery of an Ancient Crypt in Hungary.

A fine crypt, declared to be of the twelfth century, has just been discovered near the Cathedral of Gran, in Hungary. The vaults of the roof are supported by eight granite columns, the capitals of which are all different from each other. The crypt is to be restored, and dedicated to the memory of Etienne, king and saint.

Academy of the Beaux Arts, Vienna.

The Emperor of Austria has confirmed the nomination of the following French artists as honorary members of the Vienna Academy of the Fine Arts:—MM. Henriquet-Dupont, line engraver; Robert-Fleury, Cogniet, and Gérôme, painters; Guillaume, sculptor; Duban, Viollet-le-Duc, Beswilwald, and Ballu, architects.

Notes for Connoisseurs.

Water-colour drawing is a comparatively new art in France, or at any rate it is only recently that it has attained anything like importance. The most remarkable water-colour artist of the present day in France is M. Ziem, whose oil paintings are well known by all who visit the annual exhibition or *salon* in Paris. He delights in blazing skies and wondrous atmospheric effects, and his works remind sometimes of Claude and at other times of our own Turner; a view of the harbour of Marseilles exhibited last year was all in a blaze, like some of Turner's Italian views—and it was a blaze of beauty.

Ziem is an enthusiast in his art, lives and paints, when in France, at Barbizon, an artistic colony on the edge of the beautiful forest of Fontainebleau; but the greater part of his time is spent in Italy or in the East. His water-colour paintings are rather finished sketches than pictures, and looked at in that light they are gems of their kind. The treatment is light, decided, and not over elaborate, as water-colour drawings should be, and not worked up in imitation of oil paintings; they have the appearance of being thoroughly completed in the presence of nature, and so we believe they are. From time to time M. Ziem disposes of his beautiful sketches, and a sale of thirty-four of these occurred the other day and created great interest. Some of these were hardly larger than an octavo page, one was no bigger than a large address card, and few surpassed the size of a page of *THE ARCHITECT*, yet the thirty-four sold for more than 900*l.* A View of the Port of Venice, sunset, sold for 70*l.*; another of the Palace of the Doges, with a Party of Pleasure, nearly 42*l.*; Tunny-Fishing at Sausset, 54*l.*; a View of Martigues, 76*l.*; and an exquisite picture of a Caravan quitting Cairo for Mecca, glowing in sunshine, 120*l.* Skies and sunlight are M. Ziem's fortes, and the simple means by which his effects are produced offer valuable lessons to young artists.

Other drawings and sketches have of late fetched high prices in Paris: a water-colour drawing of Catalonian Sailors, by Decamps, formerly Lord Seymour's, for 132*l.*; a Fête at Versailles, by Eugène Lamy, water colours, 164*l.* At another sale a water-colour sketch of a tiger, by Barye, the famous animal sculptor, fetched 24*l.*

Amongst sales of oil paintings may be mentioned a Wood Scene, by Cabanel, a work not in the line of this clever artist, sold for 380*l.*; the Banks of the Cure, at Morvan, by Daubigny, exhibited in 1864, 168*l.*; Oaks and Rocks in the forest of Fontainebleau, by Diaz, 388*l.*; the Return from Drinking, one of Delacroix's spirited horse pieces, a small work, 508*l.*

La Zingara, a striking figure of a gipsy woman, well known, 268*l.*; the Halt at the Oasis, by Fromentin, 320*l.*; Eastern Fisherman raising his Nets, by Zian, 238*l.*; and a View of Chambord, by the late admirable landscape painter Théodore Rousseau, 94*l.*

A very important sale is approaching, that of the collection of the two brothers Delessert, the younger of whom is recently deceased. The catalogue will contain the only known work by Raphael in private hands in France; it is a small Virgin and Child, formerly in the Orleans collection, and once in England; but we shall have to return to this subject when the sale catalogue appears.

General.

The Thames Embankment.—The Thames Embankment has this week received a valuable embellishment in the shape of a row of vigorous young plane trees, which have been carefully planted near the edge of the footway. The trees selected for this purpose are about 20 feet high, and are planted 20 feet apart. A square opening has been cut in the paving at the spot where each tree is planted, and within this space the paving is replaced (as on the Paris boulevards) by a heavy perforated iron grating, in four portions. The trees have been well planted in deep pits, and a common drain tile is inserted vertically close to each one, in order to secure that water shall reach to the roots. It appears to us that some protection for the stems of these trees will be needed.

The Rev. C. H. Spurgeon has received an intimation from a person who desires to remain incognito, that he is anxious to build a chapel, some schools, and a number of almshouses in connection with the Metropolitan Tabernacle.—*South London Press.*

The Relationship between masters and men in the Blackburn building trade is by no means of an assuring character. About a month ago it was decided, at a meeting of the operative carpenters and joiners, to give notice of a reduction in the hours of labour from fifty-four to forty-nine per week. The men assert that this concession, which implies the commencement of work at seven instead of six o'clock in the morning, is enjoyed by other branches of the trade; and the hope is expressed that the privilege will be extended to them. A circular has been issued, appealing to the masters in this matter, and in reply the masters suggest that payment should be made by the hour; and if this proposal be rejected, then that the question shall be referred to arbitration.

The Hyde Park and City Railway has been abandoned for the present session.

The Building Trade of Lancashire and Cheshire.—A Liverpool paper states that a requisition to 'the master builders and other employers of labour connected with the building trade of Lancashire and Cheshire' has been drawn up, and numerous and influentially signed, suggesting 'the employment of non-unionist workpeople and members of the Free Labour Registration Society.' The requisitionists hold the opinion that 'with a free exchange of labour there would be abundance of employment for every class of workpeople,' and undertake 'to give a preference to those master builders who offer the greatest encouragement to free labour.'

The Royal Institute of British Architects has just issued the Supplementary Catalogue of their Library, as enriched by the donation of Mr. Tite and by other additions of recent dates.

The Statue of Lord Palmerston, by Mr. Woolner, which is to be erected in Palace Yard, Westminster, is now so nearly completed that the model is in the hands of the bronze casters. The statue will be a little larger than life.

Treasure Trove at Hampstead.—The other day, while engaged in digging the foundations of the new Home for Sailors' Orphans between Church Row and High Street, Hampstead, a working man came upon a leaden coin, about 2 feet below the surface, in a bed of loam and clay. It is about an inch and a half in diameter, and on inspection it turns out to be a 'bull' of Pope Innocent IV., one of the well-known family of Fiesco, who sat in the chair of St. Peter from A.D. 1243 to 1254. The 'bull' bears on the reverse the figures of St. Peter and St. Paul, and is in a tolerable state of preservation; it has been secured for the British Museum.

Lead-Poisoning.—The *Lancet* says there is a great amount of lead-poisoning involved in the various works on the Tyne, and that it is not improbable the subject will be brought before Parliament.

The Salary of Sir Francis Grant, as President of the Royal Academy, is to be raised from 300*l.* to 600*l.* It is possible that he may live to have it tripled, as on the death of Lady Chantrey, 300*l.* a year of her husband's property will go to the President of the Academy.

An Exhibition of the works of the late Mr. George H. Thomas is to be held in the course of the spring.

A Statue to William Tell is about to be erected by the canton of Uri in the town of Altorf.

The Hartley Institution, Southampton, has just had a narrow escape from being either partially or totally destroyed by fire. The mishap was occasioned by the pipe from a stove recently erected in one of the classrooms being allowed to run into a narrow air shaft, which was mistaken by the workmen for the shaft of the chimney. The effect of this was that the roof of the building became so much heated that some bricklayers at work raised an alarm, and the cause was soon discovered and the pipe removed. Had the building caught fire, damage to the extent of some 10,000*l.* might have been done in a few hours.

Threatened Strike of Stone Masons.—A dispute, not likely to be healed, has arisen between the stono masons and their employers in the North, and is now agitating the men belonging to the trade in the metropolis. The dispute has arisen respecting the rough and fine or finishing dressing of stone. Some time since the masters got the stones rough-

dressed by machinery, and that displeased the men, but an agreement was entered into by which the rough-dressing as well as the finishing was left in the hands of the men. Experience, however, taught the latter that but small wages were to be made by the rough dressing, and accordingly they are now determined to give it up. The masters are firm in keeping the men to their agreement, and there is at the present moment every probability of a strike, disastrous in its consequences as that of two years ago. Delegates from London will, it is stated, go to the North to endeavour to adjust the difficulty.

The Ironworks at Creusot, in France, are constantly presenting some new feature of interest. The other day a new theatre was opened there, capable of containing from 700 to 800 persons, with pit, two galleries, and orchestra stalls, painted in white picked out with gold, and illuminated by means of a transparent ceiling.

Liverpool.—The Corporation have granted a half-year's salary (600*l.*) to the widow of the late Mr. Thomas Duncan, C.E., as a mark of respect for his long and faithful services as Water Engineer to the Corporation. They have also appointed Mr. Joseph Jackson, C.E., to superintend the new works at Rivington for three years, at a salary of 500*l.* per annum, and travelling expenses. The Deputy Engineer will conduct the business of the department. This practically postpones the appointment of a successor to Mr. Duncan for three years.

The New Blackfriars Bridge.—The works on this magnificent structure continue to progress in the most satisfactory manner. All the iron girders have now been laid. The abutment on the north side has been raised to its proper height with solid brickwork, and iron balustrades have been laid and riveted on the adjoining arch for the support of the roadway. Workmen are busily engaged in finishing No. 2 arch from the north side in a similar manner. The piers are being raised from the level at which the iron girders rest to that of the roadway. On the abutments of the piers wooden sheds have been constructed, in which masons are busily engaged cutting large blocks of stone, which will be placed on the abutments of the piers for improving the appearance of the bridge.

Dartmouth, Devon.—This town gave birth to Newcomen, whose name and memory will ever be honoured among engineers. A great portion of the old town was built with houses having richly carved oak fronts, in one of which Newcomen lived. A year or two ago the house (with others) was taken down to make a new street, when Mr. Lidstone, a native of the place, embraced the opportunity to secure the woodwork of Newcomen's sitting-room. In the room is walled in, in the fireplace, the original 'clayal' of the fireplace of Newcomen's room. The building presents the character of a renovated courthouse of temp. Jacq. I., and has been much admired. There can certainly be no lack of taste in a private individual, at his own cost, rearing such a memorial to a neglected man's memory.

Ancient Carving in the Old Reading Room of the Bibliothèque Impériale in Paris.—The handsome wood carvings of the time of Louis XIV. which decorated the old reading room of the Bibliothèque Impériale in Paris have just been sold by the authorities as old building materials. But these beautiful specimens of carvings will not be lost, they having been purchased by M. Recappe, the well-known dealer in works of art.

Discovery of Greek and other Antiquities.—In the *Athenæum* some time ago was found a better account of the discoveries at Idalium in Cyprus than is given from the German periodical, and which answers the question as to some of the antiquities being Phœnician. The upper cemetery is Greek, but this curiously rests on another cemetery of vaulted graves, within which are found well-authenticated Phœnician objects with Phœnician characters. As Phœnician remains are found in Cyprus, a common observer has no difficulty in the identification. The question is, whether remains earlier than Phœnician will be found.

Cliff Fall in Denmark.—A celebrated cliff in Denmark, the 'Queen's Seat,' has just fallen bodily into the Baltic from a shock of earthquake. The rock, about 400 ft. high, was an object of great interest to tourists from the magnificent view to be had from it. On a clear day Rügen and the coast of Pomerania could be plainly seen. Everything has disappeared except some masses of chalk, which form a sort of island near the shore. No life has been lost, but the inhabitants and neighbouring villages were terrified at the noise produced, which lasted several seconds.

Mr. J. H. Parker is again busily engaged this winter upon fresh excavations at Rome. The Papal authorities are more favourably inclined to his work than they were a year or two since.

MEETINGS OF LEARNED SOCIETIES.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Monday, February 1, at 8 P.M. Special meeting to discuss proposed alterations in the Metropolitan Building Act.

ROYAL BOTANIC SOCIETY.—Saturday, 3.45 P.M.

ASSOCIATED ARTS INSTITUTE.—Saturday, 8.15 P.M. Discussion:—'Has the Street Architecture of London derived Benefit from the Introduction of Coloured Materials?'

THE INSTITUTION OF CIVIL ENGINEERS.—Tuesday, January 26, at 8 P.M.

THE INSTITUTION OF SURVEYORS.—Monday, January 25, at 8 P.M. Adjourned discussion on Paper, by R. B. Grantham, C.E.—'Parochial Assessments,' by Edward Ryde.

ARCHITECTURAL ASSOCIATION.—Class of Design. Friday, February 5, at 8 P.M. 'Architecture of Belgium.' R. Phéné Spiers.

ASSOCIATED ARTS INSTITUTE.—Monday, January 25, at 8.30 P.M. Sketches. Discussion:—'Question:—Does General Mental Training tend to Develop Art Power?'

LONDON INSTITUTE.—January 25, 6 P.M.

INSTITUTE OF ACTUARIES.—Monday, January 25, 7 P.M. Paper, by the President:—'On the Mortality Experience of Life Assurance Companies, collected by the Institute of Actuaries.'

BRITISH ARCHAEOLOGICAL ASSOCIATION.—Wednesday, January 27, 6 P.M.

ROYAL GEOGRAPHICAL SOCIETY.—January 25, 8.30 P.M.

SOCIETY OF ARTS.—January 27, 8 P.M.

EDITORIAL NOTICES.

No communication can be inserted unless authenticated by the name and address of the writer, not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such enquiries.

PUBLISHERS ANNOUNCEMENT.

Advertisements cannot be received for insertion later than 2 P.M. on Thursdays.

Temporary Office, 4, Monument Yard, London.—GILBERT WOOD, Publisher.

THE GAZETTE.

PARTNERSHIPS DISSOLVED.

Samuel Pickins & Samuel Bywater, Strefford New Road, Manchester, painters and house decorators—Alexander Perkins & Frederick Perkins, Clapham Road, Kennington, timber merchants—Thos. Martyn & John Hopkin Morgan, New Pottery, Church Gresley, Derbyshire, tile manufacturers—Silas Guest, Silas Griffiths & Caleb Griffiths, Churchbridge, Oldbury, Worcestershire, brick and tile manufacturers—John Pickard & Benjamin Price, Bridgnorth, Shropshire, builders—William Pinfold France & John Edward Harde, Bridge Wharf, Paddington, timber merchants—John Williams & Edward Jones, Liverpool, brickmakers—Richard Savadge Davenhill, John Edmund Thomas, & William Donaldson, Park Street, Westminster, engineering surveyors—Thos. Bevington, Sydney Courtland, & Charles Stuart Baker, Spa Road, Bermondsey, manufacturing engineers—Margaret Lumley & George Watson, Lower Shadwell East, engineers.

DECLARATION OF DIVIDEND.

William Lee, Honiton, Devonshire, builder—further div. of 3d. any Tuesday or Friday, at Mr. Carrick's, Queen Street, Exeter.

BANKRUPTS.

LONDON.—George Gregory, Church Road, Teddington, contractor, Jan. 29, at 1—Ebenezer Warwick Howell, Crozier Terrace, Hornorton, builder, Jan. 27, at 2—William Leonard, Hawthorn Cottage, Kilburn, timber merchant, Jan. 29, at 1—Edward Richard Palmer, Durham Place, Seven Sisters Road, Holloway, builder, Feb. 1, at 1—Wm. Francis Reeves, Dulwich Road, Brixton, marble mason, Feb. 3, at 2.

TO SURRENDER IN THE COUNTY.—John Fuke, late of Torquay, Devonshire, builder, Jan. 27, Exeter—John Carey Kemp, Commercial Road, Exeter, timber dealer, Jan. 26, Exeter—Isaac Lunn, Cornbrook Terrace, Gorton Lane, West Gorton, Manchester, brickmaker, Jan. 27, Manchester—George Adamson, Dartmouth, Devonshire, brickmaker, Feb. 6, Tonnes—William Brynning, Terminus Place, Eastbourne, Sussex, decorative artist, Jan. 29, Lewes.

SCOTCH REQUESTRATION.

John Brunton, Dalkeith, builder.

TENDERS.

REIGATE ESTATE (Red Hill).—For the Road and Drainage Works to be completed on this estate, belonging to the United Land Company (Limited):—

Table with 2 columns: Name and Amount. Includes T. R. Hooper, W. Hignore, J. Blackmore, etc.

STANLEY PARK, LIVERPOOL.—For the Iron Railing, Gates, &c. (irrespective of stonework), forming the boundary of the Park. Mr. E. R. Robson, architect:—

Mr. W. H. Peake (accepted) . . . £3,646 0 0

SEPTON PARK, LIVERPOOL.—For the Plantations. Messrs. Andre & Hornblower, landscape architects:—

Messrs. Thomas Dickson & Co. . . £4,898 16 0 (accepted)

For Woolton Stone Paving to Boundary Railing:—

Mr. Pearson Lee (accepted) . . . £4,069 0 3

NOTTINGHAM.—For Factory, Robin Hood Street, for William Windley, Esq. Thos. Hine & Son, Nottingham, architects:—

Table with 2 columns: Name and Amount. Includes J. E. Hall, Barker, Dennett & Co., Fish, etc.

UPPER NORWOOD.—For House, for the Rev. E. Birch. Mr. Sextus Dyball, architect:—

Perry (accepted) . . . £2,800 0 0

Table with 2 columns: Name and Amount. Includes Wandsworth, Withall, Esq. Messrs. Lee Bros. & Pain, architects:—

LONDON.—For pulling down and rebuilding House, for Mr. J. B. Gover, City Horse and Carriage Repository, Barbican. Mr. R. Walker, Architect. Quantities by Mr. W. E. Stoner:—

Table with 2 columns: Name and Amount. Includes Lark, Brass, Henshaw, Sewell & Son, Prince, etc.

LIVERPOOL.—For Lancaster Buildings, Tithebarn Street. Messrs. Pickett, Chambers & Bradley, architects:—

Table with 2 columns: Name and Amount. Includes Campbell, Mullin, Hughes, Haigh & Co., Jones & Sons, etc.

APPOINTMENTS VACANT.

HUNDRED OF WIRRAL, CHESTER.—District surveyor. Salary 160l. a year, and will be required to reside within the district of the Board, and to give his whole time and personal attention to the duties connected with his office. Applications to be sent to William Henry Churton, Eastgate Buildings, Chester, on or before Monday January 25.

LEWISHAM, KENT.—Surveyor of Highways. Salary, 300l. per annum. February 5. J. Edwards, Clerk to Local Board.

ROYAL ACADEMY OF ARTS.—National Gallery. For the best painting in Oil—or Model and Design in Painting, Sculpture, and Architecture. The Gold Medal and the Discourses of Presidents Reynolds, West, &c. and for the best Copies of Drawings, Models of Life, the Antique in Landscape Perspective, &c. The Silver Medals, &c. November 1.

COMPETITIONS OPEN.

ROTHERHAM.—March 15.—For Plans, &c., for erecting a Public Hospital and Dispensary. A prize of 75l. is offered for the best design, 60l. for the second, and 25l. for the third. John Barras, hon. secretary, Rotherham, December 15, 1868.

VIENNA, AUSTRIA.—This Municipality require Designs, Plans, Estimates, &c., for the Erection of a New Hotel de Ville. Open to all Europe. For Particulars, Austrian Consul-General, 21 Rue Lafayette, Paris. (See ARCHITECT, Jan. 2, p. 12.)

SOUTH METROPOLITAN SCHOOLS, SUTTON, SURREY.—For Designs for the Erection of an Infant Establishment adjoining the present Schools. Premiums of 40 Guineas each for the three designs considered the best. February 2. J. Burgess, Clerk to the Managers, Vestry Hall, Walworth.

KINGSTON-ON-THAMES.—March 1.—Design for new School and Master's Residence. Cost not to exceed 5,000l. F. Gould, Esq., Kingston-on-Thames.

PETERBOROUGH.—Feb. 3.—Plan and Estimate for Addition to the Corn Exchange. S. C. W. Buckle, Peterborough.

KIDDERMINSTER.—Feb. 9.—Designs, Plans, Specifications, &c., for an Infirmary and Dispensary. E. Morton, Hon. Secretary.

DOVER.—Feb. 20.—St. Mary's Burial Board. Designs for laying out 9½ acres, for the purposes of a new Cemetery. Premiums 50l. and 20l. G. Fielding.

LEAMINGTON.—Feb. 10.—Royal Pump Room Gardens. Designs for a Memorial Fountain. A. S. Field, Leamington.

CONTRACTS OPEN.

NORTHAMPTON.—February 16.—For the supply and erection of a Gasholder, 100 feet diameter by 30 feet deep, with columns, girders, &c. John Eanson, jun., Northampton Gas Company, Northampton. See Advertisement.

BATH.—Grand Pump Room Hotel.—January 30.—For the Hydraulic Apparatus connected with the Lifts. Willson & Wilcox, architects. 1, Belmont, Bath. See Advertisement.

BOARD OF WORKS (Poplar District).—January 26.—Construction of 2 Cast Iron Pipe Shafts, 12 Gullies, and 566 feet of Jennings's Patent Pipe Sewer; also 1,773 feet of Jennings's 12-inch Patent Pipe Sewer with the necessary junctions. S. Jeffries Barth, 291, East India Dock Road, London, E.

LEIGH, LANCASHIRE.—February 6.—For erection of Primitive Methodist Chapel and Schools. E. Pritchard, C.E.

BORDEAUX, FRANCE.—Granite for Curb Stones for the supply of the year 1869, to the extent of about 2,000l. Deposit by way of security, 120l.; preliminary deposit, 40l. All particulars to be obtained at the Hotel de Ville, Bordeaux, Division des Travaux publics. Tenders to be sent in before February 4.

ROUEN, FRANCE.—Enlargement of the Palace of the Prefecture, estimate for the whole work about 28,000l.; and construction of a new wing to the Female Lunatic Asylum of that town, estimated at upwards of 40,000l. Amount to be deposited as security, 1,400l. in the former, and 1,600l. in the latter case. The tenders, as usual in France, to be made at a discount on the estimates. All particulars to be obtained at the Bureau des Dépêches in the Prefecture Rouen. Tenders to be sent in before February 11, when the adjudication will take place.

BRIMMINGHAM.—Feb. 17.—Erection of Schools to accommodate 300 Boys, with Dining Hall, Workshops, Apartments for Masters and Teachers, and other Buildings. Martin and Chamberlain, Christ Church Buildings, Birmingham.

SPAIN.—March 1.—For Submarine Telegraph Cable. Urbano Montego, 155, Fenchurch Street, E.C.

WARRINGTON.—Jan. 25.—Tenders are invited for construction of 2,000 yards of Brick and Pipe Sewers. R. Vawser, Borough Surveyor, Warrington.

GLOUCESTER.—Jan. 28.—For erection of New Buildings in connection with Gloucester Infirmary. A. W. Maberley, architect, 1 Brunswick Road, Gloucester.

HORWICH MOOR (near Bolton).—Feb. 6.—Erection of Primitive Methodist Chapel. Peter Butterworth, Horwich Moor, near Bolton.

GREAT HORTON.—Feb. 5.—For erection of Great Horton Church. Messrs. J. H. & F. Healey, architects, Bradford.

STRAND UNION.—Tanner's End, Edmondton.—For the Erection of a new Workhouse and Subsidiary Buildings, &c. Feb. 9. By order, 6, Bow Street, Covent Garden.

GREAT GIDDING, HUNTINGDONSHIRE.—For the Restoration of the Parish Church. Jan. 30. T. Fowler, Louth, Lincolnshire.

ABERGAVENNY.—Erection of a town hall, with shops, offices, and other buildings, and the reconstruction of the general market place, with other works, Jan. 25, 1869. J. T. Rutherford, Abergavenny.

MONMOUTH.—For erection of new workhouse for the Monmouth Union, Feb. 5, 1869. Edwin Richards, clerk to the Local Board, Monmouth.

RADCLIFFE LOCAL BOARD.—Tenders are invited for a supply of Glazed Sewer Pipes, Tiles, Junctions, and Invert Blocks, of various sizes and descriptions, up to December 31, 1869. Jesse Haworth, Water Lane, Radcliffe.

GREAT WESTERN RAILWAY.—For supply of Fire Bricks, Fire Clay, Cement, Grindstones, Drain Pipes, Slates, Lamp Glass, Carpenters' Work and Office Furniture, English Timber, Ironmongery and Hardware, Gas Fittings, &c. F. G. Saunders, Paddington Station.

METROPOLIS ROADS.—February 2.—Watering and Sale of Road Sand, North of the Thames. For Men, Horses, &c. February 2, 11 o'clock, A.M. 32, Craven Street, Strand, W.C.

WYMOUTH AND MELCOMBE REGIS-DORSET.—For new Paving, Gutters, Curbing, &c. F. C. Steggall, Clerk.

CARDIFF LOCAL BOARD OF HEALTH.—Feb. 28.—For the construction of a New Outfall Sewer, Channel, and Works connected therewith. Geo. Salmon, Town Hall, Cardiff.

SHEFFIELD.—Feb. 10.—For the erection of Two Wings with Central Building and Offices for the new South Yorkshire Asylum, at Wadsley Park, near Sheffield. Bernard Hartley, West Riding Surveyor, Pontefract.

TONBRIDGE UNION.—Feb. 4.—For the erection of School Buildings adjoining the Workhouse of the Union at Sandhill, near Pembury, Kent. F. W. Stone, 4 Belvedere Terrace, Tonbridge Wells.

WALTHAMSTOW SOUTH-EASTERN SPECIAL DRAINAGE DISTRICT.—Feb. 8.—For the construction of the drainage works in the above district. The works comprised in the contract will be about as follows:—800 yards of 24-inch circular brick sewer, 730 yards of 18-inch pipe drain, 160 yards of 15-inch, 1,670 yards of 12-inch, 190 yards of 9-inch pipe drain. Wm. Houghton, Clerk to the Committee; Messrs. Houghton and Wragg, 15a, St. Helen's Place, E.C.

WORCESTER.—Jan. 23.—For Cast Iron Pipes for Water Mains for the Worcester Water Works. Richard Woo Guildhall, Worcester.

BANDELL & SAUNDERS have much pleasure in informing their friends, and the Building Trade generally, that to facilitate building operations during the winter season, they have provided a large stock of well-seasoned Corsham Down Block Stone. Bath Stone Office, Corsham, Wilts.—[Adv.]

STONE BROTHERS are now supplying Corsham Down Stone—Well seasoned, fit for immediate use, and of the best quality. Box Ground Stone—Unequaled for even texture and durability. Farleigh Down Stone—Matchless for good quality and large sizes. Combe Down Stone—Fine in texture, free working, and very durable. Prices, and cost of transit in any part of the kingdom, on application to the Bath Stone Office, Bath.—[Adv.]

ADVERTISEMENTS.

W. W. SPRAGUE & Co., Lithographers, PRINTERS, & STATIONERS, 14 Sherborne Lane, King William Street, London, E.C.

BILLS OF QUANTITIES, SPECIFICATIONS, REPORTS, Copied or Lithographed with rapidity and care.

Now Ready.

SPRAGUES' POCKET DIARY and MEMORANDUM BOOK, for the use of ARCHITECTS and SURVEYORS.

The Tables, Memoranda, &c., have been compiled by an experienced Surveyor, and will, from their compactness, be found very convenient to the profession.

In Roan Wallet, 7s. 6d. The Diary and Tables in Paper Cover, 2s. The Tables only, 1s.

TO BUILDERS and OTHERS.—Several Sums to LEND on MORTGAGE of FREEHOLD or LEASEHOLD PROPERTIES, at 5 per cent. or on DEPOSIT of LEASES for short terms. Large houses not quite finished not objected to. No preliminary fees.—Apply personally to Mr. WILLIAM TOY, Surveyor, 49 King William Street, London Bridge, City.

WM. OLIVER & SONS, MAHOGANY, WAINSCOT, DEAL, AND TIMBER MERCHANTS, 120 BUNHILL-Road, LONDON, E.C. The most Extensive Stock of every kind of Wood, in Planks and Boards, dry and fit for immediate use.

The Architect.

THE SITE OF THE LAW COURTS.

THE question of the site for the Palace of Justice has taken firm hold of the public mind. It will no doubt form a subject of earnest and early discussion at the opening of the ensuing session of Parliament. At present, however, no other opportunity for a public discussion has been afforded than that given by correspondence and articles in the leading journals, and a discussion arising upon some observations made by the President of the Institute of Architects

(Mr. Tite), which will be found in another column, at the last meeting of the Metropolitan Board of Works.

We are indebted to Mr. Tite's practical sense and experience for a tacit—nay more than a tacit—recognition of the paramount claims of the Thames Embankment site. That gentleman, while deprecating the entire removal of the proposed building, is heartily in favour of the appropriation to the purposes of the Law Courts of so much land as the Metropolitan Board of Works, to whom he was then speaking, have to sell. So far so good; but why not go further? If for a limited portion of the legal building a limited site on the Thames bank be good, will not a complete site for the whole building be better?

Sir Charles Trevelyan, whose able advocacy has given to the public the most forcible statement of the case yet placed before it, has had the courage boldly to face the whole problem, and has so worked it out as to show how easily, how completely, and even how economically, public requirements may be met, and immense advantages secured, by an adoption of the Embankment site.

One suggestion, and one only, Sir Charles has failed to make; he has exercised more forbearance towards the Railway and its proposed station, than we think was needed, and, as we shall presently show, a considerable improvement may be effected in the whole scheme, by a removal of the station from its present intended site, with which, we believe, Sir Charles's suggestions have not interfered, to a site in proximity to the present steam-boat pier.

This important but slight modification made, let us try to imagine the building and its surroundings as they would be when erected and completed with all their surroundings upon the Thames Embankment.

The whole space between the Thames Embankment and the Strand—with the Temple east of it, and Somerset house on the west—would be occupied by The Palace of Justice. In front of the river face of this building, would run our magnificent embankment—the finest terrace in Great Britain—with its roadway and broad footways and river wall.

The building would show all its beauty from this side, and its rich play of sky-line—which none knows better than Mr. Street how to introduce—would be excellently well seen, with the addition of an unrivalled frontage towards the Thames, while an equally good road frontage of great extent would exist towards the Strand. And it may here be remarked that the long unbroken extent westward of the Strand would afford opportunities for seeing the street front of the building foreshortened, and from a distance such as can never exist with the present site.

Between the Strand and the Embankment some sort of footway and some carriage access would be desirable. No better proposal can be made than that of a footway between the new building and Somerset House—that is to say, west of the new Courts; and a carriage way between the Courts and the Temple—that is to say, east of the Courts. In order to preserve good access between the Temple and the Courts, it has been proposed to make this in some sense a covered way.

There is no difficulty in rendering this covered way a most attractive and elegant feature. It would preserve convenient access for the Templars to the Court and still give a valuable public thoroughfare passing below their feet, thoroughly lighted and ventilated. An arcade, as understood in this country, best describes the feature intended; and this covered carriage way may be termed for convenience the 'Embankment and Strand Arcade.' This feature would leave the Embankment at its very widest point, that is to say, where the Temple estate joins the proposed site, and in a line with the existing steam-boat pier. Here the railway station ought to be placed—there is more room for it here than elsewhere; it will be more serviceable here than elsewhere to professional men, as this spot would be equidistant between the New Law Courts and the Temple, and the general public would equally have the best access; for here the line of the Embankment is met from the north by the proposed arcade, and from the south by the steam-boat pier, and the station, sunk below the level of the ground, ought to occupy half of it ground in front of the Courts, and half of it ground in front of the Temple.

The thoroughfare thus started would be continued northward in a direct unbroken line to Holborn. For this singular facilities exist; the

ground over which it would run has been purchased, or is in course of purchase, so that the Law Court Commissioners have it in their power at once to open a straight road from the Strand to Lincoln's Inn Fields. There remains nothing but to widen the Turnstile into a carriage road, and we should reach Holborn direct. At its southern extremity this thoroughfare would reach the Thames Embankment by the arcade we have referred to, and thus a direct and satisfactory access from the north to the Law Courts and the Strand and the Embankment would be rendered at once practicable. This, though only one of the minor features of the scheme, is not by any means a slight advantage, and it is obvious that a direct communication north and south at this point will be rendered impossible if the new Courts of Law are built on the Carey Street site.

On this site, of which every one can form a ready idea with the aid of any map of London, or better still by walking along the Embankment, Mr. Street's building, substantially as now designed, would stand easily. The material alterations necessary to fit it to its site would be very few, and only such as would tend to improve it alike in convenience and as a work of art.

The judges would enter from the Strand at the level of their courts, and the ominous flights of steps for them which have been brought forward, and very justly, as the great blemish in Mr. Street's present plan, would be needed no longer. As the site is a little larger, there would be rather more room to expand the buildings than at present exists, but, fortunately, the difference between the two areas is not so great as to allow the possibility of any other building for any other, or even any kindred purpose, being intruded on to that part of the Embankment, beyond those which are contemplated in the very complete scheme of the Commissioners, as embodied in Mr. Street's plans.

The Law Courts thus placed would have the two best thoroughfares in London, the Strand and the Embankment, running past them, and a new and most useful thoroughfare from the north running up to them. From the north-west they could be approached along Drury Lane, a thoroughfare, which enlarged and in parts straightened, would afford good access for as much traffic as may be expected to come from that quarter. In contrast to all this the present site has only one thoroughfare giving good access to it—the Strand, and though an access from the north could be as easily had as to the Embankment site, it is certain that very heavy expense would have to be incurred in gaining sufficient access from the west. In fact, though Sir Charles Trevelyan's estimate for this may have seemed extravagant, we do not think that those who have had experience of the work of enlarging streets of the metropolis will have much difficulty in accepting his figures.

The changes that would follow, though sweeping, are simple. There is no doubt that Somerset House will soon be abandoned by those branches of the civil service which now occupy that building. The benchers at Lincoln's Inn are, it is understood, fully prepared to appropriate the whole, if offered to them, for their own purposes, and thus the New Courts, planted between the two most powerful Inns of Court, would be more accessible than on the present site they can possibly be. The western half of the large space already cleared north of the Strand would be most appropriately occupied by the benchers of Gray's Inn, who would be great gainers by changing from their present remote locality to so central an one. We have already devoted an article to the advocacy of an appropriation of the remaining, or eastern, portion of the Carey Street site to a Palace of Industry.

Strange as it may seem, there is good reason to believe that the site south of the Strand can be procured at a price which will render it, acre for acre, barely, if at all, more costly than that already partly acquired; while the difference in cost of approaches leaves a balance in favour of the Embankment Site, which is, of course, at present only matter of estimate, but which has with great probability been placed at no less a figure than one million sterling.

If there were no other question open than the option between two sites, on the one side, one of which is imbedded among houses, badly accessible, unsatisfactory in its levels, its light and air, and separated from the Temple by a busy thoroughfare; and, on the other side, a cheaper, more roomy site, with infinitely better air, light, access and levels—one would think the question would decide itself. There remains, however, one further consideration, and one to which too much importance cannot be attached. It is this—The influence of this proposed building on the arts, and architecture, and taste of England for the present and the future.

There can be no doubt that this, the largest, the most complete, and the most important public building of our time, cannot fail to influence the art of England and the public opinion of Europe upon our art and our taste more than any other work of our time. Fortunately, the work is in the hands of a thoroughly able and an eminently representative architect. The best English work of the present day will be fairly and fully embodied in the Law Courts. And this building will form a kind of reference or starting-point for future work. What the Law Courts are our work will be for long. If they fail, if they are stifled among houses, and if the noble site which they ought to occupy be given up to speculative builders, it will be a sad day for Art in this country. If, on the other hand, this splendid opportunity is embraced, and the best building of our time is put on the best site, we have every reason to expect that an impulse will be given to our progress in Architecture, in Art, and

in fact in Tastes such as England has never yet received, and such as she sorely needs. This view of the case may have small importance in the eyes of some, but to others it will approve itself thoroughly, and there are we hope none who will not be at least willing to benefit Art; if at the same time they can also promote the efficiency of the Public Service.

ARCHITECTURAL EDUCATION AND THE ARCHITECTURAL PROFESSION.

THE Architectural Association of London have lately had submitted to them an elaborate Report on the subject of Architectural Education, drawn up by four members appointed by them as delegates from their Society to a body of gentlemen representing the majority of the architectural societies in different parts of England and Scotland, and called the 'Architectural Alliance.' As this report seeks to suggest a scheme for the better education of architectural students, and by having been printed in one of the professional papers has necessarily been made known to a great number of students and architects in all parts of the country, it necessarily attaches to itself an importance which it would perhaps have been well for the Association to have considered more carefully before permitting it to go forth to the profession at large.

That the subject is one of vital importance there can be no doubt, and, while giving all praise to the careful thought that has produced this document, and willing to endorse many of the valuable suggestions made therein, the writer would venture to dissent from much that it lays down, because it fails to enquire into and recognise the causes which are in a great measure the reason of the present admitted faulty system of education.

As the subject is about to be discussed at the invitation of the Royal Institute of British Architects, by a Committee formed of several members of its own council, and delegates from all the other architectural societies in London, it is not intended now to discuss or enter upon the system of education suggested in the report, as this will *prima facie* be doubtless fairly and duly considered by them, and in all probability some scheme will be proposed and suggested for adoption throughout the country. We venture to think, however, this report is faulty for two reasons.

Firstly, because the suggestions made therein are evidently based on the foreign systems of education.

Secondly, because it suggests a system which may or may not be followed, and which, if followed, offers no tangible advantage to the student beyond going through a more definite and systematic course of study than that usually in vogue.

Before any definite system of art education can be laid down, it becomes essential that the profession itself shall be put on a better footing, and that the question of education shall not be merely a question of choice, to be carried out or not as each individual pleases, but that it shall be made compulsory, so that architecture may occupy a position similar to the other professions, and not be in that anomalous position in which it is at present.

In support of our argument let us briefly analyse the accounts of those various systems of foreign art education, upon which so much stress is laid, as they occur in the report in question.

Firstly, let us take the French school, which briefly is as follows:—A lad on leaving school enters as a student in one of the Government schools of design, where he is taught general drawing, and, by a course of lectures, mathematics and descriptive geometry. Next he enters an *atelier* or studio, where he finds, perhaps, from twenty to thirty other students, who make and work out various designs of their own, under a professor who is paid by each twenty francs per month for a supervision of some three or four hours three or four times in each week, the remainder of the time their works being supervised and looked over by each other; beyond working out designs, the students draw out the various orders of architecture to a large scale, and are taught the art of laying on flat tints, and projecting shadows. It can hardly be supposed that the paid professor can be of any great eminence, as the smallness of the sum paid would leave him but a very small remuneration after payment of room and incidental expenses. About the end of the second year the student, if possible, passes an examination in the various studies he has been hitherto engaged upon at the 'École des Beaux Arts,' and, if successful, attends a course of lectures on various subjects in mathematics, physics, and architecture proper; and although he has not yet seen anything of real practical work, he commences writing specifications and working out details of various ordinary work, in all of which he has to pass an examination; and after three or four years thus spent, he, if he be clever, fortunately succeeds in taking off the 'Grand Prix de Rome;' and, after three more years spent in study in Italy, comes back, perhaps to Paris, at the age of twenty-seven or twenty-eight, ignorant in a great degree of the rudiments of practical learning, a victim to the system of routine wherein, as the report admits, 'all is too theoretical'—a system, however, which, if not absolutely compulsory by law, is so by custom.

Next, in Prussia, the system is somewhat changed. The student, after leaving school, enters an architect's office for a year, having previously gained at school some knowledge of drawing, physics, and mathematics. After a slight examination, he studies for two more

years in the Academy, where he learns, as far as practicable, the theory and practice of architecture, and he copies the drawings of well known architects, and makes designs of his own, and where he also attends lectures on various subjects connected with his profession; after which he has to pass an examination to enable him to take the title of 'Bauführer,' or inspector of works. He then obtains, if possible, an appointment for three years as inspector or clerk of the works, and then studies for two years more in the higher branches of his profession, when he has to pass a final examination to enable him to take the title of 'Baumeister' or Architect. Thus, it will be seen, to enable a man in Prussia to become an architect, he has to go through a course of study for eight years, which is made compulsory by law.

In Austria the system is somewhat similar, but perhaps not quite so stringent; but this too is compulsory. Thus, then, it will be seen that the systems so elaborately treated of in the Architectural Association Report are really all compulsory by law or custom; and before we can hope to inaugurate any such system in this country, or fairly to raise the standard and position of the profession, we hold that it will be necessary to make our education not a matter of choice, but of necessity; and that every student of architecture, before being able to practise, shall be compelled, as in all other professions, to pass a distinct and definite examination. By what system or in what way it is desirable to gain the knowledge that will enable him to do this, is not our purpose now to discuss; but we do hope that the Institute will recognise the importance of the question, and draw up some proposal which may be submitted to all the Architectural Societies in England and Scotland for their approval and joint co-operation, and so that the whole body of architects and students may represent in proper quarters their claims to have such a charter as will place them on the same footing as the professions of Law and Medicine. It is not our intention in this article to discuss the many considerations that may fairly be urged to show why this should be done; but that the present anomalous position of the profession should be at once altered, would be, we venture to think, not only of enormous benefit to the profession itself, but to the public at large. That this much-desired consummation will take time to arrive at, we are of course aware; but the time has come when every man loving and respecting his profession should insist that it be put on a proper and recognised footing, and we naturally look to the Institute, as the parent society, after due and careful consideration, to take such steps as may, by the united co-operation and support of the whole of the societies in the country, bring about this end. It will be the fault of the committee now about to meet if something is not done, and we have every belief that they will fairly and conscientiously discuss the various serious questions in hand; and we have little doubt that they will have the cordial and unanimous support of every man in England, whether student, assistant, or practising architect.

Once let this end be attained, alteration and improvement of the present system of architectural education will of necessity follow, and in the mean time a *suggestive* course for the training and education of students could wisely be considered and issued under the authority of the Institute; for so soon as it shall be made compulsory for architects to pass an examination or be treated as quacks are in other professions, the studies of the student will, either by private or public teachers, be necessarily directed in such a way as will enable him to pass such examination.

In the mean time it may strongly be urged that preliminary steps, if the views here taken are supported by the profession, may be taken to forward such a system, the aim of which is the advantage and benefit of architecture as a profession; and it might be a question for consideration whether the Institute could not, after due notice, make it a matter of necessity for everyone wishing to join its body, except of course such as are elected honorary members, to have been articulated to an architect.

If possible let the Institute do this, and let it be urged upon all the various Boards of Works throughout the country to insist—as is now done by the Church Building Society, and we believe all diocesan societies, in any building coming before them—on proper plans and specifications being prepared by some competent architect. All these would, we venture to think, be steps in the right direction, and would tend to a more healthy tone of building throughout the country. We believe that such a course would gladly be accepted by the public at large, and be conducive to a better and more substantial style of architecture than that which at present pertains to the thousand and one speculative buildings run up and finished almost in a day, and which are a standing disgrace to the large cities and towns which they most affect. Let the question of architects' charges be also carefully considered; and although we would in no wise desire or expect any such question to be made absolute as the laws of the Medes and Persians, we hold that the architect should be paid according to the time employed in, and the class of work required to be done, and by the skill of the artist employed. It is, however, difficult to conceive a system more degrading to architects of education, or more open to painful suspicions of underhand meddlings with subordinate tradesmen, than the present tradesmanlike mode of remuneration by a percentage on the expenditure—a system which, as a writer in one of the early numbers of the *Quarterly Review* fairly says, 'seems to hold out a premium to increased outlay and extravagance.'

The time has come when all these questions should be looked

fairly in the face, and it behoves the profession to carefully and honestly take up these matters in a united and fair spirit, as affecting not only their direct interests, but their very well-being.

R. W. EDIS.

AMATEUR CRITICISM.

WE live in a querulous age, when every matter of public import is sure to be met by question or complaint. There is nothing particularly hurtful in the prevailing disposition to criticise every subject which may arise either in politics, literature, or art: on the contrary, it only argues an increasing public interest in all that affects our moral and material progress. We are only too ready to admit that public discussion is essential to a condition of active progress, and mainly so because it tends to accelerate the accomplishment of much which is healthy and useful, while it often retards whatever is dangerous or unwholesome. At the same time one frequently has occasion to appreciate old Cobbett's description of criticism as 'a two-edged sword,' when one sees how often it recoils as severely on the critic as it strikes on his subject.

We verily believe that nothing is more acceptable to the great body of the reading public than well-weighed and skilfully expressed opinions on the various works of mind or matter in which the people are now so generally interested; but it surely follows that those who attempt to lead public opinion, especially in regard to presumed failures or successes in the technical arts, should, first of all, be able to bring to their work not only the powers of judgment necessary for genuine criticism, but the requisite skill which, while it satisfies those who know most, will not delude those who know least, of the subject which may be discussed.

We are led into this line of remark by an article which appeared a few days ago in the columns of a contemporary. It seems to furnish an apt illustration of much we have said. In treating of 'The New Law Courts' there are many ideas expressed in which we cordially join with the *Pall Mall Gazette*. At the same time we feel bound, in the interests of architectural art, to dissent strongly from the views by which the writer in that journal aims at influencing the question of the site and design of the New Law Courts. It is not uncommon, as we all know, to find opinions as to new projects advanced by abuse of works actually accomplished. The value of such criticism, however, obviously depends on the quality and character of the work reflected upon. In the present case the 'awful warning' selected by the *Pall Mall Gazette* is the New Houses of Parliament. We presume the writer imagined himself on pretty safe ground when he singled out that work for his caustic strictures; and mainly, no doubt, because it has become a kind of fashion among a certain class of casuals in criticism to speak of the Palace of Westminster as a work which, if not utterly devoid of taste and architectural design, is at least quite meaningless and useless for the purposes which created it.

It is not wonderful, therefore, if these views, smartly expressed in a popular journal, find many adherents, chiefly, no doubt, among those who know but little of the matter upon which they are asked to form an opinion. It is time, however, as we happen to think, that some protest should be made against this somewhat stale expedient of bringing in the Houses of Parliament as an example of all that is dreadful and dangerous.

So far as we can gather from the criticism of the *Pall Mall Gazette*, it is not the style of that building which is found fault with: otherwise there might, probably, be equally strong objections urged against the design accepted for the New Law Courts. The writer of the article in question boldly discusses the question of propriety and utility. Accordingly he asks us to 'imagine a visitor to London going to look at the Houses of Parliament, taking with him a general knowledge of the fact that the British Legislature comprises a House of Lords and a House of Commons. When he comes to Westminster Bridge, the first thing that he sees is an enormous tower with a very big clock to it. What, he asks, is that tower for? That is the clock tower. But what is it for? what is inside it? Most people of whom the question was asked would have to say that they had not the least idea!' In our opinion 'most people' would be quite content with the answer that this was a clock tower. And if, after all, it is desirable that a clock should be made visible, and its chimes audible for miles around in a city like London, it does not seem a very wild notion that it should be placed on a tower rather than against the wall of a three-storeyed building. If we take the merely architectural view of the question, we should like any amateur critic to tell us how many clock towers there are in Europe which can compare with that at Westminster. If a public clock is allowed to be a useless appendage to a building of this Imperial character, then the tower which carries it might well be reckoned as an absurdity. But we very much doubt if Londoners generally would endorse such an opinion. We never yet heard of any visitor to Florence, for example, being much staggered by the fact that the Campanile of Giotto had been reared to a great height. If some aerial device could be discovered by which the clock at Westminster might be suspended high up in air, the clumsy expedient of erecting a tower to carry it and its machinery might possibly have been avoided. But as constructive science is now understood, the complaint of the *Pall Mall Gazette* that 'an enormous tower' has been built to carry a clock rather vividly recalls the wail of that sapient correspondent in the columns of the *Times* some two or three years ago, who felt aggrieved that the spire of Chichester Cathedral had not been rebuilt, while all the money had been expended on the building of the tower!

This kind of criticism unfortunately extends far beyond the clock tower. The writer in the *Pall Mall* sees in every part of the Houses of Parliament features about which the visitor must be as curious as his guide is supposed to be puzzled. For instance, we are told that 'beyond the tower comes a long range of small windows several storeys in height. What, the visitor would naturally ask, are these? His guide would find a similar difficulty in answering, but he would probably make some remark about offices and committee rooms.' We heartily pity the unfortunate visitor who may happen to fall into the hands of such a guide as our critic

seems to have in his eye. There is no reason, that we can see, why there should be any vagueness in the remark that certain portions of a building required for offices and committee rooms are really designed for those purposes: the windows referred to may possibly be 'small,' but we suspect the writer in the *Pall Mall* would open his eyes if he were to measure them and compare them with those of his own rooms. We know well that many amateur critics continually get into their heads the delusion that because a building in its aggregate mass is very large, windows and doors must be on a corresponding scale. Those who study the art of architecture know that there is no such necessity. Windows, even in the most gigantic edifices, are usually intended to light what may be little more than ordinary sized rooms, while doors are usually designed for the ingress and egress of human beings. In neither case is it necessary to make extraordinary sized windows or huge doors, simply because they occur in a building whose whole mass may be very extensive.

Our contemporary makes indeed but a feeble point of the last quotation, probably feeling that if, after all, 'offices and committee rooms' were really required, it is well they should be really supplied in the building. The Victoria Tower seems to be the feature which brings the greatest disgrace on the Houses. The critic we are quoting indulges the conjecture that the same intelligent guide will inform his unhappy companion that this 'is a very splendid structure, the purposes of which are utterly unknown.' Now the Victoria Tower is, beyond all question, next to the Dome of St. Paul's, the finest architectural feature of the metropolis. It is difficult to understand why such a work reared in connection with a building representative of our national state should fall behind the principal feature of a building erected in the age of Queen Anne. There is surely the principle of *noblesse oblige* to be expected in great national works. Many things are right to be done when a powerful and wealthy nation undertakes to express its character in its monuments, which would be folly and extravagance in a small community. If mere utility guided every conception, the world would possess little or no history of art whatever. If the Victoria Tower of the Westminster Palace, the most national building of our time, a type of the royal state, is to be held simply as a splendid structure, the purposes of which are utterly unknown, it is, at least, difficult to discover what argument could justify, in another and less prosperous age, the erection of so splendid a structure as the Dome of St. Paul's.

With a similar fatuity of criticism the writer in the *Pall Mall Gazette* finds a blunder in the fact that the two Houses, of Lords and Commons, are placed quite *inside* the building. It would, as we believe, have been simply ridiculous to push the two Legislative Chambers on a street, or even river front, where their very uses would have been invaded by the din and traffic of a London thoroughfare. The two chambers are simply the kernels of two very thick shells, and no conception for such apartments could have so aptly suited their character and purpose.

The article we allude to concludes by a fair advocacy of the claims of Mr. Edward Barry to a share in the buildings connected with the Palace of Justice. It is not a little startling to find the claims of a son to a particular work advanced by a disparagement of the work of the father. We hope soon to hear the last of this cheap amateur criticism, which affects to discover nothing but failure in a building which is not only an honour to our own country, but is admitted by all educated foreigners to be a credit to the age. The kind of criticism we have been treating of is all the easier to a ready writer where the work reviewed is of a noble extent and quality; and in spite of it we will continue to entertain the wish, in the interests of modern architecture, that we had more architects like Sir Charles Barry.

MEMOIR OF ARTHUR ASHPITEL, F.R.I.B.A., F.S.A., &c.

BY WYATT PAPWORTH.

THE Architectural and Archaeological world will not easily repair the loss of such a member as Arthur Ashpitel, whose decease occurred last week.

He was born about December 15, 1807, the eldest of six children of William Hurst Ashpitel, of Clapton, who retired early in life from practice as an architect and surveyor. At about twelve years of age, when the boys at school were as vehement partisans as their parents in the matter of Queen Caroline, he was engaged in a playground strife of parties upon her case; and, being thrown, had one leg so much injured as to be lame for the remainder of his days. Thence, considering himself to be a confirmed invalid, his active and intelligent mind saw the necessity for study. Dr. Burnet grounded him well; and, as his illness prevented him from going, as intended, to college, his own talents with industry completed the superstructure, rendering him a good scholar; while an excellent memory assisted common sense in making him a learned man on many subjects. He had some acquaintance with Hebrew, translated Greek with facility, was critical in Latin, spoke French and Italian, and had perused carefully the characteristic literature of England of all periods. The extent of his reading, and part of the use which he made of it, may be judged by the numerous communications signed 'A. A.' in *Notes and Queries*, which, if collected, would form of themselves a very interesting volume. His metrical compositions in Latin, and English, as in the *Owl*, rose above mere versification; but for the amusement of his friends (especially the 'Cocked-Hat' antiquaries) he wrote doggerel, and sometimes printed it. He played well on the piano-forte; and, having studied the complications of Thorough-base, was able to improvise an accompaniment or a fantasia. His creative faculties, however, were less directed in the fine than in the industrial arts: although he had as keen an appreciation of the beauties of nature as he had a quick sense of the ludicrous and sarcastic, yet painting and sculpture were not such familiar subjects in his talk as the rites of a printer's chapel, the mysteries of a shipbuilder's loft, the management of an estate, or the manœuvres of a builder's workshop. To sail a cutter, or to snap at a rabbit, were recreations which suited his infirmity, and in which he was enthusiastic.

One of his earliest works in architecture, after establishing himself at

No. 5, Crown Court, Old Broad Street, was in 1845, when he designed the church of St. Barnabas, at Homerton, built at a cost of about 4,400l.; to which he added in 1848 the parsonage, and in 1852 the north aisle and vestry, at a cost of 1,200l. To his use of the Kentish rag-stone for these works may be ascribed his intimacy with a brother professional, Mr. John Whichcord, son of the late Mr. Whichcord, of Maidstone. He designed the Hutchison Markets, and the Palace Tavern in Gravel Lane, erected on the site of the Old House, which had been the residence of Count Gondomar while ambassador to the courts of Elizabeth and James I.; executed works to the amount of 2,500l. at the London Orphan Asylum at Clapton; and designed the Wellington Testimonial erected at the Southwark end of London Bridge, which was taken down under the pretence of its being an obstacle to the traffic, 1867-68, since which time the footway that was around it has been considerably enlarged in area, so as to lessen the carriage-way. He entered into partnership with Mr. Whichcord at No. 8, Carlton Chambers, Regent Street, removing in 1852-53 to Poets' Corner. Amongst their joint works they designed Baths and Washhouses at Maidstone, at Lambeth, at Bilston, at Tynemouth, and at Kidderminster; Kent Ophthalmic Hospital, Kentish Chronic Lunatic Asylum, Kent Infirmary, and Kent Asylum Chapel; the church erected among the ruins of St. Dogmael's Abbey, near Cardigan; churches at Blackheath, Platt, Postling, and Vernham Dean; Godmersham and Teston bridges; schools at Bexley, Milton, Rainham, and Pontardawe; Cranbrook Union; parsonages at Maidstone, and at Lamberhurst; with several villas; all these works, with others, were collected in a picturesque manner into a large drawing, and exhibited in 1855. Subsequently Mr. Ashpitel was engaged on designs for schools at Lea Bridge, near Clapton; the Gravel Pit Chapel at Hackney; model cottages for superior artisans at Hackney; the churches at Ripple, near Deal, in Kent, and at Aldborough Hatch, in Essex; the restoration of the church at Sutton, in Kent; the schools, costing 1,680l., for 650 children of Holy Trinity district at Hoxton; and a vicarage, with the enlargement of the church built about 1826, and a new tower, at Great Ilford in Essex; and the Gothic front in stone of a public-house in Redcross Street in the City; besides the drawings for a church at Oamaru, in New Zealand, to be built of wood, plastered between the timbers and to be roofed with shingles, so that his practice was Pointed or Classic, as he thought might be appropriate. He aided Mr. E. M. Barry, R.A., in hunting up the authorities according to which Charing Cross was reproduced at the Terminus in the Strand; and with Sir Charles Barry's sanction, he designed the ornament cast on the Westminster bell, so familiarly known as 'Big Ben.' His design for the restoration of the church of St. Margaret, Westminster, has been under consideration since 1860. Any list of his many executed designs for fountains, sepulchral memorials, and occasional decorations, is beyond the scope of this notice.

Two studies which specially evinced his artistic talents were 'Selections from Palladio,' made 1850; and a design (1851) for rebuilding Blackfriars Bridge, and throwing open the west front of St. Paul's; they were surpassed by the two splendid drawings printed by Messrs. Kell a few years afterwards as chromolithographs, with a small explanatory pamphlet. These were 'Ancient Rome,' being a view from the terrace of the Imperial Palace on the Palatine, looking along the Forum as he imagined it should be restored; with 'Modern Rome' from the same eminence, but looking a little more across the Forum; these drawings were carefully made from studies when at Rome (for he visited Italy after the death of his father, which occurred 20 April, 1852), and were exhibited respectively 1858 and 1859. As he became in some degree familiar with the characters and phrases occurring in the manuscripts of the sixteenth century in Italy by his extent of reading during 1853 and 1854 in the Italian libraries for the purposes of his enquiries for the restoration so shown, he was invited to examine the mass of architectural drawings in the Royal Library at Windsor Castle; his manuscript notes of its contents was graciously accepted by the Prince Consort. In that collection was a plan of the remains of an edifice which had covered a space equal to three times the area of Westminster Hall, and had been half as high again as that structure: Mr. Ashpitel was so much impressed with its value as a very old record of the Basilica of Constantine and Maxentius at Rome, that he carefully studied these materials for his drawings in restoration of the exterior and interior; these were exhibited respectively in 1864 and 1865.

As a member (elected 1851) of the Royal Institute of British Architects, he served on the Council and as Vice-President, besides acting on various committees; during several years he usually presided, and took great part in the preparation of the questions to be put to the candidates, at each meeting of its Board of Examiners of candidates for certificates of competency to act as district surveyors under the Metropolitan Building Act. When the request made by the Architectural Association for a Voluntary Architectural Examination was propounded, 1860, by the Council of the B. I. B. A. in a form not quite acceptable to the members of the Institute, a committee was appointed to investigate the subject; the services of Mr. Ashpitel as chairman of that committee were not confined to the duties of attendance at its numerous meetings, for his personal acquaintance with gentlemen officially connected with other public examinations procured to the committee the results of their experience; and when, out of the rather discordant schemes which are understood to have been proposed, one was issued that secured the adhesion of all the advocates of such an examination, its appearance was due in great part to his example of that forbearing compromise of unessential points which is so necessary in the conduct of public business. His influence with those whose dislike to a 'diploma' rendered possible the rejection of any scheme of examination, as well as with those who thought that examination would not be acceptable without the 'diploma,' offered an opportunity for his reconciliatory powers. The ultimate adoption of the Committee's plan may be fairly ascribed in great part to his subsequent energetic advocacy of it. After that point was gained he compiled the 'Sketch of Form of Examination Paper,' with the attached remarks; and cleared the way for his colleagues, Messrs. G. G. Scott, R.A., and M. D. (now Sir M. D.) Wyatt, in the labours of the first Examination, 1863. The report by the Examiners on that occasion, and also by himself, with Messrs. Scott and T. H. Lewis as Examiners, 1864,

and also by himself, with Messrs. E. Nash and J. W. Papworth, 1866, as Examiners and as Revisors of the regulations, show that, amongst many who talk much and (more or less) well on the subject of the education of the young architect, the rising generation has found none of its seniors more liberal, more helpful, more earnestly practical, than Arthur Ashpitel. Had his life been prolonged, it may be safely said that any indifference to those efforts which the younger members of the profession might show in not availing themselves of the Examination would have been the means of vexing his declining years by an ingratitude that might discourage his successors in the cause of professional education. His evening on 'Masons' Work and Masonry' with the members of the Examination class in the Architectural Association will not be forgotten by those who were fortunate enough to attend it.

When Mr. G. G. Scott's idea of a 'School for Artistic Architectural Education' was borne from the Architectural Association to the Council of the Institute and other bodies for co-operation, Mr. Ashpitel was one of those who were requested by the Council to act on behalf of the Institute. In this matter also his services as chairman were given with zeal and tact. If his dislike to pushing aside another had been conquered, and if his health had not been attacked, there is reason to believe that something like progress with the plan, which obtained the title of the 'School of Art Accessorial to Architecture,' would, ere this, have occurred. Mr. Ashpitel's disbursements in professional matters should not be forgotten: for example, the existence of the Architectural Exhibition, 1850-60, was secured by the guarantee of his providing the funds, as treasurer, without care that the balance was a chronic deficit on the part of the Exhibition. The subscription lists for many other purposes connected with art and science attest the liberality with which he used his income.

The 'Sessional Papers' of the Institute contain an Essay, contributed in 1857 by him, very much in consequence of Commendatore Canina's request that he would propound in England the views of the Italian antiquary 'upon the different theories respecting the Forum at Rome;' and another in 1860, on the 'Origin and Development of the use of Crypts in Christian Churches from the earliest periods.' His observations during the discussion in 1861 on 'the Mode in which Light was introduced into the Greek Temples' forms almost another paper; and in 1862 he supplied the notes 'on the Italian architectural drawings found at Windsor,' already mentioned. His address, November 28, 1862, to the Architectural Association on the Voluntary Examination was printed at his own expense for circulation among students. In the 'Archæologia' of the Society of Antiquaries, to which he also belonged, he contributed in 1857 a paper 'on Choirs and Chancels, particularly as to their use in Southern Europe;' and another in the same year, 'on the City of Cumæ and the recent Excavations there.' To the British Archæological Association he gave in 1845 a paper on the 'History and Position of Organs in Churches,' as well as 'Suggestions upon Chancels;' and to its 'Journal' the following discourses, delivered at the annual meetings: 1849, 'on Worcester Cathedral;' 1850, 'on the Cathedral,' and 'on St. John's Church,' at Chester; 1851, 'on Manchester Cathedral;' 1852, 'on the Priory and Church at Repton;' and 1854, 'on Newstead Abbey,' as well as 'on the Castle, the Cathedral, and the Church of All Saints at Rochester.' The interest of these discourses was heightened by original research for the purpose, in the British Museum and elsewhere, among mediæval documents. Amongst his avocations he found time for the description of a vase engraved in C. J. Richardson's 'Studies of Ornamental Design,' 1849-51; for re-writing Nicholson's 'Handrails and Staircases,' in 1851; for the essay on 'Baths and Washhouses,' 1853; for another essay called 'Town Dwellings,' advocating the erection of fireproof houses in flats, 1855; and for editing Nicholson's 'New Guide, or Book of Lines, for Carpenters, geometrically explained,' 1857. In 'The Fine Art Quarterly Review' appeared notices by him of C. Texier and R. P. Pullan's 'Principal Ruins of Asia Minor,' 1866; and of G. E. Street's 'Gothic Architecture in Spain,' 1867. The key to the plates of 'Ancient and Modern Rome' already mentioned was printed 1866; and in the following year appeared his edition of the 'Treatise on Architecture,' extracted by the proprietors of the 'Encyclopædia Britannica' from that work, and originally passing under the name of the late W. Hosking, whose treatises on 'Architecture,' on 'Building,' and on 'Construction' still form, with T. Tredgold's on 'Joinery' and on 'Stonemasonry,' and T. Young's on 'Carpentry,' and J. Robison's on 'Roofs,' on 'Arches,' and on 'Strength of Materials,' the staple of the edition; but Mr. Ashpitel, besides revising (to such extent as was allowed) those treatises, supplemented them with the sections on 'Egyptian, Jewish, and Assyrian Architecture,' adding a chapter on 'Indian and Chinese Architecture,' with a 'Glossary of Terms used in Mediæval Architecture,' and also supplemented the articles on 'Acoustics,' 'Joinery,' 'Roofs,' 'Stonemasonry,' etc., to bring their information down to the present time; and he supplied the material for numerous additional plates of illustrations. The discretion of the proprietors was perhaps less shown in repeating the issue of these stereotyped materials than in their selection of him to succeed Lord Macaulay in writing several biographical articles, as those on Vanbrugh, Wren, Wyatt, and Wykeham; in the last of these he adhered to the traditional view of his subject. His contributions to the 'Architectural Publication Society' commenced 1863 with the 'History of Ancient Baths, and their Development in the Modern Baths and Wash-houses.' He supplied to its 'Dictionary' another essay on 'The Manufacture of Brick,' and from that time (1865) to within six weeks of his death that work received his zealous assistance as a contributor, and his earnest cooperation as a revisor; he seldom returned a proof-sheet without two or three foolscap pages of criticism and suggestion, besides affording, at any time, the advantage of two or three hours' discussion on points that seemed to require particular consideration; his pleasure in the progress of that work was evinced by his even pencilling his notes whenever, unable from weakness to leave his bed, he could not write in ink. The assistance which he gave to other Societies and Literary Journals must be recorded in some more elaborate memoir.

He spoke with precision and fluency in public. The elegance of each step of his mathematical investigations was remarkable. The bent of his inventive faculty seemed to be to a rapid application of his familiarity with

technical details; in his numerous professional cases and important arbitrations that accomplishment made its effect apparent; while his knowledge of theoretical and practical construction in building was highly prized. Professors of the various sciences found in him a conversable companion, who understood their terms and phrases, and could give valuable assistance in an adjudication upon a theory, an experiment, or an operation. Lively in general society, his most joyous moments never went beyond the limits of a becoming mirth; and the indelicate topics of the day were treated by graver men with less modesty than by him. In a professional and private intercourse with him for twenty years, the only circumstance that seemed really able to provoke him was a misrepresentation of his views. Almost all who knew anything of him were aware of the acquaintance existing between him and Mr. Edmeston, which nearly dates from the time when Mr. Ashpittel first went to Crown Court to practise. Mr. Edmeston was observing last week that he had, for about twenty-five years, been in the most confidential and friendly relation to Mr. Ashpittel, although for many years disconnected with him in business, and could say, on quitting the bedside just before the final attack commenced, that exceeding kindness of heart, great disinterestedness, and a disinclination to speak ill of any one, were main features of the character which had so long been subject to Mr. Edmeston's close observation. His movements were gentle, partly regulated by his lameness; and his considerate treatment of animals caused cats and kittens to be familiar occupants of his studio; so that it is not wonderful that when such favourites in Canina's library at Rome (for the Commendatore had a similar partiality) had found their way on to Mr. Ashpittel's knee and shoulders before he had finished telling the object of his tour, that renowned Italian archaeologist was prepossessed in favour of his visitor. Neither of the two antiquarians, when wishing, in the warmth of conversation, to refer to a valuable drawing upon which a large white cat was asleep, appeared inclined to wake it by removal; so Canina smiled and suggested that the Englishman must return the very next day, when that drawing, and Canina's collections, and Canina himself, should be at his disposal. The liking was sure to be mutual; and between Canina and Emil Braun, hotly disputing, Mr. Ashpittel stood on each spot in Rome that interested the trio. Of course it will not appear surprising that, when the Italian worthy accepted Professor Donaldson's invitation to his house for his visit to England in 1856, Canina seemed, day after day, to prefer to every other bachelor's 'receptions' the library, the pets, and the piano of one who was so much his *confrère*, which were aided, as Mr. Ashpittel's receptions ever were aided, by a liberal and considerate, though unpretentious, hospitality. He liked to get committees to meet at his house.

The effects of the fever and ague which attacked him at Airole in Piedmont during his return from Italy never entirely left him. Energetic in rendering assistance in the matters in which he interested himself, he did not pay sufficient attention to his delicate constitution: his health, therefore, caused much anxiety to his relatives and friends. Early in last year he took up his residence, first at Reigate, and then at Ramsgate, whence he was brought home in the autumn in the very weak state from which he never rallied. He died on the afternoon of the 18th, and was interred on Monday last in the family vault in Hackney churchyard. A medallion head was executed at Rome by Sig. Amici, and a very successful photograph portrait was taken not long since for exchange among the members of the Surveyors' Club, to which he belonged for many years.

OBITUARY.

The late Mr. George Smith, Surveyor to the Mercers' Company, whose death took place on January 5, was born on September 28, 1783, at Aldenham, Herts. He was articled to Mr. Brettingham, afterwards was clerk to Mr. Alexander, subsequently to Mr. Beazley, and he eventually settled in business for himself in the neighbourhood of St. Paul's. He was appointed District Surveyor of the southern division of the City in 1810, and was elected Surveyor to the Mercers' Company in 1814; both these appointments he held till his death. He formerly held the office of Surveyor to the Coopers' Company, but this he resigned to take his place in the Court, and he served the office of Master twice. Among his works, as an architect, may be mentioned St. Paul's School, New Corn Exchange, the tower and entrance of the Old Royal Exchange, the Whittington Almshouses at Highgate, the Church in Blackheath Park, Hornsey Church, except the tower, Gresham College, and the Mercers' School. He was a member of the Royal Institute of British Architects, of which society he was elected a Fellow in 1834; member of the Surveyors' Club from the year 1807; and a Fellow of the Society of Antiquaries. He had recently built for himself a house, 'Newlands,' at Cophthame, in Sussex. During his long professional career Mr. Smith had earned and obtained the esteem and confidence of all who knew him or had to enter into business relations with him, and his loss will be sincerely regretted by very many.

Max Lohde, the Fresco Painter.—The subject of this brief memoir was born at Berlin on February 13, 1846. He was a pupil of Schnorr von Carolsfeld at Dresden, and afterwards an improver in the studio of another well-known fresco painter, Peter von Cornelius. In 1866 Lohde gained the Berlin Academy prize for a design depicting the last scene of Schiller's 'Bride of Messina,' and then applied himself to the study of *graffito*, following Semper's able leadership in the art. At the early age of twenty-two Lohde was commissioned to execute the frescoes in the grand staircase of the Gymnasium at Berlin, and in six months produced the four large compositions which now decorate those walls, and which have for their subjects scenes taken from the *Iliad*. His next work was the fresco in the gables of the new riding school of the Prussian War Office, the subjects being 'A Chariot Race in Olympia' and 'A Fight of the Centaurs and Lapithæ.' Upon the suggestion of the Minister for Commerce, Lohde was then offered the means to study in Italy, whither he went in June last; but the hopes which the art lovers of Prussia had entertained were not to be realised, for at Naples this promising young artist fell a victim to typhus fever on December 18 last.

The Prussian Government have taken steps to collect and preserve the sketches of one who, had he lived longer, would have been one of the greatest fresco painters of the age.

On January 3 died at Stockholm an architect well known and honoured in that city. Mr. Axel Nyström was Hon. and Corr. Member R.I.B.A., a member of the Imperial *Académie des Beaux Arts* of Paris, &c. &c., and attained the age of 75.

The Death of Sir William Newton is announced. The deceased artist was a celebrated painter of miniatures, but the introduction of photography considerably lessened his popularity. He received the honour of knighthood in 1837, and was born in 1785 or 1786.

MR. TITE ON THE NEW LAW COURTS.

AT the usual meeting of the Metropolitan Board of Works held on January 22 at the office in Spring Gardens, Sir John Thwaites in the chair,

Mr. TITE moved the following resolution with respect to the Site for the New Law Courts.

'Whereas it appears by certain public documents emanating from the Commissioners for building the New Courts of Justice that the actual cost of the site purchased in the Strand will amount to 785,000*l.*, and that the additional land now proposed to be purchased, according to Mr. Pownall's estimate, is 668,000*l.*, so that the total cost of the ground will be 1,453,000*l.*, and the expenditure on land and buildings together, as appears from the same document, will be 3,250,000*l.*, of which 1,395,150*l.* is proposed to be advanced by Government, at 4 per cent., on the security of a redeemable annuity; and whereas the Equity, Common Law, and other courts could easily be accommodated on the site already purchased by the Commissioners, the Probate Court, Masters' and Registrars' Offices could be placed on the site afforded by the Thames Embankment, with such supplementary acquisitions as the nature of the proposed buildings may require, by which means a considerable reduction would be effected in the cost of the land to be taken, and a position would be obtained superior to any, in regard to free circulation of air, unimpeded light, and in the facility of access by road, river, or rail; that it be referred to the Works and General Purposes Committee to consider the extent required for the suggested buildings, the area at present at the Board's disposal, and what additional property would require to be taken adequately to provide for the several offices enumerated, and that the committee be authorised to confer with Her Majesty's Government as to their willingness to negotiate for the acquisition of such a site for the purposes above indicated.'

In bringing forward the motion, he said he owed the Board some apology for having done so, but being confined at home by illness, and having some desire to see the embankment of the Thames continued on to Chelsea, and turning to the necessity for the Board obtaining funds for important public improvements, it led him to consider whether the Board could not advantageously dispose of some of its surplus land. He therefore saw their chairman upon the subject; and without going into the question as to whether or not it was an appropriate site, he found that selected by the Commissioners for the new Courts of Justice would entail a cost for its purchase of no less an amount than 785,000*l.*, and that the supplemental land that would be required would bring up the amount to 1,453,000*l.* This was a matter in which the public were deeply interested, but he (Mr. Tite) had no particular interest in the matter, because the money required for the land would be found by the Treasury; but it made him recur to a suggestion he made in the House of Commons some time ago, that some of the buildings should be placed on land belonging to the Metropolitan Board of Works, and such as they could spare on the Thames Embankment. He applied to the chairman (Sir J. Thwaites) to give him all the information he could upon the subject, and the result of his inquiries was the plan that was then before them. It was a great mistake to suppose that the Metropolitan Board of Works had any great amount of vacant land on the Thames Embankment, as the principal part of it had already been disposed of. At Blackfriars Bridge the land taken from the river had been given to the gasworks. The next piece was of very little value, but that following it, 800 feet long, had been allotted to the Temple for the actual or imaginary damage done to them for taking their water frontage. They then came to a piece of land of 350 ft. in length, which was at their disposal, and was to be appropriated to a station for the Metropolitan District Railway. The next land extended to Somerset House, where there was nothing to deal with; but between Somerset House and Hungerford Bridge there was a large space next to that, tinted blue on the plan, which was given to the Crown in exchange for the foreshore of the river. He then came back to the suggestion he made in the House of Commons, that, as he had been assured by a very competent authority that the land already obtained for the new Courts of Justice would be insufficient, and not equal to their wants, they should go again to Parliament for additional land marked red on the plan, unless they were to put some portion of the offices in connection with the Law Courts on the Thames Embankment. He would state a few facts on the plan which was then on the table. The land already purchased would cost 785,000*l.*, and the additional land proposed to be acquired would cost about 668,000*l.*, so that altogether the site according to the estimate, which was a very

different thing from the actual cost, would be much more than a million and a-half sterling. Then they were to take the buildings, architects' fees, furnishing, &c., which would bring up the total cost to three and a-quarter millions, of which sum 1,395,000*l.* was to be advanced by Government at 4 per cent. on the security of a redeemable annuity. About an acre on the Thames Embankment might be appropriated to some of the offices, for it would be advantageous that they should be divided from the general business of the Law Courts. For instance, persons who came to examine wills in cases before the Probate Court would be in the way, although it was necessary that the courts should be so situate that access should easily be had to barristers attending to them. Mr. Tite here quoted a very strong opinion corroborative of his own from the *Pall Mall Gazette*, written, as was supposed, by one of our leading barristers, showing that such a division was most desirable. Having alluded to the plan of Sir Charles Trevelyan, who had brought to bear a great amount of intelligence and talent, which had made a great impression on the public mind, he had proposed that the site should be changed, and that it would be a great mistake to put the buildings on the site selected in the Strand. His plan was that they should put the buildings on a site near the Thames Embankment, but that would not take a single foot of the land that the Metropolitan Board of Works might have to sell, as it kept all the buildings beyond the Thames Embankment line, although it would have a frontage towards the Thames. After a few other observations, the hon. member concluded by submitting the motion he had proposed.

Mr. PHILLIPS wanted to know whether the Board was not prevented by Act of Parliament from building on any portion of the Thames Embankment.

Mr. LE BRETON said he should move an amendment, but it was not hostile to the motion which had been proposed by the hon. member (Mr. Tite). He thought there were certain offices which might be separated from the Law Courts, such as the large offices for the deposit of wills; but they, as the Metropolitan Board of Works, could hardly at once agree to the disposal of the surplus land. He moved an amendment, which was as follows:—

'That it be referred to the Works and General Purposes Committee to confer with Her Majesty's Government and the Law Courts Commissioners as to the acquisition by them of any land which can be obtained on or adjacent to the Embankment for the purpose of affording additional space for any law offices which it may be deemed expedient to erect thereon.'

Mr. COOKE protested against any portion of the Thames Embankment being built upon. They had got a small open space and a few green trees, and he, for one, would say he would never consent to any buildings being placed on those open spaces which they had obtained with so much difficulty.

Mr. NEWTON supported the motion, and said that the Embankment was at present fringed by some of the worst houses in the metropolis, and it would be a great improvement if large, stately buildings were erected that would harmonize with the external appearance of Somerset House. As to the prohibition of buildings on the Embankment, that was done to prevent the erection of shops and other buildings of that class, but would not apply to such erections as would be in connexion with the Law Courts.

Mr. FREEMAN also supported the motion.

Mr. TITE expressed his willingness to accept the amendment of Mr. Le Breton, and withdrew his motion in favour of it.

The motion so substituted was then put and agreed to.

BUILDING CONTRACTS.

BY A LONDON CONTRACTOR.

A MOVEMENT has been set on foot by the builders and contractors of London and the principal provincial towns, having for its object the revision of some of the clauses usually inserted in building contracts and specifications of works. Some alterations are also suggested in other details of the business in which architects and builders are mutually engaged. The object of the present article is to explain the questions which are, it is to be hoped, rather under discussion than in dispute.

The authorship sufficiently indicates that this Journal is not to be considered as necessarily committed to the views now put forward.

The first suggestion made by the builders is that the 'general conditions of contract' now usually attached to the specification of works shall, for the future, be kept distinct; that the specification shall include only the detailed description of the work to be done; and that all clauses containing legal powers or liabilities shall be transferred to the 'contract.' In a very great number of cases a description of the work on the one side, and a letter undertaking its execution for a stated sum on the other, are all that is required, at any rate between parties having a knowledge of, and confidence in, each other. Where anything more is necessary, the edged tools of the law should not be meddled with by the uninstructed hands of architects and builders. The one in preparing and the other in signing the clauses now usually adopted are in most cases profoundly ignorant of the full legal bearing of the words and

forms employed, or of the vast importance of others that are omitted. Probably few architects are aware that unless they are made parties to the contract between their client and the builder, or in the absence of a special clause in the contract bearing on the point, the builder has absolutely no power at common law of obtaining redress should the architect, through infirmity of temper or judgment or from collusion with his client, refuse to issue his certificate. Whether a court of equity could or would interfere is, in the opinion of an eminent Chancery barrister, extremely doubtful; but it may be safely assumed that a less formidable remedy would be satisfactory to the great majority of the architectural profession. Again, are there many builders who know that in contracts where the payment is to be made on completion, unless there is a provision for suspending the works, they will be compelled to complete the contract, however large, before a debt will have been created, although in the meantime they may have become aware of the insolvency of the employer?

That all points in contracts having reference to legal questions should be settled by the lawyers, and not the architects, of the parties interested, appears so reasonable a proposition that the foregoing illustrations seem hardly required to enforce it, were it not that daily experience shows in how few cases it is acted upon.

It will be admitted that in drawing up an ordinary contract, the builder, on the one hand, must not refuse to secure to his employer that the work agreed upon shall be properly executed for the stipulated sum, and it will no doubt be equally admitted, on the other hand, that he must be protected from the employer seeking to obtain any excess in quality or quantity over the work described. Further, the punctual payment of the amounts agreed upon must be secured; and, lastly, all questions not foreseen or provided for should be settled on terms equitable to both sides. With these principles as a guide, there should be little difficulty in deciding on the merits of any particular clause.

One of the most prominent clauses objected to by the contractors is the one referring to orders for 'extra works.' In its most objectionable form, it provides that no 'extras' will be allowed unless an order in writing, headed 'extra work,' signed by the architect, the employer, or both, shall have been given previous to the execution of the work, and that drawings shall not be considered as orders. The sting of this lies in the words 'previous to the execution of the work.' It may well be doubted whether it is fair to insist that the contractor shall know all the details of the work sufficiently to detect at once from a working drawing that it is in excess of the agreement, and that, if the builder unwarily carries it out, no charge can be made, or that an employer may repudiate the payment of work for which only a verbal order may have been given; but there can be no doubt as to the injustice of making it possible that, where a builder shall have executed work in accordance with the instructions of the architect, sanctioned by the employer, the employer shall be able to refuse payment on the ground that the written order was not given 'previous to the execution of the work.' And yet this clause is in frequent use and has been frequently acted upon. The builders, therefore, urge that every contract should provide that the authority of the architect for extra, altered, or omitted works, shall be sufficiently evidenced by any order or subsequent approval in writing signed or initiated by him, or by any drawing furnished by him.

With reference to the clause respecting undefined works, the builders consider that they should not be bound to execute within their contract price works not shown on the drawings or mentioned in the specification, but necessary to complete the buildings as intended, unless the same can be fairly and obviously inferred from the drawings and specification. In the absence of this latter qualification a contractor may find himself legally bound to execute, without payment, additional works not contemplated either by himself or the architect, and payment for which the latter, however justly disposed, may be powerless to obtain for him, because it must be borne in mind that an arbitration clause, unless very wide, will afford no remedy, nor will a condition that questions are to be left to the architect to decide, as his decision must be based upon the terms of the contract.

With one signal exception the remaining clauses which are now called upon to justify their *raison d'être* are not of sufficient importance to warrant the space which their discussion here would occupy. That exception is the arbitration clause, which will be the subject of a subsequent notice.

ILLUSTRATIONS.

ST. PETER'S CHURCH, HEDENHAM, NORFOLKSHIRE.

The whole church has been restored and reseated. The chancel has not been rebuilt, but the roof is entirely new, and the reredos and stalls shown in the drawing are new. Our view represents the chancel looking east. The new works have been designed and superintended by Mr. E. J. Tarver, A.R.I.B.A.

ALL SAINTS' CHURCH, UPPER CALDECOTE, BEDFORD.

This church (of which we give an interior perspective view, showing the chancel) has been erected from the designs and under the superintendence of Mr. A. W. Blomfield, M.A. The chief interest which attaches to the church arises from its success as a work of art, and the very moderate amount of its cost. For a sum extremely modest

when reckoned at so much per sitting, or when looked at as the cost of a complete church, Mr. Blomfield has succeeded in producing a building which, as our illustration shows, has good claims to be looked upon with admiration.

The proportions of the church are not lofty, and the materials are chiefly brick, stone being very sparingly introduced. Coloured decoration has been to some extent employed to heighten the effect of the chancel, and, though not spread over a large surface, yet combines well with the simple patterns produced by the use of bricks of different colours. This design is a good example of that class of church which is often called for where means are narrow, and at the same time a certain amount of beauty and grace is indispensable.

SOCIETIES.

The Institution of Civil Engineers.

JANUARY 12, 1869.

Charles Hutton Gregory, Esq., President, in the chair.

The paper read was 'On Coal Cutting Machinery, as a Substitute for the use of Gunpowder,' by Mr. C. J. Chubb.

It was remarked that the improvements now needed in the art and practice of coal-mining might be thus specified:—first, to ensure greater safety to the men employed in working; and secondly, to obtain the coal in better condition, and, by preventing as much as possible the loss arising from waste, to make more fully available all the remaining resources of the coal fields. It was contended that the use of gunpowder and the operation of blasting must be altogether abandoned; and the problem to be solved was, what force could be applied which should be equally effective, and at the same time break the coal in a more perfect manner. The author thought some more simple and practicable means of getting coal by mechanical power could be devised than the costly, but skilfully contrived, coal-cutting machines. His first idea was to apply wedges, acted upon by hydraulic force, but he was induced to abandon that system, owing to objections to the use of wedges, and to adopt instead an apparatus consisting of twelve plungers, set side by side in a steel bar, which plungers, when acted upon by water from a hydraulic pump, would separate the bar in which they were set from another bar, formed in the shape of a cover upon the plungers. The pressing apparatus was 25 inches long, and it was attached to a hydraulic pump by a tube 2 feet in length, so that it might be inserted into the coal to a depth of about 3 feet 6 inches. The apparatus, with the cover on, was 4½ inches in diameter. When, by the action of the pump, the plungers had reached their limit of 2¼ inches, and further expansion was needed, the plungers were readily brought back to their first position by opening an escape-cock for the water, when a liner could be inserted between the plunger and the cover; and this process could of course be repeated. In practice, however, it was found that the first expansion to 2¼ inches was more than sufficient. It was stated that the collective area of the plungers was 24 square inches, and as the pump could exert a pressure of 12 tons on the square inch, a total pressure of 288 tons could be brought to bear on the coal.

This apparatus had been tried in the South Wales district, where the coal was of the most varied description. It was observed that by the present system of blasting, it occupied, on an average, two men ten hours to break down and fill into trams 4 to 5 tons of coal, of which 20 per cent. was 'small,' and the remainder much shattered. On the other hand with this apparatus two men could readily break down 20 tons in one hour, which could be filled, when loosened, at the rate of 10 tons per man per day, the whole of the coal so obtained consisting of large solid pieces. Again, by the present system, in order to break down 500 tons of coal a day, from a 'four-foot' seam, a 'face' of 600 yards was required, whether as 'pillar and stall,' or as 'long work;' whereas with this apparatus the same quantity could be worked from 300 yards of 'face.' In this way there would be less space requiring to be ventilated, the working operations could be concentrated, and facilities would be afforded for effecting economy in other respects.

The discussion was then resumed upon Mr. Bidder's Paper in conjunction with Mr. Chubb's, and not being concluded it was announced that it would be continued at the next meeting, when, time permitting, the following Paper would be read: 'On New Ferry and New Brighton Piers,' by Mr. H. Hooper, Assoc. Inst. C. E.

At the Monthly Ballot, the following candidates were balloted for and duly elected: as MEMBERS, W. Anderson and F. W. Kitson; as ASSOCIATES, C. J. Clarke, E. N. Clifton, T. Dyke, R. M. Greene, T. Hennell, A. H. Kessner, F. L. O'Callaghan, W. W. Phipson, L. W. Pritchard, W. Stevens, W. H. Treverton, and M. Vidler.

A report was brought up from the council stating that, under the provisions of Section IV. of the bye-laws, the following candidates had been admitted Students of the Institution since the date of the last announcement: J. Addy, J. Baumann, J. Brunlees, A. G. Fowler, A. C. Robson, R. Sharland, G. Stevens, and J. J. Stiles.

Associated Arts' Institute.

The fortnightly meeting of this Society was held in the rooms at 9, Conduit Street, on Saturday Evening, January 9, the President, Professor Westmacott, R.A., F.R.S., in the chair. After the ordinary preliminary business had been transacted, a paper was read by Mr. H. Ellis Wooldridge 'On the Cultivation of Artistic Feeling.'

Mr. WOOLDRIDGE, in opening his subject, remarked, that in the art productions of the more highly gifted races—those of the Greeks, for instance, or the Venetians—there existed certain qualities which our own efforts always failed to attain; and from this he concluded that the capacity of

those who produced them for receiving delicate impressions must have been more extended than our own. Our deficiency might, he thought, be attributed to something of the spirit of asceticism still lingering among us—to our regarding the gratification of the senses as something ignoble in itself, and as being a bar to intellectual progress. Those mistaken views had their origin in the relation of the senses to the mind not being properly understood. That they were inconsistent with the laws of human nature was shown by the fact, that whenever the enjoyment of the pleasures of the senses had been rigidly prohibited—as during the supremacy of Puritanism—reaction, developing itself in excess, had been the result. On the other hand, the full and indiscriminate cultivation of the gratification of the senses had produced no less pernicious consequences, as was seen in its disastrous effects on the societies of Greece and Rome. The true mean was only to be found by a more philosophical investigation of the relation of the senses to the intellect than had yet been attempted.

After these somewhat general observations, Mr. Wooldridge proceeded to speak more particularly of that division of the sensuous organisation of man which enables him to receive impressions from nature, and to reproduce them as art. At the close of the sixteenth century this power had reached its greatest development. It then steadily declined, till, in the first half of the present century, there came in this, as in other things, a reaction. We shall do Mr. Wooldridge greater justice by allowing him to give his own words:—

'The first evidence of this reaction in painting—the first at all events which was apprehended as such by the world at large—was, what is called the "pre-Raphaelite movement." We hear very little of the pre-Raphaelites nowadays. One, their chief, Mr. Rossetti, has withdrawn himself altogether from the public; another, Mr. Millais, is more prominent than ever, but his present work, noble as it is in some respects, by no means represents what we mean when we speak of pre-Raphaelitism; others have ceased to paint; only one, Mr. Holman Hunt, still comes forward, from time to time, with a picture which is yet true to the principles of his early faith. The name is being forgotten; if it is ever revived it is but to point the finger at it still. And yet what a debt of gratitude we owe to them; what a flood of light came in through the door which they opened! They have been accused, perhaps justly, of interpreting the visible side of nature in too literal a way, of trying to make painting do something it cannot do, and was never intended to do; but we must not forget that they were the pioneers of a reaction against a school of painting which was not only unlike nature but had even lost every ray of sympathy for nature, and it is scarcely to be wondered at, if in their enthusiasm they laid down rules for an almost servile adherence to real life which have been long since disregarded by the greatest of them. But, though what was unstable has not stood, there was after all so much stability in their work that we may be said to owe to them almost all that is admirable in the painting of to-day. Certainly they awakened the artistic sense, stimulated it, excited it; and, whatever they may have intended, they sent men to the study of Phidias, Titian, Raffaele, and Michael Angelo, with purged eyes. Hitherto men had gone to the Greek and Italian masterpieces, influenced not unnaturally by a generous admiration of the works of their contemporaries, but with their perceptions necessarily dulled and blunted by such an influence; and as it is the property of a masterpiece to give pleasure to all, but to each one only so much as he brings the capacity for, what wonder if they found in Phidias, in Titian, in Raffaele, in Michael Angelo, only those qualities they were accustomed to admire in Canova, in Haydon, in Hilton, in Benjamin West. But men came from the study of pre-Raphaelite pictures to the study of great masters, not only with new and definite ideas about them, but with their minds made highly sensitive and ready to find new qualities in them; and surely we may be said to have found many new qualities in them. When we think for instance, of the works of Benjamin West, who revered the old masters as deeply as a man well could, and who thought he sympathised with them too; when we compare his work and the small amount, as it seems to us, of real appreciation of the great masters we find in it, with the curious perception of some of their finest qualities which we see in the work of Mr. Burne Jones, Mr. Legros, Mr. Whistler, and others of our own time.

'And the mention of one of these names reminds me that the reaction, among its various forms, has even taken, in some directions, the form of a cultivation of the *purely* artistic sense. I, for my part, believe it to be—as yet, at all events—a healthy form of reaction; indeed, I do not see how it could be otherwise, while it produces work so lovely as this of Mr. Whistler and of Mr. Albert Moore. For in their delightful creations we have certain qualities of colour, and certain graces of form, given in a way so new and perfect, that they have fairly taken every one whose opinion is worth having by storm. And yet, even while we are admiring their work, we become aware of the danger that hangs as much upon the skirts of this development of a particular sense as upon the development of the senses in general. I mean the danger of pursuing it too exclusively, if not too far; the danger of preferring to work for a few, instead of as many as possible; the danger of forgetting the duty which painting owes to the intellect. For painting has a duty to the intellect just as poetry has; not, perhaps, to such an extent, because poetry, by reason of its nature, can carry more to the intellect than painting ever could. But still, to some extent, and since it is possible—as by all great work it is certainly proved to be possible—to appeal at the same time both to the artistic sense and to the intellect, the philosophic spirit, it seems, to say the least, a misfortune that both should not be appealed to. I do not want to find fault with the works of Mr. Whistler and Mr. Albert Moore because they have not something which they do not pretend to have; I am content to take them most thankfully upon their own ground, and to enjoy them unreservedly; only I say it is their very beauty that forces me upon reflections of this kind, that suggests irresistibly the danger of believing that to be complete art which in reality exhibits, however exquisitely, only one form of it. I do not think a man should deny himself the expression of any purely artistic idea that may occur to him; indeed, I think he would be wrong to do so; and that we, on our side, should be wrong if we were not grateful to him for it, since it will go to make up the sum of artistic progress; only we must not forget that if his work is to be of real importance to the world at large, if it is to live

not only in the memories of the few who know what quality in painting really is, but also in the memories of that vast army of cultivated men and women who are not educated in the subtleties of art, it must have in it something more—some dealing with a human problem—some recollection, at least, of an intellectual idea—something, in short, which, while satisfying the artistic sense, shall also satisfy, to some extent, the philosophic spirit.

'I say to some extent, because it is just as retarding to run into excess in performing a duty as in following a pleasure, and it is almost as easy; and unless the extent to which the intellectual part of a picture may be carried be rightly felt, we shall be in danger here also. It seems like a truism to say that in art the artistic sense is most important, and that the intellectual idea, though necessary, is only of minor importance; and yet, I think, we cannot look, for instance, at such pictures as Bronzino's "Allegory" in the National Gallery, or one by Tintoretto at Hampton Court—a bird's eye view of a labyrinth of human life with people wandering in it—and not feel that the painters have in some way failed to apprehend the true place of the intellect in painting—that they have allowed their fondness for thinking to carry them a little beyond the true limits of their art. There is a discord somewhere; we are puzzled, distracted, unsatisfied; and I think the cause is what I say—the claims of the intellect are put forward over strongly: they are made to demand too large a share of our attention, at least as large a share as the claims of the artistic sense. It is this just perception of the true position of thought in relation to art that makes the allegories of the great master of that kind of subject—Albert Dürer—so successful, and it is the want of it that makes the Allegory of Bronzino so unsuccessful; in the one we are attracted first by the nobility of the art, and only fall back upon the Allegory afterwards; while in the other, from the moment we begin to look at it, we are racking our brains to find out what it means. I do not stop to ask how far this just perception may be acquired, or how far it is innate. I only say it must be *there*, if we are to have great art; the want of it is always characteristic of a declining school. In the decadence of Greek and Roman art it was very remarkable, and the schools both of Florence and Venice had seen their best days when Bronzino and Tintoretto were painting these allegories in which we find it. It is true the tide had only just turned in Florence and Venice when Bronzino and Tintoretto were prominent; but it is very interesting to find these instances of an over-allegorizing tendency just at the turn, and it suggests the question whether an inclination towards reflection existing in society has not always, sooner or later, had a fatal influence upon the art of that society. I think that hitherto it has. For the artistic history of a nation is very closely connected with its political and religious history, and depends quite as much as they do upon the conditions of national life; and, in the early life of a great nation—such a life for instance as that of Greece in her best days—all that is said and done in politics, in religion, in art, will seem perfectly natural, perfectly spontaneous, the necessary expression of a happy, harmonious, noble life.

'The perfect artist is no hermit, shutting himself up from everything that does not seem to bear immediately upon art; he is influenced constantly in all sorts of ways by everything that goes on in the world; so that I make no apology for dealing with the subject in this inclusive way, nor for directing your thoughts, not to the study of any one school of art, not even to the study of art simply, but to the study of all those influences which have determined the actions of men, and especially—as being most important to ourselves, and as determining in a great measure our actions—the study of the Modern Spirit.'

After some further observations, in which Mr. Wooldridge urged the desirability of attaining by means of philosophical enquiry, in accordance with 'the Modern Spirit,' to that state of artistic sensibility which was in Greece of spontaneous growth, he brought his very thoughtful and carefully written paper to a close.

After a few brief remarks from members,

The CHAIRMAN expressed his admiration for the paper just read, and his concurrence generally with the views advanced. He thought, however, that too much importance was attached by Mr. Wooldridge to the sensuous qualities of art. It was remarkable that whenever in the history of art those qualities had gained ascendancy over the intellectual, art had at once declined. Such was the case when the luscious beauty of the school of Praxitiles became the great feature of Greek sculpture. As to the claims of the senses to be cultivated to their fullest power of perception and enjoyment, he agreed with Mr. Wooldridge, since it was through them alone that the mind could hold communication with the external world, and unless they were highly cultivated by the artist his work must be inferior. He thought that Mr. Wooldridge had somewhat over-estimated pre-Raphaelitism. Real pre-Raphaelite art—the work executed before the time of Raffaele—was most interesting. It expressed the feelings of its age, and embodied all the art-knowledge of its producers. Not so nineteenth century pre-Raphaelitism. Still, earnest work was always valuable work, and he acknowledged that much earnestness was shown in many of the paintings of this school. He believed, however, that the abandonment of pre-Raphaelitism by its most eminent professors was a proof that its principles were of small value. The pre-Raphaelites deserved praise chiefly for having boldly protested against the wrong, and followed Nature, though they might perhaps have done so in a mistaken manner. A great difficulty at the present day was, how to make art elevating, and at the same time generally attractive. It could not be said that the public showed no interest in art. As a member of the Council of the Royal Academy, he (Mr. Westmacott) had recently been going through some of the accounts of that institution. He found that during the last ten years the average receipts, from shillings taken at the doors, had amounted to no less than 11,000*l.* per annum. It was obvious, therefore, that the British public did feel some interest in art, and found pleasure in the works shown to them. But how much of that art was elevating in its character? How many of all the pictures exhibited would live? The best means by which popular art might be made noble was a subject on which he hoped a paper would be read before the Institute.

The elevating and the attraction might be reconciled, and the duty of reconciling them rested with the younger men.

A vote of thanks to Mr. Wooldridge having been briefly responded to by that gentleman, the proceedings of the meeting terminated.

Institute of Surveyors.

The usual fortnightly meeting of this Institution was held on Monday evening, Mr. J. Clutton, the President, in the chair.

After the routine business of the meeting had been disposed of, the discussion on Mr. R. H. Grantham's paper on 'Arterial Drainage,' commenced at the last meeting, was resumed by

Mr. EDMUND JAMES SMITH, who said that he had moved the adjournment of the debate less for the sake of speaking himself than for giving other gentlemen an opportunity of making observations on Mr. Grantham's very able and practical paper. He would, however, go into the question, what form the taxation of the area within any drainage district should assume. His experience, which was of thirty years' standing, tended in favour of an *ad interim* acreage charge during the construction of the works, supplemented by an assessment of the advantage which each part had received by the improved outfall. Basing the assessment on the poor's rate, by which the fields which got the most advantage from the improvement would be put at the lowest rate, was a fallacy which no man with ordinary common sense would support.

Mr. BAILEY DENTON wished to add a word or two which he thought might be of historical interest with reference to the Act of 1861. He considered that Act was the result of a public meeting held in London in February, 1861, convened at the instigation of Sir Henry Vavasour, and of a great deal of correspondence and description of evils which were then being made known in the agricultural press by the pen of Mr. Algernon Clarke. He (Mr. Denton) had also taken an active interest in the question, and he felt that his friends and himself had (no doubt most unintentionally) been rather put on one side in Mr. Grantham's note of the origin of the Act. Passing from this, he urged the formation of Conservancies for each river basin in the country. Speaking from his own experience, little would be effected by this Act till such boards were formed. As a rule, the districts are small, and the work (if it is to be done well) is costly. Landowners are not at present in a condition to agree to any very heavy expense. Still the work is progressing; and he believed that, if Conservancy Boards were established, many other improvements would be set on foot under their supervision. Coming to the question of rating—which was one of importance to surveyors—he could not quite agree with Mr. Smith. He thought that, instead of an *ad interim* charge of any kind, there should be a uniform acreage charge, to be supplemented by an improvement charge. This might be a distinction without much difference; but that if the latter form was adopted, we should be doing what was wise.

Mr. FRANCIS VIGERS thought the meeting was taking too narrow a view of the question, which was not who was the originator of the 1861 Act, but what could be done towards the improvement of the natural arterial drains of the country. It is well known that, from neglect, or for the purposes of trade, there is not a river in this country which does not offer a bar to the efficient drainage of the district surrounding it; and he thought that, if the members, who were to be found in all parts of the country, would but sink their differences of opinion and unite together, and make observations of the rivers in their neighbourhoods, a fund of information would be collected, not only creditable to themselves, but which would be of service to Government when it came to enquire into the matter. He lived on the Mole—perhaps knew more about it than any other river in England—and he would undertake to make a survey of that river, to show that he meant what he preached.

Mr. R. C. DRIVER was of opinion, judging from his experience in Gloucestershire, that mills were a total obstruction to the proper cultivation of land.

Mr. J. W. BARRY said that mills and drainage would always be antagonistic, and the point to consider was which of the two was most valuable. Again, the question of navigation came in opposition to drainage: there also the same consideration would apply. Any proposal which omits these considerations will be useless, and any gentlemen who gave them surveys ought also to furnish particulars as to the value of the mills and the navigation, as well as that of any improvement which might result from the drainage.

MESSRS. FRANCIS FULLER, SQUAREY, and F. CLARK having addressed the meeting, Mr. GRANTHAM very briefly replied to the observations of the various speakers, and stated that though Mr. Bailey Denton's statement was perfectly correct, he had not in any way raised the question as to the originator of the Act of 1861, nor did he propose to discuss that point.

The CHAIRMAN thought all present were much indebted to Mr. Grantham (hear, hear) for having brought this large and important subject before the meeting. He believed that the discussion would forward the drainage of the large valleys of the country. He thought his friend Mr. Vigers was right in his observation that we ought to discuss this matter on broad principles. Mr. Barry, too, hit the mark when he said that the value of the mills and the navigation must be weighed against the presumed value of the improvement. The Chairman then gave two or three illustrations of this fact, stating that the valley of the Thames was the worst drained in the country, and that if a really great flood should come, many of the locks are so rotten that they would be swept away. The Thames valley would afford work for six engineers and a dozen surveyors. There was one advantage in possessing the Act of 1861, as it affords the majority the power to override the minority. This is a great boon, for in land matters obstructions as a rule are caused by some obstinate owner who has but little interest at stake. With reference to the Leadon valley, mentioned by Mr. Grantham, it must be borne in mind that at least half the cost of the undertaking was incurred in purchasing the mills, and that out of the total cost but 30 per cent. was occasioned by the works and improvements. It had been asked during this

discussion how far below the surface was it necessary for the water to be taken for the proper cultivation of land. That was a question which could only be answered relatively. If the land was to be used for grazing purposes, it would not require to be taken very low; but if the land is to be arable land, then you must go at least four feet below the surface. Sometimes in pasture land the drainage would destroy all the grasses which had hitherto been nurtured by the floods; and he knew of cases in Lincolnshire where land used to fetch, as pasture or meadow, 3*l.* per acre, and which sunk to 20*s.* after being drained, but when broken up and utilised as arable land it recovered its value. He thought, as regards the rating, it should be on the improvements conferred. In Ireland the land is both valued before the commencement and after the completion of the works. This is obviously the best method, as it must be very difficult to estimate the improvements by merely going over the ground after the work is finished. Natural drainage must, of course, be preferred to steam power wherever it was possible. He was glad to see that the Government had taken this matter up, and he trusted that if this Institution could furnish any information it would do so to the utmost. He had now to call upon Mr. Edward Ryde to read his paper entitled 'Parochial Assessments.'

Mr. RYDE said he had originally intended to deal with the subject of 'Parochial Assessments' in all its phases, viz.:—1. To give 'Historical Notes' of the legislation on the subject, and of the purposes for which the various rates and taxes have been authorised. 2. To point out in respect of what property they are imposed, or what is subject to them; and the mode in which such property is to be valued for assessment. 3. To consider the form, allowance, publication, and collection of the various rates, the persons who are liable for their payment, the remedies of parties against unfair and incorrect assessments, and the tribunals to which appeals have to be made. It was found, however, that the subject was too large to be treated in one paper, and Mr. Ryde on the present occasion confined himself to the Historical portion of the subject. Without doing the author injustice, it would be impossible to abridge the paper: we will therefore content ourselves with a record of the fact, that considerable applause greeted the conclusion, that a vote of thanks was accorded to its author for its ability, and that the discussion on this paper will be the first real business of the next meeting, on Monday, February 8.

Afterwards a paper, by Mr. J. Bailey Denton, will be read, entitled 'The Future Extension of Railways with Reference to their Influence on Landed Property and Agriculture,' and which it is thought will afford plenty of scope for variety of opinion, and lead to an animated discussion.

REVIEW.

SPRAGUE'S POCKET DIARY AND ARCHITECT'S AND SURVEYOR'S MEMORANDUM BOOK. London: W. W. Sprague & Co., 14, Sherborne Lane.

This is an excellent idea carried out in a compact and most creditably got up shape. To a small pocket diary and almanac, such as almost every busy man finds it necessary to carry in order to register appointments, Messrs. Sprague have appended a calendar and a few items of that general information which accompanies every ordinary diary. This is fitted for the special use to which its name points it out by the addition of a compact series of such tables and memoranda as are supposed to be most often required in practice. The idea is, we believe, a novel one, and is certainly a happy thought. The principal drawback is, that it is not carried far enough. We would willingly exchange the list of London bankers for a list of district surveyors, Her Majesty's Ministers for the Members of the Metropolitan Board of Works, the proper lessons for every Sunday in the year for the tables of 'useful memoranda in matters of land valuation' which a very well-known London surveyor has printed for private circulation, and the Stamp Act for an abstract of the Building Act. A table for turning measures on the metrical system into feet and inches would be a most useful addition, and so would reliable tables relative to wrought and cast iron girders; but they must be better ones than those for wooden girders here given. Having thrown out these hints for a future edition, it is only fair to say that the contents of the present one, as it stands, are very useful, and that it will probably be found the most satisfactory *vade mecum* in small compass that an architect or surveyor can possess. This venture can hardly fail to be successful.

ATCHLEY'S BUILDER'S PRICE BOOK; LAXTON'S BUILDER'S PRICE BOOK.

These two very valuable annuals keep up their character for usefulness and reliability. We believe that an Architect's, Engineer's, or Builder's Office is incomplete without them. Atchley's 'Price Book,' which is well got up and well bound, consists of 348 pages, and on nearly every page something may be found of importance to the class of readers in whose interest it is published. It contains a great amount of information that is to be found nowhere else, and we can cordially recommend it to our readers. Laxton's 'Price Book' maintains the high character which a half-century of usefulness has won for it.

NEW BUILDINGS AND RESTORATIONS.

A New Lecture Hall, erected on the estate and at the sole expense of J. S. Garrett, Esq., was opened on Friday last at Cavendish. The building, which is situated close to the Cavendish Railway Station, contains on the ground floor a main hall, 50 feet long by 24 feet broad, and 20 feet in height. Leading from the lecture room is a class room, 20 feet by 13 feet, fitted up with every convenience, and a private room, 15 feet by 10 feet, with door opening on to the platform. There are besides two rooms over the entrance hall, which may be used as a residence for the hall keeper. Mr. Salter, of Sudbury, was the architect of the building, which was erected by workmen in the employ of Mr. Garrett.

A New Theatre, to be called the Theatre Royal (Stockport), has just been erected, and will be shortly opened.

The Parish Church of Camden Town has undergone some extensive alterations and improvements, which have had the effect of changing its previous dreariness to elegance and comparative cheerfulness.

The Mechanics' Hall at Nottingham, which was destroyed by fire last spring, has been rebuilt, and was opened a few days since. It is now, perhaps, one of the finest buildings in the Midland Counties.

Christ Church, Wolverhampton, which had been temporarily closed for additional improvements, has been re-opened.

The new Wesleyan Chapel has been opened at Lower Broughton, Manchester. It is built in the Italian style of architecture, at an expense of 6,200*l.*

Plans for building cottages, each containing living room and three bed rooms, have been approved by the Agricultural Employment Commissioners. The cost of construction is to be 85*l.*

A noble building has been publicly opened at South Shields for the education of seamen in navigation. It comprehends class rooms, lecture hall, and observatory; and is quite complete in its details.

The parish church of St. Feock, Cornwall, has been re-opened. The whole fabric was put in repair more than twenty years ago. Some portion of it was then rebuilt, and great improvements have just been effected in the chancel.

The new church of St. Gabriel, in the parish of St. Bartholomew, Birmingham, has been recently opened. The cost of the edifice, including fittings and lands, was 4,200*l.* Of that sum 3,000*l.* were contributed by the Ryland Fund, and the remainder has been defrayed by voluntary donation.

The old parish church at Warkworth has been renovated and restored at the sole expense of the lady of the manor.

The parish church of South Weald has been re-opened. The nave, south aisle, and upper portion of the tower were taken down; but the latter has been restored, the old lines and details still remaining. The body of the church now consists of nave and chancel, south aisle, and lay rector's chancel; the additions being the new chancel, organ-chamber, and vestry. The entire work has cost about 7,000*l.*

Bristol and Gloucester Cathedrals.—The building of the new nave in Bristol Cathedral is steadily advancing. A complete restoration of the choir of Gloucester Cathedral has commenced. The work will extend over at least two years, and involves an outlay of at least 13,000*l.* The restoration of the south transept has just been completed; it is to be followed by the restoration of the south porch. The original estimate was 45,000*l.* Out of this, work, mainly external, has been completed to the amount of 10,000*l.*, and work is now undertaken to the amount of 13,000*l.* There remains, therefore, about half the work to be taken in hand.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Decorations at the Cutlers' Hall, at Sheffield, for the Duke of Norfolk's Majority.

On Tuesday evening, January 26, the Duke of Norfolk presided at the first of a series of banquets in the handsome new hall of the Cutlers' Company, at Sheffield, to celebrate his accession to his paternal inheritance. The decorations of the hall are elaborate in character, and are intended to portray the history of the noble and ancient House of Howard, whose armorial bearings are displayed on shields and bannerets along the sides and at the upper end of the hall. From the cornice are suspended on each side six bannerets emblazoned with the coats of Warrene, Plantagenet, Mowbray, and Howard, and on the pedestals of the columns, on red cloth panels, are shields of arms chronologically arranged. The principal and central point is, however, at the upper end of the hall, behind the chair, where a trophy has been arranged, consisting of a great banneret surmounted by the Winged Coronet (Crest of Howard), and having upon it the Lion (De Brotherton), the White Horse (Arundel), and the famous motto 'Sola Virtus Invicta.' The ground is red, and from its imposing size this composition, supported and grouped with the Union Jack and the Red Cross of St. George, and rising from the dais to the principal cornice of the hall, is very effective. Tall trees in baskets are arranged on each side, the dark green Irish yew contrasting well with the rich drapery and quaint colour of the heraldry. The descent of the Lords of Hallamshire is exemplified by the shields of Lovetot, Furnival, Nevil, and Talbot. Placed on either side of this trophy, and at the four corners of the room, are bannerets on which are emblazoned the full arms of the House of Howard. Mr. Edward Eadon, of Fargate, has carried out all the decorations from the designs and under the personal superintendence of the architects, Messrs. Hadfield & Son.

New Town Hall, Wareham, Dorset.

It is in contemplation to pull down the old Town Hall at Wareham, in Dorset, and to erect a new and much more commodious one on the site.

Destruction of Valuable Pictures by Fire.

A fire lately occurred in the picture gallery of Messrs. Hodge & Co., High Street, Exeter, resulting in the destruction of valuable oil paintings by some of the most eminent artists, as well as plates and other articles, to the value of between 2,000*l.* and 3,000*l.* The gallery is situated behind the shop, and is approached by some steps. About nine o'clock one of the neighbours, finding that smoke was entering his premises, gave an alarm. The fire, it was evident, had been burning for some time and, after the flames had been subdued an examination was made in order to ascertain the damage done. The whole of the pictures were destroyed, amongst them being a very large one by Rubens, valued at no less than 1,000*l.*

Amongst the charred remains were discovered the plates of the engravings of the portraits of Lord and Lady Portsmouth. These were entirely spoilt, and were said to be worth 800*l.*, but they were insured in the sum of 100*l.* only.

Philadelphia and Liverpool.

A steamship line between Liverpool and Philadelphia has been projected. Philadelphia is probably the leading manufacturing city in the United States, and, as a large portion of the raw materials are imported, there seems to be no reason why a well conducted steamship line should not meet with success. The Pennsylvania Railroad Company, it is said, has been making great exertions to impart to the export of bread stuffs and provisions from Philadelphia the same force that has been given to the petroleum shipment. It was for this mainly that the grain elevator was built at Washington Avenue, and the bridge across the river Schuylkill erected.

An Interesting Architectural Discovery.

The demolitions in the old island known as the Cité de Paris have brought to light the existence of the old chapel of Saint Agnan, which was supposed to have been destroyed long ago. This edifice was built about the commencement of the twelfth century by Etienne de Garlande, Chancellor of France. The chapel was suppressed with many others in 1790, and sold as national property in the following year. It is situated in the court of a house, No. 19, in the Rue Basse des Ursins, a portion of it—the apsis—being built into an adjoining house. About half only of the original edifice remains intact. The columns are clustered, three in a group, and the capitals are varied, and present a capricious arrangement of foliage and figures of animals. The soil has been raised so much that nearly one-third of the height of the column and walls is at present concealed. There is no doubt that this interesting relic of the period of the decline of Roman architecture will be carefully preserved.

The Borough Surveyor of Blackburn v. George Stones.

At the Town Hall, Blackburn, before James Thompson and Thomas Bury, Esqrs., Mr. Smith, borough surveyor, summoned Mr. George Stones, contractor, and the owner of property in Addison Street, for the sum of 26*l.* 7*s.* 9*d.*, due under the Blackburn Improvement Act, for sewerage and paving executed by the Blackburn Corporation in that street.—Mr. Smith stated that on September 21, 1866, the Highway and Drainage Committee ordered Addison Street to be put under notice, and on December 18 the committee sat the usual hour to hear any objection that might be urged against it. On the 29th tenders were accepted, and the work was commenced. Witness had measured the work, and found it to be correct.—Anthony Hall deposed that in 1866 he was a clerk in the Town Clerk's office, and served the usual notice on the defendant.—Michael Keogh, clerk in the Borough Surveyor's office, deposed that he served a notice similar to the one produced on the defendant in November, 1866, and that the defendant was very saucy. (Laughter.)—Mr. Watson and Mr. King, collectors, deposed that they had demanded the account of the defendant, who had refused payment.—Defendant did not appear.—The bench made an order for the amount with costs; in default, distress, or three months' imprisonment.—*Blackburn Standard.*

General.

The Members of the Royal Academy meet on Saturday, the 30th, to fill up two vacancies in the ranks of the Associates. There are no restrictions as to the order, whether of painting, architecture, or sculpture, from which the selection should be made; but, in accordance with the course hitherto pursued, it is believed that two painters will be elected. Among the candidates in this class are to be found the names of Messrs. Marks, Mason, Poynter, Prinsep, Vicat Cole, Leader, and other popular favourites.

The Members of the Artists' Corps (composed chiefly of painters and architects) have elected for their commanding officer Frederick Leighton, Esq., R.A., in the room of H. W. Phillips, deceased. Mr. Leighton receives the rank of Major.

The Dudley Gallery General Water-Colour Society open on Monday, February 1, their Annual Exhibition of Water-colour Paintings and Drawings; and the collection this year is of more than average merit, especially in the department of landscape.

The Report of the London Permanent Benefit Building Society, to be presented on February 2, states that a profit of 3,610*l.* has been realised. Of this, 2,831*l.* has been placed to the credit of the members in respect of their deposit shares, being interest at the rate of 6*l.* per cent. per annum on their paid-up capital; 389*l.* has been added to the reserve fund, which now amounts to 1,264*l.*; and the remainder is carried to the bonus account, and will allow of a bonus of 5*s.* per share on the deposit shares that have remained fully paid up throughout the twelve months ended December 31, thus making the profits on such shares equal to 7*l.* per cent. per annum.

Report states that the South-Eastern Railway Company have consented to erect a station for the benefit of Halstead, Knockholt, &c. (Kent), providing a site is obtained and a guarantee from the district raised for the cost of building.

It is anticipated that in the course of next month the Solway Junction Railway, which has been for several years in course of progress, will be sufficiently completed to enable an engine to run over the entire line from Kirtlebridge to Brayton. The viaduct, which is a fine specimen of engineering, is already finished.

Great Improvements have been recently made in the great School-room at Westminster. Several of the Norman windows of Edward the Confessor's Dormitory have been cleansed, and an idea can now be formed of their original appearance.

New Painted Windows in Westminster Abbey.—Two new painted windows of more than ordinary interest have lately been erected in Westminster Abbey; the one in memory of Isambard Kingdom Brunel, in the north aisle of the nave, not far from the windows put up to the memory of Joseph Locke and Robert Stephenson; the other on the eastern side of the south transept, in 'Poets' Corner,' in honour of Geoffrey Chaucer, just above the poet's tomb. The Brunel window consists of two lights, surmounted by a quatrefoil opening; along the bottom runs a legend giving the dates of Brunel's birth and death (1806-1859). Over this are allegorical figures of Fortitude, Justice, Faith, and Charity; and the upper part of the window consists of six panels, representing three subjects from the Old and three from the New Testament. Above, in the head of each light, are angels kneeling, and in the quatrefoil is the Saviour in Glory, surrounded by angels. The design was executed in glass by Messrs. Heaton & Co., of Garrick Street, from the designs of Mr. R. N. Shaw, the figure subjects being drawn by Haliday. The colours are of sober rather than a brilliant tone, which contrasts not unpleasantly with the colour so prominent in the Locke and Stephenson windows. The Chaucer memorial window has been erected by the gift of a single donor, who wishes to remain anonymous; it was designed by Mr. J. G. Waller, and executed by Messrs. Baillie & Mayer, of Wardour Street. The window itself is intended to embody the intellectual labours of Chaucer, and to record his position among his contemporaries. The portrait of the poet occupies the centre of the tracery above, between those of Edward III. and Queen Philippa, his wife; below them are those of Gower and John of Gaunt; and above them Wycliffe and Strode, his contemporaries. In the borders are disposed the following shields of arms, alternately—England, France, Hainault, Lancaster, Castile, and Leon. At the base of the window runs the simple legend—'Geoffrey Chaucer, died A.D. 1400,' with four lines selected from his poem, 'Balade of gode counsaile.'

There appears to be very little probability of the sewage of the metropolis being turned to profitable account, at least for some years to come, in connection with the Metropolis Main Drainage scheme. So long ago as March 1, 1867, the Metropolitan Board of Works received tenders for a concession of the sewage on the southern side of the Thames, which were referred to the Works and General Purposes Committee. That committee has now reported to the Board that various circumstances have militated against their efforts to carry into effect arrangements with any of the gentlemen who submitted the tenders. The financial embarrassments consequent upon the crisis of 1866 had, and their effects still continue to have, an adverse influence on commercial schemes in general, and especially on such as present new and comparatively untried features. For this and other reasons the committee have from time to time been obliged to adjourn the consideration of the tenders in the hope that the time may speedily arrive when the question may be definitely and satisfactorily dealt with. So far, however, this has not been the case; and having regard to this, and to the fact that the construction of the works of the Metropolitan Sewage Company on the north side of the Thames has been in abeyance for some time, and that the position of that company is now under the consideration of the committee, they report that it would be advisable for the Board to postpone the question of utilising the southern sewage to a future and more favourable opportunity, and to discharge the present reference to the committee. To this the Board has assented.

Messrs. Agnew and Sons, of the Exchange Fine Arts Gallery, Liverpool, are exhibiting a collection of water-colour drawings, comprising examples of the best artists.

Elton, Bury, Lancashire.—In a limited competition for St. Stephen's Schools, the plans of Messrs. Farrar and Styan, of Manchester and Bury, and of Messrs. I. Medland and H. Taylor of Manchester, were selected for further consideration, and after most careful examination those of Messrs. Farrar and Styan were adopted by the Committee. The works will accordingly be immediately carried out under the direction of these gentlemen.

New Asylum, Hornsey.—The Committee of the Aged Pilgrims' Friend Society, having received designs from the eight architects invited to compete for the New Asylum at Hornsey, have selected the design of Mr. Robert Edgar, 18 Great George Street, Westminster. It is intended that the work shall be immediately commenced.

The annual distribution of prizes won by pupils of the Leeds School of Art took place last Tuesday in the Mechanics' Institute. The Rev. Canon Woodford, the vicar, was in the chair, and Mr. Baines, M.P., and other gentlemen, addressed the meeting. Amongst the resolutions adopted was one urging the continuance of the facilities for art education afforded by the National Exhibition recently closed, approving of the steps taken by the Mechanics' Institution to found a permanent art collection, and soliciting the loan and bequest of works of art in support of the project.

Great Improvements are contemplated to the Harbour at Ilfracombe in the shape of widening the quay on the south side, and building a new east quay.

The Houses at the rear of Her Majesty's Record Office in Fetter Lane, which formerly blocked up the entrance to the central yard of the Parcels Delivery Company, are being removed for the purpose of enlarging the building. On the south front of the Record Office, where an unsightly 'toothing' has for long been a conspicuous object, is being added a new oriel window.

Mr. Sedding, architect, of Penzance, read a very interesting paper a few days ago before the Exeter Diocesan Architectural Society upon the interesting churches of St. Buryan, St. Levan, and St. Sennan.

A Splendid Gift.—Sir Paul Molesworth is about to give St. Mary's Roman Catholic Church, Penzance, a splendid altar, to be composed of the choicest polished granites, serpentines, &c., of the county, and at a cost of 350*l.*

We hear that Mr. Davies, nurseryman, of Grosvenor, Bath, has obtained leave of the committee of the Assembly Rooms in that city to build a con-

servatory on the small space of vacant land adjoining that handsome elevation. If done in good taste, we conceive the erection will be an improvement to the appearance of the premises externally; whilst the local advantage of the vicinity of flowers and shrubs to the interior is manifest, as they are continually wanted to adorn the rooms when they are required for private balls and parties. We understand Messrs. Greenman and Son (who lately altered and improved the Guildhall of Bath so much to the satisfaction of the Corporation) will commence the work at once.

Sir John Cass's School.—The Trustees of this foundation have purchased of the Corporation, at a cost of nearly 9,000*l.*, premises in Jewry Street, Aldgate, for the purpose of fitting them up as a new school-house, under the superintendence of Mr. G. R. Wales.

The Direct Islington Railway, the Brighton and Metropolitan Railway, and the Hyde Park and City Railway have been abandoned for the present session.

City District Surveyor.—The Metropolitan Board of Works has appointed Mr. G. W. Williams Interim Surveyor of the southern division of the City, the appointment being vacant through the death of Mr. G. Smith. The income of the office for the last year amounted to 143*l.* 18*s.* 9*d.*, and the Building Act Committee have now under consideration the subject of the proposed re-arrangement of the several districts in the City, the income of the whole of them being much below the average of other metropolitan districts.

In clearing the ground for the foundation of some additional building to the Bishop's palace at Lichfield, Staffordshire, the ashlar facing of the old palace was laid bare at a few feet below the present garden level, and a strange discovery was made. Built up against this wall were found the remains of a pipe manufactory. The flue and the floor of the kiln were very apparent, formed of bricks of a larger size than the present common Flemish pattern. Mixed with the surrounding soil were pipes and fragments of pipes to the amount of one or two hundred, portions of the unbaked clay still quite moist, scoriæ and lumps of coal, and in one case a fully-formed pipe-bowl in its unburnt state.

The Inhabitants of Lochmaben, Dumfriesshire, who claim for that locality the nativity of King Robert of Bruce, have decided to erect a monument to his memory.

Staircases, whether of wood or stone, will wear out; but a remedy has been found by M. Cazcau, who says he has found a durable covering in thin plates of aluminium bronze. He proposes to try his covering on the column of the Place Vendôme, and reports the experiment has been made in a factory, where plates of common bronze on the stairs $\frac{1}{2}$ inch thick were worn out in six weeks, while plates of aluminium bronze $\frac{1}{4}$ inch thick remain just the same as when new, after eleven months of service. Aluminium bronze is not too expensive if it will bear this amount of usage. It is merely copper, with from eight to ten per cent. of aluminium.

A new Tower has been added to the parish church of Stalbridge.

Filey Brigg has at last given way. Some thousands of tons of rock have fallen. One of the blocks is stated to be 20 ft. in length, 14 ft. in breadth, and 3 ft. thick. Great consternation was caused to the inhabitants by the terrific noise of the falling mass.

Mr. James Gilles Brown, architect, formerly of Sunderland, has been elected surveyor of the North Riding of Yorkshire, at a salary of 300*l.* per annum. The election was made at the Quarter Sessions of Northallerton. Mr. Brown was nominated by the Earl of Zetland, and his nomination was seconded by Mr. Challoner.

A New Wing to Chester Castle, containing eighty-four separate cells for prisoners, has just been completed by Mr. Lovatt, contractor, of Wolverhampton, at a cost of 5,339*l.* Mr. R. Griffiths, county surveyor of Stafford, was the architect.

A Most Extraordinary Accident is reported at the mills of Messrs. Martin and Johnson, Bolton, by which damage has been done to the extent of some 6,000*l.*, and 700 people thrown out of employment. Whilst the works were in full operation, the mill engine 'ran away,' scattering destruction, but fortunately not death, in all directions.

A Discovery at Guildford Castle has been made by Corporal Macdonald, of the Royal Engineers, who has recently sunk shafts in different spots, and succeeded in finding, about 220 yards from the castle, in a direct line, the arch of a passage communicating with a vaulted chamber 75 feet long, 60 feet wide, and 15 feet extreme height. The total depth from the surface is about 100 feet. On the walls of this subterranean chamber many ancient dates are inscribed in rude characters, and bottles and other old rubbish have been found within it.

Five House, Whitehall, is being demolished by order of the Commissioners of Her Majesty's Works. This, together with part of the United Service Museum, several adjoining houses, and the Tudor-arched entrance to the Palace water stairs, will be gone in a few days.

The Blackburn and East Lancashire Permanent Building Society at their last meeting declared a dividend of seven per cent. per annum, still leaving a large balance at the banker's.

A Curious Report reaches us from Naples. Signor Fiorelli, under whose superintendence the excavations at Pompeii are being conducted, proposes to give a grand fête, in classic style, in honour of the Crown Prince and Princess of Italy. The interesting remains of what some eighteen hundred years ago was a flourishing and fashionable town of the Romans are once more to be the scene of Roman life on a Roman holiday. The streets, the temples, the forum, the shops, even the very houses themselves, are once more ('for this occasion only,' as the playbills would say) to be peopled with real live *toga'd* inhabitants, and the festival is to last without intermission for twenty-four hours. At noon the public games will begin, the victors to receive their prizes at the Temple of Fortune. Competitive singing and other amusements of ancient Pompeii will follow, and in the afternoon there will be the performance of a Greek tragedy ('done' into

Italian) in the Circus, the day to close with another exhibition of music and dancing in the amphitheatre, which will be lit up with thousands of torches. Signor Fiorelli estimates the costs of this 'little amusement' at 300,000 francs (12,000*l.*)

The Committee for the erection of a monument in honour of the late Emperor Maximilian of Mexico at Trieste has received the handsome donation of 5,000 francs from the French Emperor as his contribution towards the expenses.

Professor Piloty, of Munich, has been offered the post of Director of the Royal Academy of Arts at Berlin; but it is very generally expected that he will decline the honour, and will remain at Munich for the present.

The Studio at Rome of the celebrated American sculptor, Mr. Rogers, has been crowded lately to view a colossal figure in clay of the late lamented President Lincoln. The figure, which is 12 feet high, represents the President sitting, with a pen in the right hand and a scroll in the left. The face is turned slightly upwards, and has an expression of deep earnestness. The likeness is stated to be perfect. The pedestal will be 14 feet high, and enriched with bassi-relievi and emblematic ornaments. It will eventually be cast in bronze at Munich, and, when complete, will probably adorn one of the public squares in Philadelphia.

In Chicago a tunnel has been completed under the river, at an expense of 328,500 dollars; the length of the work is about 1,605 ft., and it connects the south and south-west divisions of the city.

The Foreign Coal and Iron Trades.—Several important facts may be noted this week in regard to the French and Belgian iron trades. Thus the Northern of France Railway Company has let a contract for 10,000 tons of rails to the Anzin Forges Company; the terms are stated to range between 7*l.* 16*s.* and 7*l.* 18*s.* per ton. In Belgium a contract for 35,000 tons of rails for Hungarian railways has been definitely let, and another contract for 20,000 tons of rails (for the Eastern or Hungary Railway) is now in the market. Another contract for 9,600 tons for the Belgian State Railways has been divided among the leading Belgian works, at terms ranging from 7*l.* 16*s.* 3*d.* to 8*l.* per ton. The Sclessin, Châtelineau, and Couillet Works have taken conjointly a contract, to be executed before October, for 15,000 tons of rails for a Russian railway; the terms have not transpired. An order for sixty locomotives is about to be given out for a Russian railway. Messrs. Neilson & Co., of Glasgow, have obtained a foreign order for twenty-two locomotives at 2,320*l.* per engine, delivered at the port of debarkation. M.M. de Dorlodot have obtained an order for 6,000 tons of rails for the Victor Emmanuel Railway; the terms are 6*l.* 8*s.* 9*d.* per ton, deliveries to be made at Antwerp before the close of June.

The following interesting 'Notes' are from the pen of Mr. Mechi:—

Deep and Shallow Drainage.—I observe that after a dry summer, the fields drained 5 feet deep at 30 and 40 feet apart, in stiff clay, do not discharge water through the drains so early in the season as those of 30 inches deep, at closer intervals. The reason appears to me to be obvious. The 60-inch drains take the surplus water from 6,000 tons of earth, the 30-inch drains only lay dry 3,000 tons. It is easy, therefore, to understand that when the autumnal rains come, the 6,000 tons take longer to supersaturate than the 3,000 tons. The deep drained lands had only commenced running to-day (January 8), after the recent heavy rains. Are not those extra 3,000 tons more available for the roots of plants than the same quantity undrained under the 30-inch drains—for the roots of plants descend several feet? P.S.—One inch deep of earth gives over 100 tons per acre.

A Good Suggestion.—Our contemporary the *Daily News* says:—'Is it not time the paper-knife was condemned as obsolete, or classed among the useless ornamental lumber with which our ladies love to load their drawing-rooms? That this is not possible for the reason that books and periodicals are still sold uncut is no slight reproach to the publishing trade, and one which it behoves their customers to bring home. It is the singular conservatism of the members of that trade which makes a paper-knife necessary at all, and we should be glad to know if there be any grounds upon which what seems to be a stupid anachronism can be defended. Why should the onus of completing the mechanical operations which make reading possible be thrown upon those who buy, and why is not cutting the leaves of a book made as much the duty of the binder as sewing them together? It is clear that the act of paper-cutting can be performed on a large scale at an infinitesimal cost, and that the whole of the uncut books and magazines now issuing from the press are so many encroachments upon the good-nature of the public. For no excuse of difficulty or want of knowledge or of means can be advanced. Our booksellers should really condescend to spare us this needless and petty worry, and war to the paper-knife should be the constant cry of every buyer of books.'—[The readers of THE ARCHITECT must have experienced the convenience of having the edges of the paper carefully cut for them. There is no difficulty whatever attending the process. By the powerful steam-cutting machines of the Messrs. Spottiswoode a very large number of papers can be cut in the course of a few minutes.]

MEETINGS OF LEARNED SOCIETIES.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Monday, February 1, at 8. Special, for discussion of proposed modifications of the Metropolitan Building Act.

INSTITUTION OF CIVIL ENGINEERS.—Monday, February 1, at 8. Adjourned discussion upon the papers by Mr. Bidder and Mr. Chubb. Paper 'On New Ferry and New Brighton Piers,' by Mr. H. Cooper.

INSTITUTION OF SURVEYORS.—Monday, February 8, at 8. Adjourned discussion on paper by Mr. Ryde. Mr. J. Bailey Denton on 'The Future Extension of Railways with reference to their Influence on Landed Property and Agriculture.'

ARCHITECTURAL ASSOCIATION.—Friday, February 5, at 7.30. Paper by R. Phené Splers, Esq., on the Architecture of Belgium.

ASSOCIATED ARTS INSTITUTE.—Friday, February 5. Robert Bateman, Esq., on The Beautiful.

ROYAL ARCHAEOLOGICAL INSTITUTE.—Friday, February 5, at 4.

ROYAL INSTITUTION.—Tuesday, February 2, at 3. Mr. Westmacott, on Fine Art. Thursday, February 4, at 3. Prof. Rupert Jones, on Protozoa. Friday, February 5, at 8. Mr. Ruskin, on the Flamboyant Architecture of the Somme Valley.

SOCIETY OF ARTS.—Wednesday, February 3, at 8.

EDITORIAL NOTICES.

N.B. The demand upon our last impression was so great that we were obliged to go to press a second time in the course of the week. Applicants who were unable to obtain that number of THE ARCHITECT are now informed that any copies they may require can now be obtained on application at the Office, or through the usual Newsagents.

No communication can be inserted unless authenticated by the name and address of the writer, —not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such enquiries.

PUBLISHER'S ANNOUNCEMENT.

Advertisements cannot be received for insertion later than 2 P.M. on Thursdays.

Temporary Office, 4, Monument Yard, London.—GILBERT WOOD, Publisher.

THE GAZETTE.

DOVER.—Feb. 10.—For Reflooring and Refitting the Church of St. Margaret at Cliffe. Mr. Christian, 8A Whitehall Place, S.W.

WADSEY PARK, NEAR SHEFFIELD.—Feb. 10.—For Erection of Two Wings, with Central Building and Offices, for the new South Yorkshire Asylum. Mr. Bernard Hartley, Pontefract.

RADELL & SAUNDERS have much pleasure in informing their friends, and the Building Trade generally, that to facilitate building operations during the winter season, they have provided a large stock of well-seasoned Cornham Down Block Stone.

Bath Stone Office, Cornham, Wilt.—(Adv.)

STONE BROTHERS are now supplying Cornham Down Stone—Well seasoned, fit for immediate use, and of the best quality.

Box Ground Stone—Unequaled for even texture and durability.

Fairlie Down Stone—Matchless for good quality and large sizes.

Combe Down Stone—Fine in texture, free working, and very durable.

Prices, and cost of transit to any part of the kingdom, on application to the Bath Stone Office, Bath.—(Adv.)

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, DEAL, AND
TIMBER MERCHANTS,
120 BUNHILL-ROW, LONDON, E.C.

The most Extensive Stock of every kind of Wood, in Planks and Boards, dry and fit for immediate use.

The Architect.

TWO LITTLE BILLS.

At the conclusion of every session of Parliament it is common to witness what is called the 'slaughter of the innocents,' and the sacrifice is submitted to by those interested in the victims, with some hope of future life; for it frequently happens that the same innocent has to be born and born again, to die as frequently, more or less innocently, and at the last no practical result is secured. Important interests, not of a national character (though otherwise public enough), are constantly being set aside for the exigencies of more pressing business, and crying evils have consequently to be endured long after every one has seen that they ought to be abated, and vested interests, long after they are condemned, continue to override public rights.

One advantage, it must be allowed, rises from this delay. Matters are thoroughly investigated, opinions expressed, opposition has time to show and exhaust itself, difficulties are pointed out and overcome, and all manner of counter-propositions get 'ventilated,' as is now the term. Happy is it, however, if the 'end is peace.' A good working measure is not always the result of this process; injurious compromises and hasty arrangements but too often mar a good work, and jobbery completes what common sense has begun.

Amongst those innocents to be revived this session there are two little Bills (little only in the sense of being local rather than national) which affect, or may affect, all dwellers in this Metropolis; those who build houses, and are called fools for their pains, equally with those who are called wise men and occupy them. The Bill for the Improvement of the Local Government of the Metropolis,* whether by the carrying out of the idea of the municipalities or otherwise, and the Metropolitan Buildings and Management Bill,† together affect in all their provisions the pockets or the personal feelings and comfort of every inhabitant of this vast city; and as the promoters of these Bills are buckling on their armour for the fight, and intend to press on the warfare, even during this busy opening session of Parliament, it becomes our duty briefly to draw attention to the proposals contained in both Bills.

The Municipalities Bill is a definite plan for establishing an organisation in the whole Metropolis, similar to what is enjoyed in large towns, such as Liverpool, Bristol, &c., and, indeed, in the City of London itself, with the hope of effecting thereby such desirable reforms as improved gas and water supply, increased efficiency in police arrangements, real cleansing and watering of streets, more perfect representation of the ratepayers who find the money, and more direct responsibility in those who spend it—in fact *economy* and *efficiency* combined.

Whether the establishment of separate municipalities in connection with, or centralised in, the ancient one, which would remain enthroned at the Mansion House—increased in glory, as a sun or a planet by its revolving satellites—be the best mode of effecting these reforms, may be an open question; but we note with satisfaction that the Home Secretary replied distinctly on this head to a deputation which waited on him last week, that he was in favour of municipal government, for a decided tone and a definite policy is much wanted in home affairs.

As to the principle of the Bill as it now stands, a great deal can be said in its favour from an antiquarian or historical point of view, and this is never lost upon an English community. There can be nothing to urge against the fitness of Londoners for the same kind of local government which a portion of them have carried on for ages and maintain with steadfast faith, and for the same institutions which are found suitable for their fellow-countrymen wherever they are assembled in sufficient numbers to make it desirable to have any real local government at all. With reference to the necessity for some such measure, it is a deplorable fact that the postal, political, police, parochial, and the many other divisions or districts necessary for or at least existing in this Metropolis, differ from each other in such a manner that it baffles even a Home Secretary to arrange the details of any comprehensive scheme. Mr. Bruce even has gone so far as to say that in drawing out certain educational plans, he was obliged to omit the Metropolis itself for want of sufficient organisation therein, or because of the conflict between the immense variety of organisations therein existing. How can we be surprised, then, if vestries cannot hit upon any form of combination, except in so far as they are compelled by the Metropolitan Board of Works; or if the lighting, paving, and so on, of the Metropolis are conducted in the most haphazard, uneconomical, and inefficient manner?

The arguments in favour of some remedial measure appeal to the purse, the heart, and the very life of all ratepayers and others. To

the purse, in the waste of means and the exorbitant demands necessary to meet its increasing proportions; the heart, in the bold beggary seen at the corner of every street where stand a boy and a broom—often, alas! a grown-up man or a girl—to pretend to earn the coppers they beg, and yet live far better than honest workmen with families at home; to the life, when the police are paid ever increasingly—though not too well—yet without repressing violence and robbery, or even securing the thief or the property after the deed is done. We have satisfaction in noting that the tide of public favour seems setting in favourably for this branch of those administrative reforms so sorely needed in this land of liberty and vested interests.

For the other measure referred to we must bespeak equal attention, though it can hardly in any sense be called an 'innocent,' sinning as it does in many very important particulars against the public good. Of course, if the municipality scheme is at all adopted, it will become a question what is to happen as to the Board of Works, its very existence being affected; but, meanwhile, this Board is pushing on (more, as it seems to us, for the sake of personal power than for public advantage) a new Building Act, in many respects inferior to the one now in force (that of 1855), and in which—where it improves upon this one—the improvement is so complicated with other clauses for the worse, that it would be far better to add a few good clauses, embodying amendments, to the present Act than to bring in a new Act abolishing that of 1855 altogether.

That this is the feeling of many who know most about the matter we are in a position to assert; and in fact the resolutions upon the Draft Bill passed by the District Surveyors' Association, and the Report of the Royal Institute of British Architects, are sufficient to condemn the Bill as a whole. Individual paragraphs which contradict each other, or which are impracticable, are pointed out in detail in these papers.

One contradiction especially is so glaring that it must be referred to, if only to point out to what an absurdity the pursuit of one idea—without further consideration—will reduce the best intentioned legislation. The proposed definition of 'fire-resisting materials' is evidently framed after the ideas thoroughly understood amongst the profession, that in most cases of fire, iron is worse than useless for *fire-proof* purposes, and that stone, even granite, is crumbled and split up by great heat or the action of the flames. Yet who would dream of saying that iron and stone were not *fire-resisting* materials, while wood was of that nature?

It is certainly well known that beams of oak or teak, or other hard wood, are often more likely to save a building and the goods therein, and possibly the lives of the firemen, than beams of iron and floors of stone; but would this narrow view of building operations and this restricted idea as to building materials lead to improved construction, or even improved insurance rates? Let the fire offices reply—we believe not. On the contrary the condemnation of stone as a material unworthy to be used where fire-resisting buildings are to be erected is simply absurd, for surely it is something against the spread of fire to have unflammable walls and staircases. Walls must be used to carry stone and ironwork, whereas woodwork can be made independent of walls.

To leave this remarkable contradiction, which is after all but the embodiment of some professional crotchet of the Fire Brigade, we proceed to object to the manner in which the Bill seeks to deal with the district surveyors, at present a body of gentlemen independent and yet responsible—not mere salaried clerks to attend to the letter of the law, so much as directors for good, as far as in them lies, of the buildings of the Metropolis, and often by their counsel and advice able and willing to do more for the assistance of the builder than the value of the fees received. Yet the aim of this Bill seems to be to get the whole of the districts under the direct control of the Board in such a way that a district surveyor after his appointment will not know his position, and, liable to be superseded at pleasure, may at any time be forced either to give up his position without compensation (for such are the hard terms of engagement of all new appointments) or to accept any salary the Board may direct, while he still collects the fees to hand over to the Board. If paid by salary, he is to give up all work on his own account 'within the limits of this Act or elsewhere.' It is needless perhaps to observe that we hope and believe the Legislature would never sanction such arbitrary powers, which may be exercised harshly by a body of men who in their individual capacities perhaps would not do an unkind action.

It is curious to find, also, the Board seeking powers to appoint an assistant district surveyor to take any part of the fees (how much to be decided by the Board alone), without even the consent of the original holder of the district himself. Thus, not even the present possessor of an income derived from an office which he may have held years before the Board was appointed would be safe; but at any time he might have an assistant thrust upon him, taking such part of his income as the Board may think proper, not only entirely without his consent, but against his will. That the Board might do better by conciliating its best officers, by placing them in the position of superiority rather than dependence, we firmly believe. No representatives of the Board can be of higher class than those who have given their faithful services so long to the establishing of a comprehensible Building Act. It must be remembered, too, that should this class of officer cease, the administration of the Act will be very different for all buildings from what it has been, and strict officialism will be a poor substitute for enlightened professional knowledge enlarged

* Lately under the charge of Mr. Mill, now taken up by Mr. C. Buxton.

† Brought in by the Board of Works.

by that sympathetic feeling which is derived from having personally to feel the same bonds as those upon whom they must be imposed.

It is in the interest of all we speak, and not that of the district surveyors alone. That the Bill is to be improved and amended before being submitted to Parliament we are aware, and for this reason we have been the more careful to point out its chief faults as they appear to us. It is our earnest hope that the framers of this measure, taking in good part the criticisms which have been made, will eliminate without regard to personal predilections anything which does not directly tend to simplify the Act itself—encourage really good building and do justice to its band of district officers.

The Board has done immense service to the Metropolis, and the very faults of the Bill prove the energy and good intentions in most respects of its framers; but paving materials of a different nature than good intentions are required for the Metropolis.

HISTORY OF ARCHITECTURE, ENGINEERING, AND ART IN EGYPT.

TO the Architect, the Engineer, and the Decorative Artist, the study of Egyptian Art offers an equal interest. We find in the valley of the Nile the most ancient buildings in the world of which we can ascertain the date. We can trace the gradual modification of their architecture for three thousand five hundred years. We find the remains of engineering works as admirable for their audacious magnitude, as they are venerable for their extreme antiquity. We can trace the operations of Nature herself, for a period of apparently undisturbed continuity, of which we have no similar example in the Old World. We may watch, at the present moment, the progress of a French engineer in repeating, and improving on, the work of Pharaoh Neco. We shall have an opportunity before long of watching the results of the struggle of modern engineering with the sands of the desert on one hand, and with the silt of the Nile on the other.

To study Egyptian learning is not easy. Few can command the time to do so on the spot; and a hasty visit to the Pyramids or to the tombs, unless guided by some special instruction, is more effective in kindling the imagination than in informing the intelligence. It was the conquest of Egypt by Buonaparte that first opened the stores of its antiquities to the view of Europe. Some of us can remember the interest excited by the exhibition, at the Egyptian Hall, of Belzoni's models and drawings. Since that time the labours of English travellers have succeeded one another with some rapidity. But the French, the Germans, and the Italians, have far exceeded us, in the patience of their investigations and in the beauty and value of their delineations. It is to a Frenchman that we owe the discovery of the key to the long-lost learning of the hieroglyphics. It is to a Frenchman that we owe the discovery of that series of sepulchres of the God Apis, under his successive incarnations, that has restored a positive value to the chronology of the famous dynasties of Manetho. It is to a German that we owe what we may consider as almost the only truly admirable attempt to reduce the ancient history of Egypt to the precision of date.

It is a matter of humiliation to those who have some better acquaintance with what is known, and with what has yet to be known, of Egypt, to witness two of the recent English lucubrations on the subject. In one the author, starting from the assumption that his own reading of sacred history must outweigh any positive testimony of the Egyptian monuments, has piled together, as contemporaries, long lines of successive dynasties. In another, a man of science, starting with an hypothesis as useless as it is incapable of verification, has come to the conclusion that a rude sarcophagus, the contents of which can only be admeasured approximately, and that by a most complicated process, was a standard measure of capacity. The learned professor has given us a measure of his judgment in the fact that, while measuring with the utmost accuracy the widths of courses of masonry in which no one but himself takes any great interest, he was content to determine a matter of real geodesic importance, the length of the base of the Great Pyramid, by the reliable aid of—A TAPE!

It is therefore a matter of congratulation to all interested in this important subject, that the French Government, at the enlightened instance of the late M. Fould, has subscribed for a sufficient number of copies of a noble work on the history of Egyptian art, now in course of publication by M. Prisse d'Avennes, to ensure the completion of the series. This publication will contain, when complete, 180 chromo-lithographs of folio size, printed with the utmost perfection attainable by this constantly-improving process. These fine plates will be accompanied and explained by a quarto volume of text, freely illustrated by vignettes.

As far as the sheets have yet proceeded, the chief interest of the engineer will be directed to the very beautiful surveys. At a time when the directors of our own Ordnance Survey, which we may justly regard as a triumph of chartography, are introducing a new style of *hachure*, in which positive information is given in pictorial form, it is especially interesting to trace the progress of our neighbours, the engineers of the *Ponts et Chaussées*. The island of Philæ and the ruins of Thebes are represented by what we are in the habit of calling brush drawing. We are not able to derive from this method of representation the same definite degree of acquaintance with actual differences of level that may be attained by the use of contour lines, or even by the Ordnance *hachures*; but, on the other hand, the perfect representation of the country resembles that of a bird's-eye view. Were we to look down on the shores and islands of the Nile from a balloon, we should see something exactly resembling the beautiful drawings of M. Prisse d'Avennes—exactly, that is to say, in all but one particular. Where the traveller would behold half-buried and scarcely distinguishable ruins, the student of the plates sees the defined outlines of temples, and avenues; and tombs, sharply and clearly brought before him, as they would have been to an aerial spectator in the time of the great Diospolitan kings. The works and the ruins of nature are represented by the free-hand artist;—the masonic labours of man are defined by the mechanical draughtsman.

The greatest Egyptian engineering works date from a very remote antiquity. The founding of Memphis, by Menes, is placed by Brugsch 4455 years before the Christian era. After the close of the first and second Thinite dynasties, the seventeen monarchs composing which reigned for 555 years, five dynasties reigned at Memphis for a period of 1,045 years before the seat of the monarch was transferred to Thebes; two successive collateral dynasties reigning at Heracleopolis. The excavation of Lake Mœris, the most famous engineering work in the world, dates from the close of what is called the Old Empire, being attributed to Ameses, the seventh king of the 12th dynasty, which was the second Theban or Diospolitan house. This monarch died 2207 B.C. The Labyrinth bears the name of his predecessor Lamares, the fifth king, who was the immediate successor of the famous Sesostrius, or Ousertesen the Second. But the Pyramids reach to a far remoter date, the Great Pyramid having been indisputably erected not later than the reign of Souphis I., the Cheops of Herodotus, who died 3528 B.C. Although this pyramid is entirely unsculptured, in that course of blundering demolition which moderns call discovery, a set of relieving apertures, which were constructed over the central chamber, has been broken into, and at the back of the enormous stones, which perform functions similar to those of relieving arches, are to be seen, traced in red pigment, the well-known hieroglyphic of Souphis. The explanation given by M. Prisse d'Avennes of his plates is not yet forthcoming, but in one of the chromo-lithographs we recognise the famous red monogram of Cheops.

It would occupy too much space for us now to enter further into the description of so much of this splendid work as is already presented to the public. It is unnecessary to say that the architectural information will be fuller and more detailed than that which relates to ancient hydraulic works, or other branches of engineering. Slow as has been the process of change, still, to one acquainted with the subject, there is no confusion between the architectural characteristics of the successive periods of the advance or decline of Egyptian art. With all our modern appliances, with railways for the transport of building material, with the invaluable service of the auxiliary steam engine and of the hydraulic ram at our command, the engineers of the nineteenth century after Christ must stand in respectful awe in presence of the relics of the mighty works of their Egyptian brothers, who preceded them by no less than fifty-four centuries.

MR. RUSKIN ON FLAMBOYANT ARCHITECTURE IN THE SOMME VALLEY.

A PAPER on the above subject was read by Mr. Ruskin at the Royal Institution on Friday, January 29; Sir Henry Holland in the chair. Mr. Ruskin said that he should omit the introduction he had prepared, 'for there is more to be said on this subject than can be got into the limit of one hour, and I am anxious to get you at once into the Valley of the Somme: You all know perfectly well that Gothic Architecture lasted for three hundred years, and no more. It was born in 1200 and expired in 1500. There are, roughly speaking, three schools into which it may be divided, and those three schools are, a massive school, having heavy stones, first, like Stonehenge; and then carved on the surface—which is the beginning of all Gothic; a school where carving has become important and organic forms are well represented—this is the central school of Gothic; and a school where organic forms are disliked and structural ones pursued.

It is a vital question for architects and an interesting question for other people, by what fault did Gothic Architecture fall? did other styles take its place because they were better, or because no more could be got out of Gothic? And for that reason I wanted to show you pure Gothic Architecture at its last form, and the last good Gothic that I could find in Europe I knew was in the Valley of the Somme. This is a long valley cut in the chalk—perhaps a little more regularly than our English valleys—surrounded on both sides with pasture land. It is covered with larkspur and blue bells, and the valley itself is full of peat, aspen trees, and churches, and all the churches are good, and are either Flamboyant or before it. The four important Flamboyant churches of the Somme valley are, 1. St. Wulfran of Abbeville; 2. The Church of the Holy Sepulchre, Abbeville; 3. St. Riquier, five miles north of Abbeville; 4. Chapel of St. Esprit at Rue, two stations west of Abbeville. The village of St. Valéry, at the mouth of the Somme, was more or less connected with the history of the fall of three dynasties—of Charlemagne, Saxon England, and Suabia. With the latter, however, only because the decisive battle in Italy was decided by the courage of a Count of St. Valéry, trained in these Norman wars. It was in this valley of the Somme that pure Gothic expired, for it had failed fifty years before in Flanders, and had ceased in England for more than double that period.

'Are you not inclined to ask how it came to pass that a thing which had existed for three hundred years should fail, and what were the means of its fate? It is said that Gothic Architecture perished before the conjunction of the Reformation and the revival of letters. But the two were not allied. The Reformation was an illiterate movement, which, if it could, would have destroyed Gothic and all other kinds of Art. But revived Literature ignored Gothic because it was not fine Art enough, and because it thought it could put something better in its place. Yet supposing that these things had happened earlier, that the invention of printing, the revival of letters, and the Reformation had occurred in the reign of Louis IX., and had met Gothic in its youth—for there was nothing in the nature of things to prevent it occurring—that would have happened which did happen at Florence, where the revival met Gothic art in full vigour. The Gothic would have received the Classic into itself—would have

incorporated it as Dante did classic literature. Gothic architecture was rotten to the root, so that no more grafting of branches was possible, then it fell. And the form of this Christian architecture that I have to show you is its last, when its hours were numbered by its own weakness. I have asked by what faults Gothic fell. The faults of the work of art are those of the workman, while manufacture is the work of hands only. Art is the work of the whole man; all art is either infection or education.'

Here Mr. Ruskin referred to the illustrations hung up; and pointed out a bit of perfect Gothic naturalistic sculpture of living foliage from Bourges, illustrated by a fine drawing (enlarged from a photograph by Mr. A. Burgess), and, as a contrast, a bit of perfect Flamboyant from the west porch of St. Wulfran at Abbeville (enlarged from a photograph by Mr. Allen). He then continued, referring to the Bourges foliage: 'You know Michael Angelo would never have carved such a thing, beautiful as it is. He would have thought his time wasted in such fantastic work. You know also that the man who built Stonehenge could not have done it. Do you believe that Fagan or the "Artful Dodger" could have cut it? No; you feel that the man, and nobody but the man, who carved it could have done it. When you understand it you understand the man. Art is but the exemplification of the spirit of man, by which his powers are displayed and reproduced, and I hold it as one of the most sorrowful facts that English gentlemen should be led into the fallacy of denying this fact. Their confutation is written in the history of all great nations, which has always run the same course, and the faults by which Gothic fell were the faults of the men who built it.

'Now concerning this Flamboyant architecture of the valley of the Somme, let us enquire what are its mere physical properties? What is it built of? It is built of chalk, a material that can be cut deep, fast, fantastically. It is black and white; sketching as against true form; it is chiselled painting rather than carving. A perfect knowledge of effect is shown; the touch is deliciously proportioned to the distance from the spectator. Going up the spire at Abbeville you find the work constantly getting less and less delicate, always perfectly sufficient to give the required effect from below.

'Flamboyant work, if of stone in churches, was of wood in houses. That is another physical condition, and its foliage is such as can be happily rendered in wood. A bunch of withered oak leaves makes a perfect Flamboyant crocket. The leaves of the Abbeville work are shrivelled, at Bourges smooth.

'The next characteristic has mingled physical and moral causes. This is the architecture of a damp climate; each statue, consequently, had to be well protected. Morally, men's houses grew more and more important; solitude was more and more valued; so the statues were no longer grouped in vast numbers, but each statue had its own tabernacle, and tabernacle work became a characteristic of the style.

'The next character is not a physical one—excess of ingenuity. The subtle contrivances of late Gothic construction are delightful, but there is no room in them for human passion.

'Next, this is interwoven work, and it is separated from our English Perpendicular essentially by this characteristic. This involution exists in all the arts—in music as well as sculpture :

The moon on the East oriel shone
Through slender shafts of shapely stone
By foliaged tracery combined.
Thou wouldst have thought some fairy's hand
'Twixt poplars straight the cedar band
In many a freakish knot had twined;
Then framed a spell when the work was done,
And changed the willow wreaths to stone.

'The next and the essential character of Flamboyant is a bad one—Relaxation—a delight in fluttering lines in preference to the elastic lines of organic life.

'The contemplation of death, a refuge from the life of the times, was a characteristic of Flamboyant art. Albert Dürer's work shows its noblest phase. Sir Walter Scott has caught the character of that Northern gloom in the contemplation of death in his Rosabelle.

'The main fault of this architecture was not that it was florid—all true art is rich—but that it became unreal; its profusion became heartless; it had ceased to be sincere. There is just now a crusade against sentiment, but it is none the less true that Gothic fell because it had lost its sentiment—its sensibility. True architecture can only be built by—(1) a thoughtful nation; (2) a pure nation; (3) one that has a common pride; and (4) one that has a common wealth.

'1. A thoughtful people. It cannot be built by clowns or boors.

'2. A pure people. Art can only be gained by men as men distinct from brutes. Art is not the work of lambs, or swine, or serpents, but of men.

'3. Good architecture cannot be built by a modest people; but your pride must be in what you all are to be, a common pride. We, on the contrary, want to do ourselves what others do not do—to be what they are not.

'4. For common well-being, perfect unity among all the workmen is needed. It is the greatest glory of a head craftsman to be poor. Nothing is possible for us in architecture where the master workman has a commission on the cost. Pay him a salary—a high one if you will, but not a commission.

'Common well-being must be common as regards those for whom you build. You must not build for pleasure in the front of the

house, when there is want at the back; nor neglect the true meaning of the precept of Ellesmere in Mr. Helps's "Realmah," "Never mind the outside."

'Never mind the houses which look towards the Park, but those which face to Seven Dials. You have just heard from Dr. Hawkesley that you are paying seven millions a year for your London poor, and yet that pauperism is on the increase. Now the *Pall Mall Gazette* seemed much pleased with this fact of the seven millions, for to them it showed what an interest you take in the poor. On the contrary, it shows how much you don't care for them—how much you are prepared to pay as a fine for neglecting their misery. If you would spend the half of it in love, if you would leave off burning candles by day in your churches, and spread instead a light over the darkness which prevails, you will be able to spend the other half of this seven millions in magnificence. Then again there will be true shrines, true saints, and true tabernacle work; then you will be able to erect a grand Flamboyant Dragon with a triumphant St. George over every poor man's dwelling.'

This lecture was illustrated by a magnificent collection of studies, paintings, photographs, and sketches, fifty in number, of which about fifteen of the most exquisite were by Mr. Ruskin's own hand. These included a noble study from the remains of the fresco of St. Catherine by Luini, in the Monasterio Maggiore at Milan, shown as a perfect type of the rare unison of ideal purity of conception with consummate decorative and pictorial power—as 'Purist art of the highest school.' With this were grouped examples of high realistic art in painting, and studies of the highest class of Gothic art. As illustrations of Flamboyant art in the valley of the Somme, numerous sketches and some drawings from photographs were shown; but in addition, splendid studies of the Flamboyant element in Greek art, in Central Italian art, in German art (Dürer and Holbein), and in natural form were shown, together with several illustrations of 'Northern Gloom in the contemplation of Death,' shown in its noblest phase in Dürer's well-known Night and Death; other illustrations, as for example, a Dead Christ, by Holbein, 'were intended to show the dark and sad manner of contemplating death which gradually corrupted both the religion and art of the Northern nations.'

ARCHITECTURAL EDUCATION.

(Continued from page 13.)

IN our first article on this subject, we draw the attention of our readers to the great necessity for some extension of the narrow sphere within which the education of architectural students at the present day had been gradually allowed to decline. From the description we gave, it will be observed that the changes which have been brought about from the rapid advance of science and art, and especially science, during the last fifty years, have been effected so gradually, that, although they have not entirely escaped notice, no provision has yet been made to engraft them on the old system of pupillage; and the consequence is, that, at the first onset, the difficulties which beset us on every side are so great as to call for, as it were, the labours of a Hercules to cleanse this Augean stable of the accumulated neglect of forty years. And when we say the first onset, we do not mean to assume for an instant that we are now, for the first time, bringing forward new or original ideas, for the subject has been one of constant inquiry and demand during the last twenty years; but that, as the changes to be effected must be radical, the first onset or attempt to carry them through will involve many difficulties, and can only be undertaken under the most serious consideration. As long ago as 1843, Mr. Bartholomew, in a book on Specifications compiled by him, suggested the establishment of a Royal Masonic College, with professors on every subject connected with the architectural profession; his scheme was somewhat indefinite and wild, and presented a strange contrast to the practical information contained in the rest of his book: it seems, nevertheless to have caused the formation of a society, called the 'Freemasons of the Church.' A number of meetings, or chapters, were held, in which the members confined themselves, at first, to the nomination of various professors, without, however, giving them any work to do; and afterwards, proceeding to the discussion of archeological questions chiefly, abandoned their first apparent intention of establishing an educational college.

The first real step taken for the improvement of architectural education was the formation of the Architectural Association, in 1847; a society which has since maintained its position as one of the most useful in the promotion of self-education; and the immense increase in its numbers during the last three or four years may be regarded as the clearest index we have of the maturity of the question of reform at the present day. It was not to be supposed, however, that a society composed only of students, with limited means, and meeting only one evening in the week, could effect much material change or attain any important status in the profession; but we believe that its continued existence in so prosperous a condition has been a living protest against the anomalies and defects of our present system of education.

This seems to have been felt by some of the more energetic members of the Royal Institute of British Architects, who in 1860 conceived the idea of establishing examinations, partly to create a stimulus for work by laying down a curriculum of study, and a test of proficiency or distinction in the same, and partly to increase the power and position of the Institute by constituting in that body an University to which all recognised architects in future must belong. As might have been expected, this latter intention was at once quashed, not only by members of the Institute itself, but by all the Architectural Societies throughout the kingdom to whom the Institute appealed for support; and this had the effect of cooling at first somewhat of the enthusiasm with which the question would otherwise have been taken.

up. However, the scheme was established, and the first examination took place in December, 1862, with a certain amount of success. Two other examinations have since been held, the number of candidates diminishing each time; so that thus far the whole scheme has certainly been a failure, the reason for which we shall inquire into at some future opportunity.

The next measure of importance (though indirect in its bearing upon the profession with which we are concerned) was that undertaken by the Commissioners appointed to inquire into the Royal Academy. Their Report, issued in 1863, seems as yet to have had but little effect, except so far as it may have led to the removal of that body to Burlington House; but the evidence given by the two architects who were examined is interesting, if only for its strange and contradictory nature. Mr. Tite, for instance, frightens the Commissioners by telling them that, 'in order to learn architectural drawing, large boards and squares, and large means, are required, such as he hardly imagines an institution like the Academy could make the students avail themselves of;' and when asked whether the Royal Institute of British Architects supplied everything that was required in the more technical part of architectural drawing, answers 'Yes; I attach the greatest possible value to the technical and scientific discussions at the Institute, which could not of course be introduced into a general establishment. At the Institute men of large experience meet to discuss questions in a language which they thoroughly understand, which is not generally understood in the world; and by putting our experience together, great knowledge is communicated to the younger members who attend. That could not be done at the Academy; nor do I see how the mechanical teaching of architectural drawing could be managed in any other place than where it is generally managed—namely, in the office of the architect himself.'

Of course, with such opinions as these coming from the present President of the Institute, it is almost useless to look for much reform from that body unless there be a sufficiently strong adverse opinion on the council. We believe that at the present moment there are two students only in the Institute, and the drawings sent in last year in competition for the students' prizes were, it is said, so bad, that the council were ashamed to have them hung up in the room of meeting. There was one point, however, of importance elicited in the evidence, viz. that it was Mr. Tite's custom (and he it said to his honour) always to send his pupils to the Governmental School of Design, or to a private master, to learn drawing. If this were the customary practice nowadays, we should not probably be so energetic in our present movement. The evidence of Mr. Tite unfortunately nullified that of Mr. Scott, who strongly urged the establishment of an architectural drawing school within the walls of the Academy; and doubtless feeling that the result of such contradictory evidence as his own and that of Mr. Tite would be *nil*, as in fact the Report of the Commissioners shows, Mr. Scott read an admirable paper before the Architectural Association, in 1864, in which he deplored the defective state of artistic education as existing in the pupilage system, and earnestly advocated the establishment of a school, which was eventually termed the 'School of Art Accessorial to Architecture.'

In order to forward this scheme, delegates from the Institute, the Royal Academy, the Architectural Museum, the Architectural Exhibition, and the Architectural Association were nominated to serve on a committee. There seems, however, to have been some secret opposition, or at all events lukewarmness, towards the scheme, either on the part of the delegates or the Institute to whom they sent in their report, for the matter was allowed quietly to drop; until Mr. Burges during the last session repeatedly called attention to it, and early in this session letters were sent to the secretaries of the four latter societies, above named, from the Institute, asking them to reappoint their delegates to meet their own. This has just been done, and a committee of twenty-seven gentlemen representing the various institutions specially connected with architecture will now proceed to the reconsideration of this scheme, which it is to be hoped will be taken up in earnest. What the result will be, it is of course impossible to say; but we cannot help thinking that if four years ago the numerous advantages which could, with slight modifications, have been obtained from existing institutions, such as the Royal Academy, South Kensington Schools, and King's and University Colleges, had been turned to account, we should now have been in a position to establish at once a special school such as that mentioned in the report sent in to the Institute in 1864, which comprised *instruction in the drawing and modelling of organic forms with a view to the attainment of such an accurate knowledge of their structure as shall enable the student to apply them in architectural decoration with power and truth, and to form an intelligent comparison of their treatment by the masters of every period in art, and in the monuments whether of ancient or modern times.*

It is now four years and a half ago that this report was drawn up, and so much progress has since been made in the liberal advance of this question, that a school of ornamental drawing only will scarcely be sufficient to meet the present wants of the profession: and besides, inasmuch as architectural ornament is, and always has been, subservient to architectural style, the latter must be taught first to enable the student to understand and appreciate the former, and, in fact, to form the foundation on which alone a proper distinct knowledge of the various styles of ornament can be based. What therefore is wanted, is a school in which architectural drawing, the characteristics of style and its development, and the elementary principles of composition and design, would be taught practically, not by lectures, but in the solution of various problems given from time to time; the study of the figure and of ornament would form also a very essential part of this course.

It might also, and we believe will, form part of the province of this Committee which represents so many societies, to take up the whole question of architectural education. Mr. Edis, in an able article which we printed in our last number, urges the consideration of two very important points bearing upon the general question of education:—1st. Compulsory examinations, and, 2nd, a revision of the scale of charges lately issued by the Royal Institute of British Architects. It is certainly unfortunate, with regard to this latter question, that so soon after the publication of a fixed scale of 5 per cent. on all works, several of the members of the Institute should have been

willing, in the numerous competitions for hospitals and unions which have lately taken place, to accept less; and still more to be regretted that a circular should have been sent round to all the members, calling their attention to the infallibility of the 5 per cent., as being the custom not only in England but abroad, when it is well known that throughout Germany the scale of charges varies according to the nature of the work and its extent, and that in France Government architects receive only 3 per cent., their inspectors and clerks being paid by Government. With regard to the compulsory education which exists abroad, and which Mr. Edis advocates in England by the establishment of compulsory examination, it must be remembered that it is in consequence of the academical system which prevails throughout France and Germany, and which Mr. Edis affects to repudiate, that architectural education has become compulsory either by law or by custom in these two countries; and, therefore, until some such definite course of instruction for architects as that laid down abroad exist in England, it would be impossible to establish compulsory examinations here.

The subject, however, is by no means new, and was carefully considered by the Institute in 1860-62, at the time when they established their voluntary architectural examination. Whether since that time any change of opinion has taken place, the labours of the committee, to which allusion has been made, will be able to find out. We are sure that there is no architect who would not wish to see his profession placed on the same footing as those of law and medicine; at the same time, it must be patent to all that the education must be as systematic and good in architecture as it was in the above two other professions at the time of their obtaining their charter.

BUILDING CONTRACTS.

By A. LONDON CONTRACTOR.

IN a previous article on this subject the importance attached by contractors to the insertion of a full and fair arbitration clause in contracts was pointed out. Practically, it will be found that all questions which arise on building contracts are submitted to some form of arbitration. In cases where no reference clause has been inserted, an application to a judge at chambers will obtain the appointment of an arbitrator. Where this method is not adopted, but an action is brought, the same result will be arrived at by a somewhat longer and more expensive process. No sooner will the presiding judge have ascertained that the case before him relates to a builders' account than it will be summarily referred. In both these cases the referee will be a barrister, and in this arrangement there are certain manifest advantages, the arguments in its favour being at least as old as the Platonic Dialogues; but it would be useless to discuss them here, since nine tenths of the builders and nineteen twentieths of the architects are in favour of an architect as arbitrator. As this result can only be obtained by a special clause to that effect, all sides will be agreed as to the necessity of its insertion, and the only point left for discussion would appear to be as to who should be appointed arbitrator, the architect of the works or an independent one? *Solvitur ambulando.* The question is answered in stating it. In favour of appointing the architect of the works it is urged, however, that in his present position he stands between the employer and the contractor as an independent umpire, and that he has no pecuniary interest which would be liable to bias his judgment in any questions which may arise between them. Granting that architects, as a class, are a high-minded set of men who would not lend themselves to any proceedings they considered unjust, this only places them on a level with the best men in the other professions; but it is to place them above that level to require that in all matters between the contractor and the employer by whom they are nominated and paid, they shall bring to bear the mind, not of an advocate, but of a judge. Moreover, it is extremely doubtful whether employers generally would agree to this view of an architect's duties, a view not entertained with regard to any other professional man. If it were true, however, in practice as it is in theory, that the questions of difference which arise on a building contract were between the employer and the contractor, the objection to the architect being also arbitrator would probably be first raised by the architect himself, who would generally prefer to be relieved from an invidious and unpleasant position, but in reality nine out of ten such questions arise between the architect and the contractor: practically, therefore, where the contract provides that the former is to be the final referee on all questions in dispute, it provides neither more nor less than that he shall be judge in his own cause. Few architects, perhaps, require that power altogether to this extent should be left in their hands; but many desire to retain sole jurisdiction over certain points, the most important of which are the quality of the materials and workmanship, the right interpretation of the drawings and specification, and the issuing of the final certificate. It is urged that in allowing a reference on the first of the questions above alluded to, the door would be opened to endless litigation, with its attendant delay and expense. Why should this be so in building more than in any other business transaction? In all other dealings a man trusts to the inducement of further custom, or the desire to acquire or maintain an honourable reputation, or, as a last resort, to the protection which the law will give him, to obtain his due; but in building alone he desires to set himself above that law, and, sitting in judgment on his own cause, decide in his own favour. This arbitrary course is the less required since all the cost of disputing fair objections will fall on the builder, as it is he who is necessarily the loser by delay in the execution of the work, and the postponement of the stipulated payments.

With regard to the right interpretation of the drawings and specification, one would as readily expect an unbiassed opinion from an architect as to these productions of his, as from a father as to the beauty of his children, or an author as to the merits of his book. At any rate one may be forgiven for declining to take up space by defending the proposition that on this point he is an unfit judge until it has been attacked.

An arbitration clause containing no power of reference on the subject of the issue of the final certificate is an idle form of words, so far as protection to the builder is concerned. So long as the power to refuse this certificate is left with the architect of the works without appeal, a reference as to other questions is of no avail. As has already been stated, there being no power to force an architect to give a certificate, he may decline to do so unless the conditions, just or unjust, which he desires to impose, are agreed to. Under these circumstances, he may, by simply refusing to act, coerce the contractor into consenting to a reduction in his account, although an arbitrator may have decided that the prices charged are fair; alter work, although an arbitrator may have decided that it is according to the specification; or allow penalties, although an arbitrator may have decided that none have been incurred.

One other question of importance has been raised by the builders, namely, the appointment of the surveyor to take off the quantities in competitions. Formerly the general practice was to call the proposed competitors together and allow them to nominate a surveyor to act on their behalf. This is still done by some of the first architects of the day, and it is this practice which the builders seek to have restored. As the responsibility falls on the contractor if the quantities are deficient, it is obviously fair that he should have a voice in the appointment of a surveyor who is entitled to confidence either by proved ability in his profession, or at least the pecuniary power to rectify any mistakes he may make.

On this subject, as well as on that of the insertion of an arbitration clause in contracts, a conference has already taken place between the Institute of British Architects and the Builders' Society of London. Much valuable time and unpleasant discussion will be saved should a mutual understanding be arrived at, and much further benefit would be obtained if a model set of 'General Conditions' could be framed, to be recommended by the Institute to its members, and which the builders of London could refer to as a standard under which they were willing to work.

OUR RAMBLER

AT ST. PANCRAS TERMINUS.

SOME time back the curiosity of any casual passer-by in the neighbourhood of the immense space cleared at the north of the New Road (now St. Pancras Road) for the Midland Railway, was excited by the appearance of huge gaunt brown stumps of iron rising at intervals from masses of solid brickwork, and secured to them by strong bolts. These were ranged in two parallel lines, and appeared like the cores upon which might be built up, as was done at the Crystal Palace, an avenue of gigantic sphinxes, Egyptian fashion, to line this new approach to our capitol.

By and by it appeared that these stumps were not cores, but rather roots from which grew up one after another gigantic pointed arches in iron, of elegant curve, of vast span, and of graceful construction, forming the main ribs of a noble roof, under which the business of the new permanent station at St. Pancras could be carried on with the most ample convenience.

Paying a visit to this work in the course of its erection, and when more than half the roof had been fixed, our Rambler found all proceeding in regular order London-wards. The level of the rails under this shed is a good storey above the natural level of the ground, and a substructure 15 feet high was then in rapid progress, while a short distance behind it followed the fixing of the ribs of the roof, and these once fixed, the boarding and glazing crept on after them. Thus at the period of our visit the portion of the site nearest the St. Pancras Road exhibited the columns and girders of the basement, which formed a perfect net-work of regular squares. Further north, Mallett's buckled plates, which were used as the filling-in of this net-work, were being fixed; and still further on the ballast was spread over these, and the temporary rails were laid on which moved the framed scaffolding for fixing the roof.

The general aspect of this roof must be well known. Its main ribs are four-centred arches in outline, and their clear span is 240 feet. The springing line of the ribs is about the level of the rails, and the iron bases we have spoken of are really the springers. Each pair of these is tied together by a continuous tie-girder forming part of the network already referred to, and running across, supported by the columns of the basement, from one side to the other of the platform.

The fixing of the main ribs was going on at a rapid rate, and was a most interesting process to watch. The ribs are 29 feet 4 inches apart, and a travelling stage or centreing, wide enough to embrace a whole bay, was constructed in three distinct sections, a middle, and two sides. Upon this stage the work was fixed, and when a bay had been completed and was thoroughly bolted together and stayed, the staging was moved forward—first one side of it, then the other side, and lastly, the central portion, by the length of one bay. When that edge of the stage which had been under

the last rib but one was under the last rib, the staging was secured, and the framing of the next main rib began.

It was a wonderful structure, this stage; massive, rigid, and yet light; it moved readily—being supported on wheels throughout, but it remained firm enough to allow of the fixing being most accurately done.

A remarkable sight it was to witness a portion of one of the main ribs being raised and put in place: a little active, restless donkey engine, bustling at work some distance away from the stage, furnished the power; a very large hempen rope was used for the hauling, and this the engine drew over a powerful crab at a rapid rate for such heavy work.

A vast segment of a rib might be seen dangling in mid air from a derrick which leaned over from the side of the scaffold, and was, in fact, a stout timber with an universal joint at its lower end and a block at its upper, and steadied by several guy ropes. We ascend the vast staging from storey to storey till we arrive at the level of the upper end of the last fixed portion of the rib, and here we find the derrick and a small gang of men. The mass of iron makes its appearance, gradually rising till it is hauled up to a spot outside of that where it is to be fixed, and at what appears to us a height above what is required. A signal from the foreman, and the little engine stops in a moment, and the iron framing remains hanging in space. Deftly, and almost without a word of direction, the men handle the guy ropes, loosen one and tighten another, and in not much more time than it takes to write the description, the derrick and girder and all are slowly and easily swung round in a half circle; and the piece of beam having been gently tilted by pulling one end of it downward, slowly swings over and subsides into place, and hardly an inch of adjustment is necessary to bring it so neatly home that its flanges bear against those of the portion last fixed. The foreman carefully aligns it; the various men pack and wedge it up; screw bolts are at once passed through the holes already prepared for them in the flanges, and within a surprisingly short space what was a heavy dangling framework of iron hanging in mid-air like Mahomet's coffin, is fitted into its place ready to do its work as a segment of a strong securely framed rib, on the homogeneous action of which the support of the whole structure depends.

The fixing of the other portions of the framing required, of course, care and skill, but there were not here the same elements of difficulty as in the case of the main ribs; and this part of the work proceeded with the utmost dispatch, so that while the end of the roof nearest London was not even begun, the northern extremity showed almost all the details of the finished structure, as we see it now.

The natural disposition of every visitor to this station is to compare this roof with the two better known single span roofs, erected for the South-Eastern Railway, the roofs of the Cannon Street and Charing Cross Stations. Even setting aside the difference in span (which it is perhaps difficult at a glance to realize), there are other points in favour of the St. Pancras roof, which strike an observer at once. The noble sweep and fine curve of the pointed arch, gives a far more interesting outline than the segmental curve of Cannon Street. The absence of those ties which form a not ungraceful feature of the segmental roofs, is nevertheless in the St. Pancras one a great advantage, for the eye gains a sense of height and openness, and the outline of the arch is in no way interfered with. The whole central portion of the St. Pancras roof is glazed—without any opaque central strip. This arrangement is simple and effective, and this uninterrupted central mass of light; the sense of security given by the diagonal braces in each bay; and the long sweep of the various lines of the ribs, purlins, and braces as the eye follows them, contribute to the fine effect produced by this work.

Between each pair of main ribs run, parallel with them, three smaller ribs, which in the glazed part carry gutters; so that four glazed ridge and furrow roofs follow the outline of each bay. The purlins are open latticed girders of peculiar shape, their lower flanges being canted down at each end in each bay so as to act as struts and bear upon the lower flange of the deep main ribs. The diagonal braces just referred to are used to stiffen the roof in each bay and between each pair of principals and purlins, and are a very prominent feature, and their long diagonal lines stretching across the whole shed form a network that resembles very much the general outline of the ceiling of St. James's Hall. In perspective the whole shed assumes a regulated intricacy of effect which, joined to its simple and beautiful outline, entitles it to take a high rank among the efforts of architectural civil engineering of the day. This work is in the highest degree creditable to the engineer, Mr. W. H. Barlow, and to Messrs. Ordish and Lefebvre, who were consulted on the details of the iron work.

Although the ribs rise from the very level of the rails, so that the passing traveller, as he paces the platform, unconscious of the many acres of barrels of bitter beer stored beneath his feet, may forget that they rest on any brickwork at all, the roof covering does not follow the same line. From the ridge to the springing, there are eight spaces, formed by seven purlins. The highest four spaces (or vertical bays) are glazed, the next three are boarded and follow the outline of the rib, but in the last and lowest space the boarding forsakes that outline, and runs back nearly level till it meets the brickwork forming the walls of the station buildings. This is Mr. Scott's work, plain vigorous Gothic, executed mostly in red brick of a not very pleasing tint, with a sparing and judicious introduction of stone mouldings and

bands. A broad band of diamond-shaped panels filled with glazed tiles finishes this wall and forms a tolerably effective crowning feature, and this brickwork, with some well-designed open iron spandrels, suffice to impart genuine Gothic character to the whole work.

We need not add that in all this portion Mr. Scott has used thoroughly good detail—a feature conspicuous by its absence from nearly every engineering work yet executed which has a claim to architectural character. The detail of the roof is, in its way, equally satisfactory; for though nothing has been introduced for ornament, every part of it has been arranged by an architectural mind, and produces on the spectator a satisfactory effect.

CHRIST CHURCH CATHEDRAL, DUBLIN.

(WITH ILLUSTRATIONS.)

BY GEORGE EDMUND STREET, A.R.A.*

(Continued from page 31.)

THE crypt under the old choir extends but a short distance (25 feet) east of the central tower. It has a semi-circular apse, and the aisle is continued round the apse. East of this aisle are three chapels, but these, instead of having apsidal terminations, are square ended, and their dimensions are very small; the central chapel measuring 17 feet by 15½ feet, and the side chapels 7 feet by 7 feet. In the angle between the apsidal aisle and the south-eastern chapel, there are remains of what seems to be a circular turret, and I think it probable that similar remains would be found on the north side also.

The whole plan is, therefore, not only clearly made out, but it is one of much picturesqueness of outline, and, to the best of my belief, unique in Ireland. The crypt under the rest of the Church follows very closely the outline of the Church above, save that its west wall stops short one bay east of the west wall of the Nave, and that it does not appear to have been carried under the south aisle; at least if it does exist there it has been walled up, and I did not think it necessary to cut through the walls in order to settle this question.

The age of this crypt is, I believe, uniform throughout: or at any rate there is very little difference. The pointed arch occurs in its construction throughout; and the square piers which support the vaults are almost all chamfered, and the chamfers have an ornamental stopping which is certainly not earlier than the end of the twelfth century.

It follows from this, that no part of the old Irish Cathedral built by Bishop Donat now remains; and that the Church which we have to examine contains nothing earlier than the work of the English artists who followed the invasion of Strongbow, and who left so many marks of their presence in the beautiful works which they erected throughout the Pale. At first sight the planning of this crypt looks so much more like that of a Norman work than of a pointed building, that it is important to insist upon the fact that in point of date there is very little difference between the completion of the crypt and the erection of the Church above, and that whatever Church existed on the site before the time of the English Invasion was entirely removed in order to provide the necessary foundations for one on a large scale. I see no reason whatever to doubt that the whole of the Choir was erected on the same plan as the Crypt, and that from the beginning of the thirteenth century to the middle of the fourteenth it stood unaltered. But the scheme of the Nave was I suspect slightly enlarged, whilst the work was actually in progress, for the Nave is one bay longer than the crypt below it, and there are some indications of a different hand in portions of the detail of this additional western bay, which serve to strengthen the conjecture that its erection was an after-thought.

The progress of the builders of the early Church was the same, no doubt, that we almost always see. They built their crypt first throughout, and then went on gradually with the upper Church, beginning at the east end, and so going on to the west. The Choir and Transepts were the first part finished, and the two arches in the aisles (which are all that remain of the Choir), and the details of the north and south Transepts show that this portion of the work was all in a slightly earlier style than that of the Nave, being transitional from Romanesque to early Gothic. As soon as they were finished, the work in the Nave was no doubt commenced, and I suppose that this may have been in progress for some years in the first quarter of the thirteenth century, but that at any rate it was completed before 1225.

With our reduced Cathedral establishments, and our desire to see our Cathedral naves made thoroughly useful, it is probable that any architect who had to build a new Cathedral would now revert to some such plan as that which I have shown was originally seen in the Choir of Christ Church.

The arm of the cross east of the tower was only large enough to receive the altar. The Clergy and Choir no doubt had their stalls under the Central Tower, and the Nave and Transepts were thus left for the use of the people. It hardly needs to say, that, after the end of the twelfth century, the same course was pursued all over Europe. The short early Choirs were destroyed, and Choirs on a far larger scale were everywhere erected. In the case before us, the

enlargement of the Church was first of all accomplished in a round-about way, by the erection of a large Lady Chapel outside the Cathedral, and only touching it at one (the north-east) angle. This Lady Chapel was evidently built without the slightest thought of its ever forming part of the Church, and was entered from a western porch, to which access was gained from the eastern doorway of the North Transept. It was built probably on the outside boundary of the land belonging to the Church; for its axis is different from that of the Church, and its north wall formed the boundary of the street which passed along the whole north side of the Cathedral. This provision of an ample Lady Chapel did not, however, very long satisfy the authorities of the Church, and whether they were moved by a desire to emulate the larger Choir of St. Patrick's, or by the necessities of the increased staff of the Church, it is at any rate certain that in the fourteenth century it was thought necessary to make an enormous change in the plan and dimensions of the Choir. It was extended from its old modest length of less than 30 feet to the rather grand dimensions of 102 feet, and if the character of the work had been equal to its extent there would have been nothing to complain of. Unfortunately this was not the case; and even when first built it is impossible that the fourteenth century Choir of Christ Church can have been really a fine work. In order to economise as much as possible, the architect ventured to use the south wall of the new Lady Chapel, and so involved himself in the necessity of making the great bend to the north in the eastern half of the Choir, which is noticed by every one, but for which I have never seen the true reason given, because people have not realised the history of the successive additions to the fabric. The Lady Chapel was built outside the Church, and therefore its divergence from the axis of the Nave was of no consequence; but when its outer wall was made use of to save the cost of building a new north wall to the Choir, this divergence became of the utmost importance, and involved a blemish and an unsightliness which no architectural skill could have entirely surmounted. But as far as I can judge there never was any great exhibition of such skill, and the new Choir, with its awkward bend, its absence of groining, and its want of striking architectural features, must have formed a sad contrast from the first, to the exquisite art displayed in the western half of the Cathedral.

I have already quoted the statement that the tower fell in A.D. 1316. It was after this no doubt that the present tower arches were built. They are evidently not of the same age as the transepts. A still greater calamity was the fall of the groining in the nave, and of the south wall and of the Clerestory in 1562. I was in hopes that we should find that the old columns and arches still existed in the south wall; but on removing some of the plaster and masonry it appeared that the eastern arch alone remains, and in a very shattered and damaged condition. The old South Aisle has been converted into a series of Vestries and a Chapter-room, and all its original character has been entirely destroyed.

I have now I think shown sufficiently at length what the old scheme of this Cathedral was, and it only remains to say what steps ought to be taken to remedy its present forlorn and semi-ruinous condition; and in the advice which I proceed to give, I have thought well, for every reason, to dismiss from my consideration altogether, the possibility of restoring the Choir, and this for various reasons. Its present state and its present arrangements are most unsatisfactory, and I regret beyond measure that we have not still in existence the short thirteenth-century Choir, with its Apse—its Eastern Chapels, and its Turrets: such a Choir would not only be far more effective than the present Choir ever can be, but it would at the same time have been admirably adapted for our modern use and for the reduced staff of Clergy and Choir who serve the Cathedral. But it is certain that the Choir is in such a state as not to stand in urgent need of repair, and so, until the Nave shall have been properly repaired and restored, it would in my opinion be most unwise to spend any thing upon it.

I confine myself, therefore, in the recommendations which I make, and the Plans which I have prepared, to the works which are required to the west of the Choir. They are large and costly, and it will I suspect be best to confine our attention entirely to them until they are completed.

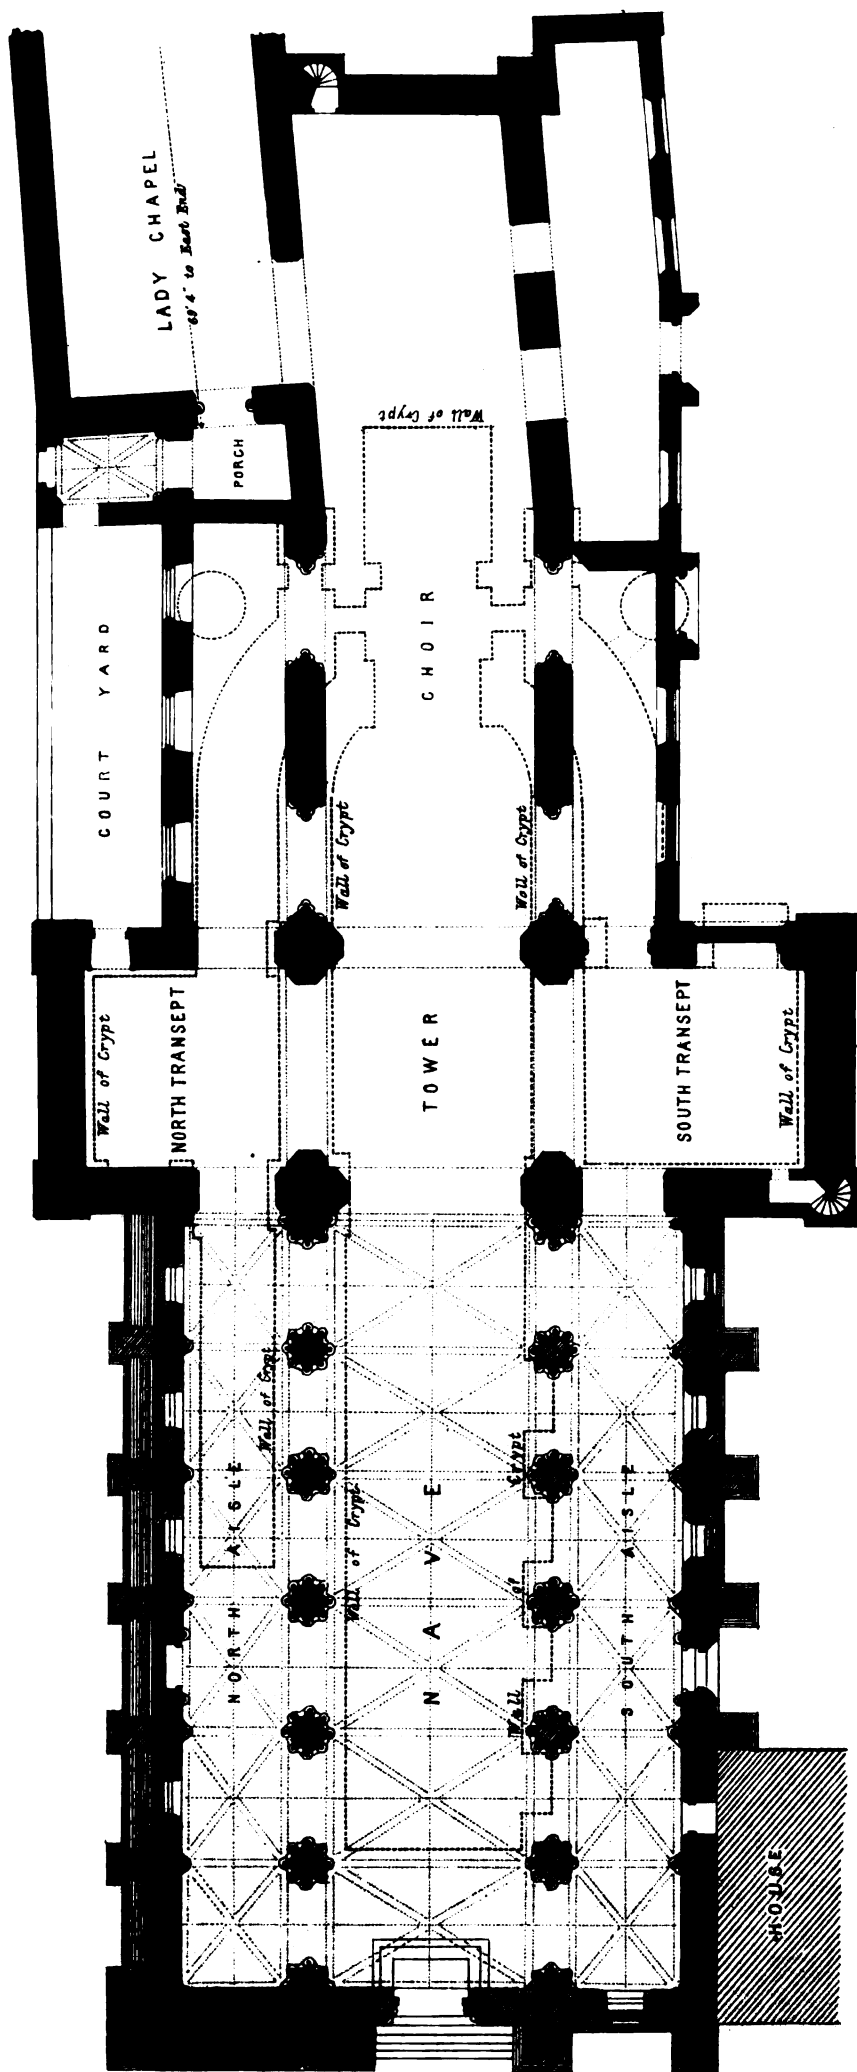

The present state of the Nave is certainly very bad in every way. The whole North wall, and the North wall of the Aisle, are much out of the perpendicular. The North Aisle has been supported on the outside by a vast and unsightly mass of masonry, and the North wall of the Nave is shored by a timber framework under the Roof. Much of the stone-work is damaged and requires repair, and the whole is covered with whitewash; whilst the floor of the Nave, being considerably raised, destroys to a serious degree the whole proportions of the fine clustered Columns.

The great object to be kept in view is to afford sufficient support to these walls without taking them down, for if they were taken down I fear it would be most difficult to rebuild them without importing so much new masonry and carving as to make the work really a new work, and so deprive it of what is beyond question one great claim to respect—its antiquity. I found on examination that the great mass of masonry built up against the north aisle wall is not so efficient a support as it appears to be. For there seems to be a good deal of loose material filled in behind its face and in front of the old wall. This at any rate was the case at the point at which I opened this wall, and is likely I presume to be the case throughout. What

* From a Report to the Dean and Chapter of the Cathedral.

The Architect, Feb: 6th 1869.

Designed by W. W. Wynne & Co. London, E.C.

I should propose would be to build up large buttresses opposite each of the principal columns of the Nave on the north side, to support the Clerestory from these by means of flying buttresses, and to strengthen the lowest tier of arches by means of groining in stone. In this way I believe that we may make a really good work of this north side of the Church, and keep it from becoming any more out of the perpendicular. I should at the same time, of course, propose to clean and restore all the stone-work very carefully, and to renew all the old features which are decayed and destroyed. The aisle windows would then admit of being opened, and thus this old part of the Church would be restored thoroughly to its old state.

On the opposite (or south) side of the Nave, the work which ought to be done is much more simple and obvious. There can be no doubt that, until the South Aisle is restored in exact conformity with the north, the Nave of the Church will not be satisfactory in its effect, and the work will not be a real restoration. Whilst, on the other hand, if the South Aisle is built, the Nave of Christ Church will be second in beauty to few churches of the same size in any part of Europe. Nor would the expense be enormous, as will be seen on referring to my estimates. In order to execute this part of the work, I should propose to shore up the existing Nave roof, to take down the whole of the south wall of the Nave, and to rebuild it in exact conformity with the other side. I believe that (as I have shown on my plans) the outer wall of the Vestries may be retained, new windows being inserted in it, and buttresses built. This Aisle would also be groined in stone in the same way as the North Aisle.

The west end of the Nave requires a new door and new windows. I was so fortunate as to find a portion of the old jamb of the window *in situ*, and so my design for this may be considered a pretty safe restoration of the original design. Then I propose to restore the old Groined Roof over the whole of the Nave, but to execute the groining in wood instead of stone; the old walls would not stand the weight and thrust of a stone vault, and this expedient, of which there are many old examples, is, therefore, as justifiable as it is unavoidable. On the exterior of the Church I should propose to take the opportunity afforded by these works to make some alterations. I should propose to finish the walls of both Aisles and Clerestory with the characteristic Irish battlements, and I should be inclined also to remove the doorway from its modern place in the south transept, and insert it instead in the South Aisle wall.

Finally, I ought also to say that I should lower the Nave floor to its old level, and repave the whole of the nave, aisles, and transepts with tiles copied from the old pavement, much of which seems still to remain buried under the present floor.

When all these works are complete, the Dean and Chapter will have a Cathedral of which, so far as the Nave and Transepts are concerned, they will have a just title to be proud.

I should propose to take the works in the following order—

FIRST. To build the South Aisle and South side of Nave. This would be a complete work in itself, and one which would be sure to interest everyone and to draw forth help.

SECOND. To restore the North Aisle and North side of the Nave.

THIRD. To restore the West Front and finish the Groining of the Nave; and

LASTLY. To complete the work by repairing the Transepts, and repaving the entire Church West of the Choir.

In this way the work may, I think, be carried on with perfect security, and so as to make no one section of the work so costly as to render it unlikely that it will be done.

DUDLEY GALLERY.

IF public interest, a throng of visitors, and walls well lined with works of pictorial art far above the average of merit may be accepted as a guarantee of success to the 'General Exhibition of Water-colour Drawings,' its Committee may be sincerely congratulated on the result of their labours in this its fifth anniversary.

It may indeed be argued that inasmuch as this Exhibition has already formed and must continue to form the nursery of a special branch of art represented elsewhere, its most successful exhibitors, when elected members of the Society or Institute of Water-colour Painters, will naturally be tempted to reserve their best efforts for display in Pall Mall; but there are nevertheless not a few who are faithful to both interests, and the Dudley Gallery has, besides, this decided advantage over other Exhibitions, that while its doors are open to all artists of merit, it is not trammelled by that unfortunate consideration of *membership* which in some instances results in the incubus of confessed mediocrity.

Among the most prominent figure subjects in the Gallery this season are those of Mr. Simeon Solomon, who we believe has filled a place on its walls from the first year of the Exhibition. To estimate the full value of this talented painter's work, it must be remembered that he belongs to a school whose aim is distinctly directed towards the ideal, and is wide from all attempt to illustrate *incident* in art. It is true that in such a work as his 'Song' (315), we find a group of young ladies and more effeminate young gentlemen dressed in the costume of our grandfathers' childhood, and gathered round a spinet; but the attitude of the figures and the whole *ethos* of this scene is neither natural, nor, we should hope, is it meant to be. With the grace of Stodhart, and a luscious charm of colour which is all the painter's own, there is nevertheless—and we are sorry to say it of such otherwise excellent work—a something—call it sentiment or what you will, about this picture from which Stodhart would have shrunk, and which will

never find true sympathy among educated lovers of art unless art itself should ever become emasculated. Much the same and more might be said of this painter's 'Sacramentum Amoris' (111), a half-draped mystical personage, with the *torso* of a Hercules and the head and limbs of a woman, who holds in—shall we say *his* or *her*?—hand a transparent shrine, in which a small winged figure—also of the epicene or doubtful gender—is deposited. What possible purpose in art such work as this can be destined to fulfil we are at a loss to guess; but judging from the Latin text inscribed on the frame (S. John, i. 5), it suggests a satire which can hardly escape the charge of irreverence.

To Mr. Solomon's 'Saint of the Eastern Church' (88) we can give nothing but the highest praise. Bating a strange tendency—observable in most of his figures—to exaggerate the width between human eyes, and represent them in one plane instead of on a curved surface—the drawing and execution of this work are admirable. The chaste key of colour in which it is painted, the deft association of hues which respectively stand for dark marbles, white vestments, and gold embroidery, combine to render this drawing one of the most attractive, to a refined taste, in the Gallery. Mr. Solomon's success has naturally induced more than one imitator to follow in his wake. Among these may be mentioned Mr. Walter Crane and Mr. Robert Bateman. The former gentleman's 'Water, Fire, Air, and Earth' (107), four symbolical figures in separate compartments, represent a work which seems to be of considerable merit so far as colour is concerned, but it is unfortunately hung too high for fair criticism. His second work, 'A Medieval Poet' (24) clad in a mantle of dark red velvet, and stretching his 'lazy length' (and a very long length it is) by a river's side, while shadowy forms flit in thin procession on the opposite bank, must be judged by its aim rather than its execution. But Mr. Bateman's ambition is of that acrobatic order which o'erleaps itself. One may fairly question whether, since the Dudley Gallery first opened, any figure subject on so large a scale as his 'Story of a Mother and her Son' (217) has been exhibited with such small pretensions to technical skill, and we humbly submit to him, with all due deference to his choice of style, that it will be time enough for him to think of style when he has become more of a master of his brush.

We doubt whether Mr. E. Clifford would care to be identified with that neo-medieval school which is the latest fashion of the day. Exceptional in character though his work may be, it possesses sufficient vitality to hold the mirror up to nature, and this too after a fashion which never descends to commonplace. His 'Head of an Angel' (19) is finely conceived and nobly drawn. The charming portrait of a child with a background of field flowers, to which he gives the title of 'In Clover' (27), exhibits sound taste in colour and composition; and though his 'Jean' (243) may be less successfully rendered in detail, there is a refinement and delicacy in the head indicative of great promise.

Let us now turn to the works of an artist who, while affecting no peculiarity of specific style, keeps steadily clear of those lamentable conventionalities which have until lately been the bane of our modern English School. Mr. E. J. Poynter is one of a very few painters, at least in this country, who have shown themselves equal adepts both in oil and water-colour painting. We are glad to find that the Royal Academy have at last recognised the ability displayed in his 'Israel in Egypt' by admitting him to the rank of Associate. We need only walk round the walls of the Dudley Gallery to acknowledge his excellence in another field of art. Whether we turn to his naïve and graceful portrait of Mrs. Alfred Baldwin (317), in which the minutest detail, down to the inlay of a Japanese cabinet, is conscientiously but unobtrusively rendered, or to his accurate study of mosaics in the central dome of St. Mark's (585), or to his other Venetian subjects—'Boats at the Dogana' (554), and 'Moonlight on the Grand Canal' (570), we cannot fail to note the taste and industry with which each and all of these several and diverse subjects have been treated. His inventive power is well represented by a group of four small but clever designs, which are described in the catalogue under the general title of 'The Prodigal Son' (519), but which can scarcely have been painted in illustration of the same subject without involving an incongruity of detail too obvious to call anachronism.

The 'eye picture' in the room—by virtue of its size, chiefly, as we apprehend, is Mr. Calderon's 'La Fileuse' (207), a buxom, but somewhat uninteresting daughter of the South, who, lolling on a garden bench, distaff in hand, seems to be—what she doubtless was—a painter's model, and nothing else. This picture, like a former one by the same hand, exhibited at the Dudley, is painted entirely in tempera on canvas; and, whatever its artistic merits may be, appears out of place in an exhibition of ordinary water-colour drawings.

Under the title of 'A Farm Corner' (75), Mr. J. North—whose name, if we mistake not, has long been before the public as an illustrator of 'gift-books'—sends a hotly-coloured study of a barn-loft, in which two men are lying. Both in this drawing and that of Mr. Pinwell—another draughtsman on the wood—the light is strangely diffused; and though the 'Calf' scene (603) exhibited by the latter artist has many good qualities of execution, we prefer it as an engraving. The 'China Shelf' (291) of Mr. Luxmoore is an instance of the interest which may be elicited by the simple study of a single figure gracefully posed with a background of appropriate accessories. It represents no high aim in art, and its rendering of texture is in parts defective; but, on the whole, it is a decided success, and is utterly free from the mawkish prettiness which too often characterises such subjects.

We are sorry to find that Mr. A. B. Donaldson shows a tendency this season to relapse into the chromatic feverishness from which he had all but recovered last year. The undeniable skill in composition which is noticeable in his 'Parlement d'Amour' (255), and his 'Requiescat in Pace' (272), is marred by the violence of hue in which both pictures are steeped. The expression of his heads, too, might sometimes be tempered with advantage. That of the lady seated in the left-hand corner of his first subject is worth all the others, because it is in a state of repose. His studies of architecture and landscape are, in our opinion, far superior to his figure subjects, and we especially commend to notice his 'Villa Borghese' (591),

'Venice from the Public Gardens' (655), and 'Village in the New Forest' (614).

'A Game of Fox and Geese' (360) is a slightly painted, but very clever drawing by Mr. Briton Riviere, full of humour and truth in animal form. The sly look of old Reynard, who lies on his side in the foreground with his eyes just sufficiently opened to see the unlucky geese waddling unconsciously towards him across the common, the stupid, self-confident look of the birds themselves, with their fat bodies and out-stretched necks, really furnish such pictorial evidence of a good practical joke that we forget the dreadful tragedy which is about to be enacted, and can only wish the ruthless free-booter a good appetite.

Miss Marie Spartali, whose taste and skill in the field of water-colour painting have long since raised her far beyond the level of an ordinary amateur, sends two large drawings: one the life-size portrait of a lady (we believe her sister), in a Venetian dress, under the title of 'Nereia Foscarini' (461); the other a subject picture, 'Brewing the Love-Philtre' (390), in which two women are concocting a charm under trees at nightfall. Both works are of considerable merit; and if they are deficient in any quality, it is that of execution rather than of judgment and design.

Here we must pause for the present, reserving many notable drawings for future comment.

SOCIETIES.

The Institution of Civil Engineers.

FEBRUARY 2, 1869.

Charles Hutton Gregory, Esq., President, in the chair.

The paper read was 'The Mauritius Railways—Midland Line,' by Mr. James R. Mosse, M. Inst. C.E.

It was announced that the discussion, which had been commenced, would be resumed at the next meeting, when the following Paper would be read: 'On the Lagoons and Marshes of certain parts of the Shores of the Mediterranean,' by Prof. D. T. Ansted, F.R.S.

At the Monthly Ballot, the following candidates were balloted for and duly elected: as MEMBERS, J. H. W. Buck, T. Dale, P. Greek, and H. J. Wylie; as ASSOCIATES, J. Bowden, A. M. Fowler, C. Hart, B. M. de Michele, J. Musgrave, E. W. Preston, A. L. Sacré, H. T. H. Siccama, A. H. Strongitharm, and J. W. Wilson.

A report was brought up from the council stating that, under the provisions of Section IV. of the bye-laws, the following candidate had been admitted a Student of the Institution since the date of the last announcement: J. P. Van der Meulen.

THE INSTITUTION OF CIVIL ENGINEERS.—Tuesday, February 9, at 8 P.M.: 1st Discussion, 'Mauritius Railways—Midland Line,' and 2nd, Prof. Ansted, 'On the Lagoons and Marshes of certain parts of the Shores of the Mediterranean.'

Associated Arts' Institute.

9, CONDUIT STREET, W.

January 23, Discussion and Exhibition of Sketches. Mr. R. Phené Spiers, V.P., in the Chair.

After the transaction of the usual routine business, the Chairman called on Mr. Walter Crane to open the discussion on the question, 'Does General Mental Training tend to develop Art Power?'

Mr. CRANE, in opening in the affirmative, remarked that the two sides of the present question bore relation to the two chief educational theories of the age, of which the great exponents were Mr. Carlyle and Mr. Mill. He might state his general position in the form of a syllogism. Art is a product of observation and experience, acting on the imagination and the feelings. Whatever educates and extends the former has a corresponding effect upon the latter; and as mental culture or training has this tendency, therefore mental training tends to develop art power. Mr. Crane then proceeded to show, in the progress of a student of art from childhood, that the forms of his practice would correspond with the phases of his mental condition, and afterwards traced the same correspondence between the art and the mind of the world at the chief periods of its history. Having touched incidentally on the value of special branches of study in various branches of art (as history and poetry in figure painting, and botany and geology in landscape), he contrasted the universalism of the great artists of old with the present tendency to the division of labour in art. He then remarked that by the chemistry of the mind, observation and experience were converted into thought, and thought was precipitated in art. Whatever in literature or in life refined the feelings, widened the sympathies, stimulated the imagination, or strengthened the intellect of the artist, must tend to ennoble his art. If the human mind had not, in the course of ages, received such education, our highest ideal of pictorial art would still be found on the walls of Memphis or of Thebes. In the present day—amid the complex conditions of modern life, the crowds of agitating questions, the varied interests and conflicting principles—to some the temptation might seem strong to retire to a self-built monastery of the mind and devote life to the quiet study of art, shutting the door upon the confused noise of the world, and caring not to answer 'the riddle of the painful earth.' But exclusiveness and isolation would no more be healthy for the artist than for the man; sooner or later would be felt the baneful influences inseparable from restricted effort and narrowed sympathies, the human mind would become intolerant and self-indulgent, and the spirit of art degenerate into the monotony of handicraft.

Mr. F. N. PRINCE briefly replied in the negative. Circumstances prevented him from fulfilling his engagement otherwise than nominally. The real duties of his position would be performed by his supporters.

Mr. H. E. WOOLDRIDGE (for the affirmative) urged that the broad culture of the Greeks had resulted in the perfection of art, while, on the other hand, the exclusive training of the Jews had produced (with the exception of

religious poetry) no art whatever; and that at the Renaissance also, when art again well-nigh attained to the Greek level of excellence, it did so under the influence of learning, and in the hands of learned men.

Mr. SCARLET POTTER (for the negative) was of opinion that the syllogism on which the speakers for the affirmative based their arguments was not one that would bear examination. If, as stated by Mr. Crane, art were mainly a product of experience, why were the works produced by artists when the maximum of experience had been reached, and before the decay of age had set in, inferior, as a rule, to their earlier works? If art were dependent on knowledge, why did not this age, more fruitful in research than any that had gone before it, produce more great art than past times? The thing of real importance was the innate art instinct. If that were present, the work would be good and true, whether the artist were as learned as Leonardo or as ignorant as Turner. He thought breadth of information rather prejudicial than otherwise, since it militated against earnestness and depth of feeling. A Dante or a Fra Angelico would be impossible in the nineteenth century. The short span of life would not permit a man to devote himself to many things if he hoped to excel in any; and, as a rule, it was by concentration, not diffusion, that power was attained.

Mr. HOLYOAKE (affirmative) thought the last speaker had argued on false premises. The question was rather, 'the art instinct being given, would general culture tend to develop it?' In his opinion it would have that tendency.

Mr. LEMON MICHAEL (negative) reminded Mr. Holyoake that the speakers in the affirmative had only been attacked in the position they had themselves assumed. His objections were therefore unnecessary. Mr. Wooldridge had instanced the Greeks and Hebrews. Now, Greek art reached its acme earlier than Greek philosophy, and, therefore, could not be said to have sprung from it; and the practice of art was forbidden to the Jews by their religion; and the difference of art instinct in the two races had also to be considered. The rise of Renaissance art had been mentioned by the same speaker as a result of learning; but that speaker had not thought proper to point out how its fall was caused by over much learning. Something of the evil of conscious knowledge in art might be seen in the antiquarian pictures of the present day, in which the subject appeared a mere peg on which to hang costumes and elaborately correct accessories. For art purposes, it was necessary that things should be seen in a child-like spirit; Nature, like religion, revealed her secrets rather to the simplicity of faith than the pride of knowledge.

Mr. LEWIS DAY (affirmative) pointed out that for the architect of the present day an education extending over so wide a range of subjects as to be general rather than technical was absolutely necessary.

Some further remarks having been made by Mr. REDGRAVE, Mr. HEWITT, and Mr. RALPH THOMAS,

The CHAIRMAN in summing up proceeded to divide the various branches of intellectual culture under different heads. Some of these, as, for instance, poetry, would from their nature prove beneficial to art power; whilst others, such as archaeology, would tend to lead the mind of the artist from imagination to fact, and would therefore be prejudicial. On the whole, he thought the arguments brought forward favoured the negative view of the question. In allusion to Mr. Day's remarks on the education of members of his own profession, he believed the study of so great a number of subjects as was now forced upon them had well-nigh extinguished all art power among English architects.

A show of hands was then taken, and the majority declared to be for the affirmative.

A considerable number of sketches by members were exhibited, illustrating the Second Act of the 'Tempest,' and the word 'Lost.' The ballot on their merits resulted in the palm of excellence being awarded to a sketch by Mr. Charles Gliddon, in the former series, and in the latter to one by Mr. Oliver Morris.

THE STUDENT'S CORNER.

Thicknesses of Arches.—In some investigations on the equilibrium of arches I deduced the following simple and convenient rule for determining the proper depth or thickness of the voussoirs of a cut stone arch at the crown. Let s represent the span of the arch, and t the thickness of the crown. Then

$$t = \frac{3}{8} \sqrt{s},$$

or the depth of the voussoir at the crown will be three-eighths the square root of the span. This simple rule is applicable to all arches, however great or however small the span, from a semi-circle to the flattest segments ever attempted on public works. It is always safe.—*Ellet.*

Size of Public Clocks.—I have no difficulty in saying that one-tenth of the height from the ground is the least size which a public dial ought to be, except in some unusual positions where they can only be seen a very little way.—*Denison.*

Coating Water-Pipes.—When pipes are coated with asphalt, they will deliver a much greater quantity than any calculated results. The 4 feet pipes at Glasgow were calculated to deliver 20,000,000 gallons in twenty-four hours with 5 feet per mile inclination. They have delivered 26,000,000 with 3½ feet. The expense of asphalt was about 5s. a ton.—*Bateman.*

Architects and Decoration.—Properly speaking the design for the decoration of any building both externally and internally is the province of its architect, since in this case decoration is essentially a part of its architecture. If the principle that 'ornament is the decoration of construction' be just, it will be apparent that it is hardly possible to judge of the one without the other. In works wherein the decorator makes his own sham construction in order to

ornament it, as well as in those multiplied manufactured 'parts' which form the staple ornament of a large class of workmen in this line, we may admire the skill of the execution, the cleverness of the details, the excellence of the manufacture, or the imitation of early works of acknowledged merit; but to appreciate 'decoration' we must view it as a whole in the place for which it was specially designed, and in harmony with the building whose construction it ornaments. Moreover, it must mainly originate in local circumstances, and ought to have an individual significance.—*Redgrave.*

Slates.—The finest and largest roofing slates seem to be those of a bluish grey or pale green colour. Where they become either very red or quite black, they are more brittle, and more readily decompose, owing probably to the presence of peroxide of iron in the one, and carbonaceous matter in the other.—*Jukes.*

Pruning Trees.—I have always had occasion to observe as a practical truth that in the cutting up of trees which had not had their large branches cut off close by the trunk, the timber was of good quality, and sound throughout, excepting where extreme old age had caused natural decay; and of the truth of this I am perfectly convinced. Therefore, I hereby beg to advise every proprietor of plantations never, as he values their health as timber, to cut clean from the boll of a tree a branch which is more than four inches in diameter at its base.—*Brown.*

Cast-Iron Columns.—Hollow columns of 20 to 24 diameters in length:—

		Columns may be loaded with	
If cast $\frac{3}{4}$ -inch thick or upwards—	2 tons per square inch of sectional area of iron		
" " "	" " "	1 $\frac{1}{2}$ " "	" "
" " "	" " "	1 $\frac{1}{4}$ " "	" "
" " "	" " "	1 " "	" "
For columns of 25 to 30 diameters in length:—			
If cast $\frac{3}{4}$ -inch thick or upwards—	1 $\frac{1}{2}$ tons per square inch		
" " "	" " "	1 $\frac{1}{4}$ " "	" "
" " "	" " "	1 " "	" "

Columns being supposed of good construction, with flat ends, and with base plates at their bearings.—*Shields.*

ARCHITECTURAL EDUCATION.

Sir,—Mr. Edis, in criticising the Report of the Association delegates to the Architectural Alliance on Architectural Education, takes exception to certain points in it, I think, without sufficient grounds. He 'dissents from much that it lays down, because it fails to enquire into and recognise the causes which are in a great measure the reason of the present admitted faulty system of education.'

I am afraid Mr. Edis has not read all the Report; for seventy lines of printed matter are confined to enquiring into those causes alone: whether he agrees with them or not is another matter.

Mr. Edis thinks the Report is faulty for two reasons:—

1st—because the suggestions made therein are evidently based on the foreign systems of education.

Without admitting that to be a fault, I beg to point out that the propositions contained under Head IV., and recommended for adoption at present, are based on the *pupilage system*; those under Head II., which are *suggestive only*, are based on the *academical system*, which will, of course, ultimately replace the former just as railway travelling has taken the place of that by the stage coach.

With regard to the second fault—namely, that it only suggests a system which is not to be compulsory—I am really unable to see how the profession can be put on a better footing until the education of its members be carried on by some systematic and definite course; compulsory examination may follow as the result of such system, as it has abroad, either by law or by custom, but it certainly cannot precede it.

Even abroad it is in *Prussia alone* that examination is compulsory by law, and there everybody is examined, from the highest authorities in the land to the commonest soldier or sailor, or even the shoemaker. It will, I fear, be a long time before we are able to arrive at that state of civilisation.

In speaking of the French school, Mr. Edis assumes 'that the paid professor cannot be of any great eminence, as the smallness of the sum paid would leave him but a very small remuneration after payment of rooms and incidental expenses.'

It does, however, happen that the professors of the ateliers are, without exception, the very highest architects of eminence in the country, as the names of Labrousse, Lebas, Gilbert, Blouet, Questel, Constant-Dufeux, Daumet, and others testify.

With regard to the theoretical instruction of the French School, the Report is somewhat exaggerated, for during the last ten years no 'Grand Prix' man has visited Rome without having passed two or more years in the office of an architect; two of them were inspectors for more than four years at the New Opera, Paris; and it is well known that nearly all the students of the atelier, after the second year in the school, work for three or four months in the year in the office of an architect, at so much per hour, and in some cases as much as eight or nine months. The administration of the school, however, does not recognise, as in Germany, the practical instruction thus obtained elsewhere as a necessary part of their system; and

this fact, and also because the Report had to be considerably shortened, led, I am afraid, to the exclusion of these important points, which considerably modify the general theoretical tone of the system.

I remain, Sir, yours obediently,

R. PERSE SPIERS.

BALLIOL COLLEGE.

Sir,—In your interesting account of the enlargement of Balliol College, Oxford, an inaccuracy occurs, which, I trust, you will allow me to correct, as it refers to a lady to whom the College has been indebted for a munificence which, if withheld, would have deprived the building of much of its present distinction.

Miss Brackenbury is described in your article as a descendant of the original founder, *John de Balliol* (1264). This is not the case, although a former connection between the families of Balliol and Brackenbury may have been the motive for selecting 'Balliol' in preference to other colleges as the recipient of her munificent endowments.

It is, however, as the last of her line, and in *memoriam* of her two brothers, who were the last lineal male descendants of Sir Perse de Brackenbury, of Sellaby, Durham, who married a daughter of *Hugh de Balliol*, of Barnard Castle, and died about 1106, that her donations have been made to Balliol College.

One of her brothers was in the law and the other in medicine, and in their memory three scholarships at Balliol have been founded by Miss Brackenbury, for young gentlemen intending to devote themselves to those professions; and her contributions to the construction of the building were made in the hope of securing, gratuitously, suitable rooms for her scholars in the Brackenbury Tower.

Trusting that you will kindly insert this slight correction of your excellent notice of Balliol College, I am, Sir, yours, &c.,
Brighton, Feb. 1, 1869. H.

REMOVING HOUSES.

Sir,—An interesting article appeared in one of your early numbers with reference to the American mode of removing houses from one part of the city of Chicago to another, without taking them down or injuring their stability. A similar removal has just been successfully made at Caversham Bridge, under the direction of Mr. Woodman, our borough surveyor. A house in the occupancy of Mr. Piper stood until Friday last close to the east side of the old pier, but it was found that this would be an obstruction to the erection of the new bridge, and it was accordingly determined to try the American plan of removal *en masse*. The attempt was made on Friday morning, and in less than three hours the building was placed 8 feet farther back, and was settled safely and uninjured in the position it is to permanently occupy.

ARCHITECT.

Caversham.

UTILISATION OF REFUSE.

Sir,—In the last number of THE ARCHITECT a disheartening view is taken of the prospects of utilising the London sewage. Others see much promise in the prospect of the sewage being made a source of wealth and benefit to agriculture as well as of profit to those who will undertake the task of organising the supply of a simple and substantial manure for the purposes of the agriculturist. This might be done by the action and responsibility of the Board of Works: it could be done most suitably by them, but failing that, it may be done by the action of a Company, Limited, and I beg you for one moment to consider a rough sketch for the purpose.

At suitable stations on the Thames, places or wharves could be opened for the reception of the London shootage, FREE. By the means of free shootage a constant and large supply of matter would be collected at these depôts, from the diggings, the sweepings, and rubbish of London. Barges filled with this shootage would be tugged down the river to the Sewage Outlets, where a site would be taken for the reception and conversion of the manure. The shootage, after a rough sorting, would be lain in suitable beds, to be run over by the London sewage to saturation. This valuable and simple manure, when partly dried, would be then ready for distribution on the lands around, enriching and gradually raising them. The residue of hard material taken from the shootage would make and raise roads in the low lands adjoining, and the effect of this simple arrangement would be to make a constant supply of valuable manure for a large district requiring it, a good supply of road material, a fair return for capital invested, as well as the removal of the filth from London, to the great benefit of the inhabitants.

February 2, 1869.

I am, Sir, yours obediently,

C. P. ASTON.

FIRE-ESCAPES.

Sir,—The recent calamitous fire at the house of my friend Mr. E. H. Barlee, at Kensington, leads me to ask for the use of your columns for one or two practical suggestions.

In a leading article in *The Standard*, one day last week, it is made a reflection upon the architectural profession, that while we design and erect houses more or less impregnable from without, we give little heed to the necessary means of egress for the unfortunate inmates whose escape is cut off in consequence of smoke and flame having taken possession of the staircase. Now, while there is, no doubt, some truth in the observation, yet I submit that it is savouring of unfairness to reflect wholly upon the foresight and care of the architect, for I think that the matter of escape by the windows of the house—to which *The Standard* evidently refers, is more for the consideration of the inmates than of the architect. Upon us, clearly, lies the responsibility of providing against facilities for unlawful ingress, but to my simple mind the facilities of egress by means of the windows come more within the province of the house furnisher and upholsterer than of the architect and surveyor.

Probably in five bedrooms out of six, a dressing-table of some sort stands under or near the window. It most frequently has one or more shallow drawers in front, sometimes it is dressed up in the mysteries of muslin and glazed calico, but in any case there is room to fit a shallow drawer, opening only at the back of the table, and therefore not likely to be perverted to other than its proper use, wherein might be kept a coil of some 20 or 30 yards of strong $\frac{1}{4}$ inch rope, i.e. half-an-inch thick (which by-the-by should not be 'knotted at intervals,' as I think has been elsewhere recommended) rove at one end through the eye of a stout iron hook, like a fish-hook, and having about three inches *gape*, i.e. between stem and point. Or a shallow drawer might be conveniently made (opening at the back, for the reason before stated) at the bottom of the box ottoman now so frequently found in better class bedrooms, in which the rope and hook might be stored, always ready to hand, without previous adjustment or fixing, yet out of sight and occupying no valuable space. A sum of five pounds would furnish all the bedrooms of a moderate-sized house with this useful expedient.

This is, at once, the best, cheapest, simplest, of all fire-escapes. By its means an adult might quickly and safely land half-a-dozen children from a third or fourth floor window on the pavement below, letting down other adults in like manner if necessary, using the hooked or free end of the rope as the circumstances of the moment might require, and finally passing the rope round a bedpost, might lower himself, or, having secured the hook to the inside sill of the window, the bedstead, or other convenient and safe anchorage, slip down quickly and safely to the ground.

The very fact of knowing that so ready and simple a means of escape is at hand in every room would go far to nerve and strengthen the most timid of the inmates, and contribute to that presence of mind that is half the battle, and oft-times more, in the case of a fire.

How useful, too, would be the hook as a means of bringing up help from below!—even

'the broken fly ladder' at Kensington might have been easily reared by its means. There is very little doubt that had this simple and inexpensive apparatus been at hand at Lansdowne Crescent last week, the valuable life of my friend's wife would have been preserved, and his feelings, and those of his servants and connections, saved many a bitter pang.

I am becoming more and more convinced that most, if not all, of the Patent Domestic Fire Escapes are a delusion and a snare. Rope ladders, too, that are never at hand when wanted, and that will never *shake out* properly when they are, are little better; clearly they are of no use to infants and young children, and but little to timid men and females. Probably not one female in a hundred could descend a rope ladder amid the excitement of a fire and under the gaze of a gaping crowd without falling; and hundreds would hesitate until resolution came too late. Nay, for one that would venture on a rope or wire ladder—possibly hanging loose and swinging about like a pendulum—ten would let themselves down quickly and safely by means of the rope.

Just one more suggestion. Would it not be well always to have a door at the foot of the attic stairs, to shut down the smoke and flame, when there is a means of exit—as there ought always to be—by a skylight in the roof? Such a door need not be fire-proof, but it would enable the inmates, if driven to the upper floors, to escape leisurely on to the roof without being affected by the blinding smoke and unbreatheable hot air that rush like a whirlwind up the staircases the moment a vent is opened in the roof. How often has it happened that some poor soul has been suffocated, scorched, blackened, and burnt to death at the very foot of the escape ladder in the roof!

Lastly, that ladder should never be out of its place, and every fresh servant should be well instructed in the *means and modes of escape*.

Prevention is always better than cure; but carefulness alone is no safeguard against fire, as is most amply proved by the calamity that has called forth this letter from

Yours faithfully,

W. L.

LEGAL.

At Marylebone Police Court, on Monday, Thomas Crofts, contractor, Kentish Town Wharf, and Joseph Manning, labourer, were charged on remand with stealing about 40,000 bricks belonging to Mr. William Henshaw, the contractor for building a new infirmary at Highgate, for St. Pancras. Mr. George Lewis conducted the prosecution, and Mr. F. H. Lewis defended Crofts, as reported in THE ARCHITECT of January 23. It was shown that the prosecutor had the contract for the erection of a new infirmary at Highgate. He had made arrangements with several brickmakers to supply him with bricks to be delivered at Crofts' Wharf, and thence carted to the site of the infirmary at Highgate. Messrs. Pickett and Sharpe, of Southend Green, Hampstead, contracted to cart the bricks for Mr. Henshaw from the prisoner Crofts' wharf. They, however, without the sanction of Mr. Henshaw, sublet their contract to Crofts. Bricks from that time were missing, and from what had been stated by the prisoner Manning, he had been induced by Crofts and his foreman to tally bricks from the barges to the extent of about 40,000, for which he received 4s. a thousand. The lowest price for these bricks was, including the cartage, 34s. a thousand. Competent surveyors had measured up the work, and found that there were about 218,000 bricks deficient, and this was borne out by the invoices. Mr. D'Eyncourt committed both prisoners for trial, and refused bail.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

India.

Engineering.—A Baboo, Kalutch Chunder Ghose, has recently purchased the plant of the Beerbhoom Iron Works, and started the works afresh. One of his new furnaces is capable of turning out about eighty tons of fair iron a month. Specimens of ore have been lying about unnoticed for the past five years. There is a promising seam of coal not far from the works, and lime can be had in abundance. The works are also very advantageously situated with respect to the East Indian Railway.

Works have been commenced at Salem, in the Madras Presidency, for improving the drainage of the town, and for conveying water to the reservoirs in the Fort.

The Government of India has ordered the revival of *tuccanee* advances for irrigation purposes, such as wells and reservoirs, throughout the Punjab.

The Ahmedabad merchants are taking active steps to promote the construction of a railway from that city to Veerungnum, a distance of thirty-eight miles.

A successful trial trip over thirty-two miles of the Chord line of the East Indian Railway, from Seetarampore to Setakuttee, was made on December 26 last by a special train.

The late accident to the telegraph on the Arakan coast shows the urgent need of an alternative line connecting Calcutta with British Burmah. It is rumoured that a deep sea line is shortly to be laid across the Bay from False Point to Henzai, in the Tavoy district.

It is stated that the Maharajah Holkar is about to work the iron mines at Burwai, which were lately purchased by him from Government.

Architecture.—It is understood that the New Presidency College building at Madras will be completed about May next, no fewer than 600 work-people being just now busily employed upon it. When finished there will be accommodation enough for several hundred pupils, besides library and reading rooms, examination hall 60 feet by 60, and a large number of offices.

Permission has been received from the French Government at home to erect a *Hôtel de Ville* for the benefit of the public at Pondicherry. The site has already been chosen on one side of the *Place Napoléon III.*, and commanding an excellent view of the esplanade, the pier, and other objects of interest. It is also in contemplation to put up a statue in the centre of the Place to the memory of Duplex.

The foundation stone of the University of Bombay was laid on December 29 by His Excellency Sir Seymour Fitzgerald, in the presence of a large concourse of the public, both European and Native. Although the University itself was founded in 1857, nothing has been done till now to provide it with a local habitation of its own, beyond procuring sketches from several architects, and ultimately a complete design from Mr. G. G. Scott, R.A.

Notes from Paris for Connoisseurs.

A man of taste is known by the quality and not by the quantity of his treasures, and the late Comte d'Hauversart must be accounted such, though his pictures, sold the other day in Paris, were but four in number: the first was a fine example of Jacques Ruysdaël, *The Torrent*, and sold for a sum equal to 328*l.*; the second, a sea-piece by Ludolf Backuysen, fetched 320*l.*; the third, a small work by Jean Van Hughtenburch, *Attack of a Military Convoy*, 36*l.*; and the last, a *Public Square* in a Dutch town, by Gérard Berckeyden, 200*l.*

Another small collection sold recently in Paris presents several points of interest. A bust of Voltaire in marble by Houdon, signed, and bearing the date of the year 1781, formerly presented by the Marquis de Vilette to the Comtesse de Ferney, sold for little over 49*l.* At the same sale three remarkable pieces of tapestry were sold at high prices: one, representing the *Triumph of Alexander* and having the arms of England over the subject, fetched 108*l.*; another, in which Apollo and the Muses are placed in a *Landscape*, 200*l.*; and the third, of Beauvais manufacture, a *Concert* in a Park, in the style of Watteau, 120*l.*

At the sale of the effects of Madlle. Delphine Marquet, two works in pastel sold for relatively large sums. One, a portrait, by La Tour, of Madlle. Sallé, a dancer, dated 1745, formerly in the Véron collection, sold for 101*l.*; and the other, a portrait of the *Fermier Général de la Reynière*, by the same artist and of the same date, 53*l.*

The season for the sale of works of art in Paris is now coming on, and the DelSSERT and other collections are expected to create considerable excitement at the great mart in the Rue Drouot, which in truth, for the last few years, has been one of the most fashionable as well as crowded resorts in Paris: the connoisseur is almost sure to find something of interest in one of the many sale rooms of that establishment, the only one in which public sales are allowed to take place in Paris, with the exception of one small sale room for books only, unless in the houses of the proprietors themselves. The Art-market is a great institution in Paris, and a highly-interesting one; there is scarcely any scene in which the characteristics of the people may be studied with more effect than at the private view of the pictures, sculpture, artistic furniture, or *bric-à-brac*. The French taste in art is certainly far from pure, but there are few French people who have not a love, if not exactly an appreciation, of art.

General.

At the Royal Academy Election last Saturday, Messrs. Mason and Poynter were chosen to fill up the vacancies in the ranks of the Associates. The difficulty of making a choice, when so many distinguished names were to be found in the candidates' list, must have been necessarily great; and the Academy are to be congratulated on having added to their number two men so eminently fitted to uphold the credit and reputation of the institution. The only painful reflection connected with the result is that both gentlemen studied abroad; an additional proof, if any were wanted, of the truth of the remarks in a recent article in this Journal on the deficiency of art education in this country.

The 'private view' of the Dudley Gallery Exhibition came off on Saturday, and more than 700 persons visited the gallery during the course of the day. Sales were effected to the extent of over 1,500*l.*—an advance of 600*l.* on the amount realised on the same occasion last year—a satisfactory proof of the sure though gradual improvement in monetary matters.

Mr. Layard has selected Messrs. Leighton, R.A., Poynter, A.R.A., Prinsep, and Albert Moore, to execute four of the figures which form part of the internal decoration of the Houses of Parliament.

On Saturday, at Chatham Dockyard, a wooden bridge gave way under the weight of a train laden with clay, by which four men were injured, and one fatally. Works are in progress for the extension of the dockyard.

A scheme, approved of by several leading scientific authorities, for providing telegraphic stations in mid Channel, is about to be considered by the Government and the Trinity Board. Its purpose is to establish floating telegraph vessels in different parts of the Channel and also on the Irish Coast, so that passing ships will be enabled to keep up communication with Great Britain, America, and the Continent.

The dividend of the Clifton Suspension Bridge Company for the half-year ending December 31 was at the rate of 1½ per cent. per annum. The passenger traffic during that period showed a diminution compared with the corresponding half of the previous year.

Messrs. Austin and Johnson of Newcastle have reported that owing to insufficient ventilation the sleepers, flooring, and seats of Alnwick Church have begun to exhibit signs of decay. To remedy the evil it is suggested that a drain on a level with the floor be carried round the outside of the building.

A report has been made to the Board of Works recommending that the sum of 100*l.* be contributed towards enclosing a piece of vacant ground in Beresford Square, Woolwich.

The Board of Works has been asked for a sum of 168,468*l.*, being the cost of acquiring some property for the purpose of widening Leadenhall Street. The committee considered that they were not in a position to raise so much money, unless by increasing the sewers rate; a plan which under existing circumstances they were not disposed to adopt.

The important question of an increased supply of gas to the metropolis will engage the attention of Parliament this year. Several of the large companies have applied for power to raise additional capital; they may require it, but we know we want increased light at a reduced rate.

The Commissioners of Works have given instructions to the effect that the portion of the embankment of the river which runs parallel with Battersea Park is to be finished with stone dressings.

Her Majesty's Theatre is rapidly approaching completion; and if report be true, it is likely to be of a superior character in its general details. We hope that effectual provision will be made for the ready egress of the audience in case of alarm; it is hardly likely that so important a fact will not receive due attention.

The Model of the statue of Lord Palmerston, by Mr. Woolner, which is to be erected in Palace Yard, Westminster, is in the hands of the bronze casters.

A portrait bust in marble of Dr. Muspratt, the discoverer of the chloride of iron spring, is expected to be ready for exhibition at the Royal Academy in May next. Mr. Adams-Acton is the sculptor. The bust will be placed in the New Pump-room at Harrogate.

Architects' Responsibilities.—It was stated at the Carmarthenshire Quarter Sessions that in consequence of defective workmanship and materials used in building the 'Joint Counties Asylum,' it had been found necessary to renew a considerable portion of the work; and it was added that the loss had arisen through their architect, who had certified that the work was properly executed. A case was submitted to an eminent counsel, who has given an 'opinion' that proceedings can be taken against the architect to recover damages for the defects, and it has been decided to take legal proceedings against him.

It is anticipated that new Blackfriars Bridge will be opened on May 24 next. Should this date be finally decided on, it will be the hundredth anniversary of the opening of the old bridge, in 1769; and by a curious coincidence, it happens that on the same day her Majesty will have completed her fiftieth year.

It is proposed to erect a memorial church to Archbishop Longley at Oxford. The cost is expected to be about 15,000*l.* to 20,000*l.*, and the building is intended to hold at least 1,000 persons. The subscriptions already amount to 2,000*l.*

Portobello.—It is estimated that the new pier which is to be built at Portobello will cost 6,000*l.*

Memorial Window.—A stained-glass window of a very handsome description has recently been placed in the chancel of St. Margaret's Church, Sibsey, by Edmund Brown Waite, Esq., a former resident of the parish, in memory of his deceased wife, who died in May, 1867. The subject is taken from the 10th chapter of St. Luke's Gospel, the three figures representing Christ, Martha, and Mary. There are now five memorial windows in the chancel of this church.

Rumour states that a tramway will be run on the Thames Embankment, in order to supply the public with that convenience which the Metropolitan District Railway Company have so long delayed.

Worcester Cathedral Great Bell.—A new mode of tolling great bells has just been applied to the 4½ ton bell lately cast by Messrs. Taylor, of Loughborough, for Worcester Cathedral, and recently hung there. The bell has been hung on a new plan, which, with the clock and peal of twelve bells, is designed by Mr. Denison, Q.C., and gives a new effect to bells which are too heavy to be rung in the usual way. The gudgeons or pivots, instead of being round, are wedge-shaped, like those of a scale beam, and roll on hard brasses very slightly hollowed. The friction is thereby made so little that this great bell can be tolled easily by one man with one hand; and it was so tolled for service last Sunday by the Rev. H. T. Ellacombe, of Topsham, who is a small man, and in his eightieth year, as well as by Mr. Denison himself and the Rev. R. Cattley, the author of the Worcester Cathedral clock and bell scheme. It is actually much easier than clapping, or pulling the clapper by a rope, yet brings out the full tone of the bell much more grandly. This tone is half a note below the fourth quarter bell of the Westminster clock. The heaviest bells in England might be made tollable in this way at a very small expense; now most of them are only inadequately struck by clock hammers or by clapping, which is the cause of nine out of ten cracked bells. No wheel is required, but only a long lever fixed to the stock. The gudgeons must not be lower than the top of the bell.—*Times.*

The Corner-stone of Kendal Hospital was laid on Saturday last: The building is to be opened at the end of this year, and has been planned by Mr. Joseph Bintley.

A considerable change in the facility with which stone is dressed or polished is likely soon to be made, several of the master builders in Glasgow having at last erected machinery for that purpose, a step which in America had been taken nearly twenty years ago. On Saturday last the machinery was put in motion for the first time, and the result was most favourable. In less than half an hour 160 feet of stone suitable for build-ings was dressed: an amount of work which, by the old method, eleven men could scarcely have accomplished in a whole day.

The Drainage Works, Tewkesbury.—The sewerage works of this town, which will cost about 3,000*l.*, are nearly completed, but a proposal which threatens to render them worthless, says the *Worcester Chronicle*, has just been laid before Parliament. The Severn Navigation Commissioners propose going to Parliament for powers to raise the level of the water between Tewkesbury and Gloucester by the erection of weirs at the latter place. As the Tewkesbury drainage works have not too much fall into Mill-Avon already, the permanent raising of the level will greatly interfere with them, and most probably cause the erection and constant use of pumping machinery. Foreseeing this consequence, the Board of Health has been for some time in communication with the Severn Commissioners, and a fortnight since a deputation of six members of the Board went to Worcester and had an interview with a committee of the Commissioners. 'The results,' says the *Tewkesbury Weekly Record*, 'were by no means satisfactory. The Commissioners' engineer, Mr. Leader Williams, could not see how the Tewkesbury drainage could be injured by his intended operations. The question was then asked, "If the proposed works are carried out, and it is proved that Tewkesbury is damaged thereby, will the Commissioners guarantee fair compensation?" The reply given by the

chairman, Mr. Lea, was as distinct and straightforward as the question: "The Commissioners will guarantee nothing." There seems therefore no choice left to the Board but to oppose the Commissioners when they go to Parliament for their Bill.'

The Extension of the Midland Railway from Mangotsfield to Bath will probably be opened for public traffic on the 1st of April. The present Mangotsfield station will not be used after the opening of the new line; but a new one, at present in course of construction, somewhat nearer Bristol, will replace it. This will be an additional means of transit between Bath and Bristol.

It is reported that a great treasure has been turned up among the stores of the India House—no less than the library of Timour, containing 'documents of extraordinary interest bearing on the history of Mahommed.' The *Pall Mall Gazette* adds that these documents are such as will cause a great part of Eastern history to be rewritten.

A subterranean passage leading from the school at Westminster (which was formerly the monks' dormitory) to the passage under the cloister has just been discovered. It was no doubt a *latrina* or *cloaca*, much of the same description as that found at New College, in connection with the 'Garderobe' of the time of William of Wykeham.

Before the re-assembling of Parliament, the interior of the House of Commons will have undergone a considerable alteration, the principal object of which is to make every portion of the Chamber available for the use of members.

The Town Teme Bridge, Tenbury.—This structure is admitted to be one of the best built in the counties across a portion of which it stretches, but, like most other structures built or raised centuries back, although then ample for all present purposes, now requires to be enlarged to meet the large and increasing traffic. The bridge forms a junction between the counties of Worcester and Salop. It has six arches, four and a half in Worcester and one and a half in Salop; is built of durable stone, with iron palisades. In width (and here is the evil) it is only 9 ft. 6 in., not allowing vehicles to pass each other while crossing it; and when we state that it is the great highway to the station, where terminate two important rail-ways—the Tenbury, worked by the London and North-Western Company, and the Tenbury and Bewdley, worked by the Great Western Company—it will be palpable to every one that in its present state the bridge is a great impediment to traffic, as well as being very dangerous. Application has been made to the Quarter Sessions of the two counties interested for grants towards the cost of increasing the width, and a local subscription has been for some time open.

New Palace of Justice.—The strenuous efforts made by the *Times* to obtain a favourable reconsideration of the site for our new Palace of Justice are beginning to tell on society and on the profession. We predict success. It is no secret that the new Commissioner of Public Works supports the change of site from Carey Street to Thames bank, and we are glad to report that a practical difficulty standing in the way of that exchange—the apparent impossibility of finding room for a repository of wills on the preferential site—has been overcome by the discovery that we have plenty of room for a wills repository on the Rolls estate in Chancery Lane. The Government and the public are now of one mind; the legal profession is divided, but the better opinion is gaining ground in the Inns of Court, and we cannot pretend to doubt that the new Palace of Justice will be built on the noblest site in the world.—*Athenæum.*

A New Church has just been completed at Padiham, Lancashire, from the designs of Mr. Wm. Waddington, architect, of Padiham and Burnley. It is designed in the style of the early part of the fifteenth century, and has a lofty tower, containing a peal of six bells. The work has been carried out by local contractors; it will accommodate 1,000 persons, and has cost about 8,000*l.*

A New Wesleyan Chapel in the Italian style was opened recently in Lower Broughton, Manchester. It has been designed to hold about 900 persons, and has cost about 6,000*l.* The work has been executed by Mr. Foggett, of Cheetham, from the designs of Mr. Wm. Waddington, of Burnley.

The Free West Church in Union Street, Aberdeen, is now completed, and will be opened on Sunday next. The cost is upwards of 14,000*l.* The architect is Mr. James Mathews.

At the 20th Annual Meeting of the London Congregational Chapel Building Society, it was stated that the society is at present engaged, with Mr. S. Morley, M.P., in the erection of twenty-four chapels, to each of which Mr. Morley contributes 500*l.*, and the society 500*l.*

MEETINGS OF LEARNED SOCIETIES.

INSTITUTION OF CIVIL ENGINEERS.—Tuesday, February 9, at 8 P.M. 1. Discussion on the Mauritius Railway, Midland Line. 2. 'On the Lagoons and Marshes of certain parts of the Shores of the Mediterranean,' by Professor Ansted, F.R.S.

INSTITUTION OF SURVEYORS.—Monday, February 8, at 8 P.M. Adjourned discussion on paper by Mr. Ryde. Mr. J. Bailey Denton on 'The Future Extension of Railways with reference to their Influence on Landed Property and Agriculture.'

ROYAL INSTITUTION.—Tuesday, February 9, at 3 P.M. Mr. Westmacott on Fine Art. Thursday, February 11, at 3 P.M. D. M. Foster on 'The Involuntary Movements of Animals.' Friday, February 12, at 8 P.M. Colonel Drummond Jervois on 'The Coast Defences of England.' Saturday, February 13, at 3 P.M. Professor Odling on 'Hydrogen and its Analogues.'

SOCIETY OF ARTS.—Wednesday, February 10, at 8 P.M.

PUBLISHER'S ANNOUNCEMENT.

Advertisements cannot be received for insertion later than 2 P.M. on Thursdays.

Temporary Office, 4 Monument Yard, London.—GILBERT WOOD, Publisher.

THE GAZETTE.

PARTNERSHIPS DISSOLVED.

Edward Higgins and Thomas Jacob Jones, Newport, Monmouthshire, timber merchants—William Wilson and George Wilson, High Street, Lincoln, plumbers—James Storey Allatt and William Derry, Leeds, iron merchants—Samuel Young and Samuel Hughes, Regent Road, Salford, Lancashire, beersellers—Fratt and Feather, Bingley, Yorkshire, plasterers—Gradwell and Palmer, Stockport, timber merchants—Pearson and Fawcett, Kingston-upon-Hull, builders—R. Heap and Son, Kirkland Kendal, Westmoreland, joiners.

DECLARATIONS OF DIVIDEND.

J. Armitage, Great Paxton, engineer—first div. of 1s. 8d. Wednesday next and two subsequent Wednesdays, at Mr. Edwards's, Basinghall Street.

BANKRUPTS.

George Poulson, The Elms, Harrow, builder, Feb. 17, at 1—William Riley and Charles Frederick Riley, late of Gunnersbury Place, Kew Bridge, Kew, carpenters, Feb. 22, at 11—Samuel Penfold, Great Dover Street, house decorator Feb. 17, at 1—William Thornton, St. John's Hill, Battersea, builder, Feb. 19, at 1.

TO SURRENDER IN THE COUNTRY.—Reuben Hinchliffe, Huddersfield, Yorkshire, joiner and builder, Feb. 15, Leeds —J. W. Lee, Queen Street, Leicester, engineer, Feb. 9, Birmingham—William Airey, Liverpool, joiner, Feb. 16, Liverpool—Alfred Green, St. Leonard's-on-Sea, upholsterer, Feb. 15, Hastings—Joseph Newcombe, Torquay, builder, Feb. 12, Exeter.

TENDERS.

OLD BUNDON, NEAR SUNDERLAND.—For Farm House and Buildings. No quantities supplied. Mr. G. A. Middlemiss, Architect.

Table with 2 columns: Contractor Name and Amount. Includes Mr. Parkin Thornton (£613 0 0), Mr. Henry Oliver (615 17 7 1/2), Messrs. Clark & Turnbull (613 6 8), Messrs. Geo. Reals & Sons (610 0 0), Messrs. Robinson & Pile (605 0 0), Messrs. Cole & Hindhaugh (600 0 0), Mr. Geo. Moir (accepted) (600 0 0).

DARLINGTON.—Fourteen cottages for the Low Parks Land Company. Mr. Wm. Peachey, A.R.I.B.A., architect.

Table with 2 columns: Contractor Name and Amount. Includes Richardson & Cansic (brick and stone-work) (£933 5 0), Ormrod (plastering) (234 0 0), Wharton (slating) (98 14 10), Elwin (carpenter and joiner) (474 0 0), Johnson (plumber, glazier, and iron-founder) (126 1 5), Dryden (painter) (42 0 0). Total: £1,898 1 8.

HEATHWOOD.—For erecting a residence, coach-house, and stables, at Heathwood, Kent, for John Webster, Esq. Mr. John Tarring, architect, 69 Basinghall Street, E.C. :-

Table with 2 columns: Contractor Name and Amount. Includes Stimpson (£2,717), Dove Brothers (2,500), Henshaw (3,394), Patman and Fotheringham (3,385), Hill & Sons (3,340), Keyes & Head (3,199), Robinson (2,942).

MALVERN COLLEGE HOUSE.—Haddon, Bros., architects, Great Malvern and Hereford:—

Table with 2 columns: Contractor Name and Amount. Includes Wood & Son (£5,904 0 0), Smart (5,880 0 0), Garbutt (5,823 0 0), Dixon (5,649 16 3), Griffiths (5,616 0 0), McCann and Everal (5,489 0 0), Inwood (5,106 0 0), Slim (accepted) (5,092 0 0).

APPOINTMENTS VACANT.

SMETHWICK.—Surveyor. Salary 100l. per annum. Application to be made on or before February 9. Mr. Ralph Docker, Clerk to Local Board.

MALVERN.—February 19.—Surveyor and Inspector of Nuisances. Total salary 200l. per annum, with unfurnished house, gas, and coal. Chairman of Local Board, Gt. Malvern.

COMPETITIONS OPEN.

ROYAL ACADEMY OF ARTS.—National Gallery. For the best painting, in Oil—or Model and Design in Painting, Sculpture, and Architecture. The Gold Medal and the Discourses of Presidents Reynolds, West, &c.; and for the best Copies of Drawings, Models of Life, the Antique in Landscape Perspective, &c. The Silver Medals, &c. November 1.

ROTHERHAM.—March 15.—For Plans, &c., for erecting a Public Hospital and Dispensary. A prize of 75l. is offered for the best design, 50l. for the second, and 25l. for the third. John Barras, hon. secretary, Rotherham.

DOVER.—Feb. 20.—St. Mary's Burial Board. Designs for laying out 9 1/2 acres, for the purposes of a new Cemetery. Premiums 50l. and 20l. G. Fielding.

KINGSTON-ON-THAMES.—March 1.—Design for new School and Master's Residence. Cost not to exceed 5,000l. F. Gould, Esq., Kingston-on-Thames.

LEAMINGTON.—Feb. 10.—Royal Pump Room Gardens. Designs for a Memorial Fountain. A. S. Field, Leamington.

BRECON.—March 1.—Plans and Estimates for Alterations of County Gaol. A premium of 80l. is offered for best plan. Edward Williams, Clerk of Peace, Brecon.

CONTRACTS OPEN.

CITY OF LONDON.—February 23.—For Stone Paving in Carriageways and Footways. Joseph Daw, Sewers' Office, Guildhall.

LONDON.—For pulling down and re-constructing premises, No. 15 Newgate Street. Mr. William Smith, 12 Copthall Court, E.C.

INDIA OFFICE.—February 8.—For supply of Canvas; also for 600 Tons of Smithy Coal, to be delivered at Calcutta. Mr. Gerald C. Talbot, India Office, Westminster.

EAST INDIAN RAILWAY COMPANY.—February 11.—For supply of 1,500 tons of best Smithy Coal, also 1,000 tons of best Foundry Coke. Mr. D. J. Noad, Nicholas Lane, E.C.

ST. GROUGE, HANOVER SQUARE.—February 20.—For Materials from March 25, 1869, to March 24, 1870. Mr. Joseph Henry Smith, Clerk to the Vestry.

WANDSWORTH COMMON.—For Fencing in an Estate. Mr. T. Barnett, 6 Lower Belgrave Street, S.W.

ST. GILES, CAMBERWELL.—February 15.—For Repairing of Roads. Mr. Geo. Wm. Marsden, Vestry Hall, Camberwell.

ST. MARY ABBOTT'S, KENSINGTON.—February 10.—For Carting and Carrying away Dust, &c. Reuben Green, Vestry Hall, Kensington.

UPPER HOLLOWAY.—For making up about 200 feet of roadway. 192 Albany Street, Regent's Park.

NEWINGTON SICK ASYLUM.—The Five Architects who sent in Plans are requested to supply 20 copies of Printed Reports. Joseph Burgess, Vestry Hall, Wandsworth, S.E.

ST. GILES, CAMBERWELL.—February 8.—For sinking about six Wells. Mr. J. C. Reynolds, Wells Street, Southampton Street, Camberwell.

CARDIFF GASLIGHT AND COKE COMPANY.—February 10.—For excavating, building, puddling, Mason's and brick-work required in the construction of a Brick Gas-holder Tank, at their Grange Station. The interior diameter of the tank will be 112 feet and the depth 29 feet 6 inches. Henry Bowen, Engineer, Cardiff.

CARDIFF LOCAL BOARD OF HEALTH.—Feb. 28.—For the supply of Fifty Iron Lamp Pillars and Fifty Iron Lamp Holders. Geo. Salmon, Clerk to the Local Board, Town Hall, Cardiff.

CARDIFF LOCAL BOARD OF HEALTH.—Feb. 28.—For the construction of a new Outfall Sewer, Channel, and Works connected therewith. Geo. Salmon, Clerk to the Local Board, Town Hall, Cardiff.

BURTON-ON-TRENT.—February 17.—Contract for Locomotive Engine Shed, with necessary Offices and Workshops. Plans, &c., to be seen at Mr. H. Woodhouse's Office, Stafford Station. Tenders to be sent to S. Reay, Secretary, Euston Station, London.

CASTLEFORD LOCAL BOARD OF HEALTH.—For the Sinking of a Well or Pumping Shaft for the Waterworks intended to be forthwith established for the above board at Castleford, in the county of York. George Bradley, clerk of the Board, Castleford.

SHEFFIELD.—February 10.—For the erection of two wings with central building and offices for the New South Yorkshire Asylum at Wadley Park, near Sheffield. Mr. Bernard Hartley, West Riding Surveyor, Pontefract. Bills of quantities, prepared by Mr. Thomas Taylor, Surveyor, Manchester.

ILKLEY.—February 11.—For the various works required in the erection of a pair of semi-detached Villas, at the bottom of Parish Hill Road, Ilkley. Thomas Ambler, Architect, 9 Park Place, Leeds.

MORLEY.—February 24.—For about 1,644 yards of 9-inch Pipes, which are over and above the quantity they require for their water supply. William Smith, jun., Clerk, Morley.

SHANKLIN (Isle of Wight).—For the erection of a small Villa. Bills of quantities can be had on application to Mr. J. P. Harper, Osmaston Street, Derby.

GREENWICH DISTRICT.—February 17.—For laying down Tooled York Paving Granite Kerb, and other Materials and Works required for making up the road and footways of Manor Road, in the Parish of St. Paul, Deptford. E. W. James, Clerk to the Board, Greenwich.

NORTHAMPTON.—February 16.—For the supply and erection of a Gas-holder, 100 feet diameter by 30 feet deep, with columns, girders, &c. John Emson, jun., Northampton Gas Company, Northampton. See Advertisement.

TOWN MALLING.—March 11.—For Repair of Roads from March 25, 1869, to March 25, 1870. W. South Norton, Town Malling.

OXFORDSHIRE.—February 9.—For Purchase of Pudlicote Estate, either in lots or for the whole property. James Cooper, Esq., 5 Billiter Street, E.C.

SMARDEN, KENT.—Feb. 10.—For Resecting and Restoring Smarden Church. Rev. F. F. Haslewood, Rector, Smarden.

TOPSHAM, DEVON.—February 8.—For Construction of a Storage Reservoir to contain about 10,000 gallons, together with Filter Beds, and other works attached thereto. Also for providing and laying about 95 tons of Cast-iron Mains, and about 34 tons of Cast-iron Distribution Pipes. Mr. William Serena, Topsham, Devon.

SPAIN.—March 1.—For Submarine Telegraph Cable. Urbano Montego, 155 Fenchurch Street, E.C.

BIRMINGHAM.—Feb. 17.—Erection of Schools to accommodate 300 Boys, with Dining Hall, Workshops, Apartments for Masters and Teachers, and other Buildings. Martin and Chamberlain, Christ Church Buildings, Birmingham.

CITY OF MANCHESTER.—Feb. 13.—New Police Courts.—For the erection of the above Courts, in accordance with the plans and specifications which have been prepared by the Architect, Mr. Thomas Worthington, of Manchester. Joseph Heron, Town Clerk, Town Hall, Manchester.

BRADFORD.—February 11.—For the erection of Sixteen Houses and Two Shops, near Cannon Mill, Horton Road. John Stimpson, 6 William Street, Little Horton Lane, Bradford.

LEEDS.—For the various works required in the erection of six good Houses, proposed to be built near Armley Station. John Hall, Architect, 108 North Street, Leeds.

WELLS (Somerset).—February 20.—For the execution of the Walls, and other stone-work required in the erection of a Chapel and Approaches to Lunatic Asylum. Parr & Strong, 25 College Hill, E.C. (See Advertisement.)

FULHAM.—February 10.—For supply of 750 tons of Unbroken Blue Guernsey Granite. Mr. T. Aplin Marsh, Clerk's Office, Fulham Union.

WIMBOR.—For about 30,000 feet of Glazed Clay Pipes. The Street Commissioners, Wimbor.

DURHAM.—February 22.—For erection of an Electric Light Establishment at Souther Point, midway between Sunderland and South Shields. Mr. Robin Allen, Secretary, Trinity House, London.

PORTSMOUTH.—February 23.—For purchase of 10 Boilers with Iron Tubes, lying at the Dockyards. Mr. Antonio Brady, Registrar of Contracts, Somerset House.

KING'S LYNN.—February 19.—For manufacturing Thirty-seven Screw Moorings. Mr. J. O. Smetham, Solicitor, King's Lynn.

HINCKLEY.—February 8.—For erection of a Hosiery Factory, Chimney, and Two-Storey Warehouse in Bond Street. Mr. Francis Drake, Architect, Bond Street, Hinckley.

PETERBOROUGH CORN EXCHANGE.—The Directors have extended the time for receiving plans to February 17.

NEW SOUTH WALES RAILWAY (Great Western Railway).—February 9.—For supply of materials. Mr. W. C. Mayne, 118 Cannon Street, E.C.

CAMBRIAN RAILWAY COMPANY.—February 16.—For supply of 1,000 tons of double-headed Rails and Fish Plates. Mr. Geo. Lewis, Company's Offices, Oswestry.

BIDEFOOT.—February 13.—For erection of a large Public Hall. Gould & Sons, Architects, Square, Barnstaple.

DOVER.—Feb. 10.—For Reflooring and Refitting the Church of St. Margaret at Cliffe. Mr. Christian, 8A Whitehall Place, S.W.

DUBLIN.—February 9.—For Coal, Coke, Turf, Bogwood, and Wood for kindling Fires for the barracks of Cork, Fermoy, Belfast, Dundalk, and Newry, for One Year, commencing April 1.

WALTHAMSTOW SOUTH-EASTERN SPECIAL DRAINAGE DISTRICT.—Feb. 8.—For the construction of the drainage works in the above district. The works comprised in the contract will be about as follows:—800 yards of 24-inch circular brick sewer, 730 yards of 18-inch pipe drain, 160 yards of 15-inch, 1,670 yards of 12-inch, 190 yards of 9-inch pipe drain. Wm. Houghton, Clerk to the Committee; Messrs. Houghton and Wragg, 15a, St. Helen's Place, E.C.

NORD, DEPARTMENT OF FRANCE.

Completion, Repair, and Maintenance of Canals and Navigable Rivers, in four lots, during the space of six years, commencing with the present year.

Lot 1.—The Canal of Senesé, length about 27,000 yards; the middle scarpe, from the Canal of Senesé to the foot of scarpe, about 7,500 yards; the inner scarpe, from the sluice of Saint-Amand to its confluence with the Scheldt, about 7,500 yards; the Canal of the Haute-Deule, between the scarpe and the bridge of Banvin, about 28,000 yards. Estimated annual expense, upwards of 2,000l. Deposit by way of guarantee, 68l.

Lot 2.—The Canals of the Upper and Middle Deule, between the bridge of Bauvin and the sluice of Saint-André at Lille, length about 25,000 yards; the Lower Deule, between the above sluice and the Lys at Deulmont, length 18,000 yards. Estimated annual expense, 1,200l. Deposit, 40l.

Lot 3.—The Lys, from Aire to its confluence with the Deule, length 58,000 yards; the Canal of Hazebrouck, the Canal of Nieppe, and the Canal of Prévaut and the Bourre, length 27,000 yards. Estimated annual expense, 960l. Deposit, 32l.

Lot 4.—The Canal of Bourbourg, between the river Aa and Dunkirk, upwards of 30,000 yards; the Canal of the Haute-Colme, between the Aa and Bergues, length 39,000 yards; the Canal of the Base-Colme, between the frontier and Bergues, with branch to Hondschote, length 15,000 yards; Canal from Bergues to Dunkirk, 9,000 yards. Estimated annual expense of the lot, 1,080l. Deposit, 56l. Adjudication to be made at one o'clock on February 26.

Forms of tender and all particulars to be had, and tenders to be sent in to the Préfet, at the Hôtel de la Préfecture, Lille.

ROUEN, FRANCE.—Enlargement of the Palace of the Préfecture, estimate for the whole work about 28,000l.; and construction of a new wing to the Female Lunatic Asylum of that town, estimated at upwards of 40,000l. Amount to be deposited as security, 1,400l. in the former, and 1,600l. in the latter case. The tenders, as usual in France, to be made at a discount on the estimates. All particulars to be obtained at the Bureau des Dépêches in the Préfecture Rouen. Tenders to be sent in before February 11, when the adjudication will take place.

ROUEN.—The contract for the work relating to the Female Lunatic Asylum (see The Architect of January 30) is postponed till further notice. This does not affect the contract for the Préfecture.

PARIS.—On February 25 the contracts will be entered into, at the offices of the Minister of Marine, for the supply of Teakwood, to be delivered in the ports of Cherbourg, Lorient, and Rochefort, from Moumein, Bangoon, or Bankok.

MAZIÈRES, FRANCE.

Rails, &c., for the Departmental Railway of Ardennes, in five separate lots.

Lot 1.—3,500 tons of Rails, Vignole pattern, weighing 30 kilogrammes the metre current. Estimated cost, 28,000l. Deposit, by way of guarantee, with the tender, 400l. Security for the performance of the contract, 1,000l. in money or Government stock, or 1,200l. in house property.

Lot 2.—17,500 Fish-plates, weighing about seventy tons. Estimated at 588l. Security, 20l. in cash or bonds.

Lot 3.—122,000 Bolts, in Galvanized Iron, weight about forty tons. Estimated at 700l. Security, 20l.

Lot 4.—35,000 Fish-bolts, weighing about sixteen tons. Estimated at 248l. Security, 8l.

Lot 5.—Furnishing, Transport, Fixing, and Painting of Iron Bridges, weighing about 113 tons, and estimated at 2,282l. Deposit with tender, 30l. Security for performance of contract, 80l.

All particulars to be obtained either at the Préfecture of Mazières, or of the Director of the Departmental Railways, in the same town. Tenders by the morning of February 17.

NANTES, FRANCE.—Construction of a bridge over the Sèvre, at Haie-Fouassière. Estimate, 3,770l., with probable addition, making up the sum 4,240l. Security, 136l.

Particulars to be ascertained at the Préfecture of Nantes; tenders to be sent in by the morning of February 24.

RANDELL & SAUNDERS have much pleasure in informing their friends, and the Building Trade generally, that to facilitate building operations during the winter season, they have provided a large stock of well-seasoned Cornham Down Block Stone. Bath Stone Office, Cornham, Wiltshire. [Adv.]

STONE BROTHERS are now supplying Cornham Down Stone—Well seasoned, fit for immediate use, and of the best quality. Best Ground Stone—Unequalled for even texture and durability.

Fareleigh Down Stone—Matchless for good quality and large size.

Combe Down Stone—Fine in texture, free working, and very durable.

Prices, and cost of transit to any part of the kingdom, on application to the Bath Stone Office, Bath. [Adv.]

The Architect.

THE NEW LAW COURTS.

PART from the special interest which the building of the new Law Courts must possess for the thousands who are professionally concerned in the project, there are many aspects of the subject to which none of our citizens can afford to be indifferent.

On whichever side of the Strand the building may be placed, it is certain that it will involve an extensive reconstruction of the map of London at one of its most interesting points. For opinions do not appear to differ at all as to the neighbourhood in which the Law Courts must be erected. A common-sense and business-like concession is made to the convenience of the legal profession by the selection of a site in what is known as the legal quarter of the metropolis.

The two schemes now before the public are, therefore, both in the neighbourhood of Temple Bar, the width of the Strand being almost the extent of the difference between them. We publish this week carefully-prepared plans of the two proposals, which will correctly represent the real issue, as to *locality*, between what are known as the 'Carey Street' and the 'Thames Embankment' sites. The discussion of their relative merits is necessarily exciting great public interest, as the journals and the gossip of the day abundantly testify. The argument, however, seems to be all on one side. Whereas the Carey Street, or north-of-the-Strand site, was the one fixed on by the Law Courts Commissioners for the proposed building, no one seems to be forthcoming who really can make out a strong case for it as against the more recent proposal of the Thames Embankment or south-of-the-Strand site. We must except, of course, from this statement the views as to locality put forth by some members of those Inns of Court which lie north of the Strand. Such views seem to be inspired solely by the fact that large numbers of the legal profession are located in Lincoln's Inn, who seem to regard their occupation of that quarter as a Medo-Persian kind of tenure. Mahomet will not come to the mountain, so the mountain must perforce come to Mahomet. In other words, Lincoln's Inn will not come to the Law Courts, and therefore the Law Courts must go north of the Strand.

In this view of the subject it needs hardly to be observed that the Temple, with which most of the traditions of the legal profession are associated, has to make its way to the Law Courts over a bridge which is proposed to span the Strand at Temple Bar. It is but a poor compliment to the modern idea of public improvements in the heart of such a city as London that such an expedient should be suggested.

The project by which Sir Charles Trevelyan proposes to solve the difficulty is intelligibly laid down in his plan, Lincoln's Inn being put in possession of Somerset House and the ground now occupied by King's College. The Law Courts occupy the extensive intervening space eastward towards the Temple. The result is, therefore, that the building which is sometimes comprehensively called the Palace of Justice is placed on a site where it will be flanked by the two chief Inns of Court, while the whole will be bounded by a leading thoroughfare on the north, and on the south by a new highway such as no city in the world can parallel, combining as it does facilities for communication by water, rail, carriage, and foot.

And here arises a view of the new project which has not yet had its proper value given to it. Is it sufficiently considered in discussing the site of the New Law Courts that there is, and must continue to be, an essential connection between the seat of the Legislature and the buildings in which the laws are to be administered? The House of Lords, for example, as the ultimate Court of Appeal must remain at Westminster; while, at the same time, something like two hundred members of the House of Commons belong to the profession of the law, and may reasonably be regarded as the men who represent in their practice the leading interests in the Courts of Justice. Direct communication, therefore, between the Houses of Parliament and the New Law Courts becomes a matter of real, and not imaginary, necessity. Hitherto Parliament Street and the Strand have been the thoroughfares which the busiest of our lawyers have had to traverse in their daily practice. The Thames Embankment, however, now offers a nearer and readier means of communication. If the Carey Street site for the New Law Courts be adopted, it will follow that the men who are most prominently engaged in the business of the Courts will be required to traverse the Embankment route to Essex Street, then to ascend 30 feet to reach the Strand—over the proposed site, in fact—afterwards to cross the thoroughfare of the Strand, and finally to face the ascent of something like 40 steps to gain the business level of the Courts of Justice!

By the Thames Embankment project, those features of the Carey Street site—serious difficulties from the modern business point of view—are as much reduced as is possible, for that part only of the

above-described route which forms the direct line between Westminster and the New Law Courts represents the whole method of communication.

The two sites present striking contrasts in respect of convenient access and approaches. On the one site, the Law Courts would take their principal floor level from Carey Street, which can hardly be called a thoroughfare; and that would necessitate an ascent of something like 40 steps from the Strand, which is really the one great thoroughfare from which the building should take its cue as to levels. The Thames Embankment site, on the other hand, has the advantage of Strand front and river front, each on a first-class thoroughfare, and the former being the level of the principal business floor and of the Courts themselves.

Is it just, or even seemly, in view of the fact that the whole weight of argument is with the Embankment scheme, that local prejudices should interfere to arrest so manifest an improvement, not only in the external aspect of London, but in the very convenience and capacity of the scheme itself?

The real question before the public is not which site is most convenient for particular Inns of Court, but which is the best site for the Palace of Justice *per se*. The Law quarter is determined on in any case, and one would suppose that the legal profession would accept that fact as sufficient for their wants. There is something almost grotesque in the idea of the New Law Courts, the largest building project the country has ever undertaken since the Houses of Parliament, and one which must be devised for centuries, being asked to shape and settle itself to fit the existing convenience of a law district which cannot be expected to remain long as it is, if comfort, cleanliness, and convenience are desired by the class who tenant it.

In his plan for the Thames Embankment site, Sir Charles Trevelyan goes to the root of the matter at once, and this is the only worthy method of dealing with such works as we are about to undertake. The tinkering method has had a very fair trial in all conscience, and we know that it is invariably the clumsiest and the dearest in the end.

If Lincoln's Inn will permit the Law Courts' building to take its place on a magnificent site as to position, and one which, year by year, must become increasingly valuable, with its new highways from east to west, and new communication with southern London, and will accept for itself the corresponding site westward which the Temple now occupies on the east, the whole question will be solved, and in a way which we venture to predict every year's experience will approve. The plan we give shows 'New Lincoln's Inn' as occupying Somerset House and the ground belonging to King's College. The new hall, library, and chapel would face the river and Embankment; and, as far as we have ever been able to learn, there are no associations connected with the present site or buildings of Lincoln's Inn which could suggest any misgivings as to such a plan on archaeological grounds. On the other hand, everything in the shape of comfortable and convenient chambers would be gained, and a fitting appropriation would be provided for Somerset House; and without some such provision, that noble building bids fair ere long to fall into the same ignoble state of disuse to which Greenwich Hospital is at present reduced.

The ground already purchased on the north of the Strand would then become available for the other Inns of Court, which, in the event of the Law Courts being placed there, must either be obliterated altogether or left out in the cold. Gray's Inn has almost ceased to be a law quarter, while Clement's and Dane's Inns would have to make room for the Courts if placed on the Carey Street site. In the scheme of the Embankment site, however, those societies may, and no doubt would, resume their normal status, and in immediate proximity to the tribunals or courts.

Not the least valuable feature in this plan is the facility it offers for a new thoroughfare, which will connect not only the Embankment thoroughfare, but southern with northern London. Essex Street, which would be opened up into a wide artery, to be called the 'Embankment and Strand Arcade,' would be continued through to Holborn, passing the eastern side of Lincoln's Inn Fields. If it had no other recommendation, the plan which admits of such a communication would have much in its favour. There is not at this moment a direct north and south route in the metropolis. Chancery Lane cannot be regarded as an exception, for it not only lies midway between Waterloo and Blackfriars Bridges, but is in itself the daily scene of choked traffic, for the simple reason that in the heart of London it has to do duty as the link between the two great thoroughfares of the Strand with Fleet Street, and Oxford Street with Holborn.

The confined and bottle-necked character of the Strand in the neighbourhood of Temple Bar is not likely to remain long as a blemish on the map of our main communications. If metropolitan improvements are to mean anything like progressive change, something must be done towards a reconstruction of the Strand at this quarter. If such a work is to be undertaken in addition to, or irrespective of, the New Law Courts, a costly item is evidently in store for us. But a reference to the plan will show that the adoption of the Embankment site on the south side of the Strand for the Law Courts building involves this required new line for the old thoroughfare.

We feel, in short, that there is no necessity for further commentary on the advantages to be secured by the site which Sir Charles Trevelyan has proposed and argued for with a skill and an intimate knowledge of all the surrounding facts which has not yet been com-

bated. If any one will devote half an hour's study to the two plans we publish, we venture to believe that the verdict will be that, by the adoption of the 'Thames Embankment,' the public have everything to gain, while the legal profession have really nothing to lose. The 'Carey Street' site, on the other hand, can scarcely be regarded as an *improvement* at all, in our modern reading of the word, when it is seen how it affects, not only the present, but the future map of London at one of its busiest points.

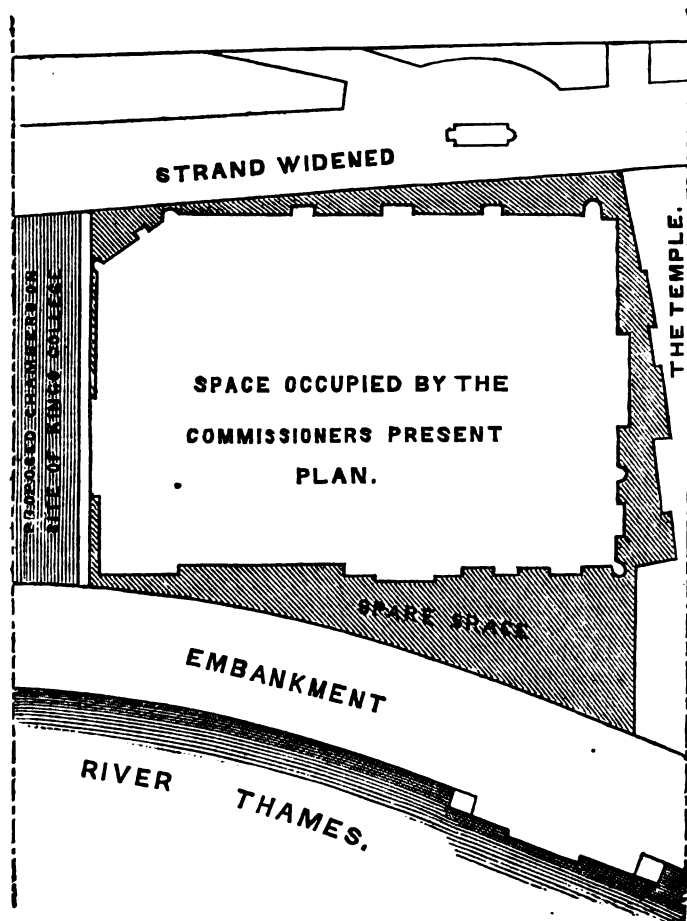

We regard it, writing as much in the interests of architectural art as of public convenience, as a fortunate circumstance that the actual settlement of the situation of the New Law Courts should have been delayed by a variety of causes, chiefly arising no doubt from the complex arrangements and multifarious requirements of the building we are about to undertake.

One of the most unfortunate tendencies with us now-a-days is to hurry on all our public works with a precipitancy which barely allows time for even a true perception of our wants, to say nothing of the best and most perfect method of meeting them. Too often, to paraphrase a well-known saying, 'we build in haste and repent at leisure.' If the discussion of the schemes for the New Law Courts now before the public results in a comprehensive and far-seeing policy as regards site and surroundings, we may confidently anticipate that Londoners a hundred years hence will have cause to be thankful for the time spent in ventilating the question of the best locality for the New Law Courts.

IS THE EMBANKMENT SITE TOO SMALL OR NOT ?

STATEMENTS based on an unfortunate and entire misconception—we will not say misrepresentation, for we believe the statements to have been only carelessly, not wilfully incorrect—of the proposals of Sir Charles Trevelyan, have obtained circulation in the course of the discussion on the site for the Law Courts. These statements, if left uncontradicted, cannot fail to mislead the public mind, and to produce the erroneous idea that on the Thames Embankment site there is not room for the proposed building.

Writing to the *Times* on February 2, a correspondent signing himself 'A Surveyor' makes statements which may be taken as a fair sample of those which we refer to. They amount to this:—that the writer has measured Sir Charles's site and Mr. Street's ground plan,

and after allowing what he considers necessary for approaches, he finds the remaining available space to be actually smaller than the area now covered by the Law Courts as designed by Mr. Street; the alleged deficiency amounting to 40,000 superficial feet.

The materials for this comparison are the Ordnance Survey and Mr. Street's block plans, which have been reduced to the same scale of five feet to one mile, and engraved. These documents are procurable

without much difficulty, or they can be consulted in the Library of the Royal Institute of British Architects.

We have instituted a careful and entirely independent examination of the plans, the result of which may be stated in a few words, and is exhibited to the eye in the sketch plan appended to this article. We find that the 'Surveyor' has measured Mr. Street's plan, it is true; but he has measured something quite different from Sir Charles's site. It is fair to add, that, with one comparatively unimportant exception, we have found the 'Surveyor's' dimensions correspond with the map; though the data he has chosen to assume do not, in the least, tally with those furnished by Sir Charles Trevelyan's letters.

If any one taking the Ordnance map with the Embankment marked thereon, will draw a line on the map from the angle of Somerset House to the north-eastern angle of the houses in Essex Street, this will form the northern boundary of the site. A line parallel to the face of the Thames Embankment, leaving an uniform width equal to that in front of Somerset House, will form its extreme southern boundary. A straight line, coinciding with the greatest projection of King's College, may be taken as its western margin, and the irregular boundary of the Temple will limit it to the east.

If this plot, thus bounded, and shown to a small scale on the map which we this day publish, be covered with a tint, and a piece of paper, the exact size and shape of Mr. Street's plan, be laid upon it, the appearance presented in our woodcut will be seen; the tint will be visible round all the edges of the white patch, showing *spare land on every side*, and proving incidentally that the design must be revised, and can be, if necessary, enlarged, if the site be changed.

This ocular demonstration will be enough for most readers; but to make clear the nature of the misapprehension under which the 'Surveyor' and those who side with him labour, we must have recourse to figures.

This site, as we have described it, exceeds the largest area ever claimed in figures by Sir Charles Trevelyan by the whole amount won from the river. Omitting, then, the Embankment portion of the site altogether, but retaining the gain accruing from correcting the line of the Strand, the figures are as follows:—

Length from King's College to the boundary of the Temple (on a give and take line, this boundary being irregular)	850 feet
Deduct for one private roadway	40 "
Remains an available length of	810 "
Depth from Strand (corrected line) to Embankment at King's College	450 "
Ditto at Arundel Street (east side)	540 "
Ditto at Essex Street (east side)	680 "
Mean of the three	556 "

Now 810 feet multiplied by 556 feet give an area of 450,300 feet, showing that Sir Charles Trevelyan was within rather than beyond the truth when he stated the area at 443,500 superficial feet; upon which to plant buildings equivalent to those, the plan of which at present occupies an area correctly stated by the 'Surveyor' at 370,000 square feet.

By the gratuitous assumptions that the eastern side of Essex Street, and not the Temple, was to be the eastern boundary, and that 120 feet instead of 40 feet was to be deducted from the available length for roadways, and by conveniently forgetting that the line of the Strand was to be corrected in such a manner as to enlarge the available site in the manner shown on the plans we this day publish, it is of course possible to cause the facts to appear other than they are; but we trust that our readers, with the figures before them and the plans in their hands, will be at no loss to discover where the truth lies, and will remain convinced that on the Thames Embankment site there is ample room for the proposed buildings.

PARIS STATISTICS.

TO the reader who knew Paris under the reign of Louis-Philippe, or during the short period of liberty, equality, and fraternity which followed the forbidden municipal dinner, the following statistics, showing what has been done since then down to the end of last year, will not be uninteresting, although they cannot, of course, be compared with the figures which we could show under the various heads here in London. We would premise that we have gathered them from French sources, merely converting the kilomètres and hectares into English miles and acres. In 1852 Paris proper covered only an extent of 935 acres, whilst the suburbs covered another 1,200 acres; since the annexation of the latter within the *Octroi* of the city, Paris may now be considered to occupy about 2,200 acres. Of this space, a network of 239 miles of streets occupied 125 acres in 1852; to-day, 528 miles of streets, including all the Boulevards, occupy 338 acres, leaving a space of 1,862 acres for house property. Thus, whilst formerly the average width of the streets throughout Paris was 30 feet, it is now increased to 43½ feet.

The pavements in these streets in 1852 were only 263 miles in length, covering a space of 29 acres; of these 263 miles, 178 were within the old city boundaries, whilst 85 were in the suburbs. At present the total length of pavement is 676 miles, covering 82 acres. Thus it will be seen that the acreage is barely in advance of what it

was in 1852, considering the increase in length; for whilst fifteen years ago the average width of the Paris pavements was 8 feet 4 inches, it is now 8 feet 11 inches. Besides the pavements, there were, in 1852, 40½ miles of unpaved sidewalks, lined with 50,000 trees; there are now 122½ miles, lined with 95,577 trees, showing that formerly the trees were planted closer together than they are now. The parks surrounding Paris are in all about 450 acres in extent. Of these the Bois de Boulogne is the largest, containing 233 acres; next comes the Bois de Vincennes, with 200 acres; then the Buttes-Chaumont, with 7 acres; the Parc de Montsouris, with 5 acres; and, lastly, the Parc de Monceaux, with 3 acres. Of the Avenues and other open places, the largest is the *Place du Roi de Rome*, containing 6½ acres; next come the *Champs Élysées*, with nearly 5; then the *Avenue de l'Impératrice*, with 3; the *Boulevard Richard Lenoir*, with 1½; and the *Avenue de l'Observatoire*, with only three-quarters of an acre. Twenty-three other open places scattered throughout Paris contain 5 acres more, whilst twenty-one squares, laid out since 1852, occupy another 2½ acres.

Since that period many of the bridges which span the Seine have been altered, repaired, and enlarged, whilst others are entirely new. To the former belong the *Ponts de Bercy*, *d'Austerlitz*, *Louis-Philippe*, *d'Arcole*, *Saint Louis*, *Saint Michel*, *Notre Dame*, *des Invalides*, as also the *Pont aux Doubles*, the *Petit Pont*, the *Pont au Change*, and the *Pont Neuf*. New, since 1852, are the bridges *Napoléon*, *Solferino*, *Alma*, and *Point-du-jour*.

But perhaps the greatest increase is shown in the item of lighting. In 1852 the city was lit by 12,494 gas jets and 85 oil lamps; whilst to-day there are 20,781 gas lights and 280 oil lamps. The suburbs formerly had but 2,918 gas lamps; they now have 12,798. In round numbers, therefore, the streets of all Paris are lit every night by means of 33,000 gas lamps. Even more important than light is water, and here we find that much has been done to supply Paris more freely than hitherto. In 1852 the amount of water supplied from various sources in 24 hours was as follows:—

The Arcueil Aqueduct	7,750 gallons.
The Canal d'Ourcq	815,000 "
The Waterworks and Reservoirs of Chaillot, Gros-Caillois, and Pont Notre-Dame	54,000 "
The Artesian well at Grenelle	4,650 "

In all 881,400 gallons, which were conducted in 438 miles of piping; but so small was the average diameter of the pipes at that time, that they never supplied more than 620,000 gallons in 24 hours, leaving more than 260,000 gallons undistributed each day. At the present time the network of water-pipes throughout Paris is equal to 857 miles in length. Of these, 419 miles are new, having a diameter varying from 15 inches to 3 feet 7 inches. More than half the new systems have been laid in the suburbs, which were but scantily supplied with water before the annexation. But the supply of water was made to keep pace with the increased facilities for diffusing it, and we accordingly find that whereas fifteen years ago the daily supply was 620,000 gallons, it now is upwards of 4,000,000 gallons, or nearly seven times more. The sources are as follows:—

Arcueil, d'Ourcq, and Grenelle, as before	827,400 gallons
The Vanne Aqueduct	776,000 "
The Reservoirs of Monceau, Racine, St. Victor, Panthéon, and Vaugirard	280,000 "
Those of Ménilmontant, Passy, Belleville, Charonne, and Gentilly	1,632,000 "
The New Water-works of Chaillot, Maisons Alfort, Auteuil, Neuilly, and Saint Ouen	683,000 "
Total	4,178,400 gallons.

Coming next to the system of Sewerage, we find that in 1852 there were only 66½ miles of sewer, having an average height of 5 feet 10 inches, and a width of 2 feet 7 inches at the voussoir of the arch. Only about 10 miles of the old system have been retained in the new, which represents a total length of 238 miles. The sections of the new sewers vary, of course, according to circumstances, the smallest being 7 ft. 6 in. high and 4 ft. 2 in. wide, and the largest 12 ft. 8 in. high and 13 ft. wide. Of the 228 miles of new sewers laid since 1852, the suburbs have received 105 miles, showing that the abominable system of cesspools in towns is rapidly disappearing in Paris.

Another great nuisance, that of the slaughter-houses, has been much abated by the suppression of those at Montmartre, Roule, and Popincourt. To take the place of these, and also to supply Paris more conveniently with live stock, the Great Cattle Market and slaughter-houses on the Canal d'Ourcq have been built. The entire establishment covers no less than 14 acres, and is connected by a railway with all the main lines of the Empire. The Halles Centrales occupy 1½ acres, and consist of ten pavillons; only six of these existed in 1852, since which period the markets of the Temple, of St. Honoré, and of St. Quentin have been reconstructed, and fourteen smaller ones built in various parts of the Capital.

In 1852 there were 1,077 schools of all descriptions, with 111,150 scholars; in 1868 there were 1,642 schools, with 174,620 scholars. The hospitals of Paris in the former year held 6,743 beds, whilst at the latter date there was accommodation for 7,820 indoor patients; 684,160 gratuitous consultations were given at these hospitals in 1867. Referring to the activity displayed in ecclesiastical architecture since 1852, we find that the churches of Sainte Clotilde

and Saint Vincent de Paul in the City, and those of St. John the Baptist at Belleville, St. Bernard at La Chapelle, Notre Dame de Clignancourt at Montmartre, and Notre Dame de la Gare at Ivry were finished; that the Churches of the Trinity and of St. Augustin were begun and completed; and that those of St. Ambrose, St. Joseph, Notre Dame de la Croix (at Ménilmontant), Notre Dame des Champs, St. Pierre de Montrouge, and St. Francis Xavier are now in course of erection. Of non-Roman Catholic places of worship, the Protestant churches of the Holy Ghost and of the Resurrection (the latter at Grenelle) have been built, and the synagogues in the Rues de la Victoire and des Tournelles are in progress. The Rectory houses of the parishes of St. Sulpice, St. Thomas Aquinas, St. Francis Xavier, and St. Peter of Gros-Caillois have been purchased, and those of the Trinity, St. Germain l'Auxerrois, St. Leu, St. Vincent de Paul, St. Nicholas du Chardonnet, and St. Bernard, as also the Consistory Court of the Oratory, have been erected. Besides the completion and erection of the churches above named, many others, too numerous to mention here, have been enlarged, restored, and redecored: amongst the number are the Cathedral, the Sainte Chapelle, St. Étienne du Mont, St. Leu, St. Germain l'Auxerrois, and St. Laurent.

Coming, lastly, to municipal works now in progress, the following list will give the reader some idea of the activity prevailing at Paris at the present time:—The completion of the Opera House, the reconstruction of the Hôtel Dieu, the continuation of the Rue Réaumur, the creation of the Boulevard de Rennes, together with the Bridge at the end of it, the drainage of the Valley of the Vanne, the new park of Montsouris, the continuation of the Boulevard St. Germain, and the completion of the Avenue Napoléon.

OPENING OF THE SUEZ CANAL.

THERE is a venerable French proverb which it is necessary to erase from the Dictionary. It is '*Il faut qu'une porte soit ouverte ou fermée.*' That was all very well for men who thought it necessary to take one of two courses. We have learned better now-a-days. We find that a gate may be at the same time open and closed; and what already lends importance to the discovery of the fact is that it applies to no less colossal a portal than the Gate of India.

It is, indeed, difficult for plain-dealing Englishmen to understand the actual position of this important gate. The Chevalier de Lesseps has been labouring at its portals for fourteen years. What he and his associates have spent, and have yet to spend, on the task, we are not in a position exactly to state. At the present moment 8,000,000*l.* sterling is said to have been laid out, and the current expenditure is rated at 200,000*l.* per month. Some enquiry reached our ears not long since after persons desirous to take shares, or to contribute, in some very remunerative manner to themselves, to the supply of further capital.

For the benefit of such long-headed investors it was announced that this famous canal was to be opened in October next. It would be ready to open long before that time, but, not to do things in a hurry—say October. While we were congratulating ourselves and the world at large on this cheering prospect, a more startling announcement was flashed through the Mediterranean cable. The promise had become a fact. A French ship of war had sailed, or steamed, through the Isthmus.

Almost at the same time with this announcement that the gate of India was actually open, the slower machinery of the post brought to London a more detailed communication, which certainly describes it as shut. The spirited owner of the Rob Roy canoe had just passed a fortnight on the salt-water canal, the fresh-water canal, and the two lakes Menzaleh and Timsah. Unaware of the discrepancy between his own picturesque description of what he saw, and the more brilliant colouring of the French telegrams, he spoke, as regarding a distant period, of what is intended to be the case, 'when the passage from the Mediterranean to the Red Sea is open to the world,' and he yet more provokingly adds, 'at this, the Red Sea end, the works of the canal seem very far behind.' The gate, then, is open to the Rob Roy, and to vessels of similar tonnage; but when it will be in a state to convey vessels drawing the 26 feet of water which it promises to hold, is another and a very different question.

We are not aware that a section of the Suez Canal is open to inspection in this country. The directors of the canal have published a statement of the work done, and remaining to be done, at the close of October, 1868; and English travellers have from time to time given their impressions as to the magnitude of the work. The 100 miles roughly stated by the owner of the Rob Roy, is more correctly given as 90 miles, some half of which distance is to be traversed by the canal itself, while the remainder passes through certain lagoons, lakes, or low-lying marshy grounds, known as Lake Menzaleh, Lake Ballah, Lake Timsah, and the Bitter Lakes. In the 11 miles between the first two of these lakes the depth of cutting to the water level or surface of the canal is from 15 to 30 feet. In the 11 miles intervening between Lake Ballah and Lake Timsah the depth of cutting is stated at from 4 to 60 feet to the same level. For 8 miles from Lake Timsah to the Bitter Lakes the depth is again stated at from 4 to 36 feet. For the 12½ miles from the Bitter Lakes to Suez the cutting is nearly of the same depth as the last. This estimate gives 42½ miles of canal proper, the width of which at top is to be 112 yards, and the depth 26 feet; a section the contents of which have to be added to those of the four previously-described excavations in order to arrive at the cubic quantity of cutting required for the completed canal.

The depth of Lake Menzaleh, 20 miles across, was originally from 1 to 10 feet. The other lakes were not expected to require much deepening, as the Bitter Lakes, although dried up by evaporation, are said to be on a sufficiently low level to admit of the access of the requisite depth of water.

In October, 1867, when the above particulars were sent to this country,

it was stated by the correspondent of the *Standard* that he had been informed by the engineers of the canal that about ONE-THIRD of the total earth work had been excavated. The remaining two-thirds were expected to be completed in two years, or by October, 1869. Regarding the enterprise, therefore, from the most favourable point of view, it is evident that the statement of the passage of a ship of war through the communication, in its present condition, cannot be intended to afford any reliable indication of the actual state of the works.

The report of the directors, however, gives a different account from that of the English tourists. Those persons who have any practical acquaintance with the systematic organisation of the French Engineering service, will feel no doubt that the returns published by the Directors are based on minute and careful measurements. On the other hand, the actual quantity of excavation performed by dredging machines must be pretty much a matter of approximation, as no means exist of readily checking the progress estimates by an actual admeasurement of the completed cutting.

The directors state the contents of the total excavations of the canal at 74,000,000 metres (or 96,000,000 cubic yards). Of this total, 49,000,000 metres are stated to have been excavated by the end of October, 1868, the present monthly rate of progress being taken at 2,000,000 of metres. At the rate of the monthly outlay of 200,000*l.*, ten metres will thus cost a pound sterling, rating the entire cost at per cubic metre of excavation. If the sum of 8,000,000*l.* has actually been expended, the 49,000,000 of metres already said to be excavated have cost a higher price. At the current rate, 2,600,000*l.* sterling will require to be expended, which fits pretty closely with the present rate of progress, if continued for another twelvemonth.

That the enterprise, the patient skill, and the original genius, of the engineers of this famous waterway are of the highest order, there is no room to doubt. The discrepancy between the ugly cubic quantities, and the flourishing accounts of water transit, is explicable from a description of the method employed in the formation of the canal. The fresh-water canal—a noble and permanently beneficial work—was in the first instance constructed to afford supplies to the numerous workmen and to facilitate the progress of the larger undertaking. So soon as it was practicable to turn a body of water on the site of the intended through route, dredging vessels were employed to deepen the channel at first superficially opened. Thus, while the ordinary appliances of the engineer—rails, waggons, and locomotive engines—as well as powerful cranes and elevators designed for the express work, were crowded into the cuttings above the maritime level, the excavation of the canal proper has been chiefly effected by the process of dredging. Between obtaining, in this manner, a sufficient depth for the passage of the *Rob Roy*, of the barges used for the conveyance of the excavated sand, or even of a 'ship of war' emptied of stores and supported so as to draw but a few feet of water, and the completion of the canal to its navigable depth of 26 feet, there is a difference, to arrive at the amount of which we are unfortunately left to the resources of the imagination.

It is possible that the Suez Canal has not been dispassionately estimated in this country. The design was one of a magnificence befitting the power of the most illustrious sovereigns of Egypt. To this country, the opening of such a gate to our Indian possessions was a matter of the deepest interest and of the utmost importance. But Englishmen have instinctively felt that the scheme was not one that came within the ordinary conditions of commercial enterprise. Politically most desirable, such a work threatens to be an economical failure. While, then, we should have rejoiced in seeing the Mohammedan rulers of Egypt or of Turkey bending their energies to the accomplishment of this royal task, we have felt a not unnatural repugnance to the idea of a belt of French territory being stretched from Port Said to Suez; even if, some day, on that belt, should be opened, and kept open, an actually navigable canal. So we took possession of a port of observation at the further end, (only landing our cannon, it is said, at the moment that a French captain was under orders to anticipate our appropriation of the spot), and since now, whoever may open, we can shut at will the proposed waterway, we have looked on with a patience not, we fear, devoid of ill-nature.

It is undoubted that if this canal be ever made, and kept in a *bona fide* navigable state, no nation can derive so much benefit from the fact as ourselves. It is further certain that, in such case, it will monopolise our means of communication with India, China, Japan, and, to some extent, with Australia. It is also clear that, in the event of a war with France, an attempt would be made to shut this gate in our face. But, on the one hand, it would seem to be only the narrowest and most pettifogging spirit of national jealousy, or indeed of national weakness, that should lead us to oppose the construction of a great highway for the marine commerce of the world, from the fear of this single contingency. On the other hand, should such a European calamity as war between Great Britain and France actually befall, the position of the forces of the latter country in Egypt would not be an unmixt strategical advantage. We should have to fight for the canal as we have had to fight in Egypt before; and it is more than probable that, if fight we must, we could not select an arena more favourable to ourselves. France must be paramount in the Mediterranean before she can shut out England from Egypt, or from the route to India through Egypt; and that mastery of the Mediterranean will not be secured by either the vast commercial growth of Marseilles, or the military and naval development of Toulon. It will not be determined by the presence of the French flag in Algeria, or behind the parapets of Civita Vecchia. It can be secured only by such a reversal of the traditions and of the national characteristics of the last eight centuries as should enable the military and sea-hating French to beat the British sailors on their own element, and to transfer the rule of the waves to the occupant of the Tuileries. Should that change ever take place, it will matter very little to us whether the Isthmus of Suez be pierced or no. With the English flag predominant at sea, this great canal can always be opened to our commerce. With the Mediterranean a French lake, no English commerce would reach Port Said from Gibraltar, or would venture to tempt the dangers of the Red Sea.

HOMERIC ARCHITECTURE.

IT is hardly necessary to say, before we glance at some of the allusions made by Homer to the subject of Building, that his works have a certain historical value. Homer in our days is not only accepted as an historian, but is ranked high amongst them. 'He alone,' says Mr. Gladstone, 'while producing an unsurpassed work of the imagination, is also the greatest chronicler that ever lived, and presents to us, from his own single hand, a representation of life, manners, history—of morals, theology, and politics—so vivid and comprehensive, that it may be hard to say whether any of the more refined ages of Greece and Rome, with their clouds of authors and their multiplied forms of historical record, are either more faithfully or more completely conveyed to us. . . . The main question is not whether he has correctly recorded a certain series of transactions, but whether he has truly and faithfully represented manners and characters, feelings and tastes, races and countries, principles and institutions. Here lies the pith of history: these it has for its soul, and fact for its body.' We may not give credit to such matters as the politics of Olympus, or the pedigree of King Priam; but as the greater part of the poems must have been the result of observation, we may rely on his descriptions with as much confidence as if they were found in the volumes of professed historians.

If Pope's translation, which still continues to be the most popular, is taken as authority, it would seem that Architecture had arrived at an advanced stage of its progress in Homer's day. We read not only of temples and palaces, but also of spires, lofty towers, haughty towers, as well as awful domes, brazen domes, princely domes, and Palladian domes. Pope was an amateur architect, but his little knowledge was only dangerous, as it assisted him in unfaithfully interpreting Homer. He wished to give an eighteenth century air to the heroes, and took care that the architectural back-ground should be in keeping. Some of the succeeding translators, while carefully avoiding his errors of other kinds, follow him in this, and with the primitive manners give us Pope's architecture rather than Homer's. That the style of building in Homer's day must have been of a different character and such as might be expected in such a time, may, we think, be inferred from the condition of society that is represented in the poems.

One of the most striking characteristics of both poems, but especially of the *Iliad*, is the extent to which not only the battles and war scenes, but the other events of public and private life, occur out of doors. The Trojan fathers, although many of them are old men, meet at night in council outside Priam's house; the warriors sleep frequently outside the tents; councils are held out of doors; and even scenes that might be considered of a domestic nature, like the parting of Hector and Andromache. In the shield of Achilles, which is a miniature representation of the world, there is nothing exhibited but scenes of out of doors life. This brings out by contrast the effeminacy of Paris when he is found so often within the palace; and to a Greek, the rage of Achilles was perhaps more strongly indicated by his self-inflicted imprisonment than by any other circumstance. Nor is this to be regarded as a peculiar theory of art that Homer might have held, but is a faithful reflection of one phase of the Greek character. It was their nature to endeavour to spend as much of life as possible in the open air, and it was there that business of all kinds, from buying and selling to teaching philosophy, was carried on, to an extent that now-a-days it is hard to realise. Consequently they never paid much attention to domestic architecture. At the time when Athens was attracting people from many parts in spite of the difficulties of the journey, the houses were small and mean, the streets crooked and narrow, with upper storeys projecting over them, and staircases and doors that opened outwards, obstructing the passage, so that the stranger might well doubt on the sudden view if really he saw Athens. If it had not been for the influence of religion which caused those temples to be erected on which the Greek genius was concentrated, it is not improbable that we should have had no evidence of their ability in architecture, and at the time Homer lived their religion had not yet reached that period when temples were considered necessary. It is not then too much to suppose that, considering the unsettled state of society and the character of the people, buildings that would merely answer necessary purposes, however simple or unadorned they might be, would satisfy all the desires of the Greeks. We will now try and see how far any other kind was attainable.

In questions of the possibility of any particular class of structure being erected, there are three elements to be considered—materials, labour, and tools—as it is on their qualities depends the character of the resulting building. Greece was, of course, as rich in materials for building in the heroic times as afterwards; and, as there was always some extent of commerce, it was possible even then to obtain them from other countries if they were required. They had abundance of stone and marble, many kinds of timber, some in sizes large enough to be used as immense piles, copper to plate walls, or for other decorations. No mention seems to be made of mortar, and from its importance, and how different the character of construction must be according as it is absent or present, it is worth inquiring if mortar was known to the Greeks in Homer's day. If we judge by what still remains of the walls of the towns, it certainly was not. Whether the masonry consists of blocks as they left the quarry, with the interstices filled with spawls, or of stones dressed so as to fit with some accuracy, it is always dry. On reading the poems, it is not easy to

credit the possibility of the works that are constructed as well as demolished being executed in the time specified unless the masonry was laid without mortar. The accuracy of Homer's similes is well established: when he wishes to describe the Myrmidons as standing shoulder to shoulder, he likens them to stones close jointed laid by a mason, which is appropriate enough. Now, if he means stones set in mortar, the likeness certainly would not exist; and yet this is the meaning which poor Cowper, who is one of the most painstaking of translators, gives the passage:—

So then he roused, and they, their leader's voice
Hearing elate, to closest order drew.
As when an architect some palace wall
With shapely stones erects, cementing close
A barrier against all the winds of heav'n,
So wedged the helmets and boss'd bucklers stood:
Shield, helmet, man, press'd helmet, man, and shield,
And ev'ry bright-arm'd warrior's bushy crest
Its fellow swept, so dense was their array.

It was the popular belief in Homer's day that the walls of many of the cities were erected by the gods themselves, Troy, for instance, being supposed to have Neptune as the builder:—

Up leaps now the Ocean god,
Riving ribbed Earth asunder
With his wondrous trident rod,
And the granite falls in thunder.
High he heaps the mighty blocks
As an infant swings a ball;
Help'd by active Hermes, rocks
Heap'd on rocks construct the wall.

LYTTON'S *Schiller*.

In an age when childlike faith in miracles abounded, this might have appeared probable, if the walls were, like those of Tiryns, made up of stones from nine to fourteen feet long and merely piled on each other; but the most credulous of believers could hardly withstand the absurdity of Mercury mixing and carrying mortar, and Neptune patiently spreading it over course after course. We think, then, it may be concluded that the builders in the heroic days were ignorant of the use of mortar, and this is in itself almost sufficient to determine the character of the work it was consequently possible to construct.

It is a law that is inevitable, that success in anything can be gained in proportion to our concentration on it, and consequently labour is every day becoming more divided. As we look backward, men are capable of performing a greater variety of operations, until, in an early age like Homer's, the division of labour is seldom carried out, except between the different members of a family. Each individual has to rely on himself for food, clothing, dwelling, and arms; and from this the chiefs are hardly exempted: hence we read that Ulysses could plough a field, construct a raft, and carve a bed-post, and even the well-frizzled Paris was able to assist in building. But in such a condition of society, as the average amount of knowledge will be only of the simplest rudiments of a craft, it cannot be expected that much progress will be made in any art, except perhaps agriculture. As ability is valued in proportion to its scarcity, we may infer how little that average was in one calling, from the honours that were paid in the Homeric days to an ordinary carpenter. He was not only ranked with the soothsayer, bard, and leech, but he could transmit his honours. With such absence of even ordinary handicraftsmen, it is easy to perceive that the general style of building would hardly have harmonised with one of Mr. Pope's Palladian domes.

Even the most dexterous workman cannot accomplish much unless he is aided with tools of various kinds. According to Gillies (and the statement is endorsed by Mr. Grote), the only tools mentioned by Homer are the hatchet, plane, wimble, and level; the saw, square, and compass being unknown.

In attempting to describe the circumstances that must have prevented the development of architecture in Homer's time, we must not be understood as maintaining the entire absence of art. The Greeks were at all times an exceptional people; and although they had some things in common, they were different as a whole from the Bulgarian peasantry or the North American Indians of the present day. That subtle feeling for the beautiful, which afterwards amounted almost to a new sense, had even then some influence; and we see its effects in the Gate of the Lions at Mycenæ, and in the columns in semi-relief sculptured on the walls that are found occasionally throughout the country, as well as in the allusions to polished marble as a decoration so often met with in the Iliad. It is held that in the heroic times they had no eye for colour; but when we find that a green marble was used for the Lions' Gate, and for the half columns of the Treasury in the neighbourhood, which had to be brought from a distance, and that the entrance to the latter building was decorated with green, red, and white stone, it is hard to believe that it was merely the result of accident. Art would have been at the time appreciated; but we think that owing to the scarcity of artists and other causes, it was seldom found, unless Möller's maxim is true—that the building fitted to answer its end would turn out beautiful though beauty had not been at first intended.

(To be continued.)

OUR RAMBLER IN BELGRAVIA.

ONE of the least satisfactory points in a survey of modern London is the architecture of its private houses. Whatever may be the shortcomings of its public buildings and business premises, the circumstances under which they are erected and the nature of their occupation preserve them,

for the most part, from the solemn monotony which reigns over the purely residential districts. The perfect contentment with which large classes—even the highest—have yielded themselves to a set routine of duties and pleasures, and to the supply of common wants in common ways, has offered strong inducements to uniformity of design, and has tended to make the more decorative building of this generation as tiresome to the eye as the bald brick elevations that are now going out of date. Any attempt, therefore, to deal with the buildings on a large estate upon a comprehensive system with due regard to variety of arrangement and of outline, and to make for them a careful selection and disposal of materials, should receive our hearty sympathy, and none the less because we may fail entirely to concur in the views which have influenced one or other of the arrangements.

A good ramble is best taken in good company: for that which has led to this paper we are indebted to the visit paid by the Architectural Association on the 30th ult. to the works now going on upon the estate of the Marquis of Westminster; and we are, in common with that body, particularly indebted to Mr. Cundy, his Lordship's architect, who most cordially received his visitors and conducted them over the various buildings.

The works visited form part of an extensive scheme for the renewal and rearrangement of the buildings and thoroughfares on the portion of the Grosvenor estate which lies between the Victoria Station and Hyde Park Corner. Starting from the latter point along the line of Grosvenor Place, we first pass the end of Grosvenor Crescent, which is now being completed, and forms a fine approach to Belgrave Square. In Grosvenor Place is the mansion now being built for Earl Grosvenor; a block of new mansions ready for occupation next succeeds; and, after passing a row of old houses which will be removed on the expiration of the present leases, we arrive at a more open space, containing several groups of mansions arranged on both sides of the thoroughfare, and small enclosed and planted plots, by virtue of which this part of the estate becomes entitled to the name of Grosvenor Gardens.

Earl Grosvenor's mansion, which was first inspected, is a picturesque composition in the modern French version of the Italian style. The exteriors are in Portland stone backed with brick-work built in cement; the design being enriched with columns and panels of polished Peterhead granite, red Mansfield stone, and terra cotta. The foundations of this and some of the neighbouring houses were carried down to a depth of sixty feet below the level of Grosvenor Place. The basement is occupied by the domestic offices and cellarage on the usual scale. On the ground floor the entrance-hall is on the longest or southern face, the staircase being immediately to the rear of it, Lord Grosvenor's room and the Secretary's room being on the right, facing Grosvenor Place, and the dining-room at the extreme left or western end of the building. On the first floor is a fine suite of reception rooms, comprising a ball-room, saloon, boudoir, and the family bedrooms, and further accommodation of this class is provided in three or four other storeys, as well as in the roof of a large angle tower which forms a bold feature in the view of the mansion. The Dennett arch has been used throughout the ground-floor and passages, generally in spans of eight or nine feet, carried on rolled iron girders, and having a thickness of about four inches at the crown. In respect of strength this contrivance is highly approved by the architect, who has severely tested it. We were told of heavy loads which had been placed upon it without producing fracture, as well as of its having been intentionally broken through by means of heavy weights dropped from the upper floors; and the extreme toughness which enables it to endure this last test without the fracture extending beyond the portion actually struck is certainly remarkable. Comparing the Dennett arch with ordinary brick arches in point of cost, the former seems to have the advantage to the extent of about 10 per cent. of the cost of the latter. The difference is, however, so slight that the builder of other houses on the estate found no inducement to adopt the new system. Its lightness and strength, and the satisfactory appearance of its soffit, will, no doubt, render its adoption in many cases desirable, although, like all other inventions which demand extreme care in the selection and treatment of their component materials, this arch can only be safely used under strict supervision. Brick rubbish and gypsum, which are the chief materials employed, do not seem well adapted to resist the percolation of water, and from ordinary observation of the effects of fire—even on 'fire-proof' constructions—we shall not expect that one of these floors would prove a very serious obstacle to its progress. Fire-proof construction has not, however, entered into the general scheme of these buildings.

The new houses in Grosvenor Crescent are being built by Mr. Waller on his own account, from the design and subject to the general approval of the architect to the estate. When completed they are expected to realise from 17,000*l.* to 20,000*l.* The construction is similar to that used in Lord Grosvenor's mansion, except that cast iron with brick arches is adopted for the fireproof flooring, between the basement and ground floor storeys. The plan adopted (which was kindly explained by Mr. Waller) is, in the first place, the ordinary arrangement of hall and staircase on one side of the ground plot, with two rooms communicating by means of folding doors. The front room is intended for a morning-room; that in the rear, which is longer, will be the dining-room, and behind it is a square open court. Beyond the court is placed the billiard-room, which extends across the rear of the premises, and has been kept one storey only in height with the view of avoiding obstruction to the light of the dining-room. On the first floor is the drawing-room suite, which, together with all the other rooms, appears to be of ample height, the five storeys which form the elevation rising considerably above those of the older houses adjoining.

The blocks of houses extending along Grosvenor Place and Grosvenor Gardens group well with those already described, and present little variety in arrangement. Many have been specially built by Messrs. Waller and others for their present owners; the remainder are being sold at prices ranging from 20,000*l.* to 27,000*l.* In those built by Messrs. Holland and Hannen we noticed the use in such parts as doors and shutters of richly inlaid wood work, tulip wood, walnut, and ebony being very well combined. This work is imported from Vienna; the ceilings also are by foreign workmen, probably French.

A visit paid on another occasion to the large building near the Victoria Station, known as the Belgrave Mansions, enables us to complete our notice of the new works of this neighbourhood. This undertaking is of a kind which, though not quite novel in London, may still be called experimental. It resembles in most respects an hotel of the first class, except that the rooms are let unfurnished on lease, in suites or single rooms as may be required. Each suite is complete in itself for all purposes of private occupation; the cooking arrangements and general service of the establishment being kept distinct and under the control of a manager. Entering at the centre of the front towards Grosvenor Gardens, we find the staircase immediately in rear of the straight corridor which runs through the length of the building. A hydraulic lift works in the centre of the staircase, and is doubtless appreciated by the tenants of the upper storeys. Each storey has its own still-room and attendants. In the basement is a very complete arrangement of kitchens and offices, with lifts to the various still-rooms. The plan also includes coffee and smoking-rooms, and the ground-floor is, after the usual system with hotels of this kind, devoted to shops, which do not hitherto seem to have let very freely. The building is constructed with fire-proof floors, on Fox and Barrett's system. The whole design and arrangement are due to Mr. Cundy, who was the architect employed by the Hotel Company. We may add that the internal finishing of the building, so far as we could observe, was of an exceedingly pleasing character.

We have preferred to reserve our remarks upon the general design of these groups of buildings until we had dealt with matters of detail, for they are to be judged as one grand scheme, or perhaps more correctly as parts of a still larger scheme, which is as yet only partially carried out.

As the older architecture of Belgravia has been founded upon Greek, Roman, or Italian models, according to the style which was in vogue at the period when each important addition was made to the estate, so in the buildings under consideration we have a style based on that variation on Italian which obtains in modern Paris. Some, no doubt, would have wished to find the new buildings more completely Parisian in detail; others would prefer them to be more in accordance with classical models; while many, and with greater reason, would prefer that variety of Italian which is associated with the name of Barry, and of which some good examples may be seen in the near neighbourhood of this property. The spirit of thoroughness, however, in which this work is being carried out, as opposed to that which inspired the stucco architecture of the last generation, seems to suggest the selection of a style different from anything habitually imitated in that material; and this being so, it is extremely probable that the manner actually followed is likely to fall in better than any other with the tastes of that class for which these mansions have been built. It is true that the architect could not command the fine soft stone or the class of carving which, in the eyes of many persons, contributes such a charm to Parisian architecture; nor will his works have the advantages of sun and atmosphere, nor the lively surroundings which they would have had in the French capital. It is impossible, at the same time, to deny that the defects here hinted at have been in a great measure counteracted by boldness and picturesqueness of general design, or that in the result a very striking group of buildings has been added to the metropolis, and yet we cannot but think it somewhat to be regretted that, seeing how much had been done to infuse something of national spirit into the design—seeing that the whole plan and arrangement throughout are distinctively English in character, and that the work is associated with one of our oldest English names—some style has not been adopted which, whether native or not, has become in some degree our own.

CHIMNEY-PIECE OF THE TOWN-HALL OF COURTRAI.

(WITH AN ILLUSTRATION.)

The Chimney-piece of the Town-hall at Courtrai, of which we give an illustration this week, is the richest specimen of Flamboyant Gothic work to be found in Belgium. It dates from the year 1523, and is carved in stone; the figures at the top represent the Virtues and Vices, and the bas-reliefs, dating from the end of the sixteenth century, relate to the municipal and judicial destination of the building, and to events in the early history of the town. The statues on corbels in the centre and on each side of the chimney-piece are those of Charles V. and of the Archduke Albert and Archduchess Isabella.

R. PHÉNÉ SPIERS.

BUILDING CONTRACTS.

BY A LONDON ENGINEER.

AS the 'London Contractor,' in the two articles on this subject that have appeared in the last numbers of this Journal, refers entirely to the practice of architects, it may be thought that an engineer has no right to enter into the question; but as house-builders may undertake work under engineers, and as specifications, contracts, extra works, arbitration clauses, &c., belong to both branches of construction, perhaps, after all, there is no great intrusion in his doing so. It seems that several builders and contractors desire to alter somewhat the general forms of specifications and contract deeds, and the first change suggested is 'that the specification shall include only the detailed description of the work to be done; and that all clauses containing legal powers or liabilities shall be transferred to the contract,' or in other words, that there ought to be a more general employment of lawyers in preparing contract deeds than there is at present. As the form that is usually adopted for general conditions has lasted so long, I confess I do not much wish to see it superseded without reason, and I prefer having as little to do with lawyers as possible. Supposing it is admitted that both parts of the contract deed ought to be separate—what advantage is gained by their being so, or by having as perfect a form for general conditions as one lawyer could draw and another find flaws in? It could not prevent

disputes arising from orders not being given in writing for extra works, or all uncertainty about undefined works, or give a contractor a voice in the appointment of a building surveyor, more than the present form does. But, how far do contractors at present suffer from clauses prepared by the 'un-instructed hands of architects?' According to the London Contractor, 'in a very great number of cases, a description of the work on the one side, and a letter undertaking its execution for a stated sum on the other, is all that is required;' which means that, in a very great number of cases, contractors have no opportunity of showing their patience in suffering. It is the misfortunes, however, that have been latent during all those years of building that are now to be dreaded by the contractor. 'Probably few architects are aware that the builder has absolutely no power at common law of obtaining redress should the architect, through infirmity of temper, &c., refuse to issue his certificate.' Could the architect be ignorant of possessing this terrible power if he ever exercised it, or heard of any one who did? 'Whether a Court of Equity could or would interfere is, in the opinion of an eminent Chancery barrister, extremely doubtful.' Any case that stands in this marvellous position cannot do much harm to anyone. Is it not evident that all this ignorance on the part of Courts of Equity, Chancery barristers, and architects, arises simply from their never having any occasion to need knowledge on the subject? 'Are there many builders who know that in contracts where the payment is to be made on completion, unless there is a provision for suspending the works, they will be compelled to complete the contract, however large, before a debt will have been created, although in the mean time they may have become aware of the insolvency of the employer?' Of course there are not many builders who know that, because they don't require to know it, and because builders are usually paid by instalments; and if the financial revolutions of the last few years have not taught the lesson, I think they may without injury to themselves be allowed to remain in such blissful ignorance. The conclusion which the London Contractor wishes to establish by the foregoing illustrations, and which he thinks 'enforce it,' is 'that all points in contracts having reference to legal questions should be settled by the lawyers, and not the architects.' May I ask the Contractor to define what are not legal questions in case any dispute should arise, or what a lawyer would not meddle with? As soon as a builder signs a specification, or a set of plans, then every sentence in the one or line in the other may become at one time or another a legal question. But surely it is not expected that lawyers are for the future to revise our plans. If it is stated that the mortar shall have two parts sand and one part lime, then the mixing of mortar may become a legal question; but how are our legal friends to settle the matter beforehand? I am afraid that builders and contractors are becoming very much like the conventional farmer, and having no real grievances to endure they are obliged to invent some; and I think it will be allowed that so far it is only imaginary grievances the London Contractor asks us to sympathise with.

The next grievance is this: 'one of the most prominent clauses objected to by contractors is the one referring to extra works.' Why do they object? Because it is too hard on contractors to expect them or their representatives to understand common working drawings, or, as it is stated, 'to insist that the contractor shall know all the details of the work sufficiently to detect at once from a working drawing that it is in excess of the agreement.' Might one suggest a little legal assistance to the contractor in such cases? The great objection is being obliged to exercise the power of asking for orders before extra works are begun. 'The sting of this lies in the words "previous to the execution of the work."' It is not often contractors are obliged to seek the orders; but if they have, where is the difficulty in doing it? Besides, does the Contractor really expect us to believe that it often happens that employers refuse payment of work approved by their architects and 'sanctioned by the employer,' merely because a miserable docket was not given at a particular time? We agree that such practice would be most unjust if it took place, but how often does it? The builders urge that orders for extra works given by the architect after their execution are to be held as valid; but if it is possible to obtain them, why not before the execution, if the builder thinks the architect's certificate is not sufficient?

Do contractors have often to execute works without payment not contemplated by them or by the architect? 'The builders consider that they should not be bound to execute, within their contract price, works not shown on the drawings or mentioned in the specification, but necessary to complete the buildings as intended, unless the same can be fairly and obviously inferred from the drawings and specification.' As 'intended' by whom, if not by the architect? This looks very much like a desire on the part of the builders to get rid of the old-fashioned clause, that whatever is usually found necessary is to be executed, no matter if it is not shown on drawings, or referred to in specification, which is merely intended to cover an oversight that might arise, and for which contingency contractors take care to provide in their prices.

We next come to the appointment of arbitrators by the courts. The London Contractor of course sees manifest advantages in the employment of lawyers in such cases. Why? 'Nine tenths of the builders and nineteen twentieths of the architects are in favour of an architect as an arbitrator;' but on the other hand, and outweighing all the experience of architects and builders, the lawyers are supported by the 'Platonic Dialogues' and the London Contractor. Possibly there are other reasons that might be brought forward, but we are told 'it would be useless to discuss them here,' which is, at the least, not complimentary to us.

'Who should be appointed arbitrator—the architect of the works or an independent one?' I may be showing my ignorance in saying it, but I have never heard of an important case where the architect who designed or superintended the work was appointed as arbitrator by a judge in chambers or out of chambers. Nor does the 'London Contractor,' I think, maintain that there has been; for if I understand the remainder of this part of his communication, he shifts to the question of the architect being considered as arbitrator between the employer and the builder in the generality of cases that never enter courts, and, I fancy, objects to the venerable clause that the architect is to decide on all matters arising out of the contract, and that his decision is to be final and binding. Many architects, we are

told, desire to retain sole jurisdiction over the quality of the materials and work, and the interpretation of the drawings and the final certificate. Do not all architects desire this, and is there anything wrong in doing so? 'With regard to the right interpretation of the drawings and specification'—says the 'London Contractor'—'one would as readily expect an un-biased opinion from an architect as to these productions of his as from a father as to the beauty of his children, or an author as to the merits of his book.' I may be again displaying my ignorance, but I think that the questions in disputed contracts do not usually turn on points of aesthetics, but have to do with much less sublime things, such as quantities of materials and day-work, and have consequently not much analogy to beauty and literary merit. And as a father might be allowed to be competent to measure his child's height, or an author to count the pages of his book, and even sometimes say whether it was well or badly printed or bound; the 'uninstructed hands' of the architect, if not equal to the task of framing clauses to indicate how the work was to be done, might surely be allowed to be able to point out differences between a house as he designed it and as it was erected.

With regard to the important question of the builder having a voice in the selection of the surveyor, nothing can be fairer than that he should, and there can hardly be any obstacle to making it a universal rule. It might be possible, too, for the Institute and the Builders' Society between them to frame 'a set of general conditions,' although we think it could not differ much from that in general use; and in these things we are glad to agree with the London Contractor. But we must be pardoned if we think that all the dangers that are likely to arise to contractors from the architect's 'infirmity of temper,' 'collusion with his client,' 'arbitrary courses,' 'sitting in judgment on his own cause,' and 'deciding in his own favour,' exist in his own and his friends' imagination, excited, perhaps, with over much study of the Platonic Dialogues. H.

THE FEMALE ARTISTS' EXHIBITION.

ON what possible principle of segregation the Society of ladies, whose works form the subject of this notice, first came to be established—whether it arose at the instigation of some ardent advocate of woman's rights, or from a conviction that the pictorial skill of our fair limners was not fairly recognised at ordinary exhibitions, we cannot say, and possibly it might be ungracious to inquire. It is sufficient to know that the Society exists, and, thanks to the management of its working members, has been steadily gaining ground in public estimation, and in the standard of excellence which characterises its annual display.

The present exhibition in Conduit Street is on the whole a very successful one; and though we cannot help thinking that the Hanging Committee would have exercised a sound discretion in excluding some works which shall be nameless, but which it would have been really charitable to reject, there is on the other hand matter for sincere congratulation in the fact that the catalogue this year includes the names of Mrs. Ward, Miss Starr, Miss Spartali, Mrs. Marrable, Miss Helen Thorneycroft, and the Misses Rayner.

The first-mentioned lady, whose name has been for a two-fold reason long associated with art, sends a couple of slight but tenderly handled sketches of 'Sleeping Children' (269 and 270), which, with her oil picture, 'The Young Sailor' (427), suggest, if they do not realise, her artistic power. Miss Starr's life-size 'Study' (440) is a broadly painted head, full of vigorous drawing and truth in colour—qualities amply compensating for that apparent want of refinement in execution which is sure to become exaggerated alongside of works whose chief characteristic is an effeminate delicacy of hue and touch. The other portrait (473) is on a smaller scale, low, but well pitched in tone and colour, and not unworthy of the hand which has already won the first academical honours awarded to a lady-artist in this country. 'Proene in Search of Philomela' (131) is the somewhat pedantic title given by Miss Spartali to a refined and artistic figure-piece belonging to that ideal school of modern art for which she has long declared. Her work is always so excellent in general aim, that it is not a little difficult to say whether the absence of modelling and apparent messiness of execution noticeable here and there in this and similar studies are due to want of skill in manipulation, or to an absolute attempt towards the realisation of certain qualities of tone with which this speciality of style is accredited.

Miss Brodie sends a modest but clever little landscape, 'Durweston Bridge, near Blandford, Dorset' (45), which, however, would be improved by somewhat more forcible treatment in the sky. The two companion drawings by Miss Frances M. Keys—viz., 'Under the Beech Trees' (49), and 'In the Woods near Cornwood' (59)—are notable examples of the free use of body colour, once so much condemned by the old school of water-colour painters, but now in common vogue. 'A view on the East Lyn' (225), by Miss Lloyd Jones, and 'On Mitcham Common' (228), by Miss F. Kempson, represent the very antipodes of principle in landscape art—the first being an elaborate and very conscientious study, inclining perhaps a trifle too much to prettiness, but on the whole very successful; the second an example of the bold *blottesque* manner which found its best exponent in the moorland sketches of David Cox. Holding a middle position between these two extremes are the 'Studies of Swiss Scenery,' by Mrs. Marrable—no less than sixteen in number—thoroughly unaffected in manner, evincing great judgment in composition, and very skilfully executed. We may especially mention in this interesting series the 'Beruna Fall and Morteratsch Glacier near Pontresina, Engadine' (331); a View of the Roseg Glacier (332); and Pont Ota (338), in the same neighbourhood.

The field of the picturesque in architecture is as copiously represented by the Misses Rayner, the elder of whom exhibits twelve views in Chester, remarkable for the master-like expression of detail which they display, and in more than one instance for great strength of scenic effect. The interior of James I.'s bed-room at Knole (210), and a study in Edinburgh, by the same hand, complete this group. It is to be regretted that Miss Rayner adopts such a coarse method of execution. The body-colour in some of these studies might be scraped off in masses with a knife, and it may be questioned whether such a lavish use of this material can be excused even

by so effective a result. Miss Margaret Rayner's Welsh and Scotch studies are interesting examples of her skill, and well worthy of attention. Indeed, if space allowed us, we might enumerate many other works both in the way of landscape and figure-subjects which do credit to the Exhibition and its promoters. We must, however, content ourselves in conclusion with mentioning Miss G. Bower's clever pen and ink sporting sketches, with the character of which readers of *Punch* must now be tolerably familiar, and a very sweet and carefully painted head, 'Barbara' (294), by Miss Helen Thorneycroft, which clearly indicates the influence of a higher aim in art than that which we are generally accustomed to associate with the productions of lady-artists in this country.

SOCIETIES.

Architectural Association.

The usual fortnightly meeting of this Association was held on Friday the 5th inst., William White, Esq., the President, in the chair.

After the reading of the minutes and the election of new members,

Mr. R. PHENÉ SPIERS rose and said:—You are all aware that since our last meeting we have lost Mr. Arthur Ashpitel, a gentleman who held the highest rank in the profession. He became a member of this Association in 1861, chiefly from the great interest that he felt in the educational question, and it was almost entirely owing to him that that scheme was carried out. He was chairman of the committee, and found the money that was necessary for the printing of papers and other things, and he was one of the examiners throughout. Seeing, then, that he took such a great and lively interest in our welfare, I think it becomes us to place on record the deep regret that we feel at his loss, and that the said resolution be communicated to his brother. (Cheers.)

The CHAIRMAN thought it would be hardly necessary to put the motion formally to the meeting. All present knew the great interest which Mr. Ashpitel had evinced in educational matters, and he was sure that from his unvarying kindness all who had sought him for advice—and they were not a few—would remember him with gratitude.

The motion was agreed to *nem. con.*

A vote of thanks was passed to Earl Grosvenor for his kindness in allowing the members of the Association to view the Grosvenor Mansions now in course of erection, and also to Mr. Cundy, Earl Grosvenor's architect, for the explanations he had afforded them respecting the same.

Mr. R. PHENÉ SPIERS was then called upon to read a paper entitled 'Architecture in Belgium.' Mr. Spiers said that having visited Belgium in September last, and finding it to be full of architectural treasures, he had thought, considering that though most easy of access it was somewhat passed over by English students, he should be doing material service by pointing these architectural treasures out, and giving such an account of them as could be squeezed into an evening's lecture. Of the early history of Belgium during the first eight centuries of our era, there is little to occupy our attention. In the ninth century the country became part of the empire of Charlemagne, the influence of whose reign, however, is not apparent in any of the existing monuments, save in some on the river Meuse. He must confess that he had been unable to find any traces of an Oriental style ascribed to those artists whom Charlemagne imported from the East, which, it is affirmed, exists in some of the buildings at Liège and Maestricht. He would allow that features of a peculiar style do exist in these towns and at Cologne, unlike what one generally sees in Europe; but then these features happen to be still more unlike anything to be found in the East, so that he was inclined to ascribe their origin to the inhabitants of the Rhine provinces. Under the successors of Charlemagne the country became divided into a number of small sovereignties more or less identified with the great towns now existing. This subdivision naturally prevented that centralisation of effort which predominated in France during the twelfth and thirteenth centuries; and to this oneness, as well as to the high class of intellect to which the production of these erections was entrusted, we owe that purity of design, power of imagination, and that adherence to true principles of art, which are so perfectly developed in the French cathedrals. The church architecture of Belgium never seems to have attained the qualities of French work; and, with the exception of the cathedrals of Tournai and Maestricht, we find no churches of any large size which are in any way to be compared with those of the same period in France or England before the fourteenth century, and then the decadence of the style was too far advanced to hope for any great excellence except in point of style. It was natural, however, to expect that this subdivision of the country into a number of principalities would induce each to emulate the other in the production of fine buildings, and consequently we find, from the thirteenth century—when the activity of the people and their immense commerce gave them the necessary wealth—down to our own age, a series of the most magnificent municipal buildings in Europe. The institution of self-government in the chief towns called for the production of municipal and trade buildings to an extent not required in any other country; and although, as might be expected in an essentially commercial country, these buildings are not remarkable for their purity of style, they are still the best examples of the application of the principles of Gothic art to the wants and requirements of their age. In the beginning of the sixteenth century Belgium became subject to Spain, and many of the buildings of this period seem to suggest the influence of this latter country, though, of course, more is to be ascribed to the constant commercial intercourse with them as well as with other countries. This, in fact, is found in all those towns which border along the Baltic. This, however, does not apply to the towns on the Meuse in the south of Belgium, which seem rather to have been influenced by the early architecture of Cologne and the Rhine provinces. The architectural styles of Belgium may be divided into five periods, viz.: the Romanesque, the Transition, and First, Second, and Third Pointed. The Romanesque, which existed till the middle of the twelfth century, is in many respects very different from that which we

find in Normandy and England. There is almost an entire absence of that description of decoration known in England as the zigzag or chevron moulding, the Beakhead, Billet, and others which abound in all Norman buildings. The cornices to the window heads, which are circular and have as many as two or three orders, consist of simple mouldings, and the exterior walls are decorated with a series of flat blank arcadings with very slight projection, similar to those found in Lombard churches. To the Transition period, which lasted from the middle of the twelfth to the first quarter of the thirteenth century, belong some of the most interesting buildings, which deserve most careful study. This period seems to have lasted a considerable time in consequence of the hesitation that showed itself to the acceptance of the pointed arch, and we find both this and the round arch existing in juxtaposition in the same buildings. The ornament of this period is more like that found in German round arched architecture, or the earlier parts of French thirteenth, or more correctly speaking, twelfth century work. Whilst the capitals have square abaci in the First Pointed, they are octagonal and the caps have one or two rows of leaves, sometimes like French caps, but in certain cases showing a special type of foliage peculiar to Belgium, and the hard stone with which they worked. The windows in the small churches are often lancet-shaped. In the Second Pointed style, from 1310 to 1400, geometrical tracery in the windows becomes the chief exponent; the ornament of the capitals is still thoroughly conventional, and differing in that respect from German caps of the same period. In the Third Pointed style the windows assume immense size, for the admission of stained glass. The decadence of the style shows itself in the elaboration of the ribs of their vaulting, in the panelling of the walls, and in bringing down the mouldings of their arches instead of stopping them in capitals. The plan of the earliest churches seems to have been based on that of the old Basilica, consisting of nave and side aisles, sometimes a transept and choir with an apsidal end, although in the two most ancient churches actually existing, St. Vincent at Soignies and St. Gertrude at Nivelles, we find square ends. Towards the close of the Transitional period the aisles are carried round the choir, which increases in length till in many cases it becomes as long as the nave. In the fourteenth century chapels are added round the choir, the centre and largest of which are dedicated to the Virgin. In the fifteenth and sixteenth centuries chapels are added on each side of the side aisles. In most of the old churches crypts extended under the choirs, sometimes stretching under the transept. As a rule the crypt was low, so as not to cause a difference of level in the church between the nave and choir. To this rule, however, the church of Notre Dame, Maestricht, forms an exception. In the arrangement of the façades a feature is found peculiar to all the earliest churches in Belgium, and which exists also in many of the churches of the north of Germany; it consists of a western tower the full width of the nave, in the upper portion of which the bells were placed, and which joins a kind of narthex or vestibule to the church at a point where formerly stood the font. This narthex is sometimes flanked on either side by circular towers, in which the stairs are placed to ascend into the belfry. The whole mass rises a considerable height above the church, and forms a distinguishable and noble feature. The chief examples of these towers are at St. Servais and Notre Dame, Maestricht; St. Denis, St. Bartholomew, and St. John, at Liège; St. Gertrude at Nivelles; and St. Vincent at Soignies. The towers in Belgium themselves have always formed the most conspicuous feature of the churches, though, singular to say, the most remarkable of them have never been completed, and still want the crowning feature—a spire. The picturesque grouping of the five towers of Tournai Cathedral is, perhaps, familiar to you, that being the only instance of five towers to one church. When there are one or two towers they are generally found at the west end, though at St. Pamale, Oudenarde, where there is only one tower, and that an octagonal one, it comes at the intersection of the nave and transept. Spires are very rare in Belgium, and the only important church which, in the memory of the lecturer, possesses one, is Notre Dame at Bruges. The towers of St. Gudule, Brussels, of the cathedral at Malines, and of St. Martin's, Ypres, all of the fourteenth century, are all incomplete, wanting the spires with which it was intended to crown them; and when it is noted that two of these towers, if completed, would have risen to the height of 530 feet, and that their foundations and walls are of sufficient strength to support easily spires of that height, some idea may be formed of the massive nature of these structures, equalled in size only by the towers of Cologne Cathedral. The cathedral at Antwerp is remarkable for its lacework spire or tower, and he (Mr. Spiers) knew not, of the criticisms passed on it by two celebrities, Napoleon and Wellington (without any idea or wish to detract from its merits), which was the most cutting; the one observing that it reminded him of Mechlin lace, the other saying that it was so beautiful and delicate that it ought to be put under a glass shade. Both these criticisms show that elaborate detail and too great fineness of parts are out of place in northern climates, and unfit for the external decoration of architectural buildings. Of brick church-towers there are many examples in the northern part of Belgium, and none more remarkable either for size, design, or execution than those of Notre Dame and the cathedral at Bruges. The former, begun in 1230 and completed in 1297—the largest brick tower in Belgium—rises to a height of 220 feet, not including the spire, added in 1524, which—part brick and part stone—has since been considerably altered from its original design. The eye is carried up the tower by the long vertical lines of the principal and secondary buttresses without a single horizontal line or break, and the small size of the material, the openings, and the intimate juxtaposition of an elaborate 15th century porch at its base, give a scale to this tower which imparts impressions of sublimity and magnificence not surpassed by any other building known to Mr. Spiers. The tower of the cathedral is a simple mass of brick-work, without any ornament or relief in the shape of buttresses. The upper portion is modern, and due to the design of an English engineer. The details are Romanesque, and the grouping of the four turrets round the central tower, masking as it does the fact of the tower not being square, is extremely ingenious. There are no porches to the Belgian churches worth note, excepting that of St. Servais at Maestricht, the ornament of which is very good, though the figures have not the earnestness and beauty of French work. The west end of the nave, as a rule, when there are no towers, is surmounted on both

sides by circular turrets decorated with blank arcadings. In the church of Notre Dame at Bruges these turrets are in brick, with long slender shafts, also decorated with arcadings of the same material. The west front of Liège has an apse, as also the north and south transepts of Tournai. The choirs externally at Ypres and Tournai are also fine, the former possessing neither aisles nor choir chapels. The interiors of the churches generally are very grand, and even to a late period the piers of the nave were always cylindrical, and have good capitals, both features conducive to simplicity and grandeur of effect. There are only two churches in Belgium which have the nave and side aisles of the same height. This form of church, called *Hallen Kirchen* in Germany, and often found there, exists only in St. Martin's at Courtrai and St. Croix at Liège. At the entrance to the choir is generally placed a rood screen, sometimes increasing, but more often destroying, the general effect. The nave piers have invariably huge statues standing on corbels attached to them, which add to the picturesqueness of the general effect, but cannot always be accepted as in good taste. The extravagance and wildness of their subjects, carved in expensive woods, with trees, shrubs, grottoes, and flying cherubs, form not the least attractive portion of the Belgian cathedrals to the generality of travellers, who thus prove their utter ignorance of what is good or bad art. Having thus described in a general manner the result of his observations, Mr. Spiers now turned to a description of the construction of particular churches, selecting as his examples the Cathedral of Tournai, foremost in interest to every student, and undeniably the finest Romanesque church in Europe; the Cathedral of St. Servais, Maestricht, of immense size and height, and possessing features peculiar to itself; the Church of Notre Dame, Maestricht; the Church of Notre Dame de Pamale, at Oudenarde, externally effective by the windows being more or less flush with the internal wall, and having arcades astride. The windows are lancet-headed, and, with their arcadings carried in columns, remind one of early English examples; the Church of St. Martin, at Ypres, is the best specimen of First Pointed work in Belgium. After these in point of date come a series of large churches or cathedrals of great size and magnificence, but deficient generally in purity of detail in ornament and moulding. They generally date from the 14th and 15th centuries. The most remarkable of these are the Church of St. Gudule, at Brussels; St. Peter's, Louvain; St. Rumboldt, Mechlin; and St. Martin's, Liège. They are all of great size and good general proportions, and have one great redeeming feature, viz. cylindrical pillars to the nave. Speaking of St. Gudule, Brussels, Mr. Spiers parenthetically remarked, 'the stained glass which abounds here is deficient in those principles which we are accustomed to lay down as necessary for the production of good work. There is one point, however, to be borne in mind, which very often escapes the attention of those who have the interests of the manufacture at heart, and that is that these windows are not always intended to delight amateurs or connoisseurs with their brilliancy of colour, or their adherence to precedent, but to teach Scripture and the history of religion more forcibly than can be done in sermons or books. In this respect I am bound to say that these pictures quite fulfil their object; for having read the story of "The Jews and the Stabbing of the Holy Sacrament," I had made my tour round the church, greatly interested in the illustrations I beheld; and it was not till I began to note down the most remarkable points in the glass that I discovered that there was scarcely a single good principle in their manufacture, excepting that the figures displayed a knowledge of anatomy and drawing of the human figure, which is more than can be said of all glass.' After speaking of the cathedral at Antwerp, the base of which covers more ground than that of any building in Belgium; St. Jacques at Liège, the latest church in the Gothic style and the finest example of sixteenth century work; the Chapel and Crypt of St. Sang, Bruges, dating from the twelfth century, the crypt, or lower chapel, having been built by Thierry of Alsace on his return home from the Holy Land, is most peculiar in its formation, possessing two towers which, though apparently separate, are, on close examination, found to be joined together; the Church of St. Croix, Liège; and last, though decidedly not least, the Church of Aix la Chapelle and the tomb of Charlemagne—Mr. Spiers proceeded to say that if the ecclesiastical architecture of Belgium does not afford us that brilliant series of examples which we find in France, the deficiency is amply supplied by the magnificence and variety of her secular buildings, in which she remains unrivalled.

(To be continued.)

The Graphic Society.

The fourth meeting of this Society took place on Wednesday evening last, when there was the usual attendance of artists and visitors, amongst whom were Messrs. D. Mocatta, J. Holland, Lucy, Goodall, Carl Haag, J. Lewis, E. H. Corbould, R. W. Edis, Eastlake, and Woolner, and Sir M. D. Wyatt, &c. A very good collection of paintings and drawings was exhibited, the most noticeable of which were some clever water-colour sketches by Alfred Fripp, a careful study of a head by F. W. Burton, some paintings by Frost Anthony, Alfred Newton, and Geo. Mawley, and some interesting chromolithographs of Greek paintings, from one of the churches of Moscow, and some photographs of the Kremlin, &c., &c.

N.B.—We are compelled to postpone the reports of several other meetings till next week.

ARCHITECTURAL EDUCATION AND THE ARCHITECTURAL PROFESSION.

SIR.—Mr. Spiers mistakes the object of my paper, and objects to my venturing, in a general article on the above subject, to criticise a Report which he, as one of the delegates, had probably some considerable share in

composing. I read the Report carefully, and expressed my opinion somewhat strongly thereon at the meeting of the Architectural Association; and although Mr. Spiers thinks I have not read it, because he says some 'seventy lines of printed matter are confined to inquiring into those causes' which are in a great measure, in my opinion, the reason of the present admitted faulty system of education, I cannot consider that those said seventy lines to which I presume Mr. Spiers alludes are in any way fair exponents of the reasons which make the present system faulty; and I almost entirely disagree with the views expressed by Mr. Spiers as to the present pupilage system, and venture to assert that he would not hold the views thereon in the Report, and which I must consider his, had he more real knowledge of the system in question. Mr. Spiers's training upon another system naturally leads him to lean to the foreign system of education.

As regards his second objection, I feel quite certain that the proposition of the Report as to apportionment of time for a *pupil* under Head IV. could not be practically carried out, and I doubt much whether any architect would be willing to receive a pupil in the way proposed, nor do I think it would at all be desirable, and therefore can hardly look upon the suggestions made as 'based upon the pupilage system,' since they more or less propose that the pupil shall spend a very considerable portion of his time out of the office; and, if the office be a large one, that a paid instructor should be provided, which would practically be more or less making the architect's office a private 'atelier,' independent of the architect himself, who I believe, with a few unworthy instances, is in no wise the 'bête noir' that Mr. Spiers would make him out to be. I forbear to discuss Mr. Spiers's remarks as to the academical system, and his comparisons as to railway travelling and stage-coaches. We have only to take the fact that, with very solitary exceptions, all the well-known architects in this country have as pupils gone through the curriculum of an architect's office, and I think it will be admitted that they will compare more than favourably with those educated on the foreign system.

It remains to be seen whether my own or Mr. Spiers's views are right as to compulsory examination being a *necessity*, or the *result* of architectural education. Basing my views on the foreign system named in the Report in question, I think naturally that it will be the *former*. I still hold to my views as to the paid professor; and with one, or perhaps two exceptions, the names quoted by Mr. Spiers as 'architects of the highest eminence' are comparatively unknown in this country. As regards my remarks on the present theoretical system of French education, I confess I took my opinion in a great measure from the words of the Report, which, if, as Mr. Spiers says, too exaggerated, must account partly for my views, although, as far as my knowledge of the system itself goes, they are practically borne out by the results. I have every desire to see an alteration in the present system of architectural education if such can be made really beneficial to those about to enter the profession, and I have every hope that the General Committee now sitting at the Institute will be enabled to put forward such a scheme as will be, not only *beneficial*, but *practical*, and one which will seek to associate with it and make prominent the *PRESENT* means of obtaining a higher knowledge of all branches of artistic and constructional education; means which it seems to me have been neglected, perhaps from want of being more generally known, but which do offer in reality many of the opportunities for learning that are so strenuously advocated. Whether the education of an architect shall be made compulsory or not is a question for the general profession at large to determine: I for one am sanguine enough to believe that it must eventually be so, and that a man shall have no more right to practise as an architect than he has to do so as a doctor or lawyer, without going through a similar course of compulsory education and examination.—I am, Sir, yours, &c.,
February 9, 1869. ROBERT W. EDIS.

THE NATURE OF GOTHIC.

SIR,—Whilst reading the review in the *Times* to-day of Dr. Lubke's work on the 'History of Art,' I came upon the following passage:—'*Of this bevelled edge or chamfer, it should be observed, our author makes no mention; he seems not to be aware that in it consists the essence of the Gothic style, and not, as is generally supposed, in the pointed arch.*' This really wonderful discovery, which the architectural critic of the *Times* has made, and thus gives forth generously to the world, is calculated to upset our previously existing notions, and perhaps the whole course of study which should be pursued in acquiring an intimate acquaintance with the Gothic style. I suppose that in point of importance, after chamfers, notches would come; so that the *ci-devant* Music Hall in the Strand, which has been so much abused, is really the finest specimen we have of Gothic art, and where all its principles are developed to their fullest and truest extent. Seeing that that is the case, I think some means ought to be at once taken to prevent the ruthless destruction of this building by the architect of the Gaiety Theatre, who has already destroyed the lovely doorway formerly existing; and I think that a committee of members of the Royal Institute of British Architects (who, beyond the election of foreign honorary members, seem to be doing little) might be appointed to inquire into the best means of preserving this marvellous building, and especially its essential qualities,
February 9, 1869. CHAMFERS AND NOTCHES.

THE SOUTH KENSINGTON MUSEUM.

SIR,—When we have such an excellent Institution as the Kensington Museum and its Schools amongst us, a sort of Fountain of Art, we are tempted to become critical on the doings at such a place, and I should like to call your attention to what seems to me to be a terrible break down in the High Art department.

There has been lately opened a new gallery, called with absurd affectation 'Keramic,' but it is nevertheless a capital gallery and well lighted. There is also, leading up to it, a staircase, also 'keramic.' I suppose, as it is chiefly composed of earthenware.

It is in the ceiling of this staircase where the break down seems to have occurred. In the centre panel is painted a wonderful confusion of figures flying up-stairs against a hard blue sky; and in the dome over the landing are some more of the same sort, capriciously painted, but utterly inappropriate to their position. They are pictures, not architectural paintings; in fact one is irresistibly reminded of the huge putty angels and cherubs of the French palaces, or the heathen gods and goddesses of Verrio and Laguerre.

The pictures, which would do very well in a frame, are not in the least of the nature which is demanded by their position.

If figures are to be placed as these are, they should be treated architecturally, as are those of Raphael on the ceiling of the Stanza de la Segnatura in the Vatican, where the gold ground at once takes away the idea of a picture, and such a treatment would harmonise well with the smaller panels of the ceiling of the staircase, where the ground is gold.

At present the contrast between the sober richness of the small panels and the common modern French look of the centre panel is very painful and harsh.

There is about the whole of this staircase, and indeed about many of the new decorations, an apparent laxity in the use of the human figure, which is not a very hopeful sign. In the dado there are unfortunate creatures crammed into sloping panels in the most painful and acrobatic fashion.

Such things were never done in the purest days of art.

Trusting that the Museum authorities may put the right thing in the right place,

I remain, Sir, yours obediently,
SCRIBATOR.

NEW BUILDINGS AND RESTORATIONS.

Church Extension at Sheffield.

On February 5 the new church of St. Silas at Gilcar was consecrated by the Archbishop of York; a number of the local clergy and a numerous congregation assisting at the ceremony.

The church, which has been erected by the munificence of H. Wilson, Esq., at a cost, exclusive of the site, of about 6,800*l.*, consists of a nave 80 feet long and 27 feet wide, north and south aisles seating 800 persons, and a well-proportioned and rubrical chancel, with an organ chamber and commodious vestry on the south side, and on the north side are seats for the accommodation of the Sunday school children.

The style selected by the architects is Early Pointed, in which a Continental influence is strongly apparent, and the effect of the exterior is simple and ecclesiastical, while thoroughly effective as a piece of town church architecture—a move in the right direction on the part of the local church builders which we hail with satisfaction.

At the south-west corner of Hanover and Broomhall Streets rises a lofty, massive, and pinnacled tower, the belfry windows of which have shafted jambs and deep louvre boards, and the whole surmounted by a boldly-carved corbel table and parapet, with gargoyles at the angles. The lower portion of the tower forms the principal entrance to the interior of the church, which has a well-proportioned and lofty arcade of stone on circular columns, having well-studied and spirited conventional capitals.

The chancel is 'fitted up' with carved oak reredos, altar table, screens, choir stalls, and pulpit and reading desk in (to say the least) a very doubtful and nondescript style of 'Gothic,' which, being in direct variation from the detail and general sentiment, and unworthy of the rest of the church, have quite marred the effect of the interior.

This is the more to be regretted, for the architect (working in the true spirit) has employed his best efforts here, trusting doubtless to the opportunity of completing the various accessories in a spirit worthy of the other portions of his work.

We cannot but add that on inquiry we ascertained these fittings have not been under the control of the architects, and have been designed and executed by Mr. Shaw, of Saddleworth, 'architect (*sic*) and carver,' who is, according to a local contemporary, 'very eminent in such matters.'

The roofs are open and boarded, and the chancel has a waggon-headed wooden ceiling.

The gas fittings are by Peard & Jackson, the stone carving by Farmer & Brindley, of London; and the contractors, Messrs. Badger & Holmes, of Sheffield, have executed their work most efficiently from the designs and under the superintendence of the architects, Messrs. Blackmoor & Mitchell Withers, of Sheffield and Rotherham. Mr. Mellors has acted as clerk of the works.

The Archbishop assisted the same day at the opening of the new church of All Saints at Brightside, near Sheffield, erected by Sir John Brown, to which we may return next week. Messrs. Flockton & Abbot are the architects.

The New Church at Brookhouse, Blackburn.—On January 28 the Bishop of Manchester consecrated the new church at Brookhouse, dedicated to St. Michael and All Angels. The new parish church was designed by Messrs. Stevens & Robinson, architects, of Derby, and contains accommodation for 800 persons. The plan consists of nave, with north and south aisles, divided from it by arcades of fine arches, and together measuring 72 feet by 51 feet; the chancel is 32 feet by 22 feet; and an organ aisle and vestry on the north side of the chancel, 26 feet by 13 feet. The tower is placed at the south-eastern angle, with arches opening—one into the chancel and one into the south aisle, which has been arranged as a baptistery, having a font placed in it. There are two main entrances—one through a porch on the south side of the church, the other through the tower; there is also an entrance for the clergy into the vestry. The church, which is designed in the English Gothic style of the thirteenth century, is built of stone, with two and three light tracery windows in aisles, five-light east window, rose window in the west end, and large-sized trefoil windows in the clerestory. The tower is 70 feet high, and it is intended, when funds permit, to erect a spire 76 feet in height, with large spire-lights and broached pinnacles. The corner-stone of the edifice was laid at the north-east angle of the tower, by W. H. Hornby, Esq., M.P., on January 6, 1866. At the west side of the church there is a small gallery, which has been set apart for children. The woodwork of the roof and seats throughout is of deal, stained and varnished; the height of the nave from the floor to the apex of the roof is 50 feet, and of the chancel 44 feet. The floor is laid with Minton encaustic tiles. The pulpit is made of Caen stone, supported on marble pillars. In the tower is a small stained glass window, by Messrs. Clayton & Bell, of London, presented by Mr. Robinson, the architect. Mr. Richard Hacking, of Blackburn, was the contractor for the completion of the building.

The Parish Church of Padiham, Lancashire, has been rebuilt to twice its original dimensions, and at a cost of nearly 9,000*l.*, under the direction of Mr. Waddington, architect. The new church is built in the style which prevailed in the early part of the fifteenth century, and stands upon the site of the old edifice. The tower is situated at the south-west angle,

and forms an imposing feature in the design, rising to the height of 115 feet, finished with panell'd battlements and eight crocketed pinnacles. Some relics of the old church have been preserved, the most precious of which is the ancient and beautiful carved stone font, the gift of Abbot Paslew to Padiham Chantry in the sixteenth century. Two stained glass windows from the old church have been remodelled and inserted in more becoming positions; whilst the new church has been enriched by the gift of six other handsome painted windows, one of which is manufactured by Mr. Edmondson of Manchester, and the remainder by Mr. Wailes of Newcastle. The greater portion of the carving in the interior of the church was executed at the expense of the architect, who is a native of the parish.

St. Ann's New Boys' School, Birkenhead.—The new boys' school in connection with St. Ann's Church, Birkenhead, of which the Rev. A. Wright is the incumbent, was formally opened on Monday evening. The new buildings are erected from the designs of Mr. David Walker, of Lord Street, Liverpool, and provide accommodation for about 200 scholars, the plans being in accordance with the Committee of Council regulations, from whom a grant in aid is obtained. The schoolroom is 77 feet long by 20 feet in width, and there are two classrooms each 25 feet 6 inches by 15 feet in width, together with cloakroom, lavatory, entrance porches, and all usual conveniences, a large playground being likewise provided. The schoolroom is spacious, lofty, and ventilated, the roof timbers exposed to view being varnished; and the wall is coloured a warm tint on the brickwork, and finished with a skirting 4 feet high in oil paint, and capped with a stencil border. The classrooms are fitted up with galleries. The style of the building is Gothic of an early character, constructed almost entirely of brick. The site of the new buildings was presented by Mr. Thomas Brassey, who also gave a liberal donation towards the building fund. The cost of the works will be above 1,200*l.* Messrs. Booth and Richards, of Rock Ferry, were the contractors.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Berlin Cathedral Competition.

The advertisement inviting competition for a new cathedral for the capital of Prussia appeared on August 12, 1867, the time given for preparing designs being about a twelvemonth, and the result is that 49 architects have submitted 51 designs, represented by 359 drawings and 3 models. The idea was first mooted some years ago, and Mr. Stüler, since deceased, submitted plans at the time; these are now exhibited, together with the new designs, in the galleries of the Royal Academy, but ecclesiastical architecture has made such progress since the days when this great Prussian architect ceased to work, that his plan will scarcely be adopted. Of the 51 designs now submitted 10 are provided with mottos, the rest bearing the names of their authors, 4 of whom are non-Prussians, 2 Frenchmen, and 1 Belgian; there are no English competitors. The French architects are Messrs. Gazagne & Petit, both of Toulouse, and the Belgian is Mr. Minne, of Ghent. We shall content ourselves with a brief description of a few of the designs:—No. 1, Mr. V. Statz, of Cologne; five aisles, two towers at west end, no projecting transepts, Gothic. No. 7, Eberlein, of Nuremberg; seven aisles and three towers, Gothic. No. 10, Schwatlo, of Berlin; round church with dome and four towers, modernised Romanesque. No. 18, Petit, of Toulouse; French Romanesque Rococo. No. 21, Heyden & Kyllmann, of Berlin; hexagonal dome, with short nave and two towers, rich Renaissance. No. 26, Adler, of Berlin; cruciform arrangement with dome and short transepts, heavy Romanesque. Of the 51 designs submitted, 14 are Gothic, 13 modern German Romanesque, 7 Classic, 5 Renaissance, 4 Rococo, 3 old German Romanesque, 3 Italian Romanesque, and 1 Russo-Greek.

London Water Supply.

It appears that the project of Mr. Bateman for supplying London from 'the surplus water of the Severn' to the extent of 200,000,000 gallons per day is quite impracticable. The Severn, like all other rivers, requires the scour produced by occasional floods; and if this were prevented by the reduction of the necessary volume of water, the entire estuary of the river would in a short time be silted up, and the river itself would probably be rendered unnavigable. Those of our readers who are acquainted with the works of Professor Hitchcock or Sir Charles Lyell will have no difficulty in remembering the startling statistics given by both those well-known writers with reference to the gradual silting up of the estuaries of great rivers. Another evil arises from the silting up of the channel of a river which is even more serious in its consequences than the stoppage of the water way. We allude to the fact which is well known to all who have had anything to do with drainage works, that the higher the bed of a river is allowed to rise, the greater is the difficulty experienced in draining the low lands by the river side. This difficulty has already been experienced in connection with the watershed of the Severn. During the long-continued drought of last summer the reaches and deep pools near Gloucester became choked with mud and silt. No flood came down the river for nearly eight months; and during the month of July there was not sufficient water to supply the pumping mains of the Worcester Waterworks.

So great is the activity displayed in the building trade at Pest, in Hungary, that bricks are quite at a premium. 3*l.* per thousand is willingly paid, and builders are glad to get them for that. Spite of several of Hoffmann's kilns erected in the neighbourhood, and the production of bricks by machinery, the demand continues in advance of the supply. What a chance for some of our brickmakers! Only Pest is distant from London rather over a thousand miles, as the crow flies!

An Exhibition, chiefly of objects of art, is announced to take place at Wittenberg, in Saxony, under the patronage of the Crown Prince of Prussia. The Academy and Architectural Institute of Berlin have pro-

mised their support, as well as many societies and firms in the south of Germany. Applications for space should be sent in not later than April 1 next.

Antiquities of Paris.

Archæologists who visit Paris will find in the old square of the Louvre a series of extended lines marked in light-coloured cement on the pavement and central portion of the court; these mark the place of the great tower of the Old Louvre with its surrounding ditch and out-works, the foundations of which lie beneath the soil, and were very carefully laid bare and mapped not long since. It was a happy idea thus to commemorate the actual position and form of the famous old building.—A discovery equally interesting, but not capable of the same mode of perpetuation, has just been made on the Place de la Bastille. In digging the foundations for a block of houses some remnants of the foundations of the State prison of lugubrious memory have been brought to light. It appears that the general idea of the position of the Bastille was erroneous; it was supposed that the site was that of which the Column of July marks the centre, but it is now found that the building was at the entrance of the Rue Saint Antoine, as indeed some archæologists have asserted. The form of the Bastille is well known—it was octagonal, with massive towers at each of the angles, surrounded by a deep fosse and approached by two drawbridges; the parapet on all sides was machicolated and bristled with cannon. The first stone of the Bastille was laid by Hugues Aubriot, Provost of the Merchants of Paris, in the year 1370. The names of the eight towers were:—The Corner and Well towers, to which the remnants that have now been discovered belonged; the Bertaudière and Liberty towers—the latter name must surely have represented liberties taken, not accorded; the Bozinière and Comté; and the Treasury and Chapel towers. It is to be hoped that some memorial will mark the spot where once stood that dark and bloody fortress which fell in 1790 before the pent-up fury of the people.

An Archæological Discovery.

During the alterations which are being made at St. Mary's Church, Chatham, a fine specimen of a Norman arch has been discovered, between the centre entrance and the vestry-room. One side of the arch is in a tolerable state of preservation, but the other is much decayed. It is thought that a corresponding arch exists on the other side of the modern doorway. They are supposed to have been formerly the entrances to aisles of the ancient church.

Public Monuments, Statues, &c.

This should be a time of rejoicing for sculptors, for all the world seems occupied in raising memorials of the departed great. Holland deserves first notice, on account of the grandeur of the memorial which she has decided to raise at the Hague, to commemorate her freedom from foreign rule; the monument is to stand more than 70 feet high, and to include, besides a crowning figure representing Dutch Freedom, a group and three statues in bronze, of colossal size, and a number of bas reliefs and inscriptions. The figures are to represent William the First, the patriot Counts of Hoogendorp, Limberg, and Van Maasdend, Religion and History. Portugal is raising a monument in honour of the founder of her present Constitutional Government, Don Pedro IV., in the Place du Roccio, at Lisbon. This monument is to be crowned with a statue of the king, which has been modelled by a well-known sculptor, M. Elias Robert; it is in bronze, and about 9 feet in height, and according to a laudable practice in Paris, it has been for some time publicly exhibited outside the Louvre, and has but just been removed to be sent to its destination. Don Pedro is represented in the costume of a general, the head uncovered and a laurel wreath in the brow. It is a fine work of art. Corsica, which already has memorials of Napoleon the First, Cardinal Fesch, and Abbatucci, is about to raise one in honour of Joseph Bonaparte, King of Spain. A statue is now being prepared after Houdon's bust of Voltaire, to be placed near the Institut, at the corner of the Rue de Dennes, Paris; this memorial is the result of a public subscription, amounting to a sum equal to 1,436*l.* A statue of the late M. Dupin the elder is about to be raised in the Grande Place of the town of Varzy, where M. Dupin was born; it is about eight feet high, and is the work of M. Emile Boisseau. A very pleasing innovation is being made at Versailles, where formerly scarcely anything but battle scenes and portraits, statues and busts of marshals and generals, was admitted, in the introduction of memorials of artists, poets, and other peaceful heroes; twenty busts have been set up in the gallery of the palace of Louis the Magnificent, and amongst these were the effigies of the famous Egyptian scholar Champollion, the chemists Gay-Lussac and Pelletier, the musician Lesueur, the sculptor Rude, and the poet of the people, the chansonnier Béranger. Not long since the bust of Richard Cobden, the free trader, was placed in the same gallery. It should have been placed side by side with Turgot, to show at once how the same ideas may be revived from age to age, and how long it takes to reduce philosophic truth into practice. M. Dantan, the younger, is now engaged on a bust of Rossini, ordered by the Minister of the Fine Arts for the Library of the Institute of France. It will not be out of place here to mention that M. Dupré, sculptor of Florence, who obtained one of the Prix d'Honneur at the Great Exhibition of 1867, has been elected a Foreign Associate of the Paris Academy of the Beaux Arts.

General.

The Thames Embankment Viaduct.—A deputation, headed by Lord Elcho, recently waited upon Mr. Layard in order to induce him to use his influence to prevent the intended viaduct from Charing Cross Bridge to the entrance of Waterloo Bridge from being proceeded with. Mr. Layard promised to use his influence to secure the delay, and expressed his entire concurrence with the object, but said he had no actual power in the matter, as the Board of Works acted under authority of Act of Parliament.

It is probable that the members of the Arts, Fine Arts, and Junior Athenæum Clubs will coalesce and become one, in the splendid house recently acquired by the last-named club in Piccadilly.

The Corporation of London have commissioned Mr. George G. Adams to execute, for the Council Chamber at Guildhall, a marble bust of the late Lord Brougham.

The Royal Gallery in the House of Lords is being decorated, and the work which was left unfinished by the late Sir Charles Barry is now being completed.

A subterranean passage has been discovered, extending from the School at Westminster (formerly the monks' dormitory) to the great passage under the cloister.

The Institute of Naval Architects will hold its ninth annual meeting at the hall of the Society of Arts, in John Street, Adelphi, on the 18th, 19th, and 20th of next month.

Mr. G. Mason and Mr. E. J. Poynter (who, our readers will recollect, exhibited 'Israel in Egypt' last year) have been chosen Associates of the Royal Academy.

The temporary home of the new University Club at the south end of Savile Row, adjoining the Stafford Club, is about to be sold by auction.

St. Margaret's Church and Vicarage, now being erected in the Prince's Road, Liverpool, from the designs of G. E. Street, Esq., A.R.A., are advertised to be sold. The Church, which was expected to be ready for consecration in May, and will contain seats for 1,000 persons, and the Vicarage, which is of considerable size, were commenced at the sole expense of Robert Horsfall, Esq., of Liverpool, for the Rev. Mr. Clark, Vicar of St. Mary's, Taunton; but as the latter gentleman has declined to vacate his present living, owing to the emoluments thereof having been recently increased, Mr. Horsfall has determined to dispose of the buildings.

The Ecclesiastical Commissioners have made an additional grant of 5,000*l.* to the fund for the restoration of Ripon Cathedral. The choir has already been restored, and was opened a few days since.

The annual meeting of the Salisbury Diocesan Church Building Association was held on Tuesday last, when the report and statement of accounts were read and passed, and an urgent appeal was made for increased funds. The Society is doing a great work in promoting the building and restoration of churches in the diocese.

A number of interesting objects purchased for the South Kensington Museum, from the Paris Exhibition of 1867, have been added to the Bolton Mechanics' Exhibition. As an illustration of cheapness combined with art, they are of great value.

St. John's Chapel, Cambridge.—The magnificent chapel of St. John's College, Cambridge, is fast approaching completion, and will probably be ready for consecration on May 6 next. This chapel will be, beyond all doubt, the second ecclesiastical building in the University, King's College Chapel standing first, for ever secure from all rivalry. The ground-plan is that of Merton Chapel, Oxford—a cross church, *minus* the nave, with a pinnacled tower at the intersection, and an organ chamber projecting to the north-east. The east end forms a five-sided apse. The style is the Decorated of Edward the Third's reign. The tracery of the windows is varied and rich, and the whole, both inside and out, is profusely decorated with elaborate carvings. The foliage round the apse windows is peculiarly lovely. The chapel proper has a coved ceiling of wood, richly decorated with colour and gilding. It is divided into nineteen bays, which are made to correspond with the nineteen Christian centuries. The bay over the altar contains a representation of Our Lord in Majesty. The remaining eighteen display representative men in religion, science, and literature from each century. Those selected for the present century are Wordsworth, Wilberforce, and Dean Wood. These, as well as the whole of the internal decorations and the windows, are designed by Messrs. Clayton and Bell, and the general effect is one of great beauty.

Among other Indian curiosities which have been discovered in a cave at Rock Island, Illinois, the statue of an Indian Maiden has been brought to light. It has a solid copper pedestal 7 feet in height, and an obelisk of solid brass.

Bestalrig Church, Scotland, sustained some damage on Sunday last, by the bursting of one of the pipes of the heating apparatus. A portion of the congregation near the place of fracture received serious injury from the scalding steam.

At Greenwich, Mr. Charles Lyle, a builder, of Russell Street, Queen's Road, Peckham, was brought up for final examination, charged with wilfully and maliciously doing damage to two houses in course of erection at Lewisham, to the amount of 100*l.*, and carrying away and disposing of fixtures, valued at 150*l.*, belonging to Mr. Alfred Blackburn of Clapham. The prisoner could not procure bail, and was conveyed to Newgate.

Mr. Daniel Flitcroft, of Bolton, has obtained the contract for the erection of the new Industrial School at Lostock. The cost will be 3,000*l.*

The guardians of St. Pancras have erected a mortuary-house, with *post-mortem* room, in the burial-ground adjoining the workhouse.—*English Churchman.*

Trieste has raised 20,000 florins for the erection of a monument to Maximilian, and an 'expiatory church' is also being built at Vienna.

After a great deal of excavation an entrance to the subterranean vaults and dungeons of Guildford Castle has been made. The largest room is now open, and measures 60 ft. by 57 ft.; height 9 ft. to 15 ft. Six others have yet to be found.

St. Mary's Roman Catholic Church, Penseance, is about to be enriched by a splendid altar, composed of the choicest polished granites, serpentine, &c., of the county, the gift of Sir Paul Molesworth. The cost will be 350*l.*

The Choir of Ripon Cathedral was re-opened last week, the restoration, which has been in progress for some years, being now nearly finished.

The New Church at Waddeton, Devon, was used for the first time on the first Sunday in the new year. It comprises nave, chancel, vestry, and porch. The former chapel was consecrated in the twelfth century.

The parish church at Camden Town has undergone some extensive alterations and improvements.

Additional improvements have been made to Christ Church, Wolverhampton, and it is now re-opened.

The tower of the parish church of St. Issey, Cornwall, which contained a fine peal of bells, fell with a tremendous crash on the 2nd inst. The roof of the church was broken entirely in, and the organ was smashed to pieces.

The Wilts and Dorset Banking Company have pulled down their premises in Salisbury, and are building a much more spacious and well-planned bank. Mr. Henry Hall, of 15 Duke Street, Adelphi (London), is the architect, and Mr. Robert Fulcher, of Salisbury, the builder. The cost of the new bank will be about 6,000*l.* The front of the building will be of Hern Hill stone; and the banking-room, 40 feet by 60 feet in extent, will be roofed with a dome supported on Devon marble columns. The bank, when completed, will be one of the finest architectural ornaments of the ancient city of Salisbury.

Towards the end of last year a handsome Statue of Charles XII. of Sweden was inaugurated at Stockholm with military honours. It has been erected in what was formerly called Charles XIII. Square, but is now known as the King's Garden; together with its pedestal, it reaches a height of 30 feet. The figure itself is 15 feet high, cast at Stockholm, but modelled by George Herolt, of Nuremberg, and displays no ordinary amount of life and animation. The King, who has been well called the 'Alexander of the North,' stands with head uncovered in the military costume of his time; his drawn sword is in his right hand, and the left arm is raised, pointing in an attitude of command. The pedestal is of Swedish grey granite, and plain. At the four corners are four mortars connected by chains. The mortars were taken in 1701, by Charles, at the battle of Neumünden, and the old inscriptions upon them tell us that they were cast at Dresden in 1678, by one Andrew Heraldt. The chains were taken from an old Swedish man-of-war. We are informed that all classes, from prince to peasant, contributed towards this national monument of the man who spread the fame of the Northmen from Copenhagen to Ukraine. Of him Johnson sang:—

Peace courts his hand, but spreads her charms in vain;
'Think nothing gained,' he cries, 'till nought remain;
On Moscow's walls till Gothic standards fly,
And all be mine beneath the polar sky.'

It is the intention of the Erie Railway Company to extend its line to New Jersey by means of a tunnel under the Hudson. In order to obtain space for the necessary approaches at the New York end of the tunnel, Pike's Opera House and other property in the neighbourhood of 23 Street and 8th Avenue have already been purchased by the Company, and it is expected that the works will be commenced early this spring.

A new and very perfect aquarium is being added to the Zoological Gardens at Berlin, and will probably be finished in the course of this spring. No less than 10,000 animals are awaiting the completion of their new home, and amongst them are said to be twenty crocodiles.

QUESTIONS.

To the EDITOR of THE ARCHITECT.

DEAR SIR,—Will you kindly inform me, through the medium of your Journal, of a receipt for polishing marbles, granites, &c., and oblige
Yours respectfully,
MILEY SONAM.

ANSWERS.

SIR,—In your No. IV., January 23, there are two questions put to which I beg to submit answers.

In the first case, the Clerk of Works is responsible either for ordering or sanctioning any materials or workmanship not according to specification, because he is acting in opposition to the very objects for which he was appointed.

In the second case, if the work is specified to be done to the satisfaction of the architect, and he is satisfied, his opinion cannot be overruled by any proprietor or surveyor, except there is something very gross; something so different from the specification as not to be a matter of opinion at all. I had a similar case not long ago in my own professional experience, and the dispute was settled as now stated.

I am yours, &c., NORTH BRITAIN.

MEETINGS OF LEARNED SOCIETIES.

- ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Monday, February 15, at 8 P.M.
- INSTITUTION OF CIVIL ENGINEERS.—Tuesday, February 16, at 8 P.M. 1. Renewed discussion on 'The Mauritius Railway, Midland Line.' 2. 'On the Lagoons and Marshes of certain parts of the Mediterranean,' by Professor Ansted, F.R.S.
- ARCHITECTURAL ASSOCIATION.—Friday, February 19, at 7.30 P.M. On 'The Arrangement of a Parish Church to meet the requirements of the present day,' by J. T. Micklethwaite, Esq.
- ROYAL INSTITUTION.—Tuesday, at 3 P.M. Mr. Westmacott on Fine Art. Thursday, at 3 P.M. Dr. Foster on Involuntary Movements. Friday, at 8 P.M. Mr. Greville Williams on the Female Poisoners of the 16th and 17th Centuries. Saturday, at 3 P.M. Professor Odling on Hydrogen and its Analogues.
- STATISTICAL SOCIETY.—Tuesday, February 16, when a paper by Mr. Horace Mann, 'On the Cost and Organisation of the Civil Service,' will be read.
- SOCIETY OF ARTS.—Wednesday, February 17, at 8 P.M.
- ROYAL BOTANIC.—Saturday, February 13, at 3.15 P.M.
- ROYAL ASIATIC SOCIETY.—Monday, February 15, at 3 P.M.
- ENTOMOLOGICAL SOCIETY.—Monday, February 15, at 7 P.M.
- SOCIAL SCIENCE ASSOCIATION.—Monday, February 15, at 8 P.M.
- METEOROLOGICAL SOCIETY.—Wednesday, February 17, at 7 P.M.

PUBLISHER'S ANNOUNCEMENT.

Advertisements cannot be received for insertion later than 2 P.M. on Thursdays.

Temporary Office, 4, Monument Yard, London.—GILBERT WOOD, Publisher.

THE GAZETTE.

PARTNERSHIPS DISSOLVED.

Kidd and Bourne, Birmingham, ornamental tube manufacturers; J. W. Brown and J. Harris, Upper Berkeley Street, Berkeley Mews, and Croydon Street, Bryanston Square, furnishing ironmongers; Hallam, Brothers and Co., Middlesbrough, wood planers; Johnson and Co., Gildersome, near Leeds, brickmakers; W. H. Ridgway and E. Belleruche, tile manufacturers, and Ridgway and Belleruche, London, commission agents; J. Glaholm and Sons, Newcastle-upon-Tyne, plumbers, as far as regards J. P. Dlabolm; R. Goodear and Sons, Manchester, timber merchants; H. Tidwell and Co., Queensbury, or elsewhere, Yorkshire, masons; F. Hutchinson and T. Evans, Caerwrlie, Flintshire, and elsewhere, timber merchants; Pettifor and Nutt, Devonshire Terrace, Blake's Road, Peckham, builders; Fox, Walker and Co., St. George, near Bristol, engineers, as far as regards J. K. J. Hood.

BANKRUPTS.

William Bouchard, late of South Street, Bethnal Green, cabinet-maker, Feb. 22 at 12; Robert Collins, Alfred Place west, Kensington, bricklayer, Feb. 22 at 12; Henry C. Green, Featherstone Street, cabinet-maker, Feb. 26 at 12; Robert Edward Hatch, Carshalton, bricklayer, Feb. 25 at 2; Richard Jenkin, Clark's Place, and Grange Road, Dalston, carpenter, March 1 at 12; Thomas Roper, Leytonstone, carpenter, March 1 at 11; Henry F. Simmonds, late of Low Leyton, carpenter, Feb. 25 at 1; G. Ashley, Elgin Terrace, Maida Vale, builder, Feb. 17 at 1; W. B. Beaumont, sen., William Street, Pimlico, builder, Feb. 17 at 11; Benjamin A. Jackson, Blundeston, Suffolk, builder, Feb. 24 at 2.

TO STRUKRDER IN THE COUNTRY.—George Hill, Motley Moor, Derbyshire, fire-brick manufacturer, March 3, Sheffield; James Hurrell, Ballingdon, builder, Feb. 20, Sudbury; Jesse and John Lacey, Birkenhead, builders, Feb. 24, Liverpool; Richard Martin, Darlington, builder, Feb. 20, Darlington; Jacob Stock, Weston-super-Mare, builder, Feb. 19, Bristol; J. Hunt Whitehead, Marke Rasen, builder, Feb. 26, Market Rasen; B. Ibbetson, Witton, near Blackburn, builder, Feb. 16, Manchester; Francis Edward Smith, Gillingham, builder, Feb. 19, Rochester.

TENDERS.

Tenders for Workhouse at Edmonton for the Guardians of the Strand Union. W. S. Cross, Architect. Quantities by Messrs. W. S. Cross and Alfred Cross.

Table with columns for contractor names, quantities, and prices. Includes entries like Patman & Fotheringham, Newman & Mann, Ball & Russell, Gammon & Sons, Myers & Sons, Jackson & Shaw, Henshaw, Bull & Son, Phillip, Webster, Perry & Co., Higgs, Powell, Jno. Kirk, Blackmore & Morley, Sewell & Son, Mauley & Rogers, Macey, Wigmore, Howard (accepted), Hill, Keddell & Waldram, Cooper & Cullum, Hart.

LOUGHBOROUGH PARK, BRIXTON.—For Nine houses. Mr. Alfred R. Pite, Architect.

Table with columns for contractor names and prices. Includes Suton & Dudley, Cowland, Baker & Constable, Kitson, Manley & Rogers, Watkins, Riley, Johnson.

SANTIAGO MARKET HALL.—Edward Woods, C.E. T. W. Goodman and Charles H. Driver, Architects.

Table with columns for contractor names, market prices, and total costs. Includes Laidlaw & Son, Hill & Smith, Coalbrookdale Co., A. Handyside & Co., E. Bellhouse & Co., St. Pancras Iron Works, Jas. Haywood & Co., Horsley & Co.

BRISTOL.—For the erection of a Granary, for Messrs. Wait & James, Welsh Back. Messrs. Clark & Gough, architects. Quantities taken out by Mr. Clark:—

Table with columns for contractor names and prices. Includes Heal, Brook, Davis & Son, Wilkins, Somerville, Thorn, Kingstone, Marquis & Munro, Baker, Foster, Warburton, Diment, Stephens, Sanders.

MASONS' WORK.

Table with columns for contractor names and prices. Includes Cowlin, Storkey, Flower, Wilkins, Bevan, Kingstone, Stephens, Thorn (accepted), King.

CARPENTERS' WORK.

Table with columns for contractor names and prices. Includes Low, Hatherly, Heal, Harris, Easterbrook, Davey, King, Sanders, Humphries, Somerville, Brooks (accepted).

SMITH AND GASFITTERS' WORK.

Table with columns for contractor names and prices. Includes Edbrooke, Priest, Harris (accepted).

SLATING, PLASTERING, PAINTING AND GLAZING.

Table with columns for contractor names and prices. Includes Cowlin, Lewis, Bevan, Hill (accepted), Tucker.

PLEMBERS' WORK.

Table with columns for contractor names and prices. Includes George, Vesey, Burke, Slade, Tuckey, Lear, Palmer, Osborne, Lear (accepted).

LIVERPOOL.—For Offices, Victoria Street. Messrs. Pictou, Chambers & Bradley, architects:—

Table with columns for contractor names and prices. Includes Roberts & Robinson, Henshaw, Harrongs & Son, Jones & Son, Canlie, Urmsou, Ray, Haigh & Co, Hughes (accepted).

LIVERPOOL.—For the erection of Lancaster Buildings, Tithebarn Street, Liverpool, for the Liverpool Financial Association. Messrs. Pictou, Chambers & Bradley, architects. Quantities supplied:—

Table with columns for contractor names and prices. Includes Campbell, Mullin, Hughes, Haigh & Co., Jones & Son, Holme & Nicol, Rome, Nicholson & Ayr, Calle, Westmoreland, Urmsou (accepted).

MONMOUTH UNION WORKHOUSE.—Messrs. Haddon and Payton, architects. Quantities supplied:—

Table with columns for contractor names and prices. Includes McCann & Everal, Slim, Diment, Wood & Son, Miles, Lawrence, Trow & Son, Welsh & Son, Longley Bros., Bolt & Co., G. & H. Webb, Moreland, J. & W. Bowers.

ASHFORD, DERBYSHIRE.—For Restoration of Church. Messrs. Medland and Henry Taylor, Architects. Quantities by H. Broary.

For Four shops at New Swindon, Wilts. Mr. T. S. Lansdown, Architect.

Table with columns for contractor names and prices. Includes Dyer, Wheeler, Lovatt, Kimberley, Newcombe, Smith, Barrett, Phillips, Draw.

Tenders for Four Cottages for Mr. Fisher, Swindon. Mr. T. S. Lansdown, Architect.

Table with columns for contractor names and prices. Includes Wheeler, Drew (of Highworth), Dyer, Drew (of Chalford), Newcombe, Barrett, Witshire.

Tender for Carpenters' and Joiners' Works for Four Cottages, and One Shop for Mr. T. Turner, Swindon. Mr. T. S. Lansdown, Architect.

Table with columns for contractor names and prices. Includes Barrett, Phillips, Habgood (accepted).

For the whole of the Trades for do.

Table with columns for contractor names and prices. Includes Wheeler, Norris.

Additions to Mr. Sewell's House, Swindon. Mr. T. S. Lansdown, Architect.

Table with columns for contractor names and prices. Includes Kimberley, Drew, Dyer, Lovatt, Barrett, Newcombe (accepted).

For Re-building King's Arms Hotel, Swindon. Mr. T. S. Lansdown, Architect.

Table with columns for contractor names and prices. Includes Wheeler, Dyer, James, Lovatt, Kimberley, Drew, Frampton, Barrett, Phillips, Newcombe (accepted).

For New Shop Front for Mr. Ing, Swindon. Mr. T. S. Lansdown, Architect.

Table with columns for contractor names and prices. Includes Phillips, Spreadbury (accepted).

For New Stables for W. Forester, Esq., Malmesbury, Wilts. Mr. T. S. Lansdown, Architect.

Table with columns for contractor names and prices. Includes Weeks & Bowman.

For additions to Dwelling-house, do.—

Table with columns for contractor names and prices. Includes Weeks & Bowman.

BALDERSTONE, ROCHDALE.—For erection of a Church. Messrs. Medland and Henry Taylor, Architects.

Table with columns for contractor names and prices. Includes T. Clay, Manchester, Ellis & Hitchliffe, Manchester, Rogers and Booth, Gosport, J. Robinson & Sons, Hyde, John Thompson, Manchester, W. Storrs, Stalybridge, M. Foggett, Manchester.

APPOINTMENTS VACANT.

MALVERN.—February 19.—Surveyor and Inspector of Nuisances. Total salary 200l. per annum, with unfurnished house, gas, and coal. Chairman of Local Board, Gt. Malvern.

WATFORD, HERTS.—Feb. 13.—Road Surveyor. Salary 120l. per annum, with allowance of 30l. per year for a horse. The Clerk, Highway Board, Rickmansworth, Herts.

INDIA.—July.—Forty Appointments in Engineer Establishment of Public Works Department in India. Mr. W. T. Thomson, Secretary, Public Works Department, India Office.

COMPETITIONS OPEN.

ROYAL ACADEMY OF ARTS.—National Gallery. For the best painting in Oil—or Model and Design in Painting, Sculpture, and Architecture. The Gold Medal and the Discourses of Presidents Reynolds, West, &c.; and for the best Copies of Drawings, Models of Life, the Antique in Landscape Perspective, &c. The Silver Medals, &c. November 1.

ROTHERHAM.—March 15.—For Plans, &c., for erecting a Public Hospital and Dispensary. A prize of 75l. is offered for the best design, 50l. for the second, and 25l. for the third. John Barras, hon. secretary, Rotherham.

DOVER.—Feb. 20.—St. Mary's Burial Board. Designs for laying out 9 1/2 acres, for the purposes of a new Cemetery. Premiums 50l. and 20l. G. Fielding.

KINGSTON-ON-THAMES.—March 1.—Design for new School and Master's Residence. Cost not to exceed 3,000l. F. Gould, Esq., Kingston-on-Thames.

BRECON.—March 1.—Plans and Estimates for Alterations of County Gaol. A premium of 30l. is offered for best plan. Edward Williams, Clerk of Peace, Brecon.

CORPORATION OF MANCHESTER.—ALEXANDRA PARK.—March 8.—The Corporation invite landscape gardeners, surveyors, and others to send in designs in competition for laying out the Alexandra Park. Joseph Heron, town clerk, Town Hall, Manchester.

CONTRACTS OPEN.

CITY OF LONDON.—February 23.—For Stone Paving in Carriageways and Footways. Joseph Daw, Sewers Office, Guildhall.

ST. GEORGE, HAMOVER SQUARE.—February 20.—For Materials from March 25, 1869, to March 24, 1870. Mr. Joseph Henry Smith, Clerk to the Vestry.

ST. GILES, CAMBERWELL.—February 15.—For Repairing of Roads. Mr. Geo. Wm. Marsden, Vestry Hall, Camberwell.

LONDON DISTRICT.—Feb. 15.—Tenders for Repairs to Public Buildings. Mr. George Russell, Her Majesty's Office of Works, 12 Whitehall Place, S.W.

ST. PANCRA.—Feb. 22.—For removing Coal Ashes, &c.; also for supply of Water Carts, &c. Mr. Chas. Worrell, 10 Edward Street, Hampstead Road.

ST. SAVIOUR'S DISTRICT.—Feb. 17.—For supply and use of Water Carts. Mr. Herbert Sturmy, Board-room, Emerson Street, Bankside, S.E.

MILE END, OLD TOWN.—Feb. 17.—For making up Carriage Roads and Kerbing and Paving Footpaths. Mr. Thomas Price, Vestry Hall, Bancroft Road, Mile End Road.

SHOREDITCH.—March 1.—For Watering Roads in parish of St. Leonard. Mr. W. G. Davis, Vestry Clerk, Town Hall, Old Street Road.

SHOREDITCH, March 9.—For Masons' and Pavers' Work, &c. Mr. W. G. Davis, Town Hall, Old Street Road.

SOUTHWARK. St. George the Martyr.—February 22.—For supply of broken Guernsey Granite, Yorkshire Paving, &c., &c. Mr. Daniel Birt, jun., Vestry Clerk's Office, Vestry Hall, Borough Road, S.E.

BRIGHTON.—Feb. 16.—20,000 Red-wood Sleeper Blocks, 3,000 tons double-headed Iron Rails, and 500 tons Cast-iron Chairs. Mr. William Walker, Brighton Station.

POPLAR.—Feb. 23.—For Erection of new Offices. Mr. S. Jeffries Bath, 281 East India Dock Road.

CHILSWICK.—Feb. 17.—For Constructing a 12-in. pipe Sewer, about 4,000 feet in length. Mr. W. J. Trehearne, C.E., 58 Great Russell Street, Bloomsbury.

CHILSEA.—Feb. 15.—For Plumbers', Bricklayers', and Masons' Work, &c. Mr. Charles Lahee, Vestry Hall, King's Road, Chelsea.

RYHL.—February 22.—For supplying Valves and Special Pipes, also for casting and laying about 14 miles of Cast-iron Water Pipes. Ryhl District Water Companies' Office, Clywd Street, Ryhl. See Advertisement.

TOWN MALLING.—March 11.—For Maintenance and Repair of Roads. Mr. W. South Norton, Clerk to the Board, Town Malling.

ROCHESTER.—February 23.—For Maintenance and Repair of Roads. Mr. Charles Martin, Clerk to the Board, Strood.

STAFFORD.—March 1.—For Erection of New Stone Bridge, and taking down the old one. Mr. Robert Griffiths, County Surveyor, Stafford. See Advertisement.

The Architect.

CONTRACTS.

THE question already raised in these columns as to the mutual relations existing between Clients, Architects, and Builders, is one of the greatest importance. It is also one of the greatest difficulty. Three conflicting interests force themselves into an unwholesome prominence; and in a manner which at present has defied all attempts at entirely reconciling them.

The proprietor naturally wishes to get as much as he can for his money; and he may well be pardoned for being somewhat exacting and suspicious, if he sees in his architect no desire to keep within compass, or in the builder no intention of sticking closely to his contract.

The builder naturally desires to ensure his fair profits; and he may fairly complain if he sees an attempt made to enforce upon him unfair conditions.

The architect, if he has anyone's interests at heart besides his own, and desires at the same time to serve his client, and to act with even-handed justice towards the builder, has to encounter an amount of difficulty which is well nigh insurmountable; on account of the free and easy way in which the former often seems to think that a trifle can cost but a trifle, whilst the latter takes for granted that all work actually done is—regardless of every other consideration—fairly entitled to payment.

The opening of these columns to the investigation of questions which affect the interests of all generally, rather than to the advocacy of any particular interests or courses of action, will be, it is to be hoped, of real value. A little free inquiry into these relations can do no harm, and can hardly fail to be productive of much good.

It is impossible not to accept the general statement already put forth in the two remarkable articles which appeared in our issues of January 30 and February 6, followed as they have been by communications bearing on several sides of the question, as evidence of the existence of a *prima facie* grievance. Whether it is at all capable of redress, and by whom, remains yet to be proved. We should be sorry to deny the general reasonableness of the remedies suggested by a 'London Contractor,' supposing that we are content to regard the matter from only a single point of view. But there are two sides even to a round plum-pudding, and it will hardly satisfy us to criticise the *outside*, without making some attempt to examine the *inside* also. And in our present case the merits do not lie merely on the surface.

Supposing the client, the architect, and the builder, to be all equally high-minded, well-intentioned, competent, honest, and good-tempered, it is not often that a difficulty need arise. But if any of the parties concerned should be deficient in any one of these qualities, some unpleasantness or other is not unlikely to arise. And it is chiefly to meet such cases that restraints of law, and a better understanding of their respective responsibilities, are required by all the three, in order to protect the interests of any one of them quite as much as of the other two.

It is undoubtedly very hard upon a builder that he should be responsible for the fulfilment of his contract, if no money is forthcoming from the proprietor, or if the architect refuses to certify the fair value of the work done. That such cases, however rare, do occur is proved by a statement which we publish in another part of our columns, and they must be admitted as a real grievance. At the same time it is seriously to be questioned whether an easy remedy for the evil would not prove worse than the disease itself, by enabling incompetent or embarrassed men to make even a justifiable refusal the ground for tedious disputes, and the excuse for vexatious delays in carrying out a work.

In case of the insolvency of a proprietor, summary justice ought to be obtainable for the builder; and a bankruptcy clause applicable to the proprietor, giving the builder release from the contract, and a lien upon all materials delivered by him and unfixed, would be quite as justifiable as is the usual clause against the builder. The insolvency of a proprietor has on the other hand been known occasionally to have been brought about, or his position seriously crippled, by a builder obtaining the work by an unjustifiably low tender, with the deliberate intention of making up any deficiency by extra works. If such an one be sometimes caught in his own trap, and receive well-merited punishment, it might appear that no further harm would be done. But if we look deeper we shall see that an incalculable amount of injury has been done to the building cause generally, by loss of credit amongst large bodies of deserving persons, by the creation of unworthy suspicion, and by the rousing a mutual, though it may be only tacit, want of confidence amongst all parties concerned.

This want of confidence, moreover, is nowise diminished by other facts which occasionally crop up, tending in the same direction. As for example, it is no exaggeration to say that in the case of a special stipulation as to agreement for extras beforehand, a builder, even of good standing and of honest reputation, has been known to value the work shown in a drawing at over 200 per cent. more than it was fairly worth, that is to say at more than three times its

fair actual value, to try and make up for his own ignorance or rashness in his original undertaking.

If such occurrences justify caution, and even create distrust on the part of architects and employers, it is quite possible that the recklessness, harshness, or incompetence of an architect, or the unreasonableness of an employer, may create similar suspicions and want of confidence in the contractor; and he, too, may no doubt at times fairly complain that the real basis of his contract, the bill of quantities, is frequently found defective, after having been offered for his acceptance in a way which can best be described by the homely simile of buying a pig in a poke.

The interests of the public, that is to say of the employer, must not be overlooked in this discussion, the more so that no correspondent has yet offered himself as the representative of that class which sets the whole building machinery in motion, and which afterwards has to pay the bill.

The main question often will be, not at all whether certain work is fairly worth a certain amount of payment, but whether a committee or a private gentleman embarking in an undertaking could be, under the conditions proposed by the contractors, kept so strictly informed beforehand of any extra liabilities as to enable him to judge whether he will be justified in incurring them, or able to meet them. As it has been urged on the one hand, 'that the contractor must not be supposed to know all the details of the work sufficiently to detect at once from a working drawing that it is in excess of the agreement, and that, if the builder unwarily carries it out, no charge can be made, or that an employer can repudiate the payment of work for which only a verbal order may have been given;' so, on the other hand, the architect can hardly be expected to take in at a glance that the work exhibited in a detail is in excess of what was agreed upon. How difficult it is to estimate the value of work is patent to the whole world, for we find in every list of tenders variations of 20, or 50, or 100 per cent. made in the estimates for certain works, according to certain accidental circumstances of person, time, or place.

The present customary stipulation that no extras shall be allowed unless an order in writing be given at least secures this, that no extra liability is incurred without the architect's becoming aware of the fact, and having the opportunity of endeavouring to come to some definite agreement as to the cost. And, in favour of agreement for extras beforehand, it may be safely assumed that it is far easier to avoid a dispute by a definite understanding previously, than it is to settle it afterwards by recrimination or by litigation.

Indeed, it is evident that, in these days, unless an architect is scrupulously careful, as well as thoroughly competent (and very often even then), he stands in great danger of coming into collision with his client or his builder, or with both of them, merely upon the grounds enumerated above. And he (equally with the other two) desires and deserves protection, as well from the builder's over-ready confidence or recklessness, or his superiority to such sublimary matters as pounds, shillings, and pence during the progress of a work, as from the limits exacted by a client. That is to say, he must have some such reliable safeguard as at present exists against the danger of what he intends and issues as working drawings being interpreted by the builder as orders for extras.

The dutiful nephew's considerate remembrance that 'Nunkey pays for all,' so useful in justifying his extravagance, certainly seems sometimes to meet its counterpart in many a builder's conception of the profundity of a proprietor's pocket. He needs not concern himself to represent to the architect that a work is more elaborate than in his opinion was intended. His province is only to do the work, and to take care that the work is paid for when done.

Let us not suppose, however, that undue advantage is commonly, or consciously, taken of any opportunities for increasing their claims which lie open to them by the great class of high-minded builders. We simply point out a difficulty sometimes met with, and one of equal magnitude, of equal importance—let us add, one we hope of equal rarity, with that set forth by writers on the other side—a difficulty requiring to be met, and dealt with, in any mutual arrangement between architects and builders which may be attempted. For, if the principle be acknowledged that a drawing alone shall be evidence of an order for extra work, and that there can be by no possible means any certainty of arriving at a certain understanding as to extras as the work proceeds, the door will be opened wide to the extortion of the unscrupulous.

The above are only some of the aspects of the question; we have only just named bills of quantities, we have not even so much as mentioned the arbitration clause, or the strike clause, and have not glanced at the grave question of how far any material change in the present plan may affect the position of the architect as an artist. So wide a question demands more space for its discussion than the limits of a single article, and we shall hope to return to it.

One thing more must be added. We trust it will be borne in mind that it is impossible to provide against every contingency and peculiarity of circumstance by any general series of stipulations or conditions of contract, however well-considered. We have endeavoured to show that if the conditions of contract now customary be altered in favour of the contractor, there is great danger of their being liable to abuse to the damage of the employer. The clearest evidence exists that in the majority of cases the present system when in good hands works excellently well for all parties; and we deprecate any change so great as would render the operation of a contract when in bad hands more injurious than it can be made at present.

OUR RAMBLER

ALONG THE SITE OF THE THAMES EMBANKMENT.

BY the unusual good fortune of a series of minor disappointments, our Ramble down the left bank of the Thames, from Westminster to Blackfriars, was deferred till one of those rare and charming days when the sun looks down smilingly on London through a bright and newly washed atmosphere. A series of searching and angry gusts, hurrying as if to make up for some inexcusable loss of time in their long journey across the Atlantic, had routed out every atom of mist, and fog, and vapour, from its wonted lurking-place, and whirled it away towards the Channel. Pelting showers, of almost semi-tropical urgency, had washed roof, and wall, and pavement, and lent to the newly-stimulated activity of the scavengers a degree of credit that was not altogether due to their exertions. Over Westminster, thus rinsed from smoke and rough-dried from visible damp, the sun looked down as it rarely shines through our atmosphere. The great city crowding round the Thames reflected the sunshine, and seemed to offer the mute promise that, if the architect were allowed to work by no rules but those of his own art, She would become, in a few years, one of the most imposing capitals of Europe.

The careful selection of the tint of the granite which forms the noble quay wall has much to do with the brilliancy of the scene. Not extracted from one quarry, or even from one district, Scottish, Cornish, and French granites, from Dalbeattie, Ross of Mull, Hayter, Penrhyn, Morlaix, and Dinan, find their place in the long esplanade; but the harmony of tint is for the most part very successfully maintained.

You may take that walk on at least three hundred days out of the three hundred and sixty-five, and come each time to the conclusion that a picture of the scene, drawn on the brightest of the odd sixty-five, is an exaggeration. Every gilded nut and enrichment of the Charing Cross Railway Bridge gleamed in the sunlight, and the great length of the line of iron lattice, the apparent good proportion of structure to duty, and the constant line of trains puffing and crawling behind the reticulations of the girder-parapet, were clothed with a certain indescribable air of grandeur. The whole structure asserted its claim to be regarded as a great triumph of human skill. Passing eastward, the noble façade that does honour to the taste of Sir William Chambers struck the eye with a new force. A spire rose from each end of the pile, lending a strange beauty to the sky outline; two of the Strand churches falling accidentally into the exact position which crowned either end of Somerset House with their graceful steeples. Eastward, the tower of St. Dunstan's rose like that of some Flemish cathedral; St. Bride's soared far above it towards heaven; and towering supreme over all rose the majestic dome. Let the space between Somerset House and the Temple be filled by a building of appropriate grandeur, and we may challenge Europe to display such a noble architectural *coup d'œil*.

The Embankment from Westminster to Blackfriars was originally divided into three contracts. Of these, two are now complete, so far as regards the wall and the filling up of the area. The third, reaching from the verge of the Temple to the bridge in process of construction, is now in the condition in which it is at once most interesting and most instructive to view it. And our Rambler had the advantage of being piloted over the works by a courteous and intelligent Scotchman, who rules over granite and over mud; over masonry, that is to say, and over excavation—*quocumque nomine gaudet*;—one of those men who have both their head and their heart in their work.

A man need have that vivid remembrance of the state of similar works a quarter of a century ago which no casual acquaintance with the subject can impart, to appreciate the amount of skill and of thought that has been brought to bear on the arrangement of the works of this contract. Large experience leads to a conclusion the reverse of that which is arrived at by the uninitiated visitor. The more simple everything seems, THE LESS THERE IS TO SEE, in shape of variety of work, queer shifts, original expedients, picturesque incongruity and variety of parts;—the more evidence is there of patient, provident, systematic thought in planning and in directing. It is striking to observe how simple a really well managed piece of work looks, and how infinitely various and complex is the aspect of one carried on under the ancient and time-honoured 'rule of thumb.' The best testimony to engineering or architectural skill paid by a person not familiar with the conduct of works may be couched in the expression 'Is this all?'

This remark might be applied with some justice to the central labour of the genius of the place. In all riparian work, in many works of deep excavation, and, most notably of all, in all wet tunnels, the hand-to-hand struggle of the engineer with his great, ever present, enemy, water, is everywhere apparent. Two or three pumps here; an Archimedean screw there; the bucket and the scoop in another place; everywhere leakage, everywhere exertion, everywhere anxiety, everywhere water—such is our long and time-honoured experience.

The contractors of No. 3 Contract have taken a leaf out of another book. About the centre of the enclosed area is perched, on piles and on staging, a sort of ark or wooden booth. Within its open-faced shelter, a fourteen horse-power steam-engine is steadily at work, under charge of a grave and responsible-looking engineer. This engine not only discharges all the varied and painful functions of pumpers, and ecoopers, and water men without end, but it seems to laugh at its work. Anything short of a fresh inroad of Father Thames is within

the power of this engine. Its immediate coadjutor in the task is a simple and powerful chain-pump, bearing the name of Murray as the inventor, which is the most admirably adapted machine for such a purpose that we have met in any of our rambles. A well has been sunk some 45 feet deep, into which the whole enclosed area drains. A vertical trunk is placed in this well, and an endless double chain, carrying a series of floats, is kept in constant revolution by the steam-engine. As the chains descend, the float-boards, which are attached by their edges, hang perpendicularly, and are hardly seen; but when the ascent commences, each float, in its turn endeavouring to fall in the opposite direction, pulls taut two diverging and supplemental pieces of shorter chain, attached to the main chain at some four or five feet distance from the joint that bears the float, by means of which a horizontal position is maintained during the ascent. As the chain is driven with a considerable velocity, the rising trunk is thus occupied by a series of ascending valves, not fitting very tight to the sides, but bringing up, with very little loss of water, a constant stream of a muddy mixture, in which mud, chips, wreck, or anything smaller than a young donkey, is borne up with irresistible force. A stream of water, thick with mud, but as voluminous and as rapid as that of the head water of the Thames itself, rushes down a neat wooden conduit from the delivery point of this most efficient chain-pump. The drainage of the works is completely within the power of the machinery.

So much, indeed, is this the case, that the contractors are not content that the pump should only discharge its primary function of raising water. They make it perform the work of the navy. It acts as wheelbarrow, as inclined plane, and as hoisting power, whether human or mechanical. For Father Thames is as munificent in his deposits as is the sacred Nile itself; and on his late impromptu visit to the works, when he entered, like a Roman Emperor honoured with a triumph, through a breach made for that express purpose in the walls, he left a very weighty memorial of his arrival in the shape of a thick bed of mud over the whole enclosed area. To dig, and fill, and barrow away this mud would be a matter of considerable cost; and the question would arise what was to be done with it when it had been removed from the surface, and more or less perfectly dried.

The chain-pump disposes of all this mud. It does so thus:—In the gutters and channels through which the surface drainage of the Embankment area is conveyed to the pump-well are stationed some thirty labourers, plunged up to their hips in enormous boots, and armed with implements which are colossal likenesses of the ordinary road-scraper. With these mud-compellers the men in boots constantly stir and turn the sludge into the channels and in the channels, and keep it in a state of suspension, or more than semi-fluidity, until it comes within the grip of the mighty pump itself. Then up and out it goes, were it ten times as black. This method of pumping up excavation is an admirable proof of the excellence of the machinery employed.

The area which is kept dry by this powerful machinery is protected from the entrance of the tide as follows:—A regiment of steam pile engines has been provided. Each of these machines looks, at a little distance, like one of our old acquaintances by means of which five or six men, in as many minutes, were accustomed to wind up the monkey till the action of the jaws on the nippers released the ponderous block, and it fell, with a rush, and a thump, and a rattle, on the head of the subjacent pile. But on examining these forty-two feet pile engines, they prove to be much stronger than their ancestors in their bracing and construction. They support tier after tier of aerial stages, giving free access by means of a ladder to every part of the endless chain, which circulates like that of the pump, motion being given to the driving wheel by a small inclined cylinder, like that of an American locomotive, fixed on the foot of the engine, and supplied by steam from a convenient boiler. The ram, or monkey, thus raised is rather long in proportion to its cross section, and weighs twenty-five cwt.

At intervals of some 17 feet 6 inches apart, the guide or waling piles are first driven, by these steam pile engines, in the line of the outer row of piling. Walings are then bolted to these piles in the usual manner, being whole timbers, placed horizontally, in pairs, so as to keep all the intermediate piles in line. These intermediate piles are also of whole timber, and, like the gauge piles, 45 feet long. They are driven some five or six feet into the solid clay below the gravel bed of the river. A row is driven, as closely as possible, between each pair of gauge piles; and when the two lines, proceeding from each end, meet in the middle of the space, a wedge pile is driven to key the whole as firmly as possible together.

Five feet within the outer line of piles is driven an inner row; and the space between the two wooden walls is filled up solid with puddle, made from the London clay. A third, a fourth, and a fifth line of buttress piles are driven, so as to correspond with the gauge piles; and horizontal and inclined struts form the whole into a solid bulwark against the pressure of high water in the Thames.

One additional line of these buttress piles has been driven where the breach took place. The system of struts had originally abutted against the fore shore: but the fore shore itself proved rotten, and unable to resist the pressure; and, yielding to the weight of an unexpectedly high tide, allowed a portion of the puddle dam to be blown in, and a further portion to be wrenched and twisted inwards.

No workman was injured by the accident. The piles which were only bent inwards were forced back into place by the simple and ingenious method of driving a whole pile at about 14 inches distance shoreward of the outer buttress piles, strutting and propping this new pile from the inner ones, and then driving wedge piles of half timber between the bent pile and its new neighbour. The regularity of the outer dam has thus been fully restored.

At the end of the work, which promises very fully to exercise the ingenuity of the architect, and where much care and skill will be requisite to avoid something unsatisfactory, the outer line runs shoreward at an angle till it joins the abutment of the new bridge. The piling here is single, the puddle wall being dispensed with, and the piles being caulked with tar and oakum. It is proposed that the wall of the Embankment should take a sort of ogee curve at this eastern extremity. It seems a pity that it does not run on, so as to make a land arch of the northern opening of the bridge.

The handy application of the steam-engine to replace the Irish labourer of the last generation is not limited to the pump and to the pile engines. A set of steam cranes, running, like the pile engines, on a temporary railway, raise and lower all that is requisite over the edge of the *enceinte*. The same power, applied to a well constructed traveller, is also set to work to raise, transport, and lower the sharply arised granite blocks, which are sent ready dressed from the quarries, to form the quay wall.

The care of the clerk of the works in the preservation of these arrises demands notice. The granite quarrymen are, for the most part, accustomed to insist on working the stone in the quarries; not merely scabbling it out, as is the practice at Bramley Fall and many other quarries, but actually working it, bed and face. Of course the merchants are responsible for delivering this stone with its arrises perfect; but a very limited experience in rambling over public works is sufficient to convince anyone of the difference between what is contracted for and what *is*. Constant mishap, quarrels, delay of work, and final use of stone not exactly satisfactory, but which there is no time to replace, keep engineer, contractor, clerk of the works, and foreman of masons in continual hot water. Expense, loss of time, loss of temper, and loss of excellence in the work are avoided in this instance by an excellent expedient. Holes are bored in each vertical bed, near the face, and plugged with wood. Rough slabs are nailed to these plugs, so as to surround each stone with a skeleton packing case, and thus keep every arris perfect. The first cost is in this instance the least cost, and this method should be insisted on by all who employ granite dressed at the quarries.

For the details of the solid and substantial wall of concrete faced with granite, the foundations of which are now about to be sunk within the puddled dam, our Rambler had to consult the drawings. Nor could he fail to remark the very great completeness and clearness of detail given in the atlas which contains the engraved designs of Mr. Bazalgette; the soundings of the river, taken across the area to be enclosed, and out to some depth beyond the face of the quay wall; and the survey of the riparian property. It would have rendered this set of drawings of yet more permanent value if the soundings had been continued across the whole bed of the Thames.

The foundations of the quay wall are to be sunk to the depth of 32 feet 6 inches below Trinity high-water mark, where they will rest in the solid clay. As the face of the wall has a curved batter, the width of the concrete varies, the foundation of the inner portion of the wall not being carried so low as that of the outer or riverward half. The extreme width of foundation filled in with concrete may be taken at about 20 feet, and the mean thickness of the wall at 16 feet. Granite bonders, 3 feet long, tie the ashlar of the facing to the entire mass.

Through this concrete wall, parallel with its course, will run two continuous openings. The lower one is a circular drain or culvert, of eight feet three inches diameter, intended to convey the intercepting sewer. The upper one, with a semi-circular crown, is a subway, intended for the conducting, and for the means of having access to, the pipes of the gas and water companies, and the wires of the Electric Telegraph. A very similar arrangement is made in the Holborn Viaduct. It ought to be imperative in every metropolitan street, although our Rambler was told that the gas and water companies are far from taking to it kindly. The privilege of being able to render any thoroughfare impassable at will, and to waste the money, as well as the time, of the public, by independent up-pickings of a road as soon as it has been put into decent order, is one which the companies will only relinquish when compelled. People are so unreasonable! What is the convenience of three millions of Londoners compared to the maintenance of the prescriptive rights of a board?

A Ramble is only half instructive if it lights upon nothing but what is admirable. Failure, rightly understood, is the surest pilot to success. Thus where there is so much that is excellent, criticism may be allowed a full hearing.

Would it not have very well repaid the able engineer of this noble work if he had asked some architect of the first eminence to look over the purely architectural details? If this had been done, a few would have been altered, to the very great advantage of the *ensemble* of the work. Gothic mouldings would not have been allowed to intrude themselves into work of an Italian character. The *wooden* treatment, which splay off the corners of some of the riverward piers, would have been avoided. So would the sharp vertical line, which inharmoniously replaces a regular return, in the pier by the steps; and

above all, the disproportionately heavy cornice, which the river archway by the old Temple pier seems constructed solely to carry, would have been replaced by some very different feature. Our Rambler sketched the archway. Seen endways, it assumed, in his note book (owing to some uncertainty of touch), the guise of a Welsh milkmaid, in a man's hat, with a yoke on her shoulders. Seen from the shore, it has neither the character of utility nor that of beauty. The upper block of masonry is disproportionately narrow, and seems placed merely to weight the crown of the arch. The arch itself, if opening on a flight of steps or on the level of high water, would be appropriate for a river access; but any passage through it is interdicted by a stone balustrade, the balusters of which and of the steamboat piers too much resemble turned work to be appropriate in granite, and the obstructive nature of which is brought to a maximum by a pier in the centre. A moulding intended to intimate the recurrence of similar piers at the sides looks like a church credence table. We cannot but think this gateway, in the arrangement of which constructive purpose has no part, a mistake. The features, and eyebrows, and water-logged beard of Father Thames on the key-stone do great honour to their sculptor, Mr. Farmer. But we regret his crown of bay: not one of the hoary senate of Sea and River Gods that sit, each on his throne, in the temple of memory, bore such a tiara. From the tridentine crown of Neptune, to the lobster claws and frill-like comb of fins of a bronze Proteus in the British Museum, under every kind of wreath, of flag, or water ranunculus, or sea or river weed, we can find no example for presenting Thames in the chaplet of a conqueror. The landing-stages, the idea of which is taken from the great one at Liverpool, is not yet launched on its pontoons, so that our Rambler returned to his starting-point without having gazed on the features that frown on the riverward key-stone of the Temple Arch.

THE BRIDGES ON THE THAMES.

It is no exaggeration to say that so many well-designed bridges as those that span the River Thames in the four miles from London Bridge to Chelsea are not to be found in an equal length in any part of the world. In that short distance there are two masonry bridges, three of horizontal girders, six of wrought or cast iron arches, and two suspension bridges. Some of these are amongst the best of their kinds, but all are deserving of attentive study. They have been already partly described, but it is in different volumes, for, as far as we know, there is no complete description of the entire to be found in one place. This want we hope we may be able to satisfy.

LONDON BRIDGE.

Old London Bridge, for which this was substituted in 1831, had lasted from 1209. It consisted originally of twenty arches of different sizes, the largest being 35 feet span. The piers varied in thickness, the one in the centre of the river (over which stood a chapel where the architect was said to be buried) being as large as 35 feet. On the roadway stood two rows of houses, with a space between of about 20 feet. As the traffic of the river increased, it was found that the small size of the arches and the mass of masonry in the piers offered great obstructions to it. From time to time various remedial alterations were suggested. Sir Christopher Wren advocated that eighteen of the arches should be thrown into nine; and long afterwards, in 1759, a step towards this was made by the removal of the large central pier, and the construction of an arch 70 feet span. At the same time the houses on the bridge were taken down. In 1801 Telford proposed to erect a cast-iron arch of 600 feet span, but after ordering an investigation by the ablest scientific men of the day, Parliament considered the project too bold to be approved of. The need for an enlarged waterway being every day rendered more apparent, after a lengthened inquiry, a Bill was passed to erect a new bridge, and Mr. Rennie was appointed the engineer. The practicability of altering the old bridge to answer all requirements was even then maintained by many eminent men, the great Telford holding the opinion that, at least, the piers would serve for the new arches. It was intended by Parliament when the Bill was passed that the new bridge should be on the site of the old one (a temporary bridge being erected for the traffic), with Fish Street Hill as the approach on one side, but the Corporation directed its construction 180 feet westward. This made new approaches on both sides indispensable, and the bridge was far advanced towards completion before an Act was obtained to construct them, as well as to legalise the adoption of the new site.

The increased and improved waterway of the bridge may be shown thus:—

	Old Bridge.	New Bridge.
	Feet.	Feet.
Obstruction-piers at high water	407	92
low water	700	
Waterway at high water	524	690
low water	281	

The first pile of the cofferdam of the south pier was driven on March 15, 1824; the first stone on the platform was laid by the Lord Mayor on June 15 (the company being comfortably seated in the cofferdam); and the bridge was opened by the King with much ceremony on August 1, 1831. From the drawings and the abstract of the specification (which is almost a treatise on building stone bridges) all the details of the construction are so evident as to render any further remarks on that part of the subject unnecessary.* A settlement of 9 inches in the centre arch and piers and

* For the drawings and permission to make an abstract of the specification in Cressy's *Encyclopædia* we are indebted to Messrs. Longmans, Green, Reader, & Dyer.

8 inches in the others were allowed for by the engineer, but he stated that not more than 2 or 3 inches was observed. It was, however, maintained by some of the opponents of the bridge that the piers had settled more on the east side, to an extent estimated from 4 to 12 inches. An inquiry was directed by the House of Commons to be made on the subject, but it was found impossible to ascertain the extent of the deviation, or whether it arose from actual settlement of the masonry or from an inclination given to the platforms to facilitate drainage.

As specimens of architectural engineering Rennie's bridges have been never surpassed. There is a severe beauty and grandeur about them too often absent from modern structures. The ornamental portions seem to be there of necessity, and a cube foot of cut stone could from no part be removed without detriment. There is so little intricacy in their construction that few examples could be found better suited to engineering students, or to which it is easier to apply ordinary formulae.

ABSTRACT OF SPECIFICATION.

Cofferdams for Abutments to be of circular form, of best Memel, Dantzic, Riga, or Stettin fir. Piles to be whole timbers, none less than 12½ inches square. Inner row to be driven not less than 10 feet, and outer 8 feet, below lowest part of foundations; both rows to stand 5 feet above H.W.M. Both rows to be secured with three rows of double waling 12½ inches square, having 2-inch wrought-iron screw bolts 10 feet apart, with nuts and cleats 3 feet long by 12½ square. An outer row of piles to be driven 6 feet from main row, of similar timber, and to 8 feet below foundations; to have three rows of double walings as before, with 2 in. screw-bolts passing through the three rows. Piles to be planed and straightened on edges; joints of inner rows to be made watertight with pitch; piles to have transverse and diagonal bracings of half timbers fitted and spiked; to be hooped and shod with wrought iron; spaces between piles to be filled with tough, well-beaten clay puddle to 2 feet above H.W.M. Interior of dam to have main transverse and longitudinal bracing of double whole timber, scarfed, strapped, and bolted. A tunnel 3 feet square to be placed towards centre of dam and secured to the piles; to have a sluice, and joints to be caulked.

(Cofferdams for Piers were of elliptical form, and similar in character to the above.)

Foundations.—Excavation for *abutments* to be to a depth of 34 feet 6 inches below H.W.M. at front and 25 feet at back of platform.

Side Piers to be excavated, that top of platform shall not be less than 40 feet below H.W.M. *Middle Piers* to be 43 feet below H.W.M. After the

excavation, piles 20 feet long by 12 inches diameter are to be driven in rows 4 feet apart. Those under piers, perpendicular; under abutments, at right angles to inclination of foundations. Piles to have wrought-iron shoes weighing 35 lbs. each, and hoops=30 lbs. After piles are driven, their heads to be cut off level, and the earth between is to be excavated for 9 inches below pile heads, and space filled with Kentish rag stone, well beat down and racked with gravel and lime screenings of one part lime to five parts gravel. Sills of beech, elm, or fir, not less than 12 inches square, are to be spiked on pile heads in *transverse* direction of foundations. Spaces between to be built up with brickwork, with square blocks of stone at extremities. Above these sills other rows are to be laid in *longitudinal* direction of foundations, of similar dimensions and materials, fastened with 18-inch spikes. Spaces between to be filled with Bramley or other stone in mortar grouted. The whole of the foundations to be then covered with 6-inch planking bedded in mortar and fastened to sills with 12-inch spikes, forming a platform for the masonry. Along fronts and returns of abutments, and around piers, sheet piling to be driven to a depth of 12 feet below top of platform for abutments, and 14 feet for piers. Piles to be 6 inches square for abutments and 12 inches square for piers, and to be hooped and shod.

Masonry of abutments and piers to springing of arches to be ashlar, in courses not less than 15 or more than 24 inches in front. Exterior stone for an average depth of 5 feet 6 inches, and to within 3 feet of springing, to be of granite; interior of one half Bramley Fall and remainder of Painshaw or other approved stone. To be header and stretcher courses alternately; headers not less than 4½ feet long, and average breadth of 3 feet. No stone to be less than 2·3 wide. Stretchers not less than 4 feet long. Backing to be laid in headers and stretchers alternately, headers being opposite stretchers in front. Double joggles to be used where required. Exterior course to be smooth and fine hammer-dressed on face. Horizontal beds to be fine-dressed and rusticated 2 inches each way; upright joints to be plain, straight, and fine-dressed for at least 15 inches inwards; remainder of stone to preserve its full dimension. All the backing of each course to preserve an equal thickness. Interior of stair walls to be well-burnt stock bricks; exterior, to level of river bed, of Bramley Fall or other stone, in courses not less than 15 or more than 24 inches thick; above bed of river of granite as before.

Centres.—There are to be four complete sets. Each set to consist of eight ribs properly braced; to be of best Dantzic, Memel, Riga, or Stettin fir, except springing pieces, which are to be of elm, and striking wedges to be of oak, cased, on upper and lower sides, with copper ¼ inch thick. Iron to be best English. Trestles to be best fir. The whole to be braced longitudinally and diagonally. Covering of centres to be fir half timbers 7 inches thick.

Arch-stones.—The whole of the arch-stones to be headers, 18 inches thick at intrados, increasing according to radiature: none to be less than 2 feet 6 inches wide, or to overlap at joints less than 15 inches. Length of arch-stones to increase where inverted or abutting arches on piers commence, and in abutments to be continued on same line of radius to the extremity of abutments. Quoins of arches to be continued to meet horizontal courses in the spandrels. Arch-stones to be dressed smooth and straight; faces and soffits fine-dressed and rusticated; extrados rough hammer-dressed except where inverted arches join, where they are to be smooth-dressed. Arches interior and exterior to be of granite.

Spandrels to be of solid masonry in horizontal courses, corresponding in thickness, and closely fitted to arch-stones.

Inverted Arches to be not less than 18 inches at soffit, increasing according to radius, to rest on spandrels, and to be accurately fitted to them and the arch-stones. A circular opening 18 inches diameter through centre of pier, from inverted arches, to carry off leakage. *Outside spandril walls* to be 5 feet thick, fronted with granite in courses corresponding with arch-stones. Horizontal joints of courses to be rusticated; vertical joints to be plain and fair-dressed, outside face fair hammer-dressed. Caps of piers to be fair-dressed on exterior, and dowelled to fascia-course. Rectangular buttresses over piers and abutments to be faced with granite at least 3 feet 6 inches deep.

Interior Spandril Walls.—Before these are commenced the joints on the back of arches, &c., to be well cleared out, openings to be grouted and pointed with Roman cement. They are to be of best hard grey stock bricks, seven in number over each pier, and 2 feet 3 inches thick. On tops, stone corbels, 18 inches deep, projecting 12 inches on each side, or Bramley Fall stone. The whole surface over these walls to be covered with Yorkshire landings 9 inches thick; the longitudinal joints to be over centres of interior spandrels.

LONDON BRIDGE.

(BY PERMISSION OF MESSRS. LONGMAN.)

Roadway.—The whole surface of bridge to be covered with clay puddle 15 inches thick—then with 3 inches of fine sand, and 12 inches of fine flint stones, none larger than 2 inches diameter. Foot-paving to be of granite; each flag to be the whole width of foot-path, equal 7 feet 6 inches by 8 inches thick, one end bedded on cornice, the other resting on curbstones 4 feet by 9 inches by 12 inches of granite, set edgewise; intermediate spaces being filled with fine gravel or sand.

Approaches to be formed of solid embankments and arches. Embankments to be supported on sides with brick retaining walls. Piers of arches to be founded 6 feet below H.W.M., and retaining walls 3 feet. Foundations are to be concrete, 6 inches thick; Yorkshire landings, 6 inches thick; and Bramley Fall or other stone laid 15 inches thick. Piers to be 4 feet wide at bottom, at 4 feet high to be 2 feet 3 inches wide. Over each pier 18 inches of stone. Arches to be semicircular, 16 feet span, 18 inches deep at crown, increasing towards haunches.

Mortar to be of best Dorking, Merstham, or other lime, well burnt and ground on the spot. The exterior mortar from foundations to H.W.M. to be one part Pozzolano, one part Dorking lime, and two parts sand. For the remainder of exterior three parts sand and one part lime; for interior work four parts sand to one part lime.

The cost of the bridge and approaches was 1,458,311*l.*

HOMERIC ARCHITECTURE.

(Continued from page 89.)

OF two kinds of the structures alluded to by Homer we are able to judge from existing examples—walls and treasuries. In his day Greece was studded with a number of independent towns, so close that, according to Colonel Mure, a ride of twelve hours enables one to visit at least four places celebrated by Homer. We are ignorant as to what race the original founders belonged, but it is established that they divided into groups, and, taking advantage of the natural features of the country, selected the most inaccessible positions as their dwelling places. That they must have stood in fear of each other, and it may be of other enemies, is evident from this choice and from the massive walls with which some of the villages were surrounded. In an age when mercy was not recognised as a fitting attribute of gods or men, these walls would become the most important possession of a town. If they were well defended, so that scaling was prevented, as there were no engines of attack, besiegers might have to wait for years before an opportunity offered of entering the town by stratagem. It is remarkable how carefully Homer distinguishes the towns that were possessed of walls from those which relied upon the natural security of the site. For example, 'All who Hypothebe hold—a nobly-built fortress,' 'Dion's fortress steep,' 'Wall-encircled Gortyn,' as compared with 'Where high Neritos shakes his waving woods,' 'Where Ægilipa's rugged sides are green.' In no case does he mention that the existing inhabitants had raised them—a proof that they must have been built before his time. Of the character of these 'heaven-built Cyclopean' walls we may form an idea from the remains scattered throughout the country, especially those at Tiryns. Here they are in parts 43 feet high and 25 feet thick, the enormous stones being rudely piled in tiers for about a quarter of a mile in circuit, producing at a distance, as Mure says, an effect similar to the hulk of a large man-of-war floating in a harbour. It is held by some that those elevated sites must have to some extent influenced the style of Grecian architecture, which, as Cockerell says, seems to have grown spontaneously from its rocky bed, and to partake in its monolithic masses of the stony aboriginal material on which it was founded, its horizontal outline and regularity admirably contrasting with the surrounding vertical and irregular forms.

The same desire for security which made such walls necessary, caused also the construction of underground storehouses or treasuries. To these allusion is sometimes made by Homer, as when Achilles rejects the offers of Agamemnon:—

Life is not bought with heaps of gold:
Not all Apollo's Phytian treasures hold,
Or Troy once held in peace and pride of sway,
Can bribe the poor possession of a day.

The most perfect specimen remaining is at Mycenæ, where it was known by the irreverent but expressive name of 'the Oven,' until the enquiries of travellers gave it interest, when it became 'the Agamemnon.' It resembles somewhat a gigantic beehive, about 50 feet in diameter at base, and the same in height, the stones being placed in horizontal layers, each gradually projecting over the other until they meet at the top, where one stone closed the vault. It was probably at one time covered with plates of copper, as large nails by which they were fastened have been found in parts of the building.

We have already stated it is believed that in the Homeric times temples were not needed for the purposes of religion. In the Iliad allusion is made but once to a Grecian temple, one dedicated to Minerva at Athens; but as Lord Aberdeen has shown, there is little doubt it must have been an interpolation. In the 'Hymn to Apollo' there is much about the founding of the temple at Delphi; but although it is on this poem the popular idea of Homer's blindness and poverty is founded, it is supposed to belong to an age much later than his. In Troy there was a temple or shrine which had gates; and as offerings of robes and such things were deposited in it, it must have had a roof of some kind, probably boughs. As the object of reverence was symbolical rather than representative, such as

a stone or beam, without any attempt at a likeness to any form, the receptacle might be rude enough and still be worthy of it.

We are able to form a clearer idea, from what is said in Homer, of the arrangement of the palaces than of their appearance. Priam's is thus described:—

Then hasted he across
To Priam's goodly builded court, which round about was run
With walking porches, galleries to keep off rain and sun.
Within of one side on a row of sundry coloured stones
Fifty fair lodgings were built for Priam's fifty sons.
And of as fair sort for their wives; and in the opposite view
Twelve lodgings of like stone, like height, were likewise built arw.

From this and other allusions in the poems (tested by comparison with the existing houses of the district), it is believed the different parts of the Homeric house were disposed somewhat in this manner:—

In front and opening to the road was the *aulæ*, which was a square or oblong enclosure, paved, and having in the midst of it the family altar. Within or around this *aulæ* were galleries, corridors, or open chambers called *aitousai*, i.e. probably glowing or shining, as, being in front of the building, they were full of light. These galleries, which are usually translated as porticoes, were used as places of general assembly, where the inmates sat to sun themselves, and at night were converted into sleeping places for strangers. The house itself mainly consisted of a large chamber or hall called the *megaron*, the roof of which had often to be supported by wooden columns. Usually around this were the private apartments, which seem to have been generally small, and varied in number according to the inhabitants. It is possible that in some there was a second storey, the approach being by means of a ladder. The roof, as in Eastern houses, was commonly flat; but from the simile of the wrestling match between Ulysses and Ajax it must have been sometimes pointed:—

Then nicely belted both came forth and in the middle stand,
And seize each other's elbows with the firmly grasping hand,
Firm as two beams which carpenters with nice dovetailing binds,
High on a lofty roof to hold against the blustering winds.

There is no mention of a chimney; and if the fuel was of dry olive or pine wood, as some think, little smoke would be emitted, and consequently no need of one. But as we know that Ulysses discovered the site of Circe's dwelling, or 'stately dome,' by the smoke rising, and he so longed to see it upspringing from his own hearth that he desired death, there must have been some provision of the kind.

Since the days of Wolf it has been a matter of controversy whether the Iliad and Odyssey have been the work of one or of several poets. English opinion in general has inclined towards the belief that both must have been written by Homer—and with reason, for it is not often a second poet is found capable of continuing such a poem. But this does not prevent the possibility of many passages being inserted from time to time. There are some which relate to architecture, and describe edifices so different that it is impossible to believe they could have been composed about the same time. To take one case. Above we have given the description of Priam's palace, which, on account of its position towards the east, might be expected to have all the magnificence that was known at the time; and from its relation to the poem, nothing that was noteworthy was likely to be omitted by Homer. In architecture, if one type of building is at any time adopted, it may be said to be almost permanent, and changes of style are not made suddenly, but imperceptibly. Priam's palace is exactly the kind of building that might be expected in such primitive times. If it is, what can be thought of the following, and does it seem probable that both could be contemporaneous in the same country?—

The walls were massy brass: the cornice high
Blue metals crowned, in colour of the sky;
Rich plates of gold the folding doors incase;
The pillars silver, on a brazen base:
Silver the lintels deep projecting o'er,
And gold the ringlets that surround the door.
Two rows of stately dogs on either hand,
In sculptured gold and labour'd silver, stand.
These Vulcan formed with art divine, to wait
Immortal guardians at Alcinoüs' gate.

Fair thrones within from space to space were rais'd,
Where various carpets with embroidery blaz'd,
The work of matrons.

It may be said that this is one of the architectural visions that sometimes rise before the half-shut eyes of poets, but it is contrary to our idea of Homer's excellence to believe that he drew airy nothings. Besides, we think it will be found that poets have never been architectural designers, and that their castles in the air have had a basis in reality, and were usually suggested by some work of an artist-architect.

CAN AN ENGINEER OR ARCHITECT WITHHOLD HIS CERTIFICATE?

THE relations between architects or engineers and contractors is a subject that at present is receiving deserved attention. As in the end it resolves itself into a question of what is law and what is not, the legal aspects of the subject are of primary importance, and every case that can illustrate any part merits consideration. In the last number of the *Irish Law Reports* (January 1869) there is a report of one of those cases that (to the credit of architects and engineers) seldom arise, where a contractor, or rather his representatives, were obliged to take proceedings against an engineer for loss incurred by the withholding of his certificate: we allude to the case of Murphy (Official Assignee) and others v. Bower.

In 1861 Messrs. Moore contracted to construct the 'Finn Valley Railway,' under the ordinary conditions, that the works were to be according to

the plans and instructions of the engineer; that monthly, nine-tenths of the amounts certified by the engineer were to be paid, the balance remaining until completion, &c. Before they were able to complete the works, Messrs. Moore became bankrupts, and the obligation devolved upon their creditors. When everything was duly performed, the engineer's final certificate for 6,659*l.* was applied for, but could not be obtained. The Company were then sued for the amount, and they pleaded that the necessary certificate was not given, and consequently the action was lost. The creditors then sued the engineer, who demurred—1. Because he never contracted with the Messrs. Moore to give certificates or perform the duties of an engineer. 2. That his duty as engineer was not to the Messrs. Moore, but to the Company. 3. The counts in the summons are actions upon duties arising out of contract, of which persons not parties to the contract are endeavouring to take advantage. 4. The fraudulent breach of a contract or duty arising solely out of contract, can give no cause of action except to a party to the contract. 5. A breach of contract or of duty arising out of contract, committed by one party to a contract in collusion with the only other party to said contract, is insensible, and gives no cause of action to any person, and particularly not to a stranger to the contract.

Against these pleas it was urged for the plaintiffs that the mere fact of the engineer's entering upon the duties contemplated by the contract created a duty upon his part to discharge that duty rightly. He contracted to serve the Railway Company, and the Company, armed with his authority, contracted that, as between them and the Messrs. Moore, he would do his duty. It was impossible to suppose that the Messrs. Moore would have bound themselves to incur vast expense, or that the Railway Company would have dreamt of asking them to do so, if their remuneration was to depend upon the whim of a servant of the Company, with whom they had no connection. However, even if there never had been any contract between plaintiffs and defendant, it was clearly the duty of the engineer, as engineer, to give the usual certificates given by all engineers, and a breach of that duty renders the defendant answerable.

Chief Justice Monahan delivered this judgment:—It appears that the engineer was not a party to the original agreement between Messrs. Moore and the Company, and that the alleged duty of the defendant to give a certificate, so far as it exists, arises from the simple fact that he was employed by the Company as their engineer to superintend their works. The question then arises, whether the defendant has rendered himself liable to plaintiffs' action by merely refusing to give his certificate, though aware that the plaintiffs had done everything to entitle themselves to it, and how far the matter would be affected by the fact of his being actuated by a fraudulent motive in withholding such certificate, or having done so in collusion with the Company. The argument for the defendant is, that since the duty of the engineer to give a certificate arises, if at all, out of a contract, the Messrs. Moore, or their assignees, not being parties to it, cannot maintain an action for its breach; and this argument is equally applicable, whether the contract out of which the duty arises is a contract between the engineer and the Company, or, as has been suggested, between the Railway Company and the Messrs. Moore, assuming them to have contracted on the part of their engineer, that he, as their employe, should do his duty, and give such certificate. It was also contended on the part of the plaintiffs that, inasmuch as the defendant has taken upon himself the duty of engineer, it might be inferred that he had expressly contracted with the Messrs. Moore to perform his duty as such engineer; but the answer to this suggestion is, that, if any such contract was intended to be relied on, it should have been stated that such a contract was in fact entered into; the consideration for that contract should have been also stated, and it would have been then competent for the defendant to traverse the alleged consideration. If the contract stated in the summons and plaint was an express contract between the Railway Company and the Messrs. Moore, by which the Railway Company contracted that their engineer should do his duty properly, there is no doubt but that a right to maintain an action against the Railway Company would have accrued to them upon the engineer's default; but some cases have been referred to in which it has been decided that, where the foundation of the right of action is rested upon contract, no one can maintain an action who is not a party to the contract. . . . The question then arises, are the plaintiffs remediless? There is authority to show that, if collusion did exist between the engineer and the Company, the plaintiffs have a remedy against the Railway Company. The case of *Clarke v. Watson* decides that in the absence of fraud or collusion they have not. But here fraud and collusion with the Company have been alleged; and if fraud exists, most certainly if collusion, there *must* be a remedy. In *Milner v. Field* the Court expressed an opinion that an action at law would lie against parties who fraudulently prevented such a certificate from being given, and thus attempted to shelter themselves from liability on their contract. In *Batterbury v. Vyse* a declaration upon a contract by an employer who stood in the position of the present Railway Company, charging as a breach thereof that the architect had improperly refused to give his certificate, and had neglected to do so, in collusion with the defendant and by his procurement, was supported upon demurrer. The proper course, therefore, for the plaintiffs to adopt is, to proceed, not against the engineer alone, but against both the engineer and the Railway Company, if they go into a court of equity; or if they elect to sue at law, they must proceed against the Company who contracted with them.

The engineer's demurrer was consequently allowed.

WROUGHT IRON GIRDERS.

A BEAM may be considered in two aspects: as regards stiffness, or as regards strength. We may enquire, on the one hand, what load may safely be put upon it; or, on the other, how much it will deflect under any given load. There is a close and essential connection between these two properties, yet they are not identical. One beam may be far stronger than another of the same rigidity. By a mere change in the section of a beam, without altering either its depth or its total weight of material, it is, in

certain cases, possible to increase its strength, at the same time that we reduce its stiffness.

The rigidity of beams is a question involving some use of the higher mathematics. It is well that the more important question of strength is comparatively an easy one in ordinary circumstances.

The reason of the compression at the top and tension at the bottom of a loaded beam is not far to seek. If we suppose the girder, A B, to be divided into two sections by an imaginary line at any intermediate point, C, it is obvious that these sections have a tendency to turn in opposite directions under the load. Such will be the case wherever we take C, and the result is, that more or less bending strain is at work at every point throughout the length of the beam. This strain depends both on the amount of the load, and on the purchase or leverage between the supported ends and the loaded intermediate portions of the beam. It accordingly varies with the product of the number of feet span, and the number of pounds load, modified by the way in which the latter is distributed or concentrated. If we call the load in pounds W, and the clear span in feet S, then—

When load W is equally distributed over span S,

$$\text{Bending strain} = \frac{WS}{8};$$

and when load W is concentrated at the half span,

$$\text{Bending strain} = \frac{WS}{4};$$

these being the strains at the half span, where the stress is greatest. Now, the top and bottom being firmly connected by the web, so that there cannot be any sliding (such as takes place, for example, between the laminae of a railway carriage spring), there can be no bending unless the upper flange is compressed and the lower flange stretched; because they are constrained to assume, not parallel, but concentric curves. Corresponding elastic resistances, at the top to compression, at the bottom to tension, are consequently brought into play. The amounts of these two descriptions of elastic reaction must be equal, in the absence of any external lateral force tending to shorten or lengthen the girder as a whole.

If we take one portion, C B, of the beam, and indicate by the arrows p and t the resistances respectively to compression and extension of the upper and lower portions of the vertical slice a b adjacent to the section line, we have in these resistances a pair of parallel and opposite pressures, with a leverage equal to the depth of the girder, and tending to cause upward rotation. All that is required being that this upward reaction should just balance the deflecting action of the load, it becomes an easy task to determine the amounts of compression and tension caused by a given load, and thence the sectional area needed in top and bottom flange.

For ordinary purposes of construction in buildings, wrought iron girders carry the same section from end to end, and this section is of course calculated for the maximum strain, which occurs at the half-span. When the areas of the upper and lower flanges are pretty large in proportion to the thickness of the web, the latter need not enter into the calculation of the strains, which may accordingly be considered as thrown entirely on the flanges. Calling load (in lbs.) W, and span (in feet) S, as before, and depth of girder d (in inches); we find the total compression at the top, or extension at the bottom, to be equal to

$$12 \times \frac{WS}{8d} = \frac{3WS}{2d},$$

when the load is equally distributed over the span. The same load applied at the half-span would create a stress of double the amount. Care must be taken to ascertain (as the value of W) the greatest weight that can in any possible contingency come upon the beam after it is in the building.

Good boiler plate and angle irons, as used in girders, ought to stand, per square inch of section, compression of 8,400 lbs., or tension of 10,500 lbs., without any injury to their elasticity. To keep the maximum intensity of strain within these safe limits, the following rules will give the requisite areas for flanges; provided the greatest load is one equally distributed.

$$\frac{WS}{5600d} = \text{No. of square inches area in section of top flange.}$$

Say, multiply the distributed load in pounds by the number of feet span, and divide by 5,600 times the depth in inches; the result will give the sectional area of top flange in square inches.

When the plates and angle irons are in entire lengths, without joint—

$$\frac{WS}{7000d} = \text{No. of square inches area in section of bottom flange.}$$

When the plates and angle irons are in more than one length, with secure butt joints, double riveted:—

$$\frac{WS}{5000d} = \text{No. of square inches area in section of bottom flange.}$$

The preceding rules pretty nearly accord with the results which have been deduced by Mr. Fairbairn from actual experiment. We have thought it most convenient to state the load in lbs., and the span in feet, as somewhat facilitating the application of the formulæ.

In cases where *W* is a load concentrated at the half span, the areas of flanges must be double what the rules just given would make them, so that we get

$$\frac{WS}{2800d} \text{ square inches for area of top flange;}$$

Say, multiply the *maximum* concentrated load in pounds by the span in feet, and divide by 2,800 times the depth in inches; the result will give the sectional area of top flange in inches:—

$$\text{and either } \frac{WS}{8500d} \text{ square inches, or } \frac{WS}{2500d} \text{ square inches}$$

for ditto of bottom flange—the first if the flange is in one length, and the second if it is in more than one.

When the greatest load is partly concentrated and partly distributed (as, for instance, when a beam carries a wall and also supports the end of a floor girder), the areas of flanges calculated for the concentrated load must be added to those calculated for the distributed load, and the sums will be the requisite areas.

It will sometimes happen that a girder has to carry a load concentrated at a point nearer to one support than to the other. For such a case a ready rule will be as follows:—Multiply four times the load by the product of its distances from the two supports respectively, and divide by the square of the clear span. Consider the quotient as a load applied at the half span, and calculate the flanges accordingly.

Having determined the section of girder, its weight may be pretty closely estimated by the following method:—Multiply 10 times the sum of the areas of top and bottom flanges in square inches by the length of the girder in yards, and, to the product thus obtained, add 10 times the number of square feet of web (computed from the side elevation), if its thickness be *one quarter of an inch*; if its thickness be more or less than the quarter of an inch, the multiplier 10 must be increased or reduced, at the rate of $2\frac{1}{2}$ for each sixteenth of an inch.

The sum will be the number of lbs. weight of wrought iron in flanges and web; omitting gussets, ends, joints (if any), and rivet heads, which must be estimated separately, as no general rule can be given for them.

The thickness of the web, in the ordinary Π -shaped plate girders, should be not less than such as will make the number of square inches in the web, as shown on plan (i.e., the product of its thickness and its length in inches), equal to 3 times the number of square inches in the cross section of the girder: e.g., if the cross section of a beam be 20 square inches in area, and its length 20 feet (= 240 inches), the web should be $\frac{1}{2}$ inch thick. Owing to the lateral weakness and inferior durability of very thin plates, the *minimum* given by this rule will often be largely exceeded in beams of light section.

For cases where very large spans and loads have to be dealt with, the box-shaped beam offers the advantage of superior lateral stiffness. In ordinary cases the Π -beam meets all requirements, and its single web gives it the advantage in point of economy. In estimating the strength from the cross section, one square inch of flange counts for 3 times as much as a square inch of web, on the average; so that a double web adds to the weight of metal much more in proportion than it adds to the *vertical* rigidity; and the more effective distribution of material is secured with the single web, provided it be kept from buckling sideways, by means of gussets or stiffening plates, or by the mode in which the cross joists or binders are attached. The sectional area of top or bottom of a box-beam will not materially differ from those given by the preceding rules for the Π -beam.

For testing a plate beam, it will not be necessary to subject it to more strain than that caused by the *maximum* load; and if after the removal of the test load the permanent set be found not to exceed one-third of the deflection under test, the workmanship and material may be considered free from serious defect; although, with high excellence of work, the permanent set will be much less in proportion to the deflection.

Wrought-iron joists, binders, and girders or bressumers for moderate spans and loads, are turned out from the rolling mill, so that the riveted work, with its attendant cost, may be saved in cases where the available bearings are not very far asunder. With rolled beams, an amount of metal is commonly put in the web that renders its *quota* of strength of some account, over and above its special service as solid trussing between the upper and lower parts of the beam.

We may here note the main points that make for economy in the employment of wrought-iron beams. First and most obvious is the selection of the shortest practicable bearings, and the keeping the distance between supports as small as the special conditions of the case will allow. Where walls are strong and massive, and well steadied with the weight of upper storeys, the introduction of through-stone corbels is available for some small reduction of the clear span. Secondly, the greater the depth that can be given the beam, the lighter section will suffice for the same duty, with this further advantage, that, while securing equal *strength* with less metal, we are also getting a *stiffer* beam; and thus carry the load with equal safety, and less deflection, at a reduced cost. Of course it is possible to give excessive depth to a beam; the sideways warping or buckling of the web (in the Π section) is a danger to be sedulously guarded against, which increases with the increase of depth. Sometimes lateral stiffness may be secured by the mode of attachment of binders or deep joists; sometimes, by timber cheeks, firmly secured by bolts passing through the web; sometimes gusset or stiffening plates will be indispensable; and end plates are of course essential in all plate girders. The third source of economy has already been adverted to as available with moderate spans, namely, the employment of solid rolled, in preference to built, beams. And,

although the greater thickness of web in the former does not give so advantageous a distribution of metal on the cross section, it is not without its service in adding lateral stiffness. Fourthly, in plate girders, economy is to be consulted by the avoidance of cross joints everywhere, but especially in the lower flange. All cross joints add expense in butt plates and riveting; but a cross joint in the lower flange involves (as has been already pointed out) an increase of some 40 per cent. in the weight of metal in the flange itself. In some cases, where the bottom plate is too heavy to procure in one piece from the rolling mill, it may be composed of *two strips*, one on each side of the web, each being in one length. Or, it may perhaps be preferable, instead of thus slitting the bottom flange along the middle, to laminate it, employing two, or, if need require, more plates; each the full width, and in one length. The thinner the plate, the more reliable the quality of the metal; and, so long as the lower flange has only tension to sustain, the laminated structure is no defect. A fifth mode of economy consists in the reduction of the flanges from the half span towards the points of support—a reduction which (with wrought iron) is of practical advantage only where very heavy spans are encountered. The question of continuity comes last, but not least, as one of economy in girders. The advantage derivable is dependent on the section of beam (if uniform) being the same at top and bottom, and on the ends being firmly fixed down. In very large built beams, the section can of course be varied to suit the distribution of strain peculiar to continuous flexure.

ST. GEORGE'S CHURCH, LENNOXVILLE.

(WITH AN ILLUSTRATION.)

LENNOXVILLE is a considerable and still growing village, in the eastern townships of Canada and province of Quebec. It is the centre of a population of British and American descent, and in close proximity to the village has been erected the University of Bishop's College, the chief seat of education, in connection with the Church, in the two dioceses of Montreal and Quebec.

For many years a congregation has existed at Lennoxville, and the increasing number of members has made it imperative to provide additional accommodation; and for this purpose it was wisely determined to erect a new church, rather than to attempt to enlarge and alter the present poor and ill-ordered building.

For this purpose I have prepared plans for a church to accommodate 687 persons, my aim having been to design a building sufficiently dignified for its important position in the province, and yet simple in its details and moderate in its cost. The church will be built of local brick, red and black being used for the exterior, and white and red for the interior. The black on the outside and the red inside have been sparingly used, and in purely architectural lines. Stone is difficult to obtain, but a white marble is much used, and the simple forms of the capitals and window tracery have been designed for its use. The nave and chancel piers are of polished red Aberdeen granite. The reredos, pulpit, chancel screen, and some other fittings will be added as funds allow, and will probably be worked in England. All the windows are to be double glazed, the exterior glazing being of plate-glass, in wrought-iron frames, the interior, cathedral or painted glass. All the entrances have double doors.

Durham, February, 1869.

C. HODGSON FOWLER.

THE NORTH PORCH, BRISTOL CATHEDRAL.

G. E. STREET, A.R.A., ARCHITECT.

(WITH AN ILLUSTRATION.)

THIS work, of which we give an illustration which has been reduced by photo-lithography from a drawing by the architect, is one of those portions of this restoration as to which there was no guide in the old work, although it was known that a Norman Porch existed on the position which it occupies. The new Porch is therefore an entirely original design of the architect.

The rebuilding of the Nave of Bristol Cathedral is now in active progress. The Committee at present have been only able to contract for two complete bays, and the foundations of the four western bays, and of the two western steeples up to the top of the plinth.

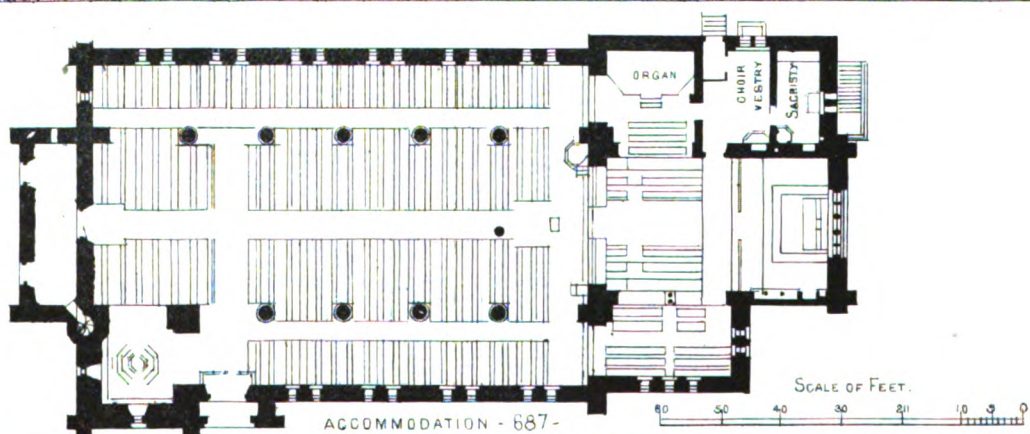

It is hoped that a third bay may be at once undertaken and completed, and then probably a temporary end wall will be erected, and the remaining three bays and the steeples carried on gradually as the funds come in.

In making excavations, the foundations of the old Norman nave were discovered exactly where Mr. Street had shown in his original report that they were to be expected.

Mr. Booth, of Gosport, has the contract for the works, and Douling stone is being employed for the whole work, inside and out.

New Water Works are about to be constructed at Winwick for the purpose of giving an additional supply to Warrington. They will consist of a well to be sunk in the red sandstone, a powerful pumping engine, and a covered reservoir. The Act authorising the construction of these works was obtained last Session. The late Mr. Thomas Duncan was the consulting engineer, and Mr. Charles H. Beloe the engineer. The works are being carried on under the superintendence of the latter gentleman.

SOCIETIES.

Metropolitan Buildings and Management Bill.

At a recent special general meeting of the Royal Institute of British Architects, the report of a committee appointed by the Council on the Metropolitan Buildings and Management Bill, having been considered and amended, was adopted, and the following resolution was come to:—That while this Institute recognises the importance of making certain modifications in the Building Act of 1855, proposed and embodied in the Metropolitan Buildings and Management Bill now under consideration, it is of opinion that there are no adequate grounds for such a complete alteration of the Act as that which would be involved by the adoption of the Bill in its entirety. The following is the most important portion of the report of the Committee:—

We, the Committee,—appointed by the Royal Institute of British Architects to examine and report on the draft of a proposed new Metropolitan Buildings and Management Bill—having duly examined the same, and considered the provisions therein contained, both in their relation to those set forth in previous Acts of the same nature, and in relation to the necessities of current practice in the Metropolis, beg to report as follows:—

Having reference to the present stage of the Bill, and the probability of its being extensively altered, we have only dealt with it at the present time in general terms, leaving the minute details to a future time.

We observed that its scope differs from that of the existing Building Act in the extended powers given to the Metropolitan Board of Works. Not only has that body, by the proposed Bill, power of authorising any deviation from the conditions of structure laid down in the Act, but it remains the sole and absolute court of appeal in all matters or questions arising out of the Act, having at the same time such despotic rule over the position of the district surveyors as to render them entirely powerless, if the Board sees fit to exercise its authority. Our chief objections to the Metropolitan Board of Works, as holding this great power, are not of any personal nature, but rest on the following considerations.

Questions arising out of this Act are generally on matters of detail of an altogether technical nature; that is, technical either from an architectural or a legal point of view. While the variety and importance of other duties already devolving upon that Board are not likely to leave them time to properly investigate complicated questions of construction, and the numerous other matters which must necessarily arise out of the working of the Bill; and the number of members of which the Board is composed must neutralise to a great extent the sense of personal responsibility which is essential for the due administration by it of such matters of detail. Your Committee would have preferred to have seen the authority conferred by the Draft Bill upon the Metropolitan Board of Works, vested in a smaller tribunal, appointed, it may be, by the Board, and adequately remunerated, especially selected for possessing the necessary legal and constructional knowledge, and directly responsible for their judgment of all questions upon which any power of discretion is left by the Act. Such tribunal should, we think, consist of one or more architects or surveyors of repute, and of one or more magistrates or barristers.

We would further observe, that the Draft Bill, as compared with the existing Metropolitan Building Acts, contains various provisions, founded in the main on the Building Act in operation at Liverpool, with respect to fire-resisting buildings, more particularly of the warehouse class; and the conditions under which goods of greater or less combustibility may be stored therein. The introduction of these clauses (subject to some remarks we shall hereafter offer in detail) will, we consider, confer a benefit both upon the public, and upon those especially connected with the use or erection of such structures.

The Bill comprises various clauses, more particularly affecting Metropolitan local management, which we consider tend to complicate unnecessarily an Act for the special regulation of buildings, a kind of Bill which, from its very nature, must always be somewhat complicated. We consider, therefore, that any such clauses would, with greater propriety, be included in a Bill for the Revision of Metropolitan Local Management.

We find so many clauses and provisions relating to the prevention of fire, that we think more general prominence should be given to the subject in the preamble of the Bill.

We think, also, that the attention of the Metropolitan Board might with advantage be recalled to the suggestion already made by this Institute, that the introduction of a Part (similar to Part VI. for party walls), having reference to questions of light and air in the Metropolis, would be a great public boon, as tending to diminish and prevent litigation on that difficult subject, and to simplify procedure when damage is caused by the erection or alterations of buildings.

The Committee then proceed to refer to certain details of the Draft Bill, which they think call for special remark, desiring to observe at the same time that they leave many other points without comment at present, but which will require more or less revision, before the Draft Bill can become law with any prospect of public usefulness.

On Architecture in Belgium.

By R. PHÉNIX SPIERS.

(Continued from page 92.)

By the great commercial prosperity of the country, and its large trade during the Middle Ages, a vast amount of wealth was accumulated, to which, as well as to the political and social freedom enjoyed by the people, we owe the development of a number of municipal and trade buildings of great size and magnificence. These buildings were of four kinds: 1. The Belfries, which were the emblems of civil liberty; 2. The Town Halls, where the town authorities assembled, and where justice was administered; 3. The Trade Halls, in which the commerce of the country was developed; and 4. The Guild Halls, buildings set apart for the protection of the various guilds or, as we term them, trades' unions. In the belfries were kept the records and archives of the town, before the town halls were erected, and in the upper part were placed the bells. One of the oldest belfries is at Tournai, but the largest and best known is at Ghent. Of the town halls, the most important are those of Brussels, Ghent, Bruges, Louvain, Oudenarde, and Antwerp. The requirements of these town halls were somewhat the same as with us, except that the number of offices was not so great. On the ground floor was a great hall with offices for civil marriages, committees, and courts of justice. In some cases there was a second floor, the original use of which it is not clear to see, as they are now invariably occupied by museums. The offices attached to these halls, and the staircase, were in the rear. Verticality of line predominates in nearly all these town halls, the façades generally divided by a series of slight buttresses between the windows, and decorated with two or more rows of statues or corbels, with canopies over the window heads, and cills alone marking the horizontal lines of the floors. Mr. Spiers then proceeded to describe what he considered the best specimens of this class of buildings, taking in his survey the Town Halls of Bruges, Brussels, and Ghent; the Hôtel de Ville, Louvain; the Town Hall, Oudenarde; the Hôtel de Ville, Courtrai; and the Town Hall, Antwerp. The Trade Halls are of greater antiquity than the Town Halls. The earliest of the former is that at Ypres, the foundations of which

were laid by Baldwin I. in 1201, and the right and left wings respectively completed in 1230 and 1285. We have here, therefore, the most ancient secular building of the middle ages of any large size. The main façade is 400 feet long, and has a massive square tower in the centre, with large octagonal turrets at each angle, which latter would have looked better if they had been carried down to the ground; as it is, they have a heavy and clumsy appearance. There are two floors, each consisting of a large hall extending from one end of the building to the other, the ceiling of the ground floor being carried by a row of pillars down the centre. Latterly this floor has been subdivided. The openings on the ground floor are all doorways, above which are windows, with pointed arches and tracery, to give light. The first floor has a series of very fine painted windows and arcades, or niches, with statues alternately, the whole crowned by a cornice of small shafts carried on corbels and a battlement. The necessary support for the tower almost cuts in two the great hall on the ground floor, which otherwise would have been the finest in existence. One of the rooms at the back of this hall is being painted with some remarkable frescoes recording the chief historical events of the town. Mr. Spiers, after describing the Trade Halls at Bruges, Louvain, and Ghent, and the 'Boucheries' of Bruges, Ghent, and Antwerp, proceeded to say that of the Guild Halls, the most interesting was that belonging to the Boatmen's Guild at Ghent. It was built in the first half of the 16th century, and its ornamental features and the quaint carvings on the walls show, to some extent, the influence of Spain on the country at that period. The arms of Charles V. and those of the guild are carved over the doorway. After referring to the Antwerp Exchange—the original building burnt down about ten years ago—the Tribunal of Justice at Bruges, and the Episcopal Palace at Liège, Mr. Spiers turned to the domestic architecture of Belgium. In no other country are the relics of bygone days found so close together or so little unaltered; and this is the more singular, because the country has not only been the field of civil war, but the 'cockpit of Europe.' To the progress of civilisation on the one hand, and of commercial projects on the other, we must attribute the ruthless destruction of all that is fine in Art; and it is, perhaps, to the lack of the latter, as compared with bygone days, that we owe the preservation of the domestic buildings of Belgium. In the Middle Ages she—then part of the Netherlands—took the lead in commerce; her docks and her halls teemed with merchandise, and her cities with large populations, resulting in the construction of a number of buildings of vast size, which at the present day are more than ample for her wants; and just as we, till within the last fifty years, had no need to build new churches or cathedrals, so in Belgium they have no need of more accommodation than can be found in their halls and residences, the solidly-built erections of their forefathers. The grass in the streets of Ypres or Ghent, the half-fallen houses of Mechlin, Antwerp, and Tournai, sad and mournful though they may appear to the political economist—to the architect, to the artist, and the antiquary, who picture their condition in bygone days, and who conjure up old associations, these towns have a tenfold interest, and teach lessons not easily to be forgotten. The earlier domestic residences of Belgium, as elsewhere, presented more or less the appearance of fortresses. In those days it was literally necessary that 'every man's house should be his castle.' They were built of stone, with towers, gateway, and small external windows. There are remains of two of these houses at Ghent, and one—the Gravensteen—with its two octagonal towers and fine gateway, forms a picturesque group overlooking the market. The earliest houses are found at Tournai. They were built in rubble with stone dressings, and consist of long walls, occasionally with gable ends pierced with windows, square-headed and divided by a single column. In the thirteenth century, painted windows with mullions and tracery appear, and the houses have as many as three and four floors. The gable ends are remarkable features, being flanked with circular or octagonal turrets. The ground floor is sometimes raised, and then the basement, with a row of pillars to cover the vault, becomes more important. The most interesting series of buildings are those found for the most part in the north of Belgium, and more especially in Bruges, built wholly or in part with brick; they date from the fifteenth and sixteenth centuries. Many of them have received a complete coat of white-wash, which hides their material and the pretty effect which the red brick, with dressings of blue stones, must have produced. One of the earliest of these brick buildings is on the Grand Place at Bruges, and is similar in style to those found in the north of Germany. The windows generally of these houses are inclosed between piers which run from the top to the bottom of the building without a break or horizontal line, so that the floors are only indicated by the heads of the windows. These are square-headed, the space between the window head of one floor and the cill of the window of the next being decorated with black tracery. The building above-mentioned at Bruges has a flat roof, but generally all the houses have gable ends, and these are stepped. Though disagreeable at the first view, the eye soon becomes accustomed to these steps, and then they form the most picturesque skyline. At Louvain there is a façade which is decorated with the mullions and tracery of a large church window, the real window being cut out between the mullions. Two of the richest houses in Belgium are to be seen at Mechlin. They are built in stone, and the upper storeys advance slightly over those beneath. Towards the end of the 16th century the detail of the Renaissance began to creep in and influence the domestic architecture, and the vertical lines which abounded in the prevalent public buildings are supplanted by horizontal mouldings marking the several floors; the windows are always square-headed (which is the real and proper form for a domestic building, whether it be Gothic or Renaissance), and are divided by mullions and transoms. The lower portion of these houses is very simple, the decoration, if there is any, being confined to the head of the doorway. The ingenuity of the Renaissance architects seems to have centred itself in the gable ends, which, though generally bad in taste, by the constant variety and change in form and silhouette, give an aspect of picturesqueness of skyline not obtained by the somewhat monotonous stepped gable. The houses themselves are imposing from their immense height. At Brussels, on the Grand Place, are a number of these houses, in the design of which more freedom has been displayed than elsewhere, to the detriment of good architectural effect. At Antwerp, where the style is more severe, the result

is far better, and Mr. Spiers knows no more delightful town about which to roam, the streets between the Town Hall and the river being lined with houses 200 to 300 years old. He wished to draw especial attention to the shop-fronts, which were in every way applicable to the requirements of the present day; and he thought a hint also was to be taken from the manner in which they support the heads of their windows by an iron bar running across into the sides of the windows, an apparent support being given by two brackets, one on each side. There still remain at Ghent and Antwerp some wooden houses covered, as the case may be, with wooden laths or slate, where the floors project one over the other. The ground floors are generally of stone, with large windows, and the gable ends are sometimes elaborately carved. Mr. Spiers wished he could speak of the development of modern architecture in Belgium with the same praise that he did of the old work, or in fact with any praise at all. There are some new works—large churches—in course of erection, and fine public buildings; but with the exception of a new bank at Brussels, which is evidently the work of the modern French school, there is nothing which calls for one's attention; and this is the more singular, because in his (Mr. Spiers's) opinion Belgium holds the highest rank in the sister arts of painting and sculpture in Europe. The pictures of Gallait representing the feeling of the classical on the one hand, and those of Leys the feeling of the Gothic on the other, both took us quite by surprise in the Great International Exhibition of 1862. He visited the Triennial Exhibition held last year at Ghent, and was astonished at the immense resource of talent possessed by the Belgian painters and sculptors, while the architectural drawings were, without exception, the vilest he had ever seen—which is saying a great deal. (Laughter.) The only way in which he could account for it was that there is no academy or school of architecture in Belgium, so that architects are obliged to pick up their knowledge in the best way they can, as in England: there being, however, this difference, that the students do not seem to be imbued with those true principles of taste based upon a knowledge of good examples and of thorough artistic construction which in England oozes forth here and there, and which has, notwithstanding many drawbacks, resulted in the production of many buildings of which all Englishmen have reason to be proud. (Loud and prolonged applause.)

The CHAIRMAN trusted that, although Mr. Spiers's paper had been exhaustive, some remarks upon it would fall from those present. The subject was one deserving attention and the most careful study.

Mr. POTTER was sure that all concurred with Mr. Spiers's views, and he would move a vote of thanks to that gentleman for his interesting paper, and for the vast number of drawings and illustrations which accompanied it. Mr. Spiers certainly had alluded to stained glass and ornamental iron-work, but he thought that an evening could be very well devoted to each of these two subjects. Even if the ghost of Quintin Matsys could appear, he thought the apparition would be satisfied, for being left out in the cold, with the apology that nothing more could be squeezed into an hour's lecture. He had therefore much pleasure in moving a vote of thanks to Mr. Spiers for his very interesting and able paper.

Mr. ALDRIDGE had much pleasure in seconding the motion.

Messrs. BIRCH and PERRY having also spoken, the CHAIRMAN put the motion, which was carried unanimously.

Mr. SPIERS having responded, the meeting separated.

N.B.—We are again compelled to postpone the reports of several other meetings till next week.

BUILDING CONTRACTS.

BY A LONDON ARCHITECT.

SIR,—As a London Architect, conscious that the moot question of 'Building Contracts' vitally affects the status of architects, if not their very *raison d'être* in the community, I sincerely trust the question raised in your columns by 'A London Contractor' and taken up by 'A London Engineer' will be exhaustively dealt with. With this question are inseparably connected the questions of architectural education, architectural competitions and architectural remuneration; and this being so, I am not a little surprised at the reticence of architects on a subject that contractors and building surveyors have said so much about. 'A London Contractor' is evidently very capable of writing well and courteously on this topic; and although I disagree with his views, I hardly sympathize with the tone of wit and banter with which 'A London Engineer' has received them. They seem to myself to have been very temperately stated. I am, of course, far from asserting that the existing system is immaculate: contractors have, I dare say, much to complain of. They have, especially the country contractors, complained pretty strongly of late, for building is not what it used to be. I may go further, and say its operations are hardly as respectable as they were thirty or forty years ago; and, as a builder's calling is a noble one, and there are men of integrity who wish to honestly and usefully follow it, it is only natural there should be an outcry raised against its existing anomalies. Let us look back some forty years. The system of contracting for a 'lump' sum is, we know, a very old one; but up to that time it was by no means so prevalent in this country as it is now. In both London and the provinces the system of contracting by schedule and ultimate admeasurement of the work done was very common indeed. A builder in those days always knew that, however exacting might be the demands of the architect as to quality of work, or however fanciful his employer, he was sure, ere the settling up of the accounts, to receive the value of his work and material, or at least to have a voice in their assessment. In those days, every

architect in the provinces was a building-surveyor, as were many architects in the metropolis, and the architect was the sole assessor. A London architect *pur et simple* would, in those days, certify instalments from time to time, leaving the question of ultimate value in the hands of a surveyor (often a provincial one), nominated by himself and his client on one side, and by the builder on the other. It was a very defective system, for the architect took very little interest in the operation, thereby grievously neglecting the interests of his client. The surveyors and builders had it all their own way; the client used to get the worst of it, and the system came deservedly into disrepute and discontinuance. It was bad—I wish I could say that the present London system is much better.

We have now in exchange for it the system of 'lump' contracts; with this difference that, while forty years ago the town and provincial customs were nearly identical, they are in 1869 wholly dissimilar. In the provinces still, nearly every architect is more or less of a building surveyor, capable, and in the habit of, estimating and measuring up the works he designs. Exceptions there are to the rule; but the provincial rule is that the bills of quantities and the admeasurements of extras and omissions are prepared in the architect's office. The provincial architect does indeed consult with the builder, and usually hears all he has to allege before final decision; but, having so done, he makes up the accounts, and settles them in his own way. If he happen to be an ignorant, inexperienced, or unjust man, the contractor suffers by these bad qualities, and provincial builders are loud in their protest against his irresponsible exercise of power.

In London the custom is wholly different. To understand the difference one must take a glance at the influence of the Institute of British Architects, to which learned corporation every respectable London architect is supposed to belong. The influence of the Institute has been to discourage amongst architects the practice of estimating and measuring artificers' works. By a by-law of the Institute no Fellow (that is to say, no member of the senior class) is permitted to estimate or measure up any artificers' works but such as relate to his own buildings. I am old enough to remember the earnest protest against this by-law uttered by one of the most munificent benefactors of the Institute—the late Sir John Soane; and I have lived long enough to see the evil consequences of that by-law. It was established with the very excellent motive of inducing architects to devote more attention to the Fine Art they professed, the practice of which was at the time in danger of being absorbed in the squaring and abstracting of measured dimensions; and so far it has been useful in its day. But, unfortunately, it has tended to diminish our power, as well as our practice, of measuring and estimating works; and in the case of very modern practitioners it has resulted in the utter annihilation of both practice and power. There are now many London architects who know nothing of measuring and valuing artificers' work. I think 'A London Contractor' could very well explain that this is a very serious evil in the building trade—a huge annoyance to contractors themselves. Nor is that the only evil of the by-law (or rather the abuse of it): it operates most prejudicially against the interests of our clients; and deprives us all of not merely an accomplishment very necessary to the efficient service of our employers, but of a good and regular source of honourable income. 'In my early days,' said Sir John Soane, 'I used to estimate, measure, and value considerably for Messrs. Holland, the builders. I found the practice very conducive to my acquisition of practical knowledge, and believe it affords an honourable source of employment to young architects, an excellent school for future professional practice.' This was at least the purport of Sir John Soane's words: their exact text will, I doubt not, be found in the Archives of the Institute—too late, I fear; for the more Sir John protested, the more the Council wouldn't listen to him; and we see the consequence—young architects, with only half their year employed, obliged to send their own work—their own bread—out of the office, obliged to call in an independent building surveyor or quantity taker, whose 'reduced rods, cubic yards and feet,' with all the rest of it, they have no other resource but to take unchallenged; so that, as far as the London custom is concerned, the contractors and surveyors (small blame to them) have everything again in their own hands; as our Gallios of the Institute care 'for none of these things:' that is to say, with poor Mantalini, 'the dim'd total' of pounds, shillings and pence. Our clients do, it seems, care about them. They are beginning (witness the Sick Asylum competitions) to take the law—the law which we should, but don't, administer—into their own hands; and, as might be expected, with very little discretion, and no benefit to anyone; for what does the general public know of the mysteries of building?

My letter, already too long, has barely half dealt with the subject raised by 'A London Contractor.' It will be seen that, though I admire the manner of his communication, my sympathies are with the matter contained in that of 'A London Engineer.' I see no great hardship to contractors in an unskilled capatiliist, and a contractor 'cunning of fence,' constituting any respectable architect a little equity judge in his own office; especially as the contractor has always access to the works in progress, and access at all times to the ear of the architect, by himself, his clerks, or (where the contract is large) his surveyor. The client is well-known to have no such facilities, even if he had the technical skill to know when and how to use them. His sole advocate, or rather guardian, is the architect, in whom he confides, and ought to confide, to do justice between employer and contractor. It is no answer to allege that some architects are afflicted with want of principle, want of knowledge, or 'infirmity of temper.' So much the worse for them in the long run. Clients are expected to abide by the arbitration of their architects, and why should not contractors?

I feel sure that the client's case has not been half stated in this controversy. Contractors feel their own grievances; but have, I think, been somewhat oblivious of the interests of employers. It is the province of the architects to see these are not forgotten. I think architects do forget them; forget their own interest and greatly endanger the welfare of the building trade, when they shrink as they do from taking their proper position as sole referees between employers and builders, and maintaining it with a high hand. Do we not always see a judge in a court of law refer building disputes to an arbitrator? What arbitrator, even though he be a surveyor or an architect, can possibly know so much of a case as the one

who, from the cutting of the first sod to the applying the last coat of varnish, has been nominated by both employer and contractor to adjudicate between them? His office is very properly a petty court of equity, which of course a higher one can always supersede, though I think not always improve upon.

A LONDON ARCHITECT.

BY A LONDON CONTRACTOR.

SIR,—As the 'London Engineer' who writes on this subject in your last number considers that 'nothing can be fairer than that a builder should have a voice in nominating the surveyor who is to take off the quantities of any work for which he is to compete, and as he is also willing to agree in an attempt being made by the Institute and the Builders' Society to frame an improved set of 'general conditions,' I am more inclined to congratulate myself on that which he approves than to grieve over that which he condemns.

The 'London Engineer' considers that I am asking for his sympathy with 'only imaginary grievances;' and with reference to my assertion that there is no power at common law, and but a doubtful one in equity, to compel an architect to give a certificate without a special clause in the contract empowering, he asks, 'Could the architect be ignorant of possessing this terrible power if he ever exercised it, or heard of any one who did?' and remarks that 'any case that stands in this marvellous position cannot do much harm to any one.' Now, in writing the articles which you have inserted on this subject, I was careful to avoid all reference to personal cases, and endeavoured to get these questions argued as points of abstract justice; but I was equally careful not to bring forward any grievance for remedy which I did not know to have been the cause of suffering and loss either to myself or some other member of the building trade. My only knowledge of the law as applied to this question of the issue of certificates is based on the experience of a friend who was the victim of these very circumstances, where thousands of pounds were involved, and to whom I must refer the 'London Engineer,' as to whether 'this marvellous position cannot do much harm to any one.' I am afraid the 'Engineer' will think he has answered this with his stock argument, applied in some form or other to every one of the points referred to by me, namely, that the evils complained of do not 'often happen;' but, in addition to pointing out that this belongs to the 'only a little one' school of argument, I must urge upon him that if it were a fact (which I do not admit), it would not justify the architects in refusing to insert a clause protecting the builder from the possible inconveniences complained of; nor could any honourable man decline to forego the power of doing an injustice, but insist on still retaining

The right divine to govern wrong.

The 'Engineer' laughs at the idea of any builder requiring to know that it is necessary to have a clause in their contracts giving them power to suspend the works in the case of inability or refusal on the part of the employer to pay what is due; but if he will have patience to listen, I should like to tell him a tale, the moral of which is that, even where the usual custom of payment by instalments is adopted, it may still be necessary.

Once upon a time a young contractor, with only a moderate capital, was fortunate enough (as he thought at the time) to obtain a contract for some extensive works at a nobleman's country seat. Large additions to the contract were made, but as the nobleman fell ill during the progress of the work, my young and inexperienced friend the contractor was content not to worry his lordship for written orders, as he should have done under his contract, but took the verbal orders of the architect. My lord died, and his heirs and executors refused to make any further payments, on the ground that no written orders had been given, besides raising several other objections. Having sought legal assistance, the contractor was advised by the present Mr. Justice Lush, then a member of the bar, that he had better finish his contract before taking action. Accordingly, my young friend had, at much inconvenience, to spend many thousands in completing the work before he could reach 'the beginning of the end,' that end being a wearisome Chancery suit, followed by a still more wearisome reference, ending, it is true, in his obtaining the greater part of his claim, but at a cost of time, money, and anxiety which would have raised the case, even in the opinion of a 'London Engineer,' beyond an 'imaginary grievance.'

I had said 'that all points in contracts having reference to legal questions should be settled by the lawyers and not the architects,' but the 'Engineer' finds a difficulty in separating them. My meaning was that the lawyers should frame those portions which are now called the 'general conditions,' and the architect the specification describing the works. I confess I do not see how, under this arrangement, a lawyer (that *bête noire* of the engineers) could 'meddle with' the mixing of mortar, or revise his plans.

I am afraid my remarks on the arbitration clause were a sadly confused performance. The 'Engineer' evidently can make neither head nor tail out of them. He begins by converting my humble confession that I was in such a minority, even with the members of my own trade, in seeing advantages in a lawyer as arbitrator, as to make it useless wasting your readers' time, or my own, in fighting at such odds as 'nine-tenths of the builders and nineteen-twentieths of the architects,' into a want of respect for architects and engineers. He further says 'I have never heard an important case where the architect who designed or superintended the work was appointed as arbitrator by a judge in chambers or out of chambers.' Nor I! It is my belief that there is not a judge on the bench who would not decide that such a course was contrary to the first principles of justice. But the 'unkindest cut of all' is where the 'Engineer,' after doubting whether I maintain that which I unreservedly deny, hesitating as to whether he understands the 'remainder of the communication,' and only dimly fancying that I object to the architect of the works deciding all questions, winds up with the air of a person who has not listened to a word you have been saying, by asking whether all architects do not desire this, and 'is there anything wrong in doing so?' As I spent a whole column in explaining that I thought there was, I clearly must not repeat what I said.

It is beside the question, no doubt, and I have already trespassed con-

siderably on your space and good nature, but I should like to ask a 'London Engineer' why he is so much tickled by my reference to the 'Platonic Dialogues,' that he wings his parting shaft with a second reference to it. Of course he is aware that the subject of keeping an architect to architecture, and a lawyer to the law, is more than once used as an illustration in that celebrated work, and will easily understand therefore how it came into my head; but can he have been under the misapprehension that I had read it in the original? I assure him I am incapable of it. I only know the work through Whewell's translation, and the 'Engineer' will, I think, admit that this book, though 'to the purpose,' contains only such 'easy things to understand' as to be within the comprehension even of

A LONDON CONTRACTOR.

LEGAL.

Court of Common Pleas, Dublin.—February 15.

(Before the CHIEF JUSTICE and a Common Jury.)

This was an action brought by Mr. James Scanlan, builder, against Mr. J. M. Craig, the proprietor of the 'Pembroke Drug Hall,' Upper Baggot Street, Dublin, for the sum of 72*l.* 6*s.* 6*d.*, balance due at foot of a building contract, and for 50*l.* claimed for loss incurred by reason of defendant's having withheld the specification and other documents, and for the neglect of the defendant's architect in not supplying the necessary working drawings and directions for carrying on the work.

The defence was that the sum of 59*l.* 7*s.* 6*d.* only was due, which sum was kept back by defendant as penalties for the non-completion of the contract on the day named in the agreement between the parties.

The facts of the case as given in evidence were—that plaintiff engaged in April, 1868, to execute certain works for the sum of 225*l.*, according to the plans prepared by Mr. Wm. Sterling, architect, the work to be finished by June 3, 1868, under a penalty of 2*l.* per day. The contract was signed on April 21, and the works commenced on that day. The contract was based on a bill of quantities, which was prepared by the architect, and no working drawings were given at the time. Plaintiff alleged that it was arranged with the architect to meet on the day after the contract was signed, to get the working drawings, &c. Mr. Sterling, who was then surveyor to the Pembroke Township, resigned his situation on April 23, and got a fortnight's leave of absence pending the appointment of his successor, and did not give plaintiff the instructions required, and could not be seen except on a few occasions during the progress of the works. Some of the working drawings were not given for one month after the date named for the completion of the work.

When the works were finished, the architect and contractor met to settle the accounts; it was then arranged to forego the claim for penalties on either side, and after giving credit for omitted works and allowing for extra works, the sum of 72*l.* 6*s.* 6*d.*, as alleged by plaintiff, was found to be due, but according to the architect's statement there was only 59*l.* 7*s.* 6*d.* due. The defendant refused to pay either sum, and claimed the sum of 2*l.* per day for every day the works were unfinished after June 3—the works were not finished till July 11.

The Solicitor-General, in opening the case on the part of the plaintiff, said that in the absence of his learned friend, who was to have opened the pleadings, he would briefly tell the jury the nature of the case which they had to try. The action had been brought by Mr. Scanlan, his client, who was a contractor for buildings, and whose reputation was well sustained in that professional capacity, against the defendant, who was a druggist, whose establishment was situated in Upper Baggot Street. The precise facts of the case were as follows:—In April, 1868, Mr. Craig, the defendant, had been anxious to effect alterations in a house in Upper Baggot Street. He employed Mr. Sterling as his architect and Mr. Scanlan as contractor. Engaged as the contractor, an agreement is entered into between all parties, and that agreement he (the Solicitor-General) now produced. [Document of agreement read.] The contract was for a sum of 225*l.*, and the works executed were admitted to have been properly done, even according to the statement of the witnesses who might, perhaps, be produced on the opposite side. He would, before going further, remind the jury that the contract had been a contract accepted by tender; and after the agreement had been made, Mr. Scanlan proceeded to execute the works.

The point was this, the necessity to have 'working drawings,' and these working drawings ought to have been supplied by the architect engaged in this transaction—a Mr. Sterling. Now Mr. Sterling is absent when those drawings are absolutely required. Absent in Belfast and various other places; and after the plaintiff had received various communications, the working drawings appeared. The character of the work would involve a matter of great detail. The learned counsel then proceeded to particularise the various items set forth in the specification, and having done so, said that the plaintiff would himself tell them that he could not carry out the suggestions—in fact, the propositions of Mr. Craig—for the want of the plans, which were not forthcoming; and towards the end of June, last year, Mr. Scanlan said to the defendant, 'I have sustained a great deal of loss, my time has been occupied, and I have been idle instead of doing my work. Now I give you warning that I hold you responsible for the loss I have sustained.' Sterling comes back and says to the plaintiff, 'You had better look sharp, you are bound to have the works done on the 3rd.' They were completed on the 11th. Plaintiff then asked to have them taken up. The answer again is—and that from defendant—'I cannot take up these works until Mr. Sterling comes;' Sterling only returns on August 7, when he visits the work, and after fully examining it, he sits down with plaintiff and tells him that the amount of his claim is 72*l.* 6*s.* 6*d.*

The Chief-Justice—When was that?

The Solicitor-General—On August 7. And that is what we complain of—the delay. Mr. Scanlan, having accepted this settlement, which was made in one of the rooms in the premises in Baggot Street, Sterling left the room, leaving Mr. Scanlan to await his return. Into another room he

went, where defendant and his father-in-law (who, I believe, is the author of this litigation) were. Mr. Sterling comes back, and, with a long face upon him, seeing that the matter was broken up, says, 'Mr. Craig's father-in-law has come in, and refuses to pay the amount we have agreed on; he then offers 40*l.*, which my client refused; subsequently 50*l.* was offered. It was also refused, and what we are here now for is the sum of 72*l.* 6*s.* 6*d.*; and we also claim damages for the loss of time and the delay. The father-in-law, as I have said, had to be consulted, and, in that consultation, the reduction, such as you heard, was suggested. They say that, according to the contract price, you only did work to the amount of 203*l.*, and that we gave you 150*l.*; and as to the rest of the contract, you owe us for forty-four days, at the rate of so much per diem, for the non-completion of the works, a sum of 88*l.* That, gentlemen, is substantially the case for you. You will have to try whether plaintiff has executed those works; whether, having done so, he is entitled to his fair and legitimate demand for the same, having due regard to the execution of the contract and the instructions which he received, as will be proved to you in evidence. I will add that I do not blame the conduct of Mr. Sterling; but at the same time I think that it was rather hard that my client should be called upon to pay penalties, and penalties at the rate of 2*l.* a-day, for that which he ought not in justice to be made in even the slightest degree liable.

After a large number of witnesses had been examined, The Chief Justice, addressing the jury, said: Gentlemen,—The whole question in this matter—about which we have heard so much, and respecting which we have wasted so much time—actually resolves itself into a very narrow and limited compass. The question really is—What is the sum due—whether it is 72*l.* 6*s.* 6*d.* or 59*l.*? Now, taking the matter in its fullest light, having regard to all the facts of the case—the witnesses upon the one side, the evidence upon the other—it will be for you, gentlemen, to say whether you accept the evidence given for the plaintiff for his demand for the 72*l.*, or the evidence adduced for the defendant as regards the deductions.

The jury were then directed to retire, and after three minutes' deliberation, they returned into Court with a verdict for the plaintiff for the full amount claimed, and 6*d.* costs.

Counsel for plaintiff, the Solicitor-General, Mr. Falkiner, Q.C., and Mr. Philip Keogh; attorney, Mr. Thomas J. White. For defendant, Mr. Carleton, Q.C., Mr. Monahan, Q.C., and Mr. E. M. Kelly; attorney, Mr. John Frazer.

Middlesex Sessions.—Feb. 12.

(Before the ASSISTANT-JUDGE.)

THE EXTENSIVE BRICK ROBBERY.

Robert Manning and Thomas Crofts, the latter a contractor in a very large way of business, were indicted for stealing and receiving 218,000 bricks, value 400*l.*, the property of William Henshaw.

Mr. Metcalf and Mr. Collins prosecuted; the Hon. G. Denman, Q.C. (specially retained), and Mr. F. H. Lewis defended the prisoner Crofts. Manning was undefended.

The case excited great interest owing to the superior position of the prisoner Crofts.

Crofts had several large contracts on hand for the erection of public buildings, and through one of his workmen he induced Manning, who was employed as 'tally-man' by the prosecutor, to sell him the enormous number of bricks mentioned at 4*s.* and 5*s.* a thousand, and for an unlimited supply of drink. Evidence was given tracing the bricks from the premises of the prosecutor to various parts of London, where Crofts had contracts on hand, and as each brick bore a peculiar stamp, there was no doubt about their identity.

The jury found both prisoners guilty.

The Assistant-Judge, in passing sentence, said the jury had felt constrained by the evidence to find a verdict of guilty, and he thought that no one else in court who had heard the evidence could have come to any other conclusion. The prisoner Crofts was a very different person to those whom they usually had the misfortune to see in the dock. He was a person surrounded by wealth, and made a deliberate arrangement with his own servant to commit a robbery. He should sentence Crofts to five years' penal servitude; the other prisoner to eighteen months' imprisonment with hard labour.

NEW BUILDINGS AND RESTORATIONS.

New School at Leamside.—A new school at Leamside, near Durham, has lately been opened. The buildings are in the style of the thirteenth century, and comprise a large school room, with class room, porch with bell cot over it, and the usual out-offices. Accommodation is provided for nearly eighty, at a total cost of 450*l.* The works have been carried out by Mr. R. Sanderson, from the designs and under the superintendence of C. Hodgson Fowler, M.R.I.B.A.

Restoration of the Transepts of Hexham Abbey.—Of the noble Abbey Church of Hexham, the choir and transepts alone remain, the magnificent nave, cloisters, and chapter house having been almost completely destroyed. The choir was restored, and the east end rebuilt some few years ago, considerable damage unfortunately being done by injudicious alterations in rebuilding. The works now undertaken embrace the thorough restoration of the transepts, the removal of the Italian doorway inserted in the north transept, and the restoration of the thirteenth century vestibule of the destroyed chapter house, to serve as the new entrance. The great western arch of the central tower is to have its filling-in rebuilt on its western face, so as to open the arch to the church. The various works are to be at once begun, and will be carried out from the plans and under the able direction of R. J. Johnson, Esq., F.R.I.B.A., Architect, of Newcastle, whose name will be a guarantee that the work will be carried out in a thoroughly conservative and artistic manner.

St. Margaret's Church, Durham.—The chancel of this ancient Norman church has just been refitted, under the direction of C. Hodgson Fowler, Esq., architect to the Dean and Chapter of Durham, who were large contributors to the restoration. The works just completed comprise the removal of the plaster ceiling, and the opening out of a good 17th century oak roof, new pavement of stone and tile, oak choir seats, and new altar vestments. A three-light window, in the style of the local 15th century work, has also recently been placed in the east wall of the south aisle, and has been filled with extremely fine glass by Messrs. Clayton & Bell.

Re-opening of Sherburn Hospital Chapel.—The chapel of this ancient foundation was restored some years ago by the late Mr. Austin, but was burnt down in the beginning of 1865. It has now been rebuilt and improved, under the direction of Mr. R. J. Johnson, architect, of Newcastle.

A new Congregational church has been opened at Nether Kellat, Lancaster. It is Gothic in style, stands about 30 yards from the road, and is closely contiguous to the school-room. The dimensions of the building are 43 feet by 27 feet, and accommodation is provided for seating 200 persons comfortably. The building is of freestone, clean chiselled and filled in with six-inch coursings. In the centre, fronting the road, there is a bell-tower, terminating in a spire, built, we believe, to meet the wishes of some of the inhabitants, who have a prejudice in favour of being called to church by a bell. The entrance is by a porch at the north end, and on the south side is the vestry. The interior fittings are neat and simple in arrangement, the seats being open and of stained wood. The desk is at the south end, and is a plain, unpretending structure. The architect was Mr. John Thompson, of Lancaster.

The Lord Bishop of the diocese, the Duc d'Aumale, and Miss Porter of Birlingham, have each given the munificent donation of 500*l.* towards rebuilding the parish church of Bishampton, and Mr. Freedy, of London, has been engaged as the architect.

Munificent Gift to the Town of Bolton.—On Saturday, Dr. Chadwick, of Southport, presented to the town of Bolton, where he formerly practised, 5,000*l.* towards the erection of modern dwellings for the poor, and an orphan asylum. Only twelve months ago Dr. Chadwick made a bequest to the town of 17,000*l.* for the same object, so that the total amount of his gifts is now 22,000*l.* Plans have been passed for the erection of two blocks of dwellings, in the Italian style of architecture, none of which will contain less than three bedrooms, while the end houses of each block will be carried up an additional storey.

Early in May the foundation stone of the Smithfield Martyrs' Memorial Church is to be laid, half of the required money having been subscribed. It is to be erected in the St. John Street Road, upon the site purchased for a new district church in Clerkenwell, adjoining Smithfield; to take 8,000 of the 25,000 of the population of the parish of St. James's. The Council of the Bishop of London's Fund have granted 1,000*l.* It is to contain special memorials of all the martyrs burned at Smithfield during the reigns of Henry VIII. and Mary, and will have a very noble memorial tower.

The New Church of St. John the Evangelist, in the parish of St. George's-in-the-East, was consecrated on the 12th instant. The building is of the decorative Gothic style, from the designs of Messrs. F. and H. Francis. It will afford sittings for 750. The cost, without extras, was 3,500*l.*

Memorial Church at Oxford to Archbishop Longley.—It is proposed to erect, within a few paces of Magdalen Bridge, Oxford, a church which shall be worthy to be a memorial to the late Archbishop, and an ornament to the University of which he was so distinguished a member. Accommodation will be provided for at least 1,000 persons. Probable cost 15,000*l.* to 20,000*l.* Archbishop Tait, his successor, and the Bishop of Oxford, have both promised their support.

The Restoration of St. David's Church, Merthyr Tydfil, is expected to be completed in the Spring.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Mr. E. B. Robson, the Architect and Surveyor to the Corporation of Liverpool, has resigned his appointment. Mr. Robson was appointed in 1864, his predecessor, Mr. Weightman, being retained as Consulting Surveyor for twelve months afterwards. Mr. Robson's principal architectural works during his term of office have been the completion of the extensive municipal offices in Dale Street, commenced before his appointment, the works at the Stanley and Newsham Parks, the erection of two new Bridewells, large additions to the Borough Gaol, the north Haymarket, the Judges' Lodgings, and other public buildings. In addition to these works he has planned and carried out extensive street improvements in Liverpool, and had charge of the immense purchases of property connected therewith, and of the large landed estate of the Corporation. He also prepared designs for a Fine Art Gallery, and for the rebuilding of St. Anne's Church, which are not yet commenced. Mr. Robson was formerly the architect to the Dean and Chapter of Durham. We believe that Mr. Robson intends practising his profession in Liverpool. The salary of the appointment thus rendered vacant has been for some years 1,000*l.* per annum, clear of all office expenses.

Marble Statue of D. Sassoon, by T. Woolner.

A sculptor must be a bold man to bring his offspring into the presence of the marble children of the mighty Florentine master. This gigantic David of Michael Angelo, even when only shadowed in plaster, looks down, as if in half unconscious contempt, on a modern intruder. But it is in the presence not only of the copies, but of some of the actual work of the unrivalled compeller of marble, that we are invited to look at a statue of to-day.

Mr. Woolner, we feel sure, did not think of this when he sent his recent marble statue of David Sassoon to be exhibited at the South Kensington Museum. In such company, and under the ever-shifting light shed down from the glass overhead, it is impossible to form a fair estimate of the merit of the work. We see the glistening white of the new cut marble, fresh and dazzling among the more subdued tints of the surrounding objects; but the figure stands too high on its pedestal to be seen close, and fades into one among many of the clustering ornaments of a fairy-like palace of art, when seen from a distance. At every hour of the day the shadows of the figure alter; so that no judge of sculpture can form an opinion as to what would appear to be its actual merit if seen alone, against a background of crimson cloth, and under a proper light. The face appears, so far as one can see it, to be characteristic and well cut. There is a certain degree of dignity in the drapery. There are marks of want of finish, especially in the hands; and the white surface of the marble is cruelly veined with blue. The statue claims attention, and we think that, if judiciously placed and properly illuminated, it would claim admiration. But it is rarely the case that a statue is to be seen in this country under circumstances such as can be approved by a sculptor.—BRAS DE FER.

The Architectural Museum.

The Council of the Architectural Museum appointed on the 15th instant Mr. Joseph H. Wallis curator of the Museum. The new building for the Museum being now practically completed, the work of removal from South Kensington will commence at once, and the Council confidently hope to be able to announce the re-opening of the Museum in its new and permanent home for an early day.

It deserves to be generally known that the intention of the Museum is to arrange for the instruction of carvers and other classes of art-workmen and students in drawing and modelling of natural forms and architectural ornament. The newly-appointed curator will have the conduct of this instruction, and the testimonials which led the Council to appoint him give, it is understood, the best guarantees for the efficient conduct of this work, the value and importance of which can perhaps hardly be overrated.

The classes will not, it is understood, form part of the South Kensington system, or be affiliated to that Institution in the first instance, the Council having very wisely judged it best to begin entirely unfettered by any Government control or Government assistance. For our part we hail this decision as a step in the right direction. The Museum has so long been eclipsed and threatened with total absorption by its great rival, that we welcome its reappearance almost like an emancipation. That there still is an Architectural Museum, and that it has a home of its own built for it, is mainly due to the indefatigable exertions and dauntless energy of its Honorary Secretary, who has laboured in this cause to an extent of which very few have any idea.

Notes for Connoisseurs.

The Directors of the Bibliothèque Impériale of Paris have taken a step which has given rise to considerable discussion. The establishment possesses a large number of antique monuments, with bas reliefs and inscriptions, which could not be exhibited for want of space. The Parisians were surprised the other day by seeing what looked not unlike a quantity of funereal monuments in the garden of the establishment, on the side of the Rue Vivienne. It is objected that the effect of the atmosphere will soon dispose of the inscriptions and sculpture, and that the garden now looks like a graveyard. The latter objection is puerile, while the former may or may not have any force in it, according to the nature of the material. The directors of the 'Ecole des Beaux Arts' have also converted a fine paved court into a museum of casts; but in this case a glass roof has been thrown over what was lately open to the sky, and thus a most valuable gallery of ancient sculpture has been formed.

The sale of the Delessert Gallery is announced to take place at the residence of the deceased, 172 Rue Montmartre, Paris, on March 15 and following days; the sale will last four days at least, there being no less than 250 pictures to be disposed of. The sale catalogue is not yet ready, but while awaiting it we may say that the Flemish school is the best represented, there being amongst others very fine examples of Teniers, Jean Steen, Hobbema, and G. Van de Velde; but the gem of the collection is the small Holy Family of Raphael, known as the 'Sainte Famille de la Maison d'Orléans,' which will certainly give rise to warm competition.

The Emperor's Prize.

As most of our readers are probably aware, this prize was instituted a few years ago by the Emperor of the French, and is awarded once every five years. It is a money prize, the amount being 100,000 francs, and is given to the artist who within the period of five years has produced the greatest and most important work. In the present year this prize again becomes due, and as the time approaches for the award to be made, many are the speculations and surmises as to who will be the fortunate recipient. Four gentlemen are supposed to have good chances, these chances varying of course according to the individual tastes of their friends and backers. They are:—

- Mr. Charles Garnier, for the new Opera.
- „ Viollet-le-Duc, for the 'Château Pierrefonds' and for his 'Dictionnaire.'
- „ Duc, for his additions to the Palais de Justice.
- „ Meissonnier (miniature painter), for his last pictures.

The first of these gentlemen has perhaps the least apparent chance of the four; in the first place the Opera has been an immense time building, and secondly there are those who have already plenty of real or imaginary faults to find before it is finished. Then there is M. Viollet-le-Duc, the value of whose archaeological works is acknowledged even by those who are not altogether of his way of thinking. His restoration of the Château of Pierrefonds, near Compiègne, has been recently completed for the Emperor, and those who think that he followed rather than led his Imperial master in matters artistic, will tell you that M. le Duc's chance is all the greater, because in honouring the servant the master honours himself. The

architect of the Palais de Justice, M. Duc, is no courtier, and the handsome façades next the river are as yet invisible, inasmuch as the wretched houses in which many of the executive authorities of Paris are at present temporarily housed, are not yet demolished. Not until these have been swept away will M. Duc's creation be seen to advantage—we had almost written been at all—from the Pont Neuf. Perhaps the greatest favourite of the four is M. Meissonnier, for the popularity of a painter to that of an architect of equal talent is as five to one, if not ten to one. Meissonnier is the greatest of French artists since *Ingres*, though this is not saying much in these days of Imperial materialism. Meanwhile all four are secretly not without hope. *Nous verrons.*

Artistic and Archæological Exhibition at Chartres.

The Archæological Society of the department of the Eure-et-Loir announces an international exhibition of the Beaux Arts of all kinds, and an exhibition of ancient works of art and curiosities, including sculpture, painting, tapestry, furniture, arms and armour, china and earthenware, books, &c., either the production of the department, or of interest in connection with its history or archæology. In order to induce collectors to contribute to the archæological portion of the exhibition, the committee offers to defray the costs of packing, unpacking, and transport, if so desired; and the members of the committee propose to act in turn as guardians during the night as well as the day, together with the staff of the exhibition, over the treasures entrusted to them. All declarations are to be made before the end of the present month of February, addressed to M. Merlet, Secretary of the Committee, Chartres. Works are to be sent in between April 1 and 15, and the exhibition is to be opened on May 1, and remain open about a month. Prices may be sent in with a view to the sale of works of art, and there will be a lottery organised by the committee, and a number of prizes awarded to artists. The exhibition of modern art includes architectural works and engravings. This is not the first instance of an archæological exhibition being held at Chartres. The same society organised one in the year 1838, and achieved great success; the plan of the present one is, however, much more extensive than the former. The time selected for these exhibitions is that of the great agricultural exhibition of the department, which will draw a very large concourse of people. Architects who have not yet seen the Cathedral of Chartres will have additional reason for paying a visit on the occasion.

India.

Engineering.—Since the beginning of October last a uniform rate of charge for telegraph messages has been fixed for the whole of India, viz., one rupee for ten words. In the first month of the new rate there was a loss amounting to 3,000 rupees; but in November, when the public had become aware of the boon, there was a gain of 3,500 rupees on paying messages.

A trial was recently made at Ballygunge with one of Norton's tube wells, but without any notable success, the wet and sandy soil having choked the holes through which the water is pumped up. In the Madras Presidency, however, these pumps appear to have been attended with better success; several experiments have been made with them at Madras, Bangalore, and elsewhere; and now they are being sent into the Godavery district, which is suffering from want of water.

Orders for the commencement of the great irrigation works in Behar have been issued by the Government of India.

A commission has been appointed at Bombay to enquire into and report upon the different schemes for draining Bombay.

An English company, says the *Friend of India*, has received a concession from the Persian Government, conveying to them the sole right of making railways in Persia for the next twenty years. A contractor has already left to commence at once the construction of a short line from Teheran to Rey, a fashionable suburb, where the wealthy Persians combine pleasure and devotion. Between that place and the capital a weekly passenger traffic of forty thousand souls is expected. The line is to be completed for less than 100,000*l.*, and will, it is estimated, yield a good dividend, exclusive of an 8 per cent. guarantee. We may next expect to hear of an undertaking to connect Teheran with Bussorah or some point on the route to Mecca. It is impossible that the enormous pilgrim and commercial traffic in that direction can be long overlooked.

Mr. Lee Smith, Chief Engineer of the Lahore and Peshawur Railway, has been telegraphed to, to remain two months longer in England to arrange for the ironwork of the bridges over the Ravee, Chenab, and Jhelum. It is stated that on this line the low-rates system is to be carried out, in which case it will take nearly a generation to complete the line.

The works at Khadakoosha, for the supply of Poona with water, have been vigorously commenced, and will be carried out under the direction of Lieutenant Bucke, R.E.

Architecture.—The following is the Latin inscription on the foundation-stone of the new Bombay University, which was laid by Sir Seymour Fitzgerald on December 29 last:—

Hunc Lapidem Primum Edificiorum Universitatis
Bombalensis
Posuit vir Honoratissimus Gulielmus Robertus
Seymour Vesey Fitzgerald,
Ordinis Præclarissimi Stellæ Indicæ Eques Amplissimus,
E Secretis Regiæ Consiliis,
Præfecturæ Bombalensis Gubernator,
Universitatis Cancellarius.
Anno Tricesimo Secundo Victoriæ,
Britanniarum Regiæ
Et Imperatricis Regionum Indicarum
A.D. MDCCCLXIX.

The main building of the new Municipal Market on the Esplanade at Bombay is making rapid progress. The corner portion of the building, the upper part of which it is intended shall be used as municipal offices, is rapidly approaching completion. One of the ornamental marble sculptures has lately been placed in position over the centre doorway. This work of art is one of the largest which has hitherto been attempted in Western India, and has been carried out by Mr. Kipling, of the School of Arts. The subject is an allegorical representation of the progress of agriculture.

A large portion of the ironwork for the market has arrived from England, and has been partly erected.

The plans for the new Telegraph office at Calcutta have been completed and approved by the Director-General. They had then to be submitted to the Lieutenant-Governor. The building will be erected at the south-east corner of Dalhousie Square, at a cost of 5 lakhs.

About four years ago Mr. Sorabjee Jamssetjee Jejeebhoy, during his travels in Guzerat, contributed the munificent sum of Rs. 35,000 for the erection of a building for the High School at Surat. This sum being inadequate for the purpose, a similar amount has been offered by the Government for the completion of the building.

The new Scotch church at Kurrachee, named 'St. Andrew's Presbyterian Church,' was formally opened for divine service on Saturday evening, January 2.

The Tanna Jail in Bombay is to be rebuilt at a cost of 2,75,000 rupees. The old buildings were of a worthless character, and are unfit for use as a prison. As reconstructed, the buildings will accommodate 655 prisoners, and afford a fair proportion of hospital accommodation besides. Of the 655 prisoners, 572 will be confined in sections, 73 on the separate system, and 10 on the solitary system. The new Tanna Jail is to be considered an instalment of a general scheme proposed by the Bombay Government for increasing the amount and improving the character of the jail accommodation of that Presidency.

The Sanitary Commissioner of Madras, at a recent visit of inspection to Kamptee, condemned the whole of the barracks for European troops at that station—those in process of construction as well as those already built, and has suggested that new ones should be erected on the rising ground on the site of the present racecourse.

A French Theatre was opened at Cairo on January 4. The building was only commenced on October 15 of last year. It was therefore erected in less than three months!

The Architects of Berlin are at present engaged in considering the best means of effectually protecting their designs against unauthorised reproduction, whether by actual execution or by lithography, wood-cuts, &c. It is intended to name a small commission to inquire into the matter, and to prepare a petition containing the results thus obtained, and requesting the 'Bund' to add the item of architectural designs to the list of such mental productions as are now protected by the Prussian Copyright Law.

The statue of an Amazon was, within the last few months, discovered in the Vincolo di San Nicola di Tolentino, at Rome, and passed into the possession of the Cavaliero Ugo. It is about 8 feet high, of Pentelic marble, and but very little damaged, principally at the hands and feet. The attitude somewhat resembles those of the Amazons in the Vatican and Capitoline Museums, but is considered far above either in artistic value. The statue has now been purchased by Dr. Helbig, on behalf of the Prussian Government, for the sum of 16,500 francs, and is on its way to the Museum at Berlin.

Palestine Exploration Fund—The Foundation of the Temple.

Lieutenant Warren's last letters from Jerusalem give an account of the results up to the present of a shaft sunk at the south-east angle of the Haram Area. The rock at this point is reached about 70 feet below the present surface of the ground. The slope is very considerable at this point. The rock is soft and decayed. The corner-stone is let into it about 2 feet, and is about 4 feet high. On the second stone three letters in red paint were found. The stones are all described as in the most excellent preservation—as perfect as if they had been cut yesterday. A marginal draft was observed along the top of each, exactly like that in the perfect specimens found above ground, except in the stones of the fourth course, where the draft was different from that in any of the others. The marginal drafts, and about 2 inches round the projecting surface, have been picked over with an eight-toothed chisel, about eight teeth to the inch. Within this a point or single-pointed chisel has been used. The letters are in red paint, apparently put in with a brush. The larger letters are 5 inches high. The colour of the paint appears to be vermilion; it easily rubs off on being touched with a wet finger. Splashes of it, as if from a brush, are lying about. Close to the angle (3 feet to the east) a hole was found scooped out of the rock, about a foot across and a foot deep. Standing in this hole is a small earthenware jar. Further to the north, and still close to the wall, the rock was found to be cut away in the form of a semicircle or horse-shoe, 2 feet wide, and about 2 feet 8 inches deep. Lieut. Warren suggests that the horse-shoe hole was for the purpose of allowing the tackle to work when lowering the corner stone into its bed. Pottery, broken into very small fragments, and a long rusty iron nail were found, but no tools. On driving a gallery along the second course to north, it was found that the first stone is 10 feet 6 inches long, and the second only 4 feet 9 inches. On the second is a deeply-engraved mark like the Greek H, and on the stone many 'flourishes' with red paint; there is also a mark in black paint. Two more characters in red paint have been found on the fourth and fifth course. All these characters and letters have been sketched and sent home. They have been referred to the British Museum for examination. Lieut. Warren conjectures that they may be only mason's marks.

Curious Composition.

The well-known painter Kaulbach is said to be at work on a 'Dance of Death,' the first sheet of which represents the Empress Marie Louise, with the little King of Rome on her knees, and receiving the homage of the German princes. At the head of the latter personages is Death, in the costume of the Pope's Nuncio, about to crown the young king with a wreath composed of bones, while the sovereigns flourish their coronets in the air, with triumphant huzzas. In order that the Devil may not be wanting, says the report, Talleyrand stands behind the figure of Death! The second sheet is said to be a charming representation of the famous *l'aid* of the *Trouvère* Walter de Vogelweide: 'Sous les Tilleuls.'

General.

Floods in the Thames.

The present state of the valley of the Thames reflects little credit on our civilisation or skill in dealing with natural phenomena. The late heavy rains have sent down large quantities of water from the upland districts, which have swollen the already overcharged river till it has overflowed its banks in all directions. The country is under water for miles and miles, and one can now travel over or through the hedges and farm gates by rowing or punting. If this were an exceptional state of things we should have nothing to say, but this is not the case. These floods occur every year and many times every year, and, as far as we know, no proposition is ever hinted at to provide a remedy, at least by those in authority. We believe there have been three of these floods this year; certainly we have seen two ourselves.

Meantime, it is to be remembered that the water, which, in the state of flood, is doing all the farmers harm and stopping communication from place to place, would be most useful if it were impounded and used during the summer to supply the metropolis. The river in its attenuated summer flow is every year more and more inadequate to the supply of this great, ever-growing city; and propositions are made to bring water from the Severn or the English lakes to supply London, while we have more water than we know what to do with within a few miles of Charing Cross.

Be this as it may, however, we are sure that something ought to be done to curb the power of Father Thames, either by impounding the floods or by improving the outlets. The present state of the country from Hampton to Oxford is simply discreditable to our common sense. It is not a slur on our engineers, as none of them have, we believe, ever been called upon to deal scientifically with the Thames valley.

The Guardians of the Strand Union and their New Workhouse.—Our attention has been called, says the *Daily News*, to the recent proceedings of this board in letting the contract for the erection of the new workhouse at Edmonton. It appears that the guardians invited, by advertisements in the public journals, tenders to be sent from plans and quantities prepared and supplied by their own architect. Twenty-three builders, for the most part of high standing in the trade, sent in tenders for the works, the highest being by Messrs. Myers and Sons, at 52,865*l.*, and the lowest by Mr. Henry Hart, at 43,940*l.* Mr. Hart has recently built, to the complete satisfaction of the authorities, the new workhouse for the Stepney board of guardians; also that for the West London Union, and the new workhouse at Croydon. The guardians of the Strand Union, however, rejected his tender, and accepted that of Mr. Howard, a local tradesman, at 45,800*l.*—a sum in excess of the lowest amount of nearly 2,000*l.* There were two other tenders lower than Mr. Howard's—viz., Messrs. Hill, Keddell, and Waldron's, the contractors for the Holborn Viaduct, at 45,257*l.*; and Messrs. Cooper and Cullum's, at 44,745*l.*

The subject given this year for the competition for the Gold Medal at the Royal Academy is a 'Theatre to accommodate 2,500 persons, and to be situated in the centre of an open space.'

The report of the Millwall Freehold Land and Docks Company, presented on the 8th of February, stated that the net profit for the half-year (7,002*l.*) is equal to the amount of the very heavy interest, &c., on the debentures which the company are liable to pay. In future the debenture interest will be reduced under the arrangement with the Credit Foncier, and the directors trust that in a short time the whole of the debentures will be placed out at 5 per cent.

The Abbey Church.—A beautiful stained glass window by Mr. Hughes, of Frith Street, London (the most effective of his works in the Abbey), has been placed in the south aisle of the above church. The window contains five subjects, viz.:—'The Raising of the Widow's Son,' 'Our Lord addressing the Nobleman, and telling him that his Son liveth,' 'Christ receiving Little Children,' 'The Prayer in the Garden and the Sleep of the Disciples,' and 'The Payment of Tribute Money.' At the top of the window (which was exhibited at the Paris Exposition) are figures of angels bearing banners, on which texts are inscribed. We observe that the scaffolding in the nave has been removed, and the beauty of the stone groining can now be seen to advantage.

The excavation of the shaft for the subway from the Tower to Southwark was commenced on Tuesday last, on the property of the Crown at Tower Hill.

The word *Theodolite* is generally supposed to be derived from the three Greek words, *theos*, I see, *odos*, a way or road, and *lithos*, a stone; the latter owing to the fact that the first instruments of this kind were placed, not upon a moveable rest or stand as now, but upon a fixed and immovable basis, generally a stone. Professor Dr. Heinzerling, of the University of Giessen, now furnishes us with a fresh etymology, which originated with Professor Weigand of the same university. We are told the word is derived from the Arabic, thus:—*al-hadajat* or *al-hidjat* signifies 'a straight course' (from *hadaj*, to lead upon the right road), and was adopted as the name of the instrument by the French, who, however, called it *Alhidade*. This we English corrupted into *Alydeday*, and subsequently, by transposition of letters, into *Athelida*. The *Athelida* was the undisputed name until the French took our two words as one, and called it *Le Theodolite*. Verily the Italian proverb applies here, 'If it isn't true, it's at all events well concocted!'

Birkenhead and Liverpool Railways.—This important Bill, for which Mr. John Fowler is the engineer-in-chief, came before the Examiner on Standing Orders on Monday week. The case lasted the whole day, and was concluded on Tuesday. The Examiner decided that in sixteen cases the Standing Orders have not been complied with, and will report the same to the Standing Orders Committee. This Bill is for the construction of a railway tunnel under the river Mersey, with branch lines connecting the tunnel with the existing railways on both sides of the river. The estimated cost is 900,000*l.*

During the Recent Gale, the whole of the ornamental parapet on the fourth side of the roof of the chancel of St. Mary Redcliff yielded to the immense pressure of the wind, and the fall of the huge pieces of stone caused a crash which, in the stillness of the night, was heard for a considerable distance around. As early as practicable a number of men were employed to remove the western and northern parapets, in order to avoid further danger. Several pinnacles were blown down, but they fell on the roof and were not materially damaged.

The value of hewn fir imported last year into the United Kingdom was 2,772,148*l.*; viz., from Russia, 197,480*l.*; Sweden, 407,196*l.*; Norway, 209,858*l.*; Prussia, 501,447*l.*; United States, 161,089*l.*; British North America, 1,279,810*l.*; other parts, 16,268*l.*

Last year, walnut wood—chiefly from Italy and British North America—was imported into the United Kingdom to the value of 28,411*l.*; and dye-woods, chiefly from Mexico, Curaçoa, and Brazil, to the value of 15,798*l.*

A new bridge is to be erected over the river at Farnham, from the plans of the local surveyor.

The Archbishop of Canterbury has written to Mr. Arthur Arnold with reference to the request that several acres of the grounds of Lambeth Palace should be given up for the purpose of public recreation and sanitary improvement, stating that the subject is still under consideration.

The committee appointed to consider the most suitable site for the new buildings of the Airedale and Rotherham Colleges have issued their report. In their opinion, 'Leeds is the most eligible centre in the West Riding for the amalgamated college.'

Mr. E. G. Papworth has been entrusted with the important work of executing a series of statues for the new Manchester Exchange, illustrating the various arts, sciences, and manufactures, also emblematical figures of the principal commercial cities of the empire.

The Scotch Memorial to the Prince Consort at Edinburgh is, according to the *Scotsman*, advancing towards completion:—'The bronze bas-reliefs, to form the panels of the pedestal, were finished a few months since, together with the other portions of the artistic work. Of the groups of figures to occupy the angles of the base, that by Mr. Brodie was ready some time ago, and Mr. Clark Stanton has just given the finishing touches to his commission. The equestrian statue of the Prince is assuming form under the hands of Mr. Steell, and a corner group by that gentleman is also well advanced. The late Mr. George McCallum had been entrusted with the fourth group, which is now in the hands of his successor in business, Mr. Stevenson. Mr. Stanton's group is yet in the clay, but in a short time it will be reproduced in plaster, and subsequently cast in bronze at Mr. Steell's foundry.'

The Earl of Carnarvon is about to build a church at Highclere, Hants, within an easy distance of the castle. The work is to be commenced shortly from a design of Mr. George Gilbert Scott.

The amount already subscribed to the fund for rebuilding the Medical Hospital in Edinburgh is 71,055*l.* 3*s.* 2*d.* The estimated cost is 100,000*l.*

Royal Scottish Academy.—Mr. Hugh Cameron and Mr. R. T. Ross were elected Academicians, in room of the late Mr. John Stevens and Mr. W. B. Johnstone, on the 10th instant.

Blasting Granite.—In one of the granite quarries near Penryn, worked by Mr. W. Hosken, a large mass of good sound granite, after being carefully cleared of all obstructions, has just been moved from its natural bed some inches by 50 lbs. of blasting powder, confined in a hole 12 feet deep and 6½ inches in diameter, bored in the rock. The stone measures, at least, 40 feet by 40 feet by 12 feet, which equals 19,200 cubic feet, or 1,280 tons, taking 15 cubic feet as equal to one ton.

At Saumur five houses have been crushed by an avalanche of earth, but no lives were lost, owing to timely warning. Masses of stone thirty feet long and six or eight thick remain suspended over the houses in the Rue Feret, and the authorities have ordered the occupants to depart. That quarter of the town was in similar danger in 1852.

Messrs. Saunders, of Malden Road, London, have just erected three very handsome stained glass windows in the chancel of St. John's Church, Monkstown, co. Dublin, as a thankoffering from a parishioner whose family narrowly escaped destruction in the Abergelle accident.

An Underground River.—Midway between Donegal and Ballyshannon a very singular phenomenon may be seen. Running through the grounds of Major Hamilton, of Brownhall, is a small river, which bores its way underground, from cavern to cavern, for nearly two miles. The caverns are formed in the limestone, and the power of petrification possessed by the water is very astonishing. Sticks, straws, leaves, &c., are soon coated and crusted over, and, by degrees, harden into stone; and so rapid is this process, that we may see one half of the same leaf of moss green and growing, and the other half crusted over in process of petrification. The caves are, some of them, very beautiful, and when lighted up by the aid of a fragment of magnesium wire, the effect is most brilliant and striking, the walls sparkling as though studded by countless diamonds. In one of them the river makes a fine waterfall. The roof of the cavern is broken; and as the spectator stands in the subdued green light, looking up through a mass of ferns, and stems of trees, with the hoarse roar of the waterfall plunging into an unseen depth through a cloud of mist at his feet, the dim cave partially lighted up around, but dark and mysterious in its recesses—the effect is inexpressibly charming—it is a perfect chamber of romance, and one can fancy superstition formerly holding high court here. Almost equally striking in another way is the manner in which the river once more makes its appearance into the light, welling up from a dark, unfathomable-looking hole under a wide rift of rock: stealthily emerging from the ground, it oozes forth in a still black stream—a veritable kelpie's hole, about which,

if legends do not exist, it certainly is high time they did, as a most eligible opportunity has been hitherto unaccountably neglected.—*Fraser's Magazine*.

Considerable improvements and additions to Ballynastragh House, co. Wexford, for Sir John Esmonde, Bart., M.P., are about to be carried out. Mr. G. C. Ashlin, architect.

New warerooms are in course of erection in Thomas Street, Dublin for Messrs. Garratt & Co. Mr. M'Curdy, architect; Messrs. Beckett builders.

Mr. Waterhouse, the eminent silversmith and jeweller, of Dame Street, Dublin, is having extensive alterations and additions made to his premises. Mr. M'Curdy, architect.

The new Berwick Wing, to be built to the Convalescent Home, Stillorgan, as a memorial to the late Judge Berwick, who met his death in the lamentable accident at Abergelle, is to be commenced forthwith. The works are to be competed for by a limited number of contractors. Mr. M'Curdy, architect.

The Cathedral of Sydney, N.S.W., was opened on St. Andrew's Day. It is a very large and handsome structure, lighted with gas.

The French Academy of Fine Arts has nominated Mr. Leighton and Mr. Herbert as Corresponding artists.

An Electrical Clock, constructed by Hipp of Neufchatel, for the Central Railway Station at Stuttgart, has now been in constant and perfect working order for the last nine months. The apparatus consists of a Regulator and one of Meidinger's batteries, and is connected with 22 dials throughout the station, besides indicating the time in the halls of two neighbouring Hotels. Some parts of Brussels have long had similar dials worked from a central clock in the Hôtel de Ville.

A Committee has been formed at Berlin for the purpose of erecting a monument over the grave of Madame Charlotte Birch-Pfeiffer, the well-known theatrical authoress. The monument will be of the simplest kind, merely a plain but handsome slab bearing her name and the words 'The German Stage, in thankful remembrance.' Subscriptions are not to exceed 1*s.* 6*d.*, in order that all actors and actresses may share in the honour of subscribing.

The City of Berlin contains 700 public buildings; of these 61 are devoted to religious purposes, 107 to education, and 73 to the treatment of diseases; 200 are Government offices, 87 municipal ditto, and 170 barracks, guard-houses, &c. Private houses number 33,263, of which 21,919 are dwelling-houses, 1,164 factories, and 10,180 stables and goods sheds. 79 per cent. of the houses of Berlin are only one storey high, 15.3 per cent. have two storeys, 25.4 per cent. have three storeys, 36.2 per cent. have four storeys, and 15.2 per cent. have five or more storeys.

Although much has yet to be done before they are wanted, Mr. Voigtel, the superintending architect of Cologne Cathedral, is already thinking about the finials which are to crown the two western towers of the Dom. Each finial will be 27 feet high, the thickness of the stem being 4 feet; it will have two rows or tiers of Gothic foliage, the lower measuring 12 feet each way (nearly 17 feet diagonally) and 4 feet in depth. It will take 432 cubic feet of rough hewn stone, weighing about 650 cwt., to execute this lower tier in four pieces, and, when finished, this will probably weigh not less than 360 cwt. The upper row of foliage will be 6 feet above the lower, the points of the four leaves being placed diagonally over those below, giving the effect of a double cross when seen from below. The total weight of each finial is estimated at 450 cwt. They cannot be fixed for the next six or seven years, but there will be some difficulty in quarrying such huge blocks free from all flaws, and hence they are to be taken in hand in good time.

Tadolini, the celebrated sculptor, who is the son of Canova's best pupil, has just finished an admirable group in marble, representing St. Michael wrestling with Lucifer.

There is nothing new respecting the Darien Ship Canal project. Washington reports state that the Government have made a proposition to the Colombian Government to assume a protectorate over the Isthmus of Panama, in order better to maintain American supremacy over the work when constructed. For the canal three routes are proposed, two of which require tunnels, one of them 1,750 feet long. The third and most feasible route is said to be 30 miles long, with a cutting through rock of about two miles.

Mr. Woolner has received a commission to execute the large marble statue of the late Sir Bartle Frere, which is to be placed in the Town Hall at Bombay.

A fine crypt, declared to be of the twelfth century, has just been discovered near the Cathedral of Gran in Hungary. The vaults of the roof are supported by eight granite columns, the capitals of which are all different from each other.

MEETINGS OF LEARNED SOCIETIES.

INSTITUTION OF CIVIL ENGINEERS.—Tuesday, February 23, at 8 P.M. 1. Discussion 'On the Lagoons and Marabes of the Mediterranean.' 2. 'On Sinking Wells for the Foundations of the Piers of the Jumna Bridge, Delhi Railway,' by Mr. Imrie Bell. 3. 'Description of Apparatus for Excavating the Interior of, and for Sinking Iron Cylinders,' by Mr. John Milroy.

INSTITUTION OF SURVEYORS.—Monday, February 22, at 8 P.M.

ROYAL INSTITUTION.—Friday, February 26, at 8 P.M. Mr. John H. Bridges 'On the Influence of Civilization upon Public Health.'

CIVIL AND MECHANICAL ENGINEERS' SOCIETY. Wednesday, February 24, at 8 P.M. Mr. Charles W. Whittaker, 'On the Scarborough Harbours Competition.'

EDITORIAL NOTICES.

No communication can be inserted unless authenticated by the name and address of the writer, —not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such enquiries.

PUBLISHER'S ANNOUNCEMENT.

Advertisements cannot be received for insertion later than 2 P.M. on Thursdays.

Temporary Office, 4 Monument Yard, London.—GILBERT WOOD, Publisher.

PARTNERSHIPS DISSOLVED.

Tracey, Southall, & Watson, Hampstead, builders, as far as regards J. Watson; Heal & Marsh, Bristol, builders; J. C. & G. E. Brown, Maidstone, pumpmakers; Hasard & Grimwood, Sylvan Grove, Old Kent Road, engineers; T. Saville & Co., Chorley, builders, as far as regards T. Saville; Waite & Jones, Derby, building surveyors; Cox & Wood, Oxford Street and Shenstone Street, Old Kent Road, patent Marsez marble manufacturers; G. Hunter & J. Simpson, Wakefield, cabinetmakers.

BANKRUPTS.

Edward William Matthews, Hayward's Heath, builder, Feb. 26, at 2; John Pallant, Hadleigh, builder, March 1, at 1; Benjamin Reynolds, Chiswick, March 1, at 1; George Smith, Church Cobham, engineer, Feb. 26, at 2; Robert Banting, Florence Terrace, Kensington, painter, March 1, at 11; George & Walter Hodcs, Worthing, engineers, March 1, at 12; Edwin Sadgrove, Caledonian Road, plumber, March 1, at 12; George Slater & Samuel John Salkeid, Lambs' Passage, Chiswell Street, engineers, Feb. 26, at 11.

To surrender in the Country.

George Henry Edwardes, Worth, near Crawley, estate agent, Feb. 26, East Grinstead; Joseph Foster, Whalley, timber merchant, March 3, Sheffield; John Liddle, West Hartlepool, builder, Feb. 27, Hartlepool; William Clarke, Eastwood, builder, March 2, Nottingham; William Downes, Torquay, builder, Feb. 26, Exeter.

SCOTCH SEQUESTRATIONS.

W. Mack, Glasgow, builder, Faculty Hall, Glasgow; J. Walker, Kilsyth, manufacturer of malleable iron, Feb. 22, at 12, Faculty Hall, Glasgow; R. Neilson, Falkirk, cabinetmaker, Feb. 19, at 1 Red Lion Inn, Falkirk.

TENDERS.

LONDON.—New Street, from Holborn Circus to Shoe Lane, for the City of London Corporation. William Hay Wood, Esq., Engineer. Quantities by Mr. F. Warburton Stent.

Clemence	£10,276
Trollope	10,100
Mowlam & Co.	9,816
Little	9,640
Browne & Robinson	9,612
Ebbs & Sons	9,542
Manfield, Price & Co.	9,473
Jackson and Shaw	9,135
Gannon & Sons	9,090
Macey	8,994
Hill, Keddell & Waldram (accepted)	8,771

LONDON.—For alteration to Messrs. Parton's premises, at Pimlico, Messrs. Jarvis & Son, architects:—

Thompson	£927 0 0
Turner & Son	791 0 0
Baguley	787 0 0
Tarrant	749 0 0
Henshaw	726 0 0
Richardson	697 0 0
Simpson	695 0 0

ACRON.—For Building Four Pairs of Houses, in concrete. Quantities supplied. Apparatus for concrete building provided by the proprietor. Mr. E. Wyndham, Architect.

	Per pair.	Fence walls per yard lineal.*
Holmes	£650 0 0	—
Ebbs	649 0 0	6s. 6d.
Drake & Reid	585 0 0	3s. 0d.
Watkins	574 0 0	2s. 7d.
Corpe	567 0 0	—
Turner	519 0 0	3s. 0d.
Hewson	500 0 0	—
Wright	350 0 0	5s. 0d.

* Fence wall of concrete, 6 ft. thick and 5 ft. high, with foundation 9 in. by 9 in.

PUTNEY.—For building a Pair of Houses. Mr. E. Wyndham Tarn, architect:—

Adanson	£1,500 0 0
Ebbage	1,455 0 0

BRIXTON.—For Nine Houses at Loughborough Park. Aldred R. Pite, Architect.

Sutton & Dunley	£5,914 0 0
Cowland	5,297 0 0
Baker & Constable	5,170 0 0
Kitson	5,089 0 0
Manley & Rogers	4,977 0 0
Watkins	4,596 0 0
Riley	4,347 0 0
Johnson	4,105 0 0

HOMERTON.—Alterations and Additions to the Hackney Union Workhouse at Homerton. Wm. Lee, Esq., Architect. Quantities by Messrs. Linsdell & Giffard.

Chessum	£11,150 0 0
Lewis	11,133 0 0
Cowdor	10,887 0 0
Higgs	10,629 0 0
Ashby & Son	10,450 0 0
Perry & Co.	10,443 0 0

Jonas Thornton, Batley		250 0

APPOINTMENT VACANT.

INDIA.—July.—Forty Appointments in Engineer Establishment of Public Works Department in India. Mr. W. T. Thoruton, Secretary, Public Works Department, India Office.

COMPETITIONS OPEN.

ROYAL ACADEMY OF ARTS.—National Gallery. For the best painting in Oil—or Model and Design in Painting, Sculpture, and Architecture. The Gold Medal and the Discourses of Presidents Reynolds, West, &c.; and for the best Copies of Drawings, Models of Life, the Antique in Landscape Perspective, &c. The Silver Medals, &c. November 1.

ROTHERHAM.—March 15.—For Plans, &c., for erecting a Public Hospital and Dispensary. A prize of 75l. is offered for the best design, 50l. for the second, and 25l. for the third. John Barras, hon. secretary, Rotherham.

KINGSTON-ON-THAMES.—March 1.—Design for new School and Master's Residence. Cost not to exceed 5,000l. F. Gould, Esq., Kingston-on-Thames.

BRECON.—March 1.—Plans and Estimate for Alterations of County Gaol. A premium of 30l. is offered for best plan. Edward Williams, Clerk of Peace, Brecon.

CORPORATION OF MANCHESTER.—ALEXANDRA PARK.—March 8.—The Corporation invite landscape gardeners, surveyors, and others to send in designs in competition for laying out the Alexandra Park. Joseph Heron, town clerk, Town Hall, Manchester.

CONTRACTS OPEN.

CITY OF LONDON.—February 23.—For Stone Paving in Carriageways and Footways. Joseph Daw, Sewers' Office, Guildhall.

LONDON.—March 5.—The Commissioners of Her Majesty's Works and Public Buildings are prepared to receive Tenders for the ordinary Works and Repairs to Public Buildings, &c., in the London District. George Russell, Secretary, Whitehall.

FINSBURY SCHOOL DISTRICT.—March 1.—For the Erection of Proposed Buildings, at Upton, West Ham, Essex. Architect, Mr. Frederick Peck, 15 Furnival's Inn, E.C. C. S. Waldron, Clerk to the Managers.

POPLAR DISTRICT BOARD OF WORKS.—February 23.—For the Erection of New Offices for the above Board, in High Street, and Woodstock Road, Poplar, Middlesex. S. Jeffries Bath, Clerk to the Board, 291 East India Dock Road.

TRINITY HOUSE, LONDON.—Feb. 22.—For the Erection of an Electric Light Establishment, comprising a Lighthouse, Tower, Engine-house, Keeper's Dwellings, and other Works at Souther Point, about midway between Sunderland and South Shields. Robin Allen, Secretary.

SHOREDITCH.—March 1.—For Watering Roads in parish of St. Leonard. Mr. W. G. Davis, Vestry Clerk, Town Hall, Old Street Road.

SHOREDITCH, March 9.—For Masons' and Pavers' Work, &c. Mr. W. G. Davis, Town Hall, Old Street Road.

SOUTHWARK. St. George the Martyr.—February 22.—For supply of broken Guernsey Granite, Yorkshire Paving, &c., &c. Mr. Daniel Birt, jun., Vestry Clerk's Office, Vestry Hall, Borough Road. S.E.

POPLAR.—Feb. 23.—For Erection of new Offices. Mr. S. Jeffries Bath, 291 East India Dock Road.

POPLAR.—February 23.—For Paving several Streets. Office of the Surveyor, 291 East India Dock Road.

TOWN MALLING.—March 11. For Maintenance and Repair of Roads. Mr. W. South Norton, Clerk to the Board, Town Malling.

STAFFORD.—March 1.—For Erection of New Stone Bridge, and taking down the old one. Mr. Robert Griffiths, County Surveyor, Stafford. See Advertisement.

BRISTOL.—February 26.—For Altering Rooms at St. Peter's Hospital and Adapting them for Offices. E. G. Doggett, Clerk.

LEEDS.—For the various works required in the erection of six good Houses, proposed to be built near Armley Station. John Hall, Architect, 168 North Street, Leeds.

The Architect.

THE THAMES EMBANKMENT AND ITS STRAND APPROACHES.

(WITH AN ILLUSTRATION.)

WE Londoners of the present day are like the Irish gentleman in the story who was left a big family diamond. We have—or are about to have—our fine Thames Embankment, and now we are beginning to discover that all its belongings must be fine as well. The ragged edge of river-side dilapidations—the unsightly lanes and rotting wharves which looked bad enough even from the middle stream, will of course never do as ad-

junctions and close neighbours to what will soon be the noblest boulevard in the world.

Luckily, it has been with the making of the Thames Embankment as with the doing of all other good deeds—it has brought its own reward with it; and this in the shape of reclaimed land of great value, which it will be our own fault if we do not make of great beauty also. The Westminster portion of this valuable gift we have been obliged to sacrifice, perhaps unavoidably, to the exigencies of riparian ownership. This is the less to be regretted, as the ground, which is Crown property, may some day or other—nay, we are promised that it will—be made available for metropolitan embellishment. Another part, not so large in itself, but which can be converted into a noble site by the acquisition and annexation of the ground between it and the Strand—that, namely, situate between the Temple and Somerset House—is likely to become, through the powerful advocacy of Sir Charles Trevelyan and others, the seat and centre of our future courts of justice. The remaining portion of this reclaimed river-side land—the largest of all in extent, being about eight acres in area, the most important in position, being between Charing Cross and Waterloo Bridges—has just been made the subject of much public discussion; thus, we hope, escaping the danger of being utterly thrown away and rendered useless for any good purpose, either of use or ornament. As the public has not hitherto been put in possession of any accurate plan or description of this land, or of the use to which it was about to be put—and might really never have heard of what is proposed, had not the Chaplain of the Savoy, Lord Elcho, and the ratepayers of the Strand come to the rescue—we this week give a plan which shows the whole, and which ventures to suggest, further, how the evils, so nearly inflicted, may be avoided. This also, with the particulars which we have already published, completes our plan of the reclaimed land adjacent to the Embankment available for public use.

Referring then to the plan, what do we find? Why, that in addition to certain continuations of existing streets, which are admittedly requisite and judicious—Whitehall Place, Villiers Street, and Craven Street being thus connected with the river-side roadway—there is a great intended street, or viaduct (shown by dotted lines), opening out of the Embankment just east of Charing Cross Bridge, and extending across the whole of the reclaimed land, in a direction almost parallel with the river-wall, until it enters Wellington Street, about midway between the Strand and Waterloo Bridge. This street was proposed as a short cut from Westminster Citywards. Bearing in mind that this roadway would be some thirty feet higher where it enters Wellington Street than at the Charing Cross Bridge end, and that for one-third of its length, at the upper extremity, it would have to be carried on arches, it will at once be seen how completely it destroys the reclaimed land, either for building purposes or as ornamental ground; how it leaves a great hole on its right hand and on its left; how it isolates all the streets lying between it and the Strand; how unsightly it would be, and how costly; how it would concentrate traffic on a thoroughfare already overcrowded; how, finally, it does not even attain the end for which it was intended—as, within a very few yards, the distance between Wellington Street and Westminster is as short by the Strand route as it would be by the viaduct.

These are the objections to the scheme as a scheme, and they are fatal. But there are others even weightier behind. For, in the Act of Parliament authorizing the construction of this viaduct, powers have been conceded to the owners of property in the streets adjacent—power of control over public highways, and power to veto public improvement—which should never have been granted, and which we hope never will again be granted, to private persons. The project is every way a bad one, and, as such, admitted even by

those who have the charge of its execution. The Metropolitan Board—to whom it was bequeathed with the original Bill of 1862—would be glad to wash their hands of it. Mr. Cowper thinks it a very good plan, 'but that it may have been purchased too dear.' Mr. Layard holds it in abomination. The Strand ratepayers cry out against it—Let it perish, abortive!

Our art being, however, not destructive, but constructive, we may consider now whether an approach-road might not be made from the Strand to the Embankment, which would not have the effect of condemning all the neighbouring streets south of the Strand to remain for ever the *culs-de-sac* which they at present are; which would not concentrate all the traffic at one dangerous point, but distribute it, by many ramifications; which would not afford additional arcades for sheltering nocturnal vagabondage, or additional receptacles for the dead cats and other *disjecta membra* of the district; and which finally, and principally, would not cut up the valuable piece of ground which has come into our hands, but leave it intact, to be afterwards dealt with as may be considered best.

To show our meaning, we would beg our reader to refer to the plan which we publish this week. The roadway we there suggest would leave the Strand by Cecil Street, the western side of which would be retained, and the street widened by the absorption of the ground occupied by the houses on the east side—the site for building on that side being obtained by purchasing the dilapidated tenements at present existing in what is known as *Carving Lane*. Cecil Street leaves the Strand by an easy gradient, which would be retained unaltered. At the southern extremity of that street, the roadway would divide right and left, skirting, with an easy incline, the existing terminations of the several streets leading southward out of the Strand, along its course. With all of these junctions might be effected (slight modifications of existing levels being, of course, required), except in the case of Adam Street and one or two other streets forming part of the Adelphi block, and they, being all of a higher level, would have to be tapped from their John Street end. In connection with this project, were such an one adopted, it would perhaps be found desirable to rearrange all the lower parts of the Savoy, the streets of which are much too steep to be convenient, and the houses ancient, and in an advanced state of decay. If, in addition to this suggested roadway, Villiers Street were to be widened, Craven Street lengthened to intersect the Embankment, and Whitehall Place produced in its present alignment, as authorised, we should then probably have a system of approaches to the Embankment amply sufficient to meet all the requirements of the traffic along Parliament Street and the Strand.

We may and do hope in any case that, public attention being fixed upon the importance of this great site, no plan or project will be tolerated which does not preserve the ground inviolate for the use of the public, who have paid for it. At no distant date, may we see a stately pile here raising its sculptured front as a fine architectural background to our river-side roadway! And, when that time comes, we trust that the building may be one dedicated, *inside* as well as outside, to the recreation and delight of the people. Not any hospital, or range of public offices, nor even the palace of that municipality which is to supersede Sir John Thwaites and the Lord Mayor of London, but some great museum or library, or institute of science, of art, or of industry.

This question was fully brought before the House by Lord Elcho, and a committee to enquire into the subject was agreed to without hesitation. We hope that short work will be made of a proposal so objectionable in itself, and so unpopular with even its natural supporters; for if Mr. Tite is to be held as representing the opinion of the Metropolitan Board in the House, his statement last Tuesday fully shows that there is no disinclination on the part of that body to surrender their project.

Another subject which can hardly fail to suggest itself whenever this or any kindred subject is mooted in any intelligent company is the necessity for establishing some sufficient and efficient control over public works in the metropolis, and for furnishing such authorities as now exist with proper advisers.

We do not wish to see a M. Haussmann in Spring Gardens, or to behold so wholesale a destruction of ancient buildings and thoroughfares as Paris has undergone at the hands of that functionary; but there can be no doubt that a responsible Minister of Public Works with large powers would be of great service in this country.

Mr. Tite threw out the suggestion that the Royal Institute of British Architects would be happy to afford assistance on questions of public taste. We consider that no more efficient council could be secured than one such as this body and the Institution of Civil Engineers could elect from among their most experienced members. No man knows better how to meet such difficulties as public works constantly encounter than the leading architects and engineers of the day. Many of them show much public spirit in devoting large portions of their time to matters which can bring in no pecuniary recompense, and we have little hesitation in endorsing the suggestion of Mr. Tite. Certain it is, that had any such advice been sought when the viaduct from Villiers Street to Waterloo Bridge was decided upon, the defects of such a project would have been promptly discovered and uncompromisingly pointed out, and the blunder we are now seeking to repair would have been avoided.

MATCH EXTRAORDINARY:
LINCOLN'S INN AGAINST ALL ENGLAND.

THOSE respectable, but wrong-headed, persons who are desirous of the erection of a noble palatial structure on a site where it can never be seen, and can only be with great difficulty approached, have hitherto shown the better part of valour in the defence of their opinions. Conscious, no doubt, that in any sally forth to discomfit their assailants, they would expose more and more the vulnerable points of their own armour, they have remained wisely silent. They have shut their shutters, barricaded their doors, pulled their night-capes over their ears, and resolved to sleep through the din; or at least to take no share in the strife unless they should be pulled, neck and crop, from their beds. 'Let well alone,' has been the most adventurous essay in the way of argument which for a long time they adduced. Possession is nine points of the law, and possession they thought was theirs. At all events they had dispossessed, and expropriated, and improved away, the former tribes of inhabitants that clustered densely between St. Clement's Church, King's College Hospital, and the Law Institution; those three formidable fixed points in the line of circumvallation that pens in the Carey Street site.

At length, however, roused by the ever-deepening hum of daily talk, the Incorporated Law Society has broken the eloquent silence. With that clear grasp of the points on which he hopes to convince the jury, and that easy skimming over all the rest of the evidence, which constitutes the act of the pleader, the writers have succeeded, unintentionally indeed, in presenting the case to the public in its true light. It is Lincoln's Inn *versus* London. Nay, indeed, so far as the grandeur, the good arrangement, and the comfort of the capital represent and foster the civilisation of the entire country, the case, as put by this legal protest, is that of Lincoln's Inn against all England.

Questions of cost, questions of area, questions of access, have been investigated at some length in our columns. We shall not be uncandid if we say that on purely architectural grounds the comparative advantage of the competing sites admits of no further discussion. But the Law Society, with something of a hinted menace as to this application of the Suitsors' Fee Fund, ignores the architectural question altogether, and seeks to decide the case on a totally different issue. Let us look for a moment at the argument.

'The Carey Street site has been purchased, and cleared at an expense of 800,000*l.* Not only have architects competed, in elaborate designs, how best to cover the area with the required buildings, but an enormous amount of labour has been bestowed on the plans by MEMBERS OF THE COMMISSION. So much trouble has been taken, that we *did* hope,' it is almost plaintively urged, 'to see the bricklayers at work this spring. If you change the site, you will require to change the plans. Really, after so much trouble has been taken, it ought to be taken for granted that no improvements can be suggested. We are in the groove—for God's sake let us alone!'

The argument that so much time, or so much trouble, has been expended that there must be, whatever happens, an end of the matter, is one not unnatural to those who are habitually aware how often great causes are judicially decided on very imperfect evidence. The presence or the absence of an important witness, or the skill of counsel in enforcing one point and obscuring half a dozen, has more to do with a verdict, nine times out of ten, than has the exhaustive balance of all the facts of the case. Indeed, it is admitted on all hands, that matters requiring minute and detailed investigation ought to be decided by arbitration, and not by a jury. The Bench, and the Bar, and the public, cannot afford the time for meting out absolute and detailed justice. We take it in the rough, and are content with the average result.

The very opposite method is that employed by the scientific man, or by the artist worthy of the name. An architect who had devoted years to the careful planning of the best mode of dealing with a bad site, would cheerfully throw away all his designs on an unexpected offer of a good one. If he were an enthusiast in his art, if he worked, as the best architects do work, for fame and for posterity, and if he could honestly afford it, he would gladly sacrifice all the time he had spent for the more than countervailing advantage of being the constructor of a nobly situated palace, which would perpetuate his name, not as having done the best under disadvantageous circumstances, but as having done something excellent and unrivalled of its kind. There can be no doubt that the architectural, and not the legal, point of view and habit of thought form the true method in which such a subject ought to be approached.

Apply, for a moment, the argument of the Law Society to another kind of building. 'Think,' a conservative master shipwright might say, 'of the thought that has been given to the construction of our three-deckers! See how they swim! Look at our dockyards; all arranged for timber work! Remember how long Britannia has ruled the waves. Let well alone; and don't bother us by your new-fangled iron-plated fleet. The wooden one is well considered, and will last our time, and we can build a dozen while you waste time in inquiring into the best form for an iron steamer.' The argument as to the trouble already expended on the plans is not one whit more pertinent than this.

We come, then, to the real grief. 'It is a bore to move house. Many of us have chambers in Lincoln's Inn. We don't want to move.

Some of our house property, dilapidated, tumble-down, and abominably inconvenient as it is, commands high rents. Don't touch our rents! We have built one decent Hall. It would be horrid to move from its immediate vicinity, or to contemplate any alienation of the result of our one liaison with architecture. We have one set of buildings, named after, and faced with, stone. Its prison-like staircases give access to very decent chambers, some of them with a fair look out, and all of them (though the chimneys smoke) receiving the rentals of independent houses. In the sacred names of Old Square, New Square, Stone Buildings, and Lincoln's Inn Fields, pop down the New Law Courts as close to them as possible.

'Against this vested right what has to be urged? The convenience of the public? Pooh! the Law Courts are not for the public, but for the profession. Is not the whole body of English law kept in that barbarous, uncodified, and unintelligible state, which renders it a scandal to all educated foreigners, solely for the advantage of the profession? The more the public are kept away the better! The witnesses are just wanted at the solicitors' offices, the handier to the Court the better; and as to all the rest, Tush!

'Look at it this way. We solicitors and our clerks make 12,000 visits a day to the Courts. Now, if you move the Courts fifty yards nearer the Thames, it follows that an additional labour is entailed on us equal to a walk of 600,000 yards by one solicitor—more than 340 miles per diem—a mile a piece for 340 of us! Think on the cost to the country—for our clients will have to pay for the extra wear of shoe leather.'

We fear that if the case be thus plainly put between the public and the solicitors, the latter will have either to take this dreaded constitutional, or to do what all other inhabitants of London are ever and anon forced to do—shift their quarters. It would be easy to show that little would be lost, and much gained by this compulsion. A man's life would be worth five years' more purchase at the least, were his day passed in one of the commodious chambers which we hope to see rise on the southern portion of the Carey Street site, instead of in one of the pestilent little pigeon-houses known very properly as 'Old Buildings.' And there is yet another consideration for our friends of the legal profession.

Concentration of the Law Courts has been an admitted desideratum. Let us remember what was meant by the term. The Law Courts were most inconveniently situated, partly in London and partly in Westminster. Counsel of sufficient eminence to have their hands full were wanted in both places at once. It is said of Brougham, that at one time his principal supply of sleep was obtained in his carriage between the two localities. The inconvenience of the solicitors has been not less than that of the barristers. The thing was an anachronism, and it was well to deal with it as such.

Yet it is certainly the case that the concentration of the Courts, while a matter of much moment and advantage to leading and popular counsel, is less or not at all favourable to their junior and hungry brothers. The more Mr. Serjeant Graball undertakes, the less there is left for Briefless, Smallbrief, and Briefworthy. It is true that the custom of the profession allows Graball to take his fees for the conduct of a case at Guildhall, which is, in point of fact, attended solely by his junior, the learned Serjeant being himself, in the body, at Westminster. But solicitors, who look more at the thing than at the name, will prefer giving their fee to Briefworthy, if they are sure that he will attend conscientiously to the case, than to Graball, though the abler man, who can't and won't. Now, concentration means giving more business to Graball, because, as a physical fact, he can attend to more if he has not to oscillate between London and Westminster. And the strident outcry for a concentration that is expressed in yards, springs from a desire (whether tacit or expressed) to throw more into the hands of the tritons, at the expense of the minnows.

We think, then, with the utmost respect for the utterance of the Incorporated Law Society as a question of Imperial interest, that, carefully weighed, it forms a fresh argument in favour of the Embankment site. The issue, 'Profession *versus* Public,' can go but one way; but when it also means 'Leaders *versus* Juniors,' and 'the over-worked against the under-worked,' that issue becomes still more narrow. It is not even Lincoln's Inn against all England, but the tenth part of Lincoln's Inn against all England, including the larger fraction of the profession. A clear statement of the pleadings must lead to a nonsuit.

OUR RAMBLER

ON NEW BLACKFRIARS BRIDGE.

ON the 31st of October, 1760, was laid the foundation-stone of old Blackfriars Bridge, which was designed by Mr. Robert Mylne, and consisted of nine semi-elliptical stone arches, having a central span of 100 feet, and, on each side, spans of 98 feet, 93 feet, 83 feet, and 70 feet. The total length of the bridge was 995 feet, the width 43 feet 6 inches between parapets. The total cost of this bridge was 261,579*l.* 0*s.* 6*d.*

Upon the 24th of June, 1769, this bridge was thrown open to the public, and in a few weeks will occur the centenary anniversary of that ceremony, on which occasion, if the anticipations of the engineer and contractors be realised, the event will be commemorated by the opening of the new Blackfriars Bridge, which occupies the site of the old one, but greatly surpasses its predecessor in beauty and construction.

It is of this bridge we wish to speak; and, by a recent visit to the works, we are enabled to place before our readers a few facts regarding

this noble structure, which bids fair to out-rival any work of the kind that has ever spanned a tidal stream.

In 1861 the Corporation of London invited several eminent civil engineers to submit designs for a new bridge to take the place of the then fast-failing stone structure; in response to that invitation, several elaborate designs were sent by Messrs. J. Fowler, J. Hawkshaw, Sir J. Rennie, P. W. Barlow, G. P. Bidder, Thomas Page, Joseph Cubitt, and others; and, after much controversy as to the merits of the various schemes, great partiality being shown for Mr. Page's cast-iron bridge of three spans, the design of Mr. J. Cubitt was ultimately selected. This design is now being carried out under his superintendence, with a few modifications; and we consider from what we have seen of the work, which is now fast approaching completion, that the Corporation of London will have no cause to regret the choice they have made, and the public cannot fail to be satisfied with their selection.

The New Blackfriars Bridge consists of five flattish segmental arches, the centre arch having a span of 185 feet in the clear, with a rise of 15 feet 11½ inches, and giving a headway of 25 feet from Trinity high water mark, the two intermediate arches having 175 feet span, with a rise of 13 feet 10½ inches, and a headway of 21 feet 6 inches, whilst the two outside arches have a clear span of 155 feet, with a rise of 11 feet 7½ inches and a headway of 17 feet 3 inches.

These arches are supported by massive piers and abutments of masonry. Each arch is composed of nine wrought-iron ribs, placed parallel to the direction of the roadway, 9 feet 6½ inches apart, and firmly connected together by means of transverse bracing: the depths of these ribs average 5 feet for the central arch, 4 feet for the intermediate arches, and 3 feet 6 inches for the outside arches. The ribs spring from skewbacks formed in the piers and abutments, lead being run in hot between the ironwork and masonry to form a springing plate.

The roadway is carried by means of longitudinal wrought-iron lattice spandrels and transverse girders. These latter are sunk below the level of the crown of the ribs, and run tangential with the extrados of the arch, resting upon the upper part of the spandrel, which in fact forms a longitudinal girder; and between these transverse girders are fixed small girders of double T-iron, running in the direction of the roadway, thus forming in fact a complete network of rectangular bracing, upon which are placed Mallet's Buckle Plates; and upon these rests the foundation of the road.

The piers are of Cornish granite with a hearting of brickwork, and stand upon a foundation formed by six caissons, about 18 feet deep, sunk below the bed of the river into the London clay. These caissons are of wrought iron; four of them are rectangular on plan, the other two taking the shape of the cutwaters, one being placed at either end of the pier. In the construction of these piers wrought-iron caissons were used, which were divided into two parts, the lower portion forming the permanent foundation, and the upper portion serving as a temporary dam. The skin of the former was composed of ½-inch plates framed together by means of angle and T-iron, the temporary caisson being formed of Mallet's Buckle Plates, having a frame properly braced and stiffened, and so constructed that when required the sides could be removed to enable the pier to be proceeded with from end to end.

The method of sinking the caissons and forming the foundation was as follows:—The caissons were placed in position about 3 feet apart, and, guided in their descent by means of piles, were lowered until they reached the bed of the river; they were then dredged round, and weights were applied to cause them to sink. When they reached the clay and began to sink into it, forming a dam, the water was pumped out, and the interior when dry could be excavated, and thus enable the caisson to be sunk to the required depth. When this stage was attained, concrete was thrown down to a depth of about 10 feet, and upon that was laid brickwork in cement about 8 feet deep, until it reached the top of the permanent caisson. Afterwards a dam was formed by piling at either end of each space between the caissons, the ground was dredged out from those spaces, and concrete thrown in until it reached the level of the other work. The sides of the temporary caissons were then removed, and the foundation being thus completed, the construction of the entire pier could be proceeded with.

Each pier is, as we have said, of Cornish granite, with a hearting of brick work in cement, hoop iron bond being used throughout. The length of each is about 110 feet, the cutwaters being about 130 feet long; the widths of the piers, at water level, average 25 feet at base and 20 feet at springing.

The piers on the Surrey side were built with comparative ease, but those on the Middlesex side, especially No. 4 pier, caused considerable anxiety and trouble. Owing to the existence of the old Fleet Ditch in years past, the bed of the river at this point has become soft and spongy, added to which the great deposit of mud that had taken place year by year had caused the ground to be thereabouts of a most treacherous nature; and instead of the caisson sinking to the required level, as in the other instances, it was observed to sink lower and lower, sometimes only half an inch, at others 12 to 14 inches at a time: and until this progress ceased, showing that a satisfactory bottom had been reached, it was not deemed prudent to commence the foundations; thus it has come to pass that the bottom of this pier is upwards of 30 feet below the anticipated level.

Piers Nos. 1 and 2 (counting from the Surrey side) are now complete, and No. 3 pier is half way above springing level, whilst No. 4 pier is at the level of the springing; but both these last are being pushed rapidly forward, and will doubtless keep pace with the other parts of the work.

The shore abutments were formed by means of coffer dams composed of two rows of piles 13 inches square, puddled between. Under the Middlesex abutment has been constructed the outlet of the Fleet Sewer, 9 feet 9 inches by 7 feet 6 inches. This sewer has been diverted from its old course to the west of the abutment, and is intended to act as a storm outlet.

In each pier, at the level of the springing of the arch above the cutwaters, and resting upon a handsome base of Portland stone, are massive polished granite columns from the Isle of Mull. The shafts are 7 feet in diameter, and average 10 feet 6 inches high; they are executed in three blocks; each block weighs from 10 to 14 tons.

These columns are surmounted by bold capitals, carved in high relief, also of Portland stone, upon which rest the semi-octangular recesses of

the bridge; and here it may be open to question whether sufficient attention has been paid to proportioning the apparent load of these sturdy columns to their obviously enormous strength.

The whole of the stone carving has been entrusted to Mr. Philip, whose treatment of the subjects is worthy of high praise. Each capital varies from the others in design. On those on the up-stream side are carved fresh-water birds and plants, whilst those on the down-stream side bear the birds and plants of the marine species.

To emphasise the angle where the web joins the top and bottom flanges of the outside ribs, a roll moulding has been introduced, of wrought-iron tube, 5 inches diameter, attached to the ribs by means of bolts.

Upon each outside rib rests a cast-iron spandrel, enriched with a sunk diamond-shaped pattern, the intersection of the bands being marked by bosses of varied design; these bosses are also placed at regular distances along the centre of the face of the outside rib.

Above the crown of the arch and the spandrel is a handsome moulded cast-iron cornice of bold outline, resting on ornamental brackets of different patterns; and upon this is fixed the parapet, executed wholly in cast iron, and forming a kind of arcade of twisted shafts, with caps of 12 different designs supporting the parapet rail.

The clear width of the bridge between the parapets is 75 feet, giving a roadway of 45 feet and two footpaths of 15 feet each. The total length is 1,272 feet, and the inclination of the roadway will be 1 in 40.

The foundation of the road is composed of a mixture of Kentish rag and asphalt, 18 inches deep, filled in upon the Mallet's Buckle Plates, which for the roadway are ⅝ inch thick, and for the pathway ⅙ inch thick. Upon this concrete is laid the roadway of granite pitching, 8 inches thick, with a channel and curb of Guernsey granite; the footpaths are of 4-inch York landing.

The pilasters upon the abutments are of Cornish granite, surmounted by caps of Portland stone, carved in bold relief, with the plants of the marine and fresh-water species facing their respective localities.

The contract was taken in 1864 by Messrs. P. & N. Thorn, for the sum of 270,000*l.* It included removing the old materials and the construction of the temporary bridge.

The work is being carried out in the most satisfactory manner, from the designs and under the superintendence of Mr. Joseph Cubitt, by his agent Mr. F. W. Bryant, who, we believe, designed the whole of the necessary staging and plant, as well as the temporary bridge, and to whose skill may be attributed the fact that as yet not a single accident has occurred.

We noticed the great order in which every branch of the work is being carried on, each body of men acting with the others in perfect concert, and without any confusion such as is at times liable to occur in works of such a magnitude.

During the removal of the old and the construction of the new bridge, three passages have been kept open for the river traffic.

In comparing the old Blackfriars Bridge with the new, it will be found that where the former gave a waterway of 788 feet, the new provides 845 feet; the one having eight piers, whilst the other will only have half that number.

The width of the old bridge was 43 feet 6 inches, giving a roadway of 28 feet, and two footpaths; whilst the new will provide nearly double the width in one case, and more than double the width in the other. As regards headway, certainly the old bridge had about an average of 24 feet 3 inches, whilst the new will only average about 21 feet 3 inches in headway; but it must be remembered that the roadway of the old bridge was 5 feet above that of the new, and the inclination was so great as 1 in 22, whilst the new provides 1 in 40—a feature of very great importance: and again, that the two outside arches were of little or no use for navigation, whilst in the new bridge all the arches will be available. So that in every respect the new bridge complies with the requirements of the enormous traffic going over and under it; providing ample space for carriage way, footpaths, and river traffic, and less obstruction to the ebb and flow of the tide.

In conclusion we may express a hope that the peculiar circumstances which are likely to distinguish the opening of the new bridge, namely, the centenary anniversary of the inauguration of its predecessor, and also the 50th birthday of Her Majesty the Queen, may be happy omens for its long and successful career.

CAPITALS.

IN the various styles of architecture which have been developed in all countries from the earliest times to the present day, there are no features in which more grace and elegance have been combined, more character evolved, or more ingenuity of design displayed, than in the capitals of columns; and no more fitting features could be found on which the artist might put forth all his power and strength to impart dignity and beauty in perfect accordance with the truest principles of art.

The capital of a column is the channel through which the characteristic refinement of any style shows itself with the most unerring fidelity, being, in fact, the reflex of the purity of the architecture which it helps to adorn.

The curvature of the capital first, and its decorative accessories afterwards, are the two surest exponents an archæologist can find of the exact style and age of the building in which it is found, and any influence from without which has been brought to bear on the building is almost sure to be found in the capital as its chief decorative feature.

We cannot but think, therefore, that by giving from time to time illustrations of the finest examples of capitals of all periods and styles, most of them hitherto unpublished, we shall be introducing into our Journal a most interesting feature. As far as possible we shall

endeavour to follow a chronological order, beginning with those of the Egyptian style.

The earliest forms of capitals with which we are acquainted are those which are found in the excavated tombs of Benihasan in Egypt, which date from the reign of Osirtasen I., 1980 B.C. The

FIG. 1.

columns which these capitals crown are of two kinds, entirely distinct in design, though belonging to the same period: the one, embodying as far as is consistent with the material the representation of natural forms; the other, a simple creation of the mind.

The latter of these two columns is well known as the supposed prototype of the Doric Order. But what modifications it had passed through before arriving at the perfect form it possesses at Benihasan, we know not: as found there, it has either sixteen or eight sides, with a simple square stone as abacus (Fig. 1). The other column with its capital is evidently an attempt, and perhaps the earliest attempt, to employ natural forms in the decoration of stone construction. The column, as we find it in this example, is too

FIG. 2.

slight to bear the superincumbent weight of the roof of the excavated tomb in which it is placed (supposing there was the necessity of any support): we may assume, therefore, that it was copied from one of the poles of a tent; this assumption being further borne out by the architrave which it carries, and by the pent-like form of the stone roof. The poles of the tent were in wood, and at certain times were

probably decorated with the flowers and stems of the lotus and papyrus plants, which on all festive occasions were employed by the ancient Egyptians, just as in the present day plants and flowers are used to decorate and cheer the interiors of our churches and private dwellings. In the application, then, of these natural forms we find that the decoration of these columns at Benihasan consists of four stems of the papyrus, bound together by ligaments, and the buds of the plant form the capital (Fig. 2), with a square abacus on the top to carry the architrave.

FIG. 3.

Of these two columns and capitals, the first described never seems to have been further developed; we find other examples in the Palace of Thothmes at Karnac, and also in the tomb

FIG. 4.

of Bayt-El-Wellee, in Nubia: in the latter instance (the column is only three diameters in height, that at Benihasan being five. The second variety of column, however, with what we may call the bud capital, undergoes many modifications: the next example

is found in that portion of the temple at Luxor which was built by Amunoph III., and dates therefore from 1400 B.C. Here the capital

FIG. 5.

has eight buds and as many stems (Fig. 3). In the Ramesseion, 100 years later, the form of the capital is still the same; but the semi-

FIG. 6.

circular form of each bud in horizontal section through the cap (a) has been suppressed in favour of a simple circular form in section (b)

to allow of painted decoration, consisting generally of the cartouche or name of the king who erected it, and of his insignia of office (Fig. 4). The lower portion of the capital, however, has still the ligaments and other smaller buds, which, as well as the ligaments under the cap which bound together the stems, are altogether done away with, in the next example at Karnac giving place to painted decoration (Fig. 5). No other modification beyond that of different proportions seems to have taken place in this capital. Sir Gardner Wilkinson has an ingenious theory that the Greeks, in order to obtain a model for their Doric capital, cut off the lower portion of the bud capital and stuck it under the abacus on the Benihasan polygonal columns: but as the earliest Doric columns, with their widely projecting capitals, differ so greatly from the examples of the polygonal column found in Egypt, there is not much faith to be put in his theory.

The next capital we have to consider is the simple bell cap, which dates from the fourteenth century before Christ, though, from the perfection in which it is then found, there can be no doubt of its having existed in ruder forms previous to that date. It is found in the Ramesseion and in the temple at Karnac, and its form is supposed to have been derived from the flower of the full-blown papyrus, as the capital before described was from the bud. Its under surface is decorated with a series of lines representing the stems of the papyrus, with flowers and buds alternating, and sometimes, as in the example we have chosen for illustration from Karnac (Fig. 6), with the cartouches of the King; round the lower portions of the capital are the sheathing leaves of the full-blown flower, with the binding ligaments under, decorating the necking of the cap. The decoration thus described on the cap is slightly incised and brilliantly coloured. The simple beauty and elegance of this capital surpass any we are acquainted with. The bell capital and the bud capital just described seem to have served all the purposes of Egyptian architects down to the time of the Ptolemies: the former is invariably found on the columns which formed the grand central avenues of the Egyptian temples, whilst the latter crown the smaller columns which form, as it were, the side aisles to the central avenue or nave. The reason for this distinction of position was, possibly, because the light admitted through the clerestory windows at the side lit up the under surface of the bell capital, rendering visible its decoration, whilst it shone down on the bud capital, the inclination of whose sides (the upper part of the cap being the narrowest) seemed formed to receive it.

CONDITIONS OF BUILDING CONTRACTS.

IT must not be considered strange in these days of Trades' Union Commissions—of inquiries into the numerous relations subsisting between class interests and the public—between professional institutions and their own members—as also in higher matters, such as the Universities, Charities, and even the important fundamental relations of Church and State—that inquiry should be instituted into the various relations existing between the profession of Architecture and the contractors, as a body, who are employed to carry out its designs. Nor should it be a matter of regret if such inquiry should enable its promoters to clear away any useless forms or obsolete modes of procedure, and the result be greater simplicity and clearer mutual understanding; though it should be no matter of surprise if, after discussion, some changes should be established in a direction quite the opposite to that intended by those originating the inquiry. In fact, we are free to admit that there is an abundant crop of weeds to be destroyed, and a quantity of time-honoured rubbish, which it would be desirable to remove from the field of inquiry, if we would cultivate and improve the state of mutual understanding and healthy confidence which ought to grow up and increase on the part both of architect and contractor with the increase of business between them. Already the subject of its own relations with its members has been taken up by the Institute of Architects, and a step or two of importance taken also—as regards professional services and charges—towards defining those existing between individual architects and their clients; and now it seems that the Institute is about to engage in the consideration of the various relations existing between the architect and the contractor, as well as between the contractor and the architect's employer or client.

The subject seems ripe for consideration, if not for actual legislation—using the word in our own limited sense—and the discussion originated in our pages seems to demand further space for the development of views on both sides of the question. It is to be hoped that all will handle it in the same temperate manner as 'The London Contractor,' and 'The Engineer;' but, of course, each will state his own view, while it more particularly belongs to us to take the *via media*, and look upon the matter as impartially as we can, having at heart the well-being of architecture as an *Art*, as well as the science of building as a business. From the Contractor's point of view, the statements made as to the necessity for a revision of Building Contracts seem to prove some dissatisfaction at least—perhaps not ill-founded—with the working of certain clauses said to be drawn up in the interests of clients only, and some desire for additional ones as protection for the contractor against the architect: yet we doubt if anyone acquainted with the undercurrent—or, indeed, the general course of building affairs—would observe any practical grievance, or be able to refer to any instances, except those given, where architects are stated to have acted in a manner contrary to common sense, and in opposition to what would be considered their ordinary duty as professional men. There has been no difficulty in arranging contracts after the ordinary recognised mode, and there is no difficulty now in obtaining any number of tenders for any important work, where the contractors would be bound by the ordinary conditions, and have to sign the ordinary documents.

To meet exceptional cases of course exceptional legislation is required,

if we would say, as all would desire, that every wrong has its remedy; and although it is obviously impossible to meet every case, and to prevent every sort of misunderstanding which occurs, or can be made to occur, between all parties, we yet admit it is the duty, as it will be also the earnest desire, of the profession, as an honourable body of men, to provide a remedy for any injustice pointed out as resulting or likely to result from its forms or customs, especially when such arrangements are imposed by themselves, whether as safeguards for their clients, or for the better mutual understanding between themselves and their contractors.

It would be a slur upon the profession, to say nothing of the resentment or resistance it would provoke, not to listen to any fair representation of injuries when it has the opportunity and possesses the power to prevent them; but, on the other hand, it would be weakness to give way to any mere fancied wrong, or deliberately to throw away any important safeguard, or any proper protective barrier against evils which have shown themselves from time to time and given cause for such protections. This would not merely be sacrificing a client's interests, but it would be lowering the standard of right, and would eventually lead to less perfect construction, cheaper and more shifty expedients, and result in damage alike to building and to builders.

The questions which are raised, be it remembered, are against certain strict rules, regulations, and conditions made by architects, and against certain arbitrary powers given into their hands for the express purpose of compelling right to be done by the contractor to the client, for seeing that money's worth is given for money, and as a guarantee for the fair dealing of the one towards the other:—of the client towards the contractor, be it observed, as much as of the contractor to the client,—for this point of the *independent* position of the architect is forgotten or ignored too much in the consideration of this matter. The architect has to see that the money is properly paid as well as that the work is properly done, and the contractor has the benefit of the architect's position and knowledge, without any charges or any liabilities to him in the smallest possible degree.

And it is not often known, or remembered indeed, how much a contractor is frequently indebted to an architect for clearing his accounts, for providing him with his 10 per cent. profit (on what the architect himself gets but 5 per cent. from his client for designing), and for making the contractor's own workmen do their duty, to the saving of his pocket, his reputation, and his credit.

In any ordinary agreement between parties, if each means honestly by the other, and so acts whenever any question arises, there is little room for complaint of the strict letter of the document, for, of course, no conditions or clauses are called into play; still they exist, very properly, to attest the meaning of the parties if required to be referred to. Even with the most honest intentions, in all the complicated affairs of life, and especially in those matters connected with building operations, it so frequently happens that different interpretations of the same form of words, or variations in the manner of carrying out the intention supposed to be conveyed by them, occur in the most unlooked for way, that strict conditions and 'good set' terms are very properly introduced in all building contracts; and the *raison d'être* is thus so generally understood that no objection is made to such ordinary hard words and well-known strict phrases, as are customarily borrowed from common legal documents, where each party is supposed to be capable of over-reaching the other, and to be likely to be incapacitated in a variety of ways—to become lunatic or bankrupt, or to leave the business of this world altogether to his 'executors, administrators, and assigns.'

If no such questions or differences ever did occur, how much would an architect's duties and responsibilities, and, we may add, those of the contractor also, be lightened, and how much more valuable time would be available for the real work of designing and executing a building instead of merely talking about it! It is needless to say how pleasant it would be to an architect if there were no extravagant estimates to cut down, no 'cutting' estimates he was obliged to accept, and no attempt to gain by day-work what was supposed to be omitted or deliberately lost, in order to obtain preference for a 'job'—no attempt to run up a bill of extras for work fairly included in the contract, no misreading of the obvious intent and meaning of the specification and drawings. If work were always done in the 'best and most workmanlike manner,' with materials 'the best of their several sorts and kinds;' if workmen were neither 'careless, negligent, nor ignorant of the work on which they were engaged;' if work were always completed at the time agreed upon and in the manner specified, the architect's 'satisfaction' would be 'entire' and complete, and there would be no withholding of certificates and no question as to the amounts due to contractors, no grounds for complaints, and no work for lawyers or arbitrators.

But are the facts such that contractors can fairly say 'This and this clause is unnecessary, that stipulation is needless, this kind of guarantee is never required, and such and such a condition is obsolete'? Looking broadly at the general conditions as adopted by most architects, without just now referring too minutely to details, we think it will be admitted that they have been framed to meet certain delinquencies and neglects which from time to time have been experienced, and that every precaution adopted has been suggested by, or is referable to, some previous error, mistake, or misunderstanding.

(To be continued.)

Mr. W. B. Scott is engaged in the preparation of a series of designs to be employed for the decoration of two of the large windows on the staircase in the South Kensington Museum. These designs are intended to illustrate the arts and crafts of civilised life. As to the arts, Michael Angelo and Raphael have been chosen as types of diverse states of design: to each of them a window is appropriated. The mode to be employed in placing these designs on the glass is chosen by Mr. Scott to resemble in its results what is called 'grisaille and yellow stain.' The designs are to be drawn in slightly shaded outlines on the glass, and in a brown tint. Yellow stain or some simple tint is to be employed *decoratively*, as the artist thinks fit.

ILLUSTRATIONS.

THE CHICAGO WATERWORKS.

ABSOLUTE novelty is rare in the works of man. In every branch of human art and human science we may trace the progress of development. The noblest creations of the architect or of the engineer have, for the most part, sprung from some small and insignificant seed, cast, it may be, into a fruitful soil by an unknown hand.

The last thirty years have witnessed the introduction of more unprecedented and altogether novel applications of human skill to the increase of human comfort than tenfold that length of time during any former period of history. The combined, but distinct, inventions of the locomotive engine and the iron railway have led to the application of iron to building purposes in such a manner that the effect has been equal to that of the introduction of a new material. Hence arose bridges, roofs, viaducts of striking and original boldness of design. To all this the engineer is now somewhat accustomed. In mining and tunnelling below the surface of the earth, or even of the water, again, he may think that his experience is ample. For almost any work which may now be expected from an engineer we are able to find a precedent.

We have, therefore, the more pleasure in laying before our readers the details of a plan, which is at once novel, bold, and carefully considered, for the supply of water to the City of Chicago. The derivation of water from a lake by a tunnel, or *emissarium*, is not, of course, anything in itself new. Lake Alba was drained by the Romans, A.U.C. 358, by means of a subterranean passage. And as to tunnelling under any inland waters, it is hardly possible that difficulties of a greater magnitude than those which were vanquished by Sir M. I. Brunel at Rotherhithe should beset the operation.

But, with this allowance, the merit of originality of design still remains with the engineer of the Chicago Waterworks. The water-supply of that city is taken from the neighbouring lake. With the rapid increase of population which forms so striking a characteristic of the great American cities of the day, has ensued the natural consequence of the pollution of the waters of this lake. Our neighbours, being no more advanced than ourselves in the knowledge of the best mode of utilising the valuable elements of sewage, turn their drainage into the lake, as we turn ours into the Thames. The lake has become foul in consequence, and the water so far affected as to be increasingly unfit for domestic use.

The method adopted to remedy this evil will be so clearly understood by an examination of the drawings, that it is not necessary to say very much in explanation. The plan, in two words, is this:—A shaft is sunk on the shore of the lake, and another is sunk in the lake itself, at two miles' distance from the shore. A species of pier, or tower, called a 'crib,' is constructed for the protection of this shaft, which was designed not only to act as a working-shaft for carrying on the excavation of the tunnel, but also to afford an inlet for pure water on the completion of the works. These two shafts are connected by a driftway, or small tunnel, driven through the solid clay which forms the basin of the lake, the exact length of which is 10,567 feet. The diameter of this *emissarium* is five feet in the clear, to which has to be added, to measure the excavation, the space occupied by two rings of brickwork. The rate of progress attained in working from both ends averaged 14 feet per diem at each face. The cost of the land and water-shafts together is stated at 120,000 dollars, that of the tunnel at 200,000 dollars. It must be borne in mind, with reference to these prices, that the nominal rate of wages is very high at Chicago; sewer-masons earning from 18s. to 21s. per diem, and ordinary labourers as much as 6s.

The engineer has not lost sight of the possibility of the spreading contamination of the waters of the lake. Careful arrangements have been made, as will be seen on the drawings, to allow of an extension of the tunnel. There is a provision in the crib for the sinking of a second shaft. The tunnel is built so as to support and form a junction with this structure, and is run a little distance lakeward, so as to give a fair start to the new work whenever it may be commenced. A strong iron bulkhead is built into the tunnel, designed to cut off all communication during the progress of the extension, and to allow of free communication so soon as that second instalment of subaqueous work shall be completed.

The care and forethought they displayed are remarkable; but the question arises, what will be the sanitary state of a city on the shores of the lake when the pollution of its waters has reached such a pitch that pure water cannot be found at a distance of a couple of miles from the shore? We think it would be a matter of evil promise for the citizens, if the time were to come when they should require Mr. Desborough, the engineer, or his successor, to dive and to burrow a second time in search of an untainted supply. Like all our sewage arrangements, the Chicago Waterworks bear, on their design, (written in large letters too), the designation 'temporary.' But as a method of meeting an immediate want, by a bold and eminently straightforward course, these works merit a very high degree of praise.

The chief point of interest, in the details of the work, is the construction of the artificial island, or crib. Special attention will be

directed to the experience thus obtained with reference to a plan, that is said to receive support in very high quarters, for a submarine tunnel under the Straits of Dover. We shall gladly open our columns to any further information which Mr. Desborough, or his friends, may feel desirous of communicating to our readers.

THE ENGINEERING COLLEGE, POONAH.

THIS building, of which we give an illustration, is one of the group of public buildings in the Bombay Presidency which in a great measure owe their existence to the public spirit and enlightened exertions of Sir Bartle Frere, while Governor of Bombay. The College has been built by the agency of the Public Works Department, under the immediate superintendence of Colonel Howard, R.E., from the designs of Mr. James Trubshawe, late Consulting Architect of the Bombay Government; and it is said, by those who have seen it, to be a highly successful building, notwithstanding that it was executed almost entirely away from the architect's superintendence—in fact, the larger part of the details were prepared by him, with the assistance of Mr. Roger Smith, in this country, and sent out to Bombay.

SOCIETIES.

Royal Institute of British Architects.

The ordinary fortnightly meeting of this Institution was held on Monday, the 15th inst., Joseph Clarke, Esq., Vice-President, in the chair.

Among the donations announced was a number of works on art and science, which had formed part of the library of the late G. R. Burnell (Fellow). On the proposal of Professor Kerr, a special vote of thanks to Mr. Burnell was passed for the very liberal manner in which he had fulfilled the wishes of his brother, lately deceased, as regards this contribution.

The CHAIRMAN announced that, in consequence of the intervention of an additional special meeting on the 1st inst., the special general meeting for the award of the Royal Gold Medal and Institute Medals and Prizes would be held on April 5, instead of on March 1, but that on the last-mentioned day the recommendation of the Council in respect to the award of the Royal Medal would be announced.

Mr. W. BRANSON was called upon to read a paper entitled the 'Science of Colour,' from which the following are extracts:—

'I propose in this paper to devote myself mainly to point out some particulars in which it seems to me, after a long and careful study of the whole subject, that the theory of colour usually maintained is not exactly what it ought to be. Much of the value of what has been ascertained about colour is lost through a misconception on some essential points, and important discoveries have been fruitless for want of being known and understood by those who should use them.

'There are innumerable different kinds of light, each distinguished by its peculiar refrangibility, and the peculiar sensation of colour with which it affects the eye; and the colours of all objects are combinations of the colours of those particular kinds of light which the same objects may happen to send to the eye.

'Newton, with marvellous skill, effected and proved the analysis of the colours of natural objects by the aid of a prism, and called the prismatic colours primary colours, because he did not go on to investigate the relations of these prismatic colours to each other, but assumed, as it seems, that they were all equally simple and uncompounded, notwithstanding that in some of his admirable experiments he found that adding together parcels of the prismatic rays produced colours which were identical with those of other simple prismatic rays.

'About a century after Newton, the great German astronomer, Tobias Mayer, observing that it was possible with mixtures of red, yellow, and blue pigments to produce an imitation (though but a poor one) of all the prismatic colours, concluded, too hastily, that these three alone were simple colours, and deserved the name of primary colours. We do not read that he tested his conclusions by any cross experiments, or, in the manner of Newton, investigated the way in which the colours of pigments and of their mixtures were produced,—otherwise he would not have failed to find out what Newton had clearly stated before him, over and again, that pigments act by destroying light, and that the colour of the mixture of two pigments is not a mixture of their separate colours, but merely the colour of those prismatic rays which both of the pigments leave undestroyed—some colour, in fact, which is common to the colours of both of the separate pigments. But Mayer's views were plausible; they seemed obvious to the eye; the illusion they concealed was not easy to make so clear; they were adopted and laid down authoritatively by Scheffer in his "Art of Painting," and by other writers; and, therefore, without any scientific examination, they were, and are to this day, received by people in general as undoubted truths, and form the foundation of that system of colour-doctrine which is now taught even in our Schools of Design under the authority of the Department of Science and Art, and which also prevails on the Continent.

'After the lapse of another century, however, some accurate observations have at length been made upon the prismatic colours, which, though they have remained for now eight or nine years almost unnoticed by practical men, will, I doubt not, in future be regarded as having established the true theory of colour, and as having relieved the student in this department of art from the difficulty or impossibility of reconciling the requirements of a false or defective theory with the approval of a refined taste or a nicely discriminating eye. The experiments I refer to are those which were made by Professor James Clerk Maxwell on the proportions in which different sets of three rays taken from different parts of the spectrum must be combined in order to produce the sensation of white, and will be found detailed

in the Transactions of the Royal Society for 1860, to which I must refer those who would fully understand the process employed. They constitute a sort of trigonometrical survey of the spectrum, on a principle which determines the relations of the colours of all the prismatic rays to each other. These experiments were made with a refined apparatus, and repeated many times over by different observers, to ensure the correctness of the results; and they distinctly prove that three of the prismatic colours, namely, the best red, the best green, and the best blue, which occur near the beginning, the middle, and the end of the spectrum, when mingled all together produce white, like the mixture of all the prismatic colours; and when combined in pairs produce all the intervening prismatic colours in the full strength which they possess in the spectrum: that is to say, the prismatic red and green, when combined in different proportions, produce the prismatic orange, yellow, and yellow-green, which lie between them in the spectrum, and the prismatic green and blue, when so combined, produce all the intervening sea-green hues.

'From these facts, then, it is scarcely possible to doubt that the prismatic red, green, and blue give the nearest possible approach to simple sensations of colour. What simpler explanation can be given of the wonderful sequence of colours in the spectrum than that the eyes of all persons who possess the ordinary faculty of discerning colours* are capable of three colour-sensations alone, and that one of these, red, is excited most strongly by the less refrangible rays; another, green, by the rays of mean refrangibility; and the third, blue, by the more refrangible rays; intermediate rays exciting the first and second, or the second and third sensations, together with a more or less near approach to equality? But here it should be observed that these three simple sensations are not excited with equal depth, that is, with equal approach to purity, even by the rays which are best of each kind; the deepest in colour of the three rays is the blue, which is far the least luminous in proportion to its strength of hue; the next deep is the red, and the least deep the green. In other words, the prismatic blue is less diluted than the red, and the red less than the green. While, therefore, there is no evidence that even the sensation of blueness can be excited with perfect purity, it is certain that that of redness cannot, and still less so that of greenness. It is well to bear in mind these essential distinctions in the depth of colours, not only because they give the reason why so many blue and red pigments, flowers, and other coloured surfaces excel in depth and power the best of a green hue, but also because, if I am not greatly mistaken, the depth of a colour is almost as important a consideration as the strength of hue, or even as the hue itself, in any composition of colours.

'I will now pass on to the exposition of the colours produced by throwing together different continuous parcels of the prismatic rays, and excluding the rest, which seem to me to constitute a very interesting part of the science of colour. For the method of exhibiting these, I must rely on experiments derived by myself. These colours are the most distant of all possible colours from that medium, grey, which is the mean or average of all colours, and are therefore the most striking of all colours that the eye can behold. The colours of the most vivid pigments, flowers, or solutions, do not equal those of perfect continuous combinations of the prismatic rays, because no substance whatever sends to the eye all the rays of one part of the spectrum, and utterly destroys all the rest. It is, however, easy to see these beautiful colours, by artificial combinations of the prismatic rays (every one, indeed, who has amused himself with looking at the edges of white and black spaces of different breadths through a prism has seen them), and the study of them is very instructive; I mean the intelligent study of them, not the mere bewildered imagination which they excite when their cause and their meaning are not known.

'When we look at the spectrum of a broad band of white (such as the rectangle) upon a black ground, in the lower part of the diagram, the prism being parallel to the edges of the band, and held so near to it that a white space shall appear in the middle of its spectrum, we have in that spectrum, first, on its lower side, a series of all the colours produced by adding together different parcels of the prismatic rays, being from the least refrangible or red end; and on the other side a series of all the colours produced by adding together parcels of the same rays, beginning from the most refrangible rays.

'If we look at the spectrum of a broad black band upon a white ground (as shown also on the same diagram), the same colours are of course seen, but reversed in position; the prism being held sufficiently near to leave a black space in the middle of the spectrum. In each case the colours seen are plainly combinations of different parcels of the pure prismatic colours, beginning always at one end or at the other end of the spectrum.'

Coloured diagrams of all these four spectra were exhibited, showing the gradations of their colours.

'The principal prismatic colours and their combinations constitute the very alphabet of the science of colour, and are as essential to any intelligent acquaintance with it as the system of notation is in arithmetic, or the scale of notes in music. It is a most fortunate circumstance that we are able so easily to produce an invariable exemplar of colour, which, though not actually perfect (since even the colours of a pure prismatic spectrum, as I said before, are, in some degree, diluted or mixed), yet excel all others in depth; and are, therefore, the best which it is possible to find, to exemplify the nature of colours, and to teach the eye to distinguish, at first sight, the true complementary colours. How far the uneducated or falsely educated eye is liable to err may be seen by taking the diagrams of primary colours, and their complementary secondaries, usually given in popular works on colours, and comparing them with the series of Nature's painting. The former are in general so extremely diverse from the truth, excepting blue and red, that they scarcely present an approximation to it. Blue, for instance, is usually opposed to a very red orange, instead of to yellow; green to red, instead of pink; red to a warm or yellowish green, instead of to the colour which I have called sea-green—a colour that would, by some,

* An extraordinary dichromic vision is more frequent than is usually supposed, in which yellow and blue are the only distinctions of hue, the red and green rays appearing to differ from the yellow in brightness alone.

be thought nearer to light blue than to green. When we consider how easily these colours are produced, how striking they are to the eye, how simple the explanation of them is, it is surprising that hitherto no attempt has been made to make use of them in educating the eye, to distinguish the true primary and secondary colours, by accustoming it to the inimitably beautiful productions of Nature's unerring pencil. The student may see here in a moment how near the colour of a pigment is in hue to the true red, green, or blue, or to their complementary colours; for nothing can be easier than to compare the colour of a pigment with any of these combinations of the prismatic colours. He may also see how far any pigment, though correct in hue, falls short of the standard of perfection in the depth or in the clearness of its colour. And there is no difficulty in learning how to use a prism; indeed it may easily be fixed in the right position, with the white and black objects of view, above described, so that the student will merely have to apply his eye to it whenever he would see the colours it produces. But, in truth, a very few inspections of these colours, and comparisons of them with the colours of pigments, will generally be enough so to impress them on his mind that he will have no difficulty in referring the hue of any bright pigment, afterwards, very nearly to its correct place in the whole circle of colour.'

Mr. CRACE would make some observations on this very interesting and able paper. He must confess that it was an exceedingly difficult thing to speak upon a question which enters so much into details. While recognising all the ability and intellect which had been brought to bear upon the system propounded by Mr. Benson, he must say that he had failed to convince him. He had read Mr. Benson's book and also the various letters which that gentleman had published on the subject, yet he failed to perceive any reason for the condemnation of yellow as a primary colour. After all, Mr. Benson addresses himself to light instead of colour; the two are rather different things. He would begin with light and proceed to colour, for the one was the foundation of the other. If we went into a Southern climate under a blue sky lighted up by a yellow sun, it at once became apparent that yellow was a primary, not a secondary colour. Again, take some of those experiments with the prism which could be tried by everyone, and here it would be found that the three primary colours given by it are yellow, red, and blue. There must be stronger reasons, far stronger than what he had heard adduced, for him to alter his opinion on the subject. And he said this while not wishing in the least to detract from the high order of intellect, of talent and perseverance which had been displayed. Mr. Crace illustrated the effects of combination of colour by the aid of small diagrams and coloured glasses.

Mr. WILLIAM WHITE, who agreed with Mr. Benson that red, blue, and green were much more harmonious than red, blue, and yellow, moved a vote of thanks to the lecturer for his very able discourse.

This was seconded by Professor KERR, who pointed out that the real issue between Mr. Benson and his opponents was, that his mixtures of colour were obtained by mixing coloured rays of light, and that those of Mr. Crace or others were obtained by mixing pigments, which was a very different thing. Several gentlemen took part in the discussion, including Mr. Benson, who in his reply pointed out that Professor Kerr had correctly seized the essential point of difference between him and most of those whose views were opposed to his. The vote of thanks was then put by the Chairman and carried unanimously.

The meeting then adjourned till Monday, March 1, when a 'Memoir of the late Joseph Bonomi, A.R.A.,' by Wyatt Papworth (Fellow), as well as some remarks on the Chevalier Da Silva's work, 'Signes qu'on voit gravés sur les Anciens Monuments du Portugal,' by Mr. George Godwin, F.R.S., will be read.

PARLIAMENTARY PROCEEDINGS.

The New Law Courts.

On Friday, the 19th, Mr. GREGORY gave notice that on the 5th of March he should call attention to the site appointed for the erection of the new Law Courts, and move a resolution on the subject.

The Proposed Viaduct on the Thames Embankment.

On the same evening Lord ELCHO brought this subject before the House, and, maintaining that nobody required or approved it, pressed the First Commissioner of Works to relieve the Metropolitan Board of Works from the necessity of carrying it out. Seconded and supported by Mr. C. Buxton and Lord BURY, Lord ELCHO enforced, from this and similar blunders, the necessity of giving to some public department a control over all great works in the metropolis, and suggested the appointment of a Council to advise the First Commissioner of Works.

On Tuesday, February 23, Lord Elcho's motion for a select committee was carried. It was seconded by Mr. Tite, M.P., who stated that the Board of Works would be glad to be relieved of the outlay incident to the project, and, referring to the admitted necessity for some control and advice upon public works, stated that the Royal Institute of British Architects, of which he was President, would, he was sure, feel flattered if their opinion could be sought upon questions of this kind.

Mr. LAYARD agreed with all that could be said in disparagement of the viaduct, the history and design of which he narrated at some length. He had no power in the matter, except what personal influence he might exercise with the Metropolitan Board; at some future time he proposed to bring before the House the public question of his department's powerlessness in these matters. He hoped that a strong expression of opinion from Parliament might induce the Metropolitan Board of Works not to proceed farther at present.

Mr. COWPER said a few words in defence of the viaduct.

Mr. BRESFORD HOPE drew from the transaction the moral that we needed a really strong Ministry of Public Works and Art; and the discussion closed by a notice of Lord ELCHO to move for a committee on the subject.

REVIEW.

CORRESPONDENCE RELATING TO THE SITE OF THE NEW COURTS AND OFFICES OF LAW. John B. Day, London.

This pamphlet consists of a reprint of Sir Charles Trevelyan's letter to the *Times* up to the 5th inst., together with some other letters, provoked by them, on the subject of the site of the Law Courts; the publication is illustrated by three plans, one showing the building as proposed, a second showing the site purchased, and the third showing the proposed site.

These plans have the advantage of being tinted, but in other respects they do not, we think, inform the reader more clearly or so fully as those we have already given. They fail to show the approaches northward with the same completeness which we judged essential. A block plan of a proposed or suggested building for occupying the site is shown, but it is of an indefinite nature, and does not, we think, serve any very useful purpose. It will, however, be of great service to those who desire to master the question thoroughly, to possess themselves of this edition of Sir Charles Trevelyan's letters, published with his sanction. These letters have done much to awaken public attention to a subject which we have felt to be one of the greatest importance, and Sir Charles Trevelyan by writing them has earned the gratitude of all who have the progress of Architecture at heart.

THE ARCHITECTURAL MUSEUM.

DEAR SIR,—I must not allow our most earnest and indefatigable officer Mr. M. J. Lomax, the Assistant Secretary, to remain unnoticed in the remarks you make of me as the Honorary Secretary. Few know what Mr. Lomax has done for the Museum during our 'eclipse' beyond the President, the Treasurer, and myself.

I may add, considering the little practical work we have really been able to do for the last two years with our whole energies devoted towards raising funds for the new building, there is no Society in the profession with such a firm and good list of subscribers as our own. We are daily increasing our members; and I hope we shall not only soon clear off the debt on the new Museum Buildings, now of over 1,000*l.*, but shall extend very much the use of the Museum.

I am, dear Sir,

Yours faithfully,

JOSEPH CLARKE.

Feb. 22, 1869.

ARCHITECTURAL EDUCATION.

SIR,—I regret that in my last letter I used words as regards the French gentlemen named in Mr. Spiers's letter of February 6 which are likely to be misunderstood without explanation. Although the gentlemen named may not all be well known in this country, they are without doubt men of high eminence in their own, three of them being members of the French Institute—a rank equal to our Royal Academician; and three of them are officers of the Legion of Honour. It may be interesting to state that M. Labronste is the architect of the Library of St. Genevieve and the house of M. Achille Fould in Paris; M. Lebas, of the church of Notre Dame de Lorette; M. Gilbert, of the Préfecture of Police; and M. Questel is architect to the Palace at Versailles. I was misled by the somewhat anomalous fact that to such men as these the even nominal fee of twenty francs was paid by each student, bearing in mind that in our hospitals, &c., the services of the physicians and surgeons are as a rule given gratuitously. Let us hope that ere long men eminent in our own profession will be found willing to render similar service to their younger brethren by lectures and otherwise. Yours, &c.,

ROBERT W. EDM.

LEGAL.

Court of Common Pleas.—Feb. 19.

(Before Mr. Justice KRATING and a Special Jury.)

FRARSON V. FLUCKNETT AND OTHERS.

Mr. T. Salter and Mr. Oppenheim were counsel for the plaintiff, and Mr. Bush Cooper and Mr. H. T. Atkinson for the defendants.

This was an action to recover compensation for personal injury caused by the alleged negligence of the defendants' servants.

The defendants are the partners in the firm of Cubitt & Co., builders, who were engaged in rebuilding the premises belonging to the London and North-Western Railway Company at Haydon Square Station, Aldgate. The plaintiff was in the employ of the railway company as a constable and watchman, and it was his duty to close the gates in the evening. On the evening of January 28, 1868, while in the act of closing them, he was struck down to the ground by a heavy plank falling on him, and he received severe spinal injury, and is now incapacitated from work. It appeared that the defendants' workmen had been engaged during the day at that part of the premises, and had placed planks across the tops of the gates after they were opened, and had left off work without removing them. The plaintiff had gone as usual to shut the gates, and he attempted to do so without having seen the planks, and the moving of the gates caused the planks to fall.

At the close of the evidence for the plaintiff it was objected that the action would not lie, as there was no duty in the defendants towards the plaintiff to see that the planks were not in the position in which they were.

After some discussion, the plaintiff was directed to be non-suited.

Rolls' Court, Chancery Lane.—Feb. 20.

(Before the MASTER of the ROLLS.)

MILLWALL CANAL COMPANY V. KELK.

The bill in this case was filed against Messrs. Kelk, the well-known contractors, to hold an account of the contract transactions between the parties. Sir R. Buggallay, Q.C., who appeared for the plaintiffs, stated that certain items of account were disputed upon grounds stated in the bill, but since

the bill was filed a deed of compromise had been executed between the directors of the company on the one hand, and Messrs. Kelk on the other, and the terms of arrangement had been submitted to an extraordinary general meeting of the company, summoned for the purpose, and approved. It was therefore proposed to take a decree in accordance with these terms of arrangement, which, in fact, carried out the provisions of the deed of compromise between the parties. It provided for the payment of a small sum of money and for the delivery of certain preference shares to the defendants in discharge of their demands against the company.

Mr. Wickens appeared for the defendants.

His Lordship approved the course proposed, and the decree was made accordingly.

Vice-Chancellors' Court.—Feb. 20.

(Before Sir R. MALINS.)

IN RE THE LONDON PERMANENT BENEFIT BUILDING SOCIETY.

This was a petition by a member of this Society, praying that it might be ordered to be wound up. In 1854 the petitioner gave notice of withdrawal, he being then entitled under the rules to receive 400*l.* It was stated that that notice was very injurious to the Society, and that after struggling with difficulties for three years, in hopes of reviving its prosperity, a resolution was passed, excepting from participation in any loss in the assets all subscriptions paid upon unadvanced shares after a day named in 1857, leaving such losses to fall rateably on the balances due to members on June 30, 1856.

Mr. Cohn, Q.C., and Mr. G. Miller were for the petition; Mr. Cotton, Q.C., and Mr. Hemming, for the company, opposed; Mr. Glasse, Q.C., and Mr. Macnaughten appeared for creditors to the amount of 500*l.*

The Vice-Chancellor considered that the resolution was *ultra vires*, but as the petitioner had allowed eleven years to elapse before presenting his petition to set it aside it must be dismissed with costs.

NEW BUILDINGS AND RESTORATIONS.

Hargrave Church, Bury St. Edmund's.—This church has undergone considerable enlargement, in consequence of insufficient accommodation, and has been opened for Divine service. Funds have been raised, and a north aisle added, which accommodates 90 more persons, and is connected to nave by an arcade of three arches, executed in stone, and lighted by 3 two-light windows; the plinth quoins, weatherings, and dressings are all of Ancaster stone, the face work is flints to match the chancel, and the walls are built of Dalham stone. The nave has been partly re-seated to match this aisle, and the pulpit and desk have been removed from south to north side. The chancel was restored a few years back, with the exception of its seats: these faced the west; they have been swept away, and proper choir seats substituted, with ornamental standards for children's book desk. A rich old screen divides the nave and chancel (no arch), which has been repaired. The chancel also contains the usual piscina and sedilia, &c., restored some few years back. The tower is of brick, and shows signs of settlement and cracks. The work has been satisfactorily carried out by the undermentioned parties:—Stonemason, Mr. Hopson, of Bury St. Edmund's; general builder, Mr. James Drake, Ousden, Newmarket; ornamental iron-work, Mr. Shrivell, of Long Acre; the Architect was Mr. Ralph Chamberlain, London.

New Chapel of St. Mary Magdalene, Ripon.—This chapel, which was recently consecrated, has been erected to the memory of the late Rev. Geo. Mason, of Copt Hewick Hall; it will accommodate 150 persons, and seats are provided for 12 inmates of the almshouses adjoining. The style in which the chapel is designed is late Second Pointed, the windows being enriched with geometrical tracery. On the north-west corner of the building is an octagonal stone bell turret. The extreme length of the chapel, inside walls, is 56 feet 6 inches, width 21 feet, and height to ridge 28 feet. There are two beautiful stained glass windows, both to the memory of the late Rev. Geo. Mason: that in the east, representing the six Beatitudes, by O'Conner, of London; and that in the south, representing Faith, Hope, and Charity, by H. M. Barnett, of Newcastle. The work has been carried out by Messrs. John Chambers & Son, of Bishop Monkton; the gas fittings by Messrs. Hardman & Co., of Birmingham; and the warming apparatus by Mr. Nicholson, of Ripon; the whole being executed from the designs of Mr. W. H. Crossland, of Leeds, who is also the architect for the new chapel of St. John, now in course of erection.

A new nunnery is in course of erection near the Kensington Cemetery, at Hanwell, and will shortly be ready for consecration. The whole of the cost, estimated to exceed 2,000*l.*, has been promised to be defrayed by an opulent lady belonging to the Romish communion.

During the past few days the church of St. Gabriel, Bromley, was consecrated by the Bishop of London. The church was built from the design of Mr. R. J. Withers, by Messrs. Dove Brothers, at a cost of 4,700*l.*, of which 2,000*l.* was given by the Bishop of London's Fund, the Church Building Society.

New Wesleyan Chapel at Bredgar.—Last week this edifice was opened for Divine worship. Mr. R. Carey, of Coxheath, gave the bricks and the land, the cost of the labour and woodwork being about 1,000*l.* The building was designed by Mr. Carey, jun., of London, and carried out under the direction of Mr. C. Pillow, of Milton. Mr. Beaumont, of Milton, was the builder; the candelabra were supplied by Mr. A. Buley, of Sittingbourne, who likewise did the staining and the glazing. The size of the chapel is 50 feet by 30 feet in the clear, and it will seat 300 persons. The style is Gothic.

New Mechanics' Institute at Bradford.—The new building for the purposes of this institute is to be erected at Bowling Green. On Monday last the drawings for the new building were thrown open for public inspection. The style is modern Italian, and has been designed by Messrs. Andrews, Son, & Pepper.

The New Wesleyan Chapel, Ellesmere Road, Sheffield, was opened for Divine Service on February 9. The foundation-stone of the chapel was laid by Sir F. Lyceet, on October 30, 1857. The building cost 2,500*l.*, and accommodates about 1,000 persons. The style of architecture is Early English, being designed by Messrs. Wilson & Crossland, architects. Its general dimensions are 75 by 43 feet, but it is 59 feet across the transepts. The contractors were Messrs. Hardy and Duke, with Mr. George Longden. Messrs. Marshall, Watson, & Moorwood have done the iron-work, and laid the hot-water apparatus for heating the building.

Hardingstone Church, Northants, was reopened on Tuesday week, after having undergone a much-needed restoration at the hands of Mr. Palgrave, architect; previous to which the body of the church was occupied by pews of surpassing ugliness, the main feature of the chancel was the squire's pew with a fireplace in it, there were galleries in the west end and north side, and the tower was blocked out from the nave. All this has been remedied, and a new font and pulpit added, as well as two stained windows, one by Heaton, Butler, & Bayne, the gift of the Rev. R. H. Cox, vicar, and the other, in memory of the late Mr. and Mrs. Bouverie, is the gift of their tenants. The churchyard has also been decorated with shrubs and trees, presented by Mr. Frederick Perkins, nurseryman.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Archæological Discovery at Jerusalem.

The operations of the Palestine Exploration Fund in Jerusalem have led to a promising discovery, reported by Lieutenant Warren, under date of the 1st inst. It is a kind of vaulted crypt, which is situated in a private garden, which forms part of the harem area. It is thus described:—

'The substructure, now used as a tank, is 63 feet from north to south, and 57 feet from east to west, thus being nearly square. Its northern wall is 23 feet 6 inches from the south side of the Birket Israil (traditional Pool of Bethesda). It consists of nine rectangular bays formed by four piers, cruciform on plan, equidistant from each other and from the walls, from which spring arches. The arches between the piers, and between the two northern piers and walls, are stilted or pointed; those from the two southern piers to the walls appear to be flying buttresses, unless the remainder of these arches are concealed behind the east, west, and south walls of the substructure.

'The dimensions of arches and piers all vary somewhat, which may arise from the thick coat of plaster which exists up to the top of the arches—that is, to about 14 feet above the floor of the tank. These arches support nothing; they merely strengthen the piers, and resist any lateral thrust against the side-walls.

'The whole of the substructure is covered in by vaults intersecting in groins over the bays; surface-ribs (of cut stone) are thrown over from the piers to the sides, the remainder of the arches being composed of rag-work. The vaults are pointed; the springing of the vault surface-ribs is 14 feet above the floor of the substructure, and the cement does not reach higher than that point. The vaults, from springing to crown, are also about 14 feet in height, giving a total of 28 feet from the floor to the crown.'

This vault was entered through what is described as a tank-mouth—probably an opening regularly built, though in this and in some other particulars, especially in the uncertainty as to the real nature of the arch conveyed by the gallant Lieutenant's words, 'stilted or pointed,' there is room for greater accuracy as well as fuller detail in the report sent. An opening for an overflow is described as existing in the northern side of about 2 feet in height by 1 foot wide. A staircase, the entrance to which is now closed, and some other openings are described.

There can be little doubt that this forms one of a series of water-tanks.

As a parallel to this structure, Mr. Conybeare pointed out that many subterranean vaulted reservoirs of corresponding design were constructed in Roman times, unquestionably for use as tanks only.

Of these the best known are the Piscena of the Villa Cardito, near Naples, and the Piscena Mirabile, near Baia; in the latter the vault has transverse ribs of cut stone, with the spandrels between filled in with rubble exactly as in the example discovered by Lieutenant Warren—the only difference being that in the latter case the vault is pointed instead of semicircular.

But the most splendid examples extant (out of India) of such subterranean reservoirs are the cistern of Bin-birdereil (or of 'the thousand and one columns') and that of the Yèrè-batan-serai (or 'Subterranean Palace'), at Constantinople. Of these the first is now dry, and used as a silk-factory. It occupies an area of 20,000 square feet, and is capable of containing 1,237,000 cubic feet of water, a quantity sufficient to supply the population of Constantinople for 16 days. The Yèrè-batan-serai still remains a cistern of water; its vaulted roof is supported by 336 marble columns, all with exquisitely sculptured Corinthian capitals, and some of them with sculptured shafts. In both the construction of the roof is the same as in the tank discovered by Lieutenant Warren—viz., a groined vault with rectangular transverse ribs.

Explorations at Herculaneum.

The artistic public will learn with great satisfaction that, through the liberality of His Majesty the King of Italy, excavations at Herculaneum are to be recommenced.

There is every reason to believe that at least as rich a collection, and in all probability a richer, of works of art and antiquity lies buried under the lava which overwhelmed Herculaneum, as was dug out from the scorie and ashes under which Pompeii was covered.

We shall watch with great interest the progress of renewed explorations in this locality, where, as is well known, no researches have been made for a great number of years.

Associated Arts' Institute.

The second Soirée of the season was given by this Society, at the Conduit Street Rooms, on Saturday, Feb. 20. Upwards of 400 persons, including many celebrities in art, literature, and science, were present. The gallery of the Society of Female Artists was thrown open for the evening, and formed a great source of attraction, the works exhibited being of a far higher character than those of previous years. There was also a collection of works by members of the Institute, a good display of photographs, reproductions from drawings by old masters (lent by the Autotype Company), and other objects of interest. A concert, under the direction of Madame Leupold, was given during the evening, the performers being Miss Alice Elton, Miss Goodall, Mdlle. Tourrier, Miss Annie King, Herr Anglyali, and Mr. Maltby. The whole affair was eminently successful.

Competition at Rochester.

The Corporation of Rochester have recently decided to invite six eminent architects to send in designs for the proposed New Corn Exchange, which they intend building at a cost of not more than 5,000. The length is to be about 100 feet, the width varying from 50 to 80 feet.

Discovery of Ancient Pavements at Palermo.

The late visit of the Crown Prince of Italy to Palermo was the occasion of an interesting discovery in that city. Amongst other festivities arranged by the local authorities in honour of the illustrious guest was a grand display of fireworks on the 'Piazza Reale.' Certain scaffolding had to be erected to carry a large pyrotechnical design, and in digging the necessary holes in the ground a piece of mosaic was found at a depth of only 3 feet from the level of the Piazza. Since then this discovery has been carefully followed up, and has resulted in the laying bare the floors of four mosaic pavements which had once belonged to as many distinct apartments. The first of these represents Orpheus sitting under a tree surrounded by animals attracted by his music; he wears the Phrygian cap, and strikes the lute with a short stick. This picture is surrounded by a coloured border, and near it is the second pavement, which consists only of a plain black and white pattern; but the fact that the surrounding walls were found more than 2 feet high makes this compartment peculiarly interesting. The walls are covered with frescoes not unlike those found at Pompeii in the brilliancy of the red. The third compartment is divided from the first by two Corinthian columns with Ionic bases and sharply cut capitals; and although the floor never appears to have had any provision for draining off the wet, it seems to have been that of an open court: the pattern is in black and white. But the finest mosaic found was the fourth, which is composed of medallions and rich borders, the subjects being mythological, such as Leda and the Swan, the head of a Neptune, &c. The date of these mosaics is believed to be that of the first century A.D. Some years ago mosaic fragments, evidently of the same period, were discovered in another part of Palermo, namely, near the Quattri Cantoni; and as the site of the recent discovery is about 1,000 yards distance from that of the earlier one, and, moreover, farthest removed from the sea, some idea may be formed as to the probable extent of this colony of ancient Rome.

The Darien Canal.

American papers are once more discussing this scheme, and it seems that the project of cutting a canal which shall unite the Atlantic and Pacific is one likely to be executed at no very great distance of time. The distances saved will be enormous: thus the journey by sea from New York to San Francisco will be shortened by 14,000 miles, to Callao by 10,000, to Melbourne by 3,000, to Canton by 9,000, and to Calcutta by 4,000 miles. The surveys made by order of Congress show that the best route will be via San Blas, where the entire distance between the two oceans is only thirty miles, of which two-thirds only would require the cutting of a canal, as for the remaining ten miles a river, running in a south-westerly direction, may be made available for the passage of large ships. The capital necessary for this undertaking is estimated at 65 million dollars, and a company, incorporated by New York State, has been formed for the purpose.

Is it True?

The *Missouri Republican* recently stated that 'the engineers engaged in making the piers of a railway bridge at St. Louis, to cross the Mississippi, are said to have found an ancient tunnel below that mighty river. The tunnel passes under the river to the Illinois shore, and whether it is wholly the work of some ancient race who once inhabited this land, whose interesting remains are strewn so thickly up and down this great valley, or whether it is partly natural and partly artificial, remains to be seen. The main passage is about twenty feet high by fifteen broad, and systematically arched overhead; part of the way by cutting through solid rock and part by substantial masonry. The bottom seemed to be much worn, as if by carriage wheels of some sort. There are many lateral passages which are about eight feet high and six feet wide. Around the walls of the main passage there were what seemed to be niches closed with closely-fitting slabs, each slab covered with inscriptions in Runic uniform characters which bore a marvellous resemblance to those upon the slab in the Mercantile Library, which was brought from the mines of Nineveh. Between the niches were projecting pilasters, with draped Assyrian or Egyptian heads. If the facts are truly stated, an ancient city must have stood on the Mississippi, near to St. Louis, though probably on the opposite bank. If so, the cases of Memphis and Cairo will have found a parallel in the New World.'

Notes for Connoisseurs.

An important collection, the property of the late M. Gueneau d'Aumont, was sold at Dijon on February 22 and following days; it included 1,500 groups, statuettes, cups, diptyques and triptyques, bas reliefs, caskets, and other works of art in ivory, besides wood carvings, bronzes, &c., 1,200 being in gold, silver, *pietra dura*, enamels, &c. This is one of the largest collections of the kind that has been offered for sale for a long time.

All the connoisseurs of Paris were collected in one of the rooms of the auction mart, in the Rue Drouot, the other day, on the occasion of the sale of a

small wooden casket which might have been seen in the Retrospective Gallery on the French side of the Exhibition of 1867. The wood of which this curiosity is composed is conjectured to be oak or walnut, but time has effaced the characteristics; the box or casket is rectangular, with a flat cover ornamented with medallions cut in the wood, and surrounded by figures of animals, real and chimerical, with German inscriptions. It is mounted in chased iron, in the style of the fourteenth century. This box, which five centuries ago cost, perhaps, five shillings, was sold for two thousand francs to M. Leroy-Ladurie.

The estimation in which the works of Eugène Delacroix are held was again evinced at the sale of the pictures, sketches, &c., of the late painter, M. A. Dauzats. Delacroix's original sketch, the first idea of the Entrance of the Crusaders into Jerusalem (the picture at Versailles), was sold for the relatively enormous sum of 7,100 francs (284*l.*).

An event of mournful interest, and not of uncommon recurrence, took place at the sale rooms recently; namely, the disposal of a number of modern works given by the artists in aid of a brother in distress. Amongst the pictures sold were, one by Ed. Frère, 'Les Sabotiers,' which fetched 42*l.*; a drawing by Gérôme, 10*l.*; and the 'Trumpeter of the Cuirassiers,' by Schreyer, 34*l.* Twenty-two artists subscribed to this Samaritan sale, and the result was a total of more than four hundred pounds.

Tapestry, artistic furniture, and objects of art are in high request just now. At the sale of the effects of the late M. de L—, of Madrid, which occurred a few days since, there appeared a very remarkable *surtout de table*, *épergne* and other pieces, thirty in all, executed in gilt bronzes by Rauro, from designs by Clodion, Prudhon, and other celebrated artists; after a very spirited bidding, it was knocked down at 4,280 francs (over 171*l.*). At the same sale five pieces of tapestry of the sixteenth century, representing episodes in the conquest of Granada by Ferdinand of Castille, fetched 132*l.* At another sale three pieces of Gobelins tapestry, with three panels of the same manufacture, figuring scenes of the Odyssey, sold for 456*l.*

Competitions Open.

ROUEN.—Artists and architects are invited to send in designs for a funeral monument, to be erected in memory of the late Maire of Rouen, M. Verdrel. The total cost of the work, including the honorarium of the architect (fixed at 5 per cent.), is not to exceed 1,200*l.* The plans, drawings, and estimates are to be deposited at the office of the secretary-general, at the Maire of the town, on or before May 15. All the designs are to be exhibited, from May 20 to June 6, in one of the rooms of the Hôtel de Ville of Rouen. The jury is to be composed of members of the municipal council, with a certain number of architects and other artists, and the decision is to be announced before July 1. The author of the selected design, if approved by competent authorities, will be entrusted with the construction of the monument, under the surveillance of the municipal authorities. In addition to the honorarium a gold medal will be awarded to the successful candidate, the second in rank to receive 20*l.*, and the third half that sum.

The details and plan of the competition may be seen at the office of THE ARCHITECT, or are to be obtained at Rouen, or of the Editor of the *Moniteur des Arts*, 43 Rue Saint Georges, Paris.

A note attached to the programme of this *concours*, 'inserted to aid foreign competitors to draw up their estimates,' has a general interest. Prices of work per cubic mètre:—

	Francs.	£	s.	d.
Excavation	2.50	0	2	0
Concrete, quick lime, and sand	20.00	0	16	0
Brickwork of the best kind, including centerings and pointing	45.00	1	16	0
Aubigny stone work, finished	200.00	8	0	0
White echailion	300.00	12	0	0
Lials for steps and pavement, including cutting and laying	250.00	10	0	0
Sainte Honorine granite do.	250.00	10	0	0

PARIS, for Chili.—A competition is now open in Paris for designs for an equestrian statue of the ancient President of the Republic of Chili, General Bernardo O'Higgins, who was the head of the state from 1817 to 1823, and whose memory is held in high estimation. The statue is to be in bronze, and to represent the General quitting Rancagua, where he was besieged by the Spaniards, who were four times more numerous than his own forces, and forcing his way at the head of the few brave followers who had survived a carnage of thirty-six hours' duration. The statue and pedestal are to be of about the same dimensions as the famous statue of Henry IV. on the Pont Neuf, Paris. On the pedestal are to be four bas-reliefs representing:—1. Deposition of the Supreme Director O'Higgins in 1823; 2. The fight at Roble, where the General was wounded; 3. The Chilean squadron leaving Valparaiso to intercept a convoy under the protection of the Spanish ship *Maria Isabel*; 4. Meeting of the patriot Generals, O'Higgins and Saint Martin, on the battle-field of Maipo, on April 5, 1818.

None but known artists are admitted to the competition, and their designs are to be sent in to the Chilean consul in Paris, before March 15. The designs are to be accompanied by a statement of the price at which full-sized models of the statue and bas-reliefs would be rendered in plaster. The designs will be judged by an official committee of sculptors, architects, painters, and competent critics. A curious condition is annexed to the proposal; namely, that the successful sculptor shall employ, as an auxiliary in carrying out the work, a young Chilean sculptor, a pupil of the eminent French sculptor Joffroy, whose talent the commission desires to encourage, while at the same time giving somewhat of a national character to the work.

The maximum cost of the monument, carriage and all other expenses included, is fixed at 3,000*l.* (75,000 frs.), and the work is to be completed by January 1, 1871.

Applications for conditions, &c., to be made to M. Fernandez Rodella, Consul-General for Chili, 26, Rue de Laval, Paris.

Suez Canal.

The chief directors of the Suez Canal works met, towards the close of last year, in committee in Paris, with a number of experienced maritime men, mining and other engineers, and naval constructors, to consider the methods of working the great ship canal when completed. The problem to be solved was, the mode of rendering the transit as rapid as possible, with due regard

to the maintenance of the banks of the canal on one hand, and to economy and, consequently, the interests of the shareholders, on the other. It is necessary, of course, to fix the maximum rate for vessels passing through the canal, to settle the methods of towing, to study the effects of the tide in the Red Sea on the navigation, to arrange for the lighting and maintenance of the canal, and to settle the mode of calculating the tonnage of vessels. The officers of the company are now studying on the spot the various questions raised by the above-named committee.

The following are a few of the conclusions and opinions now current. It seems to be admitted that steam vessels will be able to traverse the canal at the rate of 10 kilomètres or 6½ miles per hour. Sailing vessels of more than 50 tons burden may be towed at the rate of 6 to 7 kilomètres per hour; while smaller vessels will not require towing, the width of the canal being sufficient, it is believed, to allow them to navigate without obstructing the course of the larger ships. In order to prevent collision and difficulty in the navigation, small basins will be formed at distances of 10 or 12 kilomètres all along the line. All large vessels will be required to carry a pilot thoroughly acquainted with the conditions of the navigation, and with the day and night signals.

The method of lighting the canal and the lakes, and that of towing, are now under consideration.

The mode of calculating tonnage, for the transit-charge of 10 francs per ton, gives rise to some difficulty on account of the system of measurement adopted in various countries. The same vessel will measure 300 tons in France, 250 in England, and 150 in the United States; so that some general rule must be adopted, and this will be a benefit to commerce generally.

One of the effects of the opening of the canal will be, it is presumed, the hastening of the application of steam to commercial shipping. Steamers can make the transit in sixteen hours, while sailing vessels require twenty-three to twenty-seven; and the Red Sea is notoriously more easy of navigation for the former than the latter.

Such are the general statements and expectations put forth with regard to this gigantic work. Should the hopes of the projectors be fulfilled to their utmost extent, we shall have abundant reason to congratulate them as well as ourselves.

General.

The Royal Academy have lately introduced certain modifications into their system of inspection by Visitors, these being now chosen from among the Associates; and Messrs. Wells and Armitage have already filled the post. There can be no doubt that this change will work well; for, being younger men, they retain more the impressions of the difficulties with which they had to contend when students, and will try, therefore, to smooth away those difficulties from the paths of others. Mr. Armitage, who, we believe, studied in the French 'ateliers,' and is therefore well acquainted with the French system of instruction, is admirably fitted for the post, as he will be able to impart the principles of the foreign system of drawing, and to give fresh vigour and life to the drawings of the Academy students, which much require it. There is also another feature which Mr. Armitage is trying to introduce, viz., the production of sketches for fixed subjects at certain intervals; these sketches being made at home, and then brought to the Academy and publicly criticised by the Visitor; composition and design being chiefly aimed at, and execution and finish altogether disregarded. There is no doubt that this system ought to have been introduced long ago at the Academy, and the want of it has long been felt; but there are still found, unfortunately, a large number of persons who believe that the principles of composition and design, whether in painting or architecture, are only instinctive, and cannot be taught systematically, notwithstanding the abundant evidence to the contrary, as is exhibited in the results of the teaching of the French and Belgian schools.

The magnificent studies in landscape which adorn Mr. Leighton's studio, and which were made during his travels in the East, Greece, Spain, and the islands of the Mediterranean, are intended, it is stated, to be bequeathed to the Royal Academy, for the use of the students.

Bolton Exhibition.—Up to the present time about 70,000 persons have visited the Fine Arts' Exhibition at Bolton, which was opened a few weeks ago in aid of the funds for the handsome building recently erected as a Mechanics' Institution.

Historical Figures in Canterbury Cathedral.—The south-west porch and the whole of the west end of the Cathedral are now filled with niches for statues; and within the last month those of Queen Victoria and the late Prince Consort have been erected. A movement was set on foot by the Dean in 1862 to fill the niches with historical figures connected with the Cathedral, and thirty-six are now in their places, including Gregory the Great, Archbishops Theodore, Dunstan, Alphege, Becket, Baldwin, Hubert-Walter, Langton, Courtenay, Sancerft, and Laud; Kings Alfred, Edmund, Canute, Edward the Confessor, William the Conqueror, William II., Henry I., Henry II., Edward III., Henry VIII., Edward VI., Charles I.; the Black Prince, Bishop Ridley, and Dean Stanhope. The work was undertaken by Mr. Pfyffers, the sculptor, at a cost of 24*l.* each. The southern face of the porch has been reserved for the four archbishops who have had most influence on the Church, viz., Augustine, Lanfranc, Anselm, and Cranmer. These have been placed above, and King Ethelbert and Queen Bertha below.

A very interesting collection of water-colour drawings, the property of Her Majesty, illustrative of the Highlands and Highlanders of Scotland, past and present, is being exhibited, by the Queen's permission, at Messrs. Mitchell's Royal Library, Bond Street.

The Print Room of the British Museum has been enriched by the acquisition of Mr. Pye's collection of the Liber Studiorum prints and proofs,

which has been acquired for a sum which, looking at the enormous prices sometimes paid for fine copies of this remarkable work, may be held to be almost nominal.

A new method of transport for conveying granite from the quarry to the railway has been worked out by Mr. Hodgson, C.E., for Messrs. Ellis & Everard, who have to transport their stone a distance of three miles. The principal agent is an endless wire rope, supported on pulleys, which are carried at a considerable height from the ground on stout posts, the entire arrangement having much the appearance of an ordinary telegraph line. A portable steam-engine drives the rope at about five miles an hour, and it carries with it a continual stream of boxes, each holding 1 cwt. of stone. The rope being endless, the full boxes travel at one side of the supports and the empties return at the other, and the pendants by which the boxes are hung are specially formed to allow of their passing the points of support, which they do with perfect ease. This line crosses the country boldly as an ordinary telegraph would, and from its cheapness, the rapidity with which it can be constructed, and the ease with which it can be moved, it seems probable the method will be found of considerable use for similar purposes elsewhere.

Messrs. Watts, Hart, and Leighton form the 'hanging committee' of the Royal Academy Exhibition this year.

Mr. Layard, Chief Commissioner of Works, has sanctioned the carrying an iron railing 7 feet high round the Regent's Park in lieu of the present dwarf fence. The rails will be of the ordinary ugly common spike shape.

The whole of the staff and employes of the Board of Trade have removed from their former locale in Whitehall to Pembroke House, a block of buildings in Whitehall Gardens recently occupied in the Foreign Office.

Building Trade Technical Schools at Bradford.—The committee of management of this undertaking for the dissemination of technical education in the building trades have now entered upon the new premises in Godwin Street. The new building is four storeys high, has been engaged at a cost of upwards of 80*l.* a year, and a considerable sum has been expended in fittings. It is intended to form a library of practical and useful works relating to the science and art of the building trade for the use of members; 3*s.* paid in advance secure all the advantages the school may offer.

The Report of the British Land Company (Limited) states that the sales of land for the year have amounted to 211,637*l.*, being about 6,000*l.* more than during the previous year, and that after paying the interim dividend of 5 per cent., amounting to 7,500*l.*, the balance-sheet shows a profit of 30,552*l.*, out of which a further dividend of 5 per cent. is recommended and a bonus of 10 per cent., making 20 per cent. for the year, and leaving 8,052*l.* to be carried forward. The directors propose to ask authority at the ensuing annual meeting to issue new shares to an amount equal to the present capital. Estates have been purchased at Acton-green, Balham, Kilburn, Kingston, Leyton (two), Page-green, Tooting, Wimbledon, and Woodford; and the whole of those at Tottenham Station and Walthamstow (No. 8), and at Baldock, Barnet-town, Brentwood, Bristol, Chiswick, Hornsey (Nos. 1 and 3), Rochester (No. 2), and Woodford (D), have been sold.

QUESTIONS.

To the EDITOR OF THE ARCHITECT.

SIR,—As the replies may be of use to many others besides myself, I hope you will kindly find room for the following queries:—

1. Can rain-water that has passed through a slab of Ransome's filtering stone be kept in an underground (covered) tank without becoming unfit for use?
2. Information is requested as to the best mode of forming such tanks.
3. What quantity per head per diem is sufficient for ordinary domestic supply in the country?—A town average is evidently in excess, as it includes that used for manufactures, watering streets, &c.
4. Will filtered rain-water act on the zinc of a galvanised iron cistern?—It corrodes lead.
5. Is it a fact, as often stated, that water contained in gutta-percha pipes will not freeze?

Yours truly,

L. C. E.

DEAR SIR,—Will you kindly inform me, through the medium of your Journal, whether, a contractor having agreed to execute certain works according to plans and specifications, to draw 75 per cent. as the work proceeds, would a sub-contractor, who agreed to do a portion of the work according to the same plans and specifications, be bound to the pecuniary terms, or be entitled to receive the whole of his balance on the completion of the sub-contract?

Yours faithfully,

JOHN CHAPMAN, JUN.

MEETINGS OF LEARNED SOCIETIES.

ROYAL INSTITUTE BRITISH ARCHITECTS.—Monday, March 1, at 8 P.M. 1. 'Memoir of the late Joseph Bonomi, A.R.A.', by Wyatt Papworth. 2. 'Some Remarks on the Chevalier Da Silva's work, 'Signes qu'on voit gravés sur les Anciens Monuments du Portugal', by Mr. George Godwin, F.R.S.

INSTITUTION OF CIVIL ENGINEERS.—Tuesday, March 2, at 8 P.M. 1. 'On Sinking Wells for the Foundations of the Piers of the Jumna Bridge, Delhi Railway,' by Mr. Imrie Bell. 2. 'Description of Apparatus for Excavating the Interior of, and for Sinking, Iron Cylinders,' by Mr. John Milroy.

ARCHITECTURAL ASSOCIATION.—Friday, March 5, at 7.30 P.M. 'On Relief Sculpture versus Fresco Painting,' by P. A. Nairne, F.R.G.S.

SOCIETY OF ENGINEERS.—Monday, March 1, at 7.30 P.M. A paper will be read on 'Electric Telegraphy,' by Mr. E. G. Bartholomew.

ROYAL SOCIETY.—Thursday, March 4, at 8.30 P.M.

ROYAL INSTITUTION.—Monday, March 1, at 2 P.M. General Monthly Meeting. Tuesday, March 2, at 3 P.M. Rev. F. W. Farrar 'On Comparative Philology.' Thursday, March 4, at 3 P.M. Dr. Harley 'On Respiration.' Friday, March 5, at 8 P.M. Mr. W. Huggins 'On some further Results of Spectrum Analysis applied to the Heavenly Bodies.' Saturday, March 6, at 3 P.M. Prof. Odling 'On Hydrogen.'

SOCIETY OF ARTS.—Wednesday, March 3, at 8 P.M. 'On the Adaptation and Extension of Present Means for the Promotion of Scientific Instruction,' by H. H. Bates, Esq. On this evening Lord Frederick Cavendish, M.P., will preside.

EDITORIAL NOTICES.

No communication can be inserted unless authenticated by the name and address of the writer, —not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such enquiries.

PUBLISHER'S ANNOUNCEMENT.

Advertisements cannot be received for insertion later than 2 P.M. on Thursdays.

Temporary Office, 4 Monument Yard, London.—GILBERT WOOD, Publisher.

THE GAZETTE.

PARTNERSHIPS DISSOLVED.

Yates & Thomas, Wash-upon-Deerne, Yorkshire, bricklayers; Marshall & Hall, Derby, metal manufacturers; Ide & Pinn, High Street, Shadwell, brass-fitters; Gillett & Wisbey, Wormwood Street, and Little Pearl Street, Spitalfields, carpenters; J. Jones & Sons, Garston, builders, as far as regards J. Jones; Coates & Bown, South Stockton, brick manufacturers; Newton & Bradcock, Oldham, gas-meter manufacturers, as far as regards G. Newton.

DECLARATIONS OF DIVIDENDS.

Scott, T., Deptford Bridge Iron Works, and Blackheath Road, engineer, &c.—First div. of 7s. 3d., Wednesday next, and three subsequent Wednesdays, at Mr. Edwards's, Basinghall Street; Finch, W., Daniel Street, Bethnal Green Road, timber merchant—second div. of 2s. 6d., and 7s. 6d. to new profits, Wednesday next, and three subsequent Wednesdays, at Mr. Edwards's, Basinghall Street; Jones, H., Carnarvon, land agent—second div. of 1s. 10½d., any Wednesday, at Mr. Turner's, Liverpool; Mowbray, F. W., Leicester, engineer—third div. of 2½d., any Monday, at Mr. Harris's, Nottingham.

BANKRUPTS.

Ilsley, Thomas, Eward Street, Goswell Road, and King's Square, engineer, March 8, at 11; Higgins, W., Bridge Road, West Battersea, contractor, March 4, at 2; Tyerman, F., late of Gracechurch Street, and Church Street, Chelsea, architect, March 12, at 12; Weller, W., Foekett Mews, Harrow Road, sub-contractor, March 8, at 12; Westcott, Robert, Sutton, builder, March 8, at 12; Dann, James Wallis & James, Cromer Street, and Thanet Street, builders, March 10, at 12; Downett, Robert, Good Easter, Essex, builder, March 11, at 2; Furness, T. & H., Warwick Road, Brompton, builder, March 8, at 12; Martin, James Charles, Gray's Inn Road, revolving shutter manufacturer, March 10, at 2; Mills, William, jun., King Street, Clerkenwell, lathe-maker, March 8, at 11.

To Surrender in the Country.

Creswell, H., Great Marlow, timber dealer, March 2, High Wycombe; Giles, James, Hound, Southampton, builder, March 2, Southampton; Harbert, W. C., Great Yarmouth, builder, March 4, Great Yarmouth; M'Laren, John, Shotton, brick manufacturers, March 4, Newcastle-upon-Tyne; Tomlin, H., Chorlton-upon-Medlock, engineer, March 2, Manchester; Bainbridge, Charles, Biggins, Joseph, & Thwaites, Watson, Redcar, builders, March 8, Leeds; Creswell, H., Great Marlow, timber dealer, March 2, High Wycombe; Dunn, Henry, Whitby, builder, March 11, Newcastle-upon-Tyne; Hitchen, John, Cookley, engineer, March 6, Kidderminster; Mason, Joseph, Hereford, builder, March 6, Birmingham.

TENDERS.

LONDON.—For Rebuilding at the Buck's Head, James Street, Bethnal Green Road. Messrs. Reeves & Butcher, Architects:—

Nixon & Son	£1,696 0 0
Turner & Son	1,589 0 0
Kilbey	1,589 0 0
Macey	1,514 0 0
Cook	1,254 0 0
Higgs (accepted)	1,247 0 0

LONDON.—For the Erection of Three Houses and Shops, Walworth Road, for Mr. F. Mason. Mr. F. Codd, Architect:—

Edwards	£3,777 0 0
Oroker	3,578 0 0
Kirk	3,324 0 0

FINCHLEY.—For additions to the Railway Hotel, for Mr. Mackness. Mr. W. K. Williams, Architect:—

Eaton & Chapman	£296 0 0
Marr	941 0 0
Anley	845 0 0

CHELSEA.—For completing a House in the Cremorne Road, at the corner of Seaton Street. Mr. E. O. Symons, Surveyor:—

Stoner	£785 0 0
Shillito	778 0 0
Godbolt & Lawton	590 0 0
Long	542 0 0
Higg (accepted)	500 0 0

HACKNEY.—For Alterations and Additions to the Hackney Union Workhouse, at Homerton. William Lee, Esq., Architect. Quantities by Messrs. Linsdell & Giffard:—

Cheeseman	£11,150 0 0
Lewis	11,133 0 0
Conder	10,887 0 0
Higgs	10,829 0 0
Ashby & Son	10,450 0 0
Perry & Co.	10,443 0 0
Brown & Robinson	10,380 0 0
Hill, Keddell & Waldram	9,989 0 0
Sawyer	9,963 0 0
Henshaw	9,672 0 0
Webb & Son	9,366 0 0

HIGHGATE.—For Alterations and Additions to Whittlebury House, Highgate, for O. H. Fenwen, Esq. W. G. Habersham & Pite, Architects:—

Hemmings	£1,600 0 0
Bays	1,550 0 0
Fincher & Martin	1,450 0 0
Salter	1,450 0 0
Carter	1,450 0 0
Crockett	1,400 0 0
Davies	1,400 0 0
Jackson	1,289 0 0
Blackmore & Morley	1,265 0 0
Kendall	1,260 0 0
Brown & Sons	1,249 0 0
Bennett	1,210 0 0
Fethok	1,170 0 0
Turner	1,170 0 0
Baker & Constable	1,075 0 0
Cubitt & Sons (too late)	1,040 0 0

MALMESBURY (Wilt).—For Additions to Dwelling-houses for Mr. W. Forrester. Mr. T. S. Lansdown, Architect:—

Weeks & Bowman	£460 0 0
----------------	----------

MALMESBURY (Wilt).—For new Stables for Mr. W. Forrester. Mr. T. S. Lansdown, Architect:—

Weeks & Bowman	£221 0 0
----------------	----------

BIRMINGHAM WORKHOUSE SCHOOLS.—The following tenders were received for the erection of School Buildings at the Workhouse:—

Hardwicke & Son	£8,995 0 0
Moffatt	8,969 0 0
W. & J. Webb	8,900 0 0
Barnsley & Sons	8,868 0 0
Jones	8,800 0 0
Sutman	8,769 0 0
Creswell & Sons	8,739 0 0
Falmer & Son	8,688 0 0
Briggs & Son	8,498 0 0
Horsley Brothers	8,475 0 0
Trow & Sons	8,342 0 0
Jeffery & Fritchard	8,050 0 0

SUTTON.—For Two Houses for Mr. John Buck. Mr. Edwin Nash, Architect:—

Deards	£1,974 0 0
Cooper & Cullum	1,966 0 0
Cuff	1,890 0 0

WATFORD (Herts).—For the Erection of a Shop for Mr. Catherall, of Berkhamstead. Mr. Frank E. Thicke, Architect:—

Chalk	£570 0 0
Waterman	560 0 0
Wilkins	554 0 0
Snell	580 4 8
Halley	517 12 0

APPOINTMENTS VACANT.

INDIA.—July.—Forty Appointments in Engineer Establishment of Public Works Department in India. Mr. W. T. Thomson, Secretary, Public Works Department, India Office.
CAMBRIDGE.—March 1.—Surveyor. Salary, 1500. per annum. Duties to commence on Lady-day next. Mr. Frederick Barlow, 60 St. Andrew's Street, Cambridge.
ST. MARY'S, ISLINGTON.—March 1.—For the appointment of Sanitary Inspector. Mr. John Layton, Vestry Offices, Upper Street, Islington.
METROPOLITAN BOARD OF WORKS.—March 3.—For appointment of Gas Examiner. Salary, 1000. a year. Clerk to the Board, Office, Spring Gardens.
ROMFORD.—March 4.—For the appointment of Surveyor of the Highways. Salary, 1500. per annum. Mr. North Surridge, Clerk to the Board, Romford.

COMPETITIONS OPEN.

ROYAL ACADEMY OF ARTS.—National Gallery. For the best painting in Oil—or Model and Design in Painting, Sculpture, and Architecture. The Gold Medal and the Discourses of Presidents Reynolds, West, &c.; and for the best Copies of Drawings, Models of Life, the Antique in Landscape Perspective, &c. The Silver Medals, &c. November 1.
ROTTERHAM.—March 15.—For Plans, &c., for erecting a Public Hospital and Dispensary. A prize of 750. is offered for the best design, 500. for the second, and 250. for the third. John Barras, hon. secretary, Rotterdam.
KINGSTON-ON-THAMES.—March 1.—Design for new School and Master's Residence. Cost not to exceed 9,0000. F. Gould, Esq., Kingston-on-Thames.
BRECON.—March 1.—Plans and Estimate for Alterations of County Gaol. A premium of 300. is offered for best plan. Edward Williams, Clerk of Peace, Brecon.
CORPORATION OF MANCHESTER.—ALEXANDRA PARK.—March 8.—The Corporation invite landscape gardeners, surveyors, and others to send in designs in competition for laying out the Alexandra Park. Joseph Heron, town clerk, Town Hall, Manchester.
BOGNOR.—March 12.—Designs for Sea Defence Work. A premium of 500. will be given for the plan approved of by the Board. Mr. Frederick Eklins, Clerk to Local Board, Bognor, Sussex.

CONTRACTS OPEN.

LONDON.—March 5.—The Commissioners of Her Majesty's Works and Public Buildings are prepared to receive Tenders for the ordinary Works and Repairs to Public Buildings, &c., in the London District. George Russell, Secretary, Whitehall.
INDIA OFFICE.—March 1.—For Proposals to supply Mammooties and Picka. Director-General of Stores, India Office, Westminster, S.W.
FINSBURY SCHOOL DISTRICT.—March 1.—For the Erection of Proposed Buildings, at Upton, West Ham, Essex. Architect, Mr. Frederick Peck, 15 Funnival's Lane, E.C. C. S. Waldron, Clerk to the Managers.
SHOREDITCH.—March 1.—For Watering Roads in parish of St. Leonard. Mr. W. G. Davis, Vestry Clerk, Town Hall, Old Street Road.
SHOREDITCH, March 9.—For Masons' and Paviers' Work, &c. Mr. W. G. Davis, Town Hall, Old Street Road.
UPPER HOLLOWAY.—March 6.—For Execution of Drainage Works and Road-making. Mr. James Wylson, 33 Norfolk Street, Strand.
HOLBORN DISTRICT.—March 1.—For Cleansing Streets and Removing Dust, &c.; also for Watering the Streets. Mr. Lewis H. Isaacs, C.E., Office of the Board, Little Gray's Inn Lane.
HAMMERSMITH.—March 3.—For Formation of Roadways, Pathways, Surface Drainage, Levelling, and Laying-out of Burial Grounds in Fulham Fields. Mr. George Saunders, 111 King Street, West Hammersmith.
HAMMERSMITH.—March 8.—For the various Works connected with the Formation of the Roadways, Pathways, Surface Drainings, Levelling, and laying out of their Burial Ground, situate in Fulham Fields. Alfred J. Roberts, Clerk to the Burial Board.
ST. MARYLEBONE.—March 11.—For Supply of Materials to Repair Roads; for Supply of Stoneware Sewage Pipes, Bends, Junctions, &c.; for Bricklayer's Work, &c. &c. &c., all for one year, from March 25. Mr. T. Gaal Browning, Surveyor, Court-house, St. Marylebone.
LAMBETH.—March 5.—For Supply of Men, Horses, and Carts for Watering and Carting; also for Slopping and Cleansing Work; also for supply of Granite and Execution of Mason's and Paviers' Work. Mr. Thos. Roffey, Vestry Hall, Kennington Green.
LAMBETH.—March 5.—For the Execution of Masons' and Paviers' Work to be done during the ensuing year, commencing March 25, 1869, and ending March 25, 1870. Thomas Roffey, Clerk to the Vestry, Vestry Hall, Kennington Green.
LAMBETH.—March 5.—For the Supply of Guernsey Flints, Fine and Rough Gravel, Paving Materials, &c., during the ensuing year, commencing March 25, 1869, and ending March 25, 1870. Thomas Roffey, Clerk to the Vestry, Vestry Hall, Kennington Green.
POPULAR DISTRICT.—March 5.—Board of Works. For the following Works for one year, ending Lady Day, 1870, viz:—
For Mason's Work, Materials and Labour inclusive.
For the Supply of Port Phillip and Bombay Stone, Gravel and Flints, and Broken Guernsey Gravels.
For the Execution of Repairs to Sewers, Gullies, &c., and General Jobbing Works.
S. Jeffries Barth, Clerk to the Board, 291 East India Dock Road.
POPULAR.—March 5.—For Mason's Works, &c. S. Jeffries Barth, 291 East India Dock Road.
MILE END ROAD.—March 3.—For Making-up Carriage Roads, and Kerbing and Paving Footpaths. Mr. J. Knight, Vestry Hall, Bancroft Road, Mile End Road.
BROMLEY.—February 28.—For supply of Stoneware Drainage Pipes. Mr. Arthur Jacob, Bromley, Kent.
HACKNEY.—March 11.—For Supply and Execution of Mason's Work Gas Fittings, Ballast, &c. &c. Mr. James Lovegrove, C.E., Town Hall, Hackney.
PEKTONVILLE AND OTHER PARISHES.—March 18.—For Supply of Building Materials. The Directors of Convict Prisons, 48 Parliament Street, S.W.
ST. MARY, ISLINGTON.—March 5.—For Day and Jobbing Works in connection with Sewers and Drains. Mr. Higgins, Vestry Offices, Upper Street, Islington.
SAINT MARY, ISLINGTON.—March 5.—For Stone Paving such parts of the Footpaths and Carriageways of the Parish, and Repairing and Keeping in Repair the Paved Footpaths and Carriageways. John Layton, Clerk, Vestry Hall, Islington.
WESTMINSTER (St. James's).—March 4.—For the performance of the Paviers' and Masons' Work required within the said parish, and for Supplying Broken and Unbroken Granite and other Stone, for a term commencing from March 25, 1869, for three years. George Buzzard, Vestry Clerk.
WESTMINSTER.—For the Erection of a House on the site of the Chapel, Duke Street, Westminster, immediately contiguous to St. James's Park. Charles E. Davis, F.S.A., 3 Westminster Chambers, Victoria Street, London, or 55 Great Pulteney Street, Bath.
WESTMINSTER (DUKE STREET).—For Erection of a House. Mr. Charles E. Davis, F.S.A., 3 West Chambers, Victoria Street.
WESTMINSTER (Parish of St. James's).—March 4.—For Supply of Carts, Horses, and Men for Watering Streets. Also for Paviers' and Masons' Works. Vestry Hall, Piccadilly.
FULHAM.—March 3.—For the Construction of 400 feet run of Sewer in St. Peter's Square, Hammersmith. The Chairman, Broadway House, Fulham.
PADDDINGTON.—March 1.—For Execution of Day and Jobbing Works in Constructing and Altering Sewers. Surveyor's Office, Vestry Hall, Harrow Road.
CAMBERWELL.—March 2.—Vestry of St. Giles.—For the Execution of Sewers Works, comprising 1,380 feet 18 inches pipe sewer, 700 feet 15 inches pipe sewer, and 230 feet 12 inches pipe sewer, to be laid in the Crystal Palace Road, Goose Green, Peckham Bye. George William Marsden, Vestry Clerk, Vestry Hall.
SAINT GILES, CAMBERWELL, March 2.—For Execution of Sewers Works in the Crystal Palace Road, Peckham Bye. Mr. Geo. Wm. Marsden, Vestry Hall, Camberwell.
BAMPTON (OXON).—March 2.—For the Warming of the Parish Church. Rev. D. Adams, Bampton, Faringdon.

The Architect.

THE ARTIST, THE MANUFACTURER, AND THE TRADESMAN.

WE all know what it is for two or three persons, after accidentally meeting as perfect strangers and conversing casually and indifferently for a time, to hit upon the name of some mutual friend, or to find themselves to be natives of the same town, or all immersed in the same pursuit. In a moment they are on common ground, they begin to understand one another, their distrust vanishes, and the conversation becomes free and friendly. We think the artist, the manufacturer, and the tradesman, if they could only perceive how much common ground they occupy in all that relates to buildings, would often become better friends, to the very great advantage both of themselves and the public.

Strangers such as those whose case we started with remain so only from want of fully knowing all about each other. We venture to think that it is much the same in the present case. To begin with the popular idea of the Artist. Is the word not commonly supposed to designate every man who paints pictures or carves statues, and no one else?—and no matter how badly he does these two things, the selection he has made of a calling in life is supposed to entitle such an one to be termed an artist; a title which many would never dream of applying to a worker in iron or mosaic, a painter of glass windows, a goldsmith, or an architect. It may be difficult to say precisely and distinctly what an artist is, but we can at least say boldly and emphatically that every man who paints or carves is not an artist—unless he does those things really well; and that he who exercises well these two arts, or any other of the arts known as fine—the arts whose aim it is to produce objects of beauty—is an artist.

A painter of bad pictures or a carver of ugly statues has forfeited his claim to be called an artist, because, the aim of painting and sculpture being to produce beautiful work, what he has done has no beauty in it; on the other hand, the designer and producer of a beautiful building, a charming decoration, or any work of art in wood, stone, iron, glass, lead, or any other material whatever, is a true artist, and may be one of the highest order.

Again, and to take the other side of the case, the art-workman, it is true, has been to some extent appreciated, and with justice, for often he is a brother artist of a high order of skill; but is it not too often believed by many who ought to know better, that the sole aim of a tradesman, be he manufacturer, retailer, or workman, is to make money, and that so long as he succeeds in doing this he will be perfectly indifferent to all other considerations whatever? This idea, wherever it is held, may be safely said to have about as much of verisimilitude in it, and no more, as lurks behind the popular notion of an artist just described. It is true that the tradesman has selected his calling in life (just as in fact the professional artist selected his) with a view to make a living—and perhaps a fortune; but no tradesman worthy of the name is quite without pride in the excellence of his wares, and a desire to excel in his workmanship; and there are happily not a few tradesmen who are real artists—and many more who, without being artists themselves, have had the good sense to introduce art into the objects they manufacture or deal in.

Now, of all the classes of work which come into a building, there are none which cannot be more or less brought under the hand of the artist, and none in which the artist does not need to depend upon the pride which the tradesman or the craftsman takes in good work for the full carrying out of his ideas; and it is this which makes every building a common ground to these two classes of men, who move in very different spheres of life and work, and are not always as ready as they ought to be to perceive where they are related.

We believe, however, if we may be forgiven for speaking candidly, that the manufacturer, the retailer, and the workman have more to learn in this matter than the artist. When an architect, a designer of mosaic or of stained glass, a decorator, or any other of the many descriptions of artists who have to depend on the hands of others for the working out of their ideas, finds his work well carried out, he is not slow to appreciate the advantage. We feel sure, on the other hand, that there are many manufacturers of and dealers in the various articles used in buildings who would willingly do what is needful to raise their work to the highest level, but who do not understand all that makes the distinction in an artist's eyes between bad and good art-work, and cannot comprehend why work that they know to be solid is objected to because it fails to correspond to the designer's drawing in what they deem minute particulars.

To a tradesman thus situated—and there must be many thousands of such—we have to point out that good art, like many other good things, can generally be had for money. There is now no trade and no manufacture in which some men thoroughly able to do the artistic part of the

work are not to be had; and he is a wise employer who, aware that he himself was not trained at a school of art or accustomed to work for an accomplished architect, will secure the best art-workmen that are to be got, will procure designs from the most highly gifted designers, and, having done this, will leave all that relates to design and decoration to others, occupying himself in making sure that work and materials are of the best, and the putting together of the soundest.

In addition to the works done on a building, such as carving, plasterer's work, joinery, and masonry, which all of them give more or less scope to the dexterity of the art-workman, there are very many manufactures with which the artist has now little to do where he ought to have much. We have no doubt that any dealer in or manufacturer of chimney-pieces, stove-grates, door furniture, gas fittings, ground and cut glass, or in fact of any of the adjuncts of buildings which are ordinarily bought out of a wholesale or retail tradesman's stock, if he would take the trouble to obtain from really skilled artists designs thoroughly appropriate to the purpose, and excellent as works of art, would find his efforts repaid.

It may be invidious to mention names, and we shall not now do so; but there are prosperous firms, whose success is notoriously as much due to the good design as to the excellent workmanship of their metal-work, their tiles, their glass or their paper-hangings. There is quite as large a field open to the manufacturers of many other articles used upon a building as to the trades we have just named; and as yet but little has been done to occupy it. It is difficult, for example, to get a thoroughly bad tile paving, but it is more difficult to get a tolerably good stove-grate—looking at both from an artistic point of view; and there is ample room for a perfect revolution of the best kind, by the employment of the art designer and art workman in this branch of the building business.

Nor is it simply the case that there is room for art in such manufactures; there is a call for it. We have in this country, and in the present day, begun to resume the habit of paying attention to the design of matters of every-day use. More persons have learned to distinguish between well-designed ornament and that which is inappropriate than used to care about such things. We have only to look at the stride which church building has taken in our own day to see that architectural taste is spreading and extending.

Art is beginning to show itself in our dwelling houses; and the man who anticipates the change, who prepares and manufactures articles that are not only thoroughly sound, but also perfectly well designed, may, we think, fairly hope to find his wares become the rage, and to fill his own cash-box while he also contributes to the advance of public taste.

If we refrain from pointing to any living art manufacturer, there can be no delicacy in recalling the career of Josiah Wedgwood as an example of what a single man, who personally was even more a good workman and a sound tradesman than an artist, can do in raising a branch of British industry to the highest possible position within the space of a single lifetime. There is ample room for more Wedgwoods; and though all may not attain his rare success, few will work in his spirit without obtaining both substantial returns, and some share of the honours bestowed upon him.

It is unfortunately quite true that many a manufacturer whose wares would not pass muster in the eyes of even a very tolerant artist has his hands full of business, and that the retailer who deals in the goods required on buildings finds what he considers a large enough demand for his goods without his taking the trouble of running after novelties about which he does not know a great deal, and for which no very urgent demand has arisen, so far as he is aware. This, we say, is quite true; it is very much to be regretted; and were this all that could be said about it, we should not trouble ourselves much further in advising the introduction of art into all our manufactures.

We are fully aware that manufacturers will not produce, and retailers will not vend, articles for which there is no demand. But it is because the demand is rising, and has in fact arisen, that we venture to direct attention to the question of art in manufactured goods. No one can walk about any great town with his eyes open and not see that the fashion of building is greatly changed for the better—that good materials are driving out bad, grace is replacing ugliness—the work of the artist is gaining ground. Further, the greatest signs of this alteration in taste are to be seen in the houses of the wealthy, the influential, and the fashionable.

If political changes begin with the many, there can be no doubt that fashions start with the few. Artistic work of all kinds is *coming into fashion*, and to anticipate the demand is to have the control of the market.

If we urge manufacturers to take up this question more energetically than hitherto, we call also upon our architects and art-designers to turn their attention to it. There are many objects which, in houses of moderate cost, must be necessarily made in large quantities. If architects who are artists and have felt the difficulty of obtaining suitable and pleasing articles of this sort will only take the trouble to prepare good and simple designs for such objects, and will cause them to be manufactured whenever they can induce makers to adopt them, and will arrange for the articles made up from these designs being brought into the market, a great deal of good will be done, and progress will be made towards securing a sufficient supply of such objects of daily use as shall replace, and in fact supersede, the many eyesores which are daily on sale and in use in this country.

OUR RAMBLER

AT ST. THOMAS'S HOSPITAL.

THE promise, or more correctly speaking, the threat, of an eruption, once led 'Our Rambler' to ascend Vesuvius. On arriving at the *locanda* at Resina, where it is customary to quit the carriage, and to engage some of the long-legged and long-suffering animals—some species of horse, certainly not the pony—on which visitors are ordinarily borne to the foot of the cone, a native party was before him, and two cavaliers were just in the act of establishing confidential relations with their hired steeds. Signor Don Massimo di Pompeio was as fat as a Neapolitan of two or three and forty always is, if he escapes the usual hungry meagreness of his nation and his sex. His height was about five feet two, his face was of the colour of tallow, his stubby black moustaches stood out angrily over his mouth, his round black eyes glared suspiciously at the ever present cigar, at which he sucked so vigorously, that the wet end in his mouth seemed to consume as fast as the lighted end in advance of his nose. He raised his right leg like a ballet-dancer. The toe just touched the under side of the stirrup. He pirouetted for a considerable time on the left leg, with no result except that of giving one or two feeble kicks to the dangling iron. Then he went round to the other side of the animal, and raised the left leg, with no better result. Then a chair was brought out, on which he *did* mount, and then, with some aid and trouble, he clomb to his saddle.

Signor Don Giulio di Cesaribus took advantage of the experience of Don Massimo. He tried the chair in the first instance. He swerved heavily forward when motion was first essayed; but when his feet were inserted in the stirrups, he took kindly to his unaccustomed elevation. His legs were long, and, finding that he could keep the nag between them, his courage rose, and he excited the speed of the animal by a series of joyous little howls. Very straight he rode across the country, over everything indiscriminately—road, scoriae, hedge, what not—woe to pig, or dog, or child, that did not fly from his rapid path. At length the animal made a sudden genuflection, and Don Giulio, figuring for a moment like a flying eagle, with his long skirts spread out as wings, shot through the air, and alighted on his head. When they put him up again, he rode sadly and silently in the rear.

On we went, over those infamous scoriae. A chapel to Saints Crispinus and Crispianus ought to be erected at the Hermitage. And when we reached the summit, for that is all to which we now seek to refer, what was it that first struck and most constantly attracted the eye in all that magic panorama? Two very ugly buildings. Look where we would—at the sharp precipice of Capri, with its cap of floating-cloud, at the bluff outline of Misenum, at the noble palaces of Portici, Caserta, Naples—at city, shipping, or fisher barque on the distant horizon—back came the glance. The long, unbroken façade of the Albergo dei Poveri, or the ugly light yellow masses of a set of half-finished warehouses at Naples, constantly attracted the vision from all the more noble and more picturesque incidents of the Seine.

It was in that volcanic ramble that we first became distinctly impressed with the fact that, of all elements of architectural structure, none strikes the observer so irresistibly as magnitude. Sheer bulk presses on the vision. It is not necessary to this effect that symmetry should regulate this bulk. On the contrary, a perfectly proportioned building is apt to look far less than it is. Magnitude in a single dimension is, perhaps, the most intrusive or commanding, as in the case of a certain ponderous London column, or of the long, straight, roof line of St. Alban's Abbey. But repetition of heavy masses, such as those of the warehouses of the *Arenaccia*, at Naples, has the most irresistible effect. Look where you like, you will always see these ponderous blocks, while they are everywhere within the field of vision.

This reflection occurred with unusual force to "Our Rambler" as he stood, a day or two ago, on that light and tremulous platform with which the taste and skill of Thomas Page has replaced the hopeless modern ruin of Westminster Bridge. Thomas Page, who having, as resident engineer under Sir M. I. Brunel, completed the patient and heroic labour of the tunnel beneath the bed of the Thames, has now, on his own design, erected the widest, and the lightest, and, taken all in all, perhaps the most graceful of the road bridges that span its surface. Looking northwards, the great cluster of towers forming the sky line of the Legislative Palace, gave the idea rather of a group of buildings than of a single structure. On the southern bank, behind the long white line of the finished river wall, rose a forest of masts. Within this leafless wood, the warm glow of red brick, and the gleam of newly-cut Portland stone, indicate the growth of a building which, when completed, will attract the eye more forcibly than almost any, if not quite than any, of our newer Metropolitan structures.

The new Hospital of St. Thomas is a striking illustration of that never-to-be-forgotten lesson, that the plan is the first proper object of the study of the architect. Novelty of purpose demands novelty of plan; novelty of plan, if rightly dealt with, produces, in its turn, not only novel, but commanding, effects of pictorial excellence.

The first requisite for a healthy hospital, we are taught by the medical science of the day, is a free supply of pure air for the wards. For the air to be pure, there must be a sufficient interval between ward and ward, so that infection or de-oxygenated air shall not pass from window to window. Therefore when a hospital is intended to

contain a greater number of beds than can be disposed in a single line of building, something of a gridiron form of plan becomes essential, and the spaces between the bars of the gridiron must be adequately wide.

This interspacing of wards and open courts is differently contrived in some of the best modern hospitals. In the Herbert Hospital at Woolwich, the wards jut out on either side of a central longitudinal corridor. The plan of the new Infirmary at Leeds might almost have been taken from that of a portion of the former building. At Blackburn the wards project alternately from either side of the central continuous line. At the Lariboisière Hospital, at Paris, wards and offices are arranged round an open quadrangle. In St. Thomas's Hospital the continuous part, a back bone of the building, is to the south, facing towards the grounds of the Archbishop's palace. Six pavilions or blocks, containing wards, project each some 124 feet towards the Thames. A central chapel advances to about one-third of that distance. A block containing offices, to the east of the main building, and connected with it by arcades, is to some extent a repetition of the pavilions. Thus over the long line of 1,200 feet are regularly disposed eight large blocks of very similar structure, connected by an arcade in front, and, with one exception, by a more massive structure behind. The effect of this large mass of building, cut into such distinctly repetitive forms, will be to attract the eye of the spectator with a power which more ornate but less important structures can never possess, but even in this particular it seems probable that the elevation least seen, and perhaps least studied, may, as is not unfrequently the case, prove the more effective of the two; certainly, as far as it has gone, the land-front produces a remarkable, and to us an unexpected impression on the spectators.

It remains to be seen whether the general forms, and the treatment throughout, and especially the features on the sky-line, will be such as to cause this building to give as much pleasure to the critical observer of its detail, as its striking aspect is likely to afford the ordinary passer-by. The work, as far as it has gone, warrants our hoping that this will be so. Thoughtful care is evident in every detail; the colours of the materials are rich and well-contrasted, the very best of bricks and stone (Fareham bricks and Portland stone) are employed, and the mouldings, though plain, are of good design.

We cannot however dismiss the fear that an architectural mistake has been committed in the spacing of the blocks, and in their alignment on the Thames front. They are not all equidistant, nor all on one line. The chapel, which forms the central feature, sets back from the general river-frontage, and the space between the blocks is wider here than elsewhere. It may prove that the effect of this is satisfactory; but if it produce the result that the building, as seen from Westminster Bridge, shall appear not so much one effective whole, as two much less effective groups on either side of an inconspicuous centre, a very considerable portion of the overpowering effect due to regular repetition will be found to have been lost.

But to return to the works. In a prolonged stroll round, and through, and over the building itself, while seeing much to note, and much to admire, the Rambler is weak enough to confess that he does not remember anything very distinctly to condemn. Whether that is his fault or the architects' time will show. There was, indeed, a disappointing absence of hurry and scramble. Over the whole area of the great building the work was proceeding in a manner that may be characterised as highly monotonous; no strikes among the men seem to have occurred. The scaffolding was everywhere alike; clean, strong, and sound, and covered with acres of planks. We did not see a bit of the building left out here, and another pulled down there; or any of those incidents which add so much to the picturesque variety of a large work, and show that the architect thinks it never too late to mend. Amid this steady and unpretending progress, the points that most delayed us on our ramble were the concrete walls and arches of the foundations, the machinery for sawing and dressing stone, and the girders from Belgium.

We must not, however, omit to mention the long series of cantilevers, vases, bases, and other items, in Ransome's artificial stone. Those critics who demand that every individual stone in a building shall bear the mark of the human purpose of the mason who cut it, cannot but sneer at the cantilevers turned out of a mould, and as sharp as good Staffordshire castings. But price is an important element, even when an architect has half a million to spend, and in the choice between a series of well-formed, durable, artificial, stone ornaments, and none at all, we are on the side of the former.

Another remark applies to a simple but most effectual contrivance, the honour of which the Rambler understood to be due to the clerk of the works. Are any of our readers unacquainted with the usual condition of the inside of a flue? Do they know how invariably, or almost invariably, smoke-traps and soot-traps are set, as if of *malice prepense*, by the bricklayers. As surely as a cabman's Euclid it is demonstrated that a straight line is the longest that can be taken between two points), so certainly does the bricklayer—well, *scamp*,—the inside of a flue. Our friend here has been too much for him, however. By the simple contrivance of a wooden trunk, round which the flue is built, not tightly, but so that the trunk can be drawn upwards as the work ascends, regularity is secured, and trouble is actually diminished. We noticed a very skilful disposal of some of the flues, which creep round the semi-circular heads of the windows of the first-floor, within the very thickness of the arch.

Over the whole area to be covered by the building has been spread, broad and deep, a solid bed of concrete. To say nothing of the structural value of this precaution, especially in case of the unwelcome visit of an earthquake, we cannot but believe the hygienic effect will be of great importance. Residing on the alluvial bed of a river is distressing to many constitutions. It is a sure aggravation of any tendency to cancer. The relief experienced, in some cases, by passing on to a marble floor, or a limestone soil, cannot be explained either by thermometric or on hygrometric reasons. It is no doubt a phenomenon due to terrestrial electricity; and we trust that the concrete in the present instance will have a somewhat similar effect. In the buildings to the west of the main edifice the work is at present only level with the ground floor. It is interesting there to observe the concrete walls, and the arches of the same material, not built on blocks, but thrown in, layer after layer, between boards, the removal of which, when the concrete has hardened, allows the display of a series of horizontal marks, that tell of the method of construction. The arches have been frequently built, as is so often the case in Italy, on earthen centres.

Chapter and verse, heights and depths, precise measurements of all kinds, are matters for a report on the building, such as may doubtless be furnished in due time. It is not within the province of the Rambler to provide notes bristling with statistics; but a building 1,200 feet long in one structure, and extending, with its subsidiary schools and offices, to 1,760 feet in length, occupying an area of $8\frac{1}{2}$ acres of ground, purchased at a cost of some $\$5,000$., and containing 24 millions of bricks, 350,000 cube feet of Portland stone, and 1,250 tons of wrought-iron girders, presents certain very salient points to the memory.

The noble style on which this great work has been planned has enabled the architect to allow an unusual width between the wards—a matter, as above hinted, of extreme importance to their healthy ventilation, and freedom from mutual infection. At the Lariboisière Hospital, the space thus allowed is 23 yards; at the Herbert Hospital, it is only 18; at the Leeds Infirmary, and at the Blackburn Infirmary, it is 25. At St. Thomas's it is no less than 42.

The patients who are cured in this hospital, which is intended to contain 588 beds, will no doubt depart full of gratitude for the care that has been taken to provide for their comfort and tendance. But let science do her best, there are some who will not depart, or at least who, ascending, let us hope, by a staircase, compared to which that of the giant's at Venice is paltry and contemptible, will leave that on their forsaken couches which has to be removed by others. A tunnel under the building provides for this necessity, with decorum and privacy. It goes on to the lecture-room of the anatomical theatre, into which, not writing F.R.C.S. after his name, the Rambler cannot venture to peep.

For lifts, and flues for ventilation, and earthenware pipes down which the linen from the beds is to disappear, for kitchens, and subsidiary kitchens, and all the well-considered details of the Hospital proper, we must refer to the professional papers before-mentioned. The Belgian girders—as to which so much interest has been excited, as a proof of the effect of our own trades' disputes in enabling foreigners to undersell us in London itself—are strong and solid. A man familiar with English, and ignorant of foreign, iron work, would be puzzled to know whence they come. One peculiarity struck the Rambler. There are a certain number of upright pieces of angle iron bolted to each vertical web. In all these the Belgian contractor has given good measure; in fact, from want probably of rolls to turn out the exact size shown on the drawings, all these pieces were from $\frac{3}{4}$ to $\frac{1}{2}$ inch at least too wide. They projected beyond the end plates of the girders, in a conscientious, but useless fashion. The iron thus wasted (and all iron work that is not doing duty does harm, as extra weight) must come to an appreciable percentage on the 1,250 tons of girders. It would seem to amount to a difference sufficient to turn the question of price, if it ran very close, or was calculated very exactly. The English manufacturers need not close their works just yet, as far, at all events, as finish of manufacture is concerned.

The ever-growing application of the power of steam was remarkable in the arrangements of the builder: here you saw a barrow, full of mortar, ascending on its airy road, without the attendance of a single Irish labourer; there a pump was raising from a well, sunk for the purpose to the depth of 45 feet, a supply of water to a wooden tank at the level of the top of the building, from which pipes distributed the liquid to every portion of the work. For that supply the water companies would have demanded not less than 2,000*l*.

Under a convenient shed-roof a series of saws were slicing the clean-cutting Portland stone into blocks and slabs, with a business-like rapidity that confounded the very memory of the solitary man whom the Rambler remembers, as having slowly sawn away at a single block of marble during the whole of his boyhood (perhaps the block was changed during the holidays, but it always looked the same). One man looks after five or six of these saws, feeds them with sand and water, and removes and replaces the stone. Steam does all the rest; and does it well—rapidly, neatly, and cheaply. Still more interesting than the saws (which are also in use at the quarries), were two machines for cutting cornices, or other moulded stone work. One of these was, in plain words, but a simple gigantic plane. The stone is fixed on a ponderous traversing iron lathe bed, which moves to and fro beneath a steel cutter, changed from time to time as greater precision of outline is attained. It is an application of the principle

of the joiner's moulding plane to stone; only the stone moves, and the plane is fixed. In the other, instead of a fixed cutting iron, we have a revolving wheel, in the periphery of which steel cutters are inserted. The rapid revolution of this wheel gave a series of blows to the stone, in its slow passage beneath, like those of the mason's chisel. The work thus executed is remarkably fine and regular. It is very possible that this system might answer with stone that would not take kindly to the plane.

Looking back, as we recrossed the bridge, on that busy scene, how different was the interest it presented from that excited by the view an hour or two before! That whole tangle of poles and planks, which veiled the rising walls, seemed now instinct with purpose, and pregnant with wise forethought. The genius of execution was doing justice to the labour of the genius of design. Stretching within the quay wall, which replaced the ancient confused squalor of the muddy shore, from the iron bridge of Westminster to the grey and growing ruin—or quasi ruin—of the Lollard's Tower, resting one flank on the expression of the science of the nineteenth century, the other on that of the faith, or at least of the theology of the sixteenth, the Hospital seemed to form a link between the two. Exacting the utmost service from constantly-advancing science, and rendering the fruit of that service in a noble and varied work of charity and mercy, the benevolent institution erected under the invocation of the doubting Apostle seems to hold to both worlds. Home, or rather outpost, of those whose care it is to go between the dead and the living, and oftentimes to stay the ravages of plague, it tells us that the example of him who showed kindness to his neighbour is not altogether without fruit among ourselves. If there be one class of public buildings of the present day on which either the professional man or the philanthropist can reflect with almost unalloyed satisfaction, it is that which comprises our modern hospitals. Nor is it any disparagement to those other examples of the same class to which we have referred, to express the conviction that of all those now standing in Europe, that of St. Thomas's will be among the most worthy of admiration.

RED-TAPE.

A CURIOUS and instructive instance of the peculiar logic of red-tape was afforded by one of our late Chief Commissioners of Works on the occasion of the discussion in the House of Commons on the proposed viaduct in connection with the Thames Embankment.

Lord Elcho had been deploring the absence of any central authority in London which could hinder the execution of such a monstrous piece of ugliness as this viaduct. 'At the present moment,' said his Lordship, 'there was no controlling power in London over matters of this kind, a state of things that existed in no other metropolis in the world. Take the case of a railway company—say the South-Western—which wished to join their line to a railway in the North of London. They brought in their Bill, which was submitted to a Committee of that House; and if the plans were properly drawn, and the public requirements seemed to render the railway necessary, the Bill passed. The Committee paid no attention to the nature of the works, so far as regarded the beauty of the metropolis. What was the result? The result was that they had such a bridge as Hungerford Bridge, which intercepted the view of the Houses of Parliament; and that they had the monstrous station at Cannon Street, which jutted out and intercepted the view of St. Paul's.' This was the gist of the argument—not that there was no control, but that there was no control in matters of taste.

Now, what is Mr. Cowper's answer? It deserves to be recorded as showing the mysterious workings of the official mind. 'His noble friend seemed to think,' says Mr. Cowper, 'that if there were only a Council to advise the First Commissioner of Works, every one would be pleased; but, in point of fact, the Embankment had been submitted to a Commission, consisting of General Jebb, Captain Douglas Galton, Mr. Payne, Sir William Cubitt (then Lord Mayor), and Mr. Hunt. Sir J. Thwaites was also a member of it, and though he declined to sign the report, because he disapproved of one suggestion in it, he expressed his general agreement with the scheme.' That is Mr. Cowper's answer, and it amounts to this:—'You say that there is no controlling power in matters of taste, and yet you had here a Commission sitting on this very project, and authorising it, consisting of two Royal Engineer officers (one of them an Inspector of Prisons), a stipendiary magistrate, a contractor (who was also Lord Mayor), and a surveyor, with a civil engineer who does not count, as he would not sign the report.' Surely a wonderful answer, and worthy of the horticultural First Commissioner of 'Works and Buildings'!

MR. FOWLER ON THE SUEZ CANAL.

MR. JOHN FOWLER, the engineer of the Metropolitan Railway, has lately published his impression of the works of the Suez Canal as derived from a personal visit.

He observes that these works are simple in character, and in a soil favourable to execution; but they are of such vast magnitude, and in a country which presents such peculiar difficulties in climate and in the absence of fresh water, that special organisation and adaptation of means of no ordinary kind have been required for their realisation.

A harbour for the entrance to the canal, and for the general purposes of the undertaking, has been constructed at Port Said by running out into the sea two breakwaters, formed by artificial blocks of stone.

The harbour is well protected from the strong and prevailing north-west winds. The portion of the harbour affording shelter to vessels is nearly 500 acres in extent, and, although the depth of water is not sufficient for the largest men-of-war, it is quite sufficient for ordinary merchantmen if the present depth be maintained.

The artificial blocks in the breakwater are composed of one part of hydraulic lime from France, and two parts of sand obtained on the spot, and are therefore really hard mortar.

Leaving Port Saïd, the canal to Suez may be conveniently divided into the following portions:—

	Miles in Length.
1. Port Saïd through Lakes Menzaleh and Balla to near El Ferdam	37
2. From near El Ferdam through the great excavation of Seuil d'al Guise to Lake Timsah	9½
3. Through Lake Timsah	5½
4. From Lake Timsah through the excavation of Seuil du Serapeum to the Bitter Lakes	7½
5. Through the Bitter Lakes	23½
6. Through the deep portion of Chalouf Cutting	5
7. Thence to Suez and the end of the canal	11
Total length	99

With minute exceptions the whole of the canal is now being excavated and completed according to one or other of the following sections:—

1st. 196 feet in width at the surface of the water, and 26 feet deep for 72 feet at the bottom. The slopes are 2 horizontal to 1 vertical, with one or more horizontal benches of 10 feet in width, according to the depth of the cutting.

2nd. 327 feet in width at the surface of the water, and a similar depth of 26 feet for a similar width of 72 feet at the bottom. The lower part of the excavation is also 2 horizontal to 1 vertical, but the slopes above and below the surface of the water are 5 to 1, and a horizontal bench of 58 feet connects the two slopes.

The canal is being carried out with reference to these two sections in the following manner:—

According to the first section—

	Miles.
From near El Ferdam to Lake Timsah	9½
From Lake Timsah to the Bitter Lakes	7½
Through the deep part of Chalouf Cutting	5
Total	22

According to the second section—

	Miles.
Port Saïd to near El Ferdam	37
Through Lake Timsah	5½
Through the Bitter Lakes	23½
At the Suez end of the Canal	11
Total	77

Through the Timsah and Bitter Lakes the lower portion only of this section is required to be excavated, in consequence of the low level of the ground.

It will be observed in the description of the second section that the slope at the surface of the water is flat (5 to 1), and provision is now being made for protecting this slope with rough stone pitching, trimming the upper slopes, and otherwise treating it as a finished work. This may be safely done, because the section is so arranged that the canal may be widened at any subsequent period without disturbing any of the work already done.

With the first section, however, the case is different. This section has been adopted in the deep cuttings to effect the largest saving possible in the quantity of excavation, and therefore, if a future widening of the canal is required, one or both side slopes must be thrown back, and a considerable portion of the present work interfered with.

As a rule no stone pitching or other protection against the wash of passing vessels, or wind, or current has been provided for the part of the canal where this section has been adopted, although the slope at the surface of the water is 2 to 1.

The works of the canal at Suez consist chiefly of an entrance channel into the Red Sea, increasing gradually from 72 feet in width at the bottom to 980 feet, of a basin or dock, and a considerable extent of reclaimed land.

The quantity of work yet remaining is very large, but taking the progress made during the last few months, and applying the same rate for the future, it appears to be possible that in the absence of some unforeseen contingency the canal may be sufficiently completed for the purposes of traffic during the present year.

The question of maintaining the canal and its harbour of Port Saïd permanently open for traffic has created almost as much professional and public attention as the construction itself, and in some minds probably much greater doubt and difficulty have been felt on this than on any other point.

The Prevention of Nile Deposit from Choking up Port Saïd.

It cannot be doubted that large and almost constant quantities of fine alluvium will continue to be brought to Port Saïd from the Nile, and that the effect of placing a new obstruction to its course by a breakwater at right angles from the shore must cause a constant tendency to deposit, and this result has already occurred to an extent deserving the most serious consideration.

After the most careful observation of the old and new shore at Port Saïd, and the operations and consequences now going on there, Mr. Fowler's opinion is that no apprehension need be entertained as to the channel and harbour being silted up and destroyed; but, at the same time, that considerable expense in dredging will be constantly required—that the western breakwater must be made solid, and may have to be extended.

The Impossibility of Preventing the Sand of the Desert blowing into the Canal in quantities totally unmanageable.

This objection has been felt to be one of great weight, and when it was considered generally and without the correction of local knowledge it appeared to be fatal: fortunately, the only portions of the canal which will be liable to be affected by the sand of the Desert to any extent worthy of consideration are the two excavations on each side of Lake Timsah, and here the company are making provision to diminish the quantity by trying experiments with trees and shrubs, so as to plant the slopes and the ground for some distance on each side of the canal. It is also probable that water from the freshwater canal will be made available for forming an extended oasis at and around this portion of the canal.

These operations will be somewhat expensive, although they are doubtless prudent and desirable; but after every precaution has been taken, Mr. Fowler believes it will be necessary to keep one or two powerful dredges in Lake Timsah to keep the canal clear from drifting sand.

The difficulty of protecting the Banks against the destructive action of the Wave caused by Passing Vessels.

Proper and immediate protection of the slopes by stone pitching above and below the surface of the water along the whole course of the canal will be found necessary if the traffic is to be conducted at a reasonable rate of speed. This work will no doubt be executed much more conveniently and economically after the canal is opened throughout, and the large quantity of stone required can be conveyed without charge; but, on the other hand, it will be more difficult to place the stones below the level of the water, and probably the slopes may have sustained some mischief before the work can be done.

The impossibility or difficulty of supplying the abstraction of the waters of the Bitter Lakes during the evaporation of the summer months through the ordinary section of the canal between the Bitter Lakes and Suez.

The vast extent of the Bitter Lakes (100,000 acres in superficial area), when connected with the tidal Red Sea by the Chalouf excavation, will produce in the summer months, when the evaporation is greatest, peculiar currents and hydraulic phenomena.

The largest daily evaporation or abstraction will amount to about 250,000,000 cubic feet of water, and this will be chiefly supplied from the Red Sea, which is far nearer than the Mediterranean, and has a tidal range of about 6 feet in spring tides, and 2 feet at neap tides, while the Mediterranean has a far less tidal range.

The currents which will thus be created by evaporation and tide will be sufficient to assist or retard navigation, as they will probably approach, if not exceed, two miles per hour; but they will scarcely be strong enough to affect injuriously the bottom or sides of the channel through the Chalouf cutting after the proper protection by stone pitching has been carried out.

Traction Power to be Employed on the Canal.

It is now understood that steam vessels (except those with paddlewheels) may use their own power, and that any vessel may be towed through the canal by steam tugs, the speed to be limited in all cases as may be settled hereafter.

This is doubtless the best decision, both for economy and convenience.

If the traffic should rapidly become very large, it is possible that several passing places will have to be provided without waiting for the widening of the whole canal.

A strong side wind would also be a considerable difficulty, and occasionally it may be found to be almost impossible to keep a large vessel from the sides of the canal. In Egypt very strong winds from the east and west are not common, and the difficulty will probably not amount to more than a simple retardation of the speed of the vessel, and the necessity of lowering all masts and rigging capable of being lowered. Tug vessels can be made available for the purpose of enabling a vessel to keep the channel of the canal.

THE HANDY-BOOK OF HOUSE-BUILDING.

CHAPTER I.—LIVING-ROOMS.

(Continued from page 51.)

Comfort.—Quiet is essential to the comfort of living-rooms. Quiet means partly that the house is so planned as to keep the most noisy part of household life remote from the sitting-rooms, and partly that the construction of its walls and floors is such as to transmit as little sound as possible.

For the sake of quiet, therefore, if there is a servants' staircase it ought not to go up close to the door of one of the living-rooms; the nursery and play-room ought to be rather secluded; the bells ought not to be fixed within hearing of any except the servants who have to answer them; lifts or any other noisy mechanical arrangements ought to be kept away from the best part of the house; a force-pump or steam-engine, if there be either, ought to be well out of earshot. No pipe for conveying water or drainage from an upper floor ought to pass close to any living-room lest the disagreeable sound of its action be overheard. Those apparently convenient rolling shutters, which being metal, and running in metal grooves, raise a clatter every time they are lowered or lifted, are on account of their noise, as well as the difficulty of repairing them when out of order, unfit for a dwelling-house; and, not to multiply instances, a flat roof over any living-room so constructed that in times of rain or hail a rattling is heard by those below, unfits the room for comfortable occupation.

A still more serious invasion of quiet occurs when the occupant of a room hears what goes on in an adjoining room—or in the house next door, either through the walls, ceiling, or floor. The principal precautions to be taken against this are as follows:—Walls which separate rooms should be built thick (if possible not less than a brick and a half thick), and care taken that no timber goes through them from one face to the other at any point. Porous bricks will transmit less sound than very hard ones, and

may consequently, if strong enough, be used for internal walls. Where framed partitions separate room from room, they should be either brick-nogged, i.e., filled in between the timbers with fragments of brick; or else 'deafened,' which means that they are supplied with a thickness of lath and plaster, roughly but solidly executed, in the very centre of the partition intermediate between its two external faces. This is easily done by nailing strips of wood, technically called fillets, against the side of each timber of the partition, and fixing the laths for the deafening to them. It is essential that the brick-nogging, or deafening, be continued at least down to, and if possible below, the level of the floor—a precaution often omitted where wooden skirtings enclose the lower part of the partition.

Between each ceiling and the floor above it there should be a similar layer of rough plastering, which is technically called 'pugging.' There is always a risk of conducting sound from room to room if any joist or other timber is carried continuously from one room to another. Lastly, in noisy town situations the windows must be glazed with very thick glass; and if plate glass is not found sufficient to keep the room quiet, double sashes, or double glazing, probably will be. In using double glazing the necessity for occasionally getting at both sides of each pane of glass to cleanse it must not be overlooked.

To be comfortable all rooms must be dry. Living-rooms that have no others over them, or that have one-storeyed bay-windows, call for the greatest care in the roofs by which they are covered. This is very obviously a weak point, and is very often neglected; but the effects of this neglect are usually confined to damage to the plastering; for few persons will endure a stained ceiling long enough to allow the room to get damp. Unobtrusive blemishes are ever the soonest remedied. Windows not unfrequently permit rain to blow through them; this defect rises from bad material and workmanship, or from wrong contrivance, or both. Some rough and ready remedy can mostly be found in the use of sand-bags or india-rubber tubing, or similar expedients, so that health need not suffer; but comfort is very effectually damaged by any such misadventures.

Where damp attacks a floor, it is often long before it is found out. The timbers and boarding of many a ground floor have suddenly given way, and been found to be hopelessly rotten, in houses where it had not been suspected that under the carpet or the oilcloth there lay a moist decaying vegetable substance, slowly contaminating the atmosphere of the house, and keeping it constantly damp and unwholesome. The remedy (or preventive, as the case may be) against a damp floor is to secure throughout complete ventilation under the timbers, by air-bricks or some such precaution. If joists are laid direct upon the earth, floors can hardly escape rotting, even if ventilated: the surface-earth ought, consequently, always to be removed from the whole area of the site of every building. Careful persons like, in addition to this precaution, to cover over the whole site with a thin layer of concrete; but, whether this is done or not, there ought always to be a clear space of eighteen inches at the least below the joists of every boarded floor; and the level of all such floors ought to be well raised above that of the surrounding ground. All paved or tile floors should be laid on a well-prepared artificial bed of either concrete or some sort of dry hard material.

Damp in walls is the most common form, and the one least easily cured, in which this nuisance shows itself. It must be remembered that walls are always, or all but always, built of materials more or less porous, and that they have their foundations some way down in the earth. The moisture below the foot of the wall, that which trickles and creeps along the surface of the ground, and that much larger quantity which, in its passage through the earth just below the surface of the ground, is interrupted by the walls, all supply that which the porous materials of the wall will eagerly drink in; and, if this be once absorbed, it will rise by capillary attraction, and unless checked at some point will render the building damp. The remedies are these:—The water from below the foot of the wall must be prevented from rising by a 'damp-course,' i.e. a continuous layer of material, impermeable to water, going quite through the wall from outside to in, at the lowest point where it will be above all contact with the earth. This damp-course ought to be below the level of the lowest boarded floor. Slates—a double course of them—laid in cement; asphalt, put on hot; and hollow slabs of glazed earthenware, made for the purpose, are all excellent materials for use as a damp-course.

The walls should, in addition, be protected, if the soil be at all damp, by an area; either an open one, which gives light and air to a basement storey, or a 'dry area,' constructed by building a thin wall outside the main wall, and a short distance from it, and when the level of the ground or a little greater height is reached, arching over the space thus formed or covering it with paving stones. This precaution intercepts the moisture that is below the earth's surface, prevents its touching the main wall, and so keeps the sides of the base of that wall dry.

Rain, however, often finds its way through the walls themselves, and even has been known to drive through the brickwork or masonry of chimneys, and to come trickling down into the fire, or oozing out above the fireplace. Sometimes this is due to the walls being too thin for the nature of their materials. Few outer walls built of bricks, even if hard sound ones, are weather-tight, unless they are a brick and a half thick at the thinnest part; and when walls are of masonry or of soft sorts of brick, the minimum thickness that is safe varies with the quality of the material. There are some qualities of brick and some stones through which heavy rain accompanied by a driving wind will penetrate to almost any depth. The best ordinary safeguard, where such materials alone are available, is to build the external walls double (see page 50); that is to say, with a clear cavity of some two to four inches, or more, in the heart of them. If this is not done, such walls may be battened inside, i.e., small timbers being placed against their inner face, lathing and plastering is fixed to those timbers; and the space behind this plaster face being left unoccupied, does something to prevent the inner face of the wall from at least showing the damp.

The weather-tiling adopted in many parts of Sussex and adjacent counties as a protection to external walls, which, when so shielded, may be built either of soft bricks or of timber framing, is well spoken of by those who have used it, and probably deserves to be more extensively employed.

Even where the materials are good, wet penetrates walls readily if the mortar joints are not thoroughly well pointed, i.e., flushed up with mortar. Water that drips from any projection, or from any eaves that have no gutter, or the leakage from a defective rainwater pipe, will almost invariably penetrate to the inside of any solid wall, if beaten against it by the force of the wind, however good the pointing and the materials. Water that drains down from a window, and is conducted down to the face of the wall itself by a splayed cill, below which no moulding has been provided to throw off the wet, will often render the wall under the window damp; in fact, rain will at times penetrate at this point, however well thrown off by a projecting window-cill properly 'throated.' On this account it is especially undesirable to make that part of the wall immediately below the cill much thinner than any other part; yet for convenience inside the room this is almost always done.

Where the materials are very porous, and a hollow wall cannot be adopted, the best, and, in fact, the only effectual resource among those hitherto tried is the coating the exterior of the building with really good Portland cement. The use of a soap and alum wash has been much advocated to protect porous material from wet; but the present writer has been unable to discover any authentic example of the use of this or any other wash having proved successful. It is fair to add that Professor Church's process, now being made use of by Messrs. Ransome, seems to promise a better means of rendering porous materials waterproof than those yet tried; but it has not yet been long in use. Lastly, it may be well to remind the reader that all climbing plants have a great tendency to render the walls against which they grow damp; ivy being the worst, because its leaves remain on it all the year round.

THE DUDLEY GALLERY.

(SECOND NOTICE.)

TO attempt anything like a detailed description or criticism of even one-fourth of the water-colour drawings which are included in the 'General Exhibition' this year would be impossible within the limits of any ordinary journal. Nor if we had unlimited space at command, should we venture to undertake the task. A large proportion of this and many other annual exhibitions must necessarily consist of works which represent a fair amount of executive skill—the gradual progress or development of students in specific style, or that inferior quality of art which aims at nothing higher than a mere transcript of *fact*, more or less literal, but unrelieved by grace of touch or choice of subject. The latter class of pictures, no doubt, commands a certain order of popularity—just as real Hansom cabs and practicable lamp-posts on the stage will help now-a-days to draw a crowded audience. But we submit that it cannot fairly come within the scope of serious art-criticism. One may recognise the fidelity with which a sturdy ploughman's smock frock is studied, and even approve the conscientious portraiture of a drawing-room spaniel—but—*Après?* We have really nothing more to say on such matters. They may be useful accessories to a noble work, but in the hands of a commonplace painter they represent nothing more than the literal *prose* of art. On the other hand, it is astonishing how the simplest subject—the least affected treatment, may become interesting from the taste and method of its execution. Mr. A. C. H. Luxmoore, taking some familiar lines from 'In Memoriam' for his title, has painted the toilet of a country lady (81) whose blue brocaded dress suggests the costume of the last century, though the picturesque furniture of the room belongs to an earlier epoch. The work is admirable throughout; so is his study of an old oak armoire (158) in the Earl of Leicester's Hospital, Warwick, though not a single figure is introduced in the composition. Mr. Tom Gray's 'Straduaris' (157), an old musician of the Georgian period, who sits with his violin on his knees contemplating his favourite instrument with something like paternal solicitude, is full of character and artistic quality. Miss Alyce Thorneycroft sends a modest but deftly handled little work, 'Lost in Mist' (30), in the colour and general treatment of which we recognise the influence of that new school of English art called by a dozen different misnomers, but whose chief individuality lies in the rejection of the commonplace, whether in subject or workmanship. A larger figure piece by this artist's sister, Miss Helen Thorneycroft, hangs at the south end of the gallery, and is distinguished by the somewhat enigmatical title of 'From Far Away' (226). It has much to recommend it, but the turquoise blue dress of the lady represented is unfortunately out of key with the background. Miss Lucy Madox Brown is another lady artist who aims at *style* in her execution, and, it must be confessed, with considerable success. Without leaving her studio for a subject, she has composed a group (239) which, but for a little uncertainty of handling noticeable here and there, might fairly take rank among the productions of older and more experienced hands. If we cannot say quite as much for her brother's 'Jason' (125), it must be remembered that the last-mentioned picture is literally the work of a boy, and, as such, is not only very creditable in itself, but augurs well for future excellence.

Among the smaller figure pieces, Mr. Hubert Herkomer's 'Choosing' (268)—a cottage girl walking down a little avenue of cabbages in a kitchen garden—may be quoted as an instance of the eccentricity and perversity with which a clever artist will sometimes go out of his way to select an ugly subject by way of assuring us that he has no sympathy with the hackneyed themes of ordinary picture makers. Surely there is a middle course to be adopted. Here we have excellent work and a refined sense of colour thrown away upon the representation of an incident which is utterly devoid not only of the simplest conditions of pictorial beauty, but also of ordinary human interest. The drawing attracts notice, it is true, by virtue of the skill with which these difficulties have been met, but there are sufficient drawbacks to the development of true art in this country, without wilfully and needlessly encumbering it. It is, however, only fair to add that whatever affectation there may be in this painter's choice of scene, there is none whatever in his manner of work, which is at once vigorous and refined.

Let us turn now to some of the principal landscapes in the Exhibition, and note the revolution which has been brought about within the last ten years in this department of art. There was a time when amateurs had to choose between the old conventional, and the (then) new realistic school—between what in studio slang was once called *rose-y* work and the minute inaccuracy of pseudo-pre-Raphaelitism. But of late there has been a welding together of old and new principles, and the result is an eclectic school of painters which will assuredly leave its mark in this second half of the 19th century. Take, for instance, the river-side scenery of which Mr. John C. Moore has given us so many examples both at home and abroad. His 'Yellow Tiber' (326) at twilight, with St. Peter's and the Vatican mapped out in grey against the yet luminous horizon, is an intensely faithful study, true in tone, colour, and even in detail, down to the stern of the old ferry-boat; but if there are no tricks of effect, there is an equal absence of fussy elaboration. It is all the broad, simple work of a man who understands the precise relation between art and nature in landscape, and can express it with skill and confidence. As much might be said of the same artist's 'Autumn Morning on the Pincio' (184), 'Chiswick' (482), and 'December Morning on the Campagna' (667).

Mr. Henry Moore exhibits two admirable sea pieces—'Thunder Clouds, Evening' (104) and 'Clearing after Rain' (150), the titles of which speak for themselves, but not so emphatically as the artist's brush itself. His 'Early Summer near Kenilworth' (339), with its fresh green meadowland, dotted here and there with poppies—its sturdy young oak trees and crisp rounded blue-white clouds—is one of the most charming specimens of pure pastoral landscape that he has ever painted.

It is much to be regretted that the white 'mount' once in common use for water-colour drawings is being gradually superseded by the gilded 'flat.' Gold forms an excellent foil for oil paintings, but we have always considered it too heavy for works executed with the lighter pigment. Mr. North's 'Farm Corner' (299), a careful and tenderly tinted study, is in our opinion marred by the metallic sheen of its frame, and would have been twice as effective with a margin of plain 'Bristol board.' There are, however, some works in which the lavish use of body colour and the scale of the drawings themselves justify an exception to this rule. Mr. Arthur Severn's bold and master-like representation of sea-breakers (297) is a case in point, but such instances must be considered as beyond the legitimate range of artists '*en aquarelle*' proper. Indeed it might be said of this talented young painter's work in general, that it savours too much of the scenic, and would be far more thoroughly appreciated across the footlights of a theatre than on the walls of an exhibition. His 'Thames Embankment' view (566), full of dash and cleverness as it is, bears evidence of inventive power rather than of conscientious regard for fact; and though both qualities are excellent in their way, the most satisfactory development of the first can only be secured by a longer course of careful study than Mr. A. Severn seems at present inclined to bestow upon his work. Mr. Walter Severn, in his 'Anstey's Cove, near Torquay' (348), without aiming at any exceptional effect, has realised a certain solid artistic excellence which is absent from his brother's productions, and which is all the more creditable when we remember that it is due to the experience not of a professed artist, but—if we may be allowed to draw such invidious distinctions—of an amateur. We regret that we have been able to do little more than mention a few of the most remarkable works in this excellent Exhibition. It would be impossible, however, to conclude our notice without giving a brief but sincere word of praise to the admirable etchings of Mr. Edwin Edwards (713-719), who bids fair to do for our woodland scenery what Mr. Whistler achieved in the illustration of Thames wharves and shipping.

The large chalk drawing, 'An Adventurous Messenger' (716), by Miss Ellen G. Hill, is a most creditable performance, full of natural grace and palpable skill in handling; while the 'Autumn Fruit' (443), by Mr. Sidney Whiteford, and the studies of flowers and still life executed respectively by Miss H. Coleman and Miss C. Eastlake—both, we believe, very young ladies—show how far a modest and, in ordinary hands, a confessedly inferior branch of art may become ennobled by the refined taste and delicate execution of those who follow it.

ILLUSTRATIONS.

KURRACHEE HARBOUR.

ONE of the greatest wants in India, after that of improved communications, is an increase to the number of her ports, and the improvement of those that already exist. Not the least important work at present in progress in India is that undertaken with the view of improving the port and harbour of Kurrachee.

By reference to a map of India, it will be seen that Kurrachee is situated near the north-western extremity of Sindh; it is, moreover, the only seaport of that province available for vessels drawing more than ten feet of water, and its position is one of very great importance, whether regarded from a commercial, political, or military point of view. Thornton, in his *Gazetteer of India*, says, 'It has been laid down that a force stationed here, with detachments at Sehwan and Bukkur, might hold Sindh in complete subjection. In a commercial point of view, it may be defined the gate of Central Asia, and is likely to become to India what Liverpool is to England.' The late Sir Charles Napier, soon after his conquest of Sindh, became aware of the importance of improving the harbour at Kurrachee, and suggested measures for that purpose, one of which, the Napier Mole, still bears his name.

The one great want in Kurrachee harbour was that it should have been in direct communication with the river Indus, so that vessels coming down from Mooltan might have entered it without having to make the circuit round the mouths of the Indus. Had this been supplied by nature, its importance would have been largely increased; but in the absence of such communication the next best thing would undoubtedly have been to make an artificial cut for that purpose. A large trade already exists on the

Indus of produce and goods coming down to port for shipment, and in 1857 the Government Indus Steam Flotilla is stated to have been almost essential to the existence of British rule in the Punjab; for when the intercourse with the rest of India was cut off, they were the sole available means of communication with the sea-board, and they took up reinforcements to the army, military stores, and treasure. So long back as August, 1852, an officer of Government was deputed to examine the ground between Kurrachee and the Indus, with a view to the formation of a constantly navigable channel; but in an evil hour the project put forward by the Sindh Railway Company for a railway from Kurrachee to Kotree, on the Indus, was sanctioned, and the canal scheme abandoned. As a remunerative work the railway may be considered as a failure, but it has a probable future before it in the event of the construction of the proposed Indus Valley line, of which it would form a part.

Kurrachee may thus be described as it existed before the commencement of any works for the improvement of its harbour. Situated near the base of the southern extremity of the Pabb or Brahoic mountains, on a level space intervening between them and the sea, the port is protected from the sea and bad weather by Manora, a bluff rocky headland, projecting in a south-eastward direction from the mainland, and leaving a space of about two miles between the extreme point and the coast to the east. In the harbour and within the entrance are some rocky islets, which are seen from the sea over the low isthmus connecting the point of Manora with the coast to the west. There is a good roadstead outside Manora, except during the south-west monsoons. At the entrance of the harbour is a bar, which had formerly but one fathom and a quarter of water at low tide, and two and a half or three fathoms at high water spring tides. About a mile inside the bar is an extensive bank, dry at low water; and between this and the western shore is the channel up the harbour. The harbour is spacious, extending about five miles northward from Manora Point, and about the same distance from the town of Kurrachee, on the eastern shore, to the extreme western point; but before the commencement of any of the improvement works a small part only of this expanse admitted large ships.

A recently published statement of the value of articles imported and exported at Kurrachee for the last twenty-one years shows that the total imports increased from Rs. 28,78,720 in 1847-8 to Rs. 2,73,66,886 in 1866-67, and in the past year 1867-68 the amount was Rs. 2,50,41,185. The total exports in 1847-48 amounted to Rs. 15,47,308; in 1863-64 the greatest exportations were made, the amount being Rs. 4,18,80,734; and in the past year the amount had gone down to Rs. 1,99,70,423.

In 1848 a lighthouse was erected on Manora Point, on the western entrance to the harbour; and in 1855, in consequence of the increasing importance of the place, two dredging vessels were expressly constructed for the improvement of the harbour, and a light draught steamer was provided for the purpose of towing vessels in and out. It may be worthy of remark here that the first voyage from England direct to the port of Kurrachee was made in 1852, by the ship 'Duke of Argyle,' of 800 tons.

In 1856 a committee was formed on the spot for the purpose of considering the best means of effectually improving the harbour, and their report, together with other papers on the subject, was forwarded to this country, and referred for the opinion of the late Mr. James Walker, C.E., who, before recommending the construction of any specific works, deputed Mr. W. Parkes, C.E., to Kurrachee, to make further surveys of the harbour, for which purpose that gentleman left England in September, 1857, and returned in the following May. In October, 1858, Mr. Walker submitted his report, in which he recommended the construction of the following works, estimated to cost about 660,000*l.*, viz.:

1st. The Manora Breakwater, to prevent the passage of sand from the westward, and to afford shelter from the worst seas at the entrance, and also to protect the foot of Manora Cliff from the wasting by the sea.

2nd. The Keamari Groyne, to prevent the waste of water to the eastward, and to confine the ebbing and flowing currents to the Harbour Channel, so as to direct them upon the Bar. Also to stop the movement of sand from the eastward, which Mr. Parkes stated was taking place to a considerable extent, and was narrowing the channel upon its eastern shore south of Keamari.

3rd.—The closing of Chinna Creek by a solid embankment, and conveying through the harbour and its entrance the flowing and ebbing waters to and from the portion of the estuary which lies to the eastward of the Napier Mole, thereby obtaining their scouring power upon the Bar and entrance channels, and forming an extension of the navigable channel up to near the town, which would be available for native craft.

4th.—New Docks and Basins for ships of large tonnage.

5th.—A Graving Dock.

Of the above-named sum, 259,000*l.* was for the improvement of the entrance alone; the works consisting of:—1. Manora Breakwater; 2. Keamari Groyne; 3. Napier Mole Bridge; 4. New Channel; 5. Chinna Creek Stoppage; 6. East Pier, in continuation of Keamari Groyne. Orders were issued early in 1860 for the execution of the 2nd, 3rd, 4th, and 5th of these works, as well as of the proposed native jetty and quay. These were proceeded with at once, and continued without interruption till December, 1863, when orders were issued to postpone the stoppage of the Chinna Creek, which was just about to be completed, in consequence of Mr. Parkes's opinion that the increased scour which had resulted from the carrying out of the Keamari Groyne should be allowed time to deepen the entrance to such an extent that any possible small temporary deposit should not be injurious.

Mr. Parkes, shortly afterwards, in January, 1864, again visited Kurrachee, and in his report he strongly advocated the immediate execution of the following works:—

1st.—The Manora Breakwater.

2nd.—The prolongation of the Keamari Groyne.

3rd.—The removal of hard material from Deep-water Point at the discretion of the Superintendent.

Orders were immediately issued for carrying out the 2nd and 3rd of these works.

John Bartholomew, March 6th 1869.

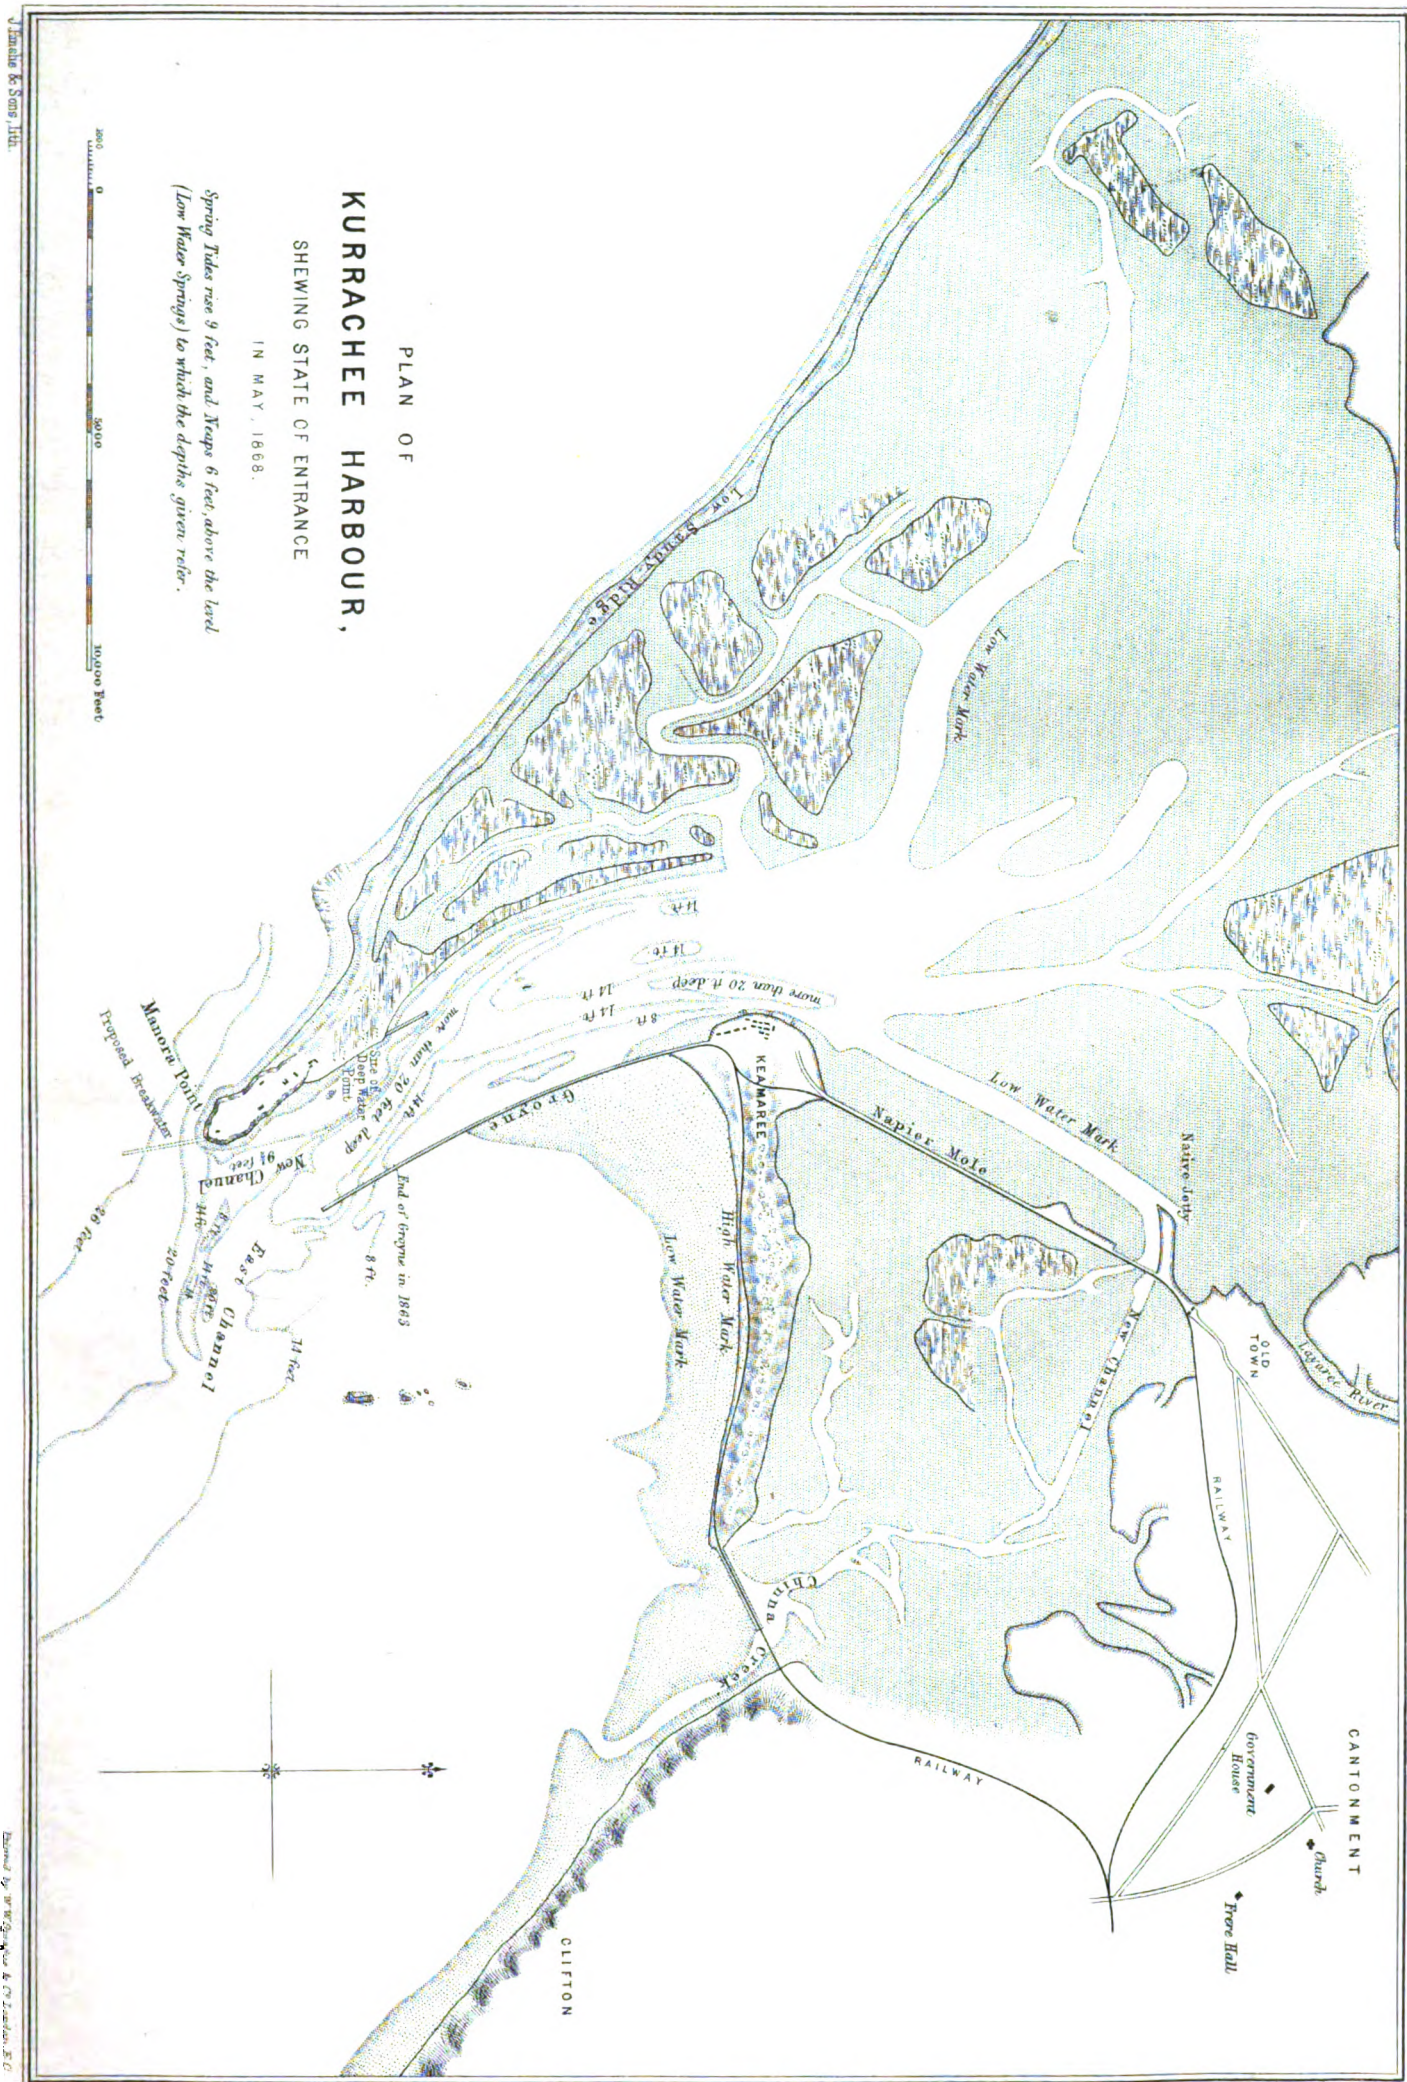

NEWTONAIRD HOUSE - DUMFRIESHIRE.

Capital · Philæ.
DRAWN BY R. PHENÉ SPIERS.

Objections having been raised by certain engineers attached to the Public Works Department in India, against some of the works then in progress, the whole subject was referred to Messrs. D. & T. Stevenson, of Edinburgh, in December, 1865; and consequent upon their report orders were sent out in April, 1866, for the immediate stoppage of all works in progress, except those which were obviously calculated to serve some purpose of public utility, independent of the general improvement of the port, and which could not be left in their present state without any positive harm.

In the early part of 1868 a telegram was despatched to Bombay, ordering that the dredgers should be set to work on the bar outside the harbour; and, in consequence partly of the successful results obtained by that measure, the Secretary of State requested Mr. Parkes to proceed again to Kurrachee to examine the present state of the harbour. For this purpose Mr. Parkes left England early in June, arriving at Kurrachee on July 10, where he remained till August 1.

The only works, then, as appears from Mr. Parkes's report, which have yet been brought to bear on the general economy of the harbour are as follows:—

I. The Keamari Groyne, 7,400 feet long, constructed of stone upon the Keamari Sand-spit, having its top 2 feet 6 inches above monsoon high-water; commenced in December, 1861, and completed in April, 1863.

II. The extension of the same for 1,500 feet (known as the East Pier), commenced in May, 1864, and completed in October, 1865.

III. The removal of Deep-water Point, commenced in 1864, and carried on chiefly by natural scour, but partly by artificial means, during that and the two following years.

IV. A trained Groyne, constructed in 1866, running for 1,000 feet northward from the site of Deep-water Point.

The cost of these works has been 75,000*l.*, including their share of the cost of plant.

The effect produced upon the upper harbour has been to increase the water space at low water, since January, 1858, from 266,451,428 cubic feet to 299,341,289, being 32,889,861, or 12½ per cent. From thence to a little outside the end of the East Pier, and the end of Manora Point (without taking account of a deep hole which has scoured out close to the end of the East Pier), the increase of water space, from 1858 to October 1867, has been 11,685,540 cubic feet, or 20 per cent., making with the 12½ per cent. in the channel above an increase of nearly 14 per cent. on the whole length. This expulsion of sand has rendered the sectional area of the channel nearly uniform throughout; and altogether there has been expelled from the harbour 2½ millions of cubic yards of sand. Another result of the works has been that the courses of the tidal currents have been rendered much more regular, and at both flood and ebb they set up and down the harbour with great regularity and in the same channel.

The value of these results to the trade of the port may best be described by a statement of the fact that whereas, in 1858, not above 20 loaded ships of from 500 to 900 tons could be berthed in the harbour, there is now space for about 55 loaded ships of from 500 to 1,200 tons.

The effects produced on the bar and entrance to the harbour have varied somewhat during each monsoon, but it would appear that, in their most prominent features, the Bar and the Main Entrance Channel are now in a permanent condition. The Channel is as capable of passing large ships as it was in 1858; but whilst it has doubled in width, the Bar has lengthened out so as partially to neutralise that advantage. The lengthening of the Bar is due to the fact that out of 60,000,000 cubic feet of sand which have been discharged from the harbour, 1,000,000 have been deposited at the tail of the Bar.

The conclusion which Mr. Parkes draws from his observations is that a necessary condition of the existence of a direct and permanently deep channel is an effectual protection from that action of the sea which has so repeatedly thwarted the natural efforts made towards it. In order to provide this protection, the construction is recommended of a breakwater 100 feet to the eastward of Manora Flagstaff, running in a direction south by east for a length of 1,500 feet. This, however, would act merely as a protective measure, and the free use of dredgers over the bar is further recommended with the view to increase the channel. The admission of a portion of the Chinna Creek waters into the harbour by the removal of the dam at the Napier Mole Bridge is also advocated, not so much with a view to improving the entrance as for the convenience of trade.

These recommendations have all been sanctioned, and Mr. Parkes has been appointed Consulting Engineer to the Government for the works in this country. When they have been so far carried out as to give any appreciable results, we shall hope to be in a position to publish early information regarding the effects that may have been produced.

CAPITALS.

IN a previous article we described the bud-shaped capital of various proportions and detail, and the simple bell-shaped capital with the stems, flowers, and buds of the papyrus and lotus plants, slightly incised and coloured, which, with the so-called protodoric capital, seem to have served all the purposes of Egyptian architecture till the period of the Ptolemies; the fact being that (with the exception of numerous pylons, colonnades, and avenues of sphinxes, which were added afterwards) the numerous and vast temples built during the reigns of Rameses the Great and his successor, in the fourteenth century before Christ, were amply sufficient for all the wants of the Egyptian people; and it is not till the reign of Ptolemy Evergetes, at the beginning of the second century before Christ, that we find new temples in which any important modifications of the above-named capitals take place. In this second century before Christ, down to, and during, the occupation of Egypt by the Cæsars, other vast temples were erected, notably those of Edfou and Philæ, and a number of large and magnificent porticoes or vestibules, with numerous columns, were

added to older temples, as at Kalabshee in Nubia, Ombos, Eneh, Denderah, &c., in which buildings we find a series of the most beautiful capitals, both in form and decoration, which have ever been designed: they are of immense variety, scarcely two of them in the same temple being alike, and their decoration is invariably imitated from some arborescent production of the country. It is extremely doubtful whether in the designs of these capitals ought to be attributed to the influence of their Greek rulers; no traces of Greek ornament are found, and in the general application of the natural forms of trees and plants, these are far too little conventionalised to resemble Greek work. There is, perhaps, more elegance in the form and disposition of the temples themselves, though this would arise from changes in their institutions or customs, and the progress, though slow, in civilisation. In the example, an illustration of which we give, taken from the portico or long gallery in front of the temple at Philæ, the bell-shaped capital is decorated with a series of reeds or bulrushes, the flowers of which resemble some of the long grasses of our own country; these are represented on the under surface of the bell; the sheathing leaves of their stems branch off to the right and left, and the ligaments which bind the whole together are indicated under the capital and form its necking. For simplicity of form, elegance, and propriety of decoration, this capital is one of the prettiest examples to be found in Egypt.

NEWTONAIRD HOUSE, DUMFRIESSHIRE.

Newtonaird House, recently erected from the designs of Messrs. Peddie & Kinnear, of Edinburgh, for P. Smith, Esq., is situated about five miles from Dumfries. It stands on the south slope of a richly wooded hill, from which the park extends down to the river Cairn. The views from the windows of the living rooms are varied and extensive. The style of the architecture is that of the old Scottish manor house, modified to suit modern requirements—a style which harmonises more perfectly with the surrounding scenery than would be the case with any other. The exterior is of red sandstone courses from Locharbriggs quarries, about 12 miles distant, and the roofs are covered with large grey Lancashire slates. The principal floor, which is reached by a flight of steps from the entrance hall and carriage porch, contains two drawing rooms, library, and dining room, and service room, along the south and east fronts, and the principal staircase and a large business room on the other side of the entrance. The entrance hall is groined in the ceiling, with moulded and enriched ribs of white free stone, springing from corner shafts of the same material, with which the walls are also lined. The principal staircase has a roof with framed and moulded principals, and the ceiling of the dining room is richly panelled and moulded in oak. The ceilings of the drawing rooms and library are elaborately finished in plaster work in panels, and the oak doors and shutters of the principal rooms are elaborately carved in the panels. The first bedroom floor contains six bedrooms, besides dressing rooms and bath rooms, &c., and in the upper floors are nine bedrooms of various sizes. The ground floor of the main building contains the servants' hall, butler's pantry, wine and beer cellars, housekeeper's rooms, and such like accommodation; and in a lower building behind are the kitchen, scullery, larders, &c. The washing house and laundry are at the stable offices, which have been erected at some distance from the house in a corresponding style of architecture. The cost of the house, exclusive of the terrace wall and entrance to flower garden, which is not yet erected, has been upwards of 13,000*l.*

NOTICE.—The name of the Engineer of the Chicago Waterworks was given in error in our last as Mr. Desborough. It should have been Mr. Chesborough.

CONDITIONS OF BUILDING CONTRACTS.

RESUMING this subject where we left it last week—at the objections now raised against certain customary conditions of Building Contracts, let us take the very first words of one of the largest of building contracts now being performed—'The works shall be executed by the contractor according to the true intent and meaning of,' &c. Do they not point to the fact that the real and obvious intent and meaning of words, figures, and drawings—which, remember, can be and should be ascertained before making the contract—is sometimes perverted, and that it is possible to introduce quibbles and questions into the best drawn specification? And what hardship is there in the words usually added, after stating that the drawings and specifications are intended to embrace all the information necessary, &c.:—'Should there appear on the face of the drawings any part not described in the specification, or should any work be described in the specification and not shown on the drawings, it is intended that the contractor should consider the same in the formation of his estimate as much as if the same had been particularly set forth in both?' Be it remembered that to describe in writing or by drawings the thousand and one little matters understood by this phrase, would involve volumes of superfluous writing and labour, and be in reality of no certain effect.

It is well known why such terms are necessary, and how easily they are complied with by every contractor in every work he undertakes; but why they should be omitted, or why any straightforward contractor should wish them to be omitted, is not so obvious to architects. It is well known how impossible it is, short of erecting the building, accurately to describe every small item, and how difficult to avoid all errors in one drawing not *showing exactly the same view as another*; but a contractor has no difficulty in ascer-

taining beforehand the exact amount of work required of him, and in providing in his estimate, if he be so inclined, for any amount of unforeseen accidents or contingencies. With regard to these and other clauses similarly framed, their effect has doubtless been so to abate certain evils aimed at, that perhaps, the original cause of framing them, and the necessity for them, are not now fully recognised. They consequently may at first sight have the appearance of encumbering the conditions, and of being not only useless, but absurd; yet it may be that many evils are only kept down by these regular standing protests against them. Let such repeated protests be removed, and it will probably be found that the old abuses will reappear and some new remedy will have to be devised hereafter, while astonishment will be expressed at the simplicity of those individuals who threw away without reflection such valuable protective clauses.

A most searching enquiry, and not a mere cursory glance, is necessary to determine how far any restrictions and regulations may be safely removed which have been framed for some wise end, and have always answered their purpose more or less. But to consider all this fully would occupy too much of our space, and we can only direct attention to a few points which seem to be more especially worthy of general consideration.

It appears strange to find amongst contractors a desire to prevent the architect attaching 'anything of a personal or legal nature' to the usual clauses of the specification, and to require that every common settlement between parties for the erection of a building should be a matter for the legal profession alone, and be settled in precise legal phraseology. It is at present rather the exception than the rule to employ a lawyer to draw up any contract unless for an exceptionally large matter; and in ordinary cases we are not aware that disputes are more frequent than where legal documents are provided, and parchment used instead of paper.

The simplest way, lawyers tell us when they are instructed to draw up a contract for building, is to embody in it the full specification and general conditions, and by adding a few phrases before and after these to make them part of the contract in due form. Judges and other high legal authorities have been known even to prefer doing without such forms in cases where they themselves are alone concerned, and have prescribed the simplest phrases possible, even asserting that the tender and a letter accepting it are quite sufficient for all purposes of contract. It is curious that this leaning towards rigid legal forms should be found on the side of contractors, and that complication rather than simplicity in such matters should be advocated by them.

One would have, perhaps, expected such a tendency amongst architects, who it might be supposed would naturally desire relief from any superfluous responsibility, and would be glad to have the trouble of arranging forms of contract—for which they seldom make any charge—put upon other shoulders. But practically they would always have to bear the same burden, for the lawyers would embody their phrases and be obliged to accept their dictation, simply because they, as lawyers, could not know all the circumstances without instructions. To give these instructions is both the duty of the architect as well as a positive necessity for him; and how the London contractors would propose to relieve him of such responsibilities does not appear. Perhaps they would institute the necessity for two lawyers—one appointed by the architect or his client, and one by the contractor (both to be paid by the client, we suppose, or, at least, in some way out of the 'job')—and to dispute the terms between themselves, in the same way that two surveyors arrange the quantities. That this would be the approved arrangement seems likely, for it is proposed that there should be two architects to every building—one to be the arbitrator, or consulting architect, as he might be called if arbitration were frequent, and one to be the actual designer of the works, but without power to see them properly executed, except by appeal to the arbitrator.

How all these different authorities would act with, or would counteract each other, or how the client would approve of these additional complications, and the multiplication of costs, is a question worth consideration. It is even more important to enquire how the present position of the architect—as master builder or controller of the works—would be affected by so much additional weight being held in readiness and capable of being brought to bear, if occasion require, for or against his judgment and authority. But we can have no hesitation in saying that under the proposed arrangements it would be impossible to maintain among architects the same independence and high feeling and that judicial character, which we are proud to say are the characteristics of those who are looked up to as the chief representatives of the architectural profession. Far be it from us to say that it is the object of any contractor to degrade the position of the architect; but in effect the present proposals would do so if all were adopted.

To such builders as appreciate the assistance and support often given by the architect, we would commend the foregoing remarks bearing upon the position of the profession, and upon the probable result of adding to the already sufficiently complicated nature of building affairs.

(To be continued.)

PARLIAMENTARY PROCEEDINGS.

The Thames Embankment.

Lord Elcho's Committee on the Thames Embankment.—The following members form the above Committee:—Lord Elcho, Mr. Layard, Mr. W. Cowper, Lord J. Manners, Mr. Bentinck, Mr. Sclater-Booth, Mr. Tite, Mr. W. H. Smith, Mr. Gregory, Mr. Beresford Hope, Mr. Buxton, Viscount Bury, Captain Dawson-Damer, Viscount Sandon, and Mr. McClean. It is understood that they will not sit till after Easter.

On Friday, February 26, a petition was presented by Mr. Watkin Williams, from practising barristers of the two Temples and Lincoln's Inn, in favour of the Thames Embankment site, instead of the Carey Street site, for the erection of the new Courts of Justice.

Government Contractors and Seats in the House.

On Tuesday, March 2, in answer to a question by Mr. Rylands, Mr. GLADSTONE said that her Majesty's Government are aware that the working of the law with respect to Government contractors is not altogether satisfactory, but they do not see their way at the present moment as to the precise manner of dealing with the question, and cannot promise to introduce a measure upon the subject.

The Recent Accident at the Bhoze Ghaut.

Mr. G. DUFF said, in answer to Sir Stafford Northcote, that a commission of inquiry had been appointed, and that that commission had power to take evidence with regard to the circumstances of the accident. Meanwhile, precautions had been taken by the company to prevent passengers entering upon the incline of the railway.

Bayswater Market and Baths.

On Wednesday, March 3, the Bayswater Market and Baths Bill, opposed by Mr. Thos. Chambers, who was supported by Colonel Sykes, was rejected.

Metropolitan Street Tramways.

This Bill provoked a long debate. Its rejection was moved by Mr. Pease on general grounds of inconvenience and danger, and supported by Mr. Locke; Mr. Maguire defended the system, following the lead of Captain Grosvenor; Mr. Laird stated that similar tramways had, from being objectionable, become popular and necessary in Birkenhead. On a division, the second reading was carried by 209 to 98.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

ARCHITECTURAL EDUCATION.

SIR,—Mr. Edis has, I see, thought it right to correct the mistake made in his last letter about the eminence of the French Professors; although without acknowledging that it was from me he first learnt his error, and that the whole of his information was obtained directly also from myself. There is another matter on which I also gave him some information, but he has quietly passed that by. I refer to my knowledge of the pupilage system. Mr. Edis says, 'his training upon the pupilage system naturally leads him to lean to that, the English system of training.' But Mr. Edis is wholly at sea with reference to my acquaintance with English training: though three years in the school of Paris, I have been five years either as improver or as clerk in English offices, one of which was, I believe, the third largest in London. I have, in addition, had the advantage, which is more than Mr. Edis can say, of having passed through all the classes of the Association, and of having come in contact with an immense number of pupils far more intimately, so far as their elementary knowledge is concerned, than could ever be done as principal of an office. I was one of those who founded the Voluntary Examination Class in the beginning of 1863, and was absent from that class (which was continued all the year round) *once* only. The experience which I gained at that class first caused me to question the efficiency of the English pupilage system; from that time till now I have been adding to that experience, the summary of which was published in the Alliance Report. I leave it, Sir, to your readers to say whether my conclusions are correct. It should also be remembered, I think, that I was not the only delegate who signed the Report in its entirety.

B. PRYDE-SPIERS.

NEW BUILDINGS AND RESTORATIONS.

Ecclestone.—The north aisle of the church has been reopened; and, after an interval scarcely exceeding three months, the church has been restored almost as it was before the fire.

Wombridge, near Shrewsbury.—Proposed Church Enlargement.—Steps are being taken for the raising of a fund for the enlargement and improvement of the church of this parish. It is proposed to more than double the accommodation on the ground floor of the church.

St. Saviour's Church and District, Preston.—Munificent Gift.—New schools for St. Saviour's Church and district are about to be erected. Mr. Hibbert, architect, has already been instructed to prepare plans, and the schools will be erected on land belonging to Mr. Newsham immediately adjoining the church.

The Great Skelton Viaduct.—This vast structure carries the new line of the North-Eastern Company from Hull to Doncaster (Staddlethorpe and Thorne) over the Ouse, and is now so far complete that a train conveying the officials of the company and the engineer, Mr. T. E. Harrison, last week passed over it. The viaduct is one of the greatest engineering achievements of the age. Not only did the foundations present almost insuperable difficulties, but the superstructure presents extraordinary features. The comparatively low level of the new line necessitated an opening bridge, and the moveable portion so provided for the accommodation of the river traffic is the longest of any work of the kind in England. At the point of crossing the Ouse is about 800 feet wide, and the moveable part of the over-channel bridge is not less than 232 feet. This immense length crosses the deepest part of the river, turns on a stupendous mid-river pier, and is opened and closed at will, hydraulic power being applied. The most complete signalling has been provided to guard against possible accident to trains while

the bridge is open for the passage of ships. The entire structure is carried by seven spans of solid fish-backed girders, resting upon massive iron piers, forced to a great depth into the river bed through various layers of river silt, peat, and clay. The structure is one of imposing appearance, and is a great triumph of engineering skill. The line is double throughout, and is nearly ready for traffic. It will be opened for the Hull and London summer traffic this year.

The New Viaduct on the Midland Extension to Barnsley.—The new extension of the Midland Railway from Cudworth to Barnsley, which is rapidly drawing near to completion, embraces one of the finest pieces of engineering and architectural skill which is to be found upon the Midland system. The line, which is about four miles in length, crosses the valley of the Dearne at its greatest depth a short distance from the too-well known Oaks Colliery, where 361 persons lost their lives, many of whose bodies are still unrecovered. The crossing of the valley at a point where it is intercepted by the Pontefract Road and the Dearne and Dove Canal presented difficulties of no ordinary character. These were, however, not only overcome, but a structure both picturesque and substantial has been put up. The work, which was of a very formidable character, was let separate on March 18, 1863, to Messrs. Nicholson & Sons of Leeds so far as the masonry works were concerned, and the ironwork to Messrs. Butler & Pitt of Leeds. The foundations for so great a structure were laid with great care, and occupied some considerable time, there being no fewer than fourteen piers. The first stone was laid on September 11, 1863, by Mr. Nicholson, in the No. 6 pier. The total length of the viaduct is 302 yards and 1 foot. It is of sufficient width to admit of a double line of rails, and is surmounted by a railing weight. The viaduct, when viewed from almost any point, has a picturesque appearance. It consists of three stone piers, one 41 feet, and a third 10 feet long with two abutments, one of which is 45 feet, and the other 10 feet in length. There are no fewer than thirteen openings, ten of them 60 feet in length, two 90 feet, and one 36 feet. The estimated cost is said to have been between 30,000*l.* and 40,000*l.* The whole is of a lofty, light, and airy appearance. The greatest height from the valley is 96 feet 6 inches. So pleased were the Midland directors with the structure, that they have caused it to be photographed from several stand-points in the Dearne Valley.

St. Swithin's Church, City, is to be re-opened (after considerable alterations and repairs) on the fourth Sunday in Lent.

A new Primitive Methodist Chapel is about to be erected at Sowerby Bridge. The building will be of the Corinthian order, having two columns and two pilasters in front, with ornamental capitals. The plans of Mr. Samuel Utley, of Halifax, have been accepted, and the works will shortly commence.

A new Church at Warrington, dedicated to St. Anne, was consecrated by the Bishop of Chester on Saturday last. It has been built at a cost of 5,200*l.*, of which 2,500*l.* has been contributed by Mr. Beaumont of Oxford Hall; the remainder has been raised by public subscription. The church is situated in a very poor neighbourhood, and the sittings will be entirely free. Five services will take place on Sunday, and one on each week day. The church is built of red brick, with coloured bands, with a noble tower at the south-east angle. The west window contains some good tracery. Internally the church has a fine appearance, notwithstanding the absence of decoration. The roof, which is in one span, springs from piers projecting from the side of the walls, the tops of the pillars being ornamented with encaustic tiles. It is intended to paint the spandrels of the arches. The nave contains seats for 500, with open benches of Baltic deal. The pulpit is of Derbyshire polished limestone, with slate panels, painted with Scriptural designs by Hardman of Birmingham. The chancel is raised above the level of the nave, and is apsidal in form. The floor is of encaustic tiles. The organ is placed under the tower on the south side, and a corresponding recess on the north side is devoted to the vestry. The organ is by Hopkinson of Burstall, and cost 300*l.* The edifice has been constructed from the designs of Mr. John Douglas of Chester, the builders being Messrs. Gibson of Warrington.

NOTES ON NOVELTIES.

WE propose giving, under the above title, notices of such novelties as appear to us to deserve the careful attention of our readers. These notices will not, in any case, consist of accounts received from the inventors, patentees, or agents who may be engaged in bringing a novelty before the public, nor will they be based solely upon the statements which such persons may make. They will be obtained from independent sources, and usually will only be written after the invention or improvement which forms the subject of the notice has been personally examined into by one of our staff as fully as the circumstances of each case permit.

Moore's Embossed Glass.

This invention has been known for years to a few architects and others, who have used it from time to time, as Rees's glass. It is now, however, being brought more prominently before the public, having passed into the hands of Mr. Moore, and will probably for the first time be really brought into general use.

If designs are faithfully worked out by the present manufacturers when given to them to execute, and if a variety of well-designed diapers and ornaments are prepared and kept in stock, we think that this glass may be found an extremely useful material for employment in lights where colour and ornament are desired. It is embossed with various patterns, and can be had in different colours, differing very considerably both in its lightness and the brilliancy of its effect when light passes through it from any other embossed glass with which we are acquainted, and the difference is in its favour. Mr. Moore has shown us some specimens in which the plain

portions of his glass are ground. This, no doubt, adds considerable brilliancy to the raised pattern, but we question whether the general character of a window made up of such glass would be as good as where the natural surface of the glass is less undisturbed.

Brooke's Universal Blind and Shutter Fastener.

This is an American invention, by which an outside blind or shutter may be opened or closed from the inside, and held in any position desired, either closed, fully open, or at any intermediate position, in all of which it will be securely locked. Attached to the frame of the blind is a rod upon which slides a sleeve pivoted to the outer end of an arm secured to the axis of a wormgear seated in a recess in the window sill, and gradually rotated by a worm, the whole covered by a metallic plate. The worm, or screw, is turned by a shaft and an ornamental handle inside the room. As this handle is turned, the gear is slowly rotated, and its arm, sliding on the rod or bar, throws the blind back or forward, according to the direction of the rotary motion, opening or closing it as desired. In whatever position the blind is left it is immovable, except by having recourse to the handle, or crank, inside the room. The device is capable of being made highly ornamental as well as useful, and might easily be applied to casement windows. For this purpose it seems to be likely to answer better than many inventions of a similar nature in common use in this country. Samples to be seen at the office of G. L. Taylor, 38, West Street, Trenton, N. J., United States.

Bicknell's Patent American Window Weight Pulley.

This invention is simply a segment—one half—of a pulley; but the object intended is that attained by the ordinary revolving pulley. The stile of the window frame is made to contain a semi-disk or half circle, made of glass, grooved on its periphery to receive a cord, and having shoulders, or rebates, on its sides and on the bottom to hold it in place. A thin plate of metal is screwed on the window frame to conceal that portion of the mortise necessary only to admit the glass segment. No screws, pivot, plate, or recessing, beyond the slot through the stile, necessary for ordinary pulleys, are required; the segment being merely passed in from the front, and then being held securely by the ledges on its sides and bottom resting against the sides of the mortises.

The cord sustaining the window weight merely slides in the groove of the segment over the smooth glass surface, and all creaking of pivots or axles so annoying to the ill or nervous, and all necessity of occasional oiling, are obviated.

The inventor claims the following advantages:—Simplicity in construction and application; non-liability to derangement, no screws; no letting in of face-plates; less expensive than other devices; greater friction on the cord, but less wear, requiring a less proportionate weight to balance the sash, and giving a longer life to the cord; no rusting, and always in order, not being affected by the weather.

This device was patented through the Scientific American Patent Agency, November 3, 1868, by Alfred Bicknell. For further information, address American Glass Pulley Company, 56 Congress Street, Boston, Massachusetts, United States.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Highlanders of Scotland.

Under the above title Her Majesty's publisher, Mr. Mitchell, of 33 Old Bond Street, is preparing for publication a work containing portraits illustrative of the principal clans and followings, and the retainers of the Royal Household at Balmoral. We mentioned in our last number the fact that, by Her Majesty's permission, the water colour drawings which Vincent Brooks is engaged in reproducing by lithography for this work were exhibited by Mr. Mitchell. The plates will be thirty-one in number, comprising the Royal Stuarts, Athole men, Argyle men, Breadalbane men, and thirty other clans. If the lithographs do justice to the spirited heads and hands drawn by Mr. Kenneth Macleay, R.S.A., who took the portraits by express command, the work will be a noble one. It is to be in two volumes, demy folio, containing a copious notice of each illustration from authentic sources. The tartans of each clan are carefully delineated: the badges and the slogans, or war-cries, are enumerated, and the series of notices will be such as almost to furnish a *précis* of the history of Scotland.

Sculpture recently added to the South Kensington Museum.

Among the late purchases made by the authorities of South Kensington may be noticed a small crucifix of carved wood. We have said that it may be noticed: perhaps it would have been better to say that it may be overlooked; for neither its size nor its merit are so great as to demand admiration from all passers-by. Moreover, the object is but a copy, though a very skilful one. It, however, represents a school of sculpture little known in this country—that of Mayence and the Upper Rhine. Though the composition, consisting as it does of the crucified Saviour, with the ordinary attendant figures of the Virgin Mary and St. John, leaves by its nature small scope for originality, a singular variety of treatment is noticeable. The body of Our Lord is fixed upon a withered tree, the arms being fixed to two branches, and thus giving to the figure the Y shape familiar to the student of early art, but pertinaciously opposed by later, and particularly by Italian sculptors and painters. This may probably be a relic of the old Byzantine influences, which in the eighth century so deeply impressed the German provinces near the Rhine, and is certainly remarkable from its total disregard of the revered type of the Cross, and also, it must be added, of the facts recorded in the Gospels. Two angels flying around the stem of the tree hold a ribbon label, intended, no doubt, to receive an inscription, which, however, does not appear. In a hollow beneath the tree is a group of a lion gazing earnestly upon his prostrate and semi-animate cubs. This is one of the more recondite emblems of the Resurrection, typified by the

lion breathing on his young on the third day, and thus bestowing on them life and eyesight. The original work belongs to a private gentleman of Cologne, and the present copy has been obtained by the judicious energy of Dr. Franz Bock, Canon of Aix la Chapelle, well known as an antiquary and collector.

Decoration of Churches of Paris.

The following sketch of the commissions given to sculptors and painters for the new church of St. Augustin will give an idea of the amount of art work provided by the authorities. MM. Jouffroy, Jaley, Cavalier, and Bonnassieux, sculptors and members of the Academy of the Beaux-Arts, were entrusted with a bas-relief of Christ and the Apostles for the façade, a statue in marble of the Virgin Mary, figures of Saint Augustin and Saint Thomas of Aquitaine for the façade, and a bas-relief for the porch. In addition to these are, two angels for the cross on the pediment by M. Schroeder; four groups of children with candelabra, by Carrier-Belleuse and Cordier; symbols of the Four Evangelists, by Jacquemart; a second bas-relief for the porch, by Lequesne; two figures in bas-relief in the tympanum of the great arch; and eight figures of saints in stone by as many sculptors. All the preceding sculptures are without the building; within it are four groups of angels supporting candelabra by MM. Millet aîné, Gilbert, Schonewerk, and Travaux; and figures of Saint Mary and Saint Martha, by Leharivel-Durocher and Perrey.

The paintings consist of four subjects in the pendentives, representing the evangelists accompanied by angels, by M. Signol, member of the Academy; sixteen large figures of prophets and fathers with cherubim, by Bézard; six subjects of three figures each in the vaultings of the side chapels, representing events in the lives of Saint John, Saint Peter, and Saint Paul, by Bougereau; two subjects of three figures each at the entrance of the Lady Chapel, by Brisset; the three theological virtues, in enamelled lava, by Paul Balye; painted windows by Marechal of Metz and Claudius Lavergne. In all thirty-one commissions.

General.

Accidents from the Falling of Chandeliers and Gaseliers not unfrequently occur, and are always dangerous. Writing on this subject to the *Times* on February 23, 'A Builder' states that it is only a question of time as to the certain fall of gaseliers, the consequent escape of gas, and a very probable explosion, so long as the weights which hold up gaseliers are supported by brass chains. Brass chain is sure to decay by the action of the atmosphere, and the only wise remedy is to discard the use of brass chain altogether and to substitute copper chain. In support of this view Dr. Percy, who is a high—perhaps the highest—authority, writes that he has seen brass wire, about an eighth of an inch thick, after having been subjected to occasional vibration while stretched, become so tender and brittle in the course of a few weeks as to be capable of being easily broken into short pieces between the fingers. 'I have also,' he adds, 'seen the links of brass chains, which have been employed in suspending gaseliers, undergo a similar change, though in a less degree.' These effects, so far as Dr. Percy has observed, have been due to spontaneous physical changes in the metal, and not to atmospheric corrosion. It is well known that other alloys undergo singular spontaneous changes. Brass which has become tender and brittle may, by annealing, be rendered as tough and flexible as at first. It appears that only certain varieties of brass are liable to be thus affected; and, if so, the explanation will probably be found in the presence of foreign matters in small proportion. The Doctor adds that he has never seen copper become tender and brittle like brass.

A monument of the late Mr. Richard Oastler, the successful advocate of the 'Ten Hours' Bill, is to be uncovered by the Earl of Shaftesbury, at Bradford.

The Society of Arts have nominated a large and influential Committee on the subject of the Thames Embankment, which will hold its first meeting at the house of the Society on Tuesday next.

A frightful accident recently occurred at the goods depôt of the Great Eastern Railway, Brick Lane, Whitechapel, by which the lives of four men were sacrificed, besides causing serious injuries to several others. The cause appeared to arise from a gradual settlement of the foundations of two or three of the arches of the railway. The crevices in the brickwork were perceptibly widened, and great exertions were used to prevent the falling in of the arches. At about a quarter to four o'clock, without the slightest warning, the whole mass gave way, and girders, brickwork, railway, and a heavy goods waggon, which was left on the top of the arch, were precipitated in a mass upon the unfortunate workmen beneath. Seven or eight of the men rushed to the roadway, and so saved their lives; a few ran in an opposite direction, and were injured in various ways; while four, who had no time for movement, were instantly buried in the *débris*. As soon as the gravity of the accident was realised, the whole of the men employed in the station were at once set to work to extricate the men. The waggon was, by great exertion, lifted from the mass of rubbish, and various excavations made in spots where it was thought probable the men were buried. In an incredibly short space of time, considering the labour involved in the task, three bodies were extricated and conveyed to the dead-house at the Bethnal Green Workhouse. The one man missing it was found impossible to extricate for some hours, in consequence of the great transverse girder, with a mass of solid brickwork, having fallen on him. At half-past nine o'clock, however, a large pit had been dug under the girder, and the body was taken out. Meanwhile, the greatest excitement prevailed in the neighbourhood, and all the approaches to the immense station were besieged by clamorous crowds anxiously inquiring for their friends at work on the establishment. Thanks to the excellent police arrangements, order was maintained, and the work of extrication proceeded uninterrupted. An inquest has been held, and adjourned in order to obtain the evidence of an experienced engineer as to what may have been the causes of the accident.

Mr. Ruskin will lecture at London University College on Tuesday evening next on Greek Myths and Legends. Tickets of admission are on sale at the offices of the College, and the proceeds of this, as of the other monthly lectures now delivering there, will go towards the Building Fund of the College.

A bust of the late Sir Francis Burdett, executed by Mr. Adams, of Sloane Street, has been presented by his daughter, Miss Burdett Coutts, to Westminster School.

A magnificent painted window, representing the Crucifixion, has just been placed in St. Paul's Cathedral by the Drapers' Committee. The cost of the window was 900*l*.

It is proposed to place a stained glass window in Knaresborough parish church in memory of the late Sir Charles Slingsby.

Some correspondence has taken place in the daily papers with regard to the present state of the Hammersmith Suspension Bridge. The question has arisen from the approaching annual boat race between the two Universities; and as a more than ordinary strain always occurs at these competitions, it is only right for the safety of the public that an engineer should be sent down by Government to report on the stability of the bridge, and, if necessary, use proper means to prevent an accident.

A Stained Window in memory of the late Archdeacon Thorp was unveiled last week in Durham Cathedral.

Mr. Robert Braithwaite Martineau, one of the most accomplished and amiable English painters, died of heart disease on the 13th ult., after an illness of a few weeks, which until recently was not considered important. His 'Last Day in the Old Home' made a great impression at the International Exhibition of 1862. Mr. Martineau was born in 1826.

It is now decided that there will be only one Italian Opera Company during the ensuing London season. The joint performances by the companies of Mr. Gye and Mr. Mapleson will take place at Covent Garden. Signor Arditi is to be the conductor. What use is to be made of the rebuilt Opera House in the Haymarket does not appear to be decided.

The failure was announced at Birmingham on Thursday of Messrs. Thos. Short & Son, an old and respectable house in the timber trade. The liabilities will, it is said, amount to between 40,000*l*. and 50,000*l*. The estate will, it is anticipated, turn out favourable.

At the sale of the late Lord Ashburton's china, some Chelsea specimens (curiously shaped bottles) fetched 100*l*. each, and three Sèvres (one much injured) 1,310 guineas; but the gem of the collection, the Montcalm vase, one of two presented by Louis XV. to the defender of Quebec, and a beautiful example in Rose du Barry, sold for 1,600 guineas. The entire collection fetched 7,520*l*.

The great engineering undertaking of forming a direct line of railway between the south of Scotland and the west coast of Cumberland by means of bridging the broad estuary of the Solway Firth is fast approaching completion. The earthworks are finished; the masonry also; the viaduct has been entire for some time, and the permanent way has been laid for sixteen out of the eighteen miles of the line. The principal work remaining to be done is ballasting, the formation of the junctions, and the stations. The wet and stormy weather of the winter has very much retarded the progress of the contractors, who had hoped to be quite finished with the work by this time. The distinctive feature of the line is the viaduct across the Solway. At the point where the railway crosses the Firth, the distance from shore to shore is 2,544 yards, or a mile and between three and four furlongs. Of this stretch nearly 600 yards are composed of sea embankment, and the remaining 1,950 yards consist of the iron viaduct.

The block of buildings at the south end of the present bridge, known as Tillotson's Buildings, is being pulled down, in readiness for the New North Bridge at Halifax. It is proposed to put up a portion of the new edifice before the old one is pulled down.

The Wesleyan Chapel at Gomersal has been re-opened. The building was erected in 1827, but the condition of many parts had become so bad that immediate repair was found to be necessary.

A terrible calamity at St. Patrick's Hall, Montreal, Canada, has occurred during a concert and ball given in the building. The roof, which was of massive iron, fell with a terrible crash, seriously injuring many persons. The accident is attributed to the hasty manner in which the hall was erected.

The Bishop of Elphin is vigorously prosecuting his project for the erection of a cathedral in Sligo town, and appeals are being made to the inhabitants of Dublin and other places for funds.

The collection of the late Dr. Goldschmidt, of Frankfort, which occupied more than half a century in getting together, was lately dispersed by the auctioneer's hammer in Paris.

Brigham Young has had a revelation that he must dig a canal from Salt Lake City to Salt Lake Valley. It is stated that he intends to commence the work in the Spring.

A Statue of Massena is to be inaugurated at Nice in the Place du Paillon, on May 16 next, the anniversary of the birth of the hero who, in 1799, at Zurich, saved France from an invasion.

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

INSTITUTION OF CIVIL ENGINEERS.—Tuesday, March 9, at 8 P.M. 'American Locomotives and Rolling Stock,' by Mr. Zerah Colburn, M. Inst. C.E.

ASSOCIATED ARTS INSTITUTION.—Saturday, March 6, at 8.15 P.M. 'On Criticism,' by Solomon A. Hart, Esq.

ROYAL INSTITUTION.—Tuesday, March 9, at 3 P.M. Rev. F. W. Farrar 'On Comparative Philology.' Thursday, March 11, at 3 P.M. Dr. H. Power 'On the Eye.' Friday, March 12, at 8 P.M. Professor Abel 'On Naval and Military Applications of Electricity.' Saturday, March 13, at 3 P.M. Professor Odling 'On Hydrogen and its Analogues.'

EDITORIAL NOTICES.

No communication can be inserted unless authenticated by the name and address of the writer, —not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such enquiries.

PUBLISHER'S ANNOUNCEMENT.

Advertisements cannot be received for insertion later than 2 P.M. on Thursdays.

Temporary Office, 4 Monument Yard, London.—GILBERT WOOD, Publisher.

THE GAZETTE.

PARTNERSHIPS DISSOLVED.

Goodyear Brothers, Barnsley and elsewhere, joiners (as far as regards G. & W. Goodyear); S. & J. Longbottom, Brighouse, Yorkshire, stone merchants; H. Newman & Co., Birmingham, wholesale hardware dealers; G., J., & A. Brook, Bradley, near Huddersfield, masons (as far as regards A. Brook).

DECLARATION OF DIVIDEND.

Stevens, G., Newton Abbott, builder—further div. on new profits of 1s. 1½d. any Tuesday or Friday, at Mr. Carrick's, Exeter.

BANKRUPTCY ANNULLED.

Trueman, Charles William, Whitby, jet ornament manufacturer.

BANKRUPTS.

Notices of Adjudications and First Meetings of Creditors. To Surrender at the Bankruptcy Court, London.

Allen, David, late of Mitcham, builder, March 19, at 12; Hicks, F., High Street, Whitechapel, and Bow, builder, March 15, at 1; Jones, Wm., Lavender Hill, Wandsworth, plasterer, March 15, at 2; Wenham, George, Woolwich, bricklayer, March 18, at 2; Wright, James, late of Sidmouth Terrace, Commercial Road, builder, March 19, at 11.

To Surrender in the Country.

Badley, H., Northampton, master plumber, March 13, Northampton; Banfield, John, Newport, Monmouth, carpenter, March 16, Newport; Jennings, George, Bristol, carpenter, March 19, Bristol; Moore, Joseph, Leeds, joiner, March 15, Leeds.

TENDERS.

RHYL DISTRICT WATER COMPANY.—For Providing Valves and Special Pipes, and for Laying Cast-iron Water Pipes. Charles H. Beloe, Esq., C.E., 22 Lord Street, Liverpool. Contract No. 3. For Valves and Special Pipes:—

Guest & Chimes	£393 11 5
Hamilton, Woods & Co.	293 9 6
Edmund Sharp	265 13 6
Laidlaw & Sons—Schedule of Prices	0 0 0

Contract No. 4.—For Laying Cast-iron Water Pipes:—

Abraham & Richards	£3,755 0 0
William Burrows	2,816 0 0
Thomas Stone	2,355 0 0
G. George	2,174 8 1
Pearson Lee	2,100 0 0
William Francis Jones	1,969 9 0
Naylor Brothers	1,950 0 0
John Taylor	1,862 4 10
William Chester	1,767 0 0
Scott & Edwards	1,653 13 2
John Conway, jun. (Rock cutting 2s. per lin. yard extra)	1,926 0 0
Kellett & Ha	1,559 6 6
Dixon & Sleight	1,526 10 0
Fawkes & Maud	1,513 15 6
Walker & Taylor	1,350 0 0
James Stevens	1,220 0 0

BATLEY.—For the Erection of a Chapel in Park Road, Batley, for the Christian Brethren Society. Sheard & Hanstock, Architects, Batley.

Preston & Webster, Masons	£420 0 0
Robert Ibberson, Joiner, &c.	549 10 0
Steers & Stocks, Slaters, &c.	47 16 0
Arthur Kitchingman, Plasterer	78 10 0
Matthew Lobley, Plumber	20 0 0
William Kerahaw, Painter	24 0 0
	£1,139 16 0

Five Houses and Shops in the Fulham Road, Chelsea, for H. G. Renshaw, Esq. Mr. Lucy W. Ridge, Architect. Quantities supplied by Mr. L. C. Riddett:—

Gammon & Sons	£7,204 0 0
G. W. Richardson	6,395 0 0
G. Williams & Son	6,967 0 0
W. Webb & Sons	6,750 0 0
J. M. Macey	6,744 0 0
Adamson & Sons	6,625 0 0
C. N. Foeter	6,560 0 0
Scriver & White	6,283 0 0

For New Infirmary, and other Additions at the Bedford Union, Nokin. Mr. S. J. Barber, of Eastwood, Architect:— Mr. G. Hopewell (accepted) . . . £7,997 0 0

For New Church at Webbeath, Bromsgrove, for The Right Honourable The Baroness Windsor. Frederick Freedy, Architect. Quantities furnished by Messrs. Goodman & Vinnall:—

Clark & Smallwood	£2,625 0 0
Whateley	2,479 16 0
Eapley	2,351 8 6
Jones	2,343 10 0
Field	2,217 0 0
Nelson	2,082 0 0
McCann & Everal (accepted)	2,019 10 0
Stone principally given.	

BATLEY.—For the Erection of a Warehouse, Houses, Offices, &c., at Bulrush Mills, Batley, for Messrs. Talbot, senior, & Talbot. Sheard & Hanstock, Architects.

Thomas Riley, Mason	£801 0 0
Do. Slaters	120 0 0
John Bagshaw, Ironfounder	40 0 0
J. W. Hey, Plasterer	28 10 0
George Jowett, Joiner, &c.	512 0 0
Matthew Lobley, Plumber	26 0 0
	£1,517 10 0

For Rebuilding Chancel and Restoring Parish Church of Kettlestone, Norfolk. Frederick Freedy, Architect:—

Turner & Sons	£1,203 19 0
Brown	1,009 0 0
Cornish	1,008 7 0
Barrell & Son (accepted)	921 10 0

APPOINTMENTS VACANT.

INDIA.—July.—Forty Appointments in Engineer Establishment of Public Works Department in India. Mr. W. T. Thornton, Secretary, Public Works Department, India Office.

BRACKLEY.—March 23.—For appointment of a Surveyor. Salary, 175*l.* per annum. Mr. Arthur Weston, Clerk to the Board, Brackley, Northampton.

COMPETITIONS OPEN.

ROYAL ACADEMY OF ARTS.—National Gallery. For the best painting in Oil or Model and Design in Painting, Sculpture, and Architecture. The Gold Medal and the Discourses of Presidents Reynolds, West, &c.; and for the best Copies of Drawings, Models of Life, the Antique in Landscape Perspective, &c. The Silver Medals, &c. November 1.

ROTHERHAM.—March 15.—For Plans, &c., for erecting a Public Hospital and Dispensary. A prize of 75*l.* is offered for the best design, 50*l.* for the second, and 25*l.* for the third. John Barras, hon. secretary, Rotherham.

CORPORATION OF MANCHESTER.—ALEXANDRA PARK.—March 8.—The Corporation invite landscape gardeners, surveyors, and others to send in designs in competition for laying out the Alexandra Park. Joseph Heron, town clerk, Town Hall, Manchester.

BOGNOR.—March 12.—Designs for Sea Defence Work. A premium of 50*l.* will be given for the plan approved of by the Board. Mr. Frederick Elkins, Clerk to Local Board, Bognor, Sussex.

WRINGTON.—March 15.—For Specifications, Plans, and Estimates, for Levelling and Improving the Churchyard of the Parish Church. A Premium of four guineas will be given for the accepted plan. Mr. Henry Morgan, Golden Lion Inn, Wrington.

CONTRACTS OPEN.

LONDON.—March 13.—For the Supply of Building Materials for Repairs of Convict Prisons at Pentonville, Millbank, Brixton, Portland, Portsmouth, Chatham, Parkhurst, Dartmoor, and 'Working Male' Prisons, and the Refuge at Fulham. Forms of Tender may be had on application at the several prisons before-named, or at the office of the Directors, 45 Parliament Street.

STRAND.—March 10.—For Watering the several Streets in the District. Mr. Thos. M. Jenkins, 5 Tavistock Street, Covent Garden, W.O.

TRINITY HOUSE, March 15.—For the Construction of Six large Iron Buoys. Mr. Robin Allen, Secretary, Trinity House, E.C.

St. MARYLEBONE.—March 9.—For the Supply of Stone-ware Sewage Pipes, Bends, Junctions, &c. W. E. Greenwell, Vestry Clerk, Court House, St. Marylebone.

BANKS OF THE THAMES.—Thirty Minutes from Cannon-street and Kensington Stations. To be LET or SOLD, on unusually advantageous terms, a handsome FAMILY RESIDENCE, of imposing elevation, thoroughly well built, on 18 ft. of gravelly soil, and perfectly dry. It contains on the fourth-floor, 4 rooms; on the third-floor, 3 lofty bedrooms and large dressing-room; on the second-floor, approached by a stone staircase, 2 excellent bedrooms and large dressing-room, w.c., and sink on half-landing; on the first-floor, elegant suite of drawing-rooms, handsomely decorated, having a length of 35 ft., by an extreme width of 20 ft., fitted with white marble mantelpieces and French casements; on the half-landing, a conservatory; on the ground-floor, capital dining-room, 20 ft. by 17 ft., opening on to a balcony leading to garden, library, outer and inner entrance-halls, and w.c. on the basement, capital light kitchen with range, dresser, sink, and cupboard, housekeeper's room, butler's pantry, wine, beer, and coal cellars, side entrance from area and w.c., and back area with meat-safe, &c. The residence is approached by a handsome portico, and has a back-front opening into beautiful pleasure-grounds sloping to the river, planted with forest trees, and commands magnificent views of noble domains. Rent £100. Lease 99 years from Midsummer 1851, at a ground-rent of £30. Price, £1,150, or about half the actual cost of erection.

The property is situated within a short drive of Wimbledon Common, Richmond Park, and Kew Gardens, and the neighbourhood is considered one of the most healthy in the Metropolitan Suburbs, and abounds in charming walks and drives. There is a boat-house, and capital bathing and fishing.

Mr. W. TEBB, 2a Finsbury Circus, Moorgate Street, London, E.C.

SYDENHAM PARK.—For Investment or Occupation.—A most attractive and desirable FREEHOLD PROPERTY, consisting of four Semi-detached Residences, containing ten and twelve rooms each, with lawn and flower-gardens in front, let to responsible old standing yearly tenants (two of whom have occupied fifteen and one ten years), who pay rates and taxes, and producing a rental of £700 per annum. The large gardens in the rear, which are let with the property, are held on lease for thirty years from Midsummer 1855, at a ground-rent of £5 each garden, leaving a well-secured profit rental of £200 per annum. Price only £700, subject to a mortgage on the property of £1,500, which can remain for four years at 4 per cent., so that, after deducting interest, the purchaser will realise over £100 per annum for the amount invested—or the houses will be sold in pairs.

Mr. W. TEBB, 2a Finsbury Circus, Moorgate Street, London, E.C.

UPPER NORWOOD.—Sound Freehold Investment.—Three superior Semi-detached FREEHOLD RESIDENCES, each containing ten rooms, with gardens front and rear, let to respectable tenants, who pay taxes, producing £150 per annum, but would rent to produce £180. Price £1,300, returning a purchaser nearly eight per cent. on the present low rents, and above nine per cent. when rents are raised.

This low price is named to secure an immediate sale, or the property will be divided.

Mr. W. TEBB, 2a Finsbury Circus, Moorgate Street, London, E.C.

The Architect.

CERAMIC ARCHITECTURE.

student tolerably familiar.

The result, however, of all this teaching has mainly been to create an interest in and an absorbing attention to the *forms* rather than the *materials* in which architectural art has been developed. In former times, to which lovers of the art point as the period of its grandest development, the characters of architect and builder were more nearly identical than they are with us now. The one had not grown into what is called the *professional*, or the other into the *trade* character which we find now-a-days to be the case when architects and builders are spoken of.

In mediæval, and probably in antique times, the 'master mason' was at once the responsible designer and constructor of his work. The selection and treatment of material in his hands was sure to be a matter of almost equal importance with the forms and details in which his building should be conceived. Now-a-days we have changed all that. It is no uncommon thing to find that an architect designs his work without having made up his mind as to the exact material he will employ in erecting it. In saying this, we are not thinking mainly of the despicable resorts which are made to *compo* or cement in order to give the appearance of stone construction to a building, or of the many similar tricks and shifts which are employed to deceive the eye in regard to the material of so many of our works. What is more difficult to understand is the manner in which our usual honest building materials are treated, altogether regardless of their natural qualities. When one thinks, for example, of the essential and obvious difference between stone and brick, it is evident that the treatment which would be very fitting for the one must be quite inapplicable to the other.

It is probably true that Englishmen will always regard stone as the superior material for building use. It is that which embodies our highest ideas of dignity and grandeur in architectural art: If we consider, however, how backward we are in our secular and domestic architecture at this moment, it may be well to remember that the only truly distinctive national style in that class of building which England can boast of, was one which derived its character from the brickfield rather than from the quarry. In the chronology of our English styles, the Elizabethan glories in its brickwork. No style we ever possessed has more truthfully or delightfully expressed the characteristics of English life; and we may fairly assume that the material which so largely composes it stands in need of but little apology.

Whatever may be our opinions or likings as to styles; there can be no question as to the genuineness or capability of brick as a building material. It is at least a thoroughly English one, which most districts of our country yield in abundance. It will be admitted, however, that the oblong piece of burnt clay we call a brick, is not by any process of multiplication quite equal to form very attractive features in usual architectural design. And even the use of moulded brick, though so much remains to be done with it, has limits which are soon reached when the architect wishes to express himself strongly in his work. The question then arises whether the kindred clay material which we speak of as *Terra Cotta* is not the natural corollary to brick—if one may use the expression—when details or elaboration are intended? It may be affirmed as a matter of fact, or fashion, that, at the present moment, when we desire to 'dress' our brick buildings, it is the usual practice to resort to *stone*.

The mere brick which we ordinarily use is, of course, the simplest and humblest kind of terra cotta. And I venture so far as to say that no satisfactory reply can be given to the question—Why we should use a material at all, and stop short with its vulgarest and most commonplace development? The substance in which we raise the substantial masses of our construction is, in its plastic state, equally susceptible of the most decorative elaboration, with super-added advantages which I shall have occasion to point out.

Of late years much has been said and written as to the legitimate use of materials. In proportion as these accumulate in our hands, the subject becomes more and more important, especially when we see how common a device it has become to mix up in our designs materials not less different in substance than in colour. It is doubtful whether the usual modern practice of employing brick and stone together in one design has justified itself to the artistic sense.

Certainly the difficulties attending such a combination seem to be far from trifling to the architect. There is, first of all, the essential difference in the nature of the two materials, and the consequent inharmoniousness of effect which time and weather produce upon them. Hence one so often sees in our brick and stone buildings, when even a few years have passed over them, strange effects such as the architect in the conception of his design surely never anticipated.

There is again an obvious anomaly in employing a 'noble' material, to borrow Mr. Ruskin's phraseology, which is forced to become the servant of the 'ignoble' one; for we all know that in using stone to dress our brick buildings, the quarried material has to be cut and shaped into sizes which are regulated to a great extent by the rigid quantities of the brick we use.

Beyond these considerations there lies another of increasing interest. The general question of *colour* in our building is one upon which much of the popular appreciation of architectural art is likely to be formed. It is not meant that the public are generally to be regarded as highly appreciative of colour as a fine art; but it is tolerably safe to assume that the great majority are more likely to be affected through their *senses* than their *mind* in all exhibitions of art. Purely architectural detail is one of those things which require a very technical kind of knowledge to appreciate. For one man who will feel the beauty of flowers because of their *forms*, there are many who will be quite sensible to that beauty by their *colour*. And so by analogy it would seem natural to argue that if architecture, which depends so much on both form and colour, is to take hold of popular and general interest, which is after all about the highest thing it can do as an art, we may expect to achieve that object more readily by giving greater emphasis to our studies in the direction where we are most likely to win men's likings.

Whether the public interest, which we so frequently see and hear expressed in regard to works of architecture in our time, has been excited in any degree by the noticeable regard which architects have shown towards colour in their works, it may be difficult to determine. But that the more popular productions of the art show this increased care and liking for such effects as colour will produce, is evidenced in any of our streets where new buildings arise from time to time. Even the purely stone building is now designed with varieties of effect such as the employment of various stones will produce, to say nothing of the differently coloured stones which are used to decorate what may be classed as brick buildings.

It is a fair matter for criticism whether stone so employed in combination with brick can compete with the kindred clay material, modelled and moulded into the forms and details which stone is usually employed to produce. The reason is obvious. You can only get such colour in stone as stone will give you. Here there are no gradations or compounds possible; and even when two tones or varieties of colour are sought for, they are generally to be secured only at considerable expense and delay, seeing that the quarries which produce them will most probably lie widely apart from the building site. And here one is reminded of Lord Bacon's well-known essay on Housebuilding. Whether wisely adapted or not to our modern notions, it may be granted that his speculations are natural and attractive to most minds. In building his house, he would rear it, if possible, out of the soil on which it is to stand, from which it would seem as if he had had the brick or terra-cotta material in his calculations—as would naturally indeed be the case in his time. If stone is pre-supposed, his theory becomes very limited in its application, seeing how rare it is to find a quarry of suitable material adjacent to the great majority of building sites. On the other hand, our brickfields are plentiful and comparatively near to us in any district of the country, while the clays and marls which our mother earth yields so bountifully are capable of infinite variety of treatment, from the moulding of the common brick for the masses of our walls to the most elaborate moulded or sculptured details with which we may desire to clothe them.

Suppose we have to build in almost any county in England (for in Scotland, as in France, the case is different, stone, of some sort, being more plentiful than clay), we shall with tolerable certainty find a brickfield ready and near at hand. We avail ourselves of its resources for at least the plain masses of our building. But why stop here with the use of clay, and betake ourselves probably to some distant district of the country to procure a stone with which to dress our designs? Our brickfield, let it be considered, yields us a material so facile in its nature that we can model and mould it as we choose; and, in addition, may so use it in the process of firing as to secure the most varied combinations of colour. Our whole building, in this case, becomes perfectly kindred and homogeneous in its substance, native in fact to the soil on which we are rearing our design. There is nothing of novelty or invention in this. It is true that terra-cotta has become quite vulgarised to most minds, and associated at best with chimney pots or garden vases. In its connection with architecture, and in its capabilities for receiving any amount of decorative elaboration, very little, if any regard can be said to be entertained for it. We know, as a matter of historical knowledge, what has been done with it in other times; but, as has been already remarked, we copy and reproduce old forms, and remain comfortably oblivious of the material in which they are expressed. It seems hardly necessary to refer to the actual works, or the more numerous sketches, of such sculptors as Donatello, Ghiberti, Lucca della Robbia, Jacopo della

Quercia, and a host of other names associated with the heyday of Italian art, to convince any one that the clay in which they elected to work is not a substance we can afford to despise or ignore in these times, and especially in a country like England, so incomparably rich in the resources of its clayfields.

I speak from experience in saying that there is something almost fascinating in designing architectural detail for a material so plastic and pliable as clay: so capable of every artistic form and expression in the hands of the modeller, and so susceptible of fine gradations of colour in the process of firing. The introduction into our buildings of the actual work as it comes from the sculptor's hand gives a character to terra-cotta to which no other material can lay claim. Those who will think for a moment that the thickness of a piece of paper is enough to make or destroy the quality of a work, as between the ordinary sculptor's model and the workman's rendering of it in stone or marble, will readily appreciate what that advantage means in an artistic sense.

To secure the real hand and head work of the sculptor himself, without the secondary agency of mechanical workmen, is in itself an object which might excite the interest of every architect; and to be able to place such work, regardless of silicate solutions or indurating processes, in imperishable quality as actual constructive, and not veneering, features of his design, is surely a consideration which should recommend the use of terra cotta to every one who values truth and feeling in his work. I would not pretend to say that such a treatment of our brick buildings is an easy process in the present condition of pottery as applied to architecture. But that it is easy of accomplishment has been settled by actual examples; and, therefore, all that seems necessary is that the architect should create the demand in order to induce the manufacturer to provide the supply. When one thinks of what other countries, and even our own country, in former times have produced, before a pseudo classicism inflicted on us all varieties of shams, it seems strange and unaccountable that terra cotta should be for the most part confined to the oblong piece of clay which is utterly guiltless of any artistic interest whatever.

ROBERT EDGAR.

OUR LITTLE BILL FOR LUNCHEON.

THE Metropolitan Board of Works has a right to complain. It is an ill-used Board. The public has not, even yet, formed a very high opinion of its deserts. In this respect the public is guilty, not only of want of discrimination, but of want of gratitude. In its anxiety to afford to its friends an opportunity of admiring the magnificence with which it has adorned its distant station of Abbey Mills, the Board of Works has displayed a munificence, at the cost, we presume, of the rate-payers, that will no doubt be a source of high satisfaction to all who have the honour to rank among its contributories. It has to some extent done this 'good by stealth.' It has been anxious that the left hand of the public journals should not know what the right hand, which controls expenditure, has done. It will now, no doubt, blush, if a Board can blush, 'to find it fame.'

The particular occasion to which we more especially refer is that of the visit of the vestrymen to the Main Drainage Works at Abbey Mills last summer. Nothing could have been more agreeable than the trip. The little drawback of the bill was kept out of sight in a very gentlemanly fashion. But the restless curiosity of our contemporary, the *Pall Mall Gazette*, was unsatisfied without a peep at this bill. Having peeped, this journal has had the further indiscretion to tell. We beg to offer our condolence, and to express a proper sympathy with the just indignation of the Metropolitan Board.

That our readers may not take the matter altogether on our own showing, we reproduce 'the principal items which,' says this revealer of secrets, 'have at length leaked out. They are as follows:—The cost of the cold collation, wine, &c., was 1,416*l.* 16*s.* 11*d.*; steam-boats for conveying the visitors from London to North Woolwich, 270*l.*; Great Eastern Railway, for special trains to Abbey Mills, 354*l.* 13*s.* 7*d.*; total, 2,041*l.* 10*s.* 6*d.*' The remark of Mr. Mantalini as to the odd halfpenny will recur to many persons, as applicable to the odd 16*s.* 11*d.*, if not to any larger portion of the charge.

Now we cannot but consider it to be an extremely considerate and public spirited thing for a Board, which, having spent very large sums for the improvements on which it had decided, and being in want of further large sums for further improvements, seemed to persons not very well versed in finance to be drifting towards a position of some embarrassment, to lay out 2,041*l.* 10*s.* 6*d.* in steamers and special trains, and in eating and drinking. The cost of the very commodious pier provided for the convenient landing of the vestrymen is not included in the amount above cited, because, of course, it comes under the general head of 'works.' This transitory convenience can hardly be said, like Jonah's gourd, to have sprung up in a night, and to have perished in a night, but its period of brief utility was hardly longer than that of that celebrated vegetable. At all events its cost will have come, or will have to come, out of the same convenient and well-furnished pocket as that from which have been extracted the other items of the bill.

We hope that our other governing bodies will follow the excellent example of the Metropolitan Board, and that when they invite their special portions of the public to admire and to feast, we may be there to see. In the application to Parliament for the requisite increase of borrowing or of taxing powers, or of any other means of extending

the dominion of the Metropolitan Board of Works, we trust that their well-timed munificence will not be forgotten. In the days of ancient London, when it was desired to celebrate a coronation, or a royal christening, or some other great national event, the conduits were set running with wine. It dribbled, however, from a modest spigot hole compared with that from which the generous magnificence of the Metropolitan Board of Works appears to be accustomed to flow.

ARCHITECTURAL EDUCATION IN PARIS.

THE Art Schools of Paris are well known to many English architects and other artists, but students not acquainted with France, and all who are interested in artistic education, should know the system which is in operation amongst our neighbours, especially as that system has been greatly modified and the means of education largely extended during the last few years.

The *Ecole Impériale et Spéciale des Beaux Arts* deserves first notice. This school is open for study to all the world, though none but Frenchmen born are allowed to compete for the *Grand Prix*, which gives the successful prizeman the right and the means of studying in Rome and Athens for three years.

As regards the school, the session opens at the end of November. The system of examination for diplomas is of general interest. Every student who has obtained twelve marks of merit in the first class of architecture is entitled to present himself for examination for the diploma of Architect. The trial consists in the complete working out of a project in all its details, as if for execution, and is divided into two parts, one graphic, the other oral. The former includes plans, elevations, and sections, together with a descriptive memoir and estimate, and the first sketch has to be prepared by the student, on a given subject, without assistance—in fact, within a given time, during which he is alone in a *loge*, or small atelier. The second part of the trial consists in a *visé voce* examination on the various parts of the plans, on the theory and practice of construction, the qualities and defects of various materials, their resistance, the means employed in preparing them, and, lastly, on the principal points connected with prices and estimates. The examinations are conducted by a special commission composed of architects selected by members of the Administration from a list drawn up by the superior council of the school.

After the outline plans have been made, the students who are pronounced worthy of entering into the competition are allowed six months for the completion of their plans, according to the conditions of the programme. The decisions are made on June 1, and the drawings are afterwards publicly exhibited for several days. Young architects who cannot find time or means to study in Paris would do well to pay a visit there at the period of these exhibitions, especially as there is no season more favourable for seeing the various public buildings of the capital, and as the annual exhibition of paintings, sculpture, engraving, and architecture is also open from May 1 to June 20.

Another and very important establishment for architectural education was opened in 1865, in the Rue d'Enfer. This is called the *Ecole Centrale d'Architecture*, and although it has the countenance and assistance of the authorities, is a private establishment belonging to a company with a capital of 16,000*l.* The object of this school is to give to architectural education more completeness than it obtains in the School of Fine Arts. The course of study includes practical lessons in the ateliers of the school, by eminent masters in all the branches of the art, whether structural or ornamental; drawing, modelling from copies and after nature, reproduction of architectural works, and original design; lectures on geometry, masonry and woodwork, general physics and chemistry; stability of constructions; the history of architecture and the allied arts; geology; vegetable anatomy; the laws of health and sanitary conditions. The course of study lasts three years, with three months' vacation in each year, and the hours of study are from eight in the morning till half-past four in the afternoon.

At the end of the third year the pupils are examined for the diploma of the school. The examination lasts fifty days. The pupils have to produce a set of plans on a subject and under conditions drawn up by a commission consisting of the masters of the school, the professors of the theory of architecture and of the history of architecture, and of the director. The students are left to attach such memoirs or other documents as they please to their plans, and each has to explain and, if necessary, defend, his work before a jury composed of at least five professors and architects. Those pupils who fail to obtain their diplomas are free to enter into competition afterwards.

The school is open alike to foreigners as well as natives of France, and the fee per annum is equal to 34*l.*, payable in three instalments.

Candidates for admission must pass an examination, but this may take place in Paris, in any of the chief towns of France, or even before the professors of foreign universities. The preliminary examination includes ornamental drawing in bas relief; an architectural plan, section, and elevation, from a sketch; a written composition; and an oral examination in arithmetic; algebra to equations of the second degree; geometry and mensuration; geography; and the principles of physical geography, ethnography, and political geography; the past and present empires of Europe and Asia.

The fourth session of the school opened on November 10, 1868; and the statement made to the meeting by the able director, M. Emile Trélat, was highly satisfactory. According to the report there are now above eighty pupils in the school. The number of pupils who completed their studies during the previous session amounts to seventeen, of whom nine obtained diplomas. A considerable number of prizes have already been founded. The following is the list of those awarded at the last examination:—A platinum medal, of 100 francs value, to the pupil in the third class who obtained the most good marks; a gold medal, of the same value, in the second class; a gold medal, of the same value, for construction; a similar medal for figure drawing, given by Henry Cole, Esq., C.B., of the South Kensington Museum, awarded by the votes of the competing pupils themselves; a similar

gold medal, and an architectural work of the value of 300 francs, given by M. Morel, publisher, for work done during the vacation; a prize, given by the Princess Mathilde, to the pupil who had exhibited the greatest general proficiency during the past three years. The grand prize of the school, however, is the *Prix de Sortie*, established by an association of friends of the school; it was awarded for the first time at the last examination, and amounted in value to 1,200 francs, or 48*l.*; it was divided between two pupils, who left the school with the first diploma *ex æquo*.

Prince Napoleon is a warm supporter of this school, and the Ministry of the Fine Arts subscribes four bursarships and four half bursarships.

There is no doubt that its plan is a sound one, and if well carried out, of which there is little danger, looking at the high character of the professors and masters of the school, it cannot fail to have a most beneficial effect upon the quality of French architectural education.

NOTES FROM FOREIGN PUBLICATIONS.

MONITEUR DES ARCHITECTES. Editor, M. François Lenormant. Lévy, Paris.

In a recent number of this publication will be found plans and an elevation of the Cour de Cassation, forming part of the new Palais de Justice, at Paris, designed by M. Duc, who was the architect, nearly forty years ago, of the well-known Colonne de Juillet. The principal façade is designed after the French Palladio-Mansard model, and consists of a central 'pavillon,' with four engaged Corinthian columns, on either side of which are symmetrical wings, along which the same order is continued in pilasters. Italian windows and French door pieces, the latter remarkable for their dis-proportion, complete a composition which we think hardly merits the high-flown encomiums it receives at the hands of the present learned and very talented editor of this journal. We notice, in another article from the same hand, the statement that 'the system of Assyrian architecture, the style of its edifices, their plan-arrangement, and the mode of their construction, are all matters well known at present, thanks principally to the excellent studies of M. Thomas, on the palace of Khorsabad,' no mention being made of the labours of Layard, even by allusion. And yet the measurements of the buildings are given, throughout, *in feet*, and are evidently taken from Layard's books, and not from that of Place ('Ninive et l'Assyrie'), apropos of which the article is written. Why will our French friends insist on taking *all* the glory to themselves? The following list, from the same source, comprises the various more important works of construction which have been brought to completion during the year 1868:—One theatre, that of the Vaudeville, Chaussée d'Antin; seven churches, namely, those of St. Augustin, La Trinité, St. Pierre, St. Ambroise, St. François-Xavier, Notre-Dame-de-la-Croix, Notre-Dame-des-Champs; two synagogues and a Protestant temple. Of miscellaneous works:—the laying under the Seine of the syphon connecting the main collecting drains ('égouts-collecteurs') of the right and left banks; construction of a bridge over the Rue Berthier, connecting two railways; sinking an Artesian well at the Butte aux Cailles; enlargement of the 'Halles Centrales' by two additional pavilions; construction of the fountain of the 'Château-d'eau'; reconstruction of the south wing of the Tuileries. The works for opening out new streets, &c., which have been completed, comprise:—the opening of the boulevards Arago, Port-Royal, Saint Marcel, Mouffetard and Ornano; Boulevard Haussmann, as far as the Rue Taitbout; and the Boulevard Saint-Germain, as far as the Rue Bellechasse. The following streets, namely, those called Lafayette, Cardinal Fesch, Rome, Bodin, Maubeuge and Puebla; the Quai d'Austerlitz reconstructed; the Champ de Mars restored to its state prior to the Exposition. The following public 'places' have been completed, those, namely, d'Europe, du Nouvel Opéra, de l'Eglise, de la Trinité, and de l'Arc de l'Etoile. The following squares (pronounce *squarr*, s.v.p.):—le Square de la Rue Delaborde and that of l'Ecole Polytechnique. Further, 15½ miles of roadway have been laid down in asphalt.

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

NOTE.—The space at our disposal renders it impossible to give regular reports of the meetings of all the Technical Societies in a sufficiently extended form to be serviceable, without shutting out other matter having more varied interest. As it appears likely to be unjust to speakers, and not of much value to our readers, to insert extremely brief abstracts of these proceedings, it has been determined for the future to report only such papers or meetings as appear to possess special claims.

Royal Institute of British Architects.

The usual fortnightly meeting of this Institution was held on Monday, March 1, William Tite, Esq., M.P., President, in the chair.

After the usual formal business,

The PRESIDENT, who was most cordially received, announced the recommendation of the Council that, subject to Her Majesty's gracious sanction, the Royal Gold Medal for 1868 should be awarded to Professor Lepsius of Berlin.

Mr. WYATT PAPWORTH, upon the occasion of a large number of interesting drawings executed by the late Joseph Bonomi being presented to the Institute by the widow of C. H. Smith, Esq., read an interesting memoir of Mr. Bonomi, one of the leading architects of the last century, with some account of the various public and private buildings erected under his direction. Rosenath especially was examined at considerable length. Mr. Papworth concluded his essay with an eloquent eulogium, not merely of the artistic merits, but also of the mental qualities, of one who has been almost forgotten by the present generation.

The PRESIDENT then called on Mr. George Godwin, F.S.A., to read his paper entitled 'Some Account of the Chevalier Da Silva's work, "Signes qu'on voit gravés sur les anciens Monuments du Portugal," and on masons' marks generally.

Mr. GODWIN regretted that he had not had time to make the paper as complete as he could have desired in consequence of the great mass of matter which had to be digested, and then proceeded to state that some of the stones in the Great Pyramids of Egypt present symbols, either quarry marks or mason's marks, drawn in red ochre. Some of these marks have been also found in most ancient buildings in Lycia and Mesopotamia, and in various parts of India. Similar marks were found some years back in St. Mary's Church, Leicester, on removing the west window. Mr. Godwin then proceeded to state at what places the various marks depicted on the 38 sheets hanging on the wall were to be, or had been, found. The collection had been made from all parts of the globe. The length of the marks, Mr. Godwin observed, varied from one to five or six inches. The greater number, however, are from two to three inches long. For the greater number of the specimens selected from Spain, his authority, he stated, had been Street's 'Account of Gothic Architecture in Spain,' from which work he quoted the following passage:—"The masons seemed to have worked together in large bodies, and the walls are marked in all directions with the signs which, then as now, distinguish the work of each workman from his neighbour; but I have been unable (save in one or two cases) to detect the work of the same mason in more than one work, and from this it would seem to be probable that the masons were stationary rather than nomadic in their habits—a deduction which is fortified by the difference of general character, which may, I think, be detected between the groups of marks in different buildings. Occasionally the number of masons employed on one building seems to have been unusually large, and it is clear therefore that there were great numbers of masons in the country. For the small church of Sta. Maria Benavente there are the marks of at least thirty-one masons on the eastern wall; as many as thirty-five were at work on the tower part of the steeple at Lerida, while in one portion of Santiago Cathedral there appears to have been as many as sixty." Looking through the marks given by Mr. Street, he found some marks repeated a little oftener than might perhaps be inferred from the remarks of the writer. The marks from Portugal had been chiefly taken from the Chevalier da Silva's memoir, which gives 608 marks from ancient buildings in that country, besides a supplementary plate containing 14 marks from the great Aqueduct of Lisbon (built in 1738), and 22 ancient masonic hieroglyphics—where used or how obtained is not stated. After comparing the characteristics of these marks with those of other countries, Mr. Godwin observed 'that these marks (it can hardly be doubted) were made chiefly to distinguish the work of different individuals. At the present time the man who works a stone (being different from the man who sets it) makes his mark on the bed or other internal face of it, so that it may be identified. The fact, however, that in the ancient buildings it is only a certain number of the stones which bear symbols, and that the marks found in different countries (although the variety is great) are in many cases identical, and in all have a singular accordance in character, seems to show that the men who employed them did so by system, and that the system, if not the same, was closely analogous in one country to that of the others. It seems to have been urged in Portugal that these signs were symbolical, and were used as means of recognition by the Freemasons who travelled over Central Europe exercising their art. The principal object of the Chevalier da Silva's work—to show that those who have believed that these marks have a masonic significance have been mistaken—cannot for a moment be allowed. The Chevalier urges, that as it was the highest aim of the Freemasons to keep their art a secret, it is improbable that they would have exposed it where they could be observed by all the marks of their order; that if these signs are the characteristics of the Masonic order, they ought to be identical in all buildings. He finally asks how it can be that these signs are those of Freemasons, when we find them on the stones of several monuments erected before the organisation of these fraternities? Here, however, he assumes two things: first, that the marks found on the earliest buildings are similar in description to those of the Middle Ages; and secondly, that the date of the initial organisation of such fraternities is really known. Moreover, he leaves out of consideration the probability, or rather the fact, that the guilds adopted existing forms and symbols without considering the marks symbolical. We may yet believe they owe their wide diffusion to the existence of associated guilds. The general similarity which they present all over Europe, from at any rate the 11th century to the 16th, and indeed to the present day, points to a common origin and continued transmission. M. da Silva fully admits the existence of the building guilds, and the quotations already read go to affirm that they were maintained in opposition to the monastic associations, which were depositaries of old theological traditions, and could be met only by other associations organised with sufficient strength to endure, and in time to become themselves guardians of traditions, and with enough mystery to avoid rousing dangerous resistance. Towards the end of the 12th century, when their numbers had become considerable, a special corporation of intelligent architects, stone-cutters, and labourers was instituted, who, uniting together, formed a secular body which acknowledged royal authority alone. Notwithstanding the absence of written proofs and historical documents, it is probable that societies of lay builders existed in Germany as far back as the 13th century. In the year 1275 the Emperor Rodolpho granted a special charter to the builders established in Strasbourg, and in 1278 the Pope, Nicolas III., delivered them a brief of indulgence, renewed from time to time by his successors. The precedence of the Freemasons of Strasbourg came to be recognised by neighbouring states, and at a meeting of various lodges held in Ratisbon in 1459, the head of the lodge at the Cathedral was acknowledged the head of the Freemasons in Germany. The statutes of this date of the Strasbourg Lodge, from which lodges branched to many places, have been published. As to the earlier guilds in classic countries, of which there are traces, Mr. Godwin would not pretend to speak, nor would he do more with those of our own country than briefly revive the fact that a College of Masons is mentioned in a dedicatory inscription dating from about A.D. 52, and which was found in Chichester in 1725. A Bull was issued prior to 1200 giving authority to heads of churches to build churches, and attaching to them a certain number of *liberi muradores*, or freemasons, to direct and execute

the ornamental part of structures. Much might be, and something has been, written on the actual origin of the marks. Some could be traced to the Lycian alphabet, others were of Runic form, while those of later date might be founded on the Roman alphabet. Mr. Godwin then discussed and illustrated the various marks found to have been most universally adopted. Whatever may have been the original signification of the forms adopted, he found no evidence to lead him to believe they were viewed by the masons other than as signatures given to them in some cases on joining a lodge. The Scotch Lodges gave marks till very recently, if they do not do so now. In St. Ninian's Lodge, at Brechin, every member had to register his mark in a book kept for that purpose, and he could not change it without certain formalities. The subject is probably more curious than useful, but he hoped it would be considered sufficiently interesting to have been brought before the Institute. In his first communication on the matter to the Society of Antiquaries, he ventured to express a belief that no circumstance which promises to throw even the smallest additional light on the early history of those wonderful men to whom we are indebted for so many magnificent buildings can be deemed insignificant or unworthy of consideration, and he thought so still. (Considerable applause.)

After a few remarks from the President, the proceedings closed with votes of thanks—

To Mrs. Smith for the presentation to the library of drawings executed by the late Joseph Bonomi ;

To Messrs. J. Bonomi and George Goldie, for the loan of other drawings by the same hand ;

To Mr. Wyatt Papworth for his memoir of Mr. Bonomi ; and

To Mr. George Godwin for his paper on the Chevalier da Silva's work.

At the next meeting Mr. Ingress Ball will read a paper on 'Architectural Criticism, with some Remarks on Architectural Exhibitions.'

IS HAMMERSMITH SUSPENSION BRIDGE SAFE ?

THIS bridge was opened for public traffic in August, 1827. The Act of Parliament for the construction was obtained in 1824. The time occupied, therefore, in the erection of the structure was only three years, and in this circumstance it will bear a favourable comparison with similar works more recently erected, and in times when the appliances of building and engineering science have been much more extensive.

Hammersmith Bridge was built after the design of W. Tierney Clark. It has three spans, the centre span being 400 feet in the clear, and 422 feet from centre to centre of piers. The side spans are each about 145 feet between faces of abutments and piers, and 156 feet between faces of abutments and centres of piers. The distance between abutments is 734 feet nearly, and the clear waterway 690 feet. The piers are built of stone and are very massive. There is far more material in them than would be put in piers built for a similar purpose at the present time. Each abutment is 45 feet long, 40 feet wide, and 15 feet deep, and is estimated to be over 2,000 tons. The platform is divided into a carriage way 20 feet wide, and two footways, each 4 feet wide, one on each side of the carriage way. There are eight main chains arranged in four pairs. The two pairs carrying the carriage way are about 21 feet 6 inches apart, and the chains on the outside of the footpaths are 5 feet from the centres of the other chains. The whole of these are supported on cast-iron rollers working in cast-iron frames fixed in the piers, at such a height as to make the versed sine of the curve of the chains of the centre span about 29 feet 6 inches. The chains fall nearly level with the roadway in the centre of the bridge. The roadway is about 16 feet above ordinary high-water level. As we have already said, there are four pairs, or lines, of chains, each pair for the roadway being formed of twelve links in section, six in the upper chain and six in the lower chain. Each link has a section of 5 inches deep by 1 inch wide, and as there are twenty-four of these, there is a sectional area of 120 square inches. Each pair of chains on the outside of the footways is formed of six links in section, three in the upper, and three in the lower chain. The links are the same size as in the other chains, and have 60 square inches sectional area, making the working sectional area of the whole of the chains 180 square inches. The links are connected together, and form the chains by means of short plates or links, with two bolts $2\frac{1}{2}$ inches diameter passing through them, and screwed at each end to receive a cast iron nut or cap. The chains, plates, pins, and suspension rods were made of the best wrought iron, and all the pin holes were drilled, so that no injury was done to the iron by punching. Every link was proved separately by a tensile strain of nine tons per square inch, which is very near the limit of elasticity of good wrought iron made at the present time, and was, no doubt, considered in 1827 to be the limit to which iron could safely be strained before use.

The minimum section of each vertical suspension rod has an area of one square inch, and as there are four of these to every 5 feet lineal of roadway, there are 4 square inches section of wrought iron to carry about 10 tons, which is nearly the weight of the fixed and greatest moving loads. Therefore, the greatest strain per square inch on each of these suspension rods is only $2\frac{1}{2}$ tons when the bridge is loaded. We cannot believe that the metal in these rods, or in the chains, has deteriorated, or become crystallised. If tried, there is very little doubt the quality of the metal would be found to be equal to that made at the present time. The bottom ends of these rods which pass through the roadway are made considerably thicker, evidently to provide for corrosion, as at this part they cannot be painted, and are always liable to moisture. In fact, the suspension rods are the strongest part of the structure.

It has often been stated that wrought iron changes its nature in course of time, when under the influence of strain and vibration, and becomes brittle or granulated, and loses its strength ; but it has never been proved that it does so, except, perhaps, when the strain extends or compresses the metal beyond its limit of elasticity ; even then it does not become crystallised, but simply deteriorated ; the fibres of the iron, as we may so call them, being drawn apart, or separated in proportion to the amount

of permanent set up to the moment of breakage. With brass rods under tension, and with or without vibration, it is very different. It is a well-known fact that they soon lose both strength and ductility.

The roadway was originally made of timber cross-beams suspended by the vertical rods, and longitudinal planking, 3 inches thick, covered with felt, pitch, and tar ; on this was laid another thickness of planking transversely. All the original timber beams have been replaced by cast-iron girders, and the whole of the planking renewed. The carriage-way is covered with a moderate thickness of granite metalling. The weight of the centre span was estimated to be 360 tons when it had simply a wooden roadway, but now the weight may be assumed to exceed 400 tons.

As to the weight per square foot given by a crowd, there are various opinions. Mr. E. A. Cowper stated some time since, before the Institute of Civil Engineers, that he had packed a lot of workmen so close that the weight per square foot was 144 lbs. Mr. Hiemens says he got 140 lbs. by placing men on a weighing machine. Others give lesser weights per square foot. If we take 84 lbs. as the load per square foot, we shall find it ample for calculating the strength of a bridge to carry as many people as can go upon it, if they keep 'moving on.' But such a load is probably too much for Hammersmith Bridge, as it would give a strain on the main chains exceeding the 9 tons proof strain. In no case should the strain from the actual load exceed proof strain. In fact, it should be considerably under when safety of life is concerned. Many of our first engineers do not like the working strain to exceed one-half the strain of elastic limit, which, for good iron, is about 10 to 12 tons. The working strain, therefore, would be 5 to 6 tons. But a structure is always safe so long as the proof strain has not exceeded the elastic limit of the metal, and the strain from the loads is kept under the proof strain.

The weight of the superstructure of Hammersmith Bridge may be assumed as one ton per foot lineal ; this includes cross-girders, platform, metalling on roadway, railings, suspension chains and rods ; the strain on the chains, therefore, from this fixed load alone is four tons per square inch ; and when we add the moving load, say 74 tons per square foot, the strain on the chains will be fully 8 tons per square inch, equal 8-9ths of proof strain.

There can be no doubt every precaution will be taken on the day of the boat-race to insure the bridge not being weighted beyond its safe load. The bridge was designed and calculated for a given moving load, and this must not on any account be exceeded. It was not designed to be a 'grand stand' for thousands to crowd upon it to view a boat race ; therefore the thousands must be made to 'move on.'

DRAINAGE OF THE THAMES VALLEY.

THE following Report of the engineers of the Thames Conservancy Board, on the alterations and improvements which are necessary to benefit the neighbourhood of Oxford by the relief of floods, has been transmitted to the Mayor of Oxford (Joseph Castle, Esq.) by the Conservators:—

TO THE HONOURABLE THE CONSERVATORS OF THE RIVER THAMES.

Gentlemen,—The condition of the land drainage with regard to the escape of floods from the low-lying district which, to a considerable extent, surrounds the City of Oxford, and the remedy which might be applied to the existing defects, is the subject of the following report, in accordance with your order of February 7, 1867, directing us to report on any alteration or improvement we can suggest to benefit the locality.

The valley of the Thames which surrounds Oxford on the north, south, and west is not only subject to inundation, but is so circumstanced that the floods which visit it are retained for an undue and unnecessary period in a stagnant condition, saturating the ground and causing exhalations which unquestionably must be deleterious to the health of those residing within their influence. Nor is the evil confined to the periods of actual visitation by the floods, for even after the continued prevalence of dry weather, copious mists arise from the marsh lands lying near the city, not merely conveying the idea of insalubrity, but of necessity producing that result. We have no doubt that the existing defects have been produced in the course, it may be perhaps, of many centuries, by encroachments gradually made, for it is unquestionable that the founders of the cities and towns on the Thames exercised so wise a choice in the localities they selected that they would have avoided a spot open to the objections which now exist to the situation of Oxford.

The mode of treatment we suggest will have the effect of restoring the river practically to its original condition, and the result will be that while any existing defects in the navigation will be removed, the far more important evils arising from the want of drainage of the land and subsoil will be effectually remedied.

Careful personal surveys, aided by the accurate plans and levels taken by your surveyors with special reference to this subject, have convinced us that the evils we have indicated (which might indeed be enlarged upon) are capable of a perfect remedy.

The whole district is traversed by streams and water-courses, all ready to do their part in the required drainage, and with moderate cleansing and deepening, the formation of one deep arterial channel, to which they may all gravitate, is only needed to make them perfectly efficient.

This plan recommends itself alike by its completeness and simplicity, for it demands only the adaptation of existing means, presents no difficulties that may not be readily overcome, and is practicable at an expense that we believe will be considered moderate when compared with the great extent and value of the area over which beneficial results will be enjoyed.

For about two miles below Eynsham Bridge down nearly to King's Weir, the river consists of one deep and capacious stream, fully adequate to the passing of floods when a few shoals have been removed.

Just before reaching King's Weir the Wytham stream leaves the main channel. This stream is the first of numerous inefficient and circuitous branches by which the drainage of the valley is carried through the Oxford district for a distance of $7\frac{1}{2}$ miles.

These branches have various confluences among themselves, and do not finally unite until just above Sandford Mill, whence the entire drainage of the valley flows on in a single broad channel nearly to Abingdon, a distance of 13½ miles from Eynsham Bridge.

The part, therefore, which in our judgment is that which must be dealt with in order to benefit the city and suburbs of Oxford, extends from King's Weir to Sandford.

King's Weir should be rebuilt on an improved plan. This work is necessary for the purpose of holding up the head of water required for the navigation from the Oxford Canal to Eynsham, and for the mills at Wytham and Wolvercote. Its power to discharge floods should be greatly increased.

Below King's Weir towards Godstow Lock the channel has been for many years disused for navigation, and is consequently in several places choked up. Such obstructions should be removed, and so also should the flaring bucks at Godstow Bridge. Godstow Lock might be repaired and lowered at a moderate expense to suit the improved level of the river; but it is now impassable, and the traffic of the river above King's Weir is carried for a short distance through the Oxford Canal, so that there is no absolute necessity for its maintenance.

Below Godstow Lock the river, as it skirts Port Meadow, is of ample width, but is greatly obstructed by shoals, which should be removed, together with Medley Weir. The Port Meadow, which is now even in summer scarcely raised above the surface of the river, would thus be effectually relieved of the flooding from which it suffers greatly.

The next material obstruction is presented by the Botley Bridge. The middle arch, with the massive piers on each side, should be removed, and a girder bridge of one span be substituted for the three arches. The stream down to Osney Lock should be deepened, and an efficient weir be substituted for the present paddle gates.

From Osney Lock to Sandford we recommend an entire alteration in the existing condition of the river. The main feature of this alteration would be the removal of Ifley Lock, as well as of that at Folly Bridge, and the somewhat extensive deepening of the bed of the river, which would be rendered necessary by taking away these locks.

This deepening would give full vent for flood waters by the main channels, and prevent their drowning the land by means of the various branches through which floods now direct their course.

Beginning at the upper end, it would be necessary to rebuild Osney Lock. It is too shallow even in the existing state of the river, not having a depth of three feet at times of low water, and needs extensive repair. The new lock should be eight feet deeper.

Dredging would have to be done between Osney Lock and Folly Bridge, and if practicable, the projecting points on the river cut off, as we have shown them on the plan. The Grandpont Mill, formerly the City Water Works, and the adjoining weir, situate just above Folly Bridge, should be removed, and that stream be made the main channel. The present Folly Lock should be so far altered as to serve for an additional escape for flood water.

The projecting angle at the upper end of the Christ Church Meadows should be taken off. From this point down to Ifley a considerable quantity of dredging will have to be done, and more particularly in the first half-mile below Folly Bridge, where the deepening of the river would have to be extended almost from side to side.

At Ifley we propose that the lock and mill should be entirely removed; this will immediately deprive the Weirs Mill of its head water. The mill itself is in a dilapidated condition, and its fall is small in the dry season, while, during wet periods, there is no available power.

The removal of Ifley Lock and Mill, taken with the proposed alteration at Folly Bridge Lock and the Grandpont Mill, will give an uninterrupted reach of water extending from Sandford to Osney, a length of about 3½ miles, very much facilitating navigation, and offering a great improvement for the amateur boating so much valued as a recreation for members of the University.

Between Ifley and Sandford the abrupt bend near Rose Island should be obviated by forming a new course for the river through the short neck of land at that spot. If thought desirable by the owners of adjacent lands between Folly Bridge and Sandford, it would be easy to widen the towing path so as to form a good carriage road with the large amount of surplus dredging taken out of the bed of the river.

When all these facilities for the escape of flood water come to be carried out, the millers at Sandford will, no doubt, assert that the floods would be brought down more quickly upon them. To obviate such a complaint, additional facilities for the escape of floods may be provided by increasing the width of the river where it is now somewhat confined below the several old locks and tumbling bays at Sandford. More dredging than has yet been done should also be effected on the shoals at Radley Common.

To render these works still more complete it would be very advisable to restore to the Culham Stream some of the flood-discharging capacity, which in the course of years it appears to have lost. It would be necessary to lower considerably the existing dam at the top of the stream, making provision by moveable tackle for the maintenance of a proper head of water for the navigation and the mill at Abingdon.

Having thus described the alterations in the main drainage of the valley, and the works which will be necessary to effect them, we will now state what will be their cost according to the following estimate:—

Nett cost of works for the relief of floods, 29,758*l*.

The result of the carrying out of these works would be equivalent to raising the whole surface now subject to inundation from 2 feet 6 inches to 3 feet above its present level.

Ordinary floods would be carried off by the deepened channel, and high floods would be enabled to pass away rapidly, and the stagnation of waters on the marshes and the saturation of the ground would be prevented.

With regard to the means of obtaining the amount required for carrying out these works, we find that about six thousand acres of land more or less liable to floods would derive benefit from the drainage facilities afforded by the suggested expenditure, in addition to the City of Oxford and a large area bordering upon the Thames marshes, not absolutely flooded.

Although we have adopted King's Weir as the upper limit of the district dealt with in this report, we are well aware that a similar treatment of the river beyond, subject as it is to extreme flooding, would be followed by most beneficial results; but as no survey has been made on which the proposed works could be indicated, we have not entered upon the consideration of the necessary works.

We have prepared a map and section to accompany this report, describing the district and works referred to,

And have the honour to be, Gentlemen,

Your obedient servants,

NATH. BRARDMORE.
STEPH. WM. LEACH.

Estimate in detail.

For re-building King's Weir, the alteration of Botley Bridge, the reconstruction and enlargement of the weir near Osney Lock, removal of the weir at Grandpont Mill, adapting Folly Lock to the passage of flood water, removal of Ifley Lock, the Tumbling Bays, &c., at Sandford	£10,850
Dredging shoals and deepening the bed of the river from King's Weir to Sandford, making the new cut near Rose Island, and dredging shoals at Radley Common	12,530 0
Excavations in cutting off bends	5,907 0 0
Purchase of land so cut off, and compensation in respect of Grandpont Mill, the Weirs Mills, and Ifley Mill	6,875 0 0
	£34,962 0 0
Add 10 per cent.	3,496 0 0
	£38,458 0 0
Less for navigation works only in the district as described in our former Report	11,200 0 0
	£27,258 0 0
Improvement of Old Culham River and weirs above Abingdon	2,500 0 0
Nett cost of works for relief of floods	£29,758 0 0

REVIEWS.

L'ARCHITECTURE ET LA CONSTRUCTION PRATIQUES, &c. By Daniel Ramée. 1 vol. small 8vo. Firmin Didot & Co., Paris.

The author of this work is a well-known writer on architecture, having published, amongst other books on this subject, a 'General History of Architecture,' in two volumes, large 8vo., and a 'General Dictionary of Architectural Terms in French, German, English, and Italian.'

The volume before us is a very full and clearly written manual of practical construction, intended by the author, as he says in his preface, principally for those who require to build whether in town or country, and especially for proprietors who from any cause have not an architect within reach. We have what we believe to be a wholesome dread of mere popular manuals, which generally lead the uninitiated into difficulty rather than otherwise, and we recommend this little book on grounds different from those just stated. It is the work of a thoroughly practical man put together in a thoroughly practical manner, logical in its arrangement, and fully illustrated with more than four hundred simple and useful cuts. It forms an excellent manual for country gentlemen and also for builders and young architects, and is all the more suited to our own country from the fact that, unlike most French works on architecture, it deals chiefly, though not solely, with brick and timber work of the simpler kinds. The information is very minute and precise, while unnecessary theory and elaborate calculations are as much as possible avoided.

The work is divided into three parts: the first treats of materials—stone, natural and artificial, bricks, timber, iron, cements, colours, &c.; the second deals with the science of construction, the nature of the soil, excavation, foundations, masonry, carpenter's work, joining, iron-work, roofing, &c.; and the third with plans, elevations, sections, reductions, and modes of construction. In addition to these there is an appendix relating to estimates and valuation.

One important point to which the author has given great prominence is the preparation for foundations, to which, as he says, great attention has been given in France, and with marked success. Hitherto the details of this very important preliminary work have hardly been united in any single treatise, and M. Ramée, in collecting them from various sources and giving references to his authorities, has rendered an important service to young architects as well as many other persons.

An introductory chapter on practical geometry, mensuration, weights, density, equilibrium, &c., furnishes a capital series of lessons for carpenters, and workmen of all classes, as well as for emigrants, and for all indeed who are engaged in construction.

The following passage relative to bricks will illustrate the author's method of treating his subjects:—

It is very important to be assured of the good quality of the bricks to be employed: they should neither be cracked nor vitrified, but well and equally burnt. Three main points with reference to bricks have to be taken into account:—1. The power of resistance under pressure; 2. The appearance of the fracture, which should present an even texture, and a fine and brilliant grain, without cavities in the interior, and neither ribbon nor stony; 3. The exterior, which should be smooth and regular, the angles and edges sharp and straight. When the size of the bricks is equal throughout the mass, it is a proof that the brick earth has been well prepared, and the bricks generally well made. A brick when struck should give forth a clear ringing sound. Good bricks are generally of a dark reddish brown colour, and sometimes they show vitrified spots on the surface: it is not well, however, to depend too much on this last fact, for it is often only an indication of the amount of heat to which the brick has been subjected, while the clay of which the brick is made may be impure and ill prepared. Bad bricks are readily recognised by their reddish yellow colour, but still more by the dull sound which they emit when struck; their grain being soft, they crumble easily, and absorb water with avidity. A good brick should not absorb more than about one-fifteenth of its own weight of water; it should appear and in reality be dry. A brick that does not take up any water at all is too much burnt: the mortar adheres to it imperfectly, but it is a good conductor of heat. Such bricks may be used in damp soil and for pavements. When a brick left in water either scales or swells, it is of bad quality, and contains caustic lime. A brick which, being made red hot and then having water poured upon it, does not crack, is of extraordinary and rare quality; and those which have borne the effect of moisture and dryness during two or three winters without scaling or cracking are excellent. In order to try if bricks

will bear the effect of frost, let one be boiled for half an hour in a solution of sulphate of soda, saturated cold, and then suspended by a string over the vessel in which it has been boiled; in twenty-four hours the surface of the brick will be covered with small crystals: the brick is then to be immersed again in the solution until the crystals disappear, and again suspended, repeating this operation for five days, the crystals reforming after each immersion. If after this treatment a number of particles of the brick are found at the bottom of the vessel containing the solution, the bricks are incapable of supporting the effects of frost.

The description of the method of forming walls of clay as practised in the south and other parts of France may be of interest in country places; this is known in France by the name of *Pisé*. This method was employed by Hannibal in Spain, and Pliny the elder records having seen the constructions two centuries afterwards. Vitruvius says that *Pisé* was used at Marseilles, with straw, to form tiles. In some cases, instead of clay, lime and sand, with pounded brick or forge cinders and a little cement, are used for making *Pisé*. The best proportions for this latter kind of concrete are, according to the author, five or six parts of sand, one part of brick or tile pounded, one mixed lime, and a quarter or one-third part of cement. It is either beaten down hard in its place between guide boards, or formed into blocks for building. *Pisé*, however, requires a stone or other foundation. It will not bear moisture: it is, therefore, only used in the south, while the other compound is common to the northern parts of Europe.

M. Ramée is evidently acquainted with England, and this fact recommends his work to our readers. The following extract will illustrate this, and also give an idea of M. Ramée's view respecting house-building:—

Since railways have facilitated travelling, a small number of intelligent architects have abandoned old traditions and gone abroad for inspiration, and especially to England, where the country houses have a special character of their own, perfectly adapted to their purpose. During the years following the Revolution of 1848 a number of very pretty houses grew up in the environs of Paris, some regular in design and others picturesque, but costing too much for persons of moderate means. These houses exhibit a fertility and richness of taste previously unknown in France. But this taste still leads to much unnecessary expense, and adds nothing to the comfort of the house. Amateur builders should understand that with plain surfaces of good proportions, simple string courses or mouldings to divide the storeys horizontally, and a vigorous cornice with a bold projection, façades of good taste may be produced, agreeable to the eye of one accustomed to look upon the finest monuments.

M. Ramée is a staunch admirer of the *simplex munditiis*, and in the case of domestic architecture he is beyond question right. He tells his countrymen that for cottage architecture they must go to London, Papworth, Robinson, Goodwin, and other English writers; and we can return the compliment by saying that for practical hints on construction our countrymen will do well to consult M. Ramée's work.

SMOKING FIRES; THEIR CAUSE AND CURE. By the Rev. Alex. Colvin Ainslie, M.A., Vicar of Corfe, Somerset. London: Longmans. 1869.

It is a curious circumstance that, in an age of consummate science—fertile in appliances for the comfort and luxury of life, and lavish of skill and resource in all that concerns the construction of buildings—the homely problem of the chimney should yet challenge a satisfactory practical solution. We do not allude to the purely artistic question of the treatment of a chimney-top; this may be, often is, admirably dealt with, at the same time that the true arrangement of fire-place and flue is a mystery so obscure, that the result, as to efficient draught or smoking, remains in doubt until the housewarming. Happy the householder who finds his chimneys at once finished in true architectural taste and perfectly adapted to their humble but important functions! His is a rare exemption from the smoke doctor, with his unsightly superstructures of huge pandean pipes, or creaking crows, or after thoughts in zinc, protruding from the ashlar flues like coral insects—wriggling, or with feelers outspread—and the like melancholy signals of distress. To approach the metropolis by a high-level railway, or to look down upon any part of London from the upper windows of a lofty hotel, is to have ocular demonstration of the general failure of chimneys, as designed in the first instance, to accomplish the task of getting rid of the smoke. How far the metal excrescences attain the end desired, we will not at the moment enquire. The point just now under consideration is, rather, what such extensive doctoring portends:—a prevalence of originally faulty chimneys—a prevalence that would surely not endure if a fair degree of pains and ability, such as we commonly observe in all other necessary details, were given by the architect to the thorough practical mastery of the smoke question. Problems seemingly harder have been taken in hand and solved; as the consumption of smoke, or the warming of buildings by means of air; water; and stoves. But the preference of the million, in this country at least, where the fireside seems almost essential to the idea of home comfort, as well as a regard to cheapness and simplicity of construction, will probably cause the open fire-place to hold its position in the large majority of dwelling-houses, in the face of all admonitions as to waste of fuel. The old question is therefore sure to present itself again and again, requiring (under certain stringent penalties) a definite and conclusive answer. Such answer the Rev. A. C. Ainslie essays to give, in the manual now on our table.

Commencing with a brief statement of first principles regarding air and its properties, he lays down the conditions essential to the maintenance of a steady draught up a chimney, and then proceeds, with remarkable distinctness and method, to describe and explain various causes of smoke, of which the following is a summary:—

- I. Want of sufficient height in the flue.
- II. The outlet of the chimney being placed in an exposed and cold situation, while the air with which the fire is supplied is drawn from a warmer and more sheltered region.
- III. Excessive width in the flue, by which a large volume of cold air is drawn in and allowed to lower the temperature of the ascending column.
- IV. Low temperature of the interior of the flue in comparison with that of the external air.
- V. Humidity of the air.
- VI. Too accurate fitting of the windows and doors and joints of the flooring.
- VII. The draught of one fire injuring that of others in the same house.
- VIII. A current caused by the heat of the fire circulating in the room.
- IX. A flue of insufficient size.
- X. A foul flue.
- XI. Displacement of masonry, or accumulation of mortar within the flue.
- XII. The sudden obstruction of the draught by gusts of wind entering the chimney top.
- XIII. Increase of density of the air at the chimney top, due to the effect of wind in chimneys rising from the eaves of roofs.
- XIV. Draughts within the room which throw the smoke out of the influence of the ascending chimney current.

Eight or nine pages are devoted to the symptoms indicating the cause of smoke; and the author follows up his diagnosis with a plain and highly practical chapter of remedies suited to the special ailments indicated. The discourse winds up with an application, in the form of suggestions to architects and house-builders, which are (with perhaps one exception) well worthy of attention.

Some of Mr. Ainslie's hints are such as commend themselves at once, e.g.: that the flue should be large (not too large); of circular section (say glazed 12-inch drain-pipe), to secure thorough sweeping; with avoidance, as far as practicable, of elbows and bends; that it should be carried high enough; and that, if it pass through the eaves of a high-pitched roof (a position to be eschewed), it should finish at a higher level than the ridge. The evil of external chill (less generally recognised) is pointed out; with an injunction that the masonry of chimneys in external walls should be as thick as possible. It might have been added, that metals, being rapid conductors of heat, are on that account bad material for chimney tops; also, that comfort and economy are generally best consulted by keeping fireplaces and flues well towards the centre of a building, and away from the external walls. Our author gives sound advice as to the inlet to the flue being narrow (the opposite of the old chimney-corner arrangement); and the sides of the grate so contracted that all air that ascends the chimney must first pass through, or directly over, the fire; and describes modifications of the 'blower,' well suited to wide grates and fireplaces with hobs. The suggestion that the kitchen flue should be at the north or east end of a stack is sagacious; also, the recommendation to supply every fire with air for its own consumption, drawn from the coldest side of the house. The arrangement proposed with this aim is ingenious, and no doubt capable of easy and effective application in a large proportion of cases; but the question of the exact position, size, and adjustment of the air inlet near the hearth appears to us yet open to further investigation: and it must not be forgotten that any such arrangement diminishes the efficiency of the open fire as a ventilator of the room.

One injunction of our author's ought, we think, to be received with extreme caution, viz.:—'In chimney stacks with many flues, let their outlets be at different levels.' Were this plan followed with common chimney-pots, open at the top, winds from a certain quarter might send gusts down those at the lower levels. A case came within our own knowledge, where a chimney-top, the edge of which was finished with a rim of triangular peaks, had lost one of those adornments. The result was a smoky chimney whenever the wind set in the quarter next the damaged side. The remedy, at once simple and successful, consisted in breaking off another peak, and thus making a second gap opposite the first. Now, a short chimney-pot, close to a tall one, is under the same sort of disadvantage as that just referred to, where the wind passing the gap on one side was arrested by the peak on the other. Moreover, in calm weather, if one of two chimneys in juxtaposition be shorter than the other, the upcast in the latter is very apt to set up a downcast in the other. An instance, for which we can vouch, well illustrates this tendency. In a house containing offices variously tenanted, with a common chimney-stack, the flue of a particular room suddenly took to discharging dense volumes of smoke at the wrong end. In vain the fire was fanned and stirred; windows thrown up; doors set open: the air of the room, filled with sulphurous fumes, became as yellow as a dense London fog; while 'free carbon,' in the guise of a swarming Liberia of blacks, descended on books, papers, and furniture, and evicted the lawful occupants of the room. On investigation it was found that an adjacent flue in the same stack had been raised a foot or two higher, and thus caused a downcast in the offending chimney; the inequality of level was redressed, and the nuisance ceased at once.

One point to which we do not find distinct reference in the work before us, is the covering over the tops of chimneys as a safeguard against down draughts, as well as a protection from rain and the attendant damp, that not only interferes with fires, but impairs the draught of flues. On the whole, Mr. Ainslie's little book is remarkably well thought out, clearly expressed, sensible and practical, and arranged in so systematic and orderly a manner as to afford singular facility to those who consult it.

ILLUSTRATIONS.

SOUTH TRANSEPT, CHURCH OF ST. PIERRE, LISIEUX.

ON the eastern side of the 'Grande Place,' or market-place of Lisieux, surrounded on two sides by picturesque old half-timbered houses, and on the third by the old Bishop's Palace, now the Sous-Préfecture, a Renaissance building of very good type, stands the ancient cathedral church of St. Peter, a church which, in many respects, is well worth the careful study of an architect; the present fabric dates from the middle of the thirteenth century, and contains much good work. The old church, said to have been erected about the middle of the twelfth century, was destroyed by fire in the early part of the thirteenth century; but there still remain of this original building a part of the choir and the transepts. The subject of our illustration, which is at the end of a narrow alley, hemmed in by comparatively modern buildings, is the south transept, especially noticeable for its bold and vigorous detail; the upper external gallery, between the two staircase turrets, is of later date than the other work, but the general arrangement of the triple lancets and wall-arcading under is exceedingly bold and good. There is a late Lady Chapel, built in the fifteenth century by Bishop Cauchon of Beauvais, as a sort of peace-offering for the unworthy part played by him in the condemnation and execution of Joan of Arc.

ROBERT W. EDIS.

BUILDINGS ON THE THAMES EMBANKMENT.

'THE Embankment site has never been considered,' were the words of Sir Charles Trevelyan in his important letter on the subject of the Law Courts' site—a letter which has led, not only to the reopening of the question of the arrangement of the Courts themselves, but has also directed

attention to the Embankment as *the site par excellence* for Government offices and buildings.

We have already echoed this text and 'improved' it for the benefit of our readers; adding our quota to the arguments in favour of the change.

In order, however, more fully to explain the idea and enlarge still further on the subject—directing attention more especially to details—we, this week, present to our readers a view of one part of the Embankment which ~~HAS BEEN CONSIDERED~~ and appropriated, (on paper,) as a site for Government offices; as also for other buildings of a semi-public nature, such as clubs, museums, banks, &c., as would be of a character suitable to combine with such larger public buildings to form a continuous and appropriate line of frontage towards the river on the western side of Waterloo Bridge, where the chief amount of land reclaimed from the Thames is situated.

This design, the work of Mr. Chas. Forster Hayward, F.S.A., will serve to show how the opportunity suggested by the Embankment Bill of 1861 was at once seized by at least one practical artist, and appropriated to satisfy one of our great metropolitan wants, viz., good open accessible sites for important buildings both of a public and private nature.

True it is that we owe much of our modern street improvements to the positive necessity of finding such sites along our crowded street frontages; but at the same time this necessity of purchasing large extents of already closely-occupied ground, as well as the obligation of compensating everybody for every kind of change, must have gone far to prevent many a project from being properly carried out, at least in the most suitable locality, and this fact goes a long way to counterbalance the improvements referred to. But on the Embankment, sites are simply waiting to be appropriated and used, while localities and streets adjoining are demanding improvement.

In the careful adjustment of the existing levels, and the skilful arrangement of them, so as to prevent any unnecessary climbing, lies the chief problem in the design of the buildings for these sites, and this problem has been worked out in the design before us. To carry on the terrace of Somerset House is perhaps only a natural idea; but in Mr. Hayward's design the terrace is carried *within* the building—that is, behind an arcade—which itself stands upon the lower, and carries the upper wall, similar to the upper gallery or arcade of the Doge's Palace at Venice—one of the most charming water frontages possible. This upper arcade is continued *through* two other buildings, and then returns round the western end and northern side of the block.

Since this design has been made, the Embankment with its enclosure walls and landing stages has been completed, and the trees planted; but as yet no use has been made of the roadway, owing to the railway company having possession, and no attempt has been made to connect the various existing streets, while the new projected viaduct, to run from the foot of Hungerford Bridge to the centre of Lancaster Place, level with Waterloo Bridge, is to be abandoned, or, we may say, is so likely to be given up under the searching inquiry of Lord Elcho's Committee, that practically it is abandoned already. This has rendered possible a revision, or rather a development, of the plan which we give, as Mr. Hayward's idea how the arrangements he originally proposed should now be carried out. As the plan shows, the block available for building is large enough for one edifice, sufficiently isolated to be careless of its connection with the rest of the neighbourhood; but if the viaduct were carried out, what is now desirable would have been almost a necessity, and hence the original importance of the idea is evident. First, it is important that communications should be made between the Strand and the Embankment for vehicles. This is done by the open space advocated by the plan originally—called Savoy Garden, or Savoy Square or Piazza, consisting of a sloping oval garden or paved area like Trafalgar Square, with roadways each side of it (one of which alone might be constructed if thought enough, just as St. Martin's Lane is the only northern roadway out of Trafalgar Square,) but both of which are proposed as most desirable for the traffic east and west. This square will have for its eastern boundary the walls of the old Savoy Palace and the Savoy Chapel and burial ground, while the burial ground of the German Chapel, and all the rest of the upper levels or slopes of the Savoy, can remain untouched. On this Savoy Hill, however, the plan does not show Mr. Hayward's suggestion for erecting a building to correspond with Somerset House, in which one of the principal ends of the façade, with that most charming feature the open colonnade on an open archway, would be repeated, and form the centre of the composition, while the terrace would be continued in the front and return on the Savoy walls, which, as has been said, form the eastern boundary of the proposed new piazza. The building shown is in fact a special design, with open colonnaded façades and a terrace terminating at the mid-level, as it may be called, where the roadways on each side of the open space unite in a terrace.

At this mid-level a street, inclining upwards, would lead to the Adelphi Terrace, taking up on its way the present ends of Cecil Street and Salisbury Street, while another sloping downwards would connect, if thought desirable, the lower street and arches of the Adelphi, which, however, have another exit in a westerly direction. These arches and vaults are at present most disreputable places—the haunts of the homeless and the vile; but they are capable of being converted to the most useful purposes as shops or dwellings, communicating with York Place and George Street, enlarged as it is shown on the plan.

It will be seen what a magnificent plot of ground would remain, with a continuous frontage to the river of 800 feet, and a return frontage to the piazza of 300 feet on the east, while on the western end there is a frontage of 400 feet. This is the plot for a building of large and important character, which it was impossible to obtain while the projected street or viaduct to Lancaster Place was likely to be carried out. If the first floor of this large building or the buildings on this frontage are carried out as suggested in the design, a direct footway from the upper levels all round the buildings, communicating with the east and west ends of the Adelphi, can be established, and, crossing over the mid-level of the Piazza, a passenger can reach the new westerly extension of the terrace, in front of the new Somerset House, and pass

over the bridge to the old Somerset House, without ever descending to the Embankment level. If only shops and offices were to be erected, it would be a valuable system to adopt, but with important Government offices easy access on the chief level might be essential. In addition to the direct communication northward—so much required—gained by the new street opposite to Southampton Street, to Covent Garden; the dotted lines running through *the site*, dividing the plot into two, show a continuation of George Street connecting with the important streets on the north side of the Strand by Agar Street, &c.

As to the Charing Cross communication, this is shown by the lines of the plan, and is a self-evident advantage, and one not difficult of execution.

The view of the proposed buildings is as they would appear to a spectator standing on Charing Cross Bridge, and looking along the northern shore shows the terraces at Buckingham Water Gate, the Adelphi, and the district called the Savoy, as far as Waterloo Bridge:—Somerset House being seen beyond,—and the Embankment passing beneath the first arch, continued on to the Temple. Several towers and spires of the City with the Dome of St. Paul's occupy the extreme distance.

Some idea can thus be obtained of what the banks of the Thames may become if only ordinary care be taken in the manner of laying out the reclaimed ground, and selecting the class of buildings to be put upon it, without any extravagant architectural conceptions, or any expenditure for mere ornament; for although designed with considerable novelty, and it is hoped with a certain degree of architectural propriety, these buildings do not pretend to emulate the Palaces of Venice, but are supposed to be appropriated to such purposes as shops or offices, chambers or residences, with here and there a Bank or Insurance Office, an Hotel or Clubhouse, taking a more prominent position in the line of frontage. The variety of elevations must be taken to show the applicability of the system of building advocated, to any style, however simple or elaborate.

The proposed buildings, which are shown in elevation, are all designed with an upper level of footways, with shops, offices, &c., in addition to those on the ground-floor, and level with the pavement of the Embankment. These upper footways are carried along continuously over the lower series of shops, &c., and by light foot-bridges over the intervening streets, *throughout the whole river frontage* (though not in front of the Savoy New Church and Gardens), and *backwards also along the sides* of all the blocks of houses, so as to communicate on a level, or nearly so, with all the streets which run down from the Strand to the river; while steps or inclined planes at each angle of the blocks of buildings afford access to the lower level of the Embankment itself.

By this system increased value would be given to the new frontages; and while it is applicable not only to the Embankment, but also to any of our crowded thoroughfares, it should be remembered that the adoption of this manner of building, while *doubling the number of shops*, would at the same time *double the accommodation for foot passengers*, besides providing for the safe and expeditious crossing of streets.

The main idea of the system, however, is not entirely new, having been carried out at Chester and elsewhere for three or four centuries at least; while in these towns, at the present day, new houses are being built upon the old plan, though with increased magnificence and with some modern improvements; and by the use of light iron columns and girders for the wide bridges, &c., and other modern improvements, these 'Rows'—to use the old term—would form promenades as pleasant and popular as are to be found in any city in Europe, and it is thought as *profitable* in a pecuniary point of view as the arcades and 'passages' of Paris and elsewhere.

At the foot of Charing Cross Bridge the proposed open space would be laid out as grass plots, and enclose fountains and statues; while into this space the wide thoroughfares of Whitehall Place extended, and of the new street from Charing Cross, following the boundary walls of Northumberland House and gardens, would enter; and so, it will be seen, without great expense, magnificent communications would be opened with the new Embankment Boulevard.

THE SPEECH OF M. THIERS.

THERE was a full house of the *Corps Legislatif* on the afternoon of February 23, when M. Thiers, amid deep silence, rose in his place to denounce M. Haussmann's financial system for the City of Paris. He began by alluding to the improvements effected by M. Rambuteau, Prefect of the Seine under Louis Philippe, briefly pointing out how much that gentleman managed to do with fifty millions of francs. He then went straight to his subject, comparing the thrifty management of M. Rambuteau with what he called the reckless extravagance of his successor in office, and proceeded to examine what had been done in Paris during the last 20 years, dividing it into three systems or networks. The first of these systems met with M. Thiers' unqualified approval. This comprised the creation of the Boulevard Sebastopol (the Rue Rivoli had already been sanctioned by the Provisional Government of 1848) and the construction of the Halles Centrales. But he contended that if all the other improvements were already contemplated at that time, it would have been more honest to have said so, rather than to have appeared satisfied with the original comparatively trifling loan; and he compared M. Haussmann to a dishonest architect, who deceives his client by committing him to enormous outlays step by step, instead of at once informing him of his liabilities. 'We yielded to deplorable enticements, which are the cause of the present serious state of our finances. We might have had works of real utility: the communication between the various railroads and the centre of Paris; the much-needed improvements of the *Rue Lafayette*, the *Rue Montmartre*, the *Rue Richelieu*, and the *Rue du Bac*. Instead of this, however, we have so-called improvements which appeal to the imagination rather than to common sense, and which are utterly and entirely useless. We have the newly decorated *Place du Trone*, and the *Boulevard du Prince Eugene*, which cost 75 millions, was opened up in order to give light and air to a part of the city which had plenty of light and air already. The same may be said of the *Boulevard Haussmann*

—what reason was there for spending another 80 millions there? None whatever! What object has the *Allée* of the Alma, of Latour-Maubourg? Why the *Place de l'Opéra* or the *Rue Mouje*? All these have cost 300 millions of francs! The only really useful street is the *Rue Turbigo*, and that cost 80 millions, and this was after all not so necessary as the widening of the *Rue Montmartre*, for which nothing whatever has been done.' (Our readers are aware that this latter street, leading to the Halles Centrales, is one of the most frequented in Paris, but is inconveniently narrow in many places.) M. Thiers continued:—'M. Rouher has been called the Vice-Emperor, but with injustice to that gentleman; the real Vice-Emperor is M. Haussmann, as is proved by the institution of the "Caisse des Travaux," and by his arbitrary proceedings throughout.' Continuing his criticisms and strictures, the speaker approved of the *Rue Lafayette*, connecting as it does the terminus of the Northern and Eastern Railroads with the heart of Paris; and he was glad to think that improvements were at last in progress in the *Faubourg St. Germain*, but he thought that the widening of the *Rue du Bac* might have been effected with more economy than the construction of the *Rue de Rennes*, which is entirely new from end to end. 'Instead of economy we have the *Trocadero* (laughter), which cost 20 millions! The *Boulevard Haussmann* is being continued to the *Boulevard Montmartre*, through the finest and most expensive part of the city, and this costs us another 60 millions! Then the *Rue Réaumur* and the *Rue Turbigo* are to be connected with the *Place de l'Opéra*—why pull down all the splendid houses between the *Rue de la Paix* and the *Bourse*? Why have a new street from the Tuileries to the Opera? It cannot be to meet the convenience of the Emperor, for when his Majesty wishes to drive to the Opera, the distance will not be much more by the *Rue Rivoli*, and past the foot of the Napoleon Column. (General laughter.) Gentlemen, it is no subject for mirth, for I now come to the principles which all this involves. The first two "systems" to which I have alluded were carried out by means of loans, but when this third "system" of improvements was commenced, so roundabout a method of procuring means was no longer considered necessary; the holiest fundamental principles were violated in such a manner that we can no longer be said to be living in a free country. (Applause from the Opposition side of the House). One single individual had the audacity to borrow 465 millions, without anybody knowing anything about it.' M. Thiers then went on to show that for the city of Paris alone a debt of a thousand and eighty-three millions had been contracted since 1852—about forty-three millions sterling—discussed the increase of income which is supposed to meet this expenditure, and gave a vivid description of the increase of rent and provisions, showing how the list of annual bankruptcies had increased to a frightful extent as a natural consequence of this 'insane wholesale destruction of house property.' Thirty years ago 15,000 to 20,000 francs was considered a high rent for a shop; to-day there are shops held at 80,000 and 90,000 francs per annum. The square metre of land used to cost 500 to 600 francs; now it is not always to be had for 1,100 francs. The price of wages had increased, but so had also the price of provisions, and therefore the condition of the labouring classes is now no better than it was. 'It were an easy task to criticise your works from an æsthetic point of view,' he continued; 'straight lines of roads are easy enough in America, where land costs a dollar per square metre, but there are no straight lines of streets in Rome, in Florence, in Venice, or in other ancient cities, where the attempt would cost fabulous sums of money; such an outlay could not be justified for a moment in order to obtain the doubtful advantage of perfectly straight lines of streets.' In concluding his powerful speech, of which we have necessarily only given extracts, M. Thiers was at a loss to advise what should be done; what had been done could not be undone; there is no help for it—the money must be paid. Nor would it be wise to stop everything all at once; it would be dangerous to deprive the thousands of workmen, who had been attracted to Paris, suddenly of their bread. But he could not sit down without making an effort to reconstitute a Municipal Council, such as existed under Louis Philippe, by which means Paris would again have the same right hitherto possessed by all other cities of France, namely—that of being able to control its own expenses. M. Thiers resumed his seat amidst the loud applause of the Opposition.

METROPOLITAN BOARD OF WORKS.

THE weekly meeting of the Metropolitan Board of Works was held on Friday, March 5. The Works and Improvements Committee reported that they have considered a letter referred to them from the Office of Her Majesty's Woods, &c., on the subject of the Park Lane Improvement Bill, and intimating that the Lords of the Treasury have given directions for the preparation of clauses for insertion in the Bill for securing the payment of compensation to the Crown and its lessees and tenants of the houses and buildings in Hamilton Place, not only for the property which may be taken for the measure, but also for the diminution in the value of all the houses in consequence of Hamilton Place being converted into a thoroughfare, whether compensation is or is not payable in this respect under the Lands Clauses Consolidation Act, 1845. The committee, having regard to the experience which the Board have obtained on former occasions in relation to special clauses of this nature, are of opinion that the propositions contained in the letter should be resisted. The Board did not consider they would be justified in giving the special privileges claimed, and must resist the insertion of the clauses proposed. The chief engineer (Mr. Bazalgette) presented his monthly report on the progress of the Thames Embankment Works. Mr. Newton moved, 'That a standing committee of fifteen members be appointed, whose duties shall be to watch all proceedings in relation to Bills in Parliament affecting the Metropolis, and to advise the solicitor thereon, also to take note of and report to the Board from time to time all questions affecting the constitution of the Board and the general interests of metropolitan ratepayers.' Mr. Le Breton seconded the motion, which was agreed to. Mr. White moved, 'That it be referred to the Works and General Purposes Committee to consider and report on the desirableness of forming an approach road to the Thames Embankment between Richmond Terrace,

Whitehall, and the Whitehall Club, with a view to the relief of the excessive traffic of Parliament Street, the approach to Westminster Bridge, and the Houses of Parliament.' The motion was put and agreed to. A return moved for by Colonel Sykes, and recently published, shows that the total expenditure to July 1, 1868, amounted to 3,178,716*l.* for main sewers and ordinary expenses, 125,400*l.* for the approach to Covent Garden, 597,072*l.* for Southwark and Westminster communications, 43,615*l.* for Victoria Park approach, 70,844*l.* for Finsbury Park, 87,954*l.* for Southwark Park, 172,482*l.* for the Fire Brigade, 128,520*l.* for improvements in Whitechapel, 67,379*l.* for improvements in Holborn, and 112,532*l.* for Kensington improvements, 3,967,184*l.* for metropolitan main drainage, 1,599,052*l.* for the North Thames Embankment, 846,010*l.* for the Southern Embankment, and 1,264,611*l.* for Mansion House Street. The total of sums received annually from the several vestries and district Boards and from the City of London for sewerage works and general expenses amounted to 222,122*l.*, for main drainage to 201,441*l.*, and for the Fire Brigade to 31,795*l.* and 33,742*l.* for 1867 and 1868 respectively.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

BUILDING CONTRACTS.

SIR,—It would have been more satisfactory if the 'London Engineer' who addressed you on the 13th February favoured us with some of his reasons for preferring 'to have as little to do with lawyers as possible.' If it arose from a personal and perhaps unaccountable dislike, we need not trouble ourselves much about it; but if it was intended to indicate what ought to be the general practice in business matters, we should have had further particulars; for however architects may be averse to it, it seems to me that enough has been already said to make it incumbent on both employers and builders to have 'a more general employment of lawyers in preparing contract deeds than there is at present,' and not in the preliminary contract deeds alone, but in other things relating to building as well. As long as the evils that resulted from defective agreements, or general conditions, and other masterpieces of architectural legislation, were not generally known or recognised, the simplest or rudest form of procedure might answer; but now that the serious consequences of informality, whether intentional or otherwise, are displayed in your columns, it will be strange if employers and builders will not henceforth adopt every means that is supposed to guarantee security. Besides, it may fairly be asked why the architect should wish to make the legal arrangements between a man who has a house built and the builder any more than he should between the same man and those from whom the site of the house was purchased. In the latter case, if he happens to be employed, he confines himself to selection, surveying and valuing all unquestionably within the province of his duties; why should he not act similarly in the former case? There is certainly enough in designing and superintending works (to say nothing of mixing mortar and the proper proportions of lime and sand) to occupy any man's abilities, without interfering in matters which, even when they are carried out by those who devote their lives to the employment, are often far from perfection, and are the subject of continual litigation. It would no doubt appear very absurd to architects if lawyers endeavoured to design and prepare the plans, estimates, and specifications referred to in deeds, and it is not easy to see why a lawyer should not know as much about building as an architect about law; and indeed it is a matter of notoriety that more lawyers could be found with a knowledge of architecture and engineering than either architects or engineers with an equally extensive knowledge of law. Nor could the effects resulting from amateur architects be more serious than those from amateur lawyers. If anyone chooses to adopt the principle of 'every man his own lawyer,' he is free to do so, and in the end he is pretty certain to discover he had a fool for his client (a fact sometimes worth liberally paying for); but in the architect's case, as it is not himself that usually has to bear the consequences of imperfect knowledge, it is hard to understand how any honourable man would, without the utmost circumspection, accept so grave a responsibility. At the same time, it is scarcely fair to lay all the consequences at the architect's door. If a contractor chooses to sign a deed of the meaning of which he is profoundly ignorant, one can hardly pity him, especially as it does not appear that if he desires an alteration some other person's tender is certain to be accepted instead. It may be doubted if the architect would interfere in the preparation of legal documents, if it had not been for his own immunity from loss, whatever results may follow. If the employer is 'fanciful' or 'exacting,' if he refuses to recognise extra or undefined works, or on the other hand 'if the client gets the worst of it' (to use your correspondent's language), the architect, although 'he may neglect the interests of his client,' or be an 'ignorant, inexperienced, or unjust man,' somehow manages to secure his fees, and escapes loss, whatever side suffers. In proof of this it is curious to remark that, although there are allusions in your pages to the wrongs of both employers and contractors under the present system, nothing is said about architects' grievances, which would hardly be the case if any existed. And, as it does not appear that architects would in any way suffer if they were not allowed to prepare what should be the lawyer's part of a contract, it may be worth the consideration of the committee of the Institute, and of the Builders' Society (who it appears are now considering these matters), whether they ought not to recommend, in approving of a form for general conditions, that architects ought not, as a rule, to interfere in giving it legal value.

As regards the most fitting person to be arbitrator, no general rule ought to be laid down. In some cases the proper person would seem to be an

architect, in others a barrister; but whenever the case is intricate, and many witnesses have to appear, there ought to be both an architect and a barrister, as only then is there likely to be a thorough investigation of any matter in dispute. Of course, in this case, there would have to be an umpire in case of difference, who should be competent to decide from the evidence of the arbitrators without a rehearing being necessary. It might be thought that this would be an expensive process, but everyone who has had much experience in arbitrations would be likely to admit that, in the end, it would be the cheapest course, as there would not be so much irrelevant evidence admitted, on the score of its legality, as is now the case when ever a barrister does not preside; and, on the other hand, there would not be as much time lost in going into particulars of the simplest things in construction, which has to be done in cases where the architect appears merely as a witness.

Your obedient servant, LXX.

ARCHITECTURAL EDUCATION.

Sir,—It is as unfortunate as true that as soon as architects begin to discuss a question, the 'odium architecturum' breaks out with such virulence that the whole interest of the subject becomes lost in a personal squabble, and such appears likely to be the fate of the correspondence on 'Architectural Education,' judging from the ill-advised letter in your to-day's impression.

With reference to the real question at issue, I think a great deal of misconception exists in the minds of enthusiastic admirers of the 'Continental system' as to there being a great desire, or necessity, for a change in the present system of pupilage in England.

Architects' pupils are hard-headed, matter-of-fact individuals, prone to judge by results rather than by theories, and apt to get somewhat disgusted with self-elected censors who, possessing but theories, and with neither age nor experience to justify them, are too much given to intruding their advice and opinions in and out of season.

The difficulties in the way of a strictly professional academical or university training for architects in England would be enormous; pure 'Goths' would pall one way, pure 'Classicists' another; and the sensible men who advocated both styles would probably not make headway against the cliques these greater lights would gather around themselves.

Granted that a man had duly graduated in an architectural university, what then? He would have imbibed this man's theories, that man's mannerisms; would probably make pretty drawings, and of the practical working of the profession be supremely ignorant. And in this very 'working' lies the real value of pupilage. To be in constant communication with his master, to see how clients and contractors are dealt with, and the dozens of daily difficulties, of greater or lesser importance, met and overcome, is, to the really working and observant pupil, of inestimable value. I cannot see any advantage in substituting for this any system of 'architectural go-carts,' Continental or otherwise, without which the pupil would fall; nor do I understand why the architectural pupil is to be looked upon as a delicate thing to be architecturally nursed and brought up by hand on architectural pap.

Architectural education rests with the individual. If he choose, he can learn more readily, with more lasting effect, in an office than by any formal course that could be offered him; and if he has time, there are countless facilities now open to him for supplementing his professional education.

Granted that the present system is more or less of a scramble and struggle after knowledge, few will deny that a man remembers best what he has to find out for himself; and the result, at all events, is the production of a self-reliant set of youngsters, who, having met with, are prepared still to meet, difficulties, and this is an architectural race preferable in every way to the dainty, professorially afflicted mannerists, we should probably obtain by any academical forcing system.—I enclose my card, and am, Sir, your obedient servant, X. Y. Z.

March 6, 1869.

SOUTH KENSINGTON MUSEUM.

March 2, 1869.

Sir,—If it be intended that the Museum at South Kensington should grow in public favour, at least it is necessary that the public should see it. Now the best time probably for the public is four o'clock on a Saturday afternoon. Yet this is the very hour when the bell is rung, and 'All out' is sung by the police in charge. 'This way out, gentlemen,' 'Now, Sir—if you please—this way' to any one lingering to finish looking at the one or two things he has had the opportunity of seeing during the half hour he has perhaps been enabled to squeeze out of his time before four o'clock, by dint of rushing off from the office and scrambling into the train before it was quite convenient to do so. How then of those numbers who cannot possibly reach South Kensington at this hour, and who have therefore no chance unless the doors be open till six o'clock, at least, or later still? Why not? The Museum is for the public; the object is to educate, or at least amuse. Yet two hours of precious time is lost for the benefit only of a few officials, it is presumed. By all means give these officials other holidays to make up for time spent on the Saturday afternoon in the public service; but pray keep the doors open longer than at present.

Again, to your readers it surely would be an advantage to see the drawings which are now hung in the Council-room of the Royal Horticultural Society, being the designs for the Kensington District Schools. Yet no admission is granted. How to see them is not generally known. Could you inform your correspondent?

ONE WHO DOES NOT KNOW.

P.S.—I should think as many as 1,000 or 1,200 persons were turned out of the 'Armour Galleries' last Saturday—many only just having entered—and a large proportion young persons with their parents.

NEW BUILDINGS AND RESTORATIONS.

A bust of the late G. V. Brooke, the tragedian, has been placed in the public library at Melbourne, Australia.

Bury St. Edmund's.—The chancel of St. James's Church has now been completed.

The Church of St. Giles, Cripplegate, has been re-opened after restoration.

Mr. Hardwick, the architect, has given notice to the authorities of Merchant Taylors' that in all probability the buildings at Charterhouse will be vacant and ready for the reception of their school by Easter, 1872. From this it would appear that nearly three years must elapse before the actual transfer of the Charterhouse to its new site near Godalming will be effected.

A handsome new Independent Church has been erected on the Bellevue Estate, Halifax, near the residence of Sir F. Crossley.

The Transepts of Hexham Abbey are to be restored.

Consecration of St. Ann's Church, Warrington.

This event took place recently, by the Right Rev. Dr. Jacobson, Bishop of Chester. The site was given by Colonel the Right Hon. John Wilson-Patten, M.P. It occupies an area of 2,442 square yards.

The church is wholly built of bricks of rather grey tint, moulded bricks being largely introduced for bases, strings, jambs, sills, and mullions of windows and for the doors. It consists of nave 76 feet by 42 feet, entered by north and south porches; chancel 32 feet by 18 feet, which is apsidal, and on the south side stands the tower, 21 feet square. The clergy and choir vestries are placed on the north side, with heating cell underneath. The nave is in one span. Piers projecting from the side support the principals of the roof. The piers themselves are connected east and west by arches underneath, and two light windows are placed high up in the walls. Underneath an arcade relieves the wall surface. The arcade is also carried across the west end, above which is the inscription, 'The Lord is in His Holy Temple,' in encaustic tiles. Bands of tiles are carried round the piers. The pulpit is executed in Derbyshire polished limestone, with marble shafts to the openings. The panels are of slate, and upon them are painted Scriptural subjects, by Hardman, of Birmingham. The chancel is well raised above the nave. Moulded brick piers are carried up, having sculptured capitals, from which spring stone ribs and groining in brickwork. The sanctuary wall is panelled with appropriate emblems.

It is proposed hereafter to completely decorate the chancel and west end of the nave in fresco. The organ is placed under the tower, is by Hopkinson, of Birstall, near Leeds, and cost 800l.

The church is rather plain in external appearance, of Early Gothic. The windows of the nave have three orders of mouldings in brick, with bold buttresses, eaves, and cornice. The porches are groined in brick, encaustic tile bands being introduced. Over the outer doorways large stones are left in block, to be hereafter sculptured with subjects from the life of our Lord. The west end contains large four-light traceried windows, entirely in brick, with arcade underneath. Separated from this on each side with large buttresses are moulded lancet windows. The tower is 71 feet high to the top of battlements. Above this a slated roof rises an additional height of 37 feet, surmounted with cross and vane. The chancel has five two-light windows, with plate tracery, divided with massive buttresses, and the apsidal roof terminates with a metal cross. The whole of the roofs are covered with blue slates, and dark red ridge tiles. The architect is J. Douglas, Esq., of Chester. The church has been built by Messrs. Joseph Gibson and Son, Warrington, at the moderate cost of 5,200l., which includes the architect's commission.

Sydney, Australia.—The Laying of the Foundation Stone of the Cathedral.—On December 8 the ceremony of blessing and laying the foundation stone of St. Mary's Cathedral was performed by his Grace the Archbishop. The design was entrusted to Mr. W. W. Wardell, of Victoria, a pupil of the late Mr. Pugin. It is not proposed to go on at present with the whole of the building, but to confine the work to the choir, transepts, and nave, giving a length of some 210 feet. The design is cruciform in its general plan, and comprises a nave, aisles, two transepts with aisles, and a choir with eastern and western aisles. The width within the transepts will be 118 feet, and across the nave and aisles 74 feet. The space within the sanctuary will be about 45 feet in length, and will be surrounded by the aisles and lateral chapels. The organ chamber is to be on the east side of the choir. The nave, choir, and transepts will be about 90 feet in height from the floor of the church, and will be divided from the aisles respectively by pillars and arches 30 feet in height. There will, moreover, be a central tower or lantern at the intersection of the nave and transepts, with a clear interior height from the floor of 120 feet.

Hardingstone.—The parish church of St. Edmund's, Hardingstone, has been reopened, after extensive restoration. The old high pews have been replaced by open seats. The old east window of the chancel has been removed, and a three-light stained-glass window erected in its place.

Opening of the New School at Meal Bank.—The school-room at Meal Bank has long been too small for the increasing number of children, and many have been refused admittance in consequence. A new school has been in course of erection for some months past, and this building has been formally opened. Its dimensions are 60 feet by 25 feet, with a height of about 24 feet. Attached is a reading-room for the use of Messrs. Braithwaite & Co.'s workmen, while adjoining a house is being erected for the schoolmistress. The whole is designed by Mr. Carter, of Kendal.

NOTES ON NOVELTIES.

Bacon's Improved Hot-Water Warming Apparatus.

This invention does not present itself as a novelty in principle. The use of hot water circulating through iron pipes as a means of heating conservatories and warming buildings is familiar to all; and few who have had the responsibility of warming any building put upon them have failed to become acquainted with the rival claims of steam, hot air, and hot water at low pressure and at high pressure.

Messrs. Bacon & Co.'s system professes to be an improvement upon one better known in England some years ago than now—that upon which buildings were heated by the circulation of water at a high pressure in pipes of wrought iron of small bore. This system had great recommendations and grave faults, and we draw attention to Mr. Bacon's improvement because he claims to have remedied the defects while retaining the advantages of the older plan; it seems indeed—so far as a single careful inspection of an apparatus in full work could furnish ground for judging—that Mr. Bacon has gone far to substantiate his claim. If so, we believe that for many pur-

poses this will be found a more convenient heating apparatus than any other at present in use.

The advantages of any apparatus using pipes of small bore and water at a high pressure, and consequently at a high temperature, are these:—The furnace is small and easily fixed, the pipes are small and easily introduced, the heat is great and therefore a moderate amount of piping suffices, and the pipes are easily bent and therefore can be conducted in and out of various rooms with facility. All these things point out that such an apparatus may be adapted to an existing building with greater ease than any which involves the use of a larger amount of more cumbersome piping.

The drawback to the system as originally employed was the extremely high temperature which its pipes reached, desiccating the woodwork near them to a very dangerous extent, and producing that unpleasant effect upon the atmosphere familiarly known as burning it. Mr. Bacon considers that he has remedied this by enlarging the bore of his pipes sufficiently to increase the amount of water in circulation through a given length of pipe considerably in volume (though not so much as to lead to inconvenience in the employment of the system), and by carefully adjusting the size of his furnace and the amount of fuel capable of being received into it to the heat proposed to be given out. He claims that his pipes, which have a diameter of $1\frac{1}{4}$ inches and a bore of $\frac{3}{4}$ of an inch against the older bore of $\frac{1}{2}$ of an inch, attain an average heat, when arranged for use in a private house, of 200 degrees Fahrenheit, and do not rise in the hottest part of them above 260 degrees. These temperatures are, to our knowledge, far, very far below those reached by some high pressure pipes, and the iron surface heated only to this degree would not, we believe, injure the air. It is fair to add that for drying closets or other similar purposes the furnace can be so arranged as to be capable of obtaining higher temperatures.

A well-designed arrangement of valves admits the shutting off of any part of the apparatus, as for instance any room, separately. The whole circulating system can also be raised or lowered in temperature without difficulty. The expansion cistern is simply contrived, and admits of more varied positions than in other systems. The mode of 'jointing' the pipes and putting them together employed is simple and effectual; and lastly, the inventors allege, and we believe with good ground, that in the event of that most untoward of all misfortunes, the water being allowed to freeze and then the furnace being lit, a serious explosion, such as may occur with a hot water system on the low pressure plan, is not to be feared.

We have stated thus much of what Mr. Bacon claims to have accomplished, because, from what we have seen, we are inclined to believe that he has not overstated his case; and if experience shows these improvements to have actually been attained, the apparatus cannot fail to be very useful, and extensively employed. We are not sanguine as to the possibility of universally substituting in this country an apparatus of this kind, with a system of ventilating flues, for the present open fire in dwelling-houses, though the inventor hopes to accomplish this, and has, indeed, successfully performed it in a single instance. The question of applying Bacon's apparatus to an entirely new building will have to be determined, to some extent, by original cost and cost of maintenance: these are stated at moderate prices, but, on these points, we do not feel called upon to express any opinion one way or the other. There can, however, be no doubt that if it turns out to be now possible to warm the corridors and rooms of dwelling-houses and offices by means of pipes of small bore without the risks of fire and bad air, which have hitherto attended the use of such pipes, many buildings may be warmed which could hardly be attempted on the low pressure system; because the new plan will necessitate so much less cutting away and loss of space than the larger pipes of a low pressure system would have called for.

Pether's Diaper Brickwork.

We have had submitted to us some specimens of this manufacture, and we consider that, if the bulk be equal to the sample, it cannot fail to be useful to architects and others. Mr. Pether's bricks are manufactured from the gault of Maidstone: they are kiln-burnt bricks, of the ordinary sizes, of a creamy stock-brick colour, and of an excellent consistency and hardness. The peculiarity of them is that on the face or end of each brick a repeat of a diaper pattern is impressed, so that any string-course, spandrel, or wall surface faced with these bricks will be diapered regularly and equally.

Mr. Pether, being an artist, has made and procured designs for his diaper patterns that are decidedly above the average of excellence as works of art, and the execution of them is sharp and crisp; here, indeed, lies the point which induces us to recommend his bricks to the notice of architects. A certain number of really good patterns are available for selection, and the mode in which they are executed seems to show that any architect designing his own diaper pattern, to be carried out in these bricks, might depend upon an amount of artistic intelligence being brought to bear upon the manufacture such as cannot always be relied upon.

Coloured backgrounds, burnt in, are obtainable; also arch-bricks, moulded to a radius. Curved bricks, suitable as casing for columns, are among the purposes to which Mr. Pether proposes to apply his patent.

The price quoted does not appear excessive for the nature of the article. The Burham Brick Company are the London agents.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

Hammersmith Bridge.

The strength of this bridge has been the subject of some correspondence in the public papers, in consequence of a fear having been expressed that the severe test to which its chains are put by the crowd assembling to witness the Oxford and Cambridge Boat Race may prove too great for its endurance. It is stated in the best informed circles that the Government, with a promptitude worthy of praise, have caused an examina-

tion to be made by competent engineering authorities; and the public may consequently rest assured that the bridge will not be permitted to be occupied by a crowd on that occasion unless the examination undertaken proves beyond doubt that there is no danger. The actual condition of this bridge is faithfully described in another part of our present issue.

Lord Redesdale.

This indefatigable setter to rights of long-standing abuses, is announced as bringing forward in the House of Lords a Bill for the better regulation of artistic copyright. Few subjects that touch Art directly or indirectly, more need the interference of judicious legislation; few perhaps will need more patience and care in the examination of them; but it is fair to hope that any Bill introduced thus early in the session will receive due attention from both Houses. Let us hope that the Art world will not be slow or careless in bringing their knowledge of the present anomalies, and their convictions of what is due to artists before those members of the Legislature who are willing to interest themselves in such matters.

Exhibition of Oriental China.

The Burlington Fine Arts Club have invited our attention to a fine display of Oriental China, now in their rooms, 177 Piccadilly. The articles exhibited are private property, and the variety of form and colour, and general diversity of the collection, are well worthy of admiration. It is impossible without an undue sacrifice of time to give even an abstract of the contents of the Exhibition, from the fact that, with the sole exception of some of the numerous specimens of Mr. Virtue Jebbs, which are referred to the dynasties under which their manufacture is supposed to have taken place, the only information given is the name of the owner—a matter of little interest to the spectator. In the absence of the best information of which the collectors of the china are in possession, it would be rash to offer a judgment on articles of which we know that, a hundred years ago, the Chinese were very expert forgers. There are some specimens of real old Nankin china, belonging to Mr. S. Redgrave. The collection of Sir Digby Wyatt is especially remarkable for moulded, perforated, and embossed china. The adoption of the brilliant Persian colours and patterns, in other instances, in the manufacture of china which is not of Persian origin, is interesting and instructive. One large and somewhat misshapen plate of rich dark-blue crackle ought to have a history worth telling. The curious jar of white crackle enamel, covered with embossed flourishes resembling bronze, is another notable piece of china. It is much to be lamented that a collection apparently so valuable should not be properly described.

Notes for Connoisseurs.

At the late sale of the collection Bourouet-Aubertot in Paris, a pen-and-ink drawing, portrait of Lepelletier de Saint-Fargeau, by David, sold for upwards of 30*l.*; three works of Eugène Delacroix: *Medea* 58*l.*; *Mirabeau* and the *Marquis de Dreux-Brézé* 88*l.*, and *Don Quixote* 27*l.*; *Napoleon* and *Berthier*, by Géricault, fetched little over 15*l.*; the *Iliad* and the *Odyssey*, by Ingres, sold, the former for 16*l.*, and the latter for 14*l.*; one of the late Th. Rousseau's landscapes, 'A Stream in Berry,' 16*l.*; 'A View of Venice,' by Ziem, 6*l.*. Amongst the old works at the same sale, 'Le Gâteau des Rois' (Twelfth Cake), by Jordaens, sold for 17*l.*. There was one piece of sculpture, 'The Woman and the Serpent,' by Clésinger, a remarkable work, sold not long since at the dispersion of another collection, possessing many of the beauties of Pradier's creations, and rather too much of their sentiment, which sold for 9*l.* 0*s.*

The catalogue of the Delessert sale has just appeared, and the sale is fixed for the days already mentioned, namely, the 15th of the present month and three following days, the two former being devoted to the works of the old masters. The catalogue contains 213 items, of which 112 are productions of the old schools. The famous 'Virgin and Child,' called the 'Virgin of the House of Orleans,' which, by the way, was once in the Vernon collection, stands at the head of the list. Amongst the most remarkable works are the following:—A fine *Cuyp*, 'Cows in a Meadow,' described by Smith, No. 149; 'Christ Healing the Sick,' by Dietricy, engraved by Pistruchi and Flipart; 'Portrait of Michel le Blon,' by Van Dyck, Smith, No. 809, engraved by Matham and Pye; 'Interior of a Wood,' by Hobbema, Smith, No. 106; 'The Fainting Woman,' by Mieris, frequently engraved; A small Repetition of the 'Saint Cecilia,' by Mignard, in the Louvre; the finished sketch of Murillo's 'Holy Family,' in the National Gallery; 'Portrait of a Man,' by Rembrandt, No. 15 in the Cabinet Casellan; 'A Holy Family,' and a Portrait by Rubens; 'The Fish Market,' and two other fine works, by Teniers; five works by Joseph Vernet.

Amongst the modern pictures are 'A Meadow with Cattle,' by Rosa Bonheur, painted in 1845; a fine *Bonington*; two by *Delaroche*; three by *Henri Leys*; three by *Luxx*; two famous pictures by *Meissonier*, 'The Chess Players,' and 'The Amateurs.' There is also one piece of sculpture, 'The Phryné' of Pradier.

The gallery will be open to the public on the 12th and 13th instant.

Archæological Discoveries.

Baron Visconti has made a fortunate discovery at Ostia of two fine heads: one of *Vespasian*, colossal, the other of *Trajan*, the size of life. These examples of Roman sculpture are in perfect preservation, and seem to have been carefully hidden, either through loyalty or fear, when the statues of the *Cæsars* were being destroyed.

Another discovery has been made outside the same town: namely, the remains of an immense colonnade and portico which surrounded the site called the Field of *Cybele*, in which stood the temple of that divinity with other public buildings.

Technical Education in Bavaria.

The increasing attention now given to the subject of imparting such education to our youth as shall fit them for the higher branches of mechanics gives great interest to the following description, in a report just issued from

the Foreign Office, of the Polytechnic School at Munich. It would seem that the system for which we are contending is there in full operation. Candidates for admission having passed the technical schools, and foreigners who have attended a superior technical school abroad, may be admitted without further examination. Those who are not so qualified must pass a preliminary examination, after which they receive a card for five florins (8s. 4d.), which gives them the right to the complete course of study in the institution. In addition they have to pay a fee of one florin to the professors for each half-year. The course includes the following subjects:—

The School of Engineering as applied to the construction of buildings, and to works connected with the cultivation of the soil.

The School of Architecture and Building.

The Technical School of Machinery.

The School of Technical Chemistry.

Instruction is given at the Polytechnic School by means of lectures, repetitions, graphic and constructive exercises, practical work in the laboratories and on out-door excursions.

It extends generally to the following subjects:—

Mathematical Sciences.—Plane and spherical trigonometry; algebraical and higher analysis; rules of probabilities, and their application; analytical and descriptive geometry, with their application; elements of astronomy; geodesic and practical geometry; analytical, technical, and elementary mechanics.

Natural Sciences.—Experimental physics; mathematical and applied physics; general and experimental chemistry; analytical chemistry; mineralogy (geognosis) and geology; botany and zoology.

Building and Engineering Sciences.—Knowledge of building materials; graphic statistics; knowledge of the construction of buildings, of house-building, of farm-buildings and manufactories; pyrotechnics (heating and lighting); sanitary conditions, with respect to buildings; construction of roads, railways, bridges, and canals; plans and estimates for buildings; agricultural engineering; the different styles of building; history of architecture.

Mechanical Sciences.—Mechanical technology; knowledge of machinery; theory of machinery; planning and construction of machinery; estimates of cost of constructing and working machinery.

Proposed Desiccation of the Zuyder Zee.

Mr. Thurlow, the British Minister at the Hague, reported to the Foreign Office, at the end of the year just past, that this project is in a state of forwardness. The Waterstaat, or Government authority, have applied for further explanations on some points, and the concession is withheld in the mean time; but the scheme seems nearly digested, and is of such a gigantic character that a description will be acceptable to professional men.

The proposition is to convert some 390,000 acres of water into alluvial soil; and Mr. Thurlow reports that all authorities, and among them the Council of the Waterstaat, charged with the examination of the scheme, agree that from a hydraulic point of view the desiccation of the Zuyder Zee is possible, and moreover that it could be accomplished in the comparatively short period of from eight to twelve years, or fourteen years at the outside. Taking past experience of the application on a large scale of steam power to water engineering into due consideration, this calculation has not appeared to Dutch engineers either dubious or too sanguine.

One of the chief preliminary considerations is the letting off the water flow of the Yssel as near as possible to its actual mouth, and on this point the Waterstaat and the projectors agree. Already the North Sea Canal, for connecting Amsterdam directly with the sea, is in progress, and will facilitate operations. The general direction of the boundary dyke, to the south of which the sea should be laid dry, is from Enkuizen to Kampen.

Inspector Beijerinck originally proposed for the dyke on the North Holland side a height of 3 metres + A.P., and on the Overijssel side 4 metres + A.P.; but these estimates have since been raised to 3.50 + A.P., and 4.50 + A.P. respectively.

Herr Stieltjes demands a height of 3.60 + A.P., and 4.40 + A.P.

The Waterstaat recommends a uniform height of 5 metres + A.P., but it would probably be better to make the dyke somewhat lower on the North Holland side, say 4.80 + A.P., and somewhat higher on that of Overijssel, say 5.20 + A.P.

Judging, therefore, from former experience, and the records of past floods and high tides, a dyke, the crown of which runs from 3 to 5 metres + A.P., according to the locality, with an outer slope of 4 in 1, and an inside slope of 2 in 1, is deemed by the engineers of this country to offer sufficient security against the ocean to enable a population to settle down without a feeling of anxiety to till the fields about to be rescued from the turbid waters of the Zuyder Zee.

Herr Beijerinck's proposal is to place steam-engines, working centrifugal pumps, upon the boundary dyke. These engines would later (when the work of draining is completed) be distributed about the Zuyder Zee at specified points, and would serve to drain or irrigate the lands, canals, &c., within the new administration.

The necessary steam-power, calculated upon the experience derived from former undertakings, and notably from the Haarlemmer Meer, is estimated at 12 horse-power for a metre of water over an area of 2,000 acres.

The part of the Zuyder Zee to be drained contains, in round numbers, 390,000 acres.

The water throughout this area averages 4 metres in depth.

The horse-power required is, therefore, $\frac{390000}{3600} \times 12 \times 4 = 9,360$.

Herr Beijerinck calls this 9,400 in round numbers; and this power he proposes to distribute among sixty-three engines of not more than 150 horse-power each.

With this power he reckons to drain the Zuyder Zee dry in twenty-one months—an estimate rather over than under the mark in comparison with the work at the Lake of Haarlem, which has been already drained. The engineers expect to accomplish this work with greater ease by reason of the experience on the previous work, which gives them improved data. The proposed cost of the work is under ten millions sterling; and out of 134 borings in various parts of the sea, only four were found to be peat, with

one sample only of sour ground, such as was found to exist largely at Haarlem; 94 borings produced clay, 50 being a rich clay stratum of a metre and a half. The whole of these samples have been deposited at Amsterdam. According to the calculations as to value of the reclaimed land, it appears that supposing it to be equal to that of Haarlem, the Zuyder Zee would be worth twenty millions sterling, or double the cost of its reclamation.

Street Tramways.

A numerous meeting of the residents of the southern districts of the metropolis has been held at the Horns Tavern, Kennington, in furtherance of a Bill now before Parliament for authorising the construction of tramways in Lambeth and other districts. The principal roads in Lambeth, along which it is proposed to lay the tramways, are the Clapham, Brixton, and Kennington Roads, up to Westminster Bridge. The tramways now proposed differ entirely from those laid down by Mr. Train. The rail, instead of projecting above the level of the road, and interfering with the ordinary traffic, will be laid exactly level with the surface of the road, and all other vehicles will be able to cross or run over the tramway in any direction whatever, without danger or inconvenience. The tramway will be paved between all parts of the rails, and for a certain distance beyond the rails, at the expense of the company, and kept in repair by them. Instead of a single line of tramway (as in Train's case), there will be an up and down line, so that the tramway carriages will always travel with, or in the same direction as, the other traffic. As compared with the present omnibuses, the tramway carriages will be more commodious, well ventilated, and roomy—equal in accommodation and comfort to a first-class railway carriage. The fares will be considerably less, and regulated by Act of Parliament, so that they cannot be increased from time to time, as is now done by the omnibus proprietors. Special carriages will be run in the morning and evening at half fares for the accommodation of the working-classes. The ratepayers will be relieved of about one-half the expense of repairing the streets along which the tramway will be laid.

Architects to Public Bodies, and their Private Practice.

At their last meeting, the members of the Barnsley Local Board of Health were engaged for nearly two hours in discussing a motion by Mr. Tune, to the effect that in future the surveyor to the Board should devote the whole of his time to the duties of his office, and should not be allowed to practise on his own account as architect. The present surveyor to the Board was engaged several years ago at 130*l.* per annum, with the liberty of private practice. The mover of the resolution complained that in drawing plans for private individuals, he had allowed them to pass without strictly keeping to the bye-laws, and that in other cases infractions of the bye-laws had taken place, Mr. Wade himself being the architect in those cases. Some discussion also ensued as to what is the general practice of architects to public bodies, when a list was read which showed that in twenty places in the West Riding and adjoining counties the architects to public bodies, as a rule, do not carry on private practice—in fact, in only two towns out of the twenty did the surveyors and architects practise privately. At the close of a very lengthy debate, an amendment was moved, that the subject be held over until the Charter of Incorporation, which has just been granted to Barnsley, be put in force. The motion was, however, carried by a majority of four to five.

Public Works in the Manufacturing Districts.

Mr. Rawlinson, Government engineer, has made his final report on the public works executed in the manufacturing districts during the time of distress caused by the American civil war. These works were executed by means of the aid afforded by Government loans at 3½ per cent., amounting to 1,768,515*l.*, repayable in the course of 30 years. In March, 1868, 400 miles of streets had been sewered on the most approved modern principles; 30,233 houses (a number which would be largely increased) had been drained in connection with these sewerage works, and nearly 800 acres of street area had been formed, flagged, channelled, and paved. Local traffic had thus been immensely facilitated, and the outlay has added at least its full value to house and mill property; and the result has been that Lancashire, from being backward in sanitary improvements, is at this time probably the most advanced county in England in town sewerage, street paving, public parks, waterworks, and road improvements. Waterworks have been constructed in the towns, comprising reservoirs which will store 20 gallons per head for 100 days for 740,337 persons. The works of river improvement have also proved of great local utility in preventing nuisance and affording more ready escape for storm waters. Little more than a fourth of the whole sum appropriated by Parliament was paid directly to the distressed men, but an effective mixture of skilled and unskilled men was secured, and a large proportion of the cost of materials, land, plant, and superintendence, as well as of skilled labour, added relief by its expenditure to the distressed district, by the employment of local labour in stone quarries and brickyards, and in other ways. The wages paid for day work averaged 5s. 3d. per day for masons, 5s. 7d. for bricklayers, 3s. for labourers, 2s. 6d. for factory operatives. The public works of Lancashire have benefited trade by giving 400 miles of good roads for tracks of mud; and they have removed local causes of disease, pauperism, and premature death, and at the same time increased the value of house property.

Dumfries New Infirmary Buildings.

A meeting of the Building Committee was held at Dumfries on Thursday the 4th inst., at which the report of the valuator of the three plans that had been submitted to him was taken into consideration. The plan of Mr. Starforth, which includes 100 beds, was reported to cost 12,706*l.*, exclusive of architect's fee and fee to clerk of works; that of Messrs. Hall and Lyons, with 120 beds, was valued at 13,000*l.*; and that of Mr. Oliver, with 130 beds, at 11,832*l.* A vote was then taken, when seven votes were given for that of Mr. Starforth, two for Messrs. Hall and Lyons, and two for that of Mr. Oliver. Mr. Starforth's plan will therefore be recommended by the committee.

General.

The Great Quarry at Pwllpant.—A large dock and basin are in progress of construction at Cardiff, by the Marquis of Bute. The stone for these important undertakings is being quarried at Pwllpant, in the immediate neighbourhood of Caerfili, and about twenty minutes' walk from the Caerfili station of the Rhymney Railway. Previous to the commencement of the present works a small quarry had been opened for local requirements. Such (it would seem) was the superiority of the stone produced from this quarry, that no doubt was entertained of the sound and suitable quality of the rock for structural purposes. The descent from the quarry to the Rhymney Railway, which conveys the materials to Cardiff, being rather considerable and abrupt, it was deemed advisable to commence cutting into the hill at about 200 yards farther down, and on a level with the railway. Here an immense quantity of mould and gravel had to be removed in order to make room for roads, railway sidings, and building accommodation on a somewhat extended scale; and also to lay the rock bare for intended operations. Considerable outlay having thus been unavoidably incurred, the managers found, to their great disappointment, that the expectations which the promising appearances already mentioned had led them to entertain were not apparently to be realised, for the stone, instead of being sound and solid, as had been anticipated, was found to consist of huge, shapeless lumps of such a fragile and scaly nature as to be almost totally unfit for the purposes intended. Rumours were then current to the effect that, in these circumstances, it was contemplated to abandon the works entirely and commence operations elsewhere. It is pleasing, however, to have to state that further progress has led to such encouraging discoveries as to induce the chief engineer to continue the works, it being found that all the stone required to complete the various important works which the Marquis has now in progress can be obtained from these quarries. Indeed, recent experiments seemed to have proved the capability of the quarries to be considerable. Some of the blocks produced for the frontage of the massive wall of the dock are magnificent, weighing in some instances upwards of ten tons after having been dressed; while at the same time stone can be had in large quantities, suitable almost for every description of masonry.

The student of geology might find in Pwllpant quarries abundant testimony to the accuracy of that science, if not also fresh data and materials for interesting researches. One of the beds of this rock, at the depth of about 20 yards, abounds in a variety of organic remains which are in such an admirable state of preservation as to leave no doubt of the existence of a majestic forest in this part of the country. In consequence of powder being used in bursting this bed, few if any of these fossils have been secured intact. The trunks of trees, however, or rather portions of such, with stumps of their forks and minor branches, have been frequently met with. In most instances these trees retain their bark, which has been transformed into coal, and can be easily detached from the stem, on which it leaves the beautiful impress of its inner coating. Interspersed among them may be seen the petrified forms of minor vegetable productions, such as ferns. These remains are so extremely fragile as to crumble to pieces whenever touched, which consequently precludes the possibility of securing any of them in an entire state. There is one species of fossils found in this rock of which our correspondent had not previously seen a specimen. These fossils are the remains of trees of a remarkable form and development. They taper slowly, are very slender in girth, and must have grown to a great height, while at the same time they are uniformly straight, and are divided into sections at short intervals by circular grooves like so many hoops or rings. These sections gradually diminish in length towards the top, but bear uniformly a mathematical proportion to each other. The rings which form these divisions are perfectly horizontal with respect to the tree in its natural position. In some cases these remains are found minus their bark. In such conditions the fibres of the timber are so distinctly imprinted in the rock immediately inclosing it as to leave no doubt that the substance of which the rock has been formed was softer and of a more impressible consistency than the wood of these trees at the time of their subsidence. Their under parts are considerably flattened, while the upper parts retain their natural roundness. The probability is, however, that this flattening may be ascribed to the action of intense heat retained in the stratum immediately beneath them at the moment of their coming in contact with it.

An experiment is being tried on the Erie Railway, New York, by laying down steel rails instead of iron ones. It is stated that the former will last six times as long as the latter.

The Lancashire and Yorkshire Company have decided that 50,000*l.* be authorised to be raised in connection with the expenditure on the Hull Docks, by the issue of new shares of 5*l.* each, and entitled to the ordinary dividend of the company.

The General Accident Company, which has been established by certain leading members in the interest of architects, civil engineers, and surveyors, commenced business on March 1. Mr. Cunez, F.R.S., B.A., is the chairman.

A valuable collection of pictures, the property of Dr. Goldschmidt, was sold by auction at Frankfort last week, and realised about 30,000 francs. The greater portion was acquired by M. Charles Pillet, of Paris, and includes a 'Norwegian Landscape,' by Everdingen (1,405 *f.*), a 'Dutch Interior,' by F. Miéris (2,410 *f.*), a 'View of Haarlem,' by Van der Hagen (405 *f.*), a 'Cattle Piece,' by Van der Leuw (592 *f.*), 'Sportsmen at Lunch Time,' by Maas (490 *f.*), and a 'Dutch Interior of a Barn,' by Isaac Ostade (475 *f.*).

The new street now being formed between the Rue de Maubeuge and the Rue des Martyrs at Paris will receive the name of the Rue Hippolyte Lebas. Lebas was the architect of the Church of Notre Dame de Lorette, close by, as also of numerous other buildings in and about Paris.

It is reported that the Viaduct over the Holborn Valley will be opened to the public in July or August next.

The Tower Subway, when completed, will supply the means of rapid communication under the Thames between the Middlesex and Surrey sides of the river. It has been commenced, the contractor having begun to sink the shaft on Tower Hill. By the purchase of a projecting piece of land on the Surrey bank of the river, the length of the tunnel, as originally proposed, will be shortened by upwards of 200 feet. The chief portions of the cast-iron cylinders are ready for use, and the great shield for the Tower side will be shortly finished. The latter will be constructed almost entirely of wrought iron, and will fit over the iron tunnel like the lid of a telescope.

The New Line of Railway to Gravesend.—The North London Railway Extension from Bow to the Tilbury Line, which will afford a direct communication from Broad Street and Camden Town to Gravesend and Southend, is announced to be opened towards the close of the month.

The ceremony of laying the first stone of St. Swithin's Church, Lincoln, will take place on Easter Monday.

The Sculptor Wichmann, of Munich, has just finished the model of a statue in bronze of Goethe, which is to be inaugurated in that city on August 28.

Christ Church, Waterloo Road, Wolverhampton, has been reopened after having been enlarged. The additions consist of a side aisle and extension of the nave.

Rawmarsh (Rotherham).—The contract for the restoration of Rawmarsh church tower has just been completed. The cost will be about 700*l.*

Melford.—The church restorations here have been completed. Although much has been done, there is yet ample scope for further outlay.

The Church of Herringwell, Suffolk, was destroyed by fire last Sunday morning. The fire originated in the heating by an iron pipe which ran from a stove through the thatched roof.

A correspondent of the *Durham County Advertiser* suggests that the next offering made for the enrichment of Durham Cathedral will be stained glass for the three central windows at the east end of the choir.

Stone New Market Hall.—On Tuesday this light and commodious building was opened for the use of the town, supplying a want that has for many years been felt. The new building is more than double the size of the old Market Hall, on a part of the site of which it has been erected, at the sole expense of the Hon. Mrs. Forester.

Mr. W. D. Landoe, of Luton, Bedfordshire, was unanimously elected Town Surveyor of Malvern on March 2. There were 140 candidates, out of whom six were selected by the Local Board.

QUESTIONS.

Making Floors.

To the Editor of THE ARCHITECT.

SIR,—Permission is respectfully asked to enquire, through the medium of your columns, what is the best material for, and mode of laying, floors of malt-houses?

Asphalte is considered too dry; tiles open to several objections. A malt-house floor to be perfection should be hard, smooth, but *never dry*. One that I know, and of which the maltman says 'She's a beauty,' appears to have been composed of ashes, chalk, and fliers (from a smithy), and is reported to have been mixed with blood at the time it was laid. I happen to require some two or three thousand feet of such flooring just now, and should be very glad of any information on the subject.

Yours faithfully,

Ramsgate, February 27, 1869.

W. LANE SEAR.

Storage of Rain-Water.

To the Editor of THE ARCHITECT.

Not having seen any reply to the question of your correspondent 'L. C. E.' in THE ARCHITECT of February 27 on the above subject, we avail ourselves of the opportunity to make a few remarks. Our experience leads us to the conclusion that rain-water cannot be kept for any length of time, even in a covered tank, without becoming unfit for drinking, unless it has undergone a much more effective filtration than through porous stone. When collected in the ordinary way, rain-water always contains more or less organic matter derived from various sources, such as the volatile impurities in the lower strata of the atmosphere, the spores of vegetable algae, the minute ova of insects, and the dung of birds on the roofs of houses.

The passage of the water through porous stone does not exercise the *simplest* chemical effect on this organic matter, so that although the visible impurities may be removed by the straining which the water has undergone, the soluble matters still remain in the same condition, and an accumulation of filth is gradually formed on the inside of the cistern, which renders the water extremely undesirable as a beverage, especially in hot weather.

The only practicable way of obtaining pure water for domestic use is to filter it day by day as required; and your correspondent may be assured that by this means a degree of purity is attainable, far beyond any that is possible in storing water, however carefully the reservoir may be protected from external influences.

Your obedient servants,

THE SILICATED CARBON FILTER CO.

MEETINGS OF TECHNICAL AND LEARNED SOCIETIES.

Breakfast.—Epps's Cocoa.—GRATEFUL AND COMFORTING.—The very agreeable character of this preparation has rendered it a general favourite. The Civil Service Gazette remarks :—"The singular success which Mr. Epps attained by his homoeopathic preparation of Cocoa has never been surpassed by any experimentalist. By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills." Made simply with boiling water or milk.—Sold by the Trade only in 4lb., 1lb., and 1/2 lb. tin-lined packets, labelled—JAMES EPPS & Co. Homoeopathic Chemists, London.—[Adv.]

The Architect.

LONDON AND PARIS.

ENGLISHMEN are so fond of grumbling at London, and calling it the ugliest city in the world, and many other hard names, and more especially comparing, or rather contrasting, it with Paris, that a little fair inquiry into the relative merits of the two cities as they now stand may not appear altogether undesirable. And before any just estimate can be formed, we must remove in imagination (would that it could be done in reality) the smoke nuisance, encrusting everything with black, choking architectural details, obliterating true shadows and producing false ones, until a noble façade, such as that of the Reform Club, full of the most refined detail, has actually been likened to a prison. Not Paris, or even Florence itself, would produce half the effect they do under such circumstances.

One reason, undoubtedly, why Paris possesses so great a charm in the eyes of the general traveller is, that he goes there usually for enjoyment—it forms one feature of many a pleasant holiday excursion; while he visits or lives in London to work, tired at the very sight of the well-known offices and streets, and rushes off to the Continent, where the clear, pure air and complete change give a fictitious value to whatever he sees.

Many indeed, we may almost say most men who spend their vacations abroad, will discourse learnedly enough on the tombs at Santa Croce, and are very probably unaware, or have but the vaguest idea, that there is as fine a collection at Westminster. They will go into raptures over the interiors of Amiens or Cologne, and do not know that they have at the Abbey a far finer interior, which they have possibly never visited since 1862, when they took their country cousins to see 'The Lions.' The vast exterior of St. Peter's calls forth their admiration, whilst St. Paul's, with undoubtedly the most majestic exterior of its class in Europe, is only occasionally surveyed from the top of an omnibus.

In one very important point Paris and London differ; and this very point is one particularly calculated to affect a casual visitor. Paris is, if we may be allowed the expression, an out-of-doors city. Its gardens, squares, boulevards, &c., are almost the sitting-rooms of a great part of the population. How different this is from our own habits, we need scarcely point out.

The general aspect of the two cities is the subject which will, naturally, first introduce itself.

Most persons visiting Paris for the first time will be immediately struck by the appearance of newness pervading everything. All is white, straight, and prim. There is no appearance of growth or natural development. One of the glories of an old city—its history—is now completely swept away, and with it that natural grouping of buildings and opening of streets, the result of simply placing them where they are wanted, which makes an old city so incomparably superior in an artistic point of view to a place laid out like a speculating builder's plot of ground. If there is a public building—a 'monument,' as the French delight to call it—which M. Haussmann thinks should be admired, a straight Boulevard is made, and at the end stands the building in question, as if the sole object of a street were a vista.

On this principle the axis of Cannon Street would have exactly coincided with the centre of the dome of St. Paul's, and instead of the noble group now standing at the western end of the street, slightly changing as we approach it, there would have been simply the dome and no more. Parliament Street also would be 'improved,' so as to lead to some central spot in the Houses of Parliament, or to centre with the north transept of the Abbey, instead of gradually unfolding, as it does, a splendid group of towers and spires certainly unparalleled in Paris. We really believe that so picturesquely magnificent a view is hardly to be surpassed in Europe, showing, as it does, five towers and spires, all exceeding two hundred feet in height.

There is a considerable degree of resemblance between the sites of Paris and London. The rivers are similarly placed as regards the bulk of each city, and curve in a somewhat similar manner; but the banks are in Paris perfectly flat, whilst the north bank of the Thames is sufficiently raised to afford some very picturesque groups.

We will imagine ourselves going down the river. Leaving the Houses of Parliament on our left, the banks on either hand present a continual variety, most agreeable, and often very beautiful. The high roofs of Montague House, the lofty terrace of the Adelphi, that noble bridge Waterloo, with Somerset House standing at so grand an elevation above the river, and backed by the constantly moving towers of St. Martin's, St. Mary le Strand, the Record Office, and other buildings, form a panorama of very great interest.

But, unfortunately, with the usual perverseness of our controlling powers, all has been done that could be to spoil this prospect by permitting such a hideous erection as the Charing Cross Railway Station and Bridge to intrude itself. Somewhat less ambition on the part of the Engineer and a little assistance from the Architect might have prevented all this, and have added one more feature of use and interest to the view. In Paris, most probably, neither the bridge nor the station would have been allowed in any form, but we are not at all advocating such a course. If public works are

wanted, let us by all means have them where they are required, and if well treated, they will only add to that natural picturesqueness the total loss of which we are lamenting in Paris.

As the boat carries us eastward, passing the Temple gardens, with quaint groups of old houses on all sides, we approach what is certainly one of the finest town-views in Europe—St. Paul's, with the various spires grouped around it, a view which every Englishman would admire were it out of England.

But we are once more startled by another station, that at Cannon Street, and with it another railway bridge, equally ambitious with that at Charing Cross. The bridge may be more successful, and the two towers may perhaps tend to redeem the station a little; but the design shows a complete want of scale—an entire absence, in fact, of the faintest architectural knowledge.

When a new Railway station is to be constructed in Paris, advantage is taken of the opportunity to erect a fine public building, such as not only the shareholders but the general public can see with satisfaction. As an example, take the station of the Chemin de Fer du Nord, where the engineer and architect together have produced a truly magnificent building, worthy of the great company whose terminus it is; and this at probably no great increase of cost. Cost, indeed, cannot have been so great a consideration in the two stations we have been discussing, or the company would hardly have had funds to spare sufficient to erect a hypothetical restoration of Charing Cross in a position it never occupied.

There can be no doubt that in a very modified form some controlling power, a M. Haussmann much reduced, would be beneficial to London. Many things are spoiled from the want of a little foresight, as will be the case with the new Blackfriars Bridge, where the straight lines of the Railway and curve of the new Bridge will clash in the most awkward way. The two can never agree, and the largest will always predominate. This is not only a matter of taste, but of public money thrown away; for when our funds are laid out for us, we are entitled to have the best for our money.

The southern approach to London Bridge is a crying example of waste. Upwards of one million is said to have been expended in making the approaches for this bridge, and without a moment's consideration a railway company is permitted to spoil one-half of the work by erecting certainly the most hideous bridge in London.

But to return to the River. We cannot quit the subject without noticing the Embankment, which is certainly a very finely-conceived scheme, and its arrangement shows at once that the first consideration has been to serve its purpose. Passing under the bridges, and with the various buildings rising behind it, it seems thoroughly to have attained that combination of the grand and picturesque, a good thing in the right place.

Here, however, all praise must stop. Where engineering ceases, and architecture and taste should begin, there is nothing but a display of gross ignorance. Everything is gigantic, under the impression that large parts will produce an effect of size, when a little knowledge of the commonest laws of Art would have shown the reverse. The result is that the Embankment does not look large, but the people on it and everything near it appear small—another example of vast sums of public money comparatively thrown away.

Notwithstanding, when we turn to the banks of the Seine, the comparison, in spite of railway stations and numberless other horrors, is decidedly in our favour. There is, of course, a dignity in the great width of the Thames, and the immense bridges it necessitates, which cannot be attained by a small river, as is the Seine at Paris; but that does not affect the buildings grouped upon its banks.

Imagining ourselves in one of those swift little screw boats which ply on the river, and going eastward, the first edifice of note which we pass is the Tuileries and Louvre, which, from their position and size, naturally suggest themselves as parallels to the Houses of Parliament. The river front of these buildings is so immensely long and unbroken, that it hardly escapes monotony. It has certainly nothing to offer in comparison with the great towers of Westminster and the Abbey rising behind. And, continuing our route, the buildings on the quays, though much better individually than most on the banks of the Thames, form themselves into no groups or combinations, and we miss altogether the numbers of towers and spires which form so important a feature of the panorama of London.

M. Haussmann has been busily engaged on the banks of the Seine, but has not much improved them. The new houses near the Place du Châtelet are miserably tame in design, and the barracks behind the Hôtel de Ville are equally poor; whilst the Tribunal de Commerce and the huge barracks in front of Notre Dame may certainly claim to be amongst the ugliest buildings in modern Paris.

There can be but little doubt that were the Paris atmosphere as thick as ours in London, and the houses well begrimed with soot, the river view of the former city would appear very tame compared with that of the latter.

The quays at Paris are very fine, and fortunately not encumbered with mountains of granite and other specimens of high art, as our new Embankment is apparently doomed to be, hereafter to be backed up no doubt by long terraces of monotonous design, under a mistaken idea that uniformity is grandeur—make-believe public buildings with centres and wings, but with thirty or forty front doors a-piece, which soon reveal the true state of the case. If every man builds his own house, it is certain in the end to produce the truest and best effect. What a failure Regent Street has turned out, where uniformity once reigned, and now every shop front is different! One half a pillar is dirty drab and the other half sham marble, whilst endless excrescences abound on the roofs. How infinitely finer such a series of buildings would be as is presented by several streets in the City, where each edifice has its individual character!—or we may cite Pall Mall as a very fine instance of a good street.

There is something eminently absurd in such an arrangement as that at the western end of the Rue de Rivoli, where, for three-quarters of a mile, the same monotonous and spiritless design is carried through, incorporating the Hôtel du Louvre, with a frontage of more than 400 feet, and the Bureau de Finance, a still larger building. Here are two examples of *uniformity* not to be matched even in London.

THE FOUNDER OF IRISH ARCHÆOLOGY.

As a general rule, the best way to estimate the value of any man is from the quantity and quality of the work he is known to produce. At the same time there are some whose work should not be determined merely by that which happens to bear their names, but who, as they have constantly co-operated with others in various ways, ought consequently to share in the credit obtained by work with which they have no apparent connection. Such, for instance, would be the proper manner to measure what Sir John Herschel has done. That he is, perhaps, the most eminent man of science in England would be acknowledged by all, but the books he has published, although they may be considered the best of their kind, afford by themselves but insufficient proofs of his greatness or of his industry. His admirers would, we are sure, desire that hereafter, the testimony of those who were indebted to him for counsel, should be accepted as evidence of what he had done to advance science, and of his vast attainments, as well as the volumes that might have his name on the title pages. This, too, is how George Petrie, the Irish antiquarian, and what he did for Ireland, ought to be judged. His landscape paintings, drawings for engravings, papers in the Transactions of the Irish Academy, or in penny magazines, or even the one volume of an unfinished work on which his reputation is mainly founded, seem hardly sufficient to merit that respect which all parties and creeds in Ireland had for him. But if credit is given to him for some of what may have been done by others through his influence, it is not difficult to understand why he was respected: thus we find one of the chief living antiquarians write, 'I used always to call Petrie "father" to his face, and did not scruple to confess my filial obligations to him;' and we find Petrie himself saying (and he was no boaster), 'I take great pleasure in visiting the Academy, for the students like me, and attend more when I am there than when any other visitor is on duty.' Such a man requires, indeed, a fitting biographer to be appreciated, and we are glad to say that Petrie has found one in Dr. William Stokes, the eminent physician of Dublin. Dr. Stokes speaks modestly of his qualifications for the task, but he has produced a most interesting and acceptable book (and that is by no means easy when it is an Irish subject), and one which we are sure, if Petrie could have seen, he would have approved of, and higher praise we could hardly give it.

George Petrie was the son of a portrait painter, and was born in Dublin in 1789. He was educated at Samuel White's famous old school in Grafton Street, where so many eminent men were once students, amongst others Moore and Sheridan, and where Sheridan's father used sometimes to lecture on elocution. After some hesitation, it was decided he should become an artist, and for this purpose he attended the schools of the Dublin Society, Danby and O'Connor being fellow-students of his. In 1813 the three visited London, and were introduced to Benjamin West, who treated them with the kindness he always had for young artists. Petrie returned to Dublin, and commenced practice as a landscape painter, where he obtained as much eminence as was possible in a country where there was little patronage. As well as we can remember them, most of Petrie's early works would now, we fancy, be thought weak and thin; they were, however, very careful, and there was no pretension. His aim, it appears, was not merely to make his paintings copies of scenes, but to impress upon them, as far as possible, an Irish character. 'We cannot,' he used to say, 'get the full effect and beauty of Nature, but we can paint her to convey her spiritual lessons, in however faint a degree.' Wordsworth's poetry had always influence over him, and Dr. Stokes thinks there is a striking resemblance between the poet's descriptions and Petrie's landscapes. If when young he had come to England (like Mulready, Danby, Maclise, Macdowell, and other Irish artists), where he would have received more encouragement, and been induced to give undivided attention to painting, he would probably have accomplished greater things in art than he did, for his later works, after an interval of many years, displayed an unexpected vigour and feeling. Besides his paintings, Petrie made a number of drawings for engraving to illustrate the tours that at one time were popular. These deserve the highest praise for accuracy, and the architectural subjects are treated with a care that is not often met with. All the time he was making sketches through the country, Petrie was also studying its antiquities. He was hardly led to do this because he was an artist, for the forms of the antiquities then known have but little beauty. We think it arose from an inherent love of the subject, from seeing the base uses to which ancient things were applied, and perhaps out of pity to the inhabitants, who could see no value in monuments which were amongst the best illustrations of the past history of their country. For although he might be regarded only as an alien, as his grandfather was a Scotchman of Anglo-Norman descent, Petrie always cared much for the people, and was anxious to promote their education. In 1832 he established a penny journal, with the object mainly of illustrating the country; but although with the aid of such men as Anster, Ferguson, O'Donovan, Mangan, Curry, &c., he was able to produce a few volumes that Southey prized amongst the most valuable in his library, Petrie's magazine met with the inevitable fate of publications in Ireland, and ceased from lack of support. It deserves to be mentioned here, that with the same object of educating the people, he afterwards had the exhibition of paintings of the Hibernian Academy, of which he was president, opened at a penny entrance fee.

In 1828 the present Sir Thomas Larcom was made Director of the Ordnance Survey Office in Dublin. During the progress of the survey it was found necessary that some persons acquainted with the ancient language of the country should ascertain the correct denominations of the townlands into which Ireland is divided, as well as the proper orthography. Many of the names of places were puzzling, especially to the English surveyors, and besides, one townland would often be known under different names, so that investigation was required before one name could be selected for engraving on the plan. It was also arranged that remains of ancient structures were to be shown on the maps, but it was found that many of them would be likely to be disregarded except by the trained eye of an antiquarian. For these purposes a special department was established, and Petrie was placed at the head of it, and there was not another man in Ireland at that time so

peculiarly fitted for the position. Amongst his assistants were John O'Donovan and Eugene Curry, who after himself did more than any others in laying the foundations of Irish Archaeology, and in a subordinate position, that wonderful writer, Clarence Mangan. Captain Larcom had intended that the survey should be supplemented by a series of memoirs on the geology and natural history, the statistics, and social condition of the country, the materials for which were to be collected at the time of the survey, and also the past history of the different portions, as far as it was ascertainable, the whole forming, as Lord Brougham said, 'a corollary to the survey, more valuable than the survey itself.' Perhaps it was too grand a project to be carried out at once. The geology has since been carried out by a special department, and for some of the other parts there is not so much need, but there never again can be so favourable an opportunity of investigating the past history of the country, and for the time it lasted, no men could work harder in endeavouring to take advantage of it than did Mr. Petrie and his staff. But after one volume had been published, and some four hundred manuscript volumes prepared, this branch of the survey was suspended suddenly, and notwithstanding all the entreaties that were made for its resumption, by those who were qualified to estimate its importance, no attempt was made to continue it. 'It seems,' says Dr. Stokes, 'as if some strong though concealed influence had been brought to bear on the Government, in reference to the danger of reopening questions of Irish history.' One of the papers prepared in connection with this part of the survey, and which was afterwards read by Mr. Petrie, shows how much was lost by its noncontinuance: we refer to the celebrated essay on the 'Antiquities of Tara Hill,' which may be considered as the key to the reliable history of Ireland, and the first example of Mr. Petrie's method of testing the truth of history and tradition by existing remains. Tara was the famous spot in Ireland, where the ancient councils were held, and where it was popularly imagined there stood a palace of no ordinary grandeur. A special survey was made of this hill, showing every trace of ancient remains, and this was corrected by Petrie and O'Donovan. All the references to Tara found in old manuscript chronicles were then collected, and the attempt was made to identify the structures that were alluded to with the traces still remaining, and from the correctness of the descriptions this was by no means difficult. Another plan was then prepared from the old descriptions, and the similarity between it and the first survey was marvellous. It was then but reasonable to infer, that if in this way the topography of the chronicles was found correct, the other descriptions found in them might be accepted as equally reliable. Mr. Petrie's account of the palatial architecture must have disappointed many enthusiastic Irishmen, when he described the buildings as being entirely made up of earth and timber. The old banqueting hall, however, was large enough, its size being 360 feet by 80 feet. The value of Mr. Petrie's essay was immediately recognised. Although it rendered some of his assertions incorrect, Moore said it interested and delighted him. Colonel Colby, the head of the survey, wrote to Mr. Petrie, 'You will have the consciousness of doing good service to the rising generation, and when true histories of mankind shall supersede the romances under the name of histories, which mislead the unthinking and perpetuate mischievous prejudices, your name will rise in estimation;' and Captain Larcom, who aided in its production, and in this as in other ways was more Irish than the Irish themselves, wrote, 'I look on this paper as one of a series, and properly the first; I consider it not only, perhaps not so much, an account of the remains at Tara, as a summary of proofs, that in the authentic existing documents of Irish literature is to be found the real clue to all our antiquities.'

'Next come the towers,' continues Captain Larcom, 'which will place the early Christian antiquities on a sound footing,' and it is in connection with his inquiry into the origin of the Irish round towers that Petrie is likely to be best remembered. This was a subject that afforded full scope for speculation, and Lynch, Vallancey, Beaufort, Dalton, O'Connor, Betham, Windele, Richardson, Smith, and O'Brien, as well as others, took advantage of it in proposing various theories. They were fire temples, sorcerers' towers, celestial indexes, Phallic temples, watch towers, heroes' tombs, &c.; and in support of such theories, Persian, Phœnician, Egyptian, Grecian, Hindoo, Danish, and Scandinavian mythologies were brought forward and believed in, not by a few enthusiasts merely, but by some of the best balanced minds in the kingdom. 'In fancy,' says Davis, 'we had seen the white-robed Druid tend the holy fire in their lower chambers, had measured with the Tyrian-taught astronomer the length of their shadows, and had almost knelt to the elemental worship with nobles whose robes had the dye of the Levant, and sailors whose cheeks were brown with an Egyptian sun, and soldiers whose bronze arms clashed as the trumpets from the tower top said that the sun had risen. What wonder that we resented the attempt to cure us of so sweet a frenzy?' It is not difficult, then, to understand how many people like Davis must have opened Petrie's book, 'strongly bigoted against his conclusions,' which were derived, not from the fables of other countries, but from an examination of the structures themselves and the allusions to them in the Irish annals. The marvel is that no one before thought of adopting what seems so natural a method of investigation. The work was to have consisted of three parts—the first an examination of the previous theories, which Petrie considered erroneous; the second a description of the remains of the earliest ecclesiastical architecture in Ireland, and an explanation of Petrie's theory; and the third part (which was never published) was to describe the architecture up to the time of the invasion. From an examination of all the remains, Petrie's conclusion was, that there was not the slightest authority to show that the Irish were acquainted with the art of constructing an arch, or with the use of mortar, before the introduction of Christianity into Ireland, and that consequently the pre-Christian origin of the towers had no foundation. Then, from the allusions to them in the ancient records, he inferred that they were intended to serve as belfries, as storehouses in which to keep the valuables belonging to the churches they adjoined, and to which the religious might be removed in case of a raid, and possibly as beacons at night. Petrie would seem to be so much engrossed with demolishing the pagan theories, that sufficient precision is hardly shown in assigning the periods when they were erected, and, perhaps, little

evidence could be found for asserting that so early as the sixth century the Irish were capable of performing such work.*

The collection of the old airs of Ireland was another labour which Petrie carried on during his life. He was passionately fond of music and was a good performer, but his motive for collection was not his own gratification as a musician, but the firm belief that at some future day the relations between the popular music of different nations would become a subject of scientific investigation, in the way that languages now are, and that it was right to provide materials for that purpose. 'Deep researches,' says Dr. Stokes, 'are now being made as to the extent of the civilisation of the Aryan family before it separated, as to the situation of its abode, and the relative periods at which its members left their common home. The groundwork for such researches is supplied by the words common to the various Indo-European languages, and it may well be asked whether the natural music of a country, in itself a language of all others most subtle and refined in expression, should be passed over without investigation. If the study of philology be invaluable, as a means of increasing our knowledge of the development and progress of the intellectual, so should music be prized as the language of the motive faculty.' Whenever music is studied in this way, the value of Petrie's collection (one volume only of which has been published) will be appreciated, for with the last generation most of the old airs have passed away; and not only in Ireland only, but elsewhere; for on one of his visits to Skye, his hostess told Petrie that a few years before, she was able to find several people to sing all the old music for Worsaae the great Danish antiquary, but that it was then impossible.

We wish we could describe all Petrie's other services to Irish Archaeology, but we have no space for the purpose. Our object has been merely to indicate the departments in which we think he has rendered most service. For the remainder we must refer to Dr. Stokes's book. Of the man himself we may say, few can have had a more enviable old age. He saw rising around many students of antiquity, all of whom regarded him with reverence and affection; he had honour, love, obedience, troops of friends; and he retained, too, that boyishness which, luckily, sometimes accompanies genius to the end. 'Let us,' says Danby in one of his letters to him, 'exult in the confidence that we belong to that class of our fellow-men, who, by the elixir you describe—the true enjoyment of nature—retain the heart of youth, though the eyes grow dim, the hand trembles, and the head fades grey.' And in this way his life glided along until January 17, 1866, when he passed away as peacefully as he had lived.

THE ART OF THE GOLDSMITH.

TO record a nation's history in letters of gold, is a form of expression which admits of more than a two-fold interpretation. There is, indeed, the strictly literal interpretation—the marble slab or the vellum page inscribed with golden characters; and there is the *libro d'oro*, 'the golden book'—the book 'golden' because, written also in gold, it contains only the names, the genealogies, and the memoirs of noble and illustrious citizens; and, again, there are the national annals that may establish a claim to the same proud epithet, based upon the eminent intrinsic worthiness of the narrative, coupled with the rare excellency of the narrator's style and language.

But, on the other hand, the veritable precious metal, the gold itself, may be taught to assume an historical character through the agency, not of language, but of art. Works of art of every class and variety executed by the goldsmith in process of time resolve themselves into the component elements of so many chapters in a national history; since they bear both a faithful and an unpremeditated testimony to the scientific knowledge, to the artistic taste, and to the manual skill of a people; and at the same time cast a reflected light upon their prevailing sentiments, requirements, and usages. Works of art in gold, regarded as historical relics, possess the important quality of being imperishable; while, having in the first instance been produced simply for present use and without any idea of future historical association, their testimony may be accepted without hesitation as strictly truthful and absolutely free from partiality.

In our own country the researches that have been made during the last quarter of a century amongst the graves of the Anglo-Saxons have brought to light numerous specimens of Saxon gold jewellery which, in connection with relics of other kinds, have enabled us to form a correct estimate of the civilisation and character of those early predecessors of ours in the occupancy of this island. It has been the same throughout the other north-western regions of Europe, so that at length there exists a series of chronicles, intensely interesting to ourselves, of which it may be said that they have actually been recorded in gold. If, again, we turn our attention in another direction, and look towards the south-east of Europe, we find that Italy has preserved in rich abundance works of ancient native artists in gold; and the extraordinary beauty and delicacy of these relics proclaim beyond all question the high civilisation of races that had flourished on that classic ground, and had passed away, before Rome had arisen there to overshadow even their memory with its far greater splendour.

Without now tracing the existence of similar relics in other European countries and in the East, we desire to notice certain qualities, common under varied conditions to them all, which impart to these ancient works of the goldsmith's art their historical character and their great value. The purity of the metal, and its consequent preciousness in the case of these ancient works generally, are considerations of comparatively small importance. It is in their *treatment* of fine gold that the ancient goldsmiths have bequeathed to their successors of all ages and generations such an admirable example. And, strange to say, it is in this same matter of treatment that with the general progress of civilisation, and more particularly in connection with the rapid advance and development of science,

* It is very curious that no attention seems ever to have been paid to this subject by an Irish architect. Of all the books that have been published on the Round-Towers, Mr. Wilkinson's is the only one written by an architect, and he is not an Irishman, although he has practised in that country. The controversy now turns on the character of the masonry of the different towers, and surely on this point architects and engineers ought to be the proper judges, rather than those who are striving to decide the matter.

modern goldsmiths have long permitted their art to degenerate. Happily, however, the time has at length come in which the art of the goldsmith has experienced an energetic revival. Accordingly, it is with a view to support the efforts of those living masters of art in gold who already have accomplished so much, and in the general interest, at the same time, of a great and important national expression of art in alliance with manufacture, that we appeal to the ancient glories of the art of the goldsmith, and set them forth for the admiration and also for the admonition and instruction as well of the public who employ the services of workers in the precious metals, as of the men who work in them.

Ancient works in gold are invariably distinguished by national or local peculiarities of style and character; and they are historical in consequence of their possessing such peculiarities. The works of the Etruscan goldsmiths are historical of the Etruscans, and those of the Scandinavian goldsmiths of the Scandinavians, because each group of works exhibits certain characteristics of the nationality or country of their producers. Different artists of each race, as a matter of course, may have shown that they were endowed with differing degrees of artistic capacity; and in successive periods there may have existed in the same country, in like manner, various modifications in the prevailing attributes of the same style and type; but still, in their essential and distinctive qualities, the style and the type continued to be the same—the style and type of the Etruscans always Etruscan, of the Scandinavians always Scandinavian. Again, the ancient goldsmiths, each in their own style and in harmonious conformity with the general requirements of their traditional and accepted types, worked out the embodiment of their own thoughts. Acting under the impulse of motives of their own, instead of copying and reproducing models, they devised original designs; and so they never failed to infuse into their works a genuine artistic spirit and feeling. Moreover, the ancient goldsmiths, with one consent, adapted their designs both to the nature of the material in which they worked and to the special purpose which each production of their art and skill was destined to accomplish; their designs, consequently, were assimilated to those of Nature herself in the element of appropriateness in combination with that of beauty. Their beauty was consistent and significant—a beauty made infinitely more beautiful through its consistency and significance. Once more—in their processes of practical working these artists of early times have demonstrated a perfect mastery of their art, that must ever continue to command unqualified admiration. And here, as in the matter of design, it is in the felicitous adaptation of processes to material, and also to design, that ancient goldsmiths' work is so admirable and so suggestive.

Amongst the revivers of the art of the goldsmith, the first place is worthily filled by Signor Castellani, of Rome and Naples, who at once placed this revival on a sound and enduring foundation by uniting the reproduction of ancient designs with the restored practice of the ancient processes. To Castellani is due the merit of having been the first to recognise the supreme excellence of the ancient works in gold, and to accept them as guides and instructors invested with paramount authority. Then it was, when he had resolved, as his only safe and sure guide to a corresponding excellence in his own works, to reproduce with minute exactness some of the finest of the relics of ancient art, that Castellani discerned the inseparable alliance between the ancient designs and the ancient processes—he found that by means of the ancient processes alone it would be possible for him to effect an absolutely perfect reproduction of the ancient designs. Modern works in gold, produced by modern processes, might resemble ancient models; but if the works of a modern goldsmith in every quality and condition and circumstance were to be equal to ancient works, and in fact were to be actually identical with them, recourse must be had to the ancient processes, and to them alone. It is well known how, in a remote mountainous district of Southern Italy, Castellani discovered the existence of certain families of working goldsmiths who retained a traditional knowledge, by them derived in hereditary succession from father to son, of the principles of those very processes, supposed to have been long unknown and forgotten, which the ancient goldsmiths had invented and perfected, and then applied in their practice with such triumphant success. How he succeeded in attracting to his own establishment some of the most skilled and experienced of those representatives of the Etruscan goldsmiths of remote ages, is well known also; and how it followed that, under his masterly guidance, a school of artists was formed who were enabled to execute, in granulated gold, works that would have done honour to the most renowned of the old Etruscan masters. Thus has Signor Castellani carried into effect the following propositions:—That the first thing to be accomplished by the goldsmiths of the present day is to raise themselves to an equality with the greatest of their predecessors; and that this is to be done simply and solely by reproducing, after the manner of the greatest of their predecessors, the greatest of their known works.

CAISSONS FOR PIER-BUILDING.

NEW BRIDGE AT COPENHAGEN.

BEFORE more particularly describing the engineering illustration we give this week, as showing a new and very clever method of building bridge-piers, it may not be uninteresting to many of our readers to refer to one or two former contrivances which have been employed for that purpose.

Dr. Ure, in his 'Dictionary of Arts,' mentions what is considered to have been the first application of sinking cylinders through sand and water (quicksand). He says that a mining shaft formed of a series of large sheet-iron cylinders riveted together was sunk to a great depth through the bed of the river Loire, near Languin. The seams of coal in this district of France lie under a stratum of quicksand, from 18 to 20 metres thick—equal to about 58 to 66 feet English—and they had been found to be inaccessible by all the ordinary modes of mining previously practised. The difficulty of reaching them had been thought so entirely insurmountable that every portion of the great coal basin, which extends under these alluvial deposits, though well known for centuries, had remained untouched. To endeavour, by the

CAISSON FOR PIER-BUILDING.

(DESIGNED BY MM. BURMEISTER AND WAIN.)

usual workings, to penetrate through these semi-fluid quicksands, which communicate with the water of the Loire, was, in fact, nothing less than to try and sink a shaft in that river, or to drain the river itself.

This difficulty, however, was successfully grappled with by M. Triger, an able civil engineer. By means of the sheet iron cylinders we have mentioned, he contrived with the aid of force-pumps to keep his workmen immersed in compressed air of sufficient density to force back and out of the bottom of the cylinder all the water which was there, and thus enabled the men to excavate the sand, gravel, and stones to such a depth that when the cylinder was sunk to a water-tight stratum, the compressed air was no longer necessary. An air-tight chamber at the top of the cylinder had a man-hole door in its cover and another in its floor; when the men had entered this chamber the upper door was closed, and compressed air from the cylinder was then admitted by means of a stop-cock. As soon as there was an equilibrium of pressure established between the chamber and cylinder, the man-hole door into the cylinder was opened and the men descended to their work. Here they had to work in air at a pressure of about three atmospheres, i.e., equal to a pressure of, say, 44 lbs. per square inch. While the compressed air thus drives the water of the quicksand out of the shaft, it is said to infuse at the same time such energy into the miners that they can easily excavate double the work without fatigue which they could perform in the open air. Upon many of them the first sensations are painful, especially upon the ears and eyes; but they rapidly get accustomed to the bracing element. It is even said that old asthmatic men here become effective workmen, deaf persons recover their hearing, whilst others are sensitive to the slightest whisper. Much annoyance was at first experienced by the rapid combustion of the candles, but this was obviated by the substitution of flax for cotton wicks.

The contrary principle to this of sinking cylinders was proposed by Mr. Potts, a medical gentleman of great inventive ability. His system was adopted in sinking the piers of the Black Potts Bridge, which crosses the Thames near Richmond. Each cylinder was lowered into the river in its proper vertical position, and then loaded sufficiently to make it sink when the greatest vacuum was obtained. The vacuum was produced by means of suction pumps, and then the external pressure of the atmosphere forced the mud, sand, or gravel and water from the bottom of the cylinder up inside of it, thus allowing the cylinder to descend as much as the displacement of the material at its base in the bed of the river would allow with the force of its own weight and load. The material thus forced up into the cylinder was scooped, or dredged, out as much as possible, the operation of creating a vacuum being again and again repeated till the cylinder was sunk to the supposed proper depth. It has been said that some of the cylinders sunk when the weight of the bridge and proving load came on them. This fault, however, cannot be charged to the mode of sinking, for in that case the cylinders could not have been sunk deep enough, or they were imperfectly filled in. At the same time, if the water had been forced or kept out by means of compressed air, there would naturally have been far greater facility for seeing and insuring a good and secure foundation.

The new cast-iron arched bridge over the Medway at Rochester is one of the first bridges built upon cast-iron piles sunk deep into the bed of a river by means of compressed air, used to keep out the water while the workmen were employed in excavating the material inside the piles, and allowing them to sink by means of their own weight and the load placed on them. This bridge is built near the site of the celebrated old bridge at Rochester, and consists of three spans (one an opening span). Each pier is formed of 14 cast-iron cylinders placed in a double row and sunk through the bed of the river into the hard chalk. All these cylinders were sunk by means of compressed air, to keep out the water while the men were at work in them, in a very similar manner to the method adopted by the French engineer, M. Triger, for sinking his shaft. Mr. John Hughes, Civil Engineer, was the first to adopt this mode of keeping the water out of piles while being sunk to form piers in the beds of rivers, and great praise is due to him for the thorough and practical way in which this system was carried out, in sinking seventy cylinders to a great depth in the bed of a strong tidal river like the Medway. The bed of the river was found to consist of strata of soft clay, sand, and gravel over the chalk, which was reached at a depth of 44 feet below average water line. Each cylinder was like an immense diving-bell, always having its top out of the water, no matter at what depth the bottom was. They are formed of cast-iron pipes, 9 feet long and 7 feet diameter, with internal flanges, so that the external faces are free of any projections that would interfere with their free descent through the bed of the river. The access to and from the inside of the pile, while being sunk, was through two air-locks or chambers, made of cast-iron, passing through the cover-plate bolted on the top length of the pipe forming the pile. The tops of these locks had openings 2 feet in diameter, and flap-doors which, when closed, allowed them to be filled with the compressed air from the cylinders. From each air-lock there was a vertical door opening into the air-chamber, which, when closed, was also air-tight, so that when the workmen had to pass in or out, or to take out the excavated material, they could do so without decreasing the pressure of the air very much. In coming out, they entered, through one of the vertical doors, into one or the other of the air-locks, and when this door was closed, the pressure of the air was reduced to atmospheric pressure by means of a small cock, opened to the atmosphere. As soon as there was an equilibrium of pressure, the top door was opened and the men came out. The operation of entering the pile or cylinder was the reverse of coming out. The only loss of the compressed air from the cylinder at each operation was the amount contained in the small air-lock.

Within the cylinder were two small cranes to lift the full buckets and lower the empty ones, which were worked by a two-handled windlass. As each pile was sunk 9 feet, the air-chamber was disconnected and a fresh length of pipe bolted on, and the air-chamber bolted on top of this. At each joint a floor or staging was fixed, with openings to allow of the ascent and descent of the workmen and the full and empty buckets, &c. These cast-iron pipes form part of the permanent structure of the piers, and when they were sunk to their proper depth they were filled in with concrete and brickwork.

The method of working was by setting the air-pumps in motion, having

the top door of one of the air-locks and the bottom one of the opposite air-lock closed. The pumps were of such a size that in about five minutes 15 feet head of water was forced out through the bottom of the piles; and whilst the pumping continued the workmen passed through the air-locks to their various stations.

The engineering illustration which we give this week shows a more economical method of building piers in the beds of rivers, or under water. It shows a caisson or diving-bell, designed by Messrs. Burmeister & Wain, and adopted by them in building the piers of the new bridge in Copenhagen. The principal economy consists in having the caisson, or cylinder, of less cubic capacity than the finished pile of the piers, and in being able to take it away as each pile was built. When the excavation was made deep enough for a firm foundation, the building of the pile was commenced, and as it increased in height the caisson was lifted accordingly until the pile was above water-line, when the caisson was removed to the required position of the next pile, and so on, until the two piers, each formed of two piles, were completed. This plan of lifting the caisson avoided leaving the whole of the piles of the piers encased in ironwork, as in the piers of Rochester and many other bridges. This caisson was made of wrought-iron, 18 feet diameter at the lower part by 8 feet high, and above this to the air-chamber out of the water it was only 10 feet diameter. Just above the 18-foot diameter chamber there were two annular rings, or chambers—one to contain iron ballast, A, and the lower one water ballast B, so that in sinking the caisson the water chamber was filled with water for weight in addition to the iron ballast in the annular chamber above. When they had excavated to the solid strata, a bed of concrete 3 to 4 feet thick was formed, and on this the remainder of the pile was built with granite facing filled in with brickwork. As the building of the pile proceeded, the caisson was lifted by means of the suspension chains C, connected with staging overhead, and by pumping air into the annular air chamber B to displace the water. The finished piles are about 18 feet diameter at their bases, and 16 feet diameter at their tops, by 30 feet high. The whole of the work below water line was done in the 18 feet by 8 feet chamber at the bottom of the caisson. Between the time of lowering it to the bed of the river and the completion of the first pile to water line was only twenty-eight days, and then the apparatus was moved into position for the next pile. In lowering it for the second pile, it unfortunately got upset, and caused so much delay that it took thirty-six days to complete this pile. The third pile was, however, finished in sixteen days, and the fourth in seventeen days.

The air chamber and locks on top of the caisson were very similar to those used for sinking the piles of Rochester Bridge.

THE SUEZ CANAL.

A REMARKABLE document, of which we presented our readers with an abstract in a recent number, has not received the explanation which its appearance is calculated to call for, but which, oddly enough, no one seems to have thought of requiring. For an English engineer, in the first rank for eminence and for occupation, to publish a report on one of the chief European problems of the day, is, at all events, an unusual occurrence. The habits of Mr. Fowler are hardly those of a courtier; nor can we venture to trust that that good time has yet dawned upon the profession of the civil engineer, in which Royal personages will require the services of an engineer-in-chief as a necessary functionary of a travelling household. They might, no doubt, do much worse, but that is not now the question. Nor could the most enterprising journal, on either side of the Atlantic, well afford the honorarium which would be necessary to produce such a report, from such a source, for their own special service.

Taking for granted, however, the accuracy of the simplest hypothesis, that Mr. Fowler, travelling for his health, took occasion to send home a description of a subject that he knew would so much interest the English public, and attributing to this public-spirited motive alone the precise form and elaborate detail of his report, the document in itself is one every way calculated to receive very serious attention. It is one in which we have to read between the lines, and to draw inferences from the facts set forth, which the caution, the purpose, or the good feeling of the writer, prevented him from himself stating.

Mr. Fowler commences by a sort of condemnation of the opinion formerly expressed by Mr. Stephenson, as to the impracticability of the canal scheme. Impracticability, in engineering arts, is neither more nor less than another term for disproportionate expense. Bearing in mind that explanation, we question whether anything could much more fully justify an expression of extreme diffidence as to the commercial practicability of this most interesting enterprise than the report of Mr. Fowler. That the works necessary, not only to the opening, but to the maintenance of this artificial 'Strait,' are of 'such vast magnitude, and in a country which presents such peculiar difficulty,' is precisely that which has led other engineers, besides Mr. Stephenson, to conclude that M. de Lesseps has not attacked his gigantic task in a method that will ensure a permanent triumph.

The conclusion to which our present information seems to point is not, in our opinion, that the enterprise should be suffered to fall through. That it can answer as a commercial speculation, seems more doubtful the more we learn of the precise facts of the case. But the great national importance of the enterprise, and the interest which commercial Europe, and especially commercial England, has in the opening of a sea-way to India, with which no railway could ever compete, are such that, should the time arrive when the projectors of the undertaking are compelled to admit that its magnitude is beyond the grasp of any privately-organised association, we trust that the English, the French, and the Egyptian Governments will come to the rescue; and provide at once for the real completion and the adequate maintenance of the Canal, and for the indemnification of all those who are *bona fide* contributors towards its construction.

It is not by understating the actual difficulties of the case that this result will be attained; and those are the truest friends of this great maritime enterprise, who look the facts most steadily in the face.

ILLUSTRATIONS.

CHRIST CHURCH CATHEDRAL, DUBLIN.
GEORGE EDMUND STREET, A.R.A., ARCHITECT.

A COMPLETE description of this Cathedral, and the works of a restoration proposed and in progress, was given, in the architect's own words, in our numbers for January 16 and February 3, and was accompanied by a plan, sections, and a side elevation. We this week give the elevation of the West Front, which it will be recollected 'required a new door and new windows.' Mr. Street has happily been able to recover sufficient traces of the old work to enable us to consider the elevation as now shown a very close, perhaps a perfect, restoration of the old design.

BOXGROVE CHURCH, SUSSEX.

FEW English counties are as rich in picturesque examples of Early English architecture as Sussex. The illustration given in this number is a specimen, although many of the other little churches in the county have more of that quietness and beauty which is so characteristic of Sussex work. The Priory, Boxgrove, was founded by Robert de Haiâ, Lord of Halmacro, A.D. 1117, and is now in ruins, except the chancel of the original church, which has been restored, and is at present used as the parish church.

CARISBROOKE CHURCH, ISLE OF WIGHT.

CARISBROOKE Church, Isle of Wight, is about the most conspicuous architectural work in the centre of the island, excepting the famous old castle of Carisbrooke, which stands on the hill above it. It is said to have been built in the 11th century; although the tower, which is plain in detail, but an elegant composition, is evidently the work of a later period. A priory originally stood on the north side of the church, but scarcely a trace now remains of it.

W. YOUNG.

ARCHITECTURE AND ENGINEERING.

SINCE the day when the lowly miner and man of genius, George Stephenson, begat the idea which was to make him more potent than Prospero, and enable him, calling to his aid the genius of steam which Watt had evoked, to bid his ministers girdle the solid earth with bands of iron, what has not been done by engineers? The theodolite and the level, the pick and the shovel, the blast-furnace and the rolling-mill, have conquered space and transformed the earth. The capital cities of the world have been brought nearer to each other than were county towns a half-century ago, and we can now realise the prophetic saying of Columbus, that 'the earth is little.' Electricity has conquered time, and the men who hold her currents in their hands have taught them the languages of man. Yes, engineering is a great power; its legions outnumber Cæsar's, and the works of its hands mock those of the Pharaohs.

But, while we give all honour to this new power in the material world, we must not forget that its kingdom is of the earth, and that with the sphere of beauty, of grace, of art, and of imagination, it has no part. From the geometer and the arithmetician, from the men who weigh and the men who poise, it draws its inspiration and renews its force.

Architecture, on the other hand, whose more subtle influences have been overlooked in these busy times because of the mighty triumphs of this new conqueror, can yet boast of nobler friendships and a higher lineage. Her dwelling-place is, and has ever been, with the scholars, the poets, and the painters. She has given palaces to every dynasty, and temples to every religion. On her walls the Assyrian carved his victories; within her pyramids the Egyptian entombed his monarchs; amidst her pillars the Greek loved to linger and discourse—the Roman to bathe and to wrestle; Europe learned half her Christianity from her pictured churches; and a new beauty dawned upon the world from the labours of her votaries in the cloister.

What triumphs, after all, can the science of the engineer show to compare with these, which have illumined every page of the world's history, and which still stand as the highest out-come and most enduring record of every phase of its civilisation?

While, then, we cheerfully accord to the most practical science of the present day its due merit; while we gladly watch the steam of its locomotives traversing the wide waste of North American prairie or tufted tract of Indian jungle; while we hail its steamers on every sea, and behold the world, by its energy, gradually being narrowed and its races assimilated; let us not, for that, abate a jot of our pride in the noble art—to which, indeed, the kingdoms of the earth have not been given—but which has, instead, as its heritage, all the gifts of beauty; as its field of labour, all the homes of men; as its companions, all the fair sisterhood of the arts.

MR. RUSKIN ON GREEK MYTHS.

ON Tuesday evening, March 9, Mr. Ruskin gave a lecture on this subject at London University College.

After some introductory remarks, Mr. Ruskin opened by explaining what a 'myth' is. 'A myth,' said he, 'is a story with a meaning attached to it. Thus, if I tell you that Hercules killed a water serpent in the Lake of Lerna, and no more, my story is not a myth; but if I tell you that Hercules cured many streams from a deadly miasma, the story is a myth, and means not merely that Hercules cured a miasma, but that he contended with the evils of envy and ambition, not only in others, but in his own soul.'

'It is possible that the story-teller meant nothing else but what he literally said; and it is very necessary to determine, in reading these legends, whether you are listening to what is literal fact, or to a philosopher who is telling what is really true veiled under a legend. Certain it is that to the general mass of the people the story was literally true, and in dealing with the Greek religion we must remember that this simple belief was bedded in the minds of the people. An explanatory system was as little expected by them as by us. The story of Hercules and the Hydra was a tale to almost everybody of a real giant and a real monster, as the legend of St. George is, and the average Greek was just as far from detecting any other meaning as the peasant is from perceiving that George and the dragon had relation to the story of infidelity. Hercules was no dead hero, victorious over dead monsters, but helpless now; he was the proper type and personification of heroism, and its living aid against every ravenous form of human trial and pain.

'There are two great origins and sources of myths—History and Nature. The historical myths we will leave the masters of history to follow; but the stars and hills and streams are with us yet, as they were of old, and we only have to listen to them with childlike earnestness and reverence to understand the first words spoken by them to the sons of men.

'From the rising and setting sun, and from the atmosphere, the Greek forms the idea of two personal and corporeal divinities, and, collaterally with these corporeal images, he conceives also two spiritual influences, of which one illumines like the sun, and the other, like the air, is the power of calm fortitude and righteous anger.

'The moral significance of a myth depended greatly upon who made it. You cannot make a myth unless you have something to make it of, any more than you can tell a secret unless you are acquainted with it yourself. The first question in reading a mythic story is, What wise man first perfectly told? and what strong people first perfectly lived by it? and so the real meaning of the myth is, what it had in the noblest time of the people who lived by it. We can only draw lessons from the plants and clouds and living creatures, as we ourselves take pleasure in beauty. And as the myth completed itself in the completed nation, and their every effort was stirred by the thought of companionship with immortals, we shall be able to follow them only in degree as our natures are strengthened by the same feelings. If we waste each day in sloth and folly, the rising of the sun has no meaning for us; but if for us the sun means daily restoration to the scenes of pleasant gladness and perfect life, and the purging of evil visions by the bright vision of the dew, it becomes in reality a spiritual power.

'The time then taken for one or two of the myths of the Grecian religion shall be about 500 years B.C., or the time of Æschylus. At that time we find, under the governing Lord of all, four elementary forces—the elements—the earth, the waters, the fire, and the air. Each of these is descended from more ancient deities, but at this time we find the four quite defined. They are the kings and queens of the earth, and of the air we breathe. The range of their separate dominions shall be briefly mapped out, and then the most interesting legends of the daughter of the air dwelt upon more at length.

'Earth (Demeter or Ceres) is the dust from which we are taken, and to which we must return; the god who receives and gives forth from her bosom—the avenger of blood: "thy brother's blood calleth to me from the ground."

'Poseidon (Neptune) is the dominant spirit of the water, with subordinate myriads of other spirits, and spiritually the chief of the waters is Lord also over the flow of the human mind. Ceres then was over the earth in its giving and taking, Neptune over the water in its flow and life.

'Fire, the third element, is presided over by two powers; over all earthly fire is Hephæstus (Vulcan), and over heavenly fire is Apollo, the chief of all intellectual wisdom. Lastly, we come to the myth which is to be the subject of our inquiry—the story of Athena.

'Athena was physically the Queen of the Air, and of life, the breath of man. The *heart virtue* of which she is the spirit was separated into four divisions, which have since received the names of the cardinal virtues, namely, prudence, justice, fortitude, and temperance. With respect to these, the attributes of Athena are all distinct. For her prudence she is "owl-eyed." For her justice she wore two robes—one of light, and the other of darkness. For her fortitude she wore the crested and unstooping helmet. (We may see these realised in the Hebrew imagery—"For he put on righteousness as a breast-plate, and a helmet of salvation upon his head; and he put on the garments of vengeance for clothing, and was clad with anger as a cloke.") Lastly, in her character of temperance she is the Queen of Maidenhood. But all these qualities mass themselves into the two of justice and patience; and of these the Greeks have written two mighty songs.

Mr. Ruskin then said that the stories of Athena were so many that he hoped some day to collect them together; but that to-night he would touch only upon those under the head of Eolus, the god of storm, as given us by Homer. He describes Ulysses as coming to the happy Eolian Islands, surrounded by walls of brass (emblems of towering clouds lighted by the sun). Here Ulysses was hospitably treated, and sent away with all the adverse winds securely locked up in bags; the bags were cut open by the sailors, and they were driven back to Eolus, who refuses to help again those who had incurred the anger of the gods.

'Notice the gentleness of this legend—a quality especially to be noted in Homer. In the battle for the body of Patroclus, when the Greeks are all but overpowered by Hector, how did the king, Agamemnon, address them? "Think," he says, "of Patroclus, think how gentle he was." This he addressed to the soldiers, to make them hold on. And this idea of Eolus remains to the latest time—to the very last he is a kind-hearted monarch. Another beneficent storm god, pure Boreas, occupies an important place in legend. The fable of the harpies is always connected with Boreas because the two sons of Boreas are enemies of the harpies and drive them back. Harpies are identified with those short gusts which lift the dust in whirls, or the papers on the table in a room when the window is left open. This is the physical meaning. As for the mental, harpies signify those short gusts of malicious anger wholly different from the noble anger of the greater

tempests. Harpies are related to the nobler tempests, as Charybdis is to the sea; they are gusts of frightful, lawless passion, meagre and insane, spirits of wasted energy, and bring nothing with them but evil.

'We must always be prepared to read Greek legends as we should trace threads through figures of a damask: as some thread runs through the web and makes parts of different figures, so the Greek fables bend and cross in different directions; thus the harpies who represent vain desires are closely connected with the syrens who represent constant desires. There are two groups of syrens, one noble and saving, and the other as fatal; but there are no noble harpies.

'We have hitherto spoken only of the deities of the winds; we now pass on to a more important group, which must be touched on slightly—the deities of the clouds, which are subject to the God of the Air. Chief of these is Hermes (Mercury). To Hermes is given the power of concealment and theft. The snatching of the harpies is by brute force, but the snatching away of the clouds is by deceit, and with this is associated the Egyptian thought of leading away the souls by death. We must pass by the lovely group of myths connected with Mercury dwelling in the mountains of Sparta. Temple after temple rises there of the divine marble that no tool has polluted; on these cloud-mountains of Greece, Maia, from whom our month of May has its name, gave birth to the shepherd of the clouds—wing-footed and deceiving, restless messenger between the highest sky and topmost earth—the winged Mercury.

'Semele, the mother of Bacchus; Medusa; Pegasus, the god of fountains; the Chimæra; the thunder-cloud on the volcanic mountain—all these, and many more, are subject to the dominant power of Athena. She is the air giving life to the human heart, giving power to the vegetable earth, and this is why the olive tree is precious to her. Then she is the air giving movement to the sea and rendering motion on it possible. Lastly, she is the air nourishing artificial light as opposed to the light of the sun; and with this is connected her power over household work.

'She is the breeze of the mountain and the sea. Whenever you draw a pure long breath of free heaven without any smoke in it, either from a chimney or from a cigar, you take Athena into your heart and brain. Now this breathing of fresh air is physical as well as mental. Of all people that ever lived, the Greeks knew best what pure air meant; thus the Queen of the Air became to them the real strength of battle in war.

'Then when Achilles, faint with grief, was mourning the loss of Patroclus, Jupiter pities him and sends Minerva, who restores him and pours divine ambrosia and nectar upon him, and then comes the great passage about Athena arming; and her descent is likened to the storm when Jupiter spreads the purple rainbow over heaven; but the most curious instance of the physical power of Athena is where she gives strength to Menelaus; faint with fatigue he prays to her, and she was glad he addressed himself to her, and gave him, not the strength of a lion or of an ox, but of the indefatigable fly, the creature that lives in the air. When she comes down to help Diomed against Mars, she takes his charioteer's place. Mars first casts her spear, and in Pope it is said that the goddess opposed her hand and caused it to glance aside, but the Greek expression is, caught it and threw it aside as the wind would.

'You might think it out of harmony were I to trace the way in which Minerva's power over the olive was connected with the anointing oil, still more if I endeavoured to show the analogy between the spiritual power of Athena and another Spirit, which we are forbidden at our worst peril to quench or to grieve; but I should not close without enquiring how far these legends—vain to us—were vain to those who had no better trust. There might be much in what I have been bringing before you doubtful, or even wrong; but of this fact we can all speak positively who watch the tone of the Greek thoughts, that the effect of these legends on the life of the Greek was not vain at all. The creed was different of course in different people. The peasant's was simple. Pisistratus attained the throne by appearing with a beautiful woman, whom he gave out to be Athena; and only in the last century a beautiful English lady was surrounded by poor people in one of the Grecian isles, who thought she was Athena.

'The creed of the upper classes was a little more refined and spiritual, but quite as honest. The more worldly would pray with the public faith for their own purposes, but the good and unworldly lived by their faith as sincerely as St. Louis or the Cid.

'The faith of the poets and artists was necessarily more varied, tinged with their own thoughts, like Dante's faith, or Milton's; and they strove with all their might to be as near the truth as they could.

'The creed of the philosophers varied according to the knowledge of each, and their mystic tendencies; but with all its faults, we nevertheless owe to it some of the soundest ethics and some of the wisest laws. Such was the power of the heathen creed in its strength; and remember, in endeavouring to judge it, that what the heathen did they did from a sense of duty, looking for no reward but death. The present forms of our own religion consist of sacrificing less things for greater—time for eternity, giving up houses and lands that we may receive an hundred-fold; but the poor Greeks expected no reward from heaven but justice, and no reward from earth but rest; though when they fulfilled their duties they had sometimes a prophet to tell even *them* of a land where there is a light by day and a light by night, without sorrow, and where they would need no more to trouble the earth for their daily bread.'

ACCIDENT, GREAT EASTERN RAILWAY.

THE inquest before Mr. Humphreys on the four men killed at the Coal T Depot at Waterloo Town, Bethnal Green, was, after two adjournments, concluded on Friday, March 12.

Mr. James Edmeston of Crown Court, architect, who had been professionally employed to inspect the scene of the accident, stated in his evidence that the construction which fell, consisted of an arrangement of cross girders, 5 feet apart, and 30 feet 6 inches long, carrying arches of brick in two half-brick rims, most of which girders were carried by three longitudinal girders,

one at each side, and one in the centre, the length of two of them being 55 feet, the other about 36 feet.

The platform thus formed measured 61 feet transversely, by 55 feet longitudinally.

The centre girder had twice as much work to do as either of the other two longitudinal girders, and it was evident, from the way in which the structure had fallen, that the failure had occurred in connection with the centre girder.

This girder had been supported in the middle of its length by a hollow cast-iron column, 14 feet high, 1 foot 4½ inches diameter above the base, and with a base of 1 foot 8 inches diameter. This column was set upon a Bramley Hall block of stone, 4 feet x 4 feet x 1 foot 8 inches thick, which stone was again bedded on a pier of solid brickwork, standing on a bed of concrete.

The dead weight thrown upon the centre girder and its supporting column was estimated by Mr. Edmeston at 2½ cwt. per superficial foot; in all 200 tons, equally distributed, or considerably more than the girder would bear without the support of the column. But as the column divided the space spanned by the girder into two parts, each 27 feet 6 inches long, the weight distributed upon each half of the girder thus divided would be 100 tons, a load which it would be able to carry.

The column was of metal, 1½ inch thick; and was equal to the work it had to do. Although displaced and forced through the stone base, some portion of which was found wedged up the centre of the column, and through one side of pier of brickwork, and embedded at least seven feet in the ground, it was found nearly uninjured when dug out.

The pier, of brickwork, was built in mortar, and was wholly below the level of the ground; and although the mortar had not set, Mr. Edmeston did not see reason to think that any defect in the pier occasioned the disaster; and therefore, as neither the column nor the girder was in fault, the investigation narrowed itself to the state of the stone base upon which the column was placed, and there is ample proof that this stone was in a very defective state. It was found to be broken and split into a number of pieces. Some of these injuries occurred, no doubt, at the time of the accident, but it is certain there were two rents in the stone, crossing each other, and dividing it into four unequal parts, which had occurred before the fall; for they had been grouted up with Portland cement, and a portion of the underpart, or bed of the stone, was found to be hollow, and had been filled with Portland cement to a thickness varying from ½ in. to 1¼ in.

The stone itself had been set in mortar, which still adhered to it all round the sides of the bed, and in these places there was mortar only on the stone, and no cement.

It appeared, from these premises, clear that the stone, instead of being in one solid piece, spreading the weight over the brick pier beneath it, had become split into four unequal pieces, the fractions of which were not even or perpendicular. The utmost width of the base of the column was 1 ft. 8 in. by 1 ft. 8 in., and it is very probable that the separate pieces into which the base stone was divided were pressed upon unequally, until at last, by the accumulation of the pressure, by vibration, or in some other way, they no longer remained tolerably compact beneath the base, held together by the pressure; but one or more of them was suddenly displaced, and the column, with a weight of 200 tons upon it, in an instant fell to the level of the brick pier, and with great force, was crushed through one side of it into the earth in the manner before mentioned. The long centre girder, having lost the support of the column, was quite unequal to the weight thrown upon it, and simultaneously fell to the ground, letting down all the rest of the structure which depended upon it.

As to quality: the stone was, in its interior, found to be coarse-grained, and with much more than the usual proportion of sandy ferruginous veins. These veins were not all of them parallel with the bed, and it is possible that the stone yielded sooner than it would have done in consequence of these internal defects. Two other blocks of the same stone, split open in the presence of the witness, by his desire, contrasted very favourably with the stone in question, being of much more homogeneous character, and the particles evenly united, and with very few traces indeed of the friable veins above named.

Other evidence, the effect of which was corroborative of the professional opinion we have reported, was given by Thomas Brown, a carpenter's labourer, who said: 'I was at work near the column that fell on Friday, February 26. I was going to shore it up, and just as we got the length of the first prop up, the column came down. We had noticed that the stone upon which the column rested was cracked. About a week before this happened, the stone was cracked down the side.' When witness first saw it there was only one crack, but on Friday morning, the day of the accident, he noticed there were two. They were both down one side, and that was the side nearest to the street. All the unfortunate men were acquainted with the crack. When the second crack was detected on Friday morning, every diligence was used to get the struts up, but before they could be fixed the whole fabric fell.

Thomas Aked, mason, had bedded the stone. It was 4 feet square, 1 foot 9 inches thick, and was Bramley Hall stone, which was considered good stone. The brickwork was flush—even, level. The column was let into the base of the stone. It was usual to run in cement when a stone was bedded, to fill up crevices. On this occasion it was delayed for the convenience of the men fixing the columns. The first cement was not run in because there was any crack; there was no crack then. His attention was afterwards called to the fact that there was a crack in the stone by the inspector of the railway company—Finchman. That was on February 2. Had examined the stone, and that was the first time he knew there was a crack in it. The crack was on the four sides—on each side; it was the widest at the base on each side; the widest part was as much as half an inch. Brickwork was raised up to the top of the stone, and the whole 'grouted' in with cement.

Several other men engaged on the work were examined as witnesses, but failed to add any material fact to the statements already given, and the jury returned a verdict in accordance with the evidence.

REVIEWS.

THE RAILWAYS OF INDIA. E. & F. Spon, 48 Charing Cross. London: 1868.

Under the above title a work has recently been published by Captain Edward Davidson, R.E., who lately held the office in Calcutta of Deputy Consulting Engineer for Railways to the Government of Bengal.

Before entering into an account of the various lines of railway at present in existence, Captain Davidson hastily reviews the position of the Empire before their introduction into India, and the native characteristics of the people. Amongst the greatest achievements consequent upon an increase in the facilities of intercommunication brought about by the steam engine have been an overturning of prejudices, an uprooting of habits, and a changing of customs previously as tenaciously held and dearly loved almost as life itself; whilst at the same time it has greatly strengthened the hands of Government, brought different races more into communication with each other, and given a wonderful impetus to commerce throughout the whole Empire. We will not follow the author in his account of the physical peculiarities of Hindostan, interesting though they be; after which he enters into an examination of the several lines along which railways should first have been taken, and the reasons which led to the adoption of those already sanctioned or completed.

The idea of constructing railways in India was first discussed about the year 1841-42, but there appears to be some uncertainty as to the projector to whom that country is indebted for the first conception of her railway system. The name of Sir Macdonald Stephenson is generally associated with the earliest history of Indian railways, and he asserted before the Committee of the House of Commons that the project of a railway in India first occurred to him in 1841: any how it is tolerably certain that the credit of being first concerned in a tangible and practicable line of railway for India belongs to that gentleman.

On account of the many difficulties peculiar to India, it was thought advisable, before commencing upon any particular line, to depute an engineer, acquainted with the working of railroads in England, to examine the subject of the practicability of their construction in India, and of their suitability to an Indian climate and requirements. Mr. Simms, C.E., the engineer selected for this duty, reached India in September 1846, and submitted his report on the subject in February 1846.

There appears to have been but little difference of opinion regarding the agency by which railways in India should be constructed, yet the Board of Control, whilst agreeing with the general principles proposed by the Court of Directors of the East India Company, objected to many of the details of the proposed measure, under which the work was to be entrusted to the agency of a company, and they positively objected to the very idea of a guarantee being given, concurring with the Government of India in thinking that, land being granted, it ought to be unnecessary. This, however, was subsequently overcome, and a 5 per cent. guarantee was sanctioned on the necessary capital for an experimental line in Bengal, on July 15, 1847. In September following the Board of Control agreed to the construction of an experimental line in the Western Presidency, from Bombay to Callian, 35 miles in length. Considerable delays still occurred in the completion of final and detailed arrangements for carrying out these two experimental railways, and it was not until August 17, 1849 that legal agreements were signed by the East India, and Great India Peninsula Railway, Companies.

Although Lord Dalhousie did not take his seat as Governor General until January 12, 1848, he undoubtedly did more for the promotion of railways in India than any other person, and his celebrated Minute of April 20, 1853, is justly considered the foundation of the Indian Railway system.

The contract for the first experimental line, from Calcutta to the coal fields at Raneeungee, a distance of 121 miles, was signed in August, 1849, and the first section of land was made over to the East India Railway Company in January, 1851. The greatest possible error in judgment was however committed at the outset in fixing the terminus at Howrah, instead of taking the line across the river at some convenient spot and bringing it directly into Calcutta. The gauge of railways for India was fixed at 5 feet 6 inches; and with the exception of what are termed light railways, all the arterial lines are made with the same gauge. All lines in India are at first constructed with only a single line of railway, but the earthwork and bridges are made sufficiently wide to admit of a second line being laid down so soon as the exigencies of the service shall demand it.

Space will not admit of our following out the early histories of the several railway companies in India; suffice it here to state that with only two exceptions they have all been started under the same system of guarantee. The Indian Branch Railway Company, better known now as the Oude and Rohilcund Railway Company, and the Indian Tramway Company, whose field of operations lies in the Madras Presidency, were started with the view of carrying out their works without a guarantee; but after constructing their first short lengths of railway they were unable to raise capital for the further prosecution of their undertakings, and they have since been admitted to share the privileges of the other companies. With regard to the financial prospects of the several lines, it appears that the East Indian, the Great Indian Peninsula, and the Eastern Bengal Railways are by far the most profitable concerns, and all promise to more than repay the five per cent. interest guaranteed upon their capital. Next comes the Eastern Bengal Railway, which, though a diminutive undertaking when compared with its gigantic contemporaries above-named, has from the first proved itself to be a line likely to become highly remunerative. After these, but at a long interval, follow the Madras, the Scinde, Punjab, and the Bombay and Barodah Railways; all of which are distinguished by the promising feature of a continually increasing business, though their earnings have, up to the present, fallen far short of a sum that would yield five per cent. on the capital expended in their construction. The only line which must be pronounced a failure is that called the Calcutta and South-Eastern, running from Calcutta to the river Mutlah, a distance of only 29 miles, which has hitherto been always worked at a heavy loss.

The following table will give some further interesting particulars concerning the different railways which can more easily be put in a tabular form than otherwise. The total length of railways at present sanctioned in India is 5,609 miles:—

Railway.	Total length as at present sanctioned.	Average cost per mile when finished, with a certain extent of double line.	Amount of gross receipts per mile per week required to produce 5 per cent., 50 per cent. being calculated for working and maintenance.	Average weekly receipts during 1865-68.
East Indian:—	Miles.	£	£ s.	£ s.
Main line	1,276½	22,000	42 6	39 0
Jubbulpore line	325			
Great India Peninsula	1,366½	14,510*	27 18	55 5
Madras:—				
South-West line, including Bangalore Branch	492	12,000	28 0	14 0
North-West line	332			
Bombay, Barodah, and Central India	812½	24,000	46 8	13 8
Scinde	109	20,000	38 9	19 8
Punjab	246	10,000	19 5	8 6
Delhi	320			
Eastern Bengal	159	17,000	32 18	28 7
Great Southern of India	168	10,000	19 5	8 10
Calcutta and South-Eastern	29	21,000	40 7	9 0
Indian Branch	672			

* It is certain, Captain Davidson states in a foot note, that this rate will be much exceeded, and that a cost of 20,000l. per mile will probably be nearer the truth.

The effects produced upon India by her railways are thus summed up by the author of the work under notice:—'British rule has been strengthened, the members of the vast but rather disjointed fabric have been knit together with a network of iron sinew, and consolidated. The Empire is now in a far better position than it has hitherto ever been to resist invasion from without, or insurrection from within. If war be the fate of British India, she has now a power of concentration, and an unity of vigour and energy, which will give her a force unknown before. If peace be her lot, she bids fair soon to take that place in the commonwealth of nations to which her magnitude and her fertility entitle her.' In the meanwhile, an extension of the present system of railways is under consideration, the Government of India having recently been requested by the Secretary of State for India to advise him on the subject, with a desire that attention may be directed to two classes of railways: first, those required mainly for political or military considerations, the advancement of a backward district, or the welfare of a neglected race, though not ignoring commercial opportunities or requirements; and, second, those principally needed to further the interests of trade.

THE GREAT PYRAMID.

To the Editor of 'THE ARCHITECT.'

SIR,—In the article on Egyptology in your issue of February 6, your contributor has the following passage:—

'It is a matter of humiliation to those who have some better acquaintance with what is known, and with what has yet to be known, of Egypt, to witness two of the recent English lucubrations on the subject.' In one, 'a man of science, starting with an hypothesis as useless as it is incapable of verification, has come to the conclusion that a rude sarcophagus, the contents of which can only be admeasured approximately, and that by a most complicated process, was a standard measure of capacity. The learned Professor has given us a measure of his judgment in the fact that, while measuring with the utmost accuracy the widths of courses of masonry in which no one but himself takes any great interest, he was content to determine a matter of real geodesic importance, the length of the base of the Great Pyramid, by the reliable aid of—A TAPE.'

Will you permit me, Sir, to express regret that such a sample of the flippant criticism which is the vice of modern journalism should have received your imprimatur? It would be difficult to compress into an equal number of words a wider comprehension of three distinct breaches of critical truthfulness—to wit,

1. A misapprehension of facts which are sufficiently plain.
2. A palpable self-contradiction.
3. A gross libel on the scientific character of a man known to be a patient, accurate, and intelligent investigator.

It is clear that the writer of the article does not comprehend the bearing of the questions at issue with reference to the Great Pyramid; that he is ignorant of the deep interest with which many men devoted to practical science are now studying those questions; and that it is impossible that he can have read Professor Piazzi Smyth's 'Life and Work at the Great Pyramid' with the ordinary attention due to such a work from any intelligent man—how much more from one professing to be an Egyptologist of the first water!

As for the facts which are sufficiently plain,—The theory propounded, so far from being 'useless,' is of supreme value in two directions. Because, if it be established, we have—1st. A perfect check and correction of modern calculations (confessedly only approximative) of the chief elements of Kosmic measures; and, 2nd. A complete demolition, by substantive facts, of the fundamental position of the advanced scepticism of the present day. If the theory of the pyramid be true, the doctrine of 'progressive development' of the human race, as at present defined, must be false.

To assert that the theory is 'incapable of verification' is to beg the whole question, because that is the very issue in contention. All the presumptions, so far, are affirmative of the theory. Only one important link is needed to complete the proof—viz., the true measures of the base of the pyramid.

The application of the phrase 'rude sarcophagus' to the coffer of the King's Chamber indicates complete ignorance of patent facts, and recalls the vagaries on this subject of a certain Northern obstetrician and dabbler in archaeology. The term 'sarcophagus' itself, precedent and authority notwithstanding, is utterly out of place in Egyptology. The expletive 'rude' is equally inapplicable to a coffer which is wrought in the hardest known stone; of whose original surface sufficient remains to show that it was perfectly finished and reduced to exquisite polish, and whose palpable mathematical properties are most remarkable. It is sufficient to indicate two of these—the most salient. 1st. The cube content of the mass composing the coffer is exactly equal to the cube hollow space it contains. 2nd. It is proven by the investigations of St. John V. Day that, referring to the well-ascertained dimensions of the coffer—

$$\frac{\text{max. length} + \text{max. breadth}}{\text{max. height}} = \pi \text{ (within } 0.0011 \text{)}$$

and that only by the (presumed) irregularity in the dimensions of the coffer was it possible to fulfil two diverse conditions—viz., 1st. That the coffer should give π (which is indisputably the basic element of the pyramid) by correlation of the dimensions corresponding to those which contain it in the pyramid; and, 2nd. That, coincident with this, it should contain that precise standard of capacity which is indicated by the theory of the pyramid. This of course means, to those who have had patience and honesty to study the whole matter, that the more closely the coffer is examined, the more thoroughly does the coincidence of its elements with the fundamental elements of the Great Pyramid itself (and that pyramid only) become established.

It is not true to affirm that the contents of the coffer 'can only be ad-measured approximately.' A reference to the details of admeasurement given in 'Life and Work' distinctly shows that the limits of error are practically nil.

It is not true to affirm that the admeasurement can only be made 'by a most complicated process.' A reference to the same invaluable book distinctly shows that sufficient of the original surface remains to permit of measurement by the ordinary means that any practical man would adopt to determine the size of any object infinitely more complicated. Has your contributor ever perchance 'taken out quantities' of irregular castings?

Next, as to the self-contradiction. After accusing the Astronomer Royal in Scotland of 'starting with an hypothesis as useless as it is incapable of verification,' your contributor affirms that 'the length of the base of the Great Pyramid is a matter of real geodesic importance.' Has this gentleman, who is so much 'better acquainted' (than whom?) 'with what is known, and with what has yet to be known, of Egypt,' yet to learn that the main purpose of all that Piazzi Smyth has written (volume after volume), of all the thorough, patient work through which he has waded, of the months of difficulty and hardship he endured in the tombs at Gizeh (which would doubtless have knocked up a carpet-knight in a week), was precisely to wake the scientific world to the fact that the 'length of base of the pyramid is a matter of real geodesic importance'?

And yet Piazzi Smyth was content!—to determine this supreme matter by the aid of—A TAPE! This is so cruelly, so unpardonably untrue, in the face of paragraph on paragraph, chapter on chapter, of the 1st vol. of 'Life and Work,' that it is amazing how a sincere Egyptologist could be guilty of so unjust an accusation. The only apology which is tolerable is that for which I have given your contributor credit, viz., that he has not read the book referred to, except as people pretend to read books now-a-days. It is the fact that Professor Smyth never attempted to determine the pyramid-base at all, either by a tape or any other absurd method. It is the fact that page after page of his book is filled with lamentations that any such attempt, in view of the enormous mass of rubbish to be removed from the base, was physically and financially impossible for him! But it did so happen that on the eve of his departure from the pyramid, when his 'traps were packed,' that he was present at some such attempt by a person in no way connected with him.

These simple facts I knew from 'Life and Work'; but to make assurance doubly sure, I wrote to the worthy Professor (after reading the article referred to), and put him to question categorically. He replies, 'Modifying your first question thus—"Did you, yourself (apart from Inglis), attempt a measurement of the length of a side of the pyramid's base, from socket to socket (these being the only recognisable accurate terminations of such a base line)?"—my answer to this is, briefly, No!'

I would fain ask you to give the whole of the Professor's letter, which was written without any knowledge of the article in your Journal, and which shows how wide of the truth the writer of that article was in making an attack so gratuitous; but have already too far trespassed on your space, London, March 9, 1869.

NOTE.—The expression 'flippant criticism' is more applicable to the above letter than to the article to which it refers. The writer only confirms the remark that Professor Smyth did spend months on the site of the Great Pyramid making numerous minor measurements, and yet that the measurement of the size of the pyramid to which he gave 'the place of honour' was made by a tape. With the reasons for this we have little concern; the proceeding is an inversion of any true scientific method.

As to 'self-contradiction,' we recommend our correspondent to read Professor Smyth's earlier work, published under the extraordinary title of 'Our Inheritance in the Great Pyramid.' In that book certain statements are made on certain assumptions, which the visit to the spot, detailed in the more bulky volumes, proved to be erroneous. But the hypotheses are adhered to notwithstanding. In the first book a certain archaic sarcophagus was assumed to be something else, because it had no ledge for a lid. The ledge, however, is found to exist, but the 'coffer' is a coffer all the same.

The specific gravity of the earth, which is made to perform a function entirely incredible to any ordinary mind, is differently stated in the two works, the only ascertainable reason being that the estimate given in the first will not work in with the fresh calculations given in the second.

A line or two of quotation is sufficient to explain the merciful silence of the critical press on what Professor Smyth euphuistically calls a theory:—

'If we reduce that cube quantity of 125,000 inches to a sphere of the diameter of 50 inches, we get 5 places of numbers, but they are figures too small to represent the coffer. And if, on the other hand, we multiply 125,000 by 5.672 as the best modern determination of the density of the earth, we get the right sizes of figures, but one place of numbers too much. Take, therefore, the 5 places of numbers as due to the spherical shape of the earth, but put therein the actual figures so far as given by the cube of the linear standard of the pyramid when multiplied by the earth's mean density.' So far 'Our Inheritance'; but 'Life and Work' says:—'A tenth part of such space = 12,500 cubic inches, agreeably with the Coptic interpretation of the term Pyramid—is thus to be filled with matter of the mean density or specific gravity of the earth as a whole,' which is now taken at 5.7 instead of 5.672.

Laughter is not what such lucubrations should excite, but a sense of profound sadness. But to assume the occurrence of a Divine Revelation from the results of vagaries such as these, is a proceeding which the religious man of science, and the intelligent man of piety, will alike and most unhesitatingly condemn.

ARCHITECTURAL EDUCATION.

SIR,—I quite agree with your correspondent 'X. Y. Z.' in his belief that the present English system of pupilage is the best means by which the architectural student can obtain a proper knowledge of his profession. But I think, nevertheless, it is very desirable that before a pupil enters the office, he should go through, as has been proposed, a preliminary course (for a year, I suppose, would be sufficient) of freehand drawing, perspective, and the elements of geometrical drawing. By this means he would enter upon his five years' term of articles with his eyes in some degree opened, and would certainly take more interest in, and understand better, his work than if he had commenced without any previous preparation. Your correspondent 'X. Y. Z.' has very aptly touched upon some of the useful and practical information which a pupil can only acquire in his principal's office. I would add that he also may derive advantage from seeing his master's clients when he is absent: the pupil thus has a little responsibility put upon his shoulders in answering questions (that is to say, if he can, by which means he often discovers points in which he is deficient), explaining drawings and observing the various criticisms. There are numerous facilities at the present time for the architectural student to supplement his office-work by attending the various professional lectures, and by joining the educational classes of the Architectural Association.

It appears to me to be a capital plan to take notes while reading architectural works or specifications, and invariably to jot down any technical terms not understood, and then, as soon as possible, to thoroughly find out their meaning. By this course the student is led to read more attentively than he would otherwise do, and moreover is accumulating a useful nucleus for future reference. It is also well to note down day by day any information obtained about materials, construction,* or any practical points, and afterwards to classify and index them, as memory, especially with regard to figures, often proves treacherous. In conclusion, I would strongly recommend students to read Mr. T. Roger Smith's paper (read some six years or so since, before the Architectural Association) on this subject of education. It was afterwards published, I believe, in the *Builder*.

March 16, 1869.

Your obedient servant,
'A STUDENT.'

ST. PAUL'S CATHEDRAL.

Can you, Sir, or any of your correspondents inform me when the new railings are to be put up round St. Paul's, which were promised, I believe, some eighteen months ago?

Lyndale, South Peage Park, S.E.

Yours, &c.,
A. S.

NEW BUILDINGS AND RESTORATIONS.

Proposed New Town Hall for Warrington.—We hear that Mr. Walker, who has given a donation of 1,000*l.* to the Corporation to be devoted to any public purpose they may deem expedient, has a strong desire that it should lead to the erection of a Town Hall worthy the position of Warrington as an ancient, loyal, and thriving borough. It has been suggested in several quarters that as Colonel Wilson-Patten is erecting a new mansion at Winmarleigh, and is generally supposed to be thoroughly tired of inhaling Warrington smoke—although as strongly as ever attached to Warrington people—Bank Hall might be purchased upon reasonable terms. In that case it could be readily converted into a Town Hall, and its gardens into a public park. We give publicity to the suggestion at this opportune moment, seeing that it is not too late to stop the contemplated expenditure in connection with the enlargement of the present shabby building which has so long been mis-named a Town Hall. There is probably sufficient room at Bank Hall for all Corporate purposes and for the free museum and library as well, so that the people of Warrington may have grouped together those institutions which are supported by the rates, and in which all are more or less interested. The building has long been regarded as a great public want.—*Warrington Guardian*.

* In illustration I would mention that it is very common for men who have been years in an office to ask such questions as, 'What should be the angle of inclination of a church roof?' 'What height should a lectern be?' 'What are the proper dimensions of an altar?'

Some time back it was thought that the Prince Consort Memorial in Hyde Park would be finished and solemnly inaugurated by Her Majesty on May 1 next, but this is now found to be impossible. The cost of this great national record has not been restricted to any particular amount; the Government voted a sum of 180,000*l.*, but this is quite inadequate to cover the entire expense, and the deficit, as was the case with the cost of the Mausoleum at Frogmore, will be met from out of the private purse of the Queen.

Arrangements are now in progress for building a south aisle to St. Peter's Church, Monkwearmouth, which will include a further portion of the ground formerly covered by the Benedictine monastery which existed previous to the Reformation.

Mr. William M'Arthur, M.P. for Lambeth, on Friday, March 12, in the presence of a large assemblage of persons, laid the memorial stone of a new and commodious Wesleyan day school, at Tonbridge. The building is to be erected in the Early Gothic style of architecture, from the designs of Mr. Baker, of London, and the contractor is Mr. T. Dove. The cost of the building will exceed 1,000*l.*, which has nearly all been subscribed in the neighbourhood, and it is intended to accommodate between 200 and 300 children. Attached to it are two large class-rooms.

The New Public Hall, Exeter.—Twenty designs were sent in for the erection of the new edifice in Queen Street: the first premium was awarded to that of Mr. C. J. Phipps, F.S.A., and the work has been entrusted to him. The second premium, 15*l.*, was won by Mr. Harbottle, architect, Topsham. The hall will be 69 feet wide by 131 feet long, internally, and will be covered by a large circular roof of one span. At one end there will be a gallery capable of accommodating 300 persons, and at the other an orchestra, with semi-circular back, and retiring rooms at the sides and beneath, rendering it suitable for amateur performances and concerts. The style of the Queen Street front will be Venetian Gothic, and the building will seat altogether about 2,000 persons.

New Schools, East Rainton.—New schools at East Rainton, in the county of Durham, have just been opened. They comprise school and class-room, porches and out-offices. The buildings are of stone, in the style of the thirteenth century. The architect is Mr. C. Hodgson Fowler, of Durham.

Restoration of Barnard Castle Church.—The ancient church of Barnard Castle was, till lately, one of the most dilapidated in the county of Durham, but the work of restoration has just been commenced under the direction of Mr. F. R. N. Haswell, architect, of North Shields. The church is extremely interesting, and much of it is of very early thirteenth century work. We shall recur to the subject when the work is more advanced.

The sums received by the 'Kölnen Dom-bau Verein,' or Society for the Completion of the Cathedral at Cologne, amounted during the year 1868 to 186,000 Prussian dollars, or 27,900*l.*

St. Swithin's Church, Cannon Street, was re-opened on Sunday. The church has been entirely re-modelled; seven Gothic windows have been put in, and the inside has undergone an entire restoration, the large pews being removed, and open seats being put in their stead. The large stained glass window on the south side is very fine.

The foundation-stone of a new Wesleyan Chapel has been laid at Yeovil, by Sir Francis Lyett. The style is to be Gothic, and the total cost of the edifice, including site, will be 3,000*l.*

College of St. Stanislaus, Tullabeg, King's County, Ireland.—The church is to be enlarged, and an Italian campanile added at the south-west angle. There are in course of erection a spacious refectory 69 feet 6 inches by 30 feet, with minor offices; students' chapel, 83 feet 6 inches by 31 feet, and 26 feet high; lavatories; and grand stairs uniting the new building to the eastern wing. The building will be constructed of limestone from the quarries on the property, having the quoins and all ornamental features executed in the same materials. When complete the entire block will exhibit a southern façade of 193 feet, and eastern flank of 220 feet, three storeys in height, of simple and effective character. Mr. Charles Geoghegan is the architect.

All Saints Church, Hastings.—The Church of All Saints, Hastings, is to be restored, and a sum of money has been already raised towards meeting the expense. This church, which, from its picturesque outline and position, is well known to all visitors to Hastings, has suffered cruelly from neglect and alterations. The work is entrusted to Mr. Butterfield; and while we congratulate the committee on their choice of so competent an architect, we cannot forbear expressing our earnest hope that coloured decorations, such as destroy the effect of Mr. Butterfield's otherwise excellent restoration of the Church of St. Cross at Winchester, are not to be introduced at Hastings. Let the restoration be thorough, but not more than a restoration.

THE METROPOLITAN ASYLUMS DISTRICT.

THE Returns asked for by Mr. Torrens, M.P., with respect to the asylums which are to be built, have just been issued, under the authority of the Metropolitan Poor Act, 1867. It will be remembered that the Act named gives great power to the Poor Law Board, and enables the authorities at Gwydir House to compel the action of the guardians of the poor in the Metropolitan district in various ways. The work done hitherto under the Act has been the appointment of a Metropolitan Asylums Board, the preparation of plans and estimates for the building of several asylums, and the formation of unions and parishes into what are called 'asylum districts.' The returns asked for by Mr. Torrens relate to the asylums which are in course of building under the 5th, 6th, and 7th sections of the Metropolitan Poor Act, 1867, and of those which it has been directed should be built, with the estimated cost of site and

structure in each case; of the unions, districts, or parishes having dispensaries, and of those which have complied with the provisions for establishing dispensaries and appointing dispensers for the relief of the outdoor sick poor, and the estimated cost of the same in each case. On May 15, 1867, the Poor Law Board issued an order forming the 'Metropolitan Asylums District,' which was to consist of the several unions and parishes in the metropolis, and within which asylums were to be built for insane paupers, and for paupers suffering from fever and from small-pox. It was arranged that two asylums for insane paupers should be built, one a Leavesden and the other at Caterham, each asylum to be fitted for the reception of 1,500 patients. These two asylums are now being built. The estimated cost of the site of one was 7,600*l.*, and of the other 6,000*l.*; whilst the estimated cost of structure of the two asylums, exclusive of 36,000*l.* for furnishing, bedding, and clothing, was 221,000*l.* For the projected asylums for cases of fever and small-pox sites were obtained at Stockwell, at Homerton, and at Hampstead, at an estimated cost of 44,000*l.* The Stockwell and Homerton Asylums were to be fitted for the reception of 344 fever patients and 204 small-pox patients. The original estimate for the asylum at Stockwell was 58,000*l.*, but material alterations in the plans have since been agreed upon by the Poor Law Board and the managers of the Metropolitan Asylums District, and the estimate will have to be reduced. It is also under consideration to make important alterations in the plan for the asylum at Homerton; and very probably the cost, the original estimate for which was 44,000*l.*, will be subjected to reduction. The managers of the Metropolitan Asylums District, at the suggestion of the Poor Law Board, have determined to defer the erection of an asylum at Hampstead until it is ascertained how far the accommodation which will be afforded at Stockwell and Homerton will meet the requirements of the district.

Besides the asylums for the whole district, and in which only the insane and fever and small-pox patients will be treated, other asylums have been directed to be built for the reception of the 'acute sick.' The Metropolitan Poor Act of 1867 gave the Poor Law Board power to join unions and parishes into a district or districts, in order to classify the indoor paupers in the unions and parishes so united. Under the authority so given, six districts have already been formed as follows:—1. Newington district, comprising St. Saviour's, St. Mary, Newington, and St. George the Martyr, Southwark. 2. Kensington district, containing St. Mary Abbott's, Kensington, St. Margaret and St. John, Westminster. 3. Rotherhithe district, comprising St. Olave's, St. Mary, Rotherhithe, and St. Mary Magdalen, Bermondsey. 4. Poplar and Stepney, containing the unions so named. 5. Central Union, comprising the Strand, Westminster, and St. Giles-in-the-Fields and St. George, Bloomsbury; and 6. Finsbury district, in which are comprised Holborn, St. James, Clerkenwell, and St. Luke, Middlesex. So far as the two districts named last are concerned, no asylums have as yet been directed to be built. The managers of the Central London district have submitted to the Poor Law Board a proposal to take the Cleveland Street Workhouse of the Strand Union, and to adapt it as a hospital for chronic sick and bedridden cases. They have not yet obtained a site for an asylum for the acute sick. Asylums have been ordered to be built in the Newington, Kensington, Rotherhithe, and Poplar and Stepney districts, and sites have been obtained at an estimated cost, for the four asylums, of 35,570*l.* No plans have yet been submitted to the Poor Law Board for the Newington asylum; the estimate for the plans sent in for Kensington was 47,800*l.*, but that estimate has not yet been sanctioned by the Poor Law Board. For the Rotherhithe asylum the original estimate was 30,000*l.*, exclusive of fence and engineering works, but material alterations in the plans are under consideration. Material alterations in the plans for the Poplar and Stepney asylum are also under consideration.

The second return asked for by Mr. Torrens shows that the salaries paid to all persons employed under 'The Metropolitan Poor Act, 1867,' amount, so far, to 1,320*l.*, exclusive of 700*l.*, the salary of a Receiver of the Metropolitan Common Poor Fund appointed under the Act. This motion relates only to those officers who have been appointed by managers of districts under Mr. Gathorne Hardy's Act. The third return shows that twelve of the metropolitan unions and parishes have dispensaries, but that the provisions of the Act with regard to dispensaries and dispensary committees have not yet been acted upon in any union or parish. The guardians of St. Margaret and St. John, Westminster, St. Pancras, and Poplar have established dispensaries since the passing of the Metropolitan Poor Act, but have not yet placed them under a dispensary committee.

ITEMS OF NEWS

FROM OUR

SPECIAL CORRESPONDENTS AND OTHERS.

The Opera arrangements for the forthcoming season have been the subject of a good deal of negotiation, but it appears now definitely settled that the troupes of the two rival houses will be combined, and will occupy Covent Garden under the leadership of Signor Arditi, the management being shared, we believe, between Mr. Gye and Mr. Mapleson. The season is announced to commence on Tuesday, March 30, and as the leading stars from both companies are engaged, the programme is one of the most attractive that has been seen for many years. One familiar name we miss. The Italian Opera without M. Costa appears like the play of Hamlet with the part of Hamlet left out: to no one does the London musical public owe such a debt of gratitude as to him, and his retirement will be extensively regretted.

The Designs for the proposed New Schools at Ashford, Middlesex, for the Kensington School district, have been exhibited for some weeks past in the Council Chamber of the Royal Horticultural Society, South Kensington. The designs of Mr. Saxon Snell, the architect of the new buildings now being erected at St. Marylebone Workhouse, have been selected. The estimated cost of the new schools is 27,250*l.*, and accommodation is provided for 850 children.

The New Opera House of Paris.

Amongst the subjects of debate coming forward in the Corps Legislatif and which are expected to give rise to lively comments, is the cost of the new Opera House, the estimates for which amounted to sixteen millions of francs; the report now current is that nearly twice that sum has already been expended, and that the work cannot be completed under forty or fifty millions, say about two millions sterling! We cannot credit such an astounding report, and wait for the official statements which the debate must bring out.

Curious Archæological Discovery at Bayeux.

A few days since some fragments of ancient sculpture were dug up close to the Cathedral of Bayeux; and, on inspection, they were supposed to have formed part of a Roman triumphal arch or grand doorway of the third century. Amongst the pieces was the capital of a column, much damaged, on which was a figure which the *savans* took for one of the genii of the Roman Pantheon. Further examination has led to a different and more interesting conclusion—namely, that the little figure represents the god *Mên*, an Asiatic divinity of Phœnician origin, adored in very remote times in Phrygia and throughout Asia Minor. The principal evidence in support of this opinion seems to be the presence of a double crescent, which was the attribute of that divinity; but it is not the only one: in the left hand of the god, in the Assyrian fashion, a pine-cone, the symbol of Esculapius, the virtues of which were considered in the East to be infallible against sorcery and disease. If these guesses be true—and they can scarcely be regarded as more than guesses—we have a new proof of the diffusion of Eastern religious ideas in Europe previous to the definite triumph of Christianity. If the figure be that of *Mên*, this is the first evidence that has appeared of his having been worshipped in ancient Gaul, or of his adoption amongst Roman divinities.

Berlin Cathedral.

The jury appointed to decide as to the various merits of the 52 designs submitted in compliance with the invitation of the Prussian Government began their labours on the 8th instant. The jury was to have been an 'international' one, as also the competition, but only two architects not German were named, of whom one declined to act, and now we hear that the other, M. Duban, has also withdrawn his name, so that the jury is now composed of Germans only. It is a matter of surprise at Berlin that so fine an opportunity to compete for the execution of a building of such importance as a Protestant Metropolitan Cathedral should have been neglected by English architects; and we are reminded of German impartiality in the matter of the Church of St. Nicholas and the Townhall at Hamburg; for both of which Mr. G. G. Scott obtained the first prize, as also the execution of the former. But the cause is to be attributed partly to the fact that the competition was scarcely known in this country, partly also to the vast projects at home which occupied some of the architectural minds of this country at that time, namely, the designs for the Law Courts and the National Gallery.

Railway Terminus at Berlin.

A new railway terminus is in course of erection at Berlin for the Great Eastern Railway. It has a length of 600 feet by a width of 120 feet, and the walls carrying the roof, which is of iron and glass, are 39 feet high. The upper surface of the arched roof has a pitch of $2\frac{1}{2}$ feet in the centre, so that the total middle height rises to $63\frac{1}{2}$ feet. The construction is the usual one of lattice girders of \perp iron and tension rods, the principals being placed 24 feet apart, but the foot of each principal rests upon a stout wheel which runs upon a piece of metal fixed to a projecting corbel, thus allowing for expansion and contraction—this being, as far as we are aware, a new arrangement. The roof altogether contains about 400 tons of metal, besides 52,000 square feet of glass and 1,200 feet cube of wood, which gives 12·8 lbs. to the foot super of covered area. The iron for the construction of this roof was sent, ready to put up, from Cologne, where it was prepared by the 'Maschinenbau Action Gesellschaft.'

A New School at Washington.

A brief description of a school recently erected at Washington, by Messrs. Kluss & Kammerhüber, the City architects, may not be uninteresting to our readers, as showing the arrangement peculiar to this class of buildings in the United States. This school is built for the reception of six hundred scholars, boys and girls, divided into ten classes, and its total dimensions are ninety-two feet by seventy-five feet, of two (partly of three) storeys each fifteen feet high in the clear. The basement contains the dwelling of the porter, the heating apparatus, and stowage for fuel, the rest being devoted to a play-hall in wet weather. The ground floor consists of four large school-rooms, each thirty feet by twenty-five feet, and each lighted on one long and one narrow side; between these rooms are the entrance halls and passages, the entrances for boys and girls being distinct, as are also those of the masters. The first floor contains six large rooms, the two central ones, over the entrances, carrying the third storey which consists of one large room only. There is no master's residence. The hat and coat rooms are fitted up with pegs, each peg being numbered. The walls of the schoolrooms are lined with large slabs of slate let into wooden frames, and these slates are used for diagrams, &c. The older classes are provided with desks, for two children, each 3 ft. 10 in. by 2 ft. 9 in.; the younger pupils have separate desks, 2 ft. by 1 ft. 6 in.; the desks and seats, which are of cherry-wood, on cast iron stands, being in each case screwed to the floor. The style of the building is Gothic, with projecting buttresses, and executed in brickwork faced with red pressed bricks, whilst the columns, cills, and caps are of cast iron. The total cost of this school was only 35,400 dollars, including 3,000 dollars for internal fittings.

South Kensington Museum.

Few of the ancient Greek or Roman busts are better known than the one in the British Museum which has been named Clytie. The delicate features and singularly affectionate expression of the face render it a general favourite, and in the paintings of one artist (now deceased) the influence of

this bust, which always stood near his easel, was as clearly traceable in all his female heads as, according to connoisseurs, is that of the Belvedere torso in the giant nudities of the Sistine 'Last Judgment.' But beyond the sunflower cup in which the bust rests there is no evidence to connect the marble with the legend of the enamoured maiden, who has indeed been supposed to be a portrait of some Roman lady of Imperial times. In this respect a bust by Watts, now to be seen in a corridor of the South Kensington Museum, contrasts singularly with the antique eyes. The reverted neck, the upward turn of the head, the half-closed eyes, all express most powerfully the hopeless love of the jealous sister of Leucothœe. The features are worn with disappointment, the fresh outlines of youth have disappeared, and a vivid illustration, as it seems to us, has been given of Ovid's line—

Tabuit ex illo dementer amoribus usa.

Is, then, the bust beautiful? To this question we cannot but give a negative answer. Perhaps beauty is incompatible with a faithful rendering of the subject, and to this we must ascribe the preponderance of thought and power over grace and loveliness.

Curiously opposed in treatment to Mr. Watts's Clytie is a bust in immediate proximity to it. The casual observer may, indeed, be tempted to wonder why a time-stained bust by Mino da Fiesole, or some of his Italian contemporaries, should be located among the productions of the current century. The fact is that the Lucrezia Donati—such is the name inscribed on the bust—is nothing more than an extremely perfect imitation of mediæval sculpture. We abstain from using the word 'forgery,' inasmuch as there is no evidence that Bastianini, the author of this clever *scherzo*, ever used his talent for a dishonourable purpose. That others have made unjust profits out of what he sold at a fairly remunerative price will be clear to those who have gone into the controversy respecting the bust of Girolamo Benivieni, sold at a high figure to the Museum of the Louvre, and figuring there as an unquestionable contemporary portrait of the poet, but which (*pace* Count Nieuwerkerke) seems to us clearly proved to be the work of the lately deceased Florentine. Another of Bastianini's imitations, a terra-cotta coloured bust of Dante, is to be seen in the South Court of the Museum, lent, as the label informs us, by Mr. Gibson Craig.

Sculpture and Painting in New Churches of Paris.

The new church of *La Trinité*, in the *place* which now terminates with great effect the vista of the *Chaussée d'Antin*, formerly shut in by houses, is one of the most elegant ecclesiastical structures that has been erected of late years in Paris, rather wanting in purity of design, and overloaded with ornament exteriorly, but still an effective building.

The façade is decorated with four groups, subjects—Justice, Power, Prudence, and Temperance—by M.M. Cavalier, of the Institute of France, Maillet, Crauk, and Carpeaux, all sculptors of great merit; there are four figures of saints by M. Guillaume, member of the Institute, two others by M. Maniglier, and six by five other sculptors.

At the base of the clock tower are four other saints by four different artists, and within the church are, a Virgin Mary, in marble, by M. Paul Dubois, two beautiful marble basins for holy water, sculptured by M. Gumery, and twelve figures of saints by as many sculptors.

A daring innovation has been made in connection with this church, namely, its combination with a small public square, or garden; the porch of the church projects over a carriage way to the edge of the garden, and from beneath is a fountain, the waters of which fall into basins below; on the margin of these basins stand marble figures of Faith, Hope, and Charity, admirably executed by the sculptor Duret. Our friends in Paris dared many years since to place the statue of Voltaire over a common street fountain, but this is the first time that a church and a pleasure ground have been connected together.

In addition to this long list of works in marble and stone, there are several other decorations. M. Paul Balze has painted the tympanum beneath the porch in enamelled lava. Subjects:—*Accipite spiritum sanctum; Ipsam audite*; and *Pater judicium dedit Filio*. M. Joblée Duval has filled the five tympanum of the nave with figures of the fathers of the Church, surmounted by symbols. Above the principal entrance are four compositions, by the same artist—the Paschal Lamb, the Annunciation, Saint Michel and the Archangel, and Saint Peter and Saint Paul. The other five tympanum are decorated in the same manner as the preceding, by M. Barrias, who has also painted, at the west end of the church, a composition representing Angels laying at the feet of the Holy Trinity the good works of Christians. The Lady Chapel contains an Assumption, with figures of the prophets Isaiah and Ezekiel, painted by M. Delaunay; and a Presentation in the Temple, and figures of Daniel and David, by M. Emile Lévy: the windows are painted by M.M. Oudinot and Nicod. Making in all thirty-seven commissions to artists, some of them of the first rank, and others young rising men. Assuredly no Government could do more for modern native art, or distribute its favours of this class with more judgment. All the productions of art in this church are certainly not of equal merit, but there is no glaring violation of harmony, and some of the works exhibit much talent. No artist visiting Paris should fail to pay a visit to *La Trinité*.

Destruction of the Durham Theatre by Fire.

Early on the morning of the 11th instant the Durham theatre was entirely destroyed by fire. The building, erected in 1791, was of no architectural interest, but was interesting from its associations, Kemble having been one of its earliest managers, and the well-known actors and actresses, Kemble, Mrs. Siddons, Edmund Kean, Miss Foote, Miss Buxton, Charles Mathews, and many more, having acted on its boards. Latterly the theatre had become merely a music hall, and smoking being allowed, it is probable that the fire originated by some carelessness with matches in the gallery, and the woodwork being extremely dry and old, the flames soon obtained a complete mastery.

Architectural Record Missing.

The Fifth Register of the Conferences of the Royal Academy of Architecture, Paris, has been missing for several years from the archives of the Institute of France. The following official description of the volume has just been issued:—It is in folio, and in manuscript, bound in white

parchment, gilt on the edge, and with gold lines; on the side are the royal arms surrounded by the collar of the *Saint Esprit*, with the following MS. title, '*Académie d'Architecture, registre 1711 à 1723. V.*' A general appeal is made to all librarians for the discovery of the lost volume.

Steel Works, Landore, Swansea, S. Wales.

On Thursday last an interesting and important event took place at these works.

A 70 ton cast-iron block being required for a steam hammer, and being undertaken with other works by Mr. Wm. Williams, iron founder, St. Helen's Works, Swansea, was successfully cast by him on that day. Two cupolas were specially erected at a suitable distance, to enable the metal to run directly into the mould.

Operations commenced at an early hour, and by a quarter to ten A.M., the first set of charges were ready and tapped.

Successive charges followed each other at regular intervals of three quarters of an hour up to nine P.M., at which time the block containing the full of 70 tons of solid iron was finished, thus successfully completing the largest casting ever made in Wales. The dimensions are 11 feet 6 inches by 9 feet 6 inches at base, and 7 feet 6 inches high, and it will occupy from two to three weeks to cool sufficiently to allow it to be reversed, it having been cast base uppermost. Trunnions forming part of the casting are so placed that it will simply be turned upon its own axis.

General.

The altered regulations of the Royal Academy relative to water-colour drawings, which will not now be received with mounts, have caused some uneasiness among architectural exhibitors, who have feared lest the same regulations might extend to their drawings. We are authorised to state that architectural drawings, although tinted in water colours, will still be received as before, i.e. mounts will not cause their exclusion.

The Tower Subway, when completed, will supply the means of rapid communication under the Thames between the Middlesex and Surrey sides of the river. By the purchase of a projecting piece of land on the Surrey bank of the river, the length of the tunnel, as originally proposed, will be shortened by upwards of 200 feet. The works have been commenced, and it appears that, in the operations now in progress for sinking the shaft on Tower Hill, between 200 and 300 coins have been discovered about 14 feet from the surface, dating from the reign of Henry III.

Relics of Ancient London are fast disappearing, through the destruction of property consequent both on the ordinary process of rebuilding, which constantly goes on as decayed tenements fall into disrepair, and upon the remarkable clearances that have been, and still will be, effected for public improvements. It deserves to be generally known that the authorities of the South Kensington Museum are anxious to preserve from destruction where possible, or at any rate from total oblivion, such objects as possess artistic merit, or are associated with remarkable men and historical events. With this view they are desirous to take drawings and photographs of such works, and in cases where objects of real excellence are portable, as wrought-iron screens, balusters, or panels, chimney-pieces, carved brackets, and the like, they are understood to be willing to treat for the purchase of them, or to receive them on loan. Architects, builders, and others may do good service to Art by giving timely notice to the South Kensington authorities of the existence of such buildings, or fragments and accessories of buildings (whether immediately threatened with destruction or not), as deserve to be perpetuated.

The picking out of the foundation for the new lighthouse at Land's End will commence at once, the Trinity Board having resolved to supersede the Longships Lighthouse for a new structure on the adjoining rock. The contract for the granite work has been taken by a French firm, and all the granite will be imported from France.

The High Chimney at the Gas Works, Warrington, which was built about three years ago, having commenced to crack in several places, in consequence of the great heat to which it was exposed, repairs were rendered necessary. As this was a work of some danger and difficulty, John Burns, steeple Jack to Her Majesty's works, of Openshaw, Manchester, was employed, and he has just completed his hazardous task. He has put seven large iron bands on the chimney, in addition to pointing the cracks. The work has been done to the entire satisfaction of Mr. Paterson, the manager for the Gas Company.

A large addition is being made to the Roman Catholic Church, Roscommon, from plans by Messrs. Goldie & Child, London. The cost, including sundry internal improvements, will be about 1,000*l.*

A Monument to Humboldt.—It is contemplated by the friends and admirers of the philosopher, Alexander von Humboldt, to celebrate the centennial anniversary of his birth, September 14 next, by erecting a suitable monument of marble in Central Park. Mr. William Aufermann, of No. 66, Exchange Place, a member of the committee, having the matter in charge, has written to the North German Minister at Washington on the subject, and has received in reply the following letter:—'To your inquiry as to whether you might add my name to those of the committee, I beg to reply that I shall be proud and always willing to sign my name in glorification of the memory of our great countryman, and to contribute my share towards the erection of the monument.—Yours, &c., FR. VON GEROLT.' The Park Commissioners have given their assent to the project, and the work of raising funds, therefore, will be commenced at once.—*New York Times*.

Her Majesty has visited the studios of Messrs. Philip, Bell, and J. Boehm. At Mr. Philip's studio Her Majesty inspected the memorial to be placed in the Cathedral at Calcutta to the memory of the late Lord Elgin; and at Mr. Bell's studio the group of statuary representing America, one of the four groups for the base of the Memorial to the Prince Consort.

The corner-stone of the Sheffield Master Cutlers' Almshouses has been recently laid by Lord Shaftesbury. The building will comprise thirty-five houses, designed for the accommodation of twelve married, and thirty-six single persons, all of whom will be provided with comfortable pensions. The cost will be 26,000*l.*, the whole of which has been defrayed by Mr. Mark Firth, the well-known Master Cutler.

Builders' Contracts.—The defendant in the case of the Corporation of the City of London v. Southgate had agreed to pull down a certain house of the plaintiffs and to build a new one to the satisfaction of the plaintiffs' architect, and to accept a lease, which the plaintiffs agreed to grant, of such new house at a certain rent. It was held by Vice-Chancellor Malins that the Court might decree specific performance of part of the agreement and give damages for breach of the remainder.

A warehouse has just been completed in Great Victoria Street, Belfast, nearly opposite the Ulster Railway Station. It is very substantially built, having a piled foundation, faced with white brick; mansard roof, with ornamental cresting; fine entrance door of cut stone, with a quantity of carving. The cost was nearly 3,000*l.* Messrs. Boyd & Batt, of Belfast, architects; Mr. James M'Cracken, builder.

A villa in the Italian style, at a cost of 2,600*l.*, has just been completed in Fortwilliam Park, near Belfast. It is built of brick, having a large quantity of cut stone as dressings, quoins, cornices, string courses, &c.

The Charterhouse Playground, nearly two acres in extent, has been let on a building lease.

Baron Lionel de Rothschild, M.P., laid the foundation stone of a new synagogue in Great Portland Street on Thursday last.

The General Post Office, Bombay, has been totally destroyed by fire.

The Art Society of Nancy has determined to raise a statue in honour of the celebrated Jacques Callot, who was a native of that place.

Busts in marble of Queen Victoria and the late Prince Consort, the Emperor of Russia, the King of Prussia, the King and Queen of the Belgians, the King of Bavaria, and the Sultan, all of whom have visited the fine old building of Henry IV. since 1854, have recently been placed in the galleries of the Hôtel de Ville.

It is intended to build a new school-house at Belton, in Lincolnshire, at an estimated cost of 900*l.*

A New Presbyterian Church is to be erected at Shrewsbury at a cost of 3,000*l.* A site has been secured near the Castle gate, and earnest efforts are being made to raise the necessary funds.

Fifteen estimates of builders for the new Church of St. Philip, Battersea, varied from 14,587*l.* down to 10,910*l.* For erecting a board-room and offices for the Board of Works at Poplar, we have a still more startling difference between twenty-one builders: the highest, 16,997*l.*; the lowest, 7,330*l.*

At St. Servan, in France, a part of the new quay has been carried away by the violence of the waves, and the casino, but recently constructed, has been almost totally destroyed. In the Bay of Cancale, the neighbourhood of Le Vivier was inundated by the sea, and the dykes carried away.

The gas chandelier, which has for very many years lighted the chancel of St. Lawrence's Church, Southampton, fell about eight o'clock on Sunday morning; it was to have been removed on the next day. It is exceedingly fortunate that it did not fall a few hours later, when the congregation would have been assembled, and that the long iron pipe fell across the pews, for had it gone in another direction it might have gone through one of the fine stained-glass windows or struck the organ, and thus have caused a deal of mischief. It is supposed that the pipe was worn out and broke off. Another old chandelier has been removed, and the church will be lighted at the sides.

Mr. George Cruikshank's great picture of 'The Worship of Bacchus,' which is valued at 3,000*l.*, has been presented to the nation by a number of his temperance friends. It is to be exhibited at the South Kensington Museum.

A parsonage house, with suitable offices, has just been completed at St. Saviour's, near Portadown, Ireland. It is built with black stone, having freestone dressings, projecting roof with ornamental verge boards and hip-knobs. The cost is over 1,000*l.* Messrs. Boyd & Batt, of Belfast, architects; Mr. John Collen, builder, Portadown.

A huge granite rock, extensively known as 'the Tolmen,' in the parish of Constantine, Cornwall, has been destroyed. The famous block was oval in shape, and weighed about 800 tons; it was 33 feet long, 14 feet high, and 19 feet in breadth. It rested on the point of two detached rocks, and underneath it was a free passage. During the past week one of the supporting rocks was blown down, and the Tolmen fell into a quarry, a distance of 40 feet.

A singular discovery of diamonds and jewellery has been made at Newton Abbot, Devonshire. Denbury House, belonging to a gentleman at Torquay, has lately been undergoing repairs. The house is a very ancient one. In one of the rooms a painter discovered a cupboard which apparently had not been opened for centuries. The cupboard was locked, but the painter was curious to see what was inside, and, having obtained permission to open it, was surprised to find a quantity of diamonds, jewellery, &c. No one had the slightest knowledge of the cupboard, and it is the general belief that the articles had been secreted there for generations. The owner of the property, of course, took possession of the find, which is estimated to be worth several hundred pounds.

The 'Italia' of Naples announces that at Pompeii there have just been discovered two marble busts—one of Pompey and the other of Brutus. They are both of fine execution, and have been placed in the National Museum.

The Architect.

DOVER CASTLE.

(BY ALBERT HARTSHORN.)

'Therfor a castel has the king made at his devys,
That thar never drede assant of any enemy.'
GROSENET'S *Chastels d'Amour*.

THE very imposing appearance presented by Dover Castle naturally leads the observer to speculate upon the ages and uses to which its numerous walls and towers are appropriated. All conjecture, however, on the subject will receive but unsatisfactory solution, for the buildings being occupied either by troops, or used as storehouses, converted into magazines or prisons, or else rendered serviceable for modern defensive operations, it will be immediately understood that any detailed account of them in their present condition would be alike difficult and impolitic. Indeed, without the assistance of numerous plans and illustrations, it would be impossible to make the various changes that this fortress has undergone, through a long course of centuries, in any way intelligible; and again, it is more than doubtful whether the information afforded would be commensurate with the trouble of its perusal. Under these circumstances it will be our endeavour in reviewing the architecture of Dover Castle to confine our remarks more especially to its early history, and by the help of authentic documents and architectural evidences to throw more light upon those ancient towers and buildings which we observe at the present day. A few general remarks will be sufficient to note the subsequent changes the Castle has undergone, the injuries it has sustained from prisoners, and the havoc and mutilation it has suffered at the hands of the various architects who in their turns have been permitted to disfigure this noble fortress.

THE PHAROS AND CHURCH.

There can be no doubt that the Romans held a favourable position on the eminence where the present Castle stands. Their camp was oval in form and mainly adapted to the nature of the ground; within the entrenchments were the buildings they usually erected, with the uncommon addition in the present instance of a pharos or beacon. This was, in all probability, the very first building raised in England by the Roman conquerors. In constructing the pharos they followed their usual method of laying a certain number of courses of ashlar alternated with two courses of Roman bonding tiles. Finding the Kentish rag too small and shapeless, and no other materials being within easy distance, they laid their foundations upon blocks of calcareous tufa brought from Normandy, to the depth of 7 feet 4 inches; below this they placed a single course of tile, and a stratum of conglomerate, a foot-and-a-half thick, resting upon yellow clay mixed with flints. The rules laid down by Vitruvius were accurately followed, and an analysis of the mortar proves that his precepts in that respect were as carefully adhered to. This building, in its original condition, is said to have resembled the curious lighthouse at Boulogne, attributed to Caligula, and which was destroyed in 1644. The old facing of the walls is almost entirely gone, but on the south side some of the Roman bricks still remain, with grooves and projections to dovetail into each other. One of the original entrances still exists, with the voussours of the arch formed alternately with pieces of travertine and double tiles: it bears a strong resemblance to arches of an aqueduct near Luynes, at Lillebonne, Pompeii, and other places. The Pharos is octagonal without and square within, and the walls are 10 feet thick; in its present state it is 40 feet high, but has had a much later portion imposed upon it, though at the present day this addition may be considered ancient. This was probably the work of Richard de Grey, Constable of the Castle in the beginning of the fourteenth century, whose arms appear upon a small square stone; but it was again altered at a later time by William de Clinton, Earl of Huntingdon, and constable. The Pharos is called the tower of Julius Cæsar in documents of 15 Edward I. (1287), and appears at that time to have been used as a bell-tower; and in the following reign repairs of the great bell 'in turri Cæsar' are mentioned. In the beginning of the last century 'a pleasing peal of bells' was removed from hence to Portsmouth, since which time it has been suffered to go to ruins.

Whatever other buildings there were of the Roman age exist no longer, but in their stead we find a church of the late Saxon period, cruciform in plan, with a central tower, and built irregularly, like Brixworth, in great part of Roman brick, or as Leland calls them, 'great Briton brykes,' and in imitation of Roman architecture. The brickwork is mixed with flints and Kentish rag, and this gives the building an air of antiquity that is very likely to mislead superficial inquirers, who generally suppose the Pharos and church to be of the same age; the fact is, that at Dover as well as at Brixworth, in the

absence of better materials, the builders availed themselves of those they found on the spot. St. Mary's Church has the distinctive Saxon features of doorways with straight jambs, windows splayed equally inside and out, and arches with the narrow brick pilasters carried round them. It may, however, be questioned whether the transepts are not of considerably later date than the body of the church; the Pharos is united to the nave at the west end.

The church was much altered towards the end of the twelfth century, and the character of the Early English work then introduced is extremely good; it bears so marked a resemblance in its details to the work in the chapel of the keep, that they are doubtless both from the same hand, and it is the opinion of a high authority that both are the work of William the Englishman, the second architect of the choir of Canterbury Cathedral. There are also Early English remains of about thirty years later in date, consisting chiefly of a sedilia and piscina in the south-east angle of the nave; and there is an entry on the Clause Rolls in 1223, in which Henry III. orders the church to be repaired at the same time as the castle. These repairs may be distinguished from the Early English of the first period by being worked with the claw-tool instead of the plain chisel. The same difference of tooling may be observed, though in a stronger degree and of an earlier time, at the junction of the old and new work of the choir of Canterbury.

An inventory of the contents of the church was taken in 1343, when it contained the following effects:—A silver cup, a thurible, and divers vestments, two missals, one pontiforium, one antiphonal, one book of the legends of the saints, one gradual with a proper, two psalters, two trofers (or collections of versicles to be sung at festivals), one processional, a silver feretory covered with relics, a copper candlestick, gilt, three iron candelabra, an iron pole for supporting the wax lights, one copper crucifix on a staff, silver spoons and fiols, and a picture of the Holy Trinity. To these may be added, from an inventory of 1361, an ivory bust of our Saviour, and a large quantity of costly vestments of all kinds. St. Mary's church appears to have been dismantled early in the last century, and has since been turned into a coal depôt for the use of the castle. In 1860 it was entrusted by the Government to Mr. Scott for restoration, and the difficult task of restoring a church reduced almost to ruin has been well performed. The excavations inside revealed two ancient floor levels, the Early English, and below it the original Saxon. This latter, under the central tower, consisted of blocks of chalk of about six inches thick, laid upon concrete. Among the many architectural fragments discovered during the repairs were several of the Early English vaulting ribs, which were found to be portions of Saxon balusters, one side of which retained their original form at the back of the Early English mouldings.

THE CASTLE.

In considering the protection of Dover Castle at the Saxon period, we have now nothing definite left to guide us beyond the earthworks which marked the defence of the fortress at that time. The Castle appears to have been comprised within the oval of the Roman earthworks in the vicinity of the Pharos and church, and the buildings probably extended towards the west. At the present day, however, there exist no traces of any Roman or Saxon architecture in connection with those earthworks, and it will therefore be irrelevant to speculate much upon them; in all probability they were not very extensive architecturally, or some fragments at least would have remained to the present day incorporated into later work. But it is evident that there was a stronghold of some kind here when the Conqueror marched against the place immediately after his first battle, for it is recorded that it was burnt by his followers. It may fairly be assumed that William availed himself of this important position, and that either he or his immediate successors re-erected some sort of fortress, for we have mention, on the Great Roll of the Pipe in 1160, of the Castle being victualled with corn, salt, bacon, and cheese, besides notices of repairs and additions to other buildings then in existence.

A great architectural movement took place throughout the whole of England during the reigns of Stephen and Henry II. The number of castles erected from the time of the Conqueror to before the death of Stephen is said to have amounted to eleven hundred and fifteen; but their increasing power gradually made them distasteful to the sovereign, many of the later erections were razed before Stephen's death, and on the accession of Henry II. in 1154 many more were destroyed. It was during this period that all the most important Norman keeps were erected. Their type was first introduced by the building of the White Tower by the Conqueror, and this appears, naturally enough, to have been derived in its turn from buildings of a similar kind in Normandy. The castles of Falaise, Chauvigny, Loches, Domfront, and many others not only preceded the construction of our principal English fortresses, but are all built after the same model. The keep at Dover, both from its size (which is 123 feet x 108 feet square), as well as from its imposing situation, may be compared with that at Bamborough, which is the largest in England. Dover keep differs but slightly from the usual plan. It will be seen from the woodcut that, like nearly all Norman keeps, it is quadrangular. It is divided by a wall, and has a staircase entered from a separate tower which reaches to the second storey. The walls are of great thickness, and are pierced with passages, galleries, and chambers on every floor. There is a well, built in the thickness of the

wall, and said to have been 400 feet deep; it terminates in a small chamber on the second floor. There are no architectural decorations in the loops on the two lowest floors, and only just enough in the upper ones to show that they were lighter chambers appropriated to the possessors of the castle. The point in which Dover more particularly differs from other early keeps is in having a highly decorated chapel in the entrance tower. This is a peculiarly valuable example of florid Norman, and we are enabled from it to date, within a year or two, the various ornaments and mouldings peculiar to the style.

The Castle may be generally described as consisting of a central keep within an *inner ward* or *bailey*, in which were erected the buildings commonly met with in a large Norman fortress, such as the hall, kitchen, brewhouse, and various offices. These are encircled by a *cingulum*, or wall of *enceinte*, strengthened by 'mural towers' projecting inwards, and 'buttress towers' projecting outwards, and gateways; these are further defended by a broad and deep ditch; beyond this is the *outer bailey*, or *base court*, of great extent, and comprising the church within its walls; these are again protected by an imposing array of rectangular and circular towers, and by a broad ditch going entirely round them.

We have already shown, from the 'Great Roll of the Pipe,' that the Castle was provisioned and repaired in 1160; payments were subsequently made to a large number of soldiers in the garrison, and minor repairs carried on until 1180, when such extensive works were commenced and continued for seven years that it is evident that nearly the whole of the castle was within this precise period rebuilt. Referring to that venerable series of records which were annually delivered into the Exchequer, we find that in the year 1180 a charge of 165*l.* 13*s.* 4*d.* was allowed for works upon the walls. In 1183, upon various works, 120*l.* 16*s.* 11*d.* In the following year the expenses for the keep amounted to 131*l.* 8*s.* 10*d.*; in 1185 the continued expenses upon the 'turris' alone were 290*l.* 2*s.* 1*d.*; and in the same year Mauricius the engineer (engeniator), who had probably studied at the works at Canterbury Cathedral, received 7*l.* 19*s.* In 1186 207*l.* 9*s.* were expended upon the keep and cingulum under Mauricius; in 1187, 151*l.* 15*s.* 4*d.* was paid for work on the keep and Castle, at which time it must have been very nearly completed, the building of the keep and walls of *enceinte* having cost 1,085*l.* 5*s.* 6*d.*, exclusive of the payment made to Mauricius for his plans and supervision. These expenses may be compared with those of the Castle of Orford, built in 1163 at an outlay of 323*l.*, and that of Bogis, 1172-1183, at a cost of 397*l.* 15*s.* 6*d.*, and some idea may thus be formed of the magnitude of the works carried out at Dover in the short space of seven years.

In the first year of Richard an additional outlay of 50*l.* was made upon the works; certain flooring was done in 1196, and in 1198 the walls were further strengthened at a cost of 76*l.* 3*s.*

The Clause Rolls give a few particulars of the works carried on during the reign of John and the provisioning of the castle in 1213 and 1214. These preparations are important, as Philip II. of France was then menacing England with an invasion. It is true that nothing was effected by him at that time, but at the close of the reign the 'Dauphin' captured a great many places in England, and even besieged the castle of Dover. He fruitlessly assaulted it for fifteen weeks, when, owing to the vigorous resistance of Hubert de Burgh, he was forced to raise the siege and leave the kingdom. This will explain why so much was done to further protect this extreme fortress of the English coast during the long reign of Henry III.

On the accession of this monarch in 1216, Hubert de Burgh was ordered to provision the castle; in 1218 he was allowed all the proceeds arising from farms, tallages, scutages, and pleas in the counties of Kent, Norfolk, and Suffolk; these amounted in 1221 to 1,654*l.* 10*s.* 10*d.* and were employed in strengthening and fortifying the castle, Hubert receiving 1,000*l.* a year as constable. From 1223 to 1239 we learn

from the Clause and Liberate Rolls that no less than 2,922*l.* 13*s.* 10*d.* were spent upon works. From the same authentic sources we find that during the reign of Henry III. 750 oaks were brought to the castle chiefly from the forest of Kingswood in Essex, besides joists and rafters and a large quantity of oak trees not enumerated. The names of Hugh de Alberinorte and Nicholas de Andely occur as carpenters; there are also considerable entries for lead and casks of Bordeaux.

Briefly reviewing the architecture of the Castle at this time, it may be said that the keep, with its wall of *enceinte*, was the work of Henry II. between 1180 and 1187, and that the towers and boundary wall of the outer bailey were erected in the time of Henry III., between 1216 and 1230. Very little was done during the reign of Edward I.: a windmill was built within the precincts in 1295, at a cost of 39*l.* 6*s.* 11*d.*, but no vestige of it now remains, though the full accounts of its weekly cost are still preserved. In the time of Edward III. much was done in the way of repairs, but no special buildings were erected. Among the miscellaneous entries on the Records during the reign of Henry III. the following may be mentioned:—Making the great gate at the going out of the great barbican in 1232; sending 40,000 quarrels and thirty-five ballists to the Castle in 1236; repairing the King's apartments and chapel, damaged by tempests, and putting in new glass windows in 1239; building a new kitchen in 1242; building a house in which the King's engines may be kept; providing pipes for the bellows in the forge, and a cowhide to mend them; wages of a coppersmith mending the honey casks, and bran for cleaning the King's arms.

The Castle possessed one large engine, which lay, in the time of Edward I., under the wall of the washer-woman's house. It took six men a whole day to remove it from this place into the grange; at the same time another engine was placed there that used to be kept in the church. A new springald (for projecting garroks) was constructed in 1297, and two more engines brought from London. There are charges for masons working eighty round stones for the use of these machines, and for a barrel of grease and pitch and tar purchased for the large engine.

In 1342 there were 900 calketrapes in the Castle, and in 1361 in the armoury twelve helmets, three visored bascinets, twelve light helmets, thirty haketons, nineteen chapelles de fer, thirteen plain bascinets, several boxes and barrels of quarrels, gauntlets, breastplates, &c. The wages of soldiers and archers varied from 1*s.* to 3*d.* a day in the time of Henry III., and Adam le Fevre received 4*d.* a day for making cross-bows. The nails used in the works are variously called 'shingelprig,' 'leadneyl,' 'dorneil,' 'hussem,' and 'prig.'

An account of Dover Castle, by William Darell, chaplain to Queen Elizabeth, was published in 1797. It assigns the erection of various towers to particular knights, and further states that they were obliged to defend and repair them, as they held their lands in Kent by virtue of this service. Compressing these assertions into a brief form, we find that John de Fienes granted certain manors to eight knights who were obliged to provide for the defence of the Castle. There is in this account an entire absence of reference to any kind of document, and these military services produced relating to Dover were unknown at the time of the Conqueror, the period to which they are ascribed. We can therefore scarcely accept them as reliable statements: at the same time there is exhibited in Darell's account and Lyons's History a certain amount of circumstantiality which tends to show that they derived their information from some accredited source; but it must bear the same amount of credit that an unauthenticated statement has with reference to an original document. It is only in the instances of the tower called at different times Avranches and Mansellin's that the names upon the records agree with those given by these writers. However, none of the towers now existing were the work of the period when John de Fienes and his 'confederate knights' are said to have flourished, for like themselves, their buildings have passed away.

The most valuable part of Darell's account is the description he gives of the towers and the names they bore in his time. Though many of them are now gone, it would not be impossible at the present day to define their respective sites amidst all the changes and destruction that have taken place.

Among the most remarkable features of the Castle is a spacious and lofty vault, entered by a long flight of steps. It appears, from an entry on the Pipe Rolls, that this was built, in 1229, at a cost of 100*l.*, 'in una volta facienda ad exendum de castro versus campum.' It was probably used as a large store room in case the castle was besieged. This entry enables us to estimate the date of the contiguous buildings on the north side, including the singular Avranches Tower, to the east, and the remarkably placed tower of St. John, in the middle of the ditch, to the west. The series of souterrains connected with the latter tower renders this the most curious and intricate part of the Castle.

The following are the names of the towers at present in existence:—beginning at the southern extremity of the wall of the outer bailey, we find Rokesley's Tower, Fulbert de Dover's Tower (for some time used as a debtors' prison), Hirst's Tower, Arsic's or Saye's Tower, Gattou's Tower, Peverell, Beauchamp, or Marshal's Tower, an extremely picturesque building, having the gateway set between a square and a circular tower. Passing by Post's, Gostlings or Mary's Tower, we next come to the principal entrance to the Castle, Newgate, Constable's, or Fienes' Tower. This is a very fine and impos-

ing structure, consisting of two circular and embattled Norman towers, with a gateway between them. To those succeed Clopton's, Godsfre's, and the round Crevecoeur towers, with St. John's Tower in the ditch in front. On the east side are Magminot's and Fitzwilliam's towers, and two others beyond them bring us to the angle at which occurs the Avranches or Albrincis Tower. It will be seen from the engraving that this is very picturesque in its outline, and the plan of it deserves study from the curious disposition of the loop holes. They are exceedingly well arranged to meet the requirement necessitated

by the exposed situation of the tower. This is flanked on the east by the Pincester or Veville Tower. Colton's, Chilham's, or Chaldercot's Tower, said to have been rebuilt about 1250, stands between the Pharos and the castle. The names on the accompanying plan will indicate the principal and postern entrances, and the names and positions of the buildings within the inner bailey, as far as they can now be ascertained.

From the time of Edward III. little appears to have been done in the way of additions to the previous buildings. Edward IV. laid out 10,000*l.* on the defences; Henry VIII. also expended money upon fortifications, and Elizabeth and Charles I. upon furniture and repairs, rather than on additions to the fortress. At the end of the sixteenth century frequent applications were made to arrest its further decay and place it in a proper state of defence. In 1642 the Parliamentarians seized the castle and successfully resisted the Royalists, and in 1701 Defoe speaks of it as 'neglected and in decay, and its materials at the mercy of those whose appointments gave them power over it.' The present condition of the castle sufficiently indicates the treatment it has undergone from that time to the present day. The annexed general views—the one taken in 1735 and the other a few years ago—show its bold and imposing position, while the drawing of the inner bailey and keep gives an idea of the simple and massive style of the architecture. It will be unnecessary in the present pages to enumerate the frequent visits Dover Castle has received from royalty and the many important events which have been concluded within its walls. It will ever be associated with the most stirring period of English history, and cannot fail to arrest the contemplation as one of the noblest of England's ancient bulwarks.

For the hitherto unpublished extracts from Records, the author is indebted to notes left by the late Reverend C. H. Hartshorne.

OUR RAMBLER AT THE REVIEW.

OF the many thousand inhabitants of London and the other southern cities and towns whom the shrill notes of the bugle, or the authoritative tap of the drum, will awaken from their morning slumbers on the day of the great Volunteer Review, there are few indeed who will not feel a glow of pride as they recognise the notes of a citizen band. Let any rosy-cheeked maiden or buxom matron, who may give way to a momentary feeling of annoyance at having her morning slumber broken by this unaccustomed *revel*, take comfort from the reflection that, but for the patriotic movement, which thus gives signs of its vitality, she would ere this have been scared by far rougher accents. The 'Rambler' has sauntered through other Courts and camps besides those of St. James's and of Aldershot. He has listened to far louder thunders of war than those which will this week wake the echoes of Shakespeare's Cliff, for the reports of cannon loaded with that cruel shell have an angry roar, very different from the courteous sound of a salute. And he is as convinced as it is possible for a moderate man to be with reference to any negative proposition, that the volunteer movement alone has saved England from foul insult. He has seen the sardonic grin with which the great establishment of our independent riflemen was greeted by the captains of our Imperial neighbours. He has heard twelve or fourteen years' since, the programme which was sketched for the erection of a second story on the *Arc de Triomphe* of the *Barrière de L'Étoile*. The obliteration of the Waterloo Banquet, and the blowing up of Waterloo Bridge, by the French army of occupation of London, were looked forward to with much confidence by the Croats of the Second Empire. And, what is more, whatever our English pluck might have effected by way of

vengeance or redress, we could not, so far back as 1850, have prevented the French generals from walking into London, if they had chosen to risk their chance of getting out again.

This is no exaggerated statement. It was a man to whom fear, in the pure sense of the word, was a stranger, who first sounded the alarm. It was the first chief and Captain of the country and of the age who told us that we were, in a military sense, entirely undefended. When, some little time previous to the ridiculous collapse of the Brummagem dynasty, which, if we may believe French evidence, carried the art of electoral corruption to its highest pitch, a difficulty arose as to a certain Pritchard, a danger was incurred which was a question of hours. Our neighbours were seriously angry. We were by no means aware of the real state of their feelings towards us. Councils were held at Paris, the upshot of which was, that, according to all military calculation, the French flag might fly from the dome of St. Paul's within a week of the word being given. And other councils were held in England. Of the first the 'Rambler' can speak only on that authority which forms the common material of contemporary history. Of the second we can speak from personal knowledge. The men responsible for the defence of Great Britain found, to their most disagreeable surprise, that defence was for the time impossible, if a real attack were made. Men were wanting, but that was the least formidable deficiency. If our want of guns had been distinctly known at the Tuileries, even an Orleans prince would have plucked up courage to snatch such easy laurels.

At this moment, thanks to God, to the Duke of Wellington, and to the Volunteers, we have a *matériel* for war of which we have no cause to be ashamed, and we have a wholly or partially trained force of at least 300,000 men, ready to employ that *matériel*. Our shores are safe. Therefore, in expressing the gratitude due to those men who form so valuable a portion of our defensive garrison, we wish to say a word as to the service which the civil art of the builder, the mechanist, and the engineer is able to render to those who profess the art of war, and the benefits which that art may in turn hope to receive.

In the fabrication of that defensive armour which the increased power of our modern guns has rendered more appropriate than granite or than brick for the defence of stationary forts, our manufactures hold a foremost place. The competition for extreme cheapness, and the grasping avarice of many commercial men, was rapidly degrading the character of English iron, which, from being the best, was becoming the worst in the world. The terrible blows struck by the bolts of Whitworth, and by the shells of Armstrong, led us to look for some stronger shield than cheap iron, and the solid steel planking which Messrs. Brown and others now produce is a marvel of mechanical skill. But other nations are at least as ready as our economical ministers to avail themselves of English steel. The Russian Government has lately had the wisdom to pay, to an English engineer, the highest fee ever yet offered in the world. It gives twenty thousand guineas a year to secure the counsel of a man who will tell them how to make the best use of their own national resources,—a man so able, that a Russian Grand Duke thus addressed him:—'We spoke of architecture, and you appeared to be an architect. We spoke of metallurgy, and you showed that you were a chemist—may I ask what you are?'

'Please Your Imperial Highness,' replied the sturdy Englishman, 'I am a blacksmith.'

The Architecture of forts, which is, as we write, undergoing an entire revolution, and the metallic defence of land batteries, have less importance, at this moment, in our eyes, from the consideration that the introduction of the Moncrief gun, and of similar methods of utilizing the hitherto wasted power of recoil, will infallibly complete that revolution. For the frowning and impregnable keep of the Middle Ages will be substituted, before the close of the present century, the very opposite mode of defence. We shall lay safe behind our invisible citadels.

But if trenches below the level of the ground or low mounds of earth replace our modern solid and sullen-looking forts of masonry and brickwork just as these have supplanted the lofty keeps and picturesque battlemented tower of which Dover presents such fine specimens, there is in this no loss to the civil architect or engineer. The more solid yet simple our safeguards, the more freely are civil buildings undertaken—the fewer bricks and stones we mass together in our forts, the more we have remaining to use in our churches and mansions, our viaducts and our stations. The arts of peace flourish best when the fear of war is remote, and on this account, if on no other, we who build owe a deep debt of gratitude to the Volunteer force.

But we wish to look at the subject from another point of view, to which the visit to Dover gives peculiar appropriateness. Here we are in the presence of works venerable for their antiquity, but some of them remarkable also for that peculiar picturesqueness of outline and simple beauty of detail which our modern efforts so seldom approach. If Dover is historic ground it is also artistic, and few can gaze upon its ancient Castle and Church, or visit the fine fragment of extremely early build which now stands as the nave (once the choir) of St. Mary's Church, without feeling that it is not merely the age of these structures to which they owe their charm. It was the hearty, intelligent, earnest feeling with which the work was done which gave it at once the solidity to stand so long and the grace which still clings to it in decay. The early builders wrought more in the spirit of the *Volunteer* than of the *Mercenary*,

and now that the nation has shaken off her inert reliance on the power of gold lavishly squandered to buy sufficient military service for her most pressing needs; now that we are beginning to feel that if we would have our country defended we must arm ourselves, and if we would dwell in safety we must protect our own homes, it is not too much to say that the temper of mind from which this movement has sprung, and by which it is kept up, will ennoble all our work—our buildings among the rest, nay, is in fact doing so. Genuine painstaking work, patient care, skill, art, and taste are no longer absent from our structures, as they were in the days when Napoleon affixed a stigma upon us, merited perhaps in his day, but hardly so now, that we were nothing better than 'a nation of shopkeepers.' The Volunteer force has often been to Brighton, and has beheld in the renowned Pavilion the acme of shopkeeping architecture. It has been once, and is now going again, to Dover, and will see there, in one noble work and many fragments, what the architecture of our forefathers was. There can be no doubt as to which of the two buildings—the Castle or the Pavilion—raises a thrill of honest pride in the beholder, and as to which impresses him with a sense of the dignity, beauty, and power inherent in an architectural work. And we feel some gratification in adding, there can be as little doubt which of the two buildings is most nearly allied to those habits of care and order, that love for genuine construction and solid material, and that desire to clothe our works with the graces of architectural form and treatment, which are yearly gaining ground among us.

We hail, then, with pleasure the opportunity of revisiting Dover, and once more reviving her historical associations and revisiting her monuments of ancient art. These have always rendered the recollection of our first visit to Dover peculiarly vivid and distinct among the crowd of pleasant memories which belong to volunteering. Such memories are indeed many. Who does not, for example, recollect his early days?—the drilling in Westminster Hall, when the picturesque beauty of that busy scene was new and unaccustomed; his first visit to the butts; his first inspection, the first prizes he shot for and won; or who can forget that has attended them the successive meetings at Wimbledon, with the luxurious wildness of camp life, and the keen interest of the rifle competitions? But among all these the series of Great Reviews, each having some peculiar character of its own, seems to stand out conspicuously vivid and real in the memory.
