We cast off about 2 o'clock P. M., by which time the wind was well down. Our anchor hanging into the wearing bank about thirty feet below the surface, was deep in mud, but we jerked it out by running the boat against the snubbed line. A few miles down—away below Duvall's landing—I saw Spanish moss on a tree, and soon after, several trees draped in it. I had seen pictures of Louisiana swamps, but they conveyed but scant idea of the utter ghastliness of the hanging gray crape, swinging in the wind. It did not better the impression when the sunlight and a closer view disclosed a purplish tinge. For me, there was exulting at the sight, however. The cypress tree had been evi-

## Floating Down the Mississippi.

### Another Cyclone and Vicksburg.

ONE gets used to most things on the Mississippi. The restless spirit is tamed into carelessness and shiftlessness in an attempt to float a cabin boat from St. Louis to New Orleans. The experienced river man will lie in an eddy for a week awaiting the going down of a wind, no matter how lonesome the eddy or how urgent the call from down stream. The true cabin-boater learns not to worry about not being able to float, poor duck shooting, an empty flour can, or an uncertain future; but one thing will always stir him up and bring fire into his eyes, and that is a cyclone. A man down with malaria, aching with rheumatism and not a year from the grave, will get up from his bed at the ropes when the blue clouds come sliding up out of the west and the long, white tresses of flying scud begin to dart, clawing up from the horizon and scaring the blackening storm.

The river man says three things are sudden on the Mississippi, a crevasse, a cut-off and a cyclone. To compare the Mississippi one would say "Crevasse, cut-off, cyclone"—these are the bad, worse and worst of the Mississippi bottoms. The cyclone is most frequent, and no cabin-boater of a year's experience but has a tale to tell of these storms. I had two, the first one nearly terminating my river and other experiences by jamming me down into alongshore mud and then swinging a cabin boat around on top of me. My second was equally startling and nearly as dangerous.

On March 12, we landed in at Salem landing, and on the following afternoon the Medicine Man came in about 1 o'clock, feeling happy over sales amounting to \$4. In a few minutes we sat down to dinner, and at 1:55, I went to the stern of the boat and noted the appearance of the river and the sky.

"A patter of rain," I wrote, "swallows skimming over the water close to the surface. Blue clouds low in the north, working around to the westward. Very dark clouds, with light patches among them, but no rounded thunder heads. Two ducks flying up-stream like bullets close to the water, while a bald eagle flaps awkwardly but as fast in flight a hundred feet above them, a little behind. Partner has just remarked that he was blown into the willows a mile below here by a cyclone four years ago. Drift is running. A plume of white cloud a bit south of west of us is very pretty to look at, and suggests spray whipped from the tops of salt sea waves."

At 2:05, I noted, "Drift running, rain pattering down at intervals, lightning grows plainer. As the drops hit the water, little columns of water jump up. The curious white tresses seem fairly to dart across the sky. Some of them are more than half way to the zenith, though ten minutes ago they were only just noticeable low down in the west."

The willows, with their new flung leaves, seemed fairly to be swept with green, bright and beautiful, with splashes of gold as subdued sunshine was flung across the brakes. I thought it was the coming of a heavy shower, and I sat delighted by the view and making my notes with glad heart that I had so good a description

dence that I was in the Mississippi bottoms, and now the Spanish moss showed that I was coming into the Louisiana swamp country, pictures of which in school books show alligators, Spanish moss and dense shades.

Moreover, I was meeting spring half way. Behind me, 2,000 miles, away the snow was melting, and darkies, whose tents the wind had blown down at Salem, said the annual head rise was coming. At Sterling, I had seen a peach tree in beautiful pink bloom, and green grass among the gray shreds on the levee face. Here the cypress tree was turning a soft maple red. Following the cold night, ducks were coming north with the rise of the temperature. On all sides spring voices began to predominate. One other river sign was as characteristic as any in the air. The Medicine Man looked at the latticed stern of the boat, and viewed the damp deck with undisguised fear.

"That won't neveh do!" said he, "the yellow fever season is coming—that thing must come down!"

With ax and hammer, we cut away the close lath lattice work and knocked the roof off the stern deck, letting the sun in upon the boards and wash bench, which had not been dry in months. The sun and wind worked together upon the stern deck, and widening dry spots appeared. With a shovel, debris under the boxes and fire-wood, was cast into the river and a remarkable change was wrought in the appearance of that part of the craft.

A thorough job done in the stern, the galley looked unkempt, and was subjected to as thorough a putting to rights. The fore-cabin was in turn fretted into full companionship with the stern deck and the galley.

Under the bow deck were bushels of bottles and junk—this stuff was hauled out and at the end of a week's intermittent labor, the craft had gone through its spring house cleaning—here was a similarity between river and bank life.

The Medicine Man wanted to go into Vicksburg with what he called "a good time" in his pocket. We went down from landing to landing, he "rubbing" the bank, and I skirmishing around picking up odds and ends of information about the region. At one landing, I was lying on the levee waiting the Medicine Man's return from back on a plantation, when I saw a youth on horseback galloping down the road. He stopped at the house in which my partner was trying to make a sale. A few moments later a man came out of the house, jumped astride the horse and rode away back up the road. After a time I went back to the boat and several hours later, as we were dropping down in mid-stream, he told me that the boy had come after the constable to arrest a youth who was lying beside the road in some bushes to kill a school girl who had refused to marry him on demand. All the participants were negroes.

Our landings were scanned with such vigilance by the Medicine Man that I made inquiries which elicited the information that Mississippi was "mean." Peddlers are obliged to take out license and pay high for them in that State. To sell medicine, one must pay \$50, the Medicine Man said with vicious expletives against so narrow a State as that. When he landed in Mississippi, he looked in all directions, "shunning the white man." When doing business, he went back from the river, and

worked toward it, so that no plots laid behind him would cut him off from the river and the cabin boat. Louisiana was better natured toward the dealers in alleged cures, but the laws were stringent, and it was needful to "offend" nobody, and also not to remain at a landing long after sales were made behind the levee.

"Louisiana has a farm," the Medicine Man said. "They send such men as me to hit—what do ye think of that? Seems like they was drawing the lines that close a poor man can't make a living no more, less he goes out and digs ditches, or shovels dirt—that ain't no work for a white man. Why I seen white men to work and niggers sitting down looking on! Ain't that pretty near the limit!"

At Henderson's Landing—a big store-house—the view from the levee top was such a one as a combination of many stories of the plantation South made one believe it was a dream-like reality. The things which one reads in Uncle Remus, Cable, Huck Finn and Monette seemed to be right there before the eyes. Along the inside of the levee was a road, dry, hard and smooth. A little negro girl was walking down the road, singing as if her heart was broken, but perfectly proud of her bright blue dress, flat, wide black hat and shiny shoes. A new split rail fence—built in posts—around an oasis of garden and white-washed "quarters" was beyond a five-strand wire fence, and for miles back, other oases were in the desert of plowed ground. On the far horizon were deadenings—gaunt, girdled trees with smoke rising, indicating the burning process of clearing lands toward the swamp a few miles back.

[CONTINUED ON PAGE 135.]

## NATURAL HISTORY

### A Captive Dolphin at the Aquarium

LAST week the New York Aquarium obtained its first dolphin, which was also so far as known the second ever held in captivity in this country. The old New York Aquarium had one for a few days, and many years ago the Brighton (England) Aquarium had one, but this seems to complete the record of the dolphin in captivity.

This specimen was captured in a pound net off Long Branch on the New Jersey coast and was brought to Fulton Market. On Aug. 4 it was out of the water all day long and perhaps then received some injury. At all events, when seen on Monday last, the 7th, it did not seem to be in good condition. Although it made a great show in the pool swimming steadily and rising at short intervals to blow, it nevertheless seemed weak, did not swim level, and on one or two occasions ran against an obstruction at the edge of the pool. It died Aug. 7, about 1 o'clock. The specimen in question was seven feet long and was probably a common dolphin (*Delphinus delphis*). Its form is slender, it has a gradually sloping forehead and long beak-like jaws which are armed with teeth. This is the common dolphin of the ancients, abundant, among other places, in the Mediterranean. By the ancients, of course, it was regarded as a fish; but they were impressed by its intelligence which is far greater than that of any fish. It must not be confounded with the fish *Coryphæna*, which changes its colors in dying, and about which there were so many legends. This dolphin may roughly be described as black above and white below. The specimen in question seems to have the white running forward on to the upper jaw.

The dolphin is a swift swimmer, and was often used in heraldry, a dolphin, for example, forming the arms of the eldest son of the King of France, whence he was said to be called Dauphin, but as a matter of fact the Dauphin was so-called from the Province of Dauphiné, the arms of this Province being the dolphin, and adopted by the King's son.

About the dolphin cluster a multitude of legends, all pointing to great intelligence of the animal and to its usefulness to man. Of these legends, many may be dismissed as wholly mythic, but a modern tale, from a no less authoritative source than the Proceedings of the Zoological Society, is hardly less wonderful than some of those stories of the ancients. Thus, Mr. Fairholm, in the Proceedings of the Zoological Society for 1856, says: "In Moreton Bay the natives used, to aid the men in the capture of 'mullet,' a kind of 'porpoise.' When a shoal of the fish comes into the bay, the natives with their spears make a peculiar splashing in the water. Whether the porpoises really understand this as a signal or think it is the fish it is difficult to determine, but the result is always the same. They at once come in toward, driving the 'mullet' before them." The person who told this story believed that the porpoises did understand the signal.

It is hardly necessary to say to any reader of FOREST AND STREAM that the dolphin is not a fish, any more than is any other whale. All these cetaceans are mammals adapted for life in the ocean. They are an ancient group, running back to very early tertiary times. They are fish-like in form but with the exception that the tail—known as the flukes—is carried at right angles to the plane of the body or horizontally, a fish's tail being always carried vertically. Although the accounts of their size are constantly exaggerated, whales are the largest of mammals; the great Sibbald's rorqual being sometimes eighty or eighty-five feet in length, while one of the least in size of this group is only four feet long, and some have been reported even smaller.

The whales are provided with two "fins," analogous to the pectoral fins of fishes, and which represent the fore limbs of other mammals. The hind limbs have totally disappeared from the outside of the body, but in a number of species small bones are found lying in the flesh in advance of the tail, which, while they have no

particular resemblance to any bones of the hind limbs, are yet believed to represent the pelvis and the femur. While almost all the whales are smooth skinned, nevertheless a few species have a few hairs on them, and the dolphin at the Aquarium was one of these, for it still preserves on either side of the face half a dozen hairs, called a mustache. There is evidence that in very ancient times the whales wore hair, just as to-day the seals have hair; on the other hand, the walrus, which belongs to the seal family, has little or no hair, and when we get down to the group *Sirenia*, which includes the manatee, the dugong and the long extinct rhytina, which Bering's sailors exterminated for food when they were wintering in northeastern Siberia, we find species inhabiting the water which have little or no hair. This, however, has probably nothing to do with their water life, for there are a number of land mammals, all of them ungulates, which are almost naked.

On the other hand, there is some evidence to show that at one time the whales—of course long anterior to the human period—were covered with bony scutes or scales. In fact, in some of the modern porpoises—and especially in the embryos of these porpoises—are found little tubercles, or bony nodules in the flesh which indicate that once, long ago, some of these whale-like animals had a covering of armor, not unlike that possessed to-day by the armadillos.

There are a great many more curious things to be said about the whales, for which the unfortunate dolphin down at the Aquarium might furnish the text. As one stood looking over into the pool and watching his periodical risings to the surface of the water for breath, it was interesting to observe the use of the blow hole or spiracle. The operation of blowing by the whale has been much misunderstood in the past, though it is to be presumed that all the readers of FOREST AND STREAM understand that it is merely the act of expelling the air from the lungs. On the other hand, some hundreds of years ago it used to be said that the whale drew in the sea at his "gills" and spouted it through his "trunk," while that fine old historian, who perhaps first figured the giant cuttlefish now so well known, intimated that the whale defended itself by spouting, sending up so great a volume of water that it might crush the attacking boat. He says that the whale "raises itself above the masts of the ships and belches forth draughts of ocean from its blow hole in such a way that it overwhelms with a rainy cloud even the strongest ship or exposes the sailors to greatest danger." As a matter of fact, the damp air expelled from the lungs into the cooler air above the sea undergoes a certain condensation and steam is seen. The whale does not really discharge any water from his blow hole. If he begins to expel the air just before he reaches the surface, there may be a few bubbles which will throw up a little fountain of water, but it is the animal's breath which makes what looks like a jet of steam which hangs a little while in the air and then drifts off with the wind. As Mr. Moseby says in his "Notes of a Naturalist on the Challenger," "The expiratory sound is very loud when heard close by, and is a sort of deep bass snort, extremely loud and somewhat prolonged; it might even be compared to the sound produced by the rushing of steam at high pressure from a large pipe."

In ancient times the whale had few enemies, but within the past hundred and fifty years these have become so numerous as to pretty well exterminate the whales over much of the ocean. Bomb guns and other engines of destruction are employed, and when it is once sighted the whale has a very small chance to escape.

### The Geese of Europe and Asia.

A VOLUME of very great interest has just been written by Sergius Alpheraky, a Russian ornithologist, and published in English by Rowland Ward, of London. The work is highly spoken of by some of the British journals. The twenty-four plates are in colors, and the text interesting and valuable. The net price in London is about \$16.

### Is Nature Partial to Man?

Editor Forest and Stream:

So much is said about nature being partial to man in comparison with the other animals—inasmuch as she has endowed him with high mental faculties, while to the others only instinct is given—that it may be a trifle interesting to look into the matter to discover if possible whether those assertions are true.

Now, whether the advantages that humanity has in the one direction any more than compensate for those possessed by the rest of the animal world in other ways, is a profound question. To me it seems that the Good Dame manages her affairs in such a way as to be impartial to every link in the great chain of animate beings, from the highest form to the lowest; but if there is a slight partiality shown to either it sometimes looks to be in favor of the other orders rather than humanity.

Of course it is known that nature provides the animal world with the materials for food, covering and shelter. By most of the wild animals the food, seemingly, is easily and abundantly obtained. One cannot believe they generally go very hungry or half-starved by the thousand, or very often wholly so, as is the case with humans in the big cities and in many other places; and in regard to covering, to the mammals and to birds, the thickness of the coat or the dress is adjusted in relation to the seasons without any extra effort on their part, and in most cases their shelter is found or made by them instinctively and with but a little if any worryment about the matter; while man has to hustle from the word go to get the three essentials that nature gives out and out to the other orders.

Man's brain has to work continually faster than any steam sawmill to concoct ways for getting enough food, clothing and shelter for himself and his dependents, and even with all that thought the three essentials will often be most decidedly inadequate.

Suppose one makes other comparisons between the advantages that mankind has and the ones the other animals have. Take it in the line of shelter, even the bear or his plantigrade relative the raccoon—clothed in a nice warm coat of fur provided for it, as one might say, gratuitously (fur that humans would give a big pile to get hold of)—can have a first-class domicile in a hollow tree, or else in a cave, with no fear of a magistrate poking around and trying to serve a writ of ejectment for non-payment of rent, or else trying to foreclose a mortgage on the premises. True, occasionally some hunter may succeed in getting a chance to kill bruin or the coon, but that is a side issue, a sort of a digression, as it were.

A little more as to dress. Now the feathered tribes will beat the human family ten to one in the gorgeousness of their dresses. Even "Solomon in all his glory" couldn't hold a candle to many of our birds. Why, the most richly-gowned Fifth Avenue belle, or other gorgeously attired feminine in all her wealth of toggery cannot begin to make as charming a showing as our dear little scarlet tanager, Baltimore oriole or bluejay, or even the average butterfly, to say nothing of the hundreds of species of still more beautifully plumed tropical birds and bright colored insects.

Again, in the line of bodily strength man is proportionally far behind nearly all the other animals. Somewhere among my reading matter I recollect seeing the following: "Go to the ant thou sluggard, consider her ways and be wise." Now, while one is in the considering business about ants, let him observe what a big load one of those tiny insects will tote away on its back! If a human being had as much lifting and carrying power in proportion to his size as an ant has, when moving time came around he not only could carry all of his furniture and other personal effects away at one backload but he could take the house along, too.

Now, as to the toughness of other animals in comparison with man. Not long since, while strolling through the woods here in Jersey, I saw a couple of gray squirrels playing among the branches of a large oak tree forty feet

or such a matter from the ground, when one of the rodents missing its footing came down, kerwhack, to the ground. Not hurt in the least, seemingly, it quickly jumped up, frisked up the trunk of the tree, and was again playing with its fellow as if nothing had happened. If a person had fallen from a proportionate height—which would be some 500 or 600 feet—and struck on the ground, what kind of a looking object would he then be?

Again, in the line of swimming, nature is much more partial to all the other orders than to mankind, for there is scarcely an animate thing excepting man but can swim instinctively. Pitch overboard into the sea a lot of men who have never learned to swim, and at least ninety-nine out of every hundred would drown in less than twenty minutes, while every other animal, whether accustomed to the water or not, could easily manage to keep afloat.

Still again, should one at any time wish to go on a journey to Florida, for instance, he would have to work steadily and economize like fury for at least a whole year to get the needed cash to pay his fare and his other expenses, while a bird, one of the long-winged swimmers, could easily get there in less than twenty-four hours, and have the rest of the time to loaf around in that delightful section; besides, the bird, while on its journey, could vary the programme by an occasional fish dinner and a jolly good swim in the sea.

Now, as to the power of his voice, man is proportionally far behind many of the other orders in that respect. If the average person had a voice in proportion to a frog's croaking, the most powerful foghorn would be almost as a whisper compared to it. Should a politician have such a sonorous delivery—which we are all mighty thankful is not so—he could stand on an eminence somewhere near the middle of any State and stump the whole commonwealth at one lick.

Also, in regard to singing, how much greater volume has a bird's voice comparatively than a human's! If one of our noted singers had as loud and as clear a voice proportionately as a hermit thrush or a red-winged blackbird has, he or she could take a position on one of the sky-scrapers and charm the whole population of Greater New York with her vocal music and not half try.

Then in regard to running and leaping. There is scarcely an animal, aside from a snail, but what can beat man out of his boots in those exercises—that is, taking into consideration the differences in size and weight. If one could run as swiftly as the majority of other animate things, autos, wheels, and trolleys would be useless articles. Supposing an athlete were capable of making a succession of leaps of fifty feet each, he could fill Madison Square Garden with spectators night after night from floor to ceiling. Now there are lots of our wild quadrupeds that can double that distance proportionately and keep up that gait for quite a long time.

Another illustration. If in proportion to his size and weight, one could leap or jump as far as a common flea can, why, goodness gracious, if he, facing west, stood in one of our Eastern States and commenced leaping, about ten jumps would land him over on the other side of the Rocky Mountains!

And I sometimes have wondered whether poor, sickly, bald-headed, spectacled, toothless or semi-toothless humanity would not be willing, or even glad, to part with "a few" of its highly-strung mental faculties in exchange for the bounding healths, the heads as well thatched, the teeth as sound and as pearly white, and the senses as acute as those of the average mammal.

But why continue this any further? If one will but notice he will find that nature is no more partial to man—even if she has endowed him with a superior mind—than to any one of the other orders of her animate children.

A. L. L.

MILHURST, N. J.

## New York Zoological Society.

THE annual Report of the New York Zoological Society for 1904 comes to us in an imposing volume of almost 275 pages, by far the largest as yet brought out. As usual, it is handsomely printed and is illustrated by a multitude of engravings of great beauty and value to all who are interested in the Zoological Park or in the zoology of the vertebrates.

The total membership of the Zoological Society is now 1,578, of which 1,315 are annual members, 182 life members, and the remainder founders, associate founders and patrons, with one benefactor, Mr. William Rockefeller. The report of the executive committee shows constant progress in the development of the park and the aquarium; a number of new buildings such as the bird house, the ostrich house, the small mammal house, the Harriman Alaskan house with its totem pole, have been erected and each one of these is full of attractions to the many visitors to the park. The improvements in the aquarium have been many. The Zoological Park has been recently made more accessible by the opening of the new rapid transit system, which carries the public by a new route and for a single fare to the very borders of the park. That this accessibility is being taken advantage of more and more, is shown by the constantly increased attendance, which consists very largely of very poor people, whose opportunities for pleasure are limited and to whom the opening of the park with its multitude of attractions is a very great boon and blessing.

Great numbers of additions to the collections have been received during the year. Among these are a riding elephant from Col. Oliver H. Payne, two snow leopards from Mrs. Hugh D. Auchincloss, a Baker's roan antelope and five Punjab wild sheep from Mr. George C. Clark, two Burrhel sheep from Mr. J. J. Hill, a large number of ostrich-like birds for the filling of the new ostrich house from Mr. Charles T. Barney, and a great number of other gifts, a full list of which is given in its proper place. Mr. Grant, the secretary of the Society, tells briefly of landscape and forestry work which has been done in the park, to which article is added a list of the trees and shrubs found in the park.

The Report of the Director is full of interesting detail, and gives a programme of what is contemplated in the work of construction for the year 1905. The showing is a fine one. Mr. C. H. Townsend, the Director of the aquarium, reports interestingly on conditions there. The attendance during the year—over 1,600,000 people—shows how highly the aquarium is valued by the New York public. It is also doing a remarkable educational work in

furnishing small aquaria for schools to assist teachers of biology in their work of instruction. Certain work of fish hatching is going on all the time. This is open to public inspection and arouses much interest. The gifts to the aquarium as well as those to the park are duly listed.

In addition to the reports of officers are several special papers by persons belonging to the Society. Mr. W. T. Hornaday describes a new white bear from British Columbia under the name *Ursus kermodei*; Mr. Townsend writes most interestingly of certain pinnipeds, or seals, giving data as to their present commercial importance; Drs. Harlow Brooks and W. Reid Blair discuss cage paralysis of primates in captivity; Mr. Raymond L. Ditmars gives some "Observation on the Mental Capacity and Habits of Poisonous Serpents," besides describing a new species of rattlesnake and an unusual variation in another rattlesnake; Mr. C. William Beebe gives an interesting account of the ostriches and their allies, and Mr. Madison Grant has a paper—already noticed in FOREST AND STREAM—on the Rocky Mountain goat.

All these articles, as indeed the whole report, are illustrated by beautiful reproductions of photographs carefully printed on heavy paper. The volume is one that belongs in every library.

## Siberian Birds.

IN a recent number of the Bulletin of the American Museum of Natural History Dr. J. A. Allen reports interestingly on the birds collected in northeastern Siberia by the Jessup North Pacific Expedition. The collecting ground was on the north and west shores of the Okhotsk Sea, and so very close to the point where the old world and the new approach each other within a few miles. Nevertheless there are scarcely any American birds included in the list except those which are common to the old world and the new alike, and a few sea birds which might readily enough in their wanderings overstep the exact boundaries which nature seems to have set for some species. In the list there are two new forms described, one a lark the other a titlark (*Anthus*).

The collector has made quite full notes on the habits of some of the species which came under his observation and often gives the Russian name of the bird, yet this does not necessarily mean much since the Russians seem to have special names only for the larger birds, while small land birds are called *P'tect-ish-ka*, meaning little birds. In the same way the smaller sandpiper are called *Koo-lich-kah*, the diminutive of *Koo-leek*, a sandpiper. Mr. Buxton, the collector, was assisted by a Russian officer who is greatly interested in the fauna of the region and who presented Mr. Buxton with about 220 skins.

An important species on which the inhabitants depend more or less for food is the Siberian white-fronted goose, which reaches the Anadyr district about May 1, coming a little earlier or a little later, according to the weather. By June 1 they have all arrived, and by the middle of June the eggs are laid. In the latter part of July they repair to the large lakes inland to moult, and when they have lost the power of flight, the Russians make expeditions to these lakes and kill many of the geese. The Tungus also visit these places with canoes and secure many geese. The migration from the north begins Sept. 1 and continues for a month. Some of the hunters kill large numbers of the geese and salt them for winter use.

Mr. Buxton found the black grouse near Marcova, where they are said to be common. The willow ptarmigan and the rock ptarmigan are found, but the former is much the more abundant. Of the raven Mr. Buxton says:

"One of the most interesting and conspicuous birds in northeastern Siberia. During the winter many of them congregate about the Russian and native settlements, where they find garbage and dead dogs for food. When traveling in winter time one also encounters them on the barren tundra far from villages. At that time they will come up behind the sledge and sail slowly over the whole length of the dog teams, eyeing the outfit critically, alight on the snow off to one side of the trail, and then repeat the performance after the sledges have passed. The dogs prick up their ears and race madly over the snow so long as the raven continues in sight. For days at a time this is the only diversion that the traveler has from his monotonous journey. They are a sacred bird to the Koraks, who hang reindeer heads and pieces of meat on poles about their camps for them.

"At Kooshka, about April 1, they begin to fly down the river every evening in large numbers to the sea, where they roost, and return up the river the next morning. They come straggling down after their day's foraging like a lot of children just out from school. Some play on the way, chasing each other and circling about anything that attracts their attention; some fly rapidly along, alone and in groups of four or five; while others amuse themselves by uttering all their notes and calls. Have often heard one far up the river, long before it came in view, running over these notes, and it continued until it passed and disappeared over Maiak Point, two miles distant. They have seven distinct notes.

"When sailing along, looking for food, they have a curious way of closing one wing and dropping several feet on that side, and then extending it and closing the other, repeating this several times, which makes them appear to revolve in the air."

The paper is one of unusual interest.

## Sharks and Bathers.

Editor Forest and Stream:

I have many times heard it stated that there is no well authenticated instance of a shark having attacked a Caucasian while bathing. I am not able to furnish you positively with such an instance on this occasion, but can come fairly close to it.

On the 14th inst. an enlisted man by the name of Abernathy was swimming with two companions in the bay at this station. He was out from the beach about 200 yards, and not far from a steamboat at its cus-

tomary anchorage. While he was swimming along, he was attacked by something in the water with such violence that he cried out with pain. His companions immediately came to his rescue, and a boat was sent from the steamboat, which picked up the whole three and carried them to land. On taking him out of the water, he was found to be bleeding profusely from his right foot and ankle, and by the time medical aid could be obtained, which was but a comparatively short period, he had nearly died from loss of blood. The surgeon quickly stopped the bleeding, took him to the hospital and dressed the injured member. He found several gashes penetrating to the bone—one on his ankle well up, one on his heel, and one on his instep, each several inches long, besides minor ones. The surgeon took fifty-nine stitches in dressing his injury, and he informed me that the wound had every appearance of having been made by the teeth of a shark or some similar animal. I saw the wounds myself on the following day, but of course could then form no idea as to their origin. I had supposed by their number that the fish, or whatever it was, had made several snaps at the leg, but Corporal Abernathy assured me such was not the case; he felt but one attack; it lasted only for an instant and that was all there was of it. The sailors who came out and took him into their boat say they saw a shark attack him (I give the remark for what it is worth; any one is at liberty to believe as little or as much of it as he may choose). It would appear that some large swimming animal bit this man most cruelly, and as sharks commonly loiter about steamboats, it is only a fair inference that it might have been a shark.

I am happy to add in conclusion that Corporal Abernathy is now doing well, and bids fair to recover; but the poor fellow must pass a long and painful period before he is able to swim again.

WM. T. FLYNN.

CAMP WALLACE, Union Province, Luzon, June 16.

## Some Birds' Winter Food.

MR. W. L. McATEE, of the Biological Survey, Washington, D. C., has recently called attention to a food supply for birds found in the heaps of drift cast up along the shores of rivers, creeks and other bodies of water.

It is a well recognized fact that crows, in winter and spring especially when the ground is covered with snow, resort to the shores of streams and to the seashore for food, but it is not so generally known that jays, blackbirds and many sparrows do the same. In order to ascertain the character and quantity of the available food in these drift heaps, Mr. McAtee recently filled a half-pint tin can with this material, scraping it in at random from the surface of one of the piles. In this half pint of material he found by actual count 1,583 seeds and fruits of more than fifty-five species of plants, all of them food eaten by birds and found in stomachs that have been examined. Besides the vegetable matter there were a few insects in various forms. This observation suggests the vast amount of food existing in the cast-up material which lines the shores of all our waters, and is one of very great interest.

## A New Danger to the Heron.

SURGEONS have long been seeking for some material for sutures and ligatures which should be more satisfactory than those at present in use, which include cat gut, kangaroo tendon, silk worm gut, horse hair and silver wire. Dr. Chas. F. Kieffer has recently used and suggests in a medical journal that the tendons of the cranes and heron make excellent sutures and ligatures and seem to possess some advantages over the materials at present in use.

Should these suggestions be generally approved by physicians, birds of the heron group are threatened with a new danger, which naturalists and bird lovers will deplore. Some species of heron have already so greatly decreased in numbers that they are even thought to be on the verge of extinction, and all have become much less abundant than they formerly were. The herons are not prolific birds, the number of eggs in the nest being small. The danger which threatens this group is thus a very real one.

## How Field Mice Live in Winter.

THE farmer with whom I am domiciled has recently discovered that some forty young bearing apple trees whose leaves are beginning to turn brown, were girdled last winter by field mice. The trees are about four inches in diameter. Most of them will certainly die, as the bark is eaten off all around, but a few may live, not having been entirely girdled. Besides apple trees, quite a few maples and birches have suffered in the same way. The incisions are some twenty inches above ground, indicating the winter snow level. While the blanket mantled the earth at this line a thaw came and a crust resulted. This impounded the mice and they ate the bark as a last resort to keep from starving. Very few could have died, for they are unusually abundant this summer. The hay harvest has uncovered hundreds.

PLAINFIELD, Mass.

## Fish Stop a Train.

TWO five-inch fish held up a freight train on the Jersey Central Railroad yesterday. When the train neared Whiting station the steam began to give out, and it was necessary to haul up at Whiting for want of power. The fires were drawn and an investigation made. There were no obstructions in the boiler. The feed pipe at the boiler end was clear, but when the feed pipe opening at the tender end was examined it was discovered that two little fish had been plastered, dead, over the opening. They were taken out and the train resumed its journey. Railroad men say that they have heard of eels plugging up locomotives, but never before of fish stopping a train. It is supposed that the two got into the tender tank when water was drawn from one of the brooks on the road.—New York Times.

# GAME BAG AND GUN

## Primitive Hunting Ways.

To the hunter of to-day with his breechloading shot-gun or rifle, his guides, his dogs, his thousand articles or implements tending to add to the comfort or to the effectiveness of his outing, few things should be more interesting than a knowledge of how his forerunners in the land captured the game on which to a large extent they subsisted. Their weapons were primitive; a few yards of line, a net or two woven of vegetable fibre, a wooden bow backed with sinew, and a few stone-headed arrows, constituted almost their whole equipment for the chase.

The FOREST AND STREAM has had, first and last, many accounts of such hunting; accounts given sometimes by the men whose memories went back almost to the days of the stone-headed arrow, or by some early traveler among the Indians who had observed their methods and left a record of how they lived and what they did.

We are permitted to copy from the bulletin of the American Museum of Natural History an account given by Mr. Roland B. Dixon, of the hunting methods of the Northern Maidu of California. Mr. Dixon is studying Indians for the Huntington California expedition, and his attractive accounts of the primitive methods of hunting the deer, elk, bear and smaller game furnishes interesting reading for the hunter of to-day.

That portion of the Maidu living in the mountains depended much more on game than did the lowland people, and they were much more skillful hunters.

Deer were hunted in several ways. During the rutting season in particular, a favorite method was to stalk the game, wearing either a whole deer hide with head and antlers left on, or merely the head and antlers. The antlers, in either case, were usually scraped out hollow, to make them lighter. Wearing this disguise, the hunter went to bushy places, where deer were plenty, and by pretending to be eating, attempted to get near enough to the deer to shoot it with bow and arrow, held carefully concealed close against the breast. Deer were also often run down by single hunters, both in summer and winter; in the latter season, the hunter having to rely, of course, on snowshoes.

It was on the larger hunts, in which great numbers of men participated, that the chief development of their hunting methods lay. Deer drives of considerable size were held at different times of the year. In some, the men would spread out over a large extent of country and drive the deer over some steep cliff. More commonly, certain men would be posted at known deer runways and trails, and then, the deer being started up by the beaters, the concealed hunters would shoot the deer as they fled along their accustomed paths. Often fires were set to drive deer. The most important method, however, was that in which drive-fences were employed. It was almost wholly confined to the mountain area. Thirty or forty men were necessary to carry out such a drive successfully. The fences were made of reeds or grapevines roughly twined together, stretched from tree to tree and between bushes along the mountainsides, and arranged to cross as many known deer trails as possible. The entire length of some of these drive-fences was often as much as a mile or more. The fence had usually a number of sharp salients or angles, in each of which was a pit, in which a man was concealed. These concealed men, being in place, the others spread out over the ridge, and slowly advancing, drove the game toward the fence. The deer, reaching the fence, followed it, and trying to escape at the various angles, were there shot by the men in hiding, or sometimes were merely clubbed to death. Drives of this sort were held only in the spring and fall.

The whole affair was accompanied by much ceremony. Before the drive occurred, all who were to take part in it assembled on the ridge where the drive was to be held. A fire was built, and offerings made to the *ku'kini* or spirits of the mountain, and prayers for a successful hunt were repeated by the old men. The deer were besought not to jump over the fence, or to try to break through it or crawl under it. As the hunt went on, the deer, as they were killed, were brought to the spot where the ceremony was held. The legs of all were cut off and placed on a small platform built in the branches of a tree near by, and left there till the drive was over, the affair often lasting several days. During this whole period of the drive, the women and children, who were all left at the village, must observe a variety of regulations. Children had to be very careful; they must not play violently, shout, jump over things, kick, run, fall down or throw stones. The women also must keep quiet and stay much of the time indoors. Should these regulations be broken, the deer would become unmanageable, would jump the fence, and the whole drive be unsuccessful. During the whole period of the hunt no deer bones must be thrown away or burned or eaten by a dog. During the period of the hunt, the hunters ate only the liver of the deer killed. They must also abstain from their wives for some time previous to the hunt and during it. When the hunt was over a second ceremony was held at the same place as the first. Similar offerings of food and beads were made again to the spirits and the deer. Then the meat was collected and equally divided among all who had taken part. The leg bones were taken down from the platform and divided, to be taken home and cracked for the marrow. The antlers and jaw bones of all deer killed were hung up on some bush or small tree, at the spot where the animal was killed. This custom applies as well to deer killed by single hunters at any time.

Dogs were at times used to help in these drives, or by single hunters. A good hunting dog is said to have been highly prized. The dogs used are described by some as being much like the coyote in shape, size and color. By others they are declared to have been smaller, resembling more a poodle.

In the Sierra region bears were usually hunted in the spring, at the time when they are just about awakening from their period of hibernation. The bear being located in a cave or hollow tree, the hunters, of which there are always quite a party, held before the cave a ceremony, in general similar to that already described as preceding the deer drive. Several men then took torches and bows and went into the cave. As a result of the ceremony, the bear was supposed not to look at the men. The hunters made an address to the bear, in which he was told that his life had been paid for, and that he must stand up and give them room to shoot. This the bear was supposed to do, and was accordingly shot in the heart at once. The bear being dead, the arrow was extracted, decorated with beads and hung to a bush nearby.

Grisly bears were hunted only by those who were very fleet of foot, and renowned hunters. The grisly was never attacked except by a number of men together, and in the foothill region in the following manner: Four or five men would go in a party, and all but one would hide behind trees or rocks in the vicinity of the bear. One man then went as near the bear as possible and shot once, or twice, if he could. He then ran, followed by the bear, toward the place of concealment of one of the other hunters. Slipping behind the tree or rock, the first hunter would stop, and the fresh runner would instantly jump out and run toward the place where another man was concealed. The bear would follow this second runner, and as he passed the tree or rock, the first would again shoot at him. The second runner would similarly change places with the third man, who, running toward the fourth, would lead the bear away again. Thus each hunter had time to rest and to shoot several arrows while the other men were taking the attention of the bear. By thus changing off, they tried to tire out the bear and fill his body full of arrows, until he finally succumbed. It was always, however, dangerous sport, and not infrequently several of the hunters were killed.

Elk were usually run down, being followed for days, and finally dispatched with bow and arrow. Squirrels and rabbits were shot with blunt arrows; and rabbits were also taken in nets stretched from bush to bush and upheld by sticks. Into these nets, which stretched for many hundred feet, the rabbits were driven, and clubbed to death at the nets by men stationed there for the purpose, the rabbits generally getting their heads caught in the meshes of the net.

Quail were snared. In their seasonal migrations they pass from the lower to the higher ridges, and back by well-defined little trails. Along either side of one of these runways a tiny fence of little twigs was built, standing some fifteen or twenty centimetres high and extending for perhaps two hundred metres. Every five or seven metres an opening just large enough for a single bird to pass, was left, now on one side, now on the other. In each of these openings a fine hair-noose was set, and a few berries scattered on the ground just outside the gate. The quail, following their usual runways, passed between these fences, saw the bait scattered for them outside the openings, and passing out to take it, were caught by the hair-nooses. In this manner scores of quail were often collected in a single day.

Grouse were usually shot. Pigeons were often snared or netted by stretching nets across certain gaps in ridges, through which the birds were known to fly habitually. The eagle was never shot, it seems; as to do so would be sure to bring bad luck, make the bow warp and the arrows break.

Geese and ducks were caught in several ways. In the Sierra, among the Northeastern Maidu, they were often shot; but a more common method was to stretch a cord across a stream and hang from it every foot or two, a noose, held open by a piece of stiff grass. These nooses hung just over the surface of the water, and many birds were caught as they flew. In the Sacramento Valley another method was in use. Three light props of elder from two to three metres long were used to hold vertically a net about two metres wide and six metres long. Three or four of these nets were thus set up end to end, the lower corners of the nets being pegged down by sticks. A long cord ran from the props to a grass-and-bough shelter some hundred yards away. One or more decoy geese were placed on the ground near the net. When the snare was set and the geese alighted nearby, the string was pulled by the hunter concealed in the shelter, the props gave way, and the net fell on the birds as they rose, and held them till the hunter could reach them. Ducks were, in this region, also caught with nets in another way. The nets were set on bent sticks from the bank out over the water's edge. When the ducks came to sleep, they touched strings which released the nets, and were caught under the nets as they fell. The cord-and-noose method above described was also in use here.

Crows were caught in the Sacramento Valley for their skins, which were used in the making of feather cloaks. A low, bushy willow was selected, and in it, at some height from the ground, a small nest or platform was built, reached by a rude ladder. Seated in this nest, a man was completely concealed. Two light sticks, from two metres and a half to three metres long, were then taken and tied together loosely at one end. These were then spread out like a V, and between

the open arms a net was stretched. By opening or closing the V-shaped frame, this net was opened or shut like a fan. One man then hid in the nest in the tree, entering it after dark, and had with him one of these folding nets. Other men then went about and scared up the sleeping birds, which were driven toward the concealed hunter, who, as the birds passed by overhead, swept out his net, closing the sticks as he did so, and in this way often caught a considerable number of birds.

## Audubon Society Bird Laws.

LOS ANGELES, Cal., July 28.—*Editor Forest and Stream:* One of the editorials of your issue of July 15 notices the "Audubon bird law." Please permit one of your readers a few criticisms. The scheme of classifying the game birds into various orders, Anatidæ, Rallidæ, Limicolæ and Gallinæ, does not include all American game birds. It does not, I believe, include the dove, unless by some hook or crook that bird may be classed under Gallinæ. But the laws of many of our States specifically declare the dove to be a game bird. The Penal Code of California so declares it. And any sportsman who has ever spent an hour or so on a "flight" of these swift-winged birds will surely not care to raise the question.

In the opinion of the writer, there are two sides to this "Audubon bird law," as there are to most other questions; and I do not think the Audubon Society, nor its work, past, present or prospective, is justly entitled to the unqualified praise meted out to it in the editorial columns of FOREST AND STREAM—a paper that is supposed to stand for the best interests of American sport and sportsmanship and sane game protection.

If the Audubon Society is responsible—and I believe it is—for the enactment in California of laws for the protection of such unmitigated feathered pests as the "flicker" or "yellowhammer," the orioles and other destructive species of birds, it is engaged in a poor business. The flicker has a pernicious habit of boring good-sized holes in the walls of frame houses, as I can testify, and the orioles and many other varieties are very destructive to fruit and berries. For my part, I would not for a moment obey such an unjust and irrational law, and will cheerfully continue to kill every mischievous flicker that opportunity affords.

To return to the dove. The Audubon Society—or at least that small branch of it that is located in Pasadena, Cal., recently succeeded in having an ordinance passed by the Board of Supervisors of this county prohibiting the killing of doves. This in the face of a State law which recognizes the dove as a game bird and prescribes a season during which it may be lawfully taken. The immediate result of this action on the part of the Society, and the kowtowing to them on the part of the supervisors, has been a test case, instituted by the Los Angeles County Game and Fish Protective Association, to test the validity of the various county game ordinances of this State.

The case is now pending before the District Court of Appeals on habeas corpus proceedings, and if the contention of the game association is lost there, the case will speedily be taken up to the Supreme Court of the State for decision.

Briefly, the law point presented to the court for decision is as follows: A statute of California attempts to delegate to the various county boards of supervisors, power to shorten, by ordinance, the open seasons for game and fish, as provided by the general State game law. Is this delegation of legislative authority constitutional? There are other points of law involved, but that is one of the main ones. So far as I am able to discover, after an exhaustive search of the authorities, the question has never been directly passed upon by the Supreme Court of any American State.

Under this attempted delegation of authority the various county boards of California have passed and re-passed, changed, rechanged, repealed and re-enacted game and fish ordinances by the score, until the State game law has been so butchered, so unreasonably mutilated and turned topsy-turvy, that it would require the constant attendance of a Philadelphia lawyer to determine the game laws of the different counties.

The present State game law of California is a good law, adequate in its protection of the game, and allowing a reasonable season to the sportsman within which to take it. If any one sufficiently interested will compare the California statute with those in force in the Northern, Eastern, and Southern States—the Atlantic States generally—he will see at once that California, with her abundance of game, has in general more stringent game laws than the States above referred to, where the population is much denser and game of all kinds much scarcer. Take wildfowl, for instance: California allows the shooting of wildfowl for four months—Oct. 15 to Feb. 15—whereas many of the Atlantic States permit the shooting of wildfowl for six months during the year, and in some instances, seven months.

All game in California is on the "no sale" list, except wildfowl. For this we give thanks. We hope some day to prohibit the sale of wildfowl.

If the report that has reached me is true, at a meeting of members of the Audubon Society held recently in Pasadena, one of the officers, in the course of an address, said in part (I do not attempt to use his exact language): "This Society will take immediate steps to secure the enactment of laws that will prohibit the killing of any of God's creatures." I only hope that report may be wrong in this instance. If, however, such gush and sentimental tommyrot is the object of the Audubon Society, I think FOREST AND STREAM should

think twice before giving the Society and its aims such indorsement as the editorial that caused me to send this letter.

I trust that in your accustomed spirit of fairness and love of fair play and the "square deal," you will give space to this letter.

ROBERT ERSKINE ROSS.

## Massachusetts Game.

BOSTON, Mass., Aug. 5.—*Editor Forest and Stream:* The season for the shooting of shore birds in Massachusetts opened on July 15. Reports are that but few birds have been killed, although some have reached the Boston market from Ipswich and the south shore. The price has ruled high. All are forecasting the prospects for upland shooting the coming fall.

Mr. Thomas, of Middleboro, is one of the farmers of that town who became greatly interested in the work of feeding so efficiently carried on by sportsmen and others in 1903 as well as last winter. He says the farmers co-operated heartily with the sportsmen in that work, and he has sown grain this year for the birds. His report of the number of quail in his section coincides with that of Dr. Woodward, the secretary of the Sportsman's Club. They have a good many birds. The Doctor recently passed through Boston on his way to Newfoundland, where he is accustomed to pass the month of August fishing for trout and salmon.

From Springfield, Northampton, Abington, Mansfield, Norton, Weston, Lawrence, Miller's Falls and several other towns reports agree that quail are very scarce in the vicinity of those places. Sportsmen of Natick, a town to which the State Association sent three dozen quail two years ago, take a somewhat more hopeful view and say there are "some" birds.

A former president of the Greenfield Sportsmen's Club reports that he had heard only one quail this season, but has heard from the farmers that there are many broods of partridges. A friend in Lexington says he believes the prospects are somewhat better than last year, but this is offset by the secretary of the Middlesex Club, who says both quail and partridges are scarce in that and adjoining towns where he has had an opportunity to observe.

A friend in Holbrook tells me there are "absolutely no quail" in that neighborhood, and Mr. Hassam, of Needham, says the same of his region. A correspondent of Osterville (on the Cape) says quail are "nearly extinct," but the grain that he received last winter from the Massachusetts Fish and Game Protective Association enabled him to save one covey. "Fairly good indications" is the report from Shirley. Quail seldom heard at Vineyard Haven, and no partridges. A few quail have been saved in Randolph, another town to which the State Association sent three dozen birds in 1903.

Mr. Small, who has charge of the province lands in Provincetown, informs me that he has seen only about half a dozen pairs of quail this season. That is a section which has no partridge cover.

As contrasting present conditions with those of a few years ago a gentleman residing in South Sudbury tells me he used to see as many as twenty-five feeding in his garden, but now they are "very scarce," but "slaughters" are numerous. It is not surprising that from Berkshire we hear there are no quail. Mr. William C. Whitney planted a good number in his preserve but I hear there are none to speak of there now. In fact, on the bird-map of the Biological Division of the Department of Agriculture at Washington, Berkshire is not included in the quail

zone. The portion of our State where the climate is most favorable for that species is the country on the coast, more especially the Cape district. But by winter feeding, in my opinion, quail should do fairly well in all parts of the State except Berkshire county.

H. H. KIMBALL.

## Depredating Cats.

*Editor Forest and Stream:*

When reading the account of Mr. Charles Hallock's hunting cat, the thought occurred to me that it was lucky for that cat that it did not live in my neighborhood. If he did the first time that I caught him with a robin in his mouth I might present him with a charge of BB shot in his head. Robins are my favorite among all the birds, and I take care that none of them are killed if I can prevent it. I have no use for cats, I dislike them principally for their propensity for killing all things that wear feathers if they can catch them. Some of these same cats would not hunt a rat or mouse if you wanted them to do it. I have known them to kill the half of a brood of young chickens in a single night.

When a boy of thirteen I began to get up a flock of pigeons out of two pair of common ones that came from I don't know where, and finding that I was willing to feed them took up their quarters with me. Then an old gentleman gave me a fine pair of pouter pigeons, and from these three pair in less than three years I had a flock of at least 150. I would never kill one of them. I kept them in the upper loft of an old stable that stood on the far end of the lot. I used the lower story of it to keep dogs in. This lot, nearly a quarter of an acre, was covered with grass and bushes, an ideal place to keep the pigeons in. After I had them a year I began to be troubled a great deal with both cats and rats, but the cats did not trouble the rats; it was my pigeons they were after. I got a small terrier that soon cleaned out the rats, but I still had the cats on my hands.

I had a high fence around the lot but it was not cat proof. We had not got the barbed wire yet or I would soon have made it cat tight. The cats would spend hours in crawling around after the pigeons. They could not catch the old ones, but might kill my young ones that would be just learning to fly, and I did not want the cats worrying either the young or old ones. I would knock the cats over with a club, then some would leave and stay away, others would be back again in an hour.

The cat that gave me the most trouble was a big twenty-pound tom cat that a lady near us owned. I went to her and told her that I would have to shoot him if he was not kept at home. She told me to shoot him, then she would see what the squire would have to say about it. I consulted my cousin's law books to find out what he could say about it, and came to the conclusion that he could not say anything. These cats were not property, and in my case they were a nuisance, and the law allowed me to abate a nuisance if I went about it in a proper way. But to be on the safe side I asked my cousin his opinion, telling him the opinion I had arrived at.

"You have it straight," he told me. "Go ahead and shoot any cat you find among your pigeons, but be careful to kill them and don't shoot them outside of the yard, remember. Then if those women haul you up before the squire, and you find you can't conduct this case yourself, send for me. But I guess you won't need me. You seem to be able to get around that squire every time."

I had been before him several times already, the last time for shooting snapping turtles in a large canal basin

right in the middle of the town. I would anchor my boat in the basin, then lie down in it, with my head and shotgun stuck over the side, and when those turtles stuck their heads up I would blow them off. The turtle would sink then, but I could haul him up off the bottom with a rake. A preacher in our neighborhood who attended to every one's business but his own, had me arrested. He said he did it on account of the cruelty I practiced on these turtles. I told the squire that those turtles I shot were never wasted. I ate some of them and sold the rest, and I could find nothing in the statutes to prevent me from shooting them. There was no law then to prevent us from shooting within the city limits, or the squire would have had me.

"Neither can I find any law to prevent you shooting them," he told me. "You seem to put in one-half your time in hunting through these statutes, then carefully keeping clear of them. You can go."

I went back to shooting turtles, and that afternoon took a big one up to the squire. I might be hauled up before him in a week for some other offense. I was, but it was for shooting cats the next time.

I lay for the big tom cat, and the first time I caught him after my pigeons I put a full charge of shot in his head. Then after making sure that he was dead (I did not want to maim him then be fined for cruelty to animals) I threw his body out into an open lot. In about an hour after this the squire sent his young son down to tell me to call on him. "That woman whose cat you shot is up there, and she is going to have you hung for it," the boy told me.

I went up and explained how I came to shoot the cat, and gave the squire another dose of those statutes. "Those cats are not property, your honor, and when they get to be a nuisance, as they are in this case, the law allows us to abate it. Besides, this lady told me to go ahead and shoot her cat. I take that as permission to do it."

"We will have another lawyer in your family, if you live," the squire told me. "You know already just what part of a statement to give, and how much of it to keep back. She told you to go ahead and shoot her cat, then she would see me about it. Well, if you can't keep those cats away from your pigeons without shooting them, then shoot them."

The squire had lost part of his young chickens through these same cats. I had expected that he would want them shot. Turning to the woman next, he said: "I cannot prevent that boy from killing your cats, madam. You must keep the cats at home."

I shot another one of those cats but never had to shoot any more of them after that. They seemed to know what was happening to them now and kept away from me.

CABIA BLANCO.

## Backsliding Already.

LOS ANGELES, Cal., July 30.—*Editor Forest and Stream:* I see that "The Point of View" is being discussed on broad lines. I shall sail for New Zealand on Aug. 31 to be gone three or four months. May strike something in New Zealand and perhaps relapse into savagery for a few days if I get a gun in my hands. I have symptoms of backsliding even now, with the opening of the deer season in California, and rumors of plentiful bear.

FLINT LOCKE.

[Flint Locke was the one who began the "Point of View" discussion by relating that he had stopped shooting for sport because he did not in his heart approve of it any more.]

# SEA AND RIVER FISHING

## A Trip to Barnegat Inlet.

*Editor Forest and Stream:*

Barnegat Inlet has always been noted as a haunt for bluefish. Many men well advanced in years can recall many joyous hours on the briny waves of this inlet and the nearby old ocean, spent years ago in pursuit of this voracious fish. Nothing is so suggestive of a complete change from the stuffy city, and its business cares and nervous strain, as a seat in one of Barnegat's catboats dancing over the green seas, with a two-reef breeze, the fish breaking water on every side, and the white gulls screaming all around you, and every squid-line out coming in loaded. But it must be said that for the last few years the large fish have been scarce. The "snappers" or "tailors" of about 1½ pounds have usually come every summer, and live around the shoals, while the warm weather lasts.

The word "Barnegat" is derived from a Dutch word, "Barend-gat." It is said to have been first distinctly noticed and named by Cornelius Jacobsen Mey, the Dutch navigator who, in 1614 in the ship Fortune, explored the coast of New Jersey and the Delaware Bay. It may have been visited by the Dutch traders before this period, as about this time and subsequently, they were penetrating all parts of the country adjacent to Manhattan Island in search of furs. Whether Captain Mey or other Dutch explorers first named this inlet there can be no doubt that the epithet applied to it meant in the Dutch language "Breakers Inlet." So says Dr. T. T. Price in his "History of the New Jersey Coast."

And the meaning implied is a very proper and appropriate one, for the shoals are numerous and extend off from one to two miles, requiring coasting vessels to keep well off at sea. These shoals and bars are constantly shifting and changing, rendering the navigation of the inlet difficult for persons not acquainted with its channel. Now, there is but one good channel over the bar, and that is at the extreme south end of the inlet.

There is from eight to nine feet of water on the bar at low tide, and from eleven to twelve feet at high tide. From the outgoing channel to the northward the inlet is white with foaming breakers stretching to the point of North or Island Beach bounding on the north. These foaming breakers seem to be very attractive to small fish, and these latter are attractive to the bluefish, red channel bass and other feeders, and the larger fish hover and live around the inlet frequently all summer. The menhaden, or "moss-bunkers," also frequently this locality in large numbers, and furnish a large part of the food of the bluefish. But of late years the destructive raids made by the menhaden fish companies with their steamers, pursuing up the food fish by the hundred tons have materially affected the bluefishing, to say nothing of the effort of proprietors of the fish pounds to scoop the whole thing. The larger sized fish for several years have been very scarce, and the only conclusion was they had sought other quarters where they could find their food.

The fishing has always improved when the smaller food fish have appeared. The small silver fish, the smelt, the spearing, the sand eel and the menhaden are always welcomed at Barnegat Inlet, for their presence always promises good fishing for the larger varieties.

The writer, hearing by letter from his captain, Captain Lemuel Matthews, of Barnegat, that the fishing prospects were fair, started for Barnegat city on Saturday afternoon, July 22, and putting up at the very hospitable Hotel Sunset, spent Sunday ashore, resting with breakers' roar on one side and the lapping wavelets of the broad Barnegat Bay on the other. The Hotel Sunset has a fine location on the bay side, with its front facing the setting sun, and is well and appropriately named. The sunsets here are peculiarly gorgeous at times. Fishermen can rely upon good treatment at this very pleasant hotel. Every comfort is ministered to by its genial and tactful manager, Mrs. J. H. Romaine.

Monday was spent in the bay. The weakfishing in

the bay at times is extraordinary. But the fish seem capricious, and the point that yields a good score today will be barren to-morrow, and the place where they were not to-day will have them in immense numbers to-morrow. The weakfish have been somewhat late in arriving, but their numbers are constantly increasing. Our score was fifteen very fair fish.

Tuesday was spent in the thoroughfares—High Bar and Vol Sedge—and resulted in no fish; it is too early for good thoroughfare fishing. A poorly snooded hook lost us a fine big one in High Bar. While fishing in the latter place Captain Lem. called my attention to the arrival and anchoring of several fishing smacks well off shore, and said at once, "There must be big bluefish about." In this he was not mistaken, for when we came into the dock Capt. Wm. Ridgway arrived about the same time from outside with about forty large bluefish from 4 to 6 pounds caught on squid. He had gone off shore about five miles for sea bass, and coming in in the afternoon had fallen in with the fish and had a good time among them.

Wednesday meant that everybody that had a catboat would go to sea. We were out first, getting well off shore before 8 o'clock. We found the fish easily, saw them breaking water all around us, but just at the right moment the wind entirely left us and we were helpless for squidding. It sprang up after a while, and we succeeded in capturing about fifteen of the big ones, the largest would go 6 pounds, the smallest about 4 pounds. The wind, however, was quite fluky, and during one of our becalmed drifts we crossed a school of weakfish, and caught fifteen fine ones, all with the squid. They were feeding on sand eels, which were abundant everywhere, and therefore took the squid eagerly; the small bright leaden squid very much resembling the glint and glisten of the sand eel. It was a glorious day outside—sea smooth and wind moderate—until about 3 P. M., when the wind, increasing from the south, the sea roughened and we crossed the bar on our return home, stopping down the inlet to capture twenty-two small

blues or tailors. Our score was, 15 big blues, 22 tailors, 1 bonita (about 4 pounds) and 15 weakfish (about 2 to 3 pounds). Total, 53.

Among the guests at the hotel was Mr. Edward Hudson, of New York, who has been coming here for several years seeking sheephead, striped bass and other game fish. Mr. Hudson was successful on July 17 in capturing an 11-pound sheephead on what is known as the "Old Boiler," a part of the wreck of a sunken coal barge lying among the shoals just outside the point of North Beach, a point that can only be fished on a very moderate day, as otherwise the sea breaks all over the wreck and it is impossible to lay there. In July, 1904, Mr. Hudson caught five sheephead at this place in one afternoon, weighing together 60 pounds. While outside to-day he had great sport with his rod and reel, catching bluefish, using a small squid and a 24-thread line and a moderately heavy rod for the tailors, and a stout surf rod for the 5-pounders. Mr. David Brown, with a party of four lines, caught about eighty of the larger fish.

Thursday the news of the catch of bluefish soon spread, and on this day some twenty-five yachts were outside. Another perfect day, with moderate westerly wind, and smooth sea all day; and it was the best day of all for the bluefishing. Lem. and I captured sixty of the big blues, ranging from 4 to 6 pounds, also fifteen weakfish all caught with the squid. The school of weakfish was an immense one, and if we had wanted them we could have filled the boat. Mr. Hudson was out again, using his rod and reel. It was fine sport for him, and it was interesting to watch the struggle, his captain having frequently to throw the boat into the wind to enable him to land his fish.

Friday, the 27th, was another fine day, probably the finest of the week, a moderate two-reef breeze blowing all day, with a very smooth sea. On our way out we took aboard our old friend Capt. Joel H. Ridgway, who for nearly thirty years was the keeper of Barnegat Life Saving Station, a man of cool head and rare judgment, and splendid personal character. We were glad of the opportunity to renew old acquaintance, and the day was much enjoyed by all of us. We found some fifteen fishing smacks engaged in chumming the bluefish. Each smack carries four to six dories, and each dory has two men. The chum is menhaden, ground up and spooned out at regular intervals until an oily slick is made upon the water. The bluefish get into this slick and come up to the boat, when the fishermen baiting with a small chunk of menhaden haul in the fish as fast as they can get their lines over. Large numbers are caught in this way, and as soon as a cargo is obtained the smack weighs anchor and starts for New York, and the fish soon find their way to Fulton Market. When the fish are thus chummed up and filled full of this ground up menhaden they rarely take the squid. This was our luck to-day, for our score for three lines was but nine; but they were bouncers.

Saturday was a day of no wind, and no fish were caught.

Sunday was a day of rest for me, but the inlet was full of yachts and bluefish. The small blues or tailors were there in great profusion. A walk around the strand to the northeast of the lighthouse showed the beach covered with sand eels just driven out of the water by the voracious and ever hungry *Pomatomus saltatrix*. Some of the yachts caught as high as 200 to the boat.

I neglected to mention that on Friday, when outside, we were able to see two objects which in twenty-seven years' experience at Barnegat city we had never seen before. One was a genuine tropical flying-fish exceedingly rare in our waters off New Jersey. He came out of the water like a bird, and flying for about fifty yards, about four feet above the water, entered the water and after a few seconds came out and flew for about the same distance, and so on. We were hardly through expressing our surprise over this circumstance when Lem. shouted, "There's a whale!" and sure enough there he was. He came up three times from about 200 to 300 yards away, the last time he made a tremendous crash in the water as though a three-story brick house had fallen, and then he spouted about twenty-five or thirty feet in the air. He seemed to be about seventy feet long and was headed south. He was doubtless the same whale mentioned in the New York Herald's dispatch of the next day as taking a course in the direction of Long Beach. It was off Long Beach that we saw him. A hundred years ago whales were a common sight off the Jersey coast, but they are very rarely seen now.

Monday was uneventful except for a sail inside. Mr. Hudson was outside and caught thirty-three blues, eighteen big and fifteen small, all with rod and reel. If any one wants real sport this ought to satisfy.

Tuesday we spent the morning in High Bar thoroughfare and caught six fine 2½-pound weakfish. The afternoon was spent in the inlet squidding for tailors; 78 was the score, and 60 of these were caught with rod and reel—our first experience with this kind of fishing. A small squid was used and a light line of about 25-thread. More fish can be caught in this way than with the common heavy hand line, as the lighter line is not seen so plainly in the water. Our thumb and fingers of the right hand were thoroughly tired out with the constant exertion in winding reel. The water seemed alive with fish breaking water in every direction, and there were places, where if it had been possible to have trolled twenty lines, every one would have been loaded with a fish. It was a great day.

Wednesday morning we took our departure, voting our 1905 July trip the best in many respects we ever had.

JAMES G. FRANCIS.

### Black Bass Near New York.

Good black bass fishing was had at these ponds during the week ending Aug. 3, the figures being supplied by the Erie Railroad agents at the places named: Sterling Forest, N. Y., Greenwood Lake; Monroe, N. Y., Lake Mombasha; Parker's Glen, Pa., Twin Lakes; Carbondale, Pa., Elk Lake; Narrowsburg, N. Y., Cochection, N. Y., Callicoon, N. Y., Hankins, N. Y., Long Eddy, N. Y., Hancock, N. Y., all on Delaware River,

## Chicago Fly-Casting Tournament.

We have received the programme of the fourth scientific angling tournament to be given by the Chicago Fly-Casting Club, on Friday and Saturday, Aug. 18 and 19, at North Lagoon, Garfield Park, Chicago. The programme is handsomely printed, having portraits in color of the brook trout, rainbow trout and small-mouth black bass, and a concise history of the club, which runs as follows:

The Chicago Fly-Casting Club was organized in 1891, incorporated in February, 1892, its objects being to encourage the art of angling in a scientific manner, the use of artificial lures in the capture of game fish, to promote good-fellowship and social intercourse among its members and the angling fraternity generally, and to assist in the protection and propagation of game fish.

Series of contests for each season were inaugurated and an increased interest in fly-casting was promoted to a very great extent. It was determined by the club in 1893 to add bait-casting as one of the events of its regular contests, as it was recognized that this branch of the sport could be raised to a very high plane, requiring great skill, and time has proved the contention correct, for under the impetus given by the club, bait-casting has risen to a high place in the estimation of the craft. The practicing of it in an artistic manner requiring delicate tackle and skillful, sportsmanlike manipulation, and this has been carried to a still greater degree by the addition in 1901 of the Delicacy and Accuracy Bait Event, in which one-quarter ounce weights are used.

The interest in fly and bait-casting having grown apace, the club felt moved to inaugurate the Chicago Fly-Casting Club's Columbian Exposition Tournament, which was held in the grounds of the Exposition in 1893, and proved to be the largest tournament of its kind up to that time.

Handsome gold championship medals were awarded by the club, one in each event, as well as many other valuable prizes.

The club did much in 1893 to arouse enthusiasm in scientific fly and bait-casting. It reproduced on the shores of the lagoon near the Art Palace in the Columbian Exposition grounds, the Izaak Walton Lodge, where anglers assembled, and from the pier gave exhibitions of fly and bait-casting. The World's Columbian Exposition Scientific Angling Tournament was such a pronounced success that the club may well look back to it for all time with gratification and pride. The winning scores in the 1893 tournament were as follows:

Amateur—Distance and accuracy fly, H. G. Leavitt, Grand Island, Neb., 87 per cent.

Amateur—Accuracy and delicacy fly (dry fly), W. H. Babcock, Chicago, 103½ per cent.

Amateur—Long distance bait (on lawn with accuracy feature), F. B. Davidson, Chicago, 106½ feet.

Expert—Long distance fly, R. C. Leonard, New York, 96½ feet.

Expert—Accuracy fly (at 75, 80 and 85 feet), R. C. Leonard, New York, 88 per cent.

Expert—Long distance bait (on lawn with accuracy feature), E. E. Wilkinson, Chicago, 134½ feet.

Mr. Davidson's longest cast in long distance bait was 152 feet perfect, and remained unbroken for ten years until broken by Mr. H. G. Hascall, of Chicago, in the Grand Rapids, Mich., tournament of 1903, with a cast of 172½ feet perfect, which stands to-day as the best on record in an open event. The succeeding years, 1894, 1895 and 1896, were uneventful outside of club contests. In 1897 the club decided to give a second open to the World Scientific Angling Tournament and to add two more events than were given in 1893, viz., roll fly-casting and bait-casting at buoys in the water. In this tournament, held at North Lagoon, Garfield Park, Chicago, on Aug. 13 and 14, 1897, the best scores were as follows:

Distance and accuracy fly, H. A. Newkirk, Chicago, 91½ per cent.

Accuracy and delicacy fly (dry fly), W. D. Mansfield, San Francisco, 86½ per cent.

Long distance fly, W. D. Mansfield, 111¼ feet.

Roll fly-casting, W. H. Babcock, Chicago, 90½ per cent.

Distance and accuracy bait (¼ ounce at 60, 70, 80, 90 and 100 feet), F. N. Peet, Chicago, 95½ per cent.

Long distance bait (on lawn), F. B. Davidson, Chicago, 98½ feet.

Diamond medals and six other valuable prizes were awarded in each event. Mr. Mansfield broke all records with his 111¼ feet in long distance fly, which remained until broken by Mr. R. C. Leonard in the New York tournament of 1898 with a score of 120 feet, which in turn was broken by Mr. Mansfield with a score of 134 feet in the San Francisco tournament of 1902, which stands to-day the best on record in any open event.

Through the seasons of 1898 and 1899 interest in the work of the club continued to increase, and many new and enthusiastic members were added to its lists, while the value of its efforts was evidenced by the increased scores made at its contests. The general interest having largely centered upon the five events noted below, it was decided to give a third tournament, which occurred Aug. 17 and 18, 1900, at North Lagoon, Garfield Park, Chicago, with results in highest scores as follows:

Distance and accuracy fly, A. E. Lovett, San Francisco, 98 per cent.

Accuracy and delicacy fly, I. H. Bellows, Chicago, 97 per cent.

Long distance fly, A. E. Lovett, San Francisco, 105 feet.

Distance and accuracy bait, A. C. Smith, Chicago, 98½ per cent.

Long distance bait, George Salter, Chicago, 103½ feet.

Mr. Bellows and Mr. Smith broke all records in the two events noted, and a team contest added materially to the interest of the occasion. Mr. H. G. Hascall and Mr. F. N. Peet, the Chicago team, being the winners.

The years since 1900 have been progressive ones for the club, the interest continuing and membership increasing steadily, but they have been uneventful except from a club standpoint, aside from the development of the extremely scientific and popular delicacy bait (¼ ounce) event, which originated with the Chicago Fly-Casting Club and has been incorporated in the events of this fourth tournament. The Chicago Fly-Casting Club feels that its labors have added materially to an increased appreciation of scientific angling and that it has promoted

the cause of true sportsmanship and of God's "out of doors."

Tournament, Aug. 18, 19, 1905.

RULES AND REGULATIONS.

RULE I.

Each person competing shall pay an entrance fee of \$2 for each event, or \$10 for the entire six regular events. Entries to each event close thirty minutes before contest commences.

RULE II.

The captain shall be the executive officer of the day, and shall examine and approve all tackle used in the events. The secretary-treasurer shall receive all entry fees and issue cards to contestants, designating their number in the order of competition. The timekeeper shall start and close all events. He shall signal the judges with a flag and call time to the contestants.

RULE III.

The contests shall be governed by two judges and a referee. In case of disagreement the referee shall decide. The decision of the referee shall be final, except as to a question of interpretation of rules. In such a case contestant shall have a right of appeal to the tournament committee, provided that notice of such appeal is given to the captain before the close of such contest.

RULE IV.

All casting shall be done single-handed only, except where otherwise noted.

RULE V.

Competitors may consult their own wishes in choice of reel and line, but lines must not be knotted, leaded or weighted, and bait-casting reels must be free running.

RULE VI.

Leaders shall be of single gut, and shall not be less than six nor more than nine feet in length. One fly only shall be used, of a size not larger than No. 5. Snell must not exceed six inches in length. Hooks shall be broken off at the bend. Official ½ ounce and ¼ ounce casting weights used in the bait-casting events will be furnished by the captain.

RULE VII.

Fly-rods shall not exceed eleven feet in length, except in event 1. In event 1 the weight and length of the rod is not limited. In event 2, the weight shall not exceed 8½ ounces. In event 3 the weight shall not exceed 5 ounces, but an allowance of ¾ ounce will be made for solid reel seat of metal (aluminum excepted), rubber, bone, ivory or celluloid. Bait-rods unrestricted, except that they shall be single-handed.

RULE VIII.

No cast shall count after the judges have notified contestant that fly is missing until same is replaced.

RULE IX.

If tackle breaks, contestant shall be allowed to replace same if in the opinion of the judges it was defective.

RULE X.

All ties shall be cast off immediately after the contest. The loser shall be entitled to the prize next in order.

RULE XI.

No one except active contestants and captain shall be allowed nearer the judges or casting pier than ten feet; and any contestant distracting the attention of the judges, timekeeper or active contestant in any manner whatever shall forfeit all rights or claims and be barred from any further participation in the tournament.

RULE XII.

The general rules and usages of the Chicago Fly-Casting Club shall be used in deciding any question that may arise not covered by rules in this programme.

Notice.—The Tournament Committee retains the right to reduce the number of casts specified if it deems such action necessary.

### Programme.

AUGUST 18—FIRST EVENT, 10 A. M.—LONG DISTANCE FLY-CASTING.

No limit to rod or line. Ten minutes allowed to cast fly to greatest possible distance. No time allowance for replacing fly.

SECOND EVENT, 1:30 P. M.—DISTANCE AND ACCURACY FLY-CASTING.

There shall be three 30-inch rings, distant 50, 55 and 60 feet from the edge of the casting platform. There shall be made five (5) casts at each ring. If the fly falls within the ring or on the rim of same the cast shall be considered perfect. For each foot or fraction of a foot outside the ring a demerit of one shall be made. The sum total of such demerits, divided by the number of casts, shall constitute the demerit per cent. The demerit per cent. deducted from the 100 shall be the percentage. Not more than one minute will be allowed in which to extend the line to 50-foot ring. When the contestant has extended his line and is ready, he shall call "score," and the next cast thereafter shall be counted. When five successive casts have been made at 50-foot ring, the Captain shall announce "next ring." Contestant must then lift his line, and if he so desires can make not to exceed five "dry casts" before dropping his fly at the 55-foot ring. A like procedure will be followed between 55 and 60-foot rings. Should contestant whip off his fly at any time after calling "score," he will be allowed to replace fly and proceed. For this purpose he may "work out" to point where fly was lost, call "score," and resume scoring at point where scoring stopped. The same procedure will be permitted if contestant's line is fouled through no fault of his. No cast shall count after judges notify contestant that fly is lost.

THIRD EVENT, 4 P. M.—ACCURACY AND DELICACY FLY-CASTING.

(Dry Fly.)

There shall be three 30-inch rings, distant 35, 40 and 45 feet from edge of casting platform, and there shall be made five (5) casts at each ring. If the fly falls within the ring or on the rim, the accuracy shall be considered perfect. For each foot or fraction of a foot outside the ring a demerit of one shall be made. The sum total of such demerits, divided by the number of casts, shall be considered the demerit per cent. The demerit per cent. deducted from 100 shall be the accuracy per cent. In addition, there shall be kept an account of delicacy. The delicacy per cent. shall be determined by the judges and the referee, in manner indicated below.

Contestant will be allowed thirty seconds to extend his line by "dry fly" casting to 35-foot ring. Scoring shall begin the first time the fly strikes the water. When contestant has made five (5) casts, captain will announce "next ring." Contestant must then lift his line and in not less than one nor more than five "dry fly" casts, reach the 40-foot ring. Scoring to begin the first time the fly strikes the water. A like procedure shall be followed between 40 and 45-foot rings. No cast made without a fly shall be scored. If fly is lost, contestant may replace same, and in not more than five "dry fly" casts resume his scoring. Not more than two "dry fly" casts will be allowed between scoring casts, except between rings, as stated. All casting shall be done from the reel. Contestant will be allowed to start with loose line and leader equal to length of rod, and may strip line

but once in every retrieve, and must retrieve last cast. A perfect cast is: (1) Fly to fall by its own weight without a splash. (2) Fly and leader to strike the water in advance of line with minimum disturbance of surface. (3) Retrieve must be made with minimum disturbance of surface. (4) The grace and ease of contestant, his "dry fly" casts, back cast and manner of extending line, shall be scored for style. A demerit shall be scored for each failure to properly execute Nos. 1, 2 and 3, and for lack of "style," as outlined in No. 4; and five (5) points shall be deducted for each demerit scored. The total of delicacy demerits, divided by the number of casts, deducted from 100, give the delicacy per cent. The accuracy per cent, and delicacy per cent., added together and divided by 2, determine the final percentage.

**AUGUST 19—FOURTH EVENT, 10 A. M.—DELICACY AND ACCURACY BAIT-CASTING.**

(1/2oz. Weights.)  
There will be a target provided for this event with a center or bullseye thirty (30) inches in diameter, and so arranged that it can be located at distances of 60, 65, 70, 75 and 80 feet from casting point on platform to exact center of bullseye. There shall be made three casts at the target at each of the distances, viz., fifteen casts in all. If casting weight falls within the 30-inch center, or bullseye, the cast shall be considered perfect. For each foot or fraction of a foot away from the 30-inch center, a demerit of one shall be made. The total of such demerits, divided by the number of casts, shall be the demerit per cent. The demerit per cent., deducted from 100, shall constitute the percentage. In case contestant casts with drag or click, captain shall call "foul" and contestant shall be allowed another cast. The 1/2oz. casting weights provided by the captain shall be used in this event. If weight strikes iron rings or outside edge of circular wooden float, cast scores as though just inside of said ring or edge.

**FIFTH EVENT, 1:30 P. M.—LONG DISTANCE AND ACCURACY BAIT-CASTING.**

(1/2oz. Weights.)  
In this event, the center of bullseye will be located at distances of 60, 70, 80, 90 and 100 feet from casting point on platform. Three casts shall be made at each distance. The casting weights are to be the 1/2oz. weights provided. Scoring and other conditions to be the same as for Fourth Event.

**SIXTH EVENT, 3 P. M.—LONG DISTANCE BAIT-CASTING.**

(1/2oz. Weights.)  
The casting in this event shall be done on the lawn in a V-shaped court, which is to be laid out as follows: From the casting point two diverging straight lines are to be laid out at an angle which shall cause them to be 30 feet apart at a distance of 100 feet away from the casting point. Diverging lines to be continued indefinitely at the same angle. Contestants each to make five (5) casts, in turn, one cast at a time. If casting weight falls outside the court, the cast shall be scored 0. Length of cast to be computed from casting point to where weight falls inside of court.

The sum total of the five casts in feet, divided by the number of casts, shall be the average and constitute the score of the contestant. All casting to be done from ground level. The casting weights used are to be the 1/2oz. casting weights provided. Conditions concerning free running reels and casting with click or drag as outlined in Fourth Event to prevail in this event.

Should weight fall inside court and bound out, cast to be scored from where weight first fell.  
The longest single cast, in court, will be made a matter of record and awarded a prize as noted.

The officers and the committees are: Geo. A. Hinterleitner, President; E. L. Mason, Vice-President; John Hohmann, Captain; B. J. Kellenberger, Secretary-Treasurer. Executive Committee—Geo. A. Hinterleitner, E. L. Mason, B. J. Kellenberger, John Hohmann, H. C. Hascall, E. R. Letterman and C. F. Brown. Tournament Committee—H. Wheeler Perce, Fred N. Peet, Wm. T. Church and members of Executive Committee. Reception Committee—W. T. Church, Chairman; O. E. Becker, I. H. Bellows, D. B. Bronson, G. A. Davis, Jos. A. McCormick, H. B. Noyes, F. S. Smith, E. P. Sperry. Grounds and Equipment Committee—E. L. Mason, Chairman; O. J. Loomis, C. L. Bequeath, F. P. Naylor, R. H. Gillespie, Robt. Slade, Jr.

**Chicago Fly-Casting Club.**

CHICAGO, Ill.—*Editor Forest and Stream:* Below are scores for contest of July 29:

	1/2-ounce Bait.	1/2-ounce Re-entry.	Distance & Acc'y, Fly.	Distance & Acc'y, Fly, Re-entry.
Becker, O. E.	.98 3-15	.98 5-15		
Bellows, I. H.	.96 5-15		.98 10-15	.99
Dean, D. A.	.96 9-15	.97 8-15		
Hinterleitner, G. A.	.94 11-15		.95 4-15	
Heston, N. C.	.97 2-15		.97 12-15	.96 9-15

**American Fisheries Society Meeting.**

OUT of compliment to Hon. George M. Bowers, the U. S. Commissioner of Fisheries, the American Fisheries Society held its thirty-fourth annual meeting last week at White Sulphur Springs in his native State of West Virginia. Fifteen States were represented in the attendance and the sessions were of unusual interest to everybody concerned in fishcultural work. New York State was represented by Mr. C. H. Townsend, of the New York aquarium, and Secretary J. D. Whish, of the Forest, Fish and Game Commission. Each took an active part in the proceedings and each was recognized by being named on important committees.

The meeting opened on Tuesday morning, and three sessions were held daily for three days. Two of the opening papers detailed experimental work that is being done—one by Mr. Henry O'Mally, of Baker, Wash., treating of the value of salt solutions in separating live from dead eggs; the other by Mr. Charles G. Atkins, of East Orland, Me., going into the question of the early feeding of salmonoid fry. Mr. Atkins asserted that early and abundant feeding is not by any means as necessary as has been supposed. In the discussion of the latter paper the question as to how long trout will live was considered, and it developed that brook trout have reached the age of 24 years in Pennsylvania, female rainbow trout 14 years, although they do not seem to spawn after they are 12 years old, and lake trout have been known to reach the age of 30 years. The whole subject of brook trout was brought up for discussion by the paper read by Mr. Whish, entitled, "The Passing of the Brook Trout." He took the ground that in New York State, and in many others as well, the native speckled trout is passing away before the advance of civilization. The changed conditions of water, and in particular the steady increase in parasitic diseases were the main factors at the bottom of the driving out of the brook trout, according to the ideas of the writer. After the discussion in which most of those present joined, and it appeared that in fish dis-

cases scientific men have a hard world to conquer, the Society visited the Government hatchery nearby and spent some time in examining it. In the evening Mr. J. W. Titcomb, of the U. S. Commission, gave an illustrated account of his trip to Argentina, where he went by special request of the Government to introduce fishcultural work.

Wednesday was made memorable by the settlement of the question how to designate the sizes of fish in hatchery work. The matter was in the hands of a committee comprising Mr. F. N. Clark, Mr. Seymour Bower, Mr. Paul North, Dr. H. M. Smith, Mr. William Meehan and Mr. J. D. Whish, who finally came to an agreement and the Society ratified their report. Briefly stated, the result arrived at is that the following terms shall be hereafter used in describing all fish: Fry—fish up to the time the sac is absorbed and feeding begins. Advanced fry—fish from the end of the fry period until they have reached the length of one inch. Fingerlings—fish between the length of one inch and the yearling stage, the various sizes to be designated as follows: fingerling No. 1, a fish from one inch in length up to two inches; fingerling No. 2, a fish from two inches in length up to three inches, etc. Yearlings—fish that are one year old but less than two years old, counting from the date of hatching. They may be designated as yearlings No. 1, No. 2, etc., according to length. It is believed that the uniformity thus reached will give added value to reports of work done in the future. The Society paid another visit to the hatchery at this time and saw a practical exhibition of hatchery apparatus in which were developed the latest ideas of the expert workmen and scientists in the service of the various States and of the United States Bureau. Governor Dawson was present on this occasion and welcomed the members to West Virginia in a short speech, in the course of which he dwelt particularly on the great value of the work that is being done by fishculturists. The meeting was continued by the reading and discussion of several papers at this time which the Governor seemed to find highly interesting.

Mr. G. R. Allen, of Portland, Ore., dwelt on the relation between the feeding of the parent trout and the virility of the eggs produced. Mr. Henry Talbot, of Washington, D. C., spoke entertainingly on "The Potomac Bass," and in the course of his remarks noted that "there is no good fishing in a year when there are sun spots." Dr. Henshall, of Bozeman, Mont., was heard in a paper on the "Protection of Fish in Inland Waters." He took the ground that there would not be so much need of artificial propagation if fish were given half a chance to spawn naturally, and advocated more fishways and less water-pollution. Mr. Oregon Milton Dennis, of Baltimore, Md., followed with a paper on the legal aspect of protection in his State, and told of exciting experiences in enforcing the law. He was specially hard on the net fishermen and urged that there should be laws prohibiting pound and purse nets and the selling of undersized fish. An interesting talk on the best way to get uniform laws for fish protection grew out of this paper, and will be heard from further when certain legislatures meet.

When the Society returned to the hotel, Dr. B. W. Evermann presented a paper on the "Golden Trout of Volcano Creek," which he investigated for the Government. He believes that this beautiful fish developed from the rainbow trout of Kern River to meet the requirements of the wonderful coloring of its surroundings. He showed several colored plates illustrating the coloring of the trout. Dr. F. P. Gorham, of Rhode Island, described the methods and success of the commission of that State in its lobster culture. Results are appearing already and young lobsters are now found in greater numbers than in twenty years before. Mr. Root, who was presiding, went further and told of the shellfish work of the State generally. In his judgment, sea farming is much more profitable than land farming, and he cited the fact as proof that hard clams, which are edible after they are 14 months old, can be raised to the extent of from 7,000 to 12,000 to the acre and sold at \$1.25 per bushel. The members asked many questions while the subject was up for discussion and brought out much that was not generally known about the work the Rhode Island commission is doing along the lines indicated. The hope was expressed that New York State may soon see its way clear to take advantage of the success which has been achieved in shellfish culture and return at least to the work of lobster propagation which once was carried on at the Cold Spring Harbor hatchery. A paper on the culture of the small-mouth black bass was next read by Mr. F. N. Clark, of Northville, Mich., who has long been experimenting with this species. He said that while most of the difficulties attending the cultivation of the large-mouth bass have been overcome, there are yet a lot of important things to be learned about the small-mouth bass. He told in an interesting way about his own experiments, about the use of artificial nests for the bass, and spoke at length about their habits. He said that the parent bass does not guard the young fish very long, and that at the end of eight or ten days the young fry scatter. It was not his belief that the parent bass eats many of the fry. The day closed with an instructive paper on the work of the U. S. Commission during the year, which was read by Mr. Titcomb. In the evening Mr. A. H. Denmore, of Leadville, Colo., gave an illustrated talk on the Yellowstone Park as a fishing resort. The lantern slides showed the fishculturist in actual working clothes and formed an admirable addition to the highly interesting lecture. Many of the guests of the hotel were present and listened with marked attention.

The Society worked steadily up to almost the hour for its departure and put in three full sessions on Thursday. Commissioner Bowers, of the U. S. Bureau of Fisheries, gave a short talk by request on the work of the bureau and dwelt on the magnitude of the work done. During the year that closed on June 30, the bureau distributed 1,734,495,562 fish, including both food and game varieties. This enormous output is more than 450,000,000 greater than the output of the preceding year and shows how the work is growing under Mr. Bowers' direction. The Society gave him a vote of

thanks for his remarks and for the many courtesies he has shown during his official connection with the fisheries bureau. A number of resolutions were presented for consideration by the committee, of which Mr. Townsend, of New York, was a member, and all were adopted. The more important called for greater protection for Yellowstone Park, for the ceding of jurisdiction over the Great Lakes to the Federal Government in order to get proper fish protection, and for uniform legislative action to put a stop to water pollution. Mr. C. D. Joslyn, of Detroit, Mich., backed up the Great Lakes resolution with a paper in which he set forth the necessity for such action if the important commercial fisheries of the lakes are to be preserved. Eight of the States border on the lakes and there now is no uniformity in the protective laws. Moreover, nothing can be done with Canada. But if Federal control existed the Government could put the matter up to Great Britain and the case might be different. There was not much discussion of this paper, but the members admitted that Mr. Joslyn was right in what he said. The everlasting subject of carp was then taken up and two papers presented on it. Mr. L. J. Cole, of Cambridge, Mass., wrote on "The Status of the Carp in America," and Mr. S. P. Bartlett, of Quincy, Ill., spoke of "The Carp as seen by a Friend." The "carpists" and "anti-carpists" saved much valuable time by omitting to discuss either paper. Dr. Smith came in very handily just at this juncture with an account of his visit last June to the International Fisheries Congress in Vienna as a representative of the Society. His efforts secured the selection of this country for the meeting in 1908, and the Society undoubtedly will hold its sessions that year in Washington on this account. A paper was next given by Mr. N. R. Buller, of Pleasant Mount, Pa., on the propagation of the yellow perch, which is a favorite fish in his State, as it is in our own. He showed that it can be hatched easily and that it gives great satisfaction when propagated artificially. Capt. L. G. Harron, of the United States Bureau, who also has worked on this line, added to the information furnished by the paper. Mr. Townsend, of New York, then gave the members his views on "The Home Fish Pond," which proved both interesting and valuable. It developed that there is but little literature on this important subject, although scarcely a day passes but the question how best to build a pond on the farm or estate arises. Mr. F. A. Degler, who is a native West Virginian, addressed the Society on forestry and fishcultural in his State. He was followed by a practical paper on pike-perch culture, which was read by Mr. S. W. Downing, of Put-in-Bay, Ohio. The discussion of this brought out the fact that the New York State Commission began propagating pike-perch in 1894, and annually plants an average of over 70,000,000 of the fish. Specimens of sponge grown by the United States Bureau and of much value commercially were next shown by Dr. Smith. An interesting paper on frog culture, read by Commissioner Meehan, of Pennsylvania, closed the programme.

The nominating committee, of which Mr. Whish, of New York, was a member, reported the usual nominations, and officers were elected as follows: President, C. D. Joslyn, of Detroit, Mich.; Vice-President, Dr. H. M. Smith, of Washington, D. C.; Recording Secretary, George F. Peabody, of Appleton, Wis.; Corresponding Secretary, Charles G. Atkins, of East Orland, Me.; Treasurer, C. W. Willard, of Westerly, R. I. The Executive Committee was selected as follows: Hon. W. E. Meehan, of Pennsylvania, chairman, and John D. Whish, of New York; E. Hart Ceer, of Connecticut; J. A. Henshall, of Montana; Paul North, of Ohio; J. J. Stranahan, of Georgia, and S. F. Fullerton, of Minnesota. It was decided to meet next year at Grand Rapids, Mich. A resolution complimenting Commissioner Meehan, of Pennsylvania, on the advanced position he has taken in his work and thanking him for the interest he has shown in the Society was unanimously adopted, after which the Society adjourned. An unusually large number of new members were elected during the session, among them being these from New York State:

Robert Kirby Taylor, Timothy J. Martin, H. F. De Puy and James Cruikshank, of New York city; Stephen H. Palmer, of Monticello; Clifford E. Irish, of Lake George. Mr. Whish was selected to prepare a suitable notice of the late Eugene G. Blackford for presentation at the next meeting and for publication in the proceedings.

On their way home the members were greatly delayed by the engine and a portion of their train running off the track near Charlottesville. Fortunately nobody was injured.

A FAVORITE name for German angling clubs is "Früh-Auf" ("early up"), and at this season of the year the German Angler Zeitung contains accounts of their fishing matches. On Sunday, June 18, the Central Union of the Berlin Friends of Angling had a match to see who was king of the anglers. Thirty-six anglers in twenty boats fished the Rummelsburger Lake in a steady down-pour, which soaked every contestant to the skin. In three-quarters of an hour the lot caught three pounds of fish. The greatest fish weighed 129 grammes, and the next greatest 120 grammes. The captors, Herr Gartenschläger and Herr Heese, amid great rejoicing, were declared king and knight, and duly adorned with the insignia of office. The competitors then adjourned for breakfast on Love Island, and kept on having breakfast until a late hour of the day. Our German angling friends carry out these competitions with tremendous enthusiasm. Processions with banners, songs and music, an hour or two's fishing, then feasting and more music and songs, great speechifying, a grand torchlight procession, and a finish up with a ball. They naturally do not expect to catch many fish on these occasions, but they certainly do have, as our American friends say, "a high old time," under the protection of St. Peter, the angler's patron saint. For one thing, our German friends can sing, and it is a delightful experience on a moonlight night to come home from an outing of this kind on the Rhine or other rivers with boatloads of anglers of both sexes, all singing grand old German songs.—Fishing Gazette.

## Anglers' Association of the St. Lawrence.

THERE was a large attendance at the twenty-second annual meeting of the Anglers' Association of the St. Lawrence River, which was held at the Thousand Island House, Alexandria Bay, Wednesday, Aug. 2, and the proceedings were of great interest to all. The meeting was called to order by President Charles R. Skinner, of Albany, formerly State Superintendent of Public Instruction. The president appointed A. C. Cornwall, of Alexandria Bay; Sigmund Stern, of New York, and J. M. Curtis, of Cleveland, O., as a nominating committee. Treasurer R. P. Grant, of Clayton, presented his annual report which showed a balance of \$574.21 on hand.

Hon. Charles R. Skinner then delivered his annual address as president of the Association. He called attention to the fact that during the past year the organization had lost but one member. The speaker complimented the Association upon the loyalty of its members and said that the membership was not merely local but represented nearly every county of the State as well as nearly every State of the Union. The purpose of this organization was to enforce the laws of New York State upon the St. Lawrence River and by so doing to protect the interests of the fish and game. "The Association was organized long before there was any State Department governing the game laws, and at that time the Association itself paid a game protector to enforce game laws on the St. Lawrence River. The international reservations are due to the influence of this organization, which secured the enactment of laws providing for the expenditure of nearly \$60,000 for State parks from Tibbitt's Point to Ogdensburg. I am glad to hear that our neighbors across the river have promoted this project well, and the only fault which I have to find with them is that American fishermen must pay a license to fish in Canadian waters, when New York State furnishes millions of fry annually, with which the river is stocked. We cannot mark our fish so that the Canadian fish can be distinguished from the American, and surely are not the fish of our country as good as those of another? No American would prevent a Canadian from fishing in international waters, which should be open to all who enjoy the sport of angling. Mr. Taylor, of the Canadian Parliament, has done all in his power to secure the broad and generous enforcement of laws. A short time ago Mr. Whipple, who is the head of the Forest, Fish and Game Commission, was on a tour of inspection and while here became acquainted with the work of the Anglers' Association, to which he promised his hearty support."

Speaking of the former power of the Anglers' Association, President Skinner said that before the State Forest, Fish and Game Commission was created the Association appointed Joseph Northrup, of Alexandria Bay, as the game protector, and he considered that his removal last February, at the time of the change of administration at Albany, was a bad blow to the Association, but that Mr. Whipple had assured this organization that it should have Mr. Northrup to look after the river. In regard to the legislation of last winter President Skinner said that it did not affect the river except the law which was passed at the suggestion of the anglers to prohibit the retention of maskinongé under 24 inches in length.

William H. Thompson, of Alexandria Bay, corresponding secretary of the Anglers' Association, submitted his annual report as did also A. C. Cornwall, chairman of the Executive Committee.

Hon. George Taylor, of Gananoque, Ont., Member of Parliament, said that with Hon. C. E. Britton, of Gananoque, he had tried to intercede with the Canadian Government to consider the waters from Kingston to Ogdensburg as international and to make their laws coincident with those of New York. He showed how in their discussions as to whether the Dominion or Provincial Government of Canada should make the fishery laws, the matter was carried to the Privy Council of England, which decided in favor of the Provincial Government. Mr. Taylor said that in an interview with the Minister of the Provincial Government he said that any former agreement between the Anglers' Association and Canadian officials should be honored. He expressed his deep regret at the fact that the assistant deputy commissioners of fisheries should have issued an edict prohibiting American fishermen from taking fish from Canadian waters, unless a \$5 license was paid for every rod, and in order to remedy this he suggested that a committee consisting of the prominent New York officials and also Canadian officials should wait upon the Provincial Government. Hon. C. E. Britton, of Gananoque, corroborated what Mr. Taylor had said.

R. P. Grant then spoke briefly in regard to the number of maskinongé fry which the State had placed in the St. Lawrence River.

Senator Malby, of Ogdensburg, and I. H. Dargavel, of Elgin, Ont., spoke briefly. T. F. Kerr, of Englewood, N. J., advocated the enforcement of the law in regard to the defacement of natural scenery.

Officers for the ensuing year were elected as follows: President, Hon. Charles R. Skinner, Albany; First Vice-President, Alexander Robb, New York city; Second Vice-President, Thomas F. Kerr, Englewood, N. J.; Third Vice-President, Col. O. G. Staples, Washington, D. C.; Secretary, W. H. Thompson, Alexandria Bay; Treasurer, R. P. Grant, Clayton; Executive Committee, chairman, A. C. Cornwall, Alexandria Bay; C. W. Crossman, Walter Fox, Dr. J. D. Cole, Alexandria Bay; George Hall, Ogdensburg; F. H. Taylor, New York city; A. E. Clark, Chicago; G. T. Rafferty, T. A. Gillespie, Pittsburg, Pa.; George C. Boldt, C. G. Emery, W. H. Nichols, New York city; J. P. Lamson, Cleveland, O.; Hon. C. E. Britton, Gananoque.

After the adjournment of the meeting the members of the Association enjoyed a banquet at the Thousand Island House.

It is understood that American fishermen are now free to angle in Canadian waters without a Government license for the first time in several years. The regulation requiring a license by all foreigners fishing in Canadian waters has not been officially revoked by the Government, but the present attitude of the authorities, it is said, makes it practically null and void. W. E. W.

## The Life History of the Angler.

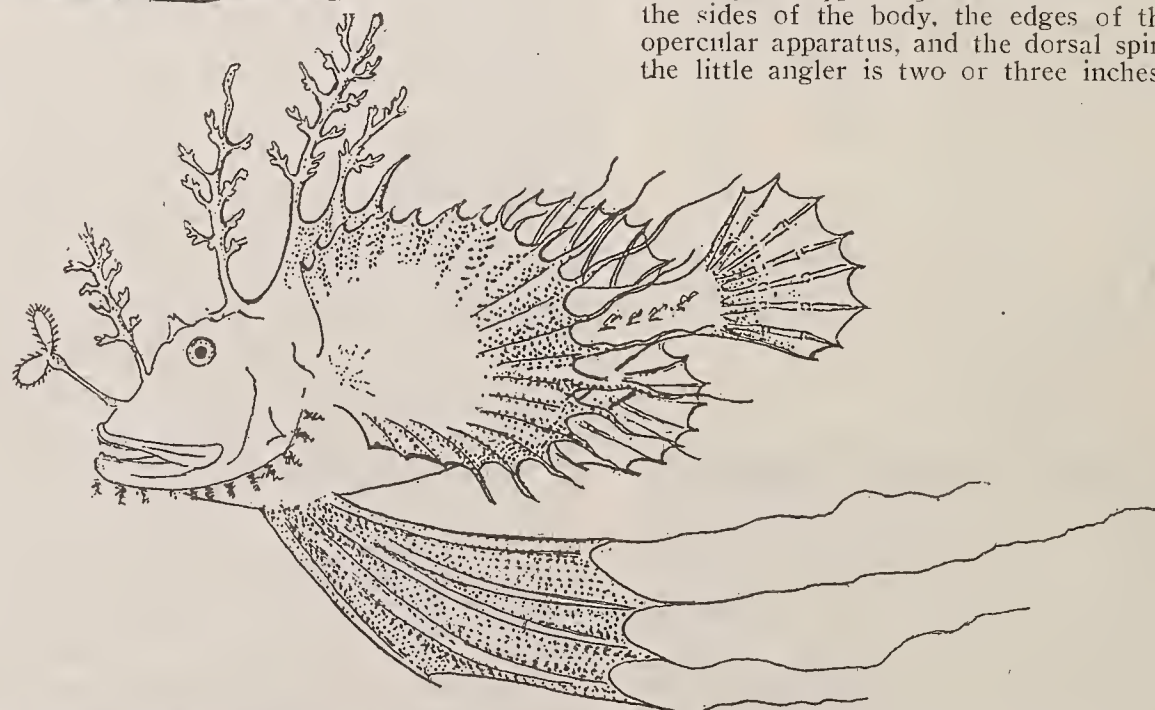

BY THEODORE GILL.

From the Smithsonian Miscellaneous Collections.

Of all the remarkable characteristics of the angler, perhaps the most remarkable are the manner in which the eggs of the female are consigned to the waves and the subsequent development and metamorphosis of the young. As much as twenty-two or twenty-three centuries ago at least the manner of oviposition was known to Greek fishermen and briefly noticed by Aristotle.

Leaving aside his irrelative and speculative remarks, he declared that the sea frog lays its eggs in a bunch near the shore. Not until quite recently was more information communicated, and then in a land unknown to the Greek philosopher.

About the end of summer the fishes seek shallower water and the inhabitants of the depths advance upwards; the sexes must then consort together, but in what manner and what rites of marriage are performed is unknown; the result, however, is, that about the time indicated "the fishermen on the New England coast often notice a substance floating on the water, which they term 'a purple veil,' the precise nature of which has caused much speculation on their part, and which answers singularly well to its designation." S. F. Baird, in

The illustrations show the young angler at various stages of growth, from a short time after hatching to a stage where it has most of the characteristics of the adult, but larger pectorals and ventrals, and less flattened head.

1871, became interested in the accounts he heard and sought to determine the origin of the "purple veil." He found one "which presented the appearance of a continuous sheet of a purplish brown color, twenty or thirty feet in length, and four or five in width, composed of a mucous substance which was perfectly transparent, to which, as a whole, a purple color was imparted by the presence of specks distributed uniformly throughout the mass to the number of about thirty or more to the square inch." The little specks were embryonic fishes "moving vigorously in their envelope, but without any appreciable latitude of motion, or change of relative position to each other." Baird could not identify the little fishes, but it happened that Alexander Agassiz had shortly before observed and investigated the veil with its contents and determined it to be the product of the angler. In 1882 Agassiz published the results of his investigations and a remarkable history was disclosed, which has been supplemented by the more recent observations of Prince, McIntosh and Masterman.

The "violet veil," in fact, is a great communistic cradle for the large family of a single mother angler. It is, according to Agassiz, "an immense ribbon-shaped mucous band, from two to three, or it may be five, feet broad, and from twenty-five to thirty feet," or even, according to Prince, thirty-six feet long. "It looks at a short distance like an immense crape. The mucus is of a light violet gray color and the dark black pigment spots of the young *Lophius*, still in the egg, give to the

mass a somewhat blackish appearance. The eggs are laid in a single irregular layer through the mass, usually well separated by the mucus in which they float." The color of the veil must vary from light when first issuing from the mother *Lophius* to dark when the eyes of the larvæ have become conspicuous. The eggs may be as many as a million or more. (Thompson estimated 1,420,000 and Fulton 1,345,848.) Each egg is about a twelfth of an inch or two millimeters in diameter. Thus the earliest stages of development are passed and when the larva has burst its shell envelope it immediately leaves the veil and begins life free on the surface of the sea.

The newly hatched young, as Agassiz well says, "it would be difficult to recognize" as the embryo of the angler. It would, indeed, be impossible to do so without extraneous information. It is an elongated, mouthless and almost shapeless being with the yolk still forming nearly half its bulk and with simply a continuous fin fold. About a week later it has obtained a mouth, a dorsal ray has been evolved, and long spatula-like ventrals as well as short broad pectorals have been developed.

In about a fortnight or little more a second dorsal ray has become manifest, the pectorals have developed incipient rays, and the ventrals show two rays.

At a considerably later period the early form is still retained but the head is more pronounced, the mouth and jaws better defined, and the four distinct dorsal rays over and behind the head are manifest; the two ventral rays have become longer.

There is an indication in the lower fold of the future caudal and where the notochord is to be tilted up.

Later still the continuous fold has been broken up and distinct rayed dorsal and anal fins are developed, but the caudal is "heterocercal." The anterior dorsal has been increased by a short ray in front and another behind and all are more elongated and ray-like than in earlier stages. The pectorals have become well developed and the ventrals enormously elongated so that, when seen swimming from above the little fish reminds us of a long-tailed butterfly.

When the angler has reached this stage, it has become a respectable fish. It does not, indeed, look at all like its mother but nevertheless an ichthyologist, perfectly familiar with the fishes of the North Atlantic, would have no difficulty in recognizing it as the young of the angler. The numbers of rays, and more especially the six nearly or quite free anterior dorsal rays, are characteristic and distinguish the fish from all others. The condition and mode of development of these free rays are indeed noteworthy on account of their early appearance, inasmuch as the anglers are not in other respects radically differentiated from other families of pediculate fishes.

Development still goes on and the caudal fin becomes homocercal, the other fins still better defined. The head grows disproportionately, the ventral fins become much reduced and the pectorals less so, the foremost dorsal spine grows out beyond all the others and the second to sixth, arrested in development, are much shorter, and the four median caudal rays become forked. A regular fully developed angler is the outcome.

The next noteworthy stage in development is in the way of perfecting the fins, especially the rays, and the isolation of the three foremost dorsal rays and their advance forward so that the first arises from the snout. The tag-like appendages are concurrently developed along the sides of the body, the edges of the lower jaw and opercular apparatus, and the dorsal spines. By this time the little angler is two or three inches long. The ven-

trals are still very long but all the rays are developed and the head and body have not yet assumed the much depressed form characteristic of the adult.

When the young fall to the bottom they are supposed "to frequent rocky algae-covered ground where they can have a shelter and also suitable food." Few are ever taken by the dredge or trawl even in ground where the old are abundant. It is only when they become older that most of them leave such secluded nooks and come out into the open.

The growth of the angler has been especially studied by T. Wemyss Fulton (1903) based on the examination of large series. When six months old, the "mean" length is 6¾ inches (5-8¾), when "one year and six months," it is 12½ inches (9-15½), and "when two years and six months," it is 18-18½ inches (14½-21-22).

"When three years old, supposing a little less than the same rate of increase continues—and in fishes growth is not usually much reduced in rapidity before the period of maturity is reached—the angler will measure approximately 21 inches in length, and when four years old about 26 or 27 inches. The information as to the size at which maturity is first attained is not extensive, but males may be found ripe at the size stated. Females probably do not become mature, as a rule, until over 30 inches in length, and the facts point to the males first reaching maturity four years of age and the females when five years."

As such an angler it passes its life year after year. It

becomes "a huge unshapely creature, and is of a soft, gelatinous and flaccid consistence. Its mouth is enormous," and its "antipathy to action is strangely contrasted with the enormity of its appetite, to satisfy which it has recourse to stratagem in the capture of its prey."

The angler is not usually ranked among food fishes, and is generally unceremoniously rejected; nevertheless, it is said to furnish excellent meat. According to Donovan (1868), "the flesh of this fish is white, and having, it is said, the same flavor as the common frog, is eaten in many countries as a delicacy." Couch (1863) reported that it "is a delicious dish." In Scotland, Parnell long ago (1839) had declared that "the flesh is considered good, especially near the tail," and McIntosh and Masterman (1897) state that "it comes under the category of a food fish and is treated in a similar way to the wolf fish. The head is cut off and only the trunk is sent into the market. This is sold under the name of 'croan,' and sometimes of john dory, a name that of right belongs to a very different fish."

In Massachusetts, where it is most frequently caught, according to Storer (1855), "no use is made of this fish, as its liver contains but little if any oil; and its flesh has no fat. This," he thought, "is a singular fact, as most, if not all, other fish have either fat in their livers or in their flesh." But although not eaten now, it was by the aboriginal Americans, as is evidenced by the discovery by Wyman (1868) of osseous remains in a shell heap in Maine (Crouch's Cove).

A singular superstition is entertained in some parts of Sweden (Bohuslan) according to Malm and Smitt. "It is so feared by many that the tackle is cut as soon as the 'monster' reaches the surface; and its captor hurries home in order to get there, if possible, before the misfortune portended by the monster overtakes him." The extreme of misfortune—death—is believed by some to be indicated. Nilsson tells that the Swedish fishermen on the banks "believe that on board the vessel on which an angler is taken, some one is *feg*, i. e., doomed to die soon. They therefore never or hardly ever take the angler on board, but prefer to cut the line and thus lose the hook with the fish."

An anemometrical faculty is attributed to the angler in Massachusetts. According to Storer, "among the fishermen in some parts of the bay, there is a common saying, 'when you take a goosefish, look out for an easterly storm.'"

## New England Waters.

BOSTON, Mass., Aug. 5.—Commissioner Delano informs me that the Board is vigorously applying the law against the pollution of streams by sawdust, and one offender in Berkshire county has appealed a case that went against him in the lower court. If the State wins, as the Commissioner thinks it will, this will be a final settlement of the authority of the Commission under the statute.

In the four western counties of our State the close time on trout began July 15. In other counties it will commence Sept. 1. From what information has come to me I think our trout streams have not yielded their usual harvest. At a future time the writer hopes to go more into details on this subject.

In northern New Hampshire the fishermen are still having excellent luck and are enjoying the sport with as keen a relish as ever. Mr. I. J. Conant, of Boston, has taken several good strings from Reservoir Brook, a tributary of the Pemigewasset River. Several anglers report good trout fishing in northern Coos county.

Two lady anglers at the Rangeleys, whose success has been phenomenal, are Mrs. J. D. Desmond, of New Haven, and Mrs. C. W. Fisher, of North Attleboro. The former rejoicing in the capture of a 5½-pound trout and the latter of a 4½-pound salmon.

Deputy Luman, who has been actively engaged in enforcing game and fish laws in the central and western portions of the State, informs me that he has had several cases of violation of the law against the use of seines and nets, but that the law forbidding the sale of trout and that prescribing the minimum length of six inches have been well observed.

From several correspondents I learn that the trout fishing generally has not been up to that of former years. Some attribute this largely to the fact that for several weeks of the early season the water in the streams was very low. Several mention seeing many small trout in the brooks and say that very few remain long enough in the water to attain any great size, being taken by the great number of anglers while barely big enough to clear the law.

Without a vast expansion of the work now possible in our hatcheries as they exist to-day, anglers who seek trout of any considerable size must go outside of Massachusetts to get them, and further, the remedy lies with the sportsmen of the State. Let some one who knows tell your readers why there has never been a trout hatchery established in the State by the United States Government?

Mr. Charles P. Horton, of Boston, has purchased the interests of the few remaining members of the Monument Club, so that he now controls the fishing in the famous Monument River, one of the finest trout streams in the State, as well as the fishing preserve at Maple Springs, near Wareham. With the possible exception of Mashpee River, probably more "salters" have been taken from Monument River than from any other of the Cape streams.

One of the fishermen who had exceptional luck at Buzzard's Bay last week was Mr. Arthur Griffin, who caught a 175-pound halibut; another, Howard Eldridge, who got a 40-pound cod on the fishing rips, making each "high-line" for the season.

Anglers on the Samoset, Capt. Robinson, and the Volante, Captain Fisher, have brought in large fares of bluefish. Among the fishermen was Mr. Garrett Schenck, of Weston, a member of the State Association, accompanied by Mr. Henry Tilden, of Providence. Colonel Willard, of the United States Engineer Department, is now at Newport engaged in preparing plans for the harbor of refuge near Great Point, Nantucket.

The steamer service in Umbagog Lake has been extended this season. Round trips are made and the traveling public have an opportunity of passing in sight of the famous Dutton Camps.

Several members of the staff of the United States Fisheries Bureau are to be located at the Lakeside, while making an investigation of the waters of Umbagog Lake, the result of which will be a matter of public interest.

In Oxford, Me., there is a camp for boys, twenty-five in number, under the management of Prof. A. F. Caldwell, of De Pauw University.

Mr. and Mrs. Alfred J. Hobbs, of Bridgeport, Conn., are occupying Camp Ideal on Pleasant Island.

Prof. W. A. Packard, of Princeton, and his brother, Dr. C. W. Packard, and Mr. J. W. Argenbright, of New York, are all enthusiastic anglers, and are taking record salmon.

Dr. Harry E. Rice and family, of Boston, have taken possession of Don't Worry Camp for the summer.

Mr. C. W. Fisher, of North Attleboro, has to his credit a 5-pound salmon, and Mrs. Fisher one of 3½ pounds. Mr. and Mrs. Edward Tracy, of Boston, have been at the Birches on their wedding trip. Mrs. H. B. Kirk, of New York, showed great skill in landing a 5½-pound salmon, which she hooked while trolling. She has sent the fish to New York friends. Her guide was Ernest Goodwin.

Cincinnati is represented by Mrs. A. L. Sanford and son, C. V. Sanford with his wife and boy. The party has taken several fish under guidance of Bob Martin.

Mr. and Mrs. F. S. Dickson, of Philadelphia, who have been well known at the Rangeleys for many years, are again at their island home, Maneskootuck. Their steamer, the Oquossock, is always a welcome sight on the lake.

Mr. J. H. Parker, of Boston, with L. A. Derby and others of Lowell, are owners of a large cabin at Black Point above Upper Dam, on Mooseluckmeguntic Lake. Mrs. Parker has taken a 4-pound salmon and a couple of 3-pound trout, and Miss Jones has landed a 4-pound salmon and two 3-pound trout.

J. J. F. Randolph, R. J. Jackson and F. R. Morse, of New York, have had good fishing for several days at Round Mountain Lake. R. E. Stevens, M. D., of Marlboro, Mass., has found enjoyment at Blakeslee Camps.

John G. Morgan, of Norwich, Conn., who will be remembered by frequenters of Upper Dam, says he has made a careful computation of the time he has spent in a boat on the pools, and it makes a total of three years, "and happy years they have been," he says. He got a 5½-pound salmon last week.

Mr. and Mrs. J. Parker Whitney, of Boston, are entertaining at their camp a bridal couple, Mr. and Mrs. T. B. Eastland, of California. There is nothing in the line of angling, whether in salt water or fresh, that Mr. Whitney is not familiar with by practical experience, and some of his experiences have been graphically described in classical English, of which he is a master.

Mr. J. M. Grosvenor, Jr., of Boston, has been taking snapshots (and trout) at King and Bartlett camps. With him were Mr. and Mrs. G. H. Andrews, also of Boston. After leaving King and Bartlett they went to Mr. Andrews' cottage at Clear Water.

Dr. M. F. Garvin and son, of Boston, have been for two weeks at the Birches.

Mr. W. H. H. Ward, of Amherst, Mass., as usual, has been several weeks at Carry Pond Camps, Bingham. He is an ardent fisherman and one of those who believe in fish and game propagation and protection.

The United States Bureau of Fisheries has recently planted 10,000 silver salmon in Seven Tree Pond in Union. CENTRAL.

## The Lateral-Lines in Fishes.

In the Bulletin of the Bureau of Fisheries for 1904, Prof. G. H. Parker, of Harvard University, reports on a series of elaborate experiments conducted to determine the functions of the lateral-line organs in fishes. We quote the preliminary remarks and the conclusions drawn from the experiments:

"The habits of fishes, like those of most other animals, are inseparably connected with their sense organs. Thus in the matter of feeding, Bateson has pointed out that probably the majority of fishes seek their food by sight. Many such fishes when kept in confinement are known not to feed at night or even in twilight, though they may be ravenous feeders in daylight. Other fishes, including the eels, skates, sturgeons, suckers, flatfishes, etc., many of which are bottom fishes and often nocturnal in their habits, seem not to depend upon sight in seeking their food. Their powers of sight are often deficient, and food excites them chiefly through its action on their organs of taste, smell or touch. As Bateson observed, none of these fishes start in quest of food when it is first put into their tanks, but remain undisturbed for an interval, doubtless until the scent has been diffused through the water. Then they begin to swim vaguely about, and appear to seek the food by examining the whole area pervaded by the scent. The search is always made in this tentative way, whether the food is hidden or within sight, and it is first seized when by accident it is come upon.

"Herrick has made the interesting discovery that in the catfish, which seeks its food in the way just described, the organs of taste pervade the whole skin, and the fish will seize unseen food with great precision, provided only that it is brought near the skin. Thus in this fish the organs of taste largely replace the eye as a means of discovering the food.

"From these examples it must be clear how close is the relation between sense organs and habits. The sense organs, in fact, are the usual means of initiating those simple acts which, when taken collectively, constitute what are popularly known as habits, for the sense organs are the avenues through which the external influences enter the animal and excite it to action. How essential, then, in studying the habits of any group of animals, must be a knowledge of their sense organs.

"From this standpoint the elucidation of the habits of fish is particularly important, for their sense organs bear close comparison with those of human beings, and their environment withal is so different that they afford a most fascinating field for investigation. It is now fairly well established that many fishes possess in a high functional state the five chief senses of man—taste, smell, touch, hearing, and sight; but it is also known that many fishes possess a sixth set of organs, the lateral-line organs, for which there is no representative in man. As these are well developed and conspicuous structures in many cases,

they may be suspected of playing an important part in the economy of these animals, and it is the purpose of this investigation to ascertain something of their role in the ordinary habits of some of our fishes.

"Everyone who is at all conversant with the external markings of fishes is familiar with a line which, in most instances, extends along the side from tail to head. This line, known from its position as the lateral line, consists usually of a row of small pores which lead into an underlying canal, the lateral-line canal. In the head of the fish this canal usually branches into three main stems, one of which passes forward and above the eye, another forward and immediately below the eye, and a third downward and over the lower jaw. These three canals, like the lateral-line canal, open on the surface by numerous pores, and, together with this canal, constitute the lateral-line system.

### SUMMARY.

"1. The lateral-line organs are not stimulated by light, heat, salinity of water, food, oxygen, carbon dioxide, foulness of water, water pressure, water currents and sound.

"2. The lateral-line organs are stimulated by water vibrations of low frequency—six per second.

"3. The lateral-line organs may be of service to the fish in orientation, but they are of no more significance in equilibration than the skin, and are inferior in this respect to the eye and the ear.

"4. Waves on the surface of the water produced by air currents and the disturbances made by bodies falling into the water produce vibrations in the deeper water that stimulate the lateral-line organs.

"5. The skin, the lateral-line organs, and the ear form a natural group of sense organs whose genetic relations are such that the skin (organs of touch) may be said to be the first generation from which the lateral-line system has been derived, and this in turn has given rise to the ear."

### Aristotle on a Danger to Fishes.

MANY vertebrates and some invertebrates have, as a part of the ear, a hard bone or sometimes a particle of calcareous matter which is called the earbone, and the general term for which is otolith, meaning earstone. Owing to the hardness of these bones they are often long preserved, and recently paleontologists have been describing certain fishes from fossil otoliths. In a recent note to a scientific journal Dr. Theodore Gill, the eminent ichthyologist, calls attention to a statement made about fishes by Aristotle, the Greek philosopher, who says: "Those which have a stone in their head, as the chromis, labrax, sciæna and phagrus, suffer most in the winter, for the refrigeration of the stone causes them to freeze and be driven on shore."

Striped bass fishermen should take warning.

### Fate of Bullhead Johnson.

BUFFALO, N. Y., Aug. 1.—"Bullhead Dick" Johnson, the most daring fish pirate on the Niagara frontier, was instantly killed about 4 o'clock this morning while trying to dynamite fish in the Niagara River opposite Tonawanda.

Charles Duffy and Charles St. Inges, the latter a son-in-law of "Bullhead," were with Johnson at the time. The three were in a rowboat and Johnson tried to throw a stick of dynamite into the river. The dynamite fell into the boat and exploded there. The explosion tore both arms from Johnson's body and severed the head completely at the neck.

Duffy, who was in the middle of the boat, was badly lacerated about the legs and St. Inges, who was in the bow, escaped without a scratch. The boat sank.—New York Sun.

### FLOATING DOWN THE MISSISSIPPI.

(Continued from page 128)

Here and there across the land were single and double mule plows, behind which the forms of gaunt negroes were tramping. Some of the land was marked off by stakes, and these patches showed that many of the workers were preparing their own rented land for a crop. Women and children were out in more conspicuous numbers than the men. The bright red and blue of the women's clothes were visible for miles by means of the glasses. They were planting seed cotton from aprons full. The levee was the only high ground in sight. From its top one could see further than from some hills. At 2:20 o'clock, March 15, we dropped into Milliken Bend, of which one reads so much in the story of General Grant's operations before Vicksburg. I have reason to remember this bend, for one of the Government inspection boats came along—The Mississippi. It's a fine boat, and runs fast, kicking up a considerable wave behind it. The black-mustached pilot came down about forty yards from our cabin boat, turning to tell a man who was sitting down in the pilot house of what was doing. The man got up and the two watched the two cabin-boaters swing their boat end on to the rollers and endeavor to get breakable things on the floor unbroken before the jouncing came. It did us no damage, but it did rattle our feelings a great deal. This same Mississippi was heartily cursed by the pilot and captain of a raft tow-boat on which I traveled from Vicksburg to the mouth of Red River. The Mississippi deliberately sheered in close to the great raft and the wash of the waves put hundreds of logs in jeopardy, threatening to break them loose, and loosening a good many of the logs. This was on the return trip of the Mississippi after having "shook us up."

However, it is cheering to remember that most river pilots have learned to respect cabin boats. Steamers found it expensive paying for smashed rowboats at landings, and they are equally careful of cabin boats in mid-stream. In fact, cabin-boaters have stories of disasters not unmixed with pleasure. A friend of the Medicine Man bought a cabin boat for \$15. He had a \$10 shotgun and a \$5 outfit on boat. The boat was wrecked at a landing, "tore loose" and sunk. By a judicious mixture of perjury and fact, the cabin-boater "settled" for \$150. A few bills of this size and oc-

casual bullets through pilot house windows have brought about a mutual understanding between cabin-boat and steam boat people. Nevertheless, cabin-boaters prefer not to be run down, of which fact the pilots of the steamer Mississippi will please take notice.

On March 16, I saw Sherman's famous 60-mile ditch by which it was hoped to get supplies past Vicksburg without incurring danger from Confederate shot. Big trees were growing in the bottom of the canal. Grant's shorter cut across the peninsula opposite the city was high above the water level as we passed down, although the river was rising rapidly, and the spring flood would soon put the stream out of the banks and back to the levees.

We fought the wind now, and though in sight of the hills and soft coal smoke of the city, we were tantalized by rough water and adverse breezes. Many times we started from the bank, determined to bull through, only to be thrown back into some eddy, and on one occasion, we had only just reached a little caving bank pocket when a squall came along which raised waves many feet in height and half filled my boat with rain water in fifteen minutes.

We worked down stream a little at a time. The banks were cleared on the west side, and past river history indicated by numerous sections of levee coming at various angles to the jumping off place. In one short bend I counted nine different levee ends at short intervals, representing vast toil soon rendered vain by the sawing current undermining the bank.

At last we got a strong south wind, which promised to last a week, more or less. The Medicine Man was out of tobacco, and groaning like a whipped baby most of the time. He was looking ahead to a "good time" at Vicksburg so anxiously that he could think of nothing else. My own feelings were also on the raw edge. I had been with the man nearly seven weeks, and tasted the floating cabin boat life as deeply as possible. My notes covered practically every phase of cabin-boating—in a bayou, on a sandbar, and "tripping." It was getting late in the year, and, however alluring the Medicine Man seemed, there was much more to be seen, and I couldn't stay with him longer without wasting time. I determined to travel on from Vicksburg as rapidly as possible in my skiff.

In spite of the wind we shoved from the bank and were driven diagonally across the river. When half way to the far side, four miles above the city, we saw a vast bank of black and blue clouds coming up with the wind out of the south. "Hit looks like a cyclone!" the Medicine Man said. "We better pull!"

We pulled the sweeps, but the wind jumped up and up, until we were teetering and the boat timbers creaked. Our effort was to keep from running into the bluff bank on the east (north) bank. We succeeded in holding off till we got down to a short, narrow sandbar, where we cast the anchor and rode the squall in safety. A little store-boat some distance below was reached when the wind fell away, and here we were told the way into Vicksburg.

"There's a big eddy at the mouth of Yazoo," we were informed. "You all want to keep to the middle of the river, skirting that eddy."

In the morning we dropped down. We couldn't see the eddy, and the river was booming with the great head rise that was coming from thousands of miles up stream. One seemed fairly to see the slope of the oncoming water. It looked as though we'd be carried far toward the Gulf of Mexico if we kept to the middle, so we compromised and went down a few rods from the shore. The eddy caught us and we worked an hour to get out of it. Next time we went further out, and butted into the eddied drift and were carried back up stream eighty rods. Then we went 'way out, and just skimmed the brim of the whirling, saucer-shaped suck. We were taken to the mouth of Yazoo, and a curious little man on whose head was a wide-rimmed cowboy hat, his face a weather-beaten goateed one and his figure built like that of a miniature athlete, hailed us with a cheery "Howdy!"

"Hello, Doc White, hello!" said the Medicine Man. "I be'n a pulling this old boat of mine to every blimmed shanty boat between here an' Lake Providence, hoping I'd find you into hit."

The eddy at Vicksburg has sucks within sucks. There were three between the mouth of Yazoo and the main river current. To see water flowing in opposite directions on lines not a foot apart was one feature of the eddy. We cordelled the cabin boat into a pocket just off the end of the \$75,000 rip-rap levee which keeps the Mississippi from filling the Yazoo with sand and mud, to the detriment of Vicksburg water front privileges.

Doc White welcomed us heartily. He is the son of one of the heroes of Memphis—a physician who fought yellow fever in one of the epidemics of the '70s. The son, on losing his wife, lost his grip, went West for his health, and is now living luxuriously in a cabin boat 24ft. long, 8ft. wide, and having a hull 40in. deep. The boat is the most substantial one on the river. The bottom stringers are 4x4 and the bottom plank 2in. thick, sprung on and edges beveled in. Dr. White called it a "trunk," for it would stand any kind of a storm or up-ending. The full sweep of so-called cyclones and attendant river waves failed to spring the boat in the least.

Our music stirred Dr. White. He tried to dance, and did execute some remarkable double and triple shuffles. But he admitted that his knees were too weak to do the music justice. However, he contributed his share of the entertainment by singing the song that begins:

"It was away last spring—

I b'lieve in May—

That old Si Hubbard to me did say,

'I hear a circus is coming to town;

S'pose we go an' see the clown?"

So we sold our barley, oats and corn—

In fact, we most cleaned out the barn—

And went and bought two bran' new suits,

White plug hats and red top boots."

Dr. White, having lived as a cowboy in Indian Territory for a long time—he was 54 years old—gave me this "infallible" snake cure, which is the Indian's favorite and "unknown to science."

"Selagmella apus (snake moss) ½ drachm. Macerate

in an ounce of sweet milk and give at once. Also apply some of the moss to the wound."

Dr. White sent this receipt to the Medical Record, from which I copied it.

Vicksburg is built on a hill—river bluffs—with streets so steep that the second stories of most houses on the up-and-down streets are on a level with the basements of the next door, while the basement door is level with the street, also the front door of the first floor. Somewhere up the railroad track, along the Yazoo, was the soldiers' cemetery, with monuments commemorating the days when the heights there were plunging round shot down upon Farragut's fleet, and reminding visitors and residents of grim swamping and fighting on all sides of the city. Somehow, long association with the big river, had dulled my appetite for historic scenes. The psychology of a heroic people divided and at war, seemed of less interest than the swaying river current, and the banks caving in. The war had lasted only a little while, but the river was pouring on forever with no ripple on its surface to indicate the clash of souls and bodies of men. Close association with the river dwarfs the human interest in war and such things. I read of a man who once said it was not good for men to study astronomy. It is not good for the human understanding to know how little it is possible to know—to feel that the human comprehension is not even capable of knowing time, space or other dread things. Realizing what these infinite unknowable things indicate, the man said, is to deaden ambition and stunt the efforts, for one is apt to say, "What is the use?" Association with the Mississippi gives rise to similar reflections. The little ditch that Grant's army dug—the Mississippi would soon cut out more dirt in five minutes, just below Vicksburg, at Lake Palmyra than thousands of men could cast out in months.

River life became oppressive, and I wanted to get away from the mental malaria of cabin boat associations. The Medicine Man disappeared on a spree. He turned up with a whiskey boat gasolene, and towed his craft up the Yazoo to the wharf. The gasolene was Hull's, and in the pilot house were many bullet holes—he had a fight with a sheriff at Leota, a few miles before, and with his wife, beat the posse off, killing three men, it is said, and wounding others. He and she looked the part—cold, grim countenances. I packed up, ready to start when the weather should clear. Squall followed squall, and then the Medicine Man showed up once more. A comely woman was with him, her husband being a prisoner in Vicksburg jail. She had paid one fine for him; she vowed she wouldn't pay another. While she was discussing with the Medicine Man what she should do, I loaded my skiff and bade the Medicine Man good-by.

RAYMOND S. SPEARS.

## The Kennel.

### Recurrence of Canine Distemper.

It is a matter of general opinion, not only of the public, but also of the medical and veterinary professions, that in the majority of contagious or infective diseases of mankind and animals one attack of a disease confers protection or immunity to a future attack of the same malady. This is to a certain extent, but not absolutely, true.

On the other hand, there are certain contagious or infective maladies that do not afford immunity, one attack constituting a predisposition to subsequent attacks.

Immunity varies in degree not only according to the period or the locality in which the disease rages, but also the race or breed, family or strain, or individual.

It is asserted that some individuals are naturally immune to a particular outbreak of disease, but if these cases were closely observed after a first exposure to infection, it would very probably be shown that the symptoms were so mild as to have escaped recognition by the observer, and the protection afforded during subsequent outbreaks to such cases would be ascribed to natural or inherited immunity.

However, many cases seem to escape a former exposure but yield to a subsequent infection.

As regards canine distemper, there are many intelligent dog breeders, kennelmen, experienced veterinary surgeons, and clinical investigators who have often observed second, occasionally third, and sometimes, though rarely, fourth attacks of the disease in the same dog.

To show that this is no new and exceptional experience, I shall here briefly quote from authorities on the subject.

Delaware P. Blaine, the father of canine pathology, and therefore our most original and, as yet, unsurpassed observer of the diseases of the dog, says in his last or fourth edition (1841) of "Canine Pathology": "Neither is its attack confined to once; it will now and then appear not only a second but a third time even."

Youatt, at first pupil, afterward partner, and ultimately successor and also a contemporary of Blaine, says in his work "On the Dog" (1845), and also in a paper on this subject read in 1830: "One attack of the disease, and even a severe one, is no absolute security against its return, and although the dog that has once labored under distemper possesses a certain degree of immunity; or, if he is attacked a second time, the malady usually assumes a milder type. I have, however, known it to occur three times in the same animal, and at last destroy him."

Mayhew, in his work on the dog, published in 1854, says: "Most people imagine a dog can have distemper but once in its life, whereas I had a patient that underwent three distinct attacks in one autumn, that of 1849." He adds that "All the stages and symptoms of ordinary distemper may appear and depart unnoticed."

Drs. Friedberger and Frohner, professors at the high schools of veterinary medicine in Munich and Berlin respectively, in their world-wide recognized text-book, "On the Special Pathology and Therapeutics of the Domesticated Animals," remark that: "Although one attack generally confers immunity for a considerable time, some dogs become infected several times. We have, for instance, treated the same dog for distemper four times in a year."

Glass, in his translation of Mueller's "Diseases of the Dog," describes a disease which he terms "infectious bronchial catarrh," or show-bench distemper, and although he does not consider it true "contagious distemper," says it is generally seen in large kennels, developing itself in dogs soon after returning from a show, and one of its peculiarities is that one attack does not protect from another. From his description of this disease, I conclude it is none other than an acute form of distemper.

It will be seen from these few quotations that the authoritative opinions on the recurrence of distemper have been held at least from the commencement of the nineteenth to that of the twentieth century.

To these opinions I myself subscribe, having repeatedly seen second, frequently third, and occasionally more attacks of the disease in the same dog, even during the same year. I have also seen an animal get quite well after a long period of convalescence, and remain well for a short time, and then have a recurrence of similar symptoms. As a rule, however, a recurrence is generally interspaced by an interval of complete health for, at least, two or three months or longer.

These remarks also hold good for feline distemper. In the cat, however, recurrences, especially in large catteries, are more frequent than in the dog. In 1896, when writing on this subject in the Ladies' Kennel Journal, I referred to the common occurrence of repeated attacks and also relapses in the same animal, as if one attack predisposed to a future one.

The disease known as typhus may also affect the same dog more than once, and cause death from the subsequent seizure, which may occur within the year or several years after the first attack.

On the other hand, Mr. A. J. Sewell, M.R.C.V.S., does not seem to agree with the view that distemper may attack a dog more than once.

In his edition of "Mayhew on the Dog" he says: "Dogs may, it is said, have distemper twice, but a second attack, in my experience, is of a very rare occurrence. \* \* \* I have many times kept dogs that I know have had the disease in a kennel full of distemper patients, and with the exception of two or three of them developing a husky cough, no other signs of the disease have occurred. There has been no rise of temperature or loss of flesh," and the dog has generally continued to take his food as usual, and appeared full of spirits. A person buying a dog generally asks the question, "Has he had distemper?" An unscrupulous dealer generally replies in the affirmative, whether such is the case or not. It often happens in the course of time that the dog contracts the malady, and shows all the usual symptoms in full. The purchaser complains, but the seller is usually ready with the answer that a dog may have two or more attacks. When I am consulted in such cases, and I find a dog suffering from the disease badly, I never hesitate in giving an opinion that he has not had it before."

I have quoted these remarks rather fully, so as to avoid being misunderstood when I state that, although Mr. Sewell seems, in one place, to infer that dogs are not liable to suffer from distemper more than once, he gives facts in another place that go to show they are liable. At least, he indicates doubt even if not denial. Finally, his opinion appears to have gained ascendancy over his facts.

It will be seen from the quotation "two or three of them developing a husky cough" with no rise of temperature or loss of flesh after being exposed in a distemper ward, that Mr. Sewell throws doubt upon the dogs having had distemper, at least, a second time. Probably he does not consider a dog to have distemper unless the animal has a rise of temperature. If so, he is mistaken. But I shall leave this question for a future occasion.—Henry Gray, M.R.C.V.S., in *Our Dogs*.

## Southern Beagle Club.

THE fourth annual meeting and field trial will be held at New Albany, Miss., on Feb. 26, 1906. Hares are plentiful on the grounds selected, the topography affords an excellent view of the chases, the weather at that season of the year is suitable, and the New Albany hotel affords ample accommodation for those in attendance.

Four classes will be run at the coming meeting, viz.:

1. A Derby (Class C) for dogs and bitches from 13 to 15 inches, to which all whelped on or after January, 1905, will be eligible.

2. A Derby (Class D) for dogs and bitches 13 inches or under, to which all whelped on or after January, 1905, will be eligible.

3. An All-Age Class (A) for dogs and bitches from 13 to 15 inches.

4. An All-Age Class (B) for dogs and bitches 13 inches or under.

Prizes of \$30, \$15 and \$5 will be given in each class.

In addition to the cash prizes, a small silver cup will be given to the owner of the first hound in each class. The entry fee is \$5 for each hound entered.

The names of two competent judges will be announced in our final circular of Jan. 1, 1906.

The club reserves the right to reject the entry of any hound, which, from the best information obtainable, and according to its judgment, is not a pure bred beagle. Dogs whose owners are absent will be cared for by the club and handled by competent handlers, but the club will not hold itself responsible for accidental loss or damage.

The attention of beagle lovers and breeders all over the country is called to the wisdom of supporting the only organization in the interest of their favorite dog in the South, thereby increasing the number of its friends, encouraging the development of good dogs that will later be entered in the Northern, Eastern and Western trials in the pursuit of further honors, and opening up and extending a market for the produce of their kennel.

The third annual meeting at Centerville, Miss., proved a great success, with a total entry of about twenty-five very high class beagles, proving by far the finest exhibition of these hounds and their work ever witnessed in this portion of our country.

Finally, the committee invites every lover of clean, healthful out-of-door sport to send his application, together with the membership fee of \$3 to the secretary. By becoming members of the club at this important

period of its existence, Southern sportsmen can insure the permanent establishment of the only field trial association in the far South. Organization and acquaintance among the devotees of field sports will be promoted and their influence increased, and from this, other clubs, more or less allied, but devoted chiefly to the interest of the bird dog and the fox hound, will readily and naturally take origin.

Executive Committee: Henry Dickson Bruns, M.D., President and Chairman, New Orleans, La.; Wm. Porcher Miles, Vice-President, Burnside, La.; J. C. George, Esq., Vice-President, Stephenville, Tex.; Jos. Redhead, Esq., Vice-President, Centreville, Miss.; G. King Logan, M.D., Secretary-Treasurer, New Orleans, La.

After Feb. 1, 1906, address mail and express to Dr. M. F. Rogers, Chairman of Arrangements Committee, New Albany, Miss.

Dogs must be at place of meeting by night of Feb. 24, 1906.

### A Breeders' Myth.

BEECHER, at the end of the seventeenth century, pointed out that "when a mare had had a mule by an ass and afterward a foal by a horse, there are evident marks on the foal of the mother having retained some ideas of her former paramour the ass." That mares used in mule breeding are liable to be "infected" is still widely believed; but irrefragable evidence of the influence of the ass persisting, as Agassiz assumed, is conspicuous by its absence. Darwin says: "It is worth notice that farmers in South Brazil are convinced that mares which have once borne mules, when subsequently put to horses, are extremely liable to produce colts striped like a mule." Baron de Perana, on the other hand, says: "I have many relatives and friends who have large establishments for the rearing of mules, where they obtain from 400 to 1,000 mules in a year. In all these establishments, after two or three crossings of the mare and ass, the breeders cause the mare to be put to a horse; yet a purebred foal has never been produced resembling either an ass or a mule." The prevalence of the belief in telegony at the present day is largely due to a case of supposed infection reported to the Royal Society in 1820 by Lord Morton. It was the following:

A chestnut mare, after having a hybrid by a quagga, produced to a black Arab horse three foals showing a number of stripes; in one of these more stripes were present than in the quagga hybrid. The mare, however, the case of Lord Morton's chestnut mare is considered, the less convincing is the evidence it affords in favor of infection. Stripes are frequently seen in high-caste Arabs, and cross-bred colts out of Arab mares sometimes present more distinct bars across the legs and other zebra-like markings than characterized the subsequent offspring of Lord Morton's seven-eighths Arabian mare. In the absence of control experiments there is therefore no reason for assuming Lord Morton's chestnut mare would have produced less striped offspring had she been mated with the black Arabian horse before giving birth to a quagga hybrid.

To account for the stripes on the subsequent foals, it is only necessary (now that the principles of cross-breeding are better understood) to assume that in the cross-bred chestnut mare there lay latent the characteristics of the Kattivar or other Indian breeds in which stripes commonly occur. Darwin and others have regarded Lord Morton's mare as affording very strong evidence in support of the infection hypothesis. It was considered some years ago desirable to repeat Lord Morton's experiment as accurately as possible. The quagga having become extinct, a number of mares were put to a richly striped Burchell zebra, and subsequently bred with Arab, thoroughbred, and cross-bred sires. Other mares were used for control experiments. Thirty mares put to a Burchell zebra produced seventeen hybrids and subsequently twenty purebred foals. The mares used for control experiments produced ten purebred foals.

Unlike Lord Morton's quagga hybrids, all the zebra hybrids were richly and sometimes very distinctly striped, some of them having far more stripes than their zebra parent. Of the subsequent foals, three out of Highland mares presented indistinct markings at birth. But as equally distinct markings occurred in two purebred Highland foals out of mares which had never seen a zebra, it was impossible to ascribe the stripes on the foals born after zebra hybrids to infection of their respective dams. Further, the subsequent foals afforded no evidence of infection either in the mane, tail, hoofs, or disposition. Of the purebred foals, i. e., the foals by purebred sires out of mares which had never been mated with a zebra, two were striped at birth, and one acquired stripes later; they were revealed as the foal's coat was shed. Moreover, while the faint markings on the foals born after hybrids completely disappeared with the foals' coat, the stripes on the purebred colts persisted. One of the permanently striped colts—a bay—was out of a black Shetland mare by a black Shetland sire, one was by a dun Norwegian pony out of a roan-colored Arab mare, while the third was by a Norwegian pony, out of a half-bred bay Arab mare.

It has been asserted by believers in telegony that evidence in infection may appear in the second, though not present in the first generation. By way of testing this assumption, a bay filly, the half-sister of a richly striped hybrid, was put to a cross-bred Highland pony, and a Highland mare, while nursing her hybrid foal, was put to a colt, the half-brother of a hybrid. The result was two fillies which in no single point either suggested a zebra or a zebra hybrid. Similar results having been obtained with horses and asses, there is no escape from the conclusion that the telegony tradition is not confirmed by such methodical investigations as were suggested some years ago by Professor Wiesman. Experiments with cats, rabbits, and mice, with sheep and cattle, with fowls and pigeons, like the experiments with horses and dogs, fail to afford any evidence that offsprings inherit any of their characters from previous mates of the dam, i. e., they entirely fail to prove that a female animal is liable to be so influenced by her first mate that however subsequently mated, the offspring will either in structure or disposition give some hint of the previous mate.

In considering telegony, it may be mentioned that some breeders not only believe that the dam is liable to be infected by the sire, but also that the sire may acquire some of the characteristics of his mates. This belief seems to be especially prevalent among breeders of cattle; but how, for instance, a long-horned Highland bull, used for crossing with black hornless Galloway cows could subsequently get Galloway-like calves out of pure Highland heifers it is impossible to imagine.

In conclusion, it may be pointed out that it was only natural for breeders and physiologists in by-gone days to account for some of their results by the infection hypothesis. Even now we know surprisingly little about the causes of variation, and not many years ago it was frequently asserted that there was no such thing as reversion or throwing back to an ancestor. But even were the laws of heredity and variation better understood, the fact remains that we know little of the origin of the majority of our domestic animals. On the other hand, from the experiments of Mendel and others, we now know that cross-bred animals and plants may present all the characters of one of their purebred parents, and we also know that the offspring of what are regarded as purebred parents sometimes revert to remote, it may be, quite different ancestors. The better we understand the laws of heredity and variation, and the more we learn of the history of the germ cells, the less need will there be to seek for explanations from telegony and other like doctrines.—H. R. B. Tweed, in *Our Dogs*.

### National Beagle Club of America.

CAMDEN, N. J., Aug. 4.—At a meeting of the Executive Committee of this club, held on Aug. 3, in New York city, it was determined to hold the sixteenth annual field trials of this club during the week commencing Oct. 30. The place of holding the trials will be determined upon when the report of the committee on grounds has been received.

At this meeting the following committees were appointed by the chairman: Committee on Grounds—Messrs. James W. Appleton, Charles R. Stevenson and William G. Rockefeller. Committee on Judges—Messrs. C. Staley Doub, Charles R. Stevenson and George F. Reed. Committee on Arrangements—Messrs. George F. Reed, Henry Dickson Bruns and A. J. Purinton. Committee on Premium Lists—Messrs. James W. Appleton, Charles R. Stevenson and William G. Rockefeller. Field Trial Committee—Charles R. Stevenson, chairman, Camden, N. J.; Henry Dickson Bruns, Howardsville, Va.; John Caswell, Pride's Crossing, Mass.; Ernest Gill, Baltimore, Md.; Samuel Frothingham, Lenox, Mass.; Harry T. Peters, New York; A. J. Purinton, Palmer, Mass.; George B. Post, Jr., New York; George F. Reed, Barton, Vt.; William G. Rockefeller, New York; William Saxby, Stony Brook, L. I.; Bradford S. Turpin, Roxbury, Mass.; Charles F. Brooke, Sandy Springs, Md.; Harry Payne Whitney, New York; James W. Appleton, New York; C. Staley Doub, Frederick, Md.; Ramsay Turnbull, Bernardsville, N. J., and T. Dudley Riggs, Stevenson, Md.  
CHAS. R. STEVENSON, Sec'y.

# YACHTING

### Yachting Fixtures for 1905.

MEMBERS of Race Committees and Secretaries will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future:

#### AUGUST.

- 9. Corinthian, M. Y. R. A., open.
- 9. Sea Side, club.
- 9. Seaside Park, club.
- 10. Corinthian, M. Y. R. A., open.
- 10. Seaside Park, ladies' race.
- 10. New York, cruise, rendezvous cups, Glen Cove.

### Defense of the Canada Cup.

THE coming Canada's Cup races, which are to commence on Saturday, Aug. 12, have inspired more enthusiasm in the hearts of yachtsmen along Lake Ontario than any former years. More yachts have been built to compete in the trials; more money has been invested to bring them to the highest standard of efficiency, and more owners have interested themselves in the project.

It is the first time in the history of the Rochester Y. C. that this organization has been called upon to defend the trophy, although it has won the cup twice. It will be the third time that the Royal Canadian Y. C. of Toronto has sent her challenger after the mug, and should they be victorious, it will prove the third successful attempt to return the coveted prize to Canadian waters. Curiously enough the challengers have always won. Toronto has set out this summer with a firm determination to keep up her splendid record of successful invasions, her hopes fortified by precedent. Rochester, twice winner of the trophy, looks fondly back on her achievements of the past, and smiles grimly as she realizes that within her grasp is the yachting honor of the Great Lakes.

In round numbers, an aggregate of \$30,000 has been expended to capture or retain the Canada's Cup. Six 30ft. yachts have competed in the trial races, representing productions from the boards of such celebrated designers as Fife and Mylne, C. F. Herreshoff, and Gardner. Two of the trial contestants are of amateur design, and one of them at least has proved her ability to rank with the creations of the best. The three candidates in the Toronto trials, Temeraire, Zoraya, and Naniwa, representing Fife, Mylne, and Fearnside respectively, had a tryout of fifteen races, the Fife offering taking thirteen of them, and demonstrating conclusively her fitness for the Cup races.

The Flower City trials brought together three closely matched and speedy 30-footers. There was Rochester, designed by Mr. William Gardner; Iroquois, a creation of Mr. Charles F. Herreshoff; and Kee Lox II., designed by Pembroke brothers, of Rochester, two amateurs.

The best racing ever seen at Charlotte was the result. Out of thirteen races sailed, Rochester captured seven, Iroquois five, and Kee Lox II. one. On windward work in heavy weather, Iroquois proved fastest. With

jib doused and staysail flattened well down Iroquois is a wonder at going to windward, and defeated her rivals handily on almost every weather leg sailed. The Herreshoff boat proved fast off the wind as well, although on this work, Rochester seemed to have a shade the better of it. All of the races were close, in several of them only a few seconds separating the contestants at the finish. Kee Lox II. won one race over a windward and leeward course, and landed second place in half a dozen contests.

No more favorable weather could have been desired for the trials. The first day brought a baby hurricane from the E., that registered 25 miles an hour at the Life-Saving Station. There was a long roll to the lake, and the yachts were buffeted about considerably. Two races were sailed, Iroquois winning both. All three boats were under double reefs and storm jibs. The first race was over a triangular 9-mile course, Iroquois defeating Kee Lox II. by 1m. 18s., and Rochester by 1m. 56s. Two hours later the second race was started, a beat to the east buoy and a run home, a distance of 6 miles.

Kee Lox II. had to drop out of this race, having lost a balloon jib halliard block. Again Iroquois showed her heels to Rochester, but the latter pressed the Herreshoff boat hard at the finish, crossing only 24s. behind. The boats were tried out again the next day in a 20-mile breeze from the W. Rochester got a lead at the start, which was increased materially through the skippers of Kee Lox II. and Iroquois getting into a luffing match. On the second leg Iroquois sustained a long crack in her boom and was obliged to drop sail and call for a tow back to the harbor. All three boats made bad weather of it in this race, Kee Lox II. giving up when 3 miles from the finish. Rochester was the only boat to cross the line.

More accidents befell the racers on the following day. In the morning, while beating to the outer mark in a 15-mile breeze, Rochester broke her jib strut and turned tail for home; and in the afternoon Kee Lox II. crushed in a spreader, which incapacitated her for further work that day. In the morning race, on a 4-mile leg to windward, Iroquois beat Kee Lox II. by 6m. 30s., and lost 11s. on the run home. In the afternoon, over the same course, shortened by 2 miles, Rochester defeated Iroquois to the mark by 45s., losing 19s. on the run home. The same day, in a triangular race, Rochester came home the winner by 1m. 28s. The same skipper, Mr. L. G. Mabbett, held the tiller on all

three winners that day, the judges having shifted the captains about for purposes of comparison. The last three days were marked by lighter winds, and the races on these days demonstrated that the boats were built for light airs as well as heavy. Iroquois, having proven her ability in a blow from 18 to 25 miles, now showed up fast in a 10-mile breeze, and bothered her light-weather rivals considerably.

Taking elapsed time into consideration, Iroquois should be credited with two or three more races than the figures indicated. On one occasion Iroquois, by being crowded off the course, was delayed nearly 3m. at the start; yet she finished second, only 11s. behind the winner, Rochester. Mabbett, aboard the Gardner boat, has a record for quick starts, and was seldom more than 15s. behind the gun. In this way he squeezed out several victories for his boat, while on actual time Iroquois was theoretically the winner.

The judges' committee, composed of former Commodore Charles Van Voorhis, of the Rochester Y. C.; Commodore John T. Mott, of the Oswego Y. C.; Louis Sayer, ex-commodore of the Canandaigua Y. C., and Lieut. E. N. Walbridge, of the second division of Naval Militia, Rochester, gave the yachts every opportunity to display their ability, and changed skippers frequently. The judges arrived at their decision only after a careful computation of the figures of each race, and while Iroquois was chosen on this basis, the idea still prevails in many quarters that Rochester is a faster boat. They are remarkably well matched, and the Colonel Pond Cup, which was donated to the club this year, to be held as a perpetual challenge trophy for the 30-footers, will bring them together in many more exciting contests.

The Canada's Cup has drifted from port to port on the Great Lakes for nearly ten years. It was given by the city of Toledo in 1896 as a perpetual challenge cup, and in that year Vencedor, of the Lincoln Park Y. C., Chicago, was defeated by Canada, representing the Royal Canadian Y. C., of Toronto. The Chicago Y. C. challenged for it in 1897, and called for other cities to compete in the trials. Rochester and Milwaukee were the only outsiders to enter candidates, and Genesee, sent by the Rochester Y. C., won out easily. A month later in the same year Genesee went to Toronto and captured the cup for the Chicago Y. C. by defeating the Canadian defender Beaver. In 1901, the Royal Canadian Y. C. again challenged for the mug. Cadillac, of Detroit, was selected to defend it against Invader, of Toronto. The Canadian boat took the series in three straight races.

Rochester Corinthians now became alive to the excellent sport furnished by these contests, and in 1903 were the first in the field with a challenge, which was promptly accepted. The Gardner designed 40-footer Irondequoit was sent across the lake and pitted against Strathcona. The latter, under the skillful direction of the veteran Jarvis, was doing finely, having taken the first two races, when Mr. Addison G. Hanan, of New York, appeared on the scene, and stepped into the cockpit of Irondequoit just as she was swinging out for the third race. What followed is a blank page in Canadian yachting history. Hanan put Irondequoit across the line a winner three times in succession, and the cherished cup went back to the Flower City with the enthusiastic Rochesterians.

This year Toronto has buckled on her spurs and sallies forth once more to do battle for the treasure. Rochester calmly awaits the outcome of the matches. The following tables will give an opportunity for a comparison of the boats:

	Iroquois.	Temeraire.
Length over all	52ft.	50ft.
Forward overhang	10ft.	10ft.
After overhang	12ft.	10ft. 3in.
Waterline	30ft.	29ft. 3in.
Ballast	5 tons	5 tons 1,460lbs.
Draft	7ft.	6ft. 10in.
Extreme beam	10ft. 6in.	10ft. 2in.
Beam on deck	10ft. 3in.	9ft. 9in.
Beam on waterline	10ft.	9ft. 9in.
Sail area	1,550sq. ft.	1,547.86sq. ft.
Mainsail	1,100sq. ft.	1,111.41sq. ft.
Fore triangle	450sq. ft.	436.45sq. ft.
Boom	37ft. 6in.	39ft. 6in.
Gaff	24ft. 6in.	25ft. 3in.
Spinnaker boom	23ft. 6in.	20ft. 4in.
Mainsail hoist	29ft. 6in.	28ft.
Cabin trunk	12ft. long.	8ft. long.
Cabin trunk	20in. high.	20in. high.
Head room	6ft.	6ft.
Bowsprit, outboard	7ft. 4in.	5ft.

The skippers chosen for the races are Mr. E. K. M. Wedd, on Temeraire, and Mr. Lorenzo G. Mabbett, on Iroquois. Both are young men, and as evenly matched as the boats. Singularly enough, each won his spurs at the Kingston regatta last year, Wedd by his succession of victories with Whirl and Petrel II., and Mabbett by his excellent handling of Chitta, which went over the line with the gun in every race.

The judges chosen for the cup races are E. H. Ambrose, of Hamilton, Ont.; Charles Van Voorhis, of Rochester, and C. Routh, of Montreal.

CLUTE E. NOXON.

STEVENSON'S YACHTING MANUAL.—Stevenson's Sea Guide and Yachting Manual for 1905 has just been distributed. This valuable little book is now published and compiled by Mr. William Gardner. In the preface Mr. Gardner says: "This little volume has been compiled with the view of placing before both yachtsmen and those of the public who are fond of blue water a modest compendium of information. We trust that yachtsmen will find something to attract them in the tide tables, the directions for entering harbors, etc., and we hope that those who are interested in statistics of the deep sea as well as of the heavenly bodies by whose aid our ships are steered across its pathless waste, may derive some entertainment from its pages."

MR. HOLLIS BURGESS announces that he has reopened his yacht brokerage office in connection with his insurance business of all kinds. He has taken over the yacht brokerage business of Messrs. Burgess & Packard and will act as general marine agent for the purchase, sale and charter of yachts and other vessels, and also for equipping, fitting out, etc. His office is at 10 Tremont street, Boston.

## British Letter.

CROSS-CHANNEL MOTORBOAT RACES.—The second annual international cross-channel race took place on July 15. The course this year was from Boulogne to Folkestone and back, instead of from Calais to Dover as was the case last year. The weather was fine, but rather hazy and the sea for the most part smooth; but in spite of the favorable conditions, the race itself was a farce, and there were no serious mishaps, simply because the water was not rough. Only two vessels of high speed escorted the fleet, a French destroyer and two torpedo boats, for the crowd of tugs and pleasure steamers was soon left far behind. There were prizes for racers, cruisers and fishing boats. With the exception of Napier II. and Napier, which are English, and Pas Pressé, a Belgian competitor, the fleet of some twenty boats was French. The racers were divided into three classes, boats of 8 meters, those of 8 to 12 meters, and 12 to 18 meters. The cruisers were likewise classified, and there were three fishing boats. Eighteen boats started and seven finished. Napier II. actually completed the course in the fastest time, but her helmsman had neglected to read his instructions and did not cross the finishing line until he had lost more than two valuable minutes. La Rapière, which was over a minute astern, cut her out and took the prize for the fastest crossing. Napier II. won first prize in her own class; in fact, she and La Rapière were the only racers to finish. The time occupied by Napier II. for the 51 miles was 2h. 24m. 47s., and by La Rapière, 2h. 25m. 50s., but Napier's official time, after correcting the error at the finish, was 2h. 27m. 4/5 s. Four of the cruisers completed the course, the fastest, Forcés Pas, doing the distance in just over three and a half hours, and the slowest taking more than seven hours, rather more time than the fishing boat occupied. Twelve boats broke down, either owing to being flooded out, or the engines going wrong. What would have happened had the sea suddenly become rough, with so little assistance at hand, it is difficult to say, but this race, with its farcical ending and lack of solid results, should serve as a warning to sensible men of the dangers which must accompany the running of flimsy, unseaworthy boats, built entirely for speed over courses where they have no right to be.

CLYDE TO COWES RACE.—The return handicap match for the big class from the Clyde to Cowes was a long drawn out affair owing to light airs prevailing. They started on July 8, as stated in my last letter. White Heather reached Cowes on July 12 at 8:28:35 P. M., taking the first prize; Adela won the second prize, finishing on July 13 at 6:01:15 A. M., and Merrymaid won third honors at 6:11:02 A. M., of the same day.

THE 52-FOOTERS.—After leaving the Clyde, the 52ft. class had four races in Irish waters. Three of these were at Belfast, and the fourth at Kingstown. The first match was that of the Royal North of Ireland Y. C. on July 14. Sonya had a new hollow mast and some lead had been taken off her keel. She was perceptibly more buoyant yet stood up well to her canvas and was making a good show to windward and leaving the fleet, when her mast began to give out and she abandoned the race. She now has her fourth hollow spar and is to have some alterations made before Cowes week under the personal supervision of her designer—at least so it is stated. Sonya's luck has certainly been out, for at times she has shown decisive superiority over the others, especially to windward, and nothing but faulty masts have prevented her winning more prizes. Maymon was the winner of the race, Moyana being second. The following day was the opening of the Royal Ulster Y. C. Moyana and Britomart were just over the line at the start, and the former, not seeing her recall number, went on. She sailed splendidly, well beating the others, but was of course disqualified, Maymon taking first prize. On July 17, the second day of the Royal Ulster, there was more wind and a lot of reaching. Britomart found the weather to her liking, easily beating Maymon, which in turn disposed of Moyana. The three then went on to Kingstown, where the Royal Alfred offered them a race for the No. 3 champion cup with money prize added. Maymon sailed beautifully and was an easy winner, Moyana taking second prize. This race was sailed on July 19, and was the last before the Solent regattas come off the second week in August. In my last letter I stated that Moyana had won six first prizes at the Clyde regattas. This should have been five. Moyana, Maymon and Britomart each started nine times. Moyana won five firsts; Maymon three firsts and two seconds, and Britomart one first and six seconds. Sonya started seven times and took one second prize. It is to be hoped that she will have a fair trial for the rest of the season.

RAMSGATE WEEK.—The annual regatta of the Royal Temple Y. C. has been shorn of much of its glory this year owing to the presence of the big boats on the Clyde, and their chief event—the first race of the last day at Deal—was reduced to a duel between Creole and Rosamond, the former winning easily.

DOVER AND OSTEND REGATTAS.—The large boats came together again on July 14 at Dover, Navahoe and Susanne having joined the fleet after the finish of the Baltic racing. On July 14 there was but little wind. In the race for yachts exceeding 100 tons Thames measurement Navahoe, White Heather, Brynhild and Susanne started. The former got away in the light airs, her lofty canvas serving well. She won easily, White Heather taking second prize. On July 15 the class was reinforced by the addition of Valdora, Adela and Sunshine, and a fine fleet of seven sailed to Boulogne and back, about 50 miles. They had a close-haul to the French mark boat and a quarterly wind home. Navahoe made a great gap between herself and the others, but Susanne sailing very fast down the wind saved her time for first prize, Navahoe taking the second. Five yachts started in the handicap under 100 tons, Vendetta winning and Creole taking second prize.

On July 17 the fleet was divided into two sections for the races from Dover to Ostend. There was a light breeze from the S.W. Seven boats started in the race for yachts exceeding 100 tons and six in the second match. The schooner Sunshine had another day to

her liking and won the leading event, Therese taking second prize. The Belgian yacht Angèle won the second race with Rosamond second. Racing at Ostend commenced on July 19, and finished on July 22. The weather was fine and the sailing for the most part interesting. Brynhild and White Heather each won a first prize in the big class, and in the second, Creole and Rosamond were the winners. On the last day the two classes had a combined race. Betty won this and Susanne took second prize.

CLASS RACING VS. HANDICAP RACING.—In the Yachtsman of July 20 appears a short letter from Sir James Pender which gives his own reason for not building into class racing, and which is, no doubt, the reason why other owners refuse to enter the lists. It is simply that Sir James, while quite acknowledging the fact that class racing is the thing, has no intention of building until the Yacht Racing Association do what they ought to have done years ago, and that is adopt some efficient system of scantlings. The culpable neglect of the Y. R. A. in this matter has given the death blow to their two most important classes which they ought to have done their best to cherish, the first class and the 65-footers. This letter ought to be an eye-opener for the governing body; whether they will take any practical notice of it remains to be seen. For the last ten years the Y. R. A. has lived on its past reputation and, with few exceptions, its members have viewed with complacency their own destruction of their own classes, through starving them of their proper conditions, putting it down to anything and everything but the right cause. Sir James Pender's letter may startle them out of their lethargy; if it does not, then nothing will.

E. H. KELLY.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

A. P. B. ASSN'S CRUISE.—The cruise is open to all power boats owned by members of any club which is enrolled in the American Power Boat Association. Fleet will rendezvous at Hudson, N. Y., Aug. 17, at 12 noon. Captains, upon arriving at rendezvous, are invited aboard the committee boat to receive instructions for the daily runs and their permit to navigate the canal. Fleet will be prepared to get under way at 3 P. M., Aug. 17, upon signal from the committee boat. The canal will be entered at Watervliet, near Albany, and will be left at Oswego, N. Y., from which point a run will be made to the Thousand Islands Y. C., Alexandria Bay. At the Thousand Islands the fleet will be the guests of the Thousand Islands Y. C., through whose kindness cards will be issued, extending the courtesies of their anchorage, house and grounds to the captains and their guests.

During Aug. 24, 25 and 26 will be witnessed the races for the American Power Boat Association Challenge Cup, to be held under the auspices of the Chippewa Y. C., and the fleet are invited to take part in the night illumination, parade and entertainments arranged for during these days, announcement of which will be duly made. Aug. 26, at sunset, upon the lowering of the committee's flag, the cruise will officially end.

Entries may be made to the chairman of the committee, and on account of the necessity of securing a permit to navigate the canal and the making of many other necessary arrangements, entries will close Aug. 12. No boats over the following dimensions can enter the canal: 98ft. long, 17ft. beam, 6ft. draft, height under bridges, above water line, 11ft. 6in. The following entries have been received:

Cactus II., C. E. Proctor, Indian Harbor; Ida Bell, Louis Kahnweilers, Brooklyn; Amrita, Dr. Emil Heuel, New York Athletic; Nawquis, A. Gardiner Cooper, Indian Harbor; Nymphaea, Preston B. Lee, Philadelphia; Mao, Dr. Seymour Oppenheimer, Far Rockaway; Graydon, Arthur S. Gray, Albany; Rene, S. J. Fleet, Atlantic; Linnet, Egbert Le Fevre, M. D., Thousand Islands; Snipe, George N. Burt, Oswego; Aztec, J. J. Adams, Indian Harbor; Viper II., Maj. J. G. R. Glasgow, Buffalo Launch; Iris, Matthew McCarty, Albany.

J. H. McIntosh, Chairman, 32 Broadway, New York.

WILLIAM FIFE, JR., ARRIVES.—Mr. William Fife, Jr., reached New York on Aug. 5 on the steamer Lucania. Mr. Fife proceeded to Rochester, where he will remain during the races for the Canada Cup. Temeraire, the challenger, which boat was designed by Mr. Fife, reached Charlotte on Monday, where she created a very favorable impression. Mr. Fife will look after the interests of his product in the races.

NEW LAUNCH SHOWS GREAT SPEED.—The 35ft. launch designed by Mr. C. F. Herreshoff and built by the American & British Mfg. Co., of Bridgeport, was given a trial on Aug. 4. It is said the boat did better than 35 miles an hour. She is constructed of aluminum and steel and is 35ft. over all, 4ft. 7in. breadth and 7in. draft. The boat is driven by a 100 horsepower motor which was designed by Mr. Herreshoff.

ADRIENNE SOLD.—The 80ft. flush-deck gasoline yacht Adrienne was sold by Mr. John S. Loomis to Mr. F. D. M. Strachan, of Brunswick, Ga., through the agency of Mr. William Gardner. The steam yacht Kanawha I. has been chartered by Mr. H. C. Baxter to Mr. William H. Bliss for use for the balance of the season in cruising along the Maine coast, and the auxiliary schooner yacht Comanche has been chartered by Mr. C. A. Tatum to Mr. E. C. Dale, Larchmont. The same agency has also arranged charter of steam yacht Loando to Mr. George F. Pynchon, and other members of the New York Y. C. owning boats in the one-design 30ft. class for use as a tender during the club cruise.

THE MARINE AND FIELD CLUB fleet seems to be subject to unusual accidents. Last year one of the boats was struck by a rowing shell, the bow of the offending craft breaking off and sticking in the hole made by the collision, thus keeping out all water. The latest mishap is

even more strange. On Sunday last the class RR boat Beta was caught in a thunder squall while on Gravesend Bay. Unknown to the occupants, the mast was struck by lightning, the fluid going down the shrouds and out through the planking just below the chain plates, burning two small holes, one on each side. On returning home the boat was noticed taking water, but nothing was thought of the matter, it being considered as merely a result of the heavy rain. On Monday morning the craft was found sunk at her moorings. After she had been hauled out and pumped dry the work of the lightning was discovered.—Brooklyn Eagle.

**KOLUTOO DESIGNED BY BURGESS & PACKARD.**—In our last issue we inadvertently stated that Kolutoo, the Seawanhaka Cup challenger of 1903, was designed by Mr. E. A. Boardman. Her designer was Mr. Starling Burgess, to whom credit is entirely due, and we regret the error.

**CLUB BOOK RECEIVED.**—We are indebted to Mr. Harry Grootage, Secretary of the Moriches Y. C., for a copy of the club book.

**SALES AND CHARTERS.**—The high speed steam yacht Scud, Mr. Samuel Untermeyer, owner, has been chartered for August and September, through the offices of Mr. Henry J. Gielow, to a member of the N. Y. Y. C.

The same agency has also sold and chartered the following yachts:

Steam yacht Marjencha, Mr. L. C. Nash, has been sold to Mr. Julian Cendoya, Santiago, Cuba. The boat will be run from Ogensburg to New York, and then proceed to Cuba as far as possible via inside route, and will be in charge of Mr. Cendoya's captain, Egbert Robinson.

The 52ft. yawl Espirito, Mr. John F. Hammond, has been sold to Mr. F. B. Cleland, New York Y. C.

The 38ft. autoboat Brown Witch, Mr. J. T. Davies, has been sold to Mr. A. C. Taylor.

The 66ft. power houseboat Reliance, Mr. L. J. Nilson, has been chartered to Mr. Chas. J. Fisk, for use at Greenwich, Conn.

The launch Hermida, Mr. H. Hessenbruch, has been chartered to Mr. Artemus Ward.

**YACHT SALES.**—The cruising sloop Ishkoodah has been sold by Mr. H. F. Parmlee, N. Y. Y. C., to Mr. L. P. Copeland, of Providence, R. I., through the office of Stanley M. Seaman. Ishkoodah was designed and built by the Herreshoff Mfg. Co., 1903, for Commodore Morton F. Plant. She is a keel boat 48ft. over all, 36ft. waterline, 13ft. beam, 7ft. draft. The same office has also sold the 21ft. knockabout Don for Mr. J. R. Suydam, of New York city, to Mr. David Kay, Newark, N. J. The same agency has sold the gasoline yacht Klein by Mr. F. G. Knowles, of Toronto, Ont., to Mr. J. P. Haines.

**Protest Decisions by the S. C. Y. C. Race Committee.**

THE Race Committee of the Seawanhaka Corinthian Y. C., composed of Messrs. Henry H. Landon, chairman, Howard C. Smith, Francis G. Stewart, Clinton H. Crane and Victor I. Cumnock, have passed on the three protests filed as a result of fouls which took place in the Seawanhaka Corinthian Y. C.'s annual regatta on June 24.

The committee has published in a small pamphlet for distribution all the evidence bearing on these protests, and we publish it in full. The idea of giving the evidence and decisions publicity in this manner is an excellent one and could well be followed by other clubs.

**Decision of the Race Committee of the Seawanhaka Corinthian Y. C. in reference to Mineola-Yankee** Protests arising from a foul which occurred in the Annual Regatta on June 24, off Oyster Bay.

The evidence is conclusive, and not denied by either party that the two yachts were converging on the outer mark of the course, both sailing free, the angle of convergence being very slight. Both yachts were carrying booms to starboard, Mineola's course being to starboard of Yankee's. As the mark which they were approaching was to be left on the starboard hand, Mineola was in a position to pass between Yankee and the mark if an overlap existed. Mineola claimed room at the mark. Yankee denied the claim. Mineola then attempted to luff across Yankee's stern, and in doing so, struck Yankee's starboard quarter with her bobstay. This clearly established the fact of the overlap as defined in Rule 24, Section 5.

The evidence is conclusive and is not denied that Yankee had not given sufficient room for Mineola to pass clear of the mark as required by Rule 24, Section 4.

Mr. Maxwell's evidence states that the two vessels were 100ft. from the mark when the foul occurred.

In the opinion of the committee, Yankee should be and is hereby disqualified for disobeying Rule 24, Section 4.

In the opinion of the committee, 100ft. in vessels of this size is within the meaning of the term "are about to pass a mark on the required side," there being no evidence to show that Yankee had any intention of passing the mark on other than the required side.

**Decision of the Race Committee of the Seawanhaka Corinthian Y. C. in reference to a Protest made by Capt. Addison C. Hanan, of the Sloop Nautilus against Sloops Minx and Alera in the First Series Race off Oyster Bay, on June 23.**

The evidence shows and is not denied that the yachts Dahinda, Nautilus and Cara Mia were approaching the outer mark of the course practically abreast, Cara Mia leading, Nautilus second, Dahinda third—Cara Mia on the outside, Dahinda on the inside. Several lengths astern of these three was Alera, and astern of her was Minx. Dahinda was given room at the mark by the other two yachts forcing them to make a wider turn and blanketing them so as to cause them to slow down.

Alera and Minx, coming up from the stern, attempted to force a passage through the opening between the mark and Nautilus left by the passage of Dahinda.

The testimony of Messrs. Duncan, of Dahinda; Hanan, of Nautilus, and Wainwright of Cara Mia, agrees that a collision was prevented by Nautilus altering her course to allow Alera to pass without touching her. Mr. Alker, of Alera, testifies to the contrary.

In the opinion of the Committee, Alera should be and is hereby disqualified for disobeying Rule 24, Section 4, paragraph 2. The Committee is left no option but to take the testimony of three gentlemen against one as the more trustworthy—especially as at the time Alera was mixed up in a foul with Minx, which must have distracted Mr. Alker's attention from the actions of Nautilus and Cara Mia.

The Committee wishes to emphasize the fact that it is not necessary for racing yachts to come into collision in order to establish their rights under the rules.

Further, that a yacht coming up from the stern and attempting to force a passage between a competitor and a mark of the course does so at her peril—and the burden of proof is on her to show that she had ample room for such passage.

In regard to the situation between Minx and Alera, the evidence is conflicting—Minx claiming an overlap and Alera denying it; but in view of the positions just prior to the foul, the Committee is of the opinion that Minx did not have an overlap before Alera altered her helm for the purpose of rounding, and therefore disqualifies Minx, this foul occurring prior to the time that Alera was disqualified for interfering with Nautilus.

**Decision of the Race Committee of the Seawanhaka Corinthian Y. C. in reference to a Protest made by M. C. Andrade, Jr., of the Sloop Invader, Jr., against the Sloop Pretty Quick, in the Annual Regatta, off Oyster Bay, on June 24, 1905.**

The evidence shows that Invader Jr., started from the windward end of the line on a course N.N.W.½W., and Pretty Quick started from the leeward end of the line on a course approximately N.W. Invader, Jr., had her spinnaker set and was sailing before the wind. The two boats converged several hundred feet from the line, and Pretty Quick hailed Invader, Jr., claiming the right of way. Invader, Jr., disputed the claim, saying that they were the overtaken boat, and also were headed for the mark, but took in the spinnaker and luffed nearly parallel to Pretty Quick's course. Shortly after this the two boats came together, about abeam. Both boats claim the right of the overtaken boat.

In the opinion of the Committee Invader, Jr., should be and is hereby disqualified for disobeying Rule 24.

Invader, Jr., with the wind aft, had to keep clear of Pretty Quick, without interference to the position of the next mark, and when two boats converge in different courses neither can claim the rights of the overtaken boat, and when they hauled on approximately the same course, there is no evidence to prove that Pretty Quick luffed into Invader, Jr., but rather that Invader, Jr., did not luff soon enough or far enough to prevent the foul.

**Squantum Y. C.**

Quincy, Mass.—Saturday, Aug. 5.

An interclub race between yachts of the Squantum, Quincy, and Wollaston yacht clubs was sailed in Quincy Bay, under the auspices of the Squantum Y. C., on Saturday, Aug. 5, in a brisk S.W. breeze. In Class A, Waweenock had things about all her own way. Toss, in this class, capsized, and there was some excitement until her crew had been taken care of. The boat sank. In Class B, Pocahontas led until the second mark was passed, when Eclipse took the lead and held it to the finish. In Class C, San Toy was first home, but lost to West Wind on time allowance. Mischief was the winner in the power boat class. In the following summary, the letter preceding the name of the owner signifies the club:

Class A.		
	Elapsed.	Corrected.
Waweenock, W., Coombs & Seymour.....	1 58 39	1 22 59

**Brooklyn Y. C.**

Bensonhurst, New York Harbor—Saturday, Aug. 5.

THE third race to count on the championship of Gravesend Bay was held on the afternoon of Saturday, Aug. 5, under the auspices of the Brooklyn Y. C. Twenty-one craft started in the different classes. Again measurements of many boats were not in the hands of the Race Committee, with the result that corrected times could not be figured out. Vivian II. and Beta were the only boats sure of victory in Classes N and RR respectively. Tabasco finished first in Class P, but there appears to be a good chance of Lizana winning out on time allowance. Cockatoo II. led the Class Q boats home, but Ogeemah is expected to gain victory on corrected time. It is also a decision of corrected time between Careless and Spots, first and second boats, respectively, in Special Class Q.

There was a fine breeze blowing from the S. throughout the race. The start of the event was off the Brooklyn Y. C. station. The regular Association courses were covered, leaving all marks to port. It was a run for all the boats to the Marine and Field Club, and a reach to Fort Hamilton. Classes Q and under went from there to Sea Gate and home, getting a fine windward leg, followed by a reach. The other starters went from Fort Hamilton to Craven Shoal bell buoy and thence to Sea Gate. Both courses were sailed twice, the inside journey aggregating 7.62 miles, and the other 10.

On elapsed time Vivian II. defeated Bobtail by 48s. Tabasco was 5m. 7s. ahead of Lizana. Cockatoo II. led Quest by 1m. 2s. Careless was 27s. ahead of Spots, and Beta beat Gamma 1m. 15s. The fourth and next to the last race counting on the championship of Gravesend Bay will occur on Aug. 19, under the auspices of the Bensonhurst Y. C. The summaries follow:

Sloops—Class N—Start, 3:20.		
	Finish.	Elapsed.
Vivian II., S. E. Vernon.....	4 38 04	1 18 04
Bobtail, E. F. Luckenbach.....	4 38 52	1 18 52
Sloops—Class P—Start, 3:25.		
Tabasco, J. B. O'Donohue.....	4 43 06	1 28 06

Delta, J. J. Mahoney.....	Disqualified.	

**Atlantic Y. C.**

Sea Gate, New York Harbor—Saturday, Aug. 5.

THE third race for the Underwood cup for Atlantic Y. C. boats in classes P and above was sailed on the morning of Saturday, Aug. 5. Vivian II. was the first to finish, and will win the event if a protest of Tabasco, claiming her actual starting time because the gun missed fire, is not allowed. There was quite a little misunderstanding at the start as to how the course stated in the Race Committee circular should be covered. Because of this there is a possibility of the race being run over. Should Vivian II. be declared the winner, she will get permanent possession of the cup, having won the second race of July 1. Bobtail captured the first on June 10. The conditions as originally announced required three victories in order to win the trophy. Since then two have been decided to be enough. The trophy was given in 1904 by former Vice-Commodore Frederick D. Underwood, but was not put up for competition until this year.

The boats went twice over a course from Sea Gate to Fort Hamilton, thence to buoy No. 6 to the eastward of West Bank Light, and home, leaving all marks to starboard. The first leg was a run, the second a beat, and the last a reach home, with balloons set to port. The boats were started on handicap times, allowances being handled at the beginning instead of the last of the race, as is customary. This method has been employed with power boats, but is not likely to prove popular with sailing yachts. The course figured about 13 miles. The wind was from the S. at the start, and remained in that quarter, freshening toward the finish. The summaries follow:

Sloops—Classes P and Above.			
	Start.	Finish.	Elapsed.
Vivian II., S. E. Vernon.....	10 19 44	1 10 50	2 51 06
Tabasco, J. B. O'Donohue.....	10 12 35	1 13 00	3 00 25
Bobtail, E. F. Luckenbach.....	10 19 34	1 13 40	2 54 06
Lizana, D. S. Wylie.....	10 05 00	1 23 00	3 18 00

**Duxbury Y. C.**

Duxbury, Mass.—Saturday, Aug. 5.

A CLUB race of the Duxbury Y. C. was sailed on Saturday, Aug. 5, in a brisk S.W. breeze. Osprey II. had the best of it in the 18ft. class, but was disqualified for fouling a buoy upon protest of Menace. Bub won in the handicap class. The summary:

Elapsed.	
Osprey II., A. R. Train.....	1 48 08
Menace, H. Hunt.....	1 48 20
Again, L. B. Goodspeed.....	1 49 07
Kittawack, Maxwell.....	1 50 13

**GAS ENGINES AND LAUNCHES.**

**Their Principles, Types, and Management. A Complete and Practical Manual.**

BY F. K. GRAIN, M. E.

Bound in cloth, with 123 pages and 20 illustrations. Sent, postpaid, for \$1.25.

THIS compact and comprehensive handbook contains all the information essential to users of the marine gasoline engines, and will be welcomed by the thousands of men now owning and running power boats. Laymen and experts will alike find the book invaluable. It treats of the various types of marine gasoline engines, points out the good in each, and tells how to run them. A knowledge of the contents of this book will help to overcome difficulties and avoid accidents. The most complete book of its kind ever published.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

**Boston Y. C.**

Hull, Mass.—Mid-Summer Series—Aug. 3, 4 and 5.

THE annual mid-summer series of Y. R. A. open races was given by the Boston Y. C. in Hull Bay, off the Hull station of the club on Thursday, Friday and Saturday, Aug. 3, 4 and 5. There was good attendance at all of the races, and the weather conditions were enough at variance on each day to bring out the abilities of the different boats. On the first day it was very light and fluky. On the second day it was calm to light. On the last day there was a moderate, wholesail breeze. Rube succeeded in pulling off two out of the three races in the 22ft. class, while there was a different winner each day in the 18ft. class. Vera took two out of three in the 15ft. class. Meemer took all three in the first handicap class, as did Jacobin in the second handicap class. Tama and Yenoh were the stars of the power boats, Tama taking two out of three.

Thursday, Aug. 3.

The first contest of the series was one of wind hunting, with what wind there was from the S.E. In the 22-footers Peri II., Clotho and Medic II. were over the line together, with Peri II. in the weather berth. All hands split on the beat to the first mark and Rube was the first to reach it. By good judgement in seeking wind, Tyro pulled ahead on the next leg, and made further gains by the same good judgment on succeeding legs, winning the race by over 8m. She was sailed by Mr. Sumner H. Foster. Gertrude, Nick Nack and Dorchen were the first three across in the 18-footers. Bat was in a pocket at the start, but she worked into the lead before the first mark was reached and was never headed. In the 15ft. class Cigarette turned the tables on Vera II., coming in many minutes ahead. Meemer sailed a fine race in the first rating class, finishing ahead of the 22-footers which started 5m. before her. She won by a long margin on both elapsed and corrected times. It seems that this old 30-footer has been going faster than ever this year, and she is a standing example that the new rating rule does not injure the chances of the centerboard. Opitsah II. did the leading in the second rating class, but lost to Jacobin on corrected time. Tama simply romped away from the fleet in the power boat class. The summary:

Class E, 22-footers.

Friday, Aug. 4.

For Friday, Aug. 4, the yachts had better luck in the line of breeze. At the start there was very little air, but the wind went to S.W. and blew wholesail strength. In spite of the shift of wind there was plenty of windward work. The order of starting in the 22ft. class was Clotho (ex-Chewink V—ex-Clotho), Medic, Tyro, Rube, Nutmeg and Peri II. Tyro and Rube hung together on the windward leg, Tyro reaching the windward mark first. The lull before the shift of wind lost Tyro the breeze, and the others came up on her, but she managed to turn the second mark in the lead. Rube then pulled up on her and went by, holding her lead to the finish and winning by 10s. Bonitwo got the start in the 18ft. class, but was passed by Hayseed before the first mark was reached. Hayseed then led to the finish with Bonitwo and Bat close astern. In the 15ft. class, Vera II. led from start to finish. Meemer again won by a long margin in the first rating class. In the second rating class Gringo was first in by 7s. over Sally IV., but Jacobin again took first on corrected time. Tama again led the power boats around the course, but lost to Yenoh on time allowance. The summary:

Class E, 22-footers.	
	Elapsed.
Rube, H. L. Bowden.....	1 56 51
Tyro, W. H. Joyce.....	1 57 01

Saturday, Aug. 5.

For the last day of the series, the yachts had a rattling whole-sail breeze from the S. In the 22-footers Clotho was first across the starting line, but with Nutmeg in rather the best position. Clotho led to the first mark, but on the beat to windward Rube went into first place and remained there for the remainder of the race, with Tyro second. The 18-footers were bunched at the start, with Bat having a little the best of it. Bonitwo had the lead at the end of the first round, but Dorchen got it afterward and finished first. Vera II. again had all the best of it in the 15ft. class. In the first rating class Meemer finished her third

straight win, but did not have as much to spare on corrected time as on the two previous days. In the second rating class Jacobin won on both elapsed and corrected times. Dorothy II. got the start in the Cape cat class and led on the first round, but was later passed by Josephine and all the rest of the class. Josephine won by less than a minute from Marvel. Barbara won in the dory class. Right o'Way sailed alone in the class of cabin launches over 40ft. Blink won from Woodpile in the cabin launches under 40ft. Tama again led all the launches and won in her class on both elapsed and corrected times. The summary:

Class E, 22-footers.	
	Elapsed.

**American Y. C.**

Milton Point, Long Island Sound—Saturday, Aug. 5.

THE American Y. C. was unfortunate in having been allotted the Saturday before the start of the New York Y. C. cruise for their mid-summer association race, as many boats that might otherwise have entered were being overhauled preparatory to the big event. This state of affairs did not, however, seriously affect the match, and with the exception of the two 70-footers, most of the important boats that have been racing on the western end of the Sound were on hand.

The Race Committee, made up of Commodore Trenor L. Park, Joseph M. Macdonough and W. H. Caswell, were on board the towboat Unique. The match was splendidly managed, and the event went off without a hitch. The start was made off the red gas buoy on Scotch Caps. It was a beat of 2 3/4 miles to the red and black striped buoy to the northward of Execution Light. The second leg was a reach of 3 1/2 miles to the black spar buoy off Week's Point and then a spinnaker run of 3 1/2 miles back to the starting line, a total distance of 9 1/2 miles. The 33-footers and the New York Y. C. 30-footers covered the course twice, while boats in all the other classes went once around the triangle. There was a nice sailing breeze from the S.W. The tide was flood on the first round and ebb on the second.

Mr. Clifford Bucknam sailed Commodore Trenor L. Park's Mimosa III. and seemed to get the best out of the boat. Nike was her only competitor, and she outsailed her on nearly every leg of the course. Mimosa III. won by over 6m., and added another winning flag to her already long list.

The racing in the New York Y. C. one-design class was of the best. There were ten starters and the result of the race was in doubt from start to finish. The start was spectacular, and Nautilus sailed down the line, killing time. She crossed 1s. after the signal. Nautilus, as well as Cara Mia, were the only two boats not gun-shy, and they made pretty starts. The wind freshened on the first leg, and it was a pretty race to the first mark. At the second mark Cara Mia led, Nautilus second and Banzai third. The latter boat made her first appearance with a suit of Ratsey canvas. On the third leg of the first round Nautilus gained steadily on Cara Mia, and at one time it looked as if she would run by. The gain made by Nautilus put Mr. Stuyvesant Wainwright on his mettle and he sailed his boat quite as faultlessly as did Mr. Addison Hanan on the windward leg of the second round. Cara Mia held her lead over the first two legs, but on the run to the finish line Nautilus gained again and ran up even with the Wainwright boat. Skipper Hanan luffed Nautilus sharply just as his bowsprit crossed the finish line, and she took the race by the very close margin of 2s. Ibis was third. She was sailed in this race as well as in some of the earlier events by Mr. Hazen Morse, and this, no doubt, accounts for the improvement made in her form. Atair beat out Banzai and Neola II. in some way and finished up nearer the top than is her custom.

In the 27ft. class Maryola got a good start and managed to keep ahead of Rascal all over the course. Maryola showed to better advantage in this race than she has in any other event this season and she secured her first win. Rascal finished second.

Ten raceabouts started and these boats afforded almost as interesting racing as did the New York boats. Tartan met with an accident before the start, and, unfortunately, could not participate. She was towed back to Glen Cove. Mr. A. B. Alley was late in getting to the starting line, owing to the light wind in the early morning; he managed to make a very good showing with his boat Pretty Quick in spite of the handicap. The boats got away in a bunch at the start, and Rana tried to force her way in between the committee boat and Busy Bee. Mr. Wainwright protested Rana, and then withdrew his protest—a very sportsmanlike and courteous thing for him to do.

Howdy sailed a nice race and crossed the finish line 1m. 34s. ahead of Invader, Jr., the second boat. Jolly Roger was third. Dorothy managed to keep between her two competitors and the mark on every leg in the Larchmont 21ft. class and she crossed the finish line a winner by 1m. 9s.

Answer proved too smart for her four competitors in the 22ft. sloop-class. She beat Opossum by 24s. Kenoshi was third.

"Bob" Bavler brought Ace home a winner as usual. Hamburg was the only other starter in the class. The summary:

Sloops, 33ft. Class—Start, 12:15—Course, 18 1/2 Miles.

**Beverly Y. C.**

Wing's Neck, Buzzard's Bay—Saturday, July 22.

THE Beverly Y. C. sailed its 369th regatta off its club house on Saturday, July 22. The event was the third Corinthian race of the season.

The weather was most unsatisfactory, the wind being so light that the start had to be postponed half an hour, and even after the start, the direction changed from S.E. to S.W. twice, with calms intervening, so that it was no reasonable test of the powers of the boats.

For the first time this season, two 30-footers came to the starting line, and all were glad to see the race renewed in this class. Young Miss won by nearly 2m.

In the 21-footers Terrapin took first honors, with Mr. Crane's Amanita III. in second place. Barnacle, which boat has been doing well up to this time, was hopelessly beaten, finishing about 7m. behind the leader.

In the 18ft. one-design class, Jap took first place and Wanderer second.

Flickamaroo won first place in the 15ft. one-design class, but she was sailed by Mr. Nelson Emmons, and therefore the race does not count in the contest for the ladies' cup. Miss Dabney, who took fifth place in the fleet, was the first of the ladies to finish.

The judge was Mr. F. E. Cabot. The times in detail follow:

30ft. Class—Course 14-11 1/4 Miles.	
Young Miss, D. L. Whittemore.....	1 58 02
Pontiac, J. A. Bebee.....	1 59 45

Jub Jub, Miss Eleanor Stockton.....	1 14 38
Fly, Miss C. M. Williams.....	1 14 46

**Riverton Y. C.**

Riverton, Delaware River—Saturday, Aug. 5.

SIXTEEN boats participated in the match given by the Riverton Y. C. on Saturday, Aug. 5. The winners were Carolyn II., Dorathea, No. 7, and Invlese.

The boats went twice over Course No. 3, which was as follows: Starting from Riverton buoy to lower Hen and Chickens buoy, thence to buoy off Mosquito boat house and back to the starting point.

Carolyn II. hugged the Jersey beach and made material gains, and beat Fiona by 1m. 2s.

In the jib and mainsail class Dorathea was the only boat to finish. The summary follows:

Catboats—Start, 3:05.		
	Finish.	Elapsed.
Carolyn II., J. W. Hamer.....	5 52 10	2 47 10
Fiona, John Perkins.....	5 53 30	2 48 30
Sea Gull, Lee Cook.....	5 56 05	2 51 05
Jib and Mainsail—Start, 3:10.		
Dorathea, C. S. Somerville.....	5 51 50	2 41 50
Tadpole, H. L. Stockman.....	Withdraw.	
Pumpkin, J. C. W. Frishmuth, Jr.....	Withdraw.

It, Myers.....	3 46 00	0 52 00
Invlese, H. Wesson.....	3 48 00	0 44 30

**Edgewood Y. C.**

Narragansett Bay, July 29 and Aug. 5.

THE series of three races for the Ford cup for the 30ft. cats of the Edgewood Y. C. resulted in the trophy going to Wanderer IV., the new boat, owned by Messrs. H. J. and D. W. Flint, the second and third races being run off on July 29 and Aug. 5. In both events there was a strong S. wind, which furnished good racing. Wanderer IV. finished first in all three races, thus establishing a percentage of 100 for the contest. This is an unusual, if not unprecedented accomplishment in a series of this sort. In the second race there were but three entries, and only one opponent to the winner appeared in the final race.

Elizabeth, which has been a prominent boat in the class for several years, has been sold by Mr. Walter D. Wood to former Commodore Herman G. Possner, for the use of the latter's sons, who are enthusiastic racing men. Howard Possner sailed the boat in the third race, and did good work for one who has had no more experience than he with boats of that class.

The summaries of the two races were as follows:

July 29—Start, 2:30—Course, 12 1/2 Miles.			
	Finish.	Elapsed.	Corrected.
Wanderer IV., H. J. & D. W. Flint.....	5 53 19	3 23 19	3 23 19
Emeline, W. J. Rooks.....	6 00 39	3 30 39	3 30 19
Elizabeth, W. D. Wood.....	6 10 31	3 40 31	3 36 21
Aug. 5—Start, 2:58—Course, 12 1/2 Miles.			
Wanderer IV., H. J. & D. W. Flint.....	5 28 27	2 30 27	2 30 27
Elizabeth, H. Possner.....	5 40 02	2 42 02	2 37 52

Senta.....	.....	5 43 00

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

shot with the Lee-Enfield. The experts at the range liked the home rifle better than the others for long distances, and in variable winds, the wind gauge and rear sight not being so good on the other. At 200yds. possibly the peep sight of the Krag would be an advantage.

The coaching of the winning team was of great advantage to the men, the wind being very fickle, and the direction flags being of hardly any use. The heat waves, too, were bad, and distorted the targets. The scores were:

After the big shoot on Saturday the Sixth Regiment dined the visitors from Washington at the Badminton. The tables had all kinds of good things upon them, and had also trophies galore won by teams and men from the Sixth Regiment. Capt. W. Hart-McHarg was orderly officer of the day, and he acted as toastmaster. The first, of course, was the King; then came the President of the United States, and Col. Edwin Dudley, United States Consul, responded for his Chief. Col. Whyte proposed Our Guests, and made a rattling good speech in doing so. Brig.-Gen. James A. Drain handed out some violets in return, and said all kinds of nice things about British Columbia's shooting.

Capt. Currie, of Victoria, who acted as range officer; Capt. Tite, Capt. Darlington, of the visiting team; Major Duhlin, Major Case, Lieut. Corbett and Sergt. Perry, G. M., he of the King's Prize and high score, also did the best they knew, and that was all. Lieut. Newton, of the United States revenue marine ship Manning, made a response to the toast of the United States Navy.

**Twin Valley Rifle Club.**

THE monthly medal shoot of the Twin Valley Rifle Club was held at Lewisburg, O., on July 29. A strong wind blowing across the range interfered very decidedly with the scores. Jesse Johnson again won the medal, his score being 44 out of a possible 50 at 100yds., offhand, 4 shots. Abner U. Clemmer and Mose Pence tied for second with 42. C. W. Matthew third with 40. Then followed five matches of 4 shots each, same conditions, four money prizes, for four highest aggregate scores, possible 240. J. Johnson won first with 213. Leshar second, 205. Izor third, 199. Lee fourth, 197. Matthew was shooting his new .22 Remington, and the trigger-pull was a little too hard.

**Cincinnati Rifle Association.**

CINCINNATI, O.—The following scores were made in regular competition by members of this association at Four-Mile House, Reading road, July 30. Conditions, 200yds., offhand, at the 25-ring target. Hasenzahl was champion for the day with a score of 222. Payne led on the honor target with 72 points. A fishtail wind from 5 to 9 o'clock quarter, blew all day. The scores:

Hasenzahl.....	222	217	212	210	210	Roberts.....	215	213	210	209	206
Freitag.....	219	202	200	197	197	Hofer.....	211	209	207	198	195
Payne.....	217	216	216	215	213	Hofman.....	204	204	203	202	202

**Rifle Notes.**

The State militia of the Commonwealth of Massachusetts will participate in the first competition of the New England Military Rifle Association, at the Wakefield Range, Aug. 15-18. Elaborate preparations have been made for a successful tournament. Numerous valuable prizes will reward the victors. Teams from New Hampshire, Maine, Connecticut, Rhode Island and Massachusetts have arranged to continue their practice on the range from Aug. 17 to Aug. 22, thence to Sea Girt to participate in the great tournament.

**Trapshooting.**

If you want your shoot to be announced here send a notice like the following:

- Aug. 29-Sept. 9.—Sea Girt, N. J.—National Rifle Association and New Jersey State Association.
- Sept. 1-10.—Annual out-door championship of the United States Revolver Association. J. B. Crabtree, Sec'y, Springfield, Mass.

**Rifle at Vancouver.**

VANCOUVER, B. C., July 31.—The appended newspaper clipping is from the Daily Province, Vancouver, B. C., July 31.

On Saturday last we had a rifle match between British Columbia and Washington, which was the first international contest of the kind ever held in western North America.

The Sergt. Perry mentioned as high score on both teams is a local boy, who has served twice in the "Boer War" and who won the biggest shooting honor in the British Empire, viz., the King's prize. It is shot for once a year in Bisley, England, by the best marksmen in Great Britain. He won it in 1904.

I might mention that three of our rifle shots are at present shooting at Bisley, on the Canadian team.

A. AUSTIN, JR.

The first international rifle match ever held in the Northwest came to an end Saturday evening, with the team from the Sixth Regiment Duke of Connaught's Own Rifles victorious over the team from the Second Regiment, National Guard, State of Washington, by 321 points. The Washington team is going east to Sea Girt, where the annual matches in the National Association of the United States are held, and before going accepted a challenge from the Sixth Regiment.

Brigadier-General Drain was in charge of the visiting team, and stated when he first came that he did not expect to win. He did think, though, that there was a possibility of getting a good lead at the shorter ranges, and that the local marksmen might not be able to catch him; or, if they did, to beat his men badly. There was no expectation of the overwhelming victory that was won. It should be said, though, that every officer and man on the Washington team was a good sportsman, and took the defeat with the best of grace. Every credit was given to the winners, and when Sergt. Perry, G.M., came within one of the possible at 800yds., and made 47 at 1,000, the visitors were the first to compliment him upon his wonderful shooting.

The Washington men used the Krag rifle, while the Canadians

Sept. 4-5.—Dayton, O., G. C. tournament; \$100 added.
Sept. 4-6.—Lynchburg.—Virginia State shoot. N. R. Winfree, Sec'y.
Sept. 5-8.—Trinidad, Colo.—Grand Western Handicap. Eli Jeffries, Sec'y.
Sept. 7-9.—Detroit, Mich.—Fifteenth annual international shoot; two days, targets, one day live birds.
Sept. 15-17.—San Francisco, Cal.—The Interstate Association's Pacific Coast Handicap at Targets, under the auspices of the San Francisco Trapshooting Association. A. M. Shields, Sec'y.
Sept. 18-20.—Cincinnati Gun Club annual tournament. Arthur Gambell, Mgr.
Sept. 27-28.—Bradford, Pa., G. C. tournament.
Oct. 3-5.—New London, Ia., Gun Club shoot; \$500 added. Dr. C. E. Cook, Sec'y.
Oct. 10-11.—St. Joseph, Mo.—The Missouri and Kansas League of Trapshooters. Dr. C. B. Clapp, Sec'y.
Oct. 11-12.—Dover, Del., Gun Club tournament; open to all amateurs. W. H. Reed, Sec'y.
Oct. 18-19.—Ossining, N. Y., Gun Club shoot, \$50 added. C. G. Blandford, Capt.

DRIVERS AND TWISTERS.

The Riverside Gun Club, of Utica, N. Y., has fixed upon Sept. 4 for an all-day tournament. Mr. E. J. Loughlin is the Secretary.

Mr. R. S. Pringle, Assistant Secretary, writes us that the Bradford, Pa., Gun Club will hold a target tournament on Sept. 27-28.

F. E. McCord, Secretary, informs us that the Rochester, N. Y. Rod and Gun Club will hold their annual fall tournament on Sept. 4-5.

Mr. J. B. Pardoe writes us that the Bound Brook, N. J., Gun Club will hold a shoot on Aug. 19. Several nice loving cups and a gold medal have been provided. All amateurs are welcome.

We are informed by the Secretary, R. W. Gorham, that the shoot of the Mt. Kisco, N. Y., Gun Club will be held on Aug. 23, instead of Aug. 24. Programmes are now ready for distribution.

Mr. Hood Waters, of Baltimore, the famous Infallible shooter, was among the distinguished visitors in New York last week. He tarried but briefly, notwithstanding the advantages of New York as a tranquil summer resort.

In the club contest of the Meadow Springs Gun Club, at Philadelphia on Saturday of last week, Henry broke 25 straight, but was tied by Watson, who had 8 handicap allowance. Henry was high in Class A shoot with 22. Chandler won in Class B.

Capt. J. A. H. Dressel was a visitor in the gun colony district of New York on Thursday of last week. His business affairs, in connection with important shows to be held in Madison Square Garden, confine him very closely to his office work. He reports many attractions for the forthcoming Sportsman's Show.

At the shoot of the Anolatan Gun Club, at Washington, D. C., Aug. 5, Mr. W. H. Heer shot at 100 targets and broke them all. Mr. Heer has been badly handicapped during some months past by a sore cheek, caused by his gun's recoil, and as every shooter knows, good scores under such painful conditions are the exception.

On the grounds of the Highland Gun Club, at Edge Hill, the final matches in the Philadelphia Trapshooters' League series were shot on Saturday of last week. The main event, for a Remington gun, resulted in a tie between Messrs. H. Buckwalter, F. Coleman and H. Howard, on 45 out of 50. Buckwalter bought the claim of his competitors.

Mr. Jacob Klein, Detroit, Mich., writes us that "The dates for the fifteenth annual International shoot, which will take place at Detroit, Mich., will be Sept. 7, 8 and 9—two days targets, one day live birds. Live-bird day will be Sept. 9, when the famous Gilman and Barnes medal will be shot for at 25 live birds, \$25 entrance, \$20 added. We are arranging our programme."

Mr. Herbert Taylor, of the Dupont Powder Co., was a visitor in New York last week. He has been sojourning in South America during several months past, and returned only recently from that land of the Incas and fevers. He apparently was in the pink of health, though suffering somewhat from the malarial fever which is a constant menace to the unacclimated in that country.

At the amateur tournament of the Chicago Trapshooters' Association, Aug. 17-19, \$500, high and low average money is provided. Each day, ten events at 20 targets, \$2 entrance, constitute the programme. Aug. 16, practice day. Shooting will begin at 9:30. Purses divided 35, 30, 20 and 15 per cent. Targets 2 cents. Lunch will be served on the grounds. Guns and ammunition, prepaid, sent to Von Lengerke & Antoine, 277 Wabash avenue, Chicago. Mr. E. B. Shogren, 940 First National Bank Building, Chicago, is the Secretary.

The eighth annual midsummer target tournament of the Spring Valley Shooting Association, of Reading, Pa., will be held on Aug. 31 on the Spring Valley grounds. Three average prizes, as fellows, will be awarded: \$5, \$3 and \$2. The annual tournaments are always big events, and this year's tournament is expected to eclipse any ever held by the popular Spring Valley organization. The programme calls for \$16 entrance, for a total of 180 targets for the day. The programme will be ready for distribution Aug. 12, and can be had by addressing Arthur A. Fink, Secretary, 426 Franklin street, Reading, Pa.

At the Interstate shoot given for the Albert Lea, Minn., Gun Club, Aug. 2-4, high amateur average on the first day was made by Mr. H. G. Taylor, with 155 out of a possible 160; second, Mr. Gus Evander, 150; third, Mr. L. E. Parker, 149. Professional high averages for the day were made by Mr. H. C. Hirschy, 154; second, Mr. W. R. Crosby, 153; third, B. O. Seymour, 147. On the second day, Mr. H. G. Taylor was again in the lead with 149 out of 160; second, Mr. Gus Evander, 146; third, Mr. E. H. Moulton, 145. Professionals, first was a tie between Messrs. Fred Gilbert and W. R. Crosby with 155; second, Mr. H. C. Hirschy, 154; third, C. A. Young, 151. On the third day, Mr. H. G. Taylor was again high amateur average with 147 out of 160. Messrs. Russell Klein and R. R. Barber tied for second on 144, and third average was made by Mr. A. P. McDowell, 140. Professionals: Messrs. Fred Gilbert and W. R. Crosby tied on 153 for first; second, Mr. W. D. Stannard, 150; third, Mr. H. C. Hirschy, 149. General averages, amateur: First, Mr. H. G. Taylor, 451 out of 480; second, Mr. R. R. Barber, 436; third, Mr. Gus Evander, 435. Professionals: First, Mr. Fred Gilbert, 462; second, Mr. W. R. Crosby, 461; third, Mr. H. C. Hirschy, 457.

The Shooting Times, of recent date, states that the following has been sent for publication: "We have been instructed, on behalf of the pigeon shooting members of the Hurlingham Club, to take legal proceedings to test the validity of the resolution which was passed at the recent annual meeting abolishing pigeon shooting from the club premises, and our attention has been called to the circular of the 10th inst., issued to the members by Major Egerton Green, the manager of the club. As it is desirable that nothing should be done by the pigeon shooting members which will enable the suggestion to be made that they have in any way acquiesced in or assented to the resolution, it is hoped by the gentlemen who have instructed us that all pigeon shooting members will refrain from accepting Major Green's invitation to respond to his circular until the question of the validity of the resolution has been determined.—Yours, etc., William Sturgess & Co., 5 and 6 Clement's Inn."

BERNARD WATERS.

Springfield, Mass., Shooting Club.

SPRINGFIELD, Mass.—The rainy weather kept several members away from the practice shoot of this club held on the afternoon of July 29. The nine who did attend did some very good shooting, especially W. H. Snow, who made the fine score of 94 out of 100, within one of tying the record for the grounds, made by Jack Panning a few weeks ago. Jordan, Le Noir and Kites also shot very well, with averages of 85, 81 and 80 per cent respectively. The prize event, a 15-target race for 100 loaded shells, was won by Chapin, who broke 12 out of 15, which, added to his handicap of 3 targets, gave him a straight score, with Kites, Snow and Jordan all tied on 14. Not much show for the scratch men in these prize events.

The Peters cup contest and the merchandise race for three prizes of equal value, are to be shot for during the season. Added target handicap in cup event, and in the merchandise race the shooters are divided into classes, A, B, C, according to their shooting. Scores in these three handicap events follow:

Table with columns: Brk. Hdp. Tot'l. Names: Chapin, Snow, Kites, Lathrop, Jordan, Le Noir, A Mysterly, L Mysterly, Kimball.

Peters cup contest, 25 targets: Snow 22, Chapin 19, Lathrop 17, Kites 20, Jordan 19, Kimball 13, Le Noir 13, A Mysterly 9, L Mysterly 5.

Three merchandise prizes, 25 targets: Class A—Snow 24, Jordan 23, Le Noir 22, Kites 20. Class B—Lathrop 15. Class C—Kimball 10, L Mysterly 10.

Table with columns: Events, Targets, Names: Kites, Snow, Jordan, Le Noir, Lathrop, Chapin, Kimball, A Mysterly, L Mysterly. Includes MISFIRE.

Anolatan Gun Club.

WASHINGTON, D. C., Aug. 5.—The Anolatan Gun Club, of this city, held a very interesting shoot to-day. Mr. W. H. Heer, the professional expert, was present and gave a splendid exhibition of how to break targets. He shot at 100 and scored them all, and what must have been gratifying to him was that not a single one of them was "scratched." "Billy" arrived here last Monday evening and took a much needed rest. On Wednesday the 2d inst., he attended the match shoot between the Tacoma and Eastern Branch Gun Clubs. On this occasion he shot at 25 targets after the teams were done shooting, which was about 15 minutes of 7, and though the light was very poor, scored 23 of them. The shoot between the two clubs above-mentioned resulted in the defeat of the Tacoma boys. The scores were 156 to 138. Eight men composed each team, and each man shot at 30 targets, 240 to the team. A return match will be shot on the Tacoma Club's grounds Aug. 19.

Table with columns: Events, Targets, Names: Wicklin, Wagner, Heer, Barr, Green, Wilhite, M Taylor, Blackstone, Pushaw, Monroe, Hench, Wolfe, Orrison, Brown, Chandler, Peyton, Thomas, Nutting, Murray, Hooligan, Graham, Kengla, Haven, Shoup.

In the trophy shoots now being held, in Class A, Barr and Brown each have two wins. M. Taylor has one, and B. Wilson and Wilhite are tied for a win.

In Class B, Dr. Taylor has four wins, Nalley one, and Wolfe, Brown and C. S. Wilson are tied for a win.

In Class C, Pushaw has four wins, and Dr. McClenahan has two wins.

Mount Kisco Gun Club.

Mr. Kisco, N. Y., Aug. 5.—The appended scores were made by the members of the Mt. Kisco Gun Club on Aug. 3. Event 4 is for the John W. Bowron trophy. Handicaps apply to that event. H. Carson wins point on trophy. Scores:

Table with columns: Events, Targets, Names: H Smith, Dr Dunn, G E Sutton, Ed Martin, H Carson, A Betti, R Gorham, C Benedict, R Fay, R Scoles, F Boehemer, F W Bailey, Al Rea, G Wood, A Burham.

R. W. GORHAM, Sec'y.

The Canadian Indians.

Toronto, August 5, 1905. To the Honored and Respected Chiefs of the Canadian Indians: As your High Scribe and Chief of Wampum, it becomes my duty, pursuant to the resolution passed at the inaugural pow-wow of our noble band, to call upon you to assemble, without fail, around the camp-fire of the tribe at the Windsor Hotel, Ottawa, on Thursday, Aug. 17, at 8:30 P. M. sharp, for the purpose of fully completing our organization, electing new members, naming the chiefs and settling such other matters as may be deemed important

to our welfare. A leg will be provided for every chief, and should one be vacant then will the sorrow of the other chiefs be great. The insignia of your membership is also ready. It is of solid gold and similar in design to the crest which adorns this call. They will be distributed at the pow-wow on payment of wampum to the amount of \$2, which is the actual cost. The membership of the tribe is limited to forty. There are seven or eight empty logs, so if a chief has a desirable friend to propose, he should send in an application, signed by two chiefs and accompanied by \$5, which, in case of rejection, will be returned to applicant. I have spoken. THOMAS A. DUFF, High Scribe and Chief of Wampum.

WESTERN TRAP.

Cincinnati Gun Club.

A hot wave rolled in on the city Aug. 5 and affected the attendance. Only sixteen scores for the Schuler trophy were shot. Krehbiel, Barker and Herman got straights, including their handicaps. Bullerdick was high in actual breaks with 46. The club will provide merchandise prizes for the Labor Day shoot, five in each event. Low gun will also be remembered.

Schuler prize, 50 targets—Krehbiel (9) 50, Herman (9) 50, Barker (9) 50, F. Altheer (7) 49, Bullerdick (1) 47, Maynard (2) 46, Sycamore (0) 44, Gambell (4) 44, Ahlers (4) 44, Peters (4) 42, E. Altheer (8) 41, Lytle (15) 41, Andrews (15) 38, Davies (6) 37, Brown (19) 37, Bill (6) 32.

Match, 50 targets: Gambell 40, Ahlers 40, Sycamore 44-84, Peters 38-78.

Match, 25 targets: Gambell 23, Ahlers 21, Sycamore 24-47, Peters 21-42.

Miss and out: Peters 111110-6 10-1, Sycamore 111110-5, Ahlers 111110-5, Bill 111110-6 11-2, Gambell 1110-3.

Ohio Notes.

Stacy again won the trophy event of the Central Covington (Ky.) Gun Club, breaking 45 out of 50, on July 30. Schreck and Shafer tied for second on 39. In an event at doubles Schmidt carried off the honors and Dowling won in the 25-target match.

The members of the Columbus, O., Gun Club had their troubles on July 29. A strong wind blew the targets in all directions, and it required a quick eye to catch them. However, the boys did pretty well, Buchanan, Webster, J. H. Smith, H. E. Smith and Shattuck making several straights during the afternoon. The trophy given by the Columbus Sporting Goods Co. was shot for and a number of other events were pulled off. Webster was high man for the afternoon with 141 out of 165. In the trophy event Weinman, Wilcox, Shattuck, Van Fossen and Ward have full scores of 50, including their handicaps. Rhoads made high score in actual breaks, 48, Van Fossen second, 46. Several new trophies for team and individual races will be put in competition soon.

Mid Limbert won the Class B medal at the shoot of the Greenville, O., Gun Club with a score of 41 out of 50, this being the third time he has captured the trophy. In Class A, Kirby won with 43, from 20yds. Noggle shot in the B class, but not for the medal, and scored 38 from 16yds. In the 100-target race Kirby was high gun with 86; Limbert, second, with 83; Ayers, third, with 80; Warner and Noggle, fourth, with 79 each.

The Springfield, O., Gun Club had a very interesting day's sport on July 28, consisting of four 25-target sweeps, \$1 entrance, two moneys in each; a practice 25-target event and a team match. This club keeps things booming on the upper Mad River as the Rohrer's Islanders do on the lower part of that stream. In the sweeps, Poole was high with 90; Hill, second, with 88. The teams were Alfred Hill, of W. Liberty, and H. H. Good, of Bellefontaine, against Capt. Ben Downs and Wm. Poole, of the Springfield Club, 100 targets per man. In the fourth round Hill and Good braced up and broke 24 each, winning the round, 48 to 45, and the match by 1 target, 183 to 182. The teams will shoot a return match the latter part of the month.

The shoot of the Columbus, O., Gun Club on Aug. 2 brought out a big crowd. Miss Fanny Fullerton was easily the star of the occasion, and her score of 32 out of 50 was warmly applauded. She is a good quail shot, but has had practically no experience at the trap. Hamilton Hayden, a boy, shooting for the first time equalled her score. Mr. Smackworth, another first-timer, broke 44 out of 65. Mr. Selbach, shooting for the first time, scored 15 out of 25. C. E. Wolf has not shot for several years, but started in to-day breaking 43 out of 50, an 86 per cent. gait. Dr. Wilcox missed 2 out of 50. P. Hayden was high gun with 138 out of 150 shot at.

The first contest for the Greater Cleveland Championship Trophy of Northern Ohio, 100 targets, was shot on the Cleveland Gun Club's grounds on July 29. C. E. Doolittle won the trophy with the excellent score of 94. Prechtel and Burns tied for second on 85. There were eleven entries.

At the shoot of the Rohrer's Island Gun Club, Dayton, on Aug. 2, Wm. C. Oldt won the medal for the fourth time this season. He leads C. F. Miller by one win.

The shoot of Springfield, O., Gun Club, held on Aug. 3, was well attended, and some good scores were made. In the Hunter Arms medal contest Foley and Snyder tied for first on 22; Poole, second, with 20.

Twelve members attended the weekly shoot of the Dayton Club on August 4. Craig was high gun with 182 out of 225. He broke 89 out of his first 100 and 93 out of the last. The stop watch was won by Whitacre. Shooting at 12 pairs each, Rike broke 11 and Ike 16. Craig shot at 24 pairs and broke 30. Mr. E. J. Clark, the club superintendent, tendered his resignation to-day.

Garfield Gun Club.

Chicago, Aug. 5.—The appended scores were made on our grounds to-day on the occasion of the second shoot of the third series. In the club trophy shoot at 25 single targets Dr. Meek, Thomas, T. L. Smedes and W. Einfield tied for Class A on 23; Al. Smedes won in Class B on 21; Ditt won in Class C on 23.

In the Dupont cup shoot, which followed, McDonald won Class A on 20 straight; Al. Smedes won Class B on 16; Ditt won Class C on 14.

In the Hunter Arms Co. trophy shoot, at 10 singles and 5 pairs, Kampp won Class A on 18; Al. Smedes won Class B on 15; Ostendorp won in Class C on 16.

The day was a good one for target shooting, only a little windy, and in the early part of the afternoon very hot. Attendance fairly good, twenty-four shooters taking part during the afternoon.

Table with columns: Events, Targets, Names: Hicks, Dr Meek, Thomas, George, Eaton, Bullard, McDonald, Stone, T Smedes, A Smedes, Horns, Kampp.

No. 7 was at 10 pairs. No. 1 was the trophy event. No. 2 was for Hunter trophy, 10 singles and 10 pairs. No. 3 was for Dupont cup.

Montpelier Gun Club.

MONTPELIER, Vt.—The Montpelier Gun Club held a regular weekly shoot at Riverside range, Aug. 2. Mr. J. A. R. Elliott was present as a guest of the club. He scored 49 out of a possible 50, and 96 out of a possible 100. Dr. C. H. Burr, of the local club, broke 45 out of a possible 50 and 84 out of 100. Scores:

Table with columns: Events, Targets, Names: Elliott, Dr Burr, Walton, Blake, McGrath, Shepard, Wahlen, Springer, Lowe.

Interstate at Albert Lea.

ALBERT LEA, Minn., Aug. 5.—The Interstate Association tournament at Albert Lea, Minn., Aug. 2, 3 and 4, under the auspices of the Albert Lea Gun Club, was a success, even though dampness on the afternoon of the second day was a trifle too great to be the most agreeable.

Among the noted manufacturers' agents were the following: W. R. Crosby, Fred Gilbert, H. C. Hirschy, J. L. D. Morrison, T. A. Marshall, B. O. Seymour, C. A. Young, W. M. Furgeson, W. D. Stannard, H. W. Vietmeyer and L. H. Fitzsimmons.

Among the crack amateurs the following may be mentioned to indicate the quality of the talent: H. G. Taylor, Russell Klein, R. R. Barber (the Grand American Handicap winner), A. P. McDowell, L. E. Parker, E. H. Moulton, E. W. Bird, Gus Evander, L. Foley, F. H. Sprague and J. H. Stair.

The cashier's office was in charge of Mr. H. C. Hirschy, assisted by Mr. B. O. Seymour, and they have had such a wide range of experience that their very presence meant success. Suffice it to say that money winners received the amounts due them within twenty minutes after the last gun was fired each day.

Nothing was left undone in the way of preparations and Messrs. Henry A. Morgan, President; N. E. Petersen, Secretary, and other officers of the local club, are entitled to great credit for their work.

A feature of the programme each day was event No. 7, which called for ten pairs. It has been quite a time since pairs were scheduled at a tournament and this event attracted more than ordinary attention. The scores made did not rank high, and one contestant was heard to remark that this event was a "great leveler"—meaning by this that the event at pairs cut down the usual high average of the expert to the equality of the ordinary shot.

The first day's events closed with everybody in the best of humor over the success of the meeting. The weather was almost perfect, and everybody felt good-natured. There were exactly fifty-one who took part in the various events, which is considered a good showing for a meeting of this character.

The second day opened with an attendance of about the same number as the first day, although not so many shot in all events.

The weather was very warm and sultry, and during the afternoon a severe rain storm stopped the shooting for some time. The scores made were about on a par with those made the first day. Among the amateurs Mr. H. G. Taylor was again in first place with 149 out of a possible 150, with Mr. Gus Evander again second, with 146; Mr. E. H. Moulton was third with 145.

The third day's attendance did not come up to that of the first two days by one-half, and it goes to show that a three days' tournament is a trifle too long for the ordinary amateur. Two days is about the proper thing. Among the amateurs Mr. H. G. Taylor for the third time was in first place with 147 out of a possible 160; Messrs. Russell Klein and R. R. Barber were tied for second place with 144, and Mr. A. P. McDowell was third with 140.

For general average among the amateurs Mr. H. G. Taylor was first with 451 out of a possible 480; Mr. R. R. Barber was second with 436 and Mr. Gus Evander third with 435.

The scores of the three days follow:

Aug. 2, First Day.

Table with columns: Events, Targets, Names (A P McDowell, E W Bird, N E Headline, S Smith, L Foley, J L D Morrison, G J French, L E Parker, E H Moulton, A Morrison, H C Hirschy, H G Taylor, Russell Klein, R R Barber, Fred Gilbert, L W Holt, Gus Evander, E G Wallace, H W Kahler, Dr. Fischer, J H Stair, W M Furgeson, F H Sprague, E O Quinlan, B O Seymour, H W Vietmeyer, W G Schulz, R Bartosch, H W Emmerson, J L Hartz, T A Marshall, W R Crosby, N E Peterson, Henry Stege, C J Adler, W D Stannard, J H Ramson, F R Patch, C A Young, F Fredette, J A Bultman, G E Hill, L H Fitzsimmons, E W Hicks, B Skinner, A Johnson, J Bowden, J Skinner, A Clausen, C Johnson, L Fuller), Shot, Broke.

Aug. 3, Second Day.

Table with columns: Events, Targets, Names (A P McDowell, E W Bird, N E Headline, S Smith, J L D Morrison, G J French, L E Parker, E H Moulton, A Morrison, H C Hirschy, H G Taylor, Russell Klein, R R Barber, Fred Gilbert, T A Marshall, W R Crosby, E W Hicks, Gus Evander, L W Holt, J H Stair, F H Sprague, E O Quinlan, B O Seymour), Shot, Broke.

Table with columns: Names (W D Stannard, C A Young, F R Patch, J H Ramson, C J Adler, H W Vietmeyer, L H Fitzsimmons, G E Hill, Dr. Fischer, H W Kahler, H W Emmerson, E G Wallace, R Bartosch, J L Hartz, G Olson, A Clausen, B Skinner, N E Peterson, L Fuller, O Subby, C H Beckett, H C Finch, E H Lippert, M H Kepler, A O Warland, H J Crockett), Shot, Broke.

Aug. 4, Third Day.

Table with columns: Events, Targets, Names (J L D Morrison, E W Bird, N E Headline, A P McDowell, E W Hicks, H C Hirschy, H G Taylor, Russell Klein, R R Barber, Fred Gilbert, W R Crosby, Gus Evander, R Bartosch, C A Young, T A Marshall, H W Vietmeyer, L H Fitzsimmons, H W Kahler, W D Stannard, J H Stair, W M Furgeson, F H Sprague, B O Seymour, G E Hill, Henry A Morgan, J L Hartz, N E Peterson, Earl Henry, O Subby), Shot, Broke.

Trap at Richmond Valley.

RICHMOND VALLEY, Staten Island, Aug. 5.—Events 2 and 3 constituted a 25-target match. The prizes were pretty pieces of jewelry. Ties in this event were shot off miss-and-out, and the winners were in the following order: Houseman, Curry, Evans, Seawood, Sprague. No. 4 was the club cup event, and it resulted in a tie between Wolfgang and Sprague; in the shoot-off Sprague won.

The grounds at Richmond Valley are pleasantly situated, a short distance from the depot. The club house is on the brow of a hill, and though the grounds are surrounded by woods, the targets are not obscured to the view.

The Aquehonga Gun Club won the team race with a total of 139. Refreshments were served in the club house. The weather was sultry, but favorable for good scores. Mr. W. R. Hobart acted as compiler of scores.

The shoot was conducted with the utmost good fellowship, and a number of the scores are excellent in point of skill.

Table with columns: Events, Targets, Names (J A Howard, F W Schoverling, R D Ellis, E A Lovett, C Wood, C Smith, W Curry, J Houseman, F Hadkins, A Evans, J Bloodgood, G Smith, H Sprague), Shot, Broke.

Table with columns: Names (Schofield, Seawood, Houseman, Evans, Curry, C Smith, Howard), Shot, Broke.

Table with columns: Names (Rea, T Bloodgood, Quackenbush, Morgan), Shot, Broke.

Philadelphia Trapshooters' League.

PHILADELPHIA, Aug. 5.—On the grounds of the Highland Gun Club, at Edge Hill, to-day, the finals in the Philadelphia Trapshooters' League were concluded.

League wind-up, between team members who averaged 80 per cent. and over during first six shoots, 50 targets, prize leather gun case:

Table with columns: Names (W Howard, T Yansey, H Sibble, H Fisher, Harry Buckwalter), Shot, Broke.

Event between the straight scores in the League matches, 50 targets; prize, Remington gun:

Table with columns: Names (J Pratt, H Buckwalter, F Coleman), Shot, Broke.

Event between the 24 and 23 scores in the League, 50 targets:

Table with columns: Names (Franklin, Chalmers, Pennington, Colton, Fisher, Garber, Coyle, Bennett), Shot, Broke.

Contest between the men who averaged 65 per cent., 50 targets:

Table with columns: Names (Myers, Stanton), Shot, Broke.

Young Nerveleigh—Congratulate yourself, old man; I'm to be a son of yours. Old Gotrox—What! You don't mean to say my daughter is going to be your wife? Young Nerveleigh—Oh, no; but she has promised to be a sister to me.—Columbus Dispatch.

Trap at Derby Line.

DERBY LINE, Vt.—Prominent sportsmen from the Province of Quebec, Canada, and northern Vermont, took part in the annual invitation shooting tournament given by Mr. J. B. Goodhue, on his private grounds, in Derby Line, Vt., last Saturday.

Despite threatening weather, there was a good attendance both in the morning and afternoon. After the tournament, the visiting sportsmen and their wives were entertained by Mr. and Mrs. Goodhue at their handsome new home on West street. The visitors expressed themselves as delighted with the hospitality of their host and hostess.

Guests who participated in the tournament were as follows: D. J. Kearney, W. H. Ewing, Montreal; C. G. Thompson, G. M. Howard, C. H. Clark, N. G. Bray, Sherbrooke; A. W. Westover, H. E. Hibbard, Sutton Junction; Dr. Henry Stockwell, Stanstead.

Excepting the fifth event, in which Craig and Stockwell killed 24 each out of a string of 25, the prettiest race of the tournament was that between Bray and Westover, for possession of the Sherbrooke spoon.

This was a handicap event, Bray having the 20yd. mark and Westover the 17. Each killed the regular string of 15 without a skip. Without giving them time to cool down, a second string of 15 was ordered up. From the very first, the birds were hard fliers, and it was only by a wonderfully clever exhibition on both sides that the score went to a tie on the fifth bird, and remained there until the last bluecock was sent skimming through the air. Amid intense excitement, Westover dusted but failed to break his bird; Bray killed clean, winning the match, and calling forth congratulations from all sides. The total score of each was as follows: Bray 29 out of 30, Westover 28 out of 30.

Following are the other scores in the spoon event: Howard (18yds.) 11, Craig (21) 11, Thompson (22) 12, Stockwell (17) 12, Goodhue (21) 7.

For convenience the regular contest for the Laffin & Rand cup, presented to the Sherbrooke club, was pulled off. This cup will become the property of the member winning it the most times during the season of 1905. The conditions call for 25 targets, handicap. Craig, Thompson, Bray and Westover killed with great regularity, but Thompson managed to win out with one point over Craig, and two over Bray. Following are the scores: Howard (17) 17, Craig (20) 22, Thompson (20) 23, Bray (20) 21, Goodhue (20) 16, Westover (20) 21, Stockwell (20) 19.

Contests for handsome and valuable merchandise prizes developed several ties. Thompson, Ewing and Craig made perfect scores, while Kearney lost only one bird. The list as completed after all ties had been settled follows: Thompson, first, 10; Ewing, second 10; Craig, third, 10; Kearney, fourth, 9; Westover, fifth, 8; Bray, sixth, 8; Goodhue, seventh, 8; Wright, eighth, 7; Stockwell, ninth, 7; Hubbard, tenth, 7; Howard, eleventh, 7.

The general average prizes were decided on the records made by the shooters in the twelve events which made up the regular programme. D. M. Craig, of Sherbrooke, P. Q., won first, breaking 175 out of a possible 200. Westover was second with 166. In the last four events Craig and Westover ran a neck-and-neck race, each breaking 56 birds. After Dr. Stockwell got warmed up in the morning he gave a very clever exhibition. He was called away in the afternoon, and thus he lost his chance of giving Craig a hard battle. Goodhue did not shoot quite up to his usual form, which was undoubtedly due to the fact that he was busy most of the time looking after the comfort of his guests.

Table with columns: Events, Targets, Names (Kearney, Ewing, Thompson, Howard, Craig, Goodhue, Westover, Clark, Bray, Stockwell), Shot, Broke.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., July 29.—Finley won Peters Cartridge Co. badge. Most of the members who shoot regularly are out of the city on their vacation.

Table with columns: Names (Parry, Hunter, Finley, Tripp, Moller, Smith, Reedy, Moore, Wands, Hann), Shot, Broke.

Trap Around Reading.

READING, Pa., July 29.—The first of a series of shoots being held by the South End Gun Club, of this city, was held to-day on the South End grounds, with a fair-sized crowd in attendance. The scores follow, 50 targets: Gerhart 46, Adams 46, Miles 45, Wentz 43, Smith 42, Walter 42, Yost 42, Ball 40, Matz 40, Henry 39, Eshelman 36, Hain 36, Gicker 36, George 34, Carver 33, Slultz 33, Wilson 29, Melchior 21.

Mahanoy City, Pa.—Harry Hersker and Steve Kurtz, both of this place, have been matched to shoot at 13 live birds on Aug. 15. George J. Goettler, of Pottsville, and William Fox, of Morea, have been matched for a live pigeon shooting contest to be pulled off on Labor Day. Peter J. Haverly, of Pottsville, and Nathan Benner, of this place, will also shoot at the same time.

Answers to Correspondents.

No notice taken of anonymous communications.

A. N., New York.—Can you or any of your readers give me simple method for refinishing gun stock? The varnish or finish of my gun stock was spoiled by rain, and it is desired to restore it if possible. Ans. To finish and polish a gun stock is a work of art, which, if done well, is better entrusted to the skill of a gunsmith. If the stock is a fine one, rich in beauty of grain and natural color, it is not a fit subject for amateur experiment. However, coach varnish, made quite thin with turpentine, and put on lightly, makes a good finish for stocks, but there are several preparatory stages before the finish.

PUBLISHERS' DEPARTMENT.

The Yellowstone Park, Lewis and Clark Exposition, and the Rocky Mountains.

An Attractive Fall Tour via Pennsylvania Railroad.

THE Pennsylvania Railroad Company has arranged a special personally-conducted tour to visit the Pacific Coast, including the Yellowstone Park, Portland (for the Lewis and Clark Exposition), and the beautiful resorts among the Colorado Rockies. This tour will leave New York, Philadelphia, Baltimore, Washington, and other cities on the Pennsylvania Railroad Saturday, Sept. 2, by a special train of high grade Pullman equipment. The itinerary will cover a period of three weeks, the party reaching the East on the homeward journey Sept. 22. The special train will be used by the party over the entire route, except during the five and one-half days in the Yellowstone Park, when the fine hotels now in service in the Great Preserve will be utilized. The train will be side-tracked in Portland for occupancy there, and all meals en route, except in the Yellowstone Park and in Denver, will be served in the special dining car.

Round-trip tickets, covering all necessary expenses for twenty-one days, \$200 from all points on the Pennsylvania Railroad, except Pittsburg, from which the rate will be \$195.

For itineraries and further information apply to ticket agents; C. Studts, Eastern Passenger Agent, 263 Fifth Avenue, New York, or address Geo. W. Boyd, General Passenger Agent, Philadelphia.

## CABIA BLANCO.

CABIA BLANCO is dead. The sturdy old cavalryman, wide traveler, keen observer and ready writer, passed away on Sunday, Aug. 13, after a brief illness.

John A. Brooks was born in Allegheny, Pa., sixty-five years ago. In the Civil War he enlisted in Company C, Eighth Pennsylvania Reserve Infantry, and served three years and four months, participating in all the many battles in which his regiment was engaged. After his discharge he went West, and enlisted in the regular U. S. Cavalry, where he served faithfully as messenger, scout and sergeant, and won the approval of the officers for his many brave deeds, and for the intelligence he always showed in the service. He served almost twenty years.

In 1888 he became a member of the Pennsylvania Soldiers' and Sailors' Home at Erie, Pa., and from his entrance to the day of his death he was a popular and useful member of the Home. He was a ready writer on most of the subjects interesting to readers of the FOREST AND STREAM, but much more wonderful than the way in which he told of what he had seen and done was his remarkable memory, in which seemed to be stored some adventure or some incident which fitted to almost every subject that came up. He wrote a vast deal that was interesting and useful on hunting, fishing, adventure and on Indian life and warfare. He was very fond of young people, and was always happiest when a number of boys were his companions, and he delighted in doing things for their amusement and instruction.

Cabia Blanco, though only an enlisted man, proved himself by his life a bright example of patriotism and love of country and a citizen whose usefulness was far above the average. He was buried with full military honors in the Home Cemetery.

## FOREIGN GAME POSSESSION.

THE test case brought by the State against August Silz, a New York game dealer, to determine the point whether the law forbids the possession of foreign game in close season, has just been decided in favor of the State. Justice Greenbaum, sitting in Part XI. of the Supreme Court, has handed down a decision that the having in possession game from abroad in the close season is unlawful.

The case was tried last May. It will be remembered that the birds which formed the subject of the prosecution were all of foreign origin, having been imported from Russia, Scotland, England and Egypt. Counsel for Mr. Silz contended that the law did not take cognizance of such species, but was intended to apply only to native game. The question of fact, as to whether the birds were identical with American species, was left with the jury, which found that they were entirely different. Justice Greenbaum then took under advisement the legal consideration involved, and his construction of the law is that it plainly forbids the possession of foreign game in the close season for domestic birds.

In commenting on the decision, the attorneys for Mr. Silz declare themselves at a loss to account for such an interpretation of the statute, since "the opinion of the bar is practically unanimous that our game laws were framed to protect the birds of the State of New York and the United States, and do not apply to the birds that are lawfully taken in Europe and elsewhere abroad." As a matter of fact, there is no such unanimous opinion of the bar; there are well known and able lawyers of New York city who have for years been contending strenuously for the principle that the law forbidding the possession of game in close time applies to all game without reference to its origin; and until recent years, so long as the statute was so worded as to leave no ground for uncertainty, that view prevailed.

There can be no question of the intent of the framers of the law. Experience has shown that the only effective close time is one which is close for all game, whether domestic or foreign; it was the purpose of the Legislature to make an effective close time, and to insure this it was likewise the purpose to forbid the possession of all game, whether from New York or New Hampshire or New South Wales. This may appear unreasonable to the importer of foreign birds, and it must be confessed that it has the look of unwarranted interference in an important branch of trade; but the argument for the com-

prehensive law and the total abolition of game traffic in the close season is found in the fact that if any game be sold, New York State game will be dealt in. The only way to close the market is to close it tight. And that is just what should be done, and must be done, if we are to prevent the illicit dealing in our own native birds.

To extend the sale prohibition to game brought over the sea is not different in principle from forbidding the traffic in game brought in across a State line.

It is announced that the case will be carried to the Appellate Division and, if necessary, to the Supreme Court of the United States. To get the point before the highest court for a final definite decision would be a result greatly to be hoped for.

## SOME PRIMITIVE PLANT FOODS.—III.

IN the more arid country of the farther Southwest, hunger and thirst are man's most terrible enemies. Over much of the dry Southwest grows a tree—the algaroba or honey mesquite—which furnishes food to many people. The algaroba is a sturdy tree which requires little moisture and yields to hungry man great crops of the fruit known as the mesquite bean. These grow in pods six or seven inches long and full of a juicy pulp which is nourishing and pleasing to the palate. Often the clusters of green pods hang from the branches in such quantities as to bend them down almost to breaking. After the beans have been gathered and dried they are pulverized when needed in mortars of wood or stone, and the meal so formed is cooked with water to make a bread. The screw bean, highly esteemed because of its sweetness, ripens a little later than the mesquite bean—early in July.

There are other fruits, but not many; a plum or two, a cactus or two, the berry of the manzanita and the flowers and seeds of yucca, agave and wormwood are all eaten eagerly. Then there are the roots or the hearts of various plants which, when roasted, satisfy hunger and please the palate.

In the mountains of California the acorn furnishes the staple food. These gathered in great quantities are roasted, hulled and dried. Pulverized to a meal, the bitter taste is leached from them by passing water through the meal, and later mixed with water, in the beautiful water-tight baskets of these Indians, this meal is boiled by the introduction of red hot stones and forms the principal food of the people. Still further to the north, along the seacoast, at the proper season of the year the Indians patrol the beaches and gather from them a certain seaweed which helps them out in their living. That, too, is a land of berries, of which on account of the great precipitation but few can be dried. They are largely eaten fresh or are pressed into cakes which keep for a long time, and during the winter are eaten with the oil of seal or salmon, forming a delicate dish.

Coming back once more to the plains, to the Mississippi valley and the moist and fertile country that lies to the eastward, we find a number of other wild foods.

A favorite root with the Indians was the wild sweet potato, found growing in the stream valleys at the foot of the bluffs in moist, but soft and rich ground. The plant somewhat resembles the sweet potato, though it is not so large. These roots, dug by the women, were eaten boiled or sometimes cooked with fat meat.

The familiar prairie turnip, better known as *pomme blanche*, was gathered everywhere. So was the artichoke, so also was a large white bean which was eaten freely by the Indians, by the wild pigeons and by the mice. An Indian woman who was lucky enough to find the cache of the mice might get a peck of beans at a time without any labor. Usually the scattered beans had to be gathered from the ground.

Under the water grow various roots, which perhaps belong to forms of the arrowhead. These roots, growing in the mud at the bottom, are discovered by the women, who wade about in the water, feel the roots with their feet, and dig them out from the mud with the toes, when they rise to the surface. They are very good to eat. Both are gathered by the muskrats for winter use. The root of the yellow pond lily is also eaten, but is not greatly to be recommended to the civilized palate.

A very well known, important and favorite article of food with the Indians who live where it grows is the famous wild rice, which is used in all their great feasts.

The mode of gathering it is too well known to need description. After being harvested it is dried on scaffolds, beneath which slow fires are built, and it is then cleansed from the husk by treading out. About a peck of the dried rice is placed in a hole in the earth about one foot wide and one foot deep, which is lined by a piece of buckskin. An Indian steps into the hole and holding himself steady by a stake planted in the ground, he jumps from one foot to another until the husks are separated from the grain, and the rice is ready to winnow.

All the crops were preserved for winter use, the corn and roots being boiled and then dried in the sun or over the fire. Besides these, berries, nuts, maple sugar and various other foods derived from plants were used. In the gathering and preparation of almost all this vegetable food, the women had the principal part, but in preparing the rice the men also were active. The men also, as is well known, furnished the chief part of the flesh food for the people. The whole subject of aboriginal subsistence is one of very great interest.

## THE THIRD GENERATION.

A THIRD generation of sportsmen is now reading the FOREST AND STREAM. It is that of the sons of the generation of those who were reading it in the seventies. A third generation is shooting over the game fields and fishing in the trout brooks and the bass lakes. What this third generation is finding for its pains is what has been left to it by its forebears.

The time which has elapsed, the passing of the men of that day, and the coming of those of this, the contrast between the conditions existing then and those existing now, give an opportunity of seeing some things in the retrospection more clearly and instructively than they appear in the looking forward.

In the conditions of the fields and the streams, as their supply may have been depleted or maintained, is demonstrated in a striking way the dependence of one generation on the conduct of that which has gone before. We are accustomed to talk much of the duty we of the present owe to the men who are to follow us with gun and rod, but the conviction of the average man in this respect is not so strong as to influence his conduct materially. He does not think of his followers; his concern does not extend beyond the immediate future, the next year or the year after that.

The feathered game and the big game supply of the West have been destroyed utterly throughout wide areas, and the extermination has been wrought by the sportsmen who have shot over the country between the seventies and the present day. The conditions which the men of this generation find there are the conditions bequeathed to them by their fathers and their fathers' fathers.

It is simple enough now to see how different might have been the state of affairs if only the men of the immediately preceding generations of shooters had recognized some of the simple principles which have come to be accepted as axioms in our game protective systems; if of the bounteous supply of wild life they had taken only for use and not for refuse; if they had been voluntarily as provident and sparing of the game as the stricter laws of to-day compel us to be; if they had more intelligently comprehended the rules of supply and demand, and had exercised in their use of the resources of the plains and the mountains temperance and discretion which would have conserved the stock for the benefit of those who were to follow. We can see all this clearly now, because we may judge by results. They did not see it then; it was not human nature that they should.

In other affairs of life, in business and property interests, the rule of regard for the future holds good; we provide for those who are to come after us; we establish business and invest moneys and acquire lands and property and life insurance policies, and devote a large share of our thought and endeavors and accomplishing to providing for our successors. This has been the rule since mankind was organized into communities. Our social system is the product of the exercise of these principles. And yet by a strange contrariety of conduct, when the sportsman's resources of wild life are concerned, we too frequently pursue a course directly the reverse, and act as if this day was the end of it all, and there were to be no successors whose rights we were bound to respect.

# THE SPORTSMAN TOURIST

## Nessmuk's Camp Grounds.

TARPON SPRINGS, Fla., July 25.—*Editor Forest and Stream:* I read the communication of Justina Johnson in your issue of April 22, and was thereby reminded that I had for some time thought to write you something about Nessmuk.

One of the first things I did, after coming to this place, was to visit Nessmuk's old camp-grounds. The first of these is on the south side of the Anclote River, and a mile or so above the present bridge. The bridge was nearer when he camped there, and there were more trees about the camp than now. There is a fine view from the high bank of the inlet on which the camp was situated, and my wife and I have gone up there in a canoe more than once, to enjoy the scenery and have a picnic. The only traces now remaining of the old camp, are a couple of half-bricks, and one or two fragments of ancient tin cans.

This place is near Salt Lake, so called, and is not far from Lake Butler, to which Nessmuk had a trail. He afterward moved his camp to the "Oak and Pine," a singular natural curiosity, which, I think, has already been described in your columns. There he stayed, I believe, while he remained in this part of the country, and he used to hang his canoe under a great oak branch, a part of the Oak and Pine. This canoe, by the by, is now the property of Commodore Phinney, and when he is here, it usually hangs under his front porch. He thought that there was no one now in town who could paddle it. I had an idea that either "Tarpon" or I could do it without much trouble, and intimated that if he would soak it up I would undertake the job. He advised me to change my clothes, and to have a rope made fast to myself before getting into the canoe, and I think that he was a good deal disappointed when I took a cruise on the bayou without taking harm.

Nessmuk's last camp was near a road which was frequently traveled by the people living to the northward, and he used to have a good many calls. There is an iron ring in a pine tree near which he put up for people to fasten their horses to. This is about the only trace of his presence now remaining, except a few potsherds—the fragments of Nessmuk's old "monkey-jug." A few years ago, when I was staying with your old correspondent, "Antler," at that time about eighty-five years old, near Grand View, Tenn., another correspondent of yours, "Camerambler," knowing that the old gentleman was a great admirer of Nessmuk, picked up the larger mouth of this jug near the Oak and Pine, and gave it to "Antler" for a relic, at which Mr. Stratton was very much pleased. I chanced to find near the same place the drinking-spout of the same old jug, and if "Justina Johnson" would like it, I shall take pleasure in sending it to her by mail.

There are those here who remember Nessmuk very well, but there seems to be little worth telling about his life at Tarpon Springs. He was old and worn, the hey-day of his youth was far behind, and the end was almost in sight.

The two poems from his pen, which I inclose, have never been in print. They were copied from an old album formerly the property of the late Mrs. Kendall, through the courtesy of her husband. So many people are still interested in the many things that Nessmuk has said, done and written in the past, that it seemed a pity that these poems should remain unpublished. KELPIE.

### Tarpon of Tarpon.

TARPON of Tarpon, here's health and good wishes,  
I have camped for long months within hail of your ranch.  
I have found you a Don among paddlers and fishes—  
A comrade in wooderaft, both able and stanch.

Tarpon of Tarpon, the wife of your bosom  
Soon follows the redbird, the blackbird, the blue,  
And one lone canoeist will sorrow to lose 'em—  
(The lady, her pets, and her eedar canoe).

Tarpon, my comrade, the solstice approaches,  
'Tis time that our sharpie stood out for the keys.  
Then adieu to debts, duns, punkies, red bugs and roaches,  
And hey for an outing on tropical seas.

OAK AND PINE, June 14, 1885.

NESSMUK.

### In an Album.

Albums are mostly paper traps,  
Put out from time to time,  
To corral unsuspecting chaps  
Within the jaws of rhyme.

When morning stars begin to fade,  
And flowers are moist with dew,  
We lay the trusty double blade  
Athwart the light canoe.

The bee is in the lily's eup,  
A zephyr on the lake,  
We watch the sun rise slowly up,  
And paddle in his wake.

And when our cruising here is through,  
Let Charon stand aside,  
And we will ehance the light canoe  
Across the Dark Divide.

TARPON SPRINGS, Fla., June 14, 1885.

G. W. S.

## Camp Surgery.

*Editor Forest and Stream:*

It is with some degree of fear and trembling that I approach the subject of surgery in the camp. Perhaps nearly every man who has had occasion to penetrate the great woods for any length of time has felt it his duty to read one or more of the many books written upon the subject, "First Aid to the Injured." No doubt that he, like myself, has been appalled by the magnitude of the surgical requirements of the little volume. The truth about the matter simply is that I have never seen one of these little brochures that was written by a man who had ever had any practical experience in the hills. They are written solely by men who have at their command surgical supplies unlimited, and are as useless for the guidance of the average woods-loafer as would be a work on comic sections.

No one more fully appreciates the weakness of this article than your most humble servant; still, I cannot help but think that some ray of light might be shed by my speaking to the lay brother anent the taking care of his body should he be so unfortunate as to require surgical aid when skilled surgical aid is an impossibility.

I shall be nothing if not simple. The medical man who reads this article will no doubt criticize; that is his privilege, but he must remember that the subject is not treated of for his enlightenment but for the instruction of the man who is not trained in surgical technique.

The first and most important surgical axiom that occurs to me now is comprised within the one word, "cleanliness." By that I do not mean the ordinary idea of the word, but absolute surgical cleanliness. You can hew and hack the human form divine in almost any old shape (as some of our would-be surgeons do) provided you keep it clean, and it will restore itself.

However, I am sort of getting the subject mixed up and slopping it all over the sides. I should first begin by telling you what I have always considered necessary for me to take into the hills. The surgical outfit has been selected with an idea of meeting all emergencies, at the same time being compact and so simple that the layman could fully understand how to use it.

You have caught my idea ere this that antiseptics (cleanliness) is an essential; nothing so conduces toward surgical cleanliness as corrosive sublimate. This powerful germicide is now manufactured into a tablet known to the medical profession as "Bernay's Tablet." One of these added to a certain quantity of warm water produces a solution of a definite strength and is the most active and powerful agent that we possess for the cleansing of wounded or otherwise septic surfaces. This tablet, then, should find the first place in your kit.

I should consider that hæmostasis (stopping blood) to be the most important knowledge that you can possess. Many valuable lives have been sacrificed from lack of information upon this very point. Nearly every school boy knows what his text-book on physiology says about the bleeding of severed vessels, but it is a safe wager that not one person in ten could successfully ligate a bleeding artery. The facts learned in your school days that a jetting stream was arterial and a steady one venous are in the main correct, but at that it is not a very valuable lesson. That you should compress *between* the heart and the injury for the jet and *beyond* it for the stream is only relatively true. That it will suffice in the majority of cases only makes the fact the more dangerous for the minority. There are very, very many arteries in the human body that branch in such manner as to form what is technically known as anastomoses, and where these anastomoses occur it would be only supplying fuel to the flame to compress above the *wound*. All this talk is a little previous, but the thought came into my head just at that point, and I am not any way responsible for the working of my mind, so right there was where I set the thought down. Buy at least six Kelly's hæmostatic forceps and at least two tank packages of Lee's catgut ligature. That will be all the stuff that you will require to stop the flow of blood.

Of course you will need some dressings for your wounded and otherwise injured surfaces. Six assorted rolled cotton bandages and four ounces of best sterilized absorbent cotton and several yards of plain sterilized gauze, and at least one jar of moist iodoform or boracic acid gauze. One ounce of camphophenique powder. One dozen assorted best surgeon's needles. One-half dozen of Red Cross ligatures (silk), one drachm of cocaine hydrochlorate in a sealed tube. A good hypodermic syringe in metal case, which case will admit of the placing of several tubes of tablets. These tablets to comprise strychnine sulphate gr. 1-60; morphine sulphate, gr.  $\frac{1}{4}$ ; glonoin, gr. 1-100; apomorphia, gr. 1-10. One small knife and a pair of sharp-pointed plain forceps will be about all the surgical supplies that you can use. Possibly you might use a roll of adhesive plaster, about 2½ inches, to a good advantage. This is all that occurs to me at the present time. Should there be anything more that I deem requisite I shall mention that fact in the course of the discussion of the various surgical phases that may present themselves.

The first and most important class of injuries that will require the attention of the woods surgeon is that class known as incised wounds. It is quite a common thing for the denizen of the woods to suffer a cut from some sharp instrument. An ax, in cutting wood, makes an ugly and

sometimes very dangerous cut. The first duty is to strip every vestige of clothing and covering from about the site of the injury, and then for the sake of heaven, do not insist upon applying chewed tobacco, flour, or the thousand and odd local remedies of popular favor, but simply keep the wounded surface as free from foreign matter as possible. Note carefully the character of the bleeding, and if arterial in its nature pass a compress about the limb or body above the wound and turn it very tight. This will only serve to stay the flow and possibly not even that. At any rate, it will give you an opportunity to investigate. After the blood has ceased flowing in spurts wash the wound out thoroughly with the solution of bi-chloride, as mentioned above and examine. You will probably find, down deep in the bottom of the wound, a little teat; now let the compress loose for an instant and if this little teat should send forth a sharp jet of bright red blood immediately clamp it with a pair of the hæmostatic forceps, catching well down on the flesh each side of the vessel. It may be that the vessel will spout from both ends. The procedure is obvious; clamp from both ends. Unless the vessel is a very large one, if you will allow the forceps to remain clamped upon the artery for some ten or fifteen minutes before removing them, the vessel will become stopped up and will not flow any more. It is better, however, to make assurance doubly sure by ligating the severed vessel. This is easily done by taking a portion of your catgut ligature, that is preserved in the tank package, and loosely tying it about the jaws of the forceps, then sliding it down over the clamped vessel and drawing tight. Tie once more and cut off short. Now, just one word about tying a ligature, and this will apply to all ligatures or sutures, so please bear it in mind. Where you desire either suture or ligature to remain taut (and you always do) take two turns with the thread under before drawing it tight. That is, tie your first knot twice then draw down. You will notice that I have not advised you to carry along any scissors. The reason for that is that you can do nearly everything with a good sharp knife that can be done with scissors, and you save one tool in your kit. To resume, having tied your bleeding vessels and washed out your wounded surface with many washings of warm water and corrosive sublimate, then are you ready to close it up. Most surgeons prefer to handle a needle upon some form of needle holder. I fancy that the average person would find that instrument a very clumsy and unwieldy one, so I have purposely omitted it from my list. If it should become necessary for you to use more force in passing your needle through the flesh than that which you possess in your fingers, then you may use one of your Kelly forceps to a very good advantage, but in almost every case you will find that you can force the needle through with your unaided fingers. Load one of your needles (preferably a curved one) with a strand of silk that seems to you most appropriate in size, and proceed to pass it through the flesh at one end of the wound, about a quarter of an inch from the injury and carrying the needle well down to the bottom of the wound before causing it to emerge into the cut. Pass it on through to the opposite side of the cut at the bottom and cause it to penetrate the opposite wall, bringing it to the skin surface an equal distance from the wound. Cut off the thread and proceed as before, allowing about one-half inch between the sutures. Right here let me define the two terms ligature and suture. Ligature means to bind and refers solely to where you throw a thread or some other substance about a limb or a vessel and constrict it by drawing the substance tight. Suture means to draw opposite surfaces together as when sewing up a wound. Bear these definitions in mind so that when reading articles upon this subject you need not become confused with the terms.

After suturing the wound as suggested, begin at the point of commencement and tie each one of the sutures snugly, turning each one under twice so that it will not slip. Wash again thoroughly and dust over with camphophenique and lay on several thicknesses of iodoform gauze and several more of plain gauze, then run on a bandage and allow Dame Nature to do the rest. Do not disturb that dressing for at least four days, and if it is not giving you any trouble not even then. It will be impossible for you to avoid a certain amount of suppuration in a vast majority of your wounds, but remember that nature is qualified to handle a great many germs, and some suppuration will not cut much figure. Should your pus become very profuse, however, it will be well for you to dress the wound with a strong solution of bi-chloride on cotton or gauze, renewing the dressing several times daily. This will only be necessary, however, when the patient finds himself with some fever and much pain about the wound, the wound itself becoming angry and red. In most cases all that will be required is to dress the surface with the dusting powder and the moist gauze, and at the expiration of the sixth day clip the sutures and pull them out.

I will now discuss very briefly gunshot wounds. The modern high velocity firearm usually produces a wound that of itself is antiseptic, that is clean from the surgeon's point of view. Therefore when wounded with one of these weapons the sole indication is to combat the shock and keep the surface clean. Remove the clothing from the immediate vicinity of the wound and apply a very strong solution of corrosive sublimate to both the entrance and exit wounds. Above all things, if the bullet has not passed entirely through do not begin probing for it. That is an error that many surgeons fall into. The

man who probes for a bullet to-day is a criminal, nothing less. I said combat the shock. Most persons when wounded by a projectile will experience more or less shock. Very often this is sufficient to cause death when the extent of the injury would not do so. Shock per se is a condition of cerebral anemia and should be treated as such. The head should be lowered and the extremities stroked toward the heart. The patient who is suffering from surgical shock is bathed in perspiration, the head and extremities feel cold, the mind, while clear, is anxious and the face shows the mental process. The heart becomes very irregular and may become so faint as to be scarcely perceptible at the wrist. These symptoms may be brought about by any injury, but they become more pronounced in gunshot accidents. The sufferer from surgical shock is a very ill person indeed, and will require all the cool collected energies of his companions to save him. Place him with the head lowered below the common body level, put hot applications about the body; give him frequently repeated doses of hot brandy or some spirit and water. Inject into the forearm at least 1-20 gr. of strychnia. Carefully note the pulse and if the strychnia does not act in thirty minutes repeat. This will be about all that you can do in these cases except that you should not let the patient himself know that you are alarmed for his condition.

Burns are divided by surgical writers into three degrees. We will be interested principally with that of the second degree, where there is a very decided blister. Should you burn yourself severely in camp, at once seek to exclude the air. There are many agents that will accomplish this purpose. The one at our command is corrosive sublimate solution and plain gauze. At once make up a strong solution of the tablets and soak the gauze in it, applying several layers; holding the whole on with a roller bandage. As soon as the blisters are well formed puncture them with a clean needle and allow the serum to escape. Dust the whole surface with campho-phenique powder and cover with gauze and bandage. As soon as the new skin forms beneath the blister you may remove the dead skin.

One of the most distressing and painful accidents that can befall the hunter is a splinter penetrating the flesh. This very often happens and it is exceedingly difficult to remove the offending substance without causing much pain. Here is about the only place that I can recall that it will be necessary for you to use cocaine, and if your fortitude is equal to the occasion it will be far better that you do not use it even here. Pour out a few crystals of cocaine in a teaspoon and fill the spoon with warm water. When the drug is dissolved draw the solution into your hypodermic syringe and inject about the imbedded splinter. Make several injections and when the skin is fully numb cut down to the splinter and remove with the sharp-pointed forceps. Let the wound bleed fully, as that removes the excess of the drug, and many persons are very susceptible to the action of cocaine and many distressing accidents have been occasioned by its use. This same procedure can apply to an imbedded fish-hook, except that in removing a hook you must never attempt to withdraw it but rather shove it on through, then cut off the barb and remove.

Sprains and bruises where the skin is not broken may best be treated by cold applications and bandaging. Keep the injured member in cold water for at least six hours, then run a roller bandage tightly about it and rest.

I realize that the treatment that I shall advocate for dislocations will not meet the approbation of my professional brethren, but then it is the only method that can be successfully pursued in the timber—that is, main strength. The most common dislocation is that of the shoulder, and when present the only method that I can suggest is that you lay the patient down upon his back, place your heel in the hollow of his arm, grasp his wrist and pull. When you hear a decided snap you may feel sure that the dislocated member is in place.

I have purposely reserved the discussion of fractures for the last from the reason that fractures constitute the *bête noir* of surgeons, and from the better reason that I wanted to warn you to do as little as possible for this class of injuries which are, alas! of too common occurrence. In extreme instances it may be necessary for you to attempt to make a permanent repair of a fractured member. In the vast majority of cases all that you will be expected to do is to prepare the sufferer so that he may be comfortably transported to skilled assistance. The fracture of an arm will present comparatively little difficulty. So also will any of the common fractures that do not interfere with locomotion. It is in such fractures as those of the upper third of the thigh that make trouble for the woodsman. It would be folly for you to attempt a complete reduction (setting) of the bone. Far better that you never try to put the fractured bones back in place. Let your whole effort be directed toward making the patient as easy as possible. This advice will apply to all fractures as well as those of the femur.

Let me relate to you a little incident and from it you may derive the lesson that I intend to inculcate. A man had the misfortune to fracture his left thigh while working in a mine some thirty miles from the nearest wagon road and sixty miles from the closest town. I was called to attend him, but the messenger failed to inform me as to the extent of the injury. In fact, he knew but very little about it. The man was hurt in the mine and that was all the information for my guidance. I hastily got together such surgical appliances as I deemed necessary and we set out. Upon arrival at the mine I found the patient as before described. It was very evident that the man could not get the care necessary to his recovery while there at the mine; therefore it became a problem how to get him out without too much suffering. After some minutes of sober thought I hit upon the following plan, and as it worked successfully, you may follow the same scheme if ever similarly situated: I went out and cut down a small white cedar tree (any loose barked tree will do as well) and removed a section of the bark long enough to envelop the entire leg from ankle to thigh. This I fitted to the leg, cutting holes for the joints and making the whole just a trifle smaller than the limb. Tearing up some old cotton-lined comforters I padded the improvised splint well and placed the injured member in it, running a broad bandage over the whole. You will at once recognize that I had the limb fixed beyond the possibility of motion. Then I went into the timber and

felled a somewhat larger tree of cedar and removed a section of its bark about seven feet in length. I cut this bark in two, making a trough somewhat larger than the body of a man. Then I cut two fir poles twelve feet in length and placed them alongside the bark trough, lashing them firmly with ropes. Within the hollow trough I placed several blankets and deposited my injured man in the bed. After lashing him firmly so that he would not roll, I swung the stretcher thus improvised between the pack saddles of two of the most reliable mules in the camp. Thus equipped we sat out in the gray twilight of dawn for the wagon road thirty-five miles distant. Up one mountainside and down another we journeyed all day, sometimes my patient was progressing on his head and again upon his feet, but when darkness gathered around us we arrived at the nearest ranch house, the beginning of the wagon road. I cannot say that the journey was made with the same degree of comfort that would be experienced in a Pullman coach, but it was very easy for him, and all that long, tiresome journey I never heard him utter a murmur of discontent.

I believe that this will conclude the remarks that I have to make. I am fully cognizant of their weakness, yet I cannot help thinking that they might, perhaps, assist some brother of the wild should he be in distress. Several years of experience as surgeon upon the uttermost frontier of the United States has rendered me qualified in some measure to speak to you of surgery upon the frontier. I shall be only too glad to answer any question addressed to me by the family, always presuming that I am not infallible and as others of the human family, liable to err.

## Floating Down the Mississippi.

### On a Rafting Towboat.

WHEN I quit the Medicine Man's shanty boat, it seemed good to be moving in the 16ft. blue skiff once more. I had felt all the riverman's nervousness in an unwieldy craft, and some more of my own. A sunk cabin boat is no thing to be joyful over, and the waves slam up against the sides of one afloat in a way that jars the contents till they rattle. Nevertheless, a cabin boat has a roof, and even after a cyclone has ripped half the roof off, unskillful repairs are enough to prevent the roof from leaking very badly, and it must be a poor shelter indeed that is worse than no shelter at all on the big river. I thought as much when I rowed away down the mile of narrow Yazoo against the wind, and the south was ominous with clouds whose silver lining was not toward the earth.

I found Dr. White on his boat, and he had a mast made for my boat.

"You better try hit," he said, "you'll find it's a great convenience if the wind's right." I put it in my skiff and sat down to watch the clouds. A tall, gray, oldish man was on the boat, and tied to the stern was his skiff. Dr. White introduced him as clerk John Elliott, of the steamer F. Weyerhaeuser, which was bringing down a great log raft.

"There's no rawhiding on that boat," the doctor said, "the crew is all white."

It was an opportunity of seeing a log raft in motion which was not to be missed, and I waited the coming of the log raft, inviting myself to an interview with Capt. Reed. At last, miles up stream, we spied the steamer coming. There were two steamers, one was at the head of the raft, and lashed broadside to the head of the raft. This steamer was the H. C. Brockman, and from its position is called the "bug" in common with other boats whose exclusive mission is to aid in steering unwieldy tows.

The rising river was flowing fast, and the big Weyerhaeuser was pushing end-on at the stern of the raft, so the tow approached rapidly. The clerk and I made our preparations for a sudden departure, and ran out to the tow at the Vicksburg bend. I went aboard and saw the captain.

Captain Reed proved to be a tall, smooth-faced man, with hands of a size to get a comfortable grip on a 4in. cable, eyes to see at night, and a long, rather wide, bony face. He smiled on the river rat tolerantly, and no less amiably on the newspaperman. I was welcome to stay with him and see the handling of one of the largest log rafts ever towed down the Mississippi. It was over 1,200 feet long, and about 216 feet wide, say five blocks long and one wide, or about six acres. It was from Hollybrook Landing and bound to the Jefferson Sawmill Co. just above New Orleans.

There were said to be 60,907 sticks in the raft, and over 2,000,000 feet. There seemed to be some uncertainty as to the exact amount, for the towing of rafts is done by the thousand feet, and Capt. Reed and the company's agent, W. H. McPike, were at variance in regard to the amount. In any event, it was a good big raft, and looked its size. It was the first thing human I had seen which compared to the wide expanse of the river below Cairo. Memphis bridge looked spidery, steamboats lost, cabin boats like flecks and row-boats mere spots. But the raft had a satisfying bigness, as seen from the pilot house of the push-boat.

The logs were all parallel with the course taken, save the outside ones. Long strands of logs were laid along each side of the main raft and looked like fringe. On the raft were many ropes, stretched lengthwise, and binding the strands of the raft into a single mass. The ropes were about a mile long, and radiated from the bow of the Weyerhaeuser to the utmost limits of the raft in spidery lines. At each end of the raft were poles standing on end, over whose tops ropes were passed from the bow and stern strands of logs. The crew called the poles "derricks" and said that the ropes over the tops of the poles kept the ends of the raft from diving. A further precaution against logs diving was the use of "saplings" six or eight inches through and fifty feet or so long. One end of a sapling was fixed under or fastened to the outside binder of one of the end strands, and the middle was held up by a log used as a fulcrum, the other end of the sapling being bent down to the logs. All the strands of logs, bridged over by these stiffeners, were fastened to it by ropes. Here and there in the middle of the raft were long saplings laid across strands of logs. These saplings were

fastened to binders and were necessary on account of logs attempting to sink in sections owing to accumulations of mud or becoming water-soaked.

The logs were either spiked or chain-dogged to the binders. Two four-inch nails with a foot or more of chain linking them together comprise a chain-dog, and the chain over a binder holds the log to it, but allows "play" enough to prevent violent loosening strains. Spikes are less expensive at first cost, but opinion differs as to the economy of chain-dogs. On the Holston River I saw rafts made with eye-spikes and bound together with a single length of steel wire. I asked Captain Reed why he didn't do that way.

"Because," he answered, "the raft would tie itself into a hard knot should it ever bow in an eddy, or hit the bank. Sometimes rafts hit the bank. Then the thing happens those derricks were put in to prevent. The raft rolls up then like you've seen a nigger roll up a runner carpet in a hotel hallway. Fancy steel cables tangled in a mass of rafted logs!"

The captain expressed the fervent wish that I should not see a log raft roll up that way, at least not on this trip.

Pilot John Rollins was at the wheel most of the time, although Captain Reed occasionally held it for a while. The captain spent most of his time in the pilot house watching the river and the raft's relations to it, with eyes more or less like searchlights. From the stern of the Weyerhaeuser a rope ran to each stern corner of the raft. In a straight reach, the Weyerhaeuser was kept going ahead, pushing the raft before it, but at bends the pretty raft work was done. To keep the mass from bowing up against a bank required a deal of calculation based on long experience with the Mississippi's perplexing currents in general and with the ones in the particular reach at hand. Preparations for a bend were begun about 5 miles before the bend was reached. The bells in the engine room were kept jingling, and the electric cable leading along the raft to the "bug" was talked over or signaled over at intervals, as the case demanded. The "bug" had one business to attend to, and that was to help hold the bow of the raft off the bank. The "bug" faced the starboard side of the raft, and when its wheel started the bow of the raft slowly moved to port or starboard until the logs lay in long curved lines. Meantime, the Weyerhaeuser would swing its stern to port or starboard by means of the two stern lines and hold back or go ahead, and thus the raft was moved across the current enough to keep clear of the bank, or to run into an eddy for a landing. The Weyerhaeuser was simply a great big rudder, the steam power but emphasizing the steering qualities.

When it came time to land on the first afternoon, the eddy just above Ursina light was chosen. The pilot knew how long the raft was—within ten feet—and he knew how long the eddy was at that stage of the water within as many feet. The boats worked the huge raft into the eddy slowly, and the raft crew, under Captain Young, scattered along the starboard side of the raft half way to the bug. Evidently one of the most picturesque operations of rafting was at hand, the checking of 11,000 tons or so of cottonwood logs.

At each starboard end of the raft was a leadsman, with a long pole, who reached for bottom with it, watched by the pilot, who had the leadsman's cries of "No bottom," or whatever depth was found to go by.

Part of a great cable, four inches in diameter, I believe, and probably nearly a mile long was run across the raft to a big skiff and a pile three feet high coiled in the stern, ten men handling the squirming, snake-like line. The men worked quietly under raft Captain Young—"No raw-hiding or hell-whooping on this boat." One man whistled a snatch of the song, "Let the Women Do the Work."

It was growing dusky, and the searchlight was turned on. By its light the captain and pilot scanned the willows the whole length of the raft. The captain shouted, "Hold that pole on the bottom and see if she's moving any"—this, when sighting with the searchlight on the willows, failed to show the motion. Finally the captain called out, "That'll do with the sounding; run your line out." A couple of lines were made fast, and the men came in. It seemed like picnic work. In the morning the ropes were hauled in by means of the capstan, the scene lighted by the searchlight, for it was before day.

One bend was so short that the Brockman was turned around and headed bow toward the raft to push it back, while the Weyerhaeuser went astern full speed in order to swing the raft around the bend, as a hammer-thrower swings the hammer by the handle.

There were places in the raft where the logs were submerged over wide patches. At intervals members of the crew went out to scrape the mud off them with "brooms," or wooden hoes. It was astonishing to me to see how much mud accumulated on the logs and submerged them. The specific gravity of the logs was so near that of the water that a thin film of mud on some of the sticks was sufficient to sink them, and would have done so had not the other more buoyant logs held them up by the binders. At that, half a raft would sink under the accumulation of mud if the logs were not swept with the hoes. But there was not much work for the crew to do in floating, and when fog drove us to the bank at intervals and held us there they entertained themselves at craps. McPike, the company's agent, remarked of one successful player that "If Finley were to fall overboard, he would come up with a fish in his pocket."

Not all the landings were as easy as the first one. Several times fog drove the rafters to shore in eddies that would not have been chosen otherwise. Then the handy line was run ashore, and the skiff crew would take a turn around a couple of dozen willows as large as one's arm. As the strain of the raft came on the line, the six turns around "niggerheads" would slip and the smoke would fly out of the turns in thin blue clouds. A man stood by the niggerhead throwing water on it, so that the fire, which accompanied the smoke, wouldn't burn the rope. On land the encircled willows crashed and were tied into sheaves by the drawing and tightening of the ropes around them—and this though the raft seemed hardly to move.

McPike said that towing the logs was rated at \$1.50 a thousand—about \$3,000 for taking this one to the mill. As the buyer of the company, he watched the

timber country throughout the Mississippi bottoms for good growths. He was a sawmill man himself, up in Missouri, when the panic of '95 wiped out so many business men.

"You people in the East didn't know what it was to suffer," McPike said. "I had a good big mill, and there were whole families dependent on it for livings. They had to have money or starve to death. To shut down meant throwing them out doors. Lots of men did shut down and saved something. But I couldn't do that—some of the men had been with me too long. So I run as long as I could, and when I went down, I went down hard. My friends told me I was a fool. But I don't think so, even if I am only a hired man now."

McPike, like many another man I met, was emphatic in his dislike of the levee system. "Look at those fellows scraping off the mud down there! Why couldn't they let the river fill up the bottoms, and fertilize the land—the land that is being all worn out now?" He thought that gates along the levee by means of which the flow over the land could be regulated, and the pressure on the levees eased off at intervals, might be a solution to the problem. "But you can't talk to people down this way," it was said. "The levee is years and years old. Before they leveed the west bank, it was right. It kept the water scattered in the Arkansas swamps. Now she's pent up in between, and when she goes through, something's doing."

The levee, Roosevelt, and stories are unfailing sources of amusement for men with time to spare along the river.

It was a great change from the cabin boat to the pilot house of the steamer. The cabin-boater, when the river is in its banks, must look up to see far. The man in the pilot house looks down on everything but the treetops, and sometimes he looks down on them. The cabin-boater is always on the verge of trouble of some sort—he is low down in the scale of river humanity. One day, when I turned my glasses on a cluster of shanty boats tied in some willows, McPike remarked: "Do ye know 'em?"

It happened that one of the boats was that of an unclean umbrella mender and tinware tinker I saw above Lake Providence. I said as much. There was a chuckle in the pilot house at the notion of any one admitting being able to tell one cabin boat from another.

"I met a cabin-boater once—happened to cross a ferry with him," McPike remarked. "He was telling what a fine dinner he had eaten the day before. 'Chickens,' he said, 'roast pig, a piece of beef, watermelon, sweet 'taters, vegetables'—I don't know what all that man hadn't been eating. Said I to him, 'Where'd you get all that? I bet some planter was set against you when he missed those chickens, and fixings.' The cabin-boater yawned a bit, but he 'lowed I had him right."

My own experience with the cabin-boater rather confirmed the common notion of shanty boat people. The fact of the matter is, the region between the levees—a strip a thousand miles long and miles wide is governed by the river itself. Uncle Sam is relentless with the men who sell liquor without a license, but for \$25 a man can go afloat on the river with bad whiskey and sell it in any quantity sixty feet from the bank, and the plantation owners have no recourse but to shoot the boat full of holes. At Lake Providence, and other river points, the ferry has a Government license. At Rose-dale, where the town is "dry," a whiskey boat is anchored the year around or was, when I was there. The magic license granted by Uncle Sam is responsible for the worst of the cabin-boat people. It is far safer to do murder on the river than sell whiskey without a license. The steamers are under marine laws, and the passenger boats carry liquor by the jug full for shore patrons. The bar is shut up carefully at each landing, but the moment the boat lands in many places, a thirsty horde rushes for the jugs and bears them away triumphantly, having handed the purser or bar tender the requisite money.

There is no regular police force over the river, save the lookout kept by the Government for unlicensed whiskey sellers. Killings, of which there are countless numbers, are often unavenged if done on a boat. The only reason more thieves do not live on the river is the loneliness of the life. The telephone has helped the police of the river towns marvelously, however. The coming of a bad gang in a boat, or of stolen property can be made known far down the river. One of the smaller Government boats with a good crew and an efficient force of officers could wipe the river clean of the lurking bad men who now live in shanty boats. The boat would do a great amount of service in rounding up the swindlers who beat the negroes out of their money by selling worthless medicines and other useless things. Such a boat should be empowered to drive the gasoline and other whiskey boats from the river. A Government license that permits men to go within pistol shot of a plantation and sell bad liquor to the hired men, although contrary to the laws of the land, should be abolished. It should not be forgotten that when the whiskey boatman Hull fought the sheriff's posse at Leota (Sterling), he was defending the rights given to him by the Government—namely, the rights to sell liquor to negroes in a county which the voters had tried to make "dry." Hull doesn't violate the law, it is said. He simply enforces his rights, granted by Uncle Sam, and does it with Winchester and Marlin rifles, which he keeps here and there in his big gasoline.

And if the river were cleared of its objectionable characters there would still be many excellent river people living in cabin boats along the stream. Fishermen, recluses and characters a-plenty find the river a comfortable and pleasing land o' Canaan. Without Dr. White, Mrs. Haney, Old Man Anderson, Charlie Brooks, "Sunny South" Young, Uncle Charlie Robertson and countless others "tripping," the Mississippi would lose half its interest. But most of the medicine men, the gamblers, whiskey-boaters, and the crooked store-boaters could be spared, even though they do add to the interest of a river experience, not but what even the river bad men have their "good points," though usually the points are steel well worked down on whetstones.

I had heard of the fragrance of southern blooms, and of air so laden with the live perfume of trees in blossom

that it was suffocating. I could now well believe these stories, for the delicious odor of forests in blossom floated over the river in fogs of incense. It is unfortunate that no poet has floated the river in a cabin boat. It takes a month to get used to the life, a month to learn its troubles so well that they are forgotten, and then a month to become one with the sand bars, the caving banks and the wide waters. If, in the fourth month, the poet ran into a cloud of tree blossom incense he would write five verses to the river and its flowers which tell of a fairy land, where the clouds rain perfume, where the main highway is undulating old gold, and where life is a sweet dream.

As we floated down with the log raft, we met the main flight of migrant ducks. They swarmed up from the sand bars and from the river like so many giant bees. They seemed to be all within four days' travel of one another. It gave me a view of migration which I had not seen before, and because the valley is so great a bird thoroughfare, I am surprised that bird students have not followed their favorite subjects down into swamp country where robins lose their dignity, and other birds begin their spring flirting. I was so fortunate one morning as to see several kingfishers gyrating over a little bayou in which the Medicine Man's cabin boat was moored. One feature of their feats was an attempt to drop sideways through the air, holding their wings outspread. To see birds which dive into the water bill first come down with the points of their wings first was sufficiently interesting, but the play of the soft, bright sunlight on their feathers was a spectacle to compare to clouds of invisible perfumes wafted across a torrent of river beauty.

From Vicksburg to the mouth of Red River was a stretch of the Mississippi containing such places as Natchez, Ellis Cliffs, Fort Adams, Rowe's Landing, Fort Hickey, Port Hudson, Lake Palmyra, soon to become the main stream again because of a cut-off a few weeks later, bayous and other things remarkable. It was like a pleasant dream of history, Fairyland and geography, and doubtless these places recall something of a nightmare 40-odd years ago.

Just before noon on Saturday, March 26, the captain indicated a rip-rapped point of land a few miles down stream:

"That's Red River," said he. "The water's setting in there now."

I got my duffle ready, and shoved the blue skill off the logs into the water. Very quickly the raft dropped down till it was nearly opposite the river, and then I cast off and pulled for the river mouth up which the Mississippi was flowing rapidly. As I ran into the narrow opening, a storm broke loose, and rain poured down in white sheets. I found a new railroad bridge half a mile or more down stream and in a lean-to tool camp there I sheltered my duffle and myself till the storm passed by. It was only a rain squall, with lots of wind, from which I was sheltered by the trees on either side the strange stream, up which the water was flowing so rapidly that I went eight miles in an hour, and then I came to the head of Bayou Atehafalaya and saw why Red River is called red.

The Mississippi was rising rapidly. It was 28½ feet, which accounted for the contrary course of Red River. It did not seem as though that narrow stream, the color of dull red lead, could be the thousand-mile river from the Rockies. For a half minute I swung in the whirling eddy, and then the current swept me into 'Chafalli, and then I was in the Louisiana swamps. On my left was a high bank of red alluvian, on my left a gentle slope, and on both sides were scattered moss-hung trees and levees. There were houseboats, landings with French names and one steamer, the Gem, passed up. It was a pretty little boat, and threw some waves that slapped the banks with a loud noise.

As I had been told, the Bayou's course was almost a straight chute. The bends were not the great U's or bottle necks of the Mississippi. The wind driving down from the northwest after a time tempted me to put my sail on the mast Dr. White made me, and for nearly an hour I drove down the rapid current at a fine rate of speed. But another squall was on the way, and in the first sprinkle of it I ran to a fish-dock, at a little cabin boat, Campbell's.

W. A. White's Woodside plantation was at this place—1,300 acres of cotton—but F. L. Cashen has 3 miles front, and as deep on the bayou, so White wasn't so much of an owner as some others. On asking how far I was from Red River, Campbell said 25 miles. I had come that distance in 3 hours and 45 minutes, which indicates how swift is the current.

Mr. Campbell did not mind the pelting rain which sloshed down upon him and ran off the end of his red beard in a stream. His main anxiety for the moment was a sack of corn meal. It was his boast that he was about the only man in the country who could buy in any store thereabouts that he pleased, common men being obliged to make their purchases in the commissary of the plantation to which they were attached. Any hand in debt—and most of the hands are in debt—must get permission to move from the owner of the plantation on which he lives, and the owner of the plantation to which he moves assumes the debts.

Campbell was happy in a contract by which he receives \$100 worth of masonry work to do each year. He pays \$30 a year for rent on six acres of land, and raises many vegetables and some cotton. Eggs sell at the rate of four dozen for two bits—6½ cents a dozen. But good chickens bring 40 cents each—the levee camps create a great demand for poultry.

From this place it was 170 miles to Morgan City, my destination. The map showed a sufficiently complicated route to satisfy the ardent wish of any labyrinth seeker. Judging from the appearance of the map, the rivers, when they got too large, divided up and hunted other streams or lakes.

"There's worlds of land here waiting for settlement," Campbell said, "jes' worlds of hit." He had found the place while wandering on the rivers of the Mississippi valley. With his wife he had tripped the Missouri, Tennessee, Ohio and Mississippi. Now that he had some children, he had settled down to fishing, gardening and raising his babies.

"I wouldn't lift the cover of my fish box for less than two bits," he said.

I slept that night in the hay room of Campbell's house. It was filled with corn fodder, and by the light of my lantern I arranged a bed with my canvas hammock and the bedding. My sleep was only broken by the rattling of rain upon the roof. Morning came as prettily as could be wished, and after a breakfast of fresh eggs and pone and biscuit and pork and fried fish, I pulled out into the river and started away into a region called "bad" by rivermen.

"You see," Charlie Brooks had said, "hit's the jumping off place. When a man gets down in there, he's safe—ain't nobody gwint to pesteh him thataway. I been down there myself—had a gasoline and the best time I eveh had in my life."

The wind shifted around after a time, so that I could use the sail again. On the previous day the sail had bellied so much that I didn't get the full benefit of the breeze. Now I rigged a little boom—a forked stick—and in a few minutes I had my sail, nine feet high by six feet base, up into the breeze. The wind was strong enough for me to sit on the starboard gunwale. For rudder, I tied an oar to the hammock hook in the stern by means of a bit of stout twine. Sometimes I ran into eddies of wind, the wind sweeping suddenly from the port side of the boat, upon which I would do a quick change of position.

I reached Melville, where the railroad crosses the bayou, and unshipped the mast to pass under. When I had passed this place, sudden qualms took possession of my throat, and I swallowed violently. It was a lonely wilderness. I saw a man sitting on horseback in the woods on my right, partly hidden by the trees. He reached into his hip pocket with his right hand and slowly brought something dark to a level with his face. Remembering all the stories of ambush murders: I had heard, I thought this lone horseman might be about to take a pot-shot at me. But he was only drawing a match box to light a cigarette.

There were some short turns in the river, and where the current slid off the points, one saw how rapidly the water was flowing. The Atchafalaya is only about half as long as the Mississippi from Red River to the Passes, so the current is correspondingly swift.

The banks grew lower as I advanced, and below Melville the plantations rapidly faded from view behind a screen of forest, and the forest was dense, with the look of snakes in the underbrush and of a funeral cortege in the Spanish moss flying from the branches. They say in the swamps that Spanish moss protects the trees; but it seemed to me that the more moss there was on a tree, the less healthy the branches and bark seemed. Some trees appeared to be fairly sloughing away with rot that was wasting their living trunks.

I passed a curious set of buildings on one side of the streams. They were whitewashed, and were markedly in contrast with the shady forest. I observed a man sitting some distance from one of the buildings with a shotgun across his knees. I guessed he was waiting for a shot at some ducks or other swamp game. Some distance further down stream I saw a similar aggregation of buildings, and a couple of men with shotguns near the water.

"Looks like they were waiting for a deer to pop in," I thought to myself. They had the look of "rough men," and I didn't stop to make any inquiries concerning supposed infractions of the game law.

I ate lunch as I sailed along, and noted with glee how rapidly the bank was passing behind me. Then suddenly I saw another aggregation of whitewashed buildings, with men sitting on chairs on a little levee built around them. The men had double-barreled shotguns. Within the inclosure made by the three-foot high levee were many colored men, and the colored men had faded clothes of black and white on them. On lines, tossed by the wind, were similar garments of black and white. The black and the white were in narrow stripes, and the stripes were horizontal to the ground on which the negroes were walking around.

With a quick flip of the oar, and a sudden yank of the mast from its step, I ran my skiff in to the bank where stood a tall man with a double-barreled shotgun. I asked permission to land, and got it. I had found a Louisiana convict camp, almost of the kind one reads about.

RAYMOND S. SPEARS.

I. F. WADSWORTH, of Zolfo, and W. R. Williams and S. E. Collins, of Crewsville, returned last week from a cow hunting trip to Parker Island. While in the woods they saw so many bear tracks and other signs which bruin had made that they could not resist the temptation to go hunting for more ferocious game than the gentle Florida cow. Accordingly, they devoted a couple of days to bear hunting with results that were enough to make President Roosevelt forever forsake the West as a bear hunting ground. Though Messrs. Wadsworth, Williams and Collins had no dogs with them and had to do their own hunting and trailing, they succeeded in two days' hunting in bagging two bear and a panther, and would have gotten several more with most any kind of a dog. Few people know that for black bear there is no better hunting ground anywhere than in south Florida, and a day's drive from Zolfo puts hunters where they can find enough sport to last a lifetime.—De Soto (Fla.) Advertiser.

WITH the death of Sir Augustus Gregory, the last of the great Australian explorers has passed away. His demise recalls the most remarkable mystery in the annals of the commonwealth. Fifty-seven years have passed since an exploring expedition, commanded by a German scientist, Ludwig Leichardt, set out from Sydney to cross Australia from east to west. To this day nobody knows what happened to that exploring party. Not a scrap of paper, not a solitary relic of its fate, has ever been discovered. It must have been either overwhelmed in some natural convulsion, or absolutely annihilated by the blacks. Sir Augustus Gregory led two expeditions in search of it, one of them organized by the Royal Geographical Society.—London Chronicle.

On the links of the Merchantville (Pa.) Field Club a robin was flying across the green just as a player drove the ball from a tee. The bird was struck with full force and fell to the ground dead.

# NATURAL HISTORY

## Hunting Snakes.

"FOR persons who enjoy snake stalking," said Curator L. Ditmars, who has conducted expeditions for snakes on behalf of the New York Zoological Park, in the Bronx, "I can recommend certain parts of South Carolina above any other section in the United States. For example, a four-mile swamp near the little town of obertsville, in Hampton county, is a snake's paradise. Portions of the swamp are overgrown with huge rushes and portions with canebrake dovetailing into pine swamps, the trees running forty feet up to the first limb and hang thick with green moss. Trees, ground and water are alive with reptiles.

"Snake hunting is as fascinating as deer stalking, especially to a man who finds some meaning in every sound on a pit viper's back. No moose was ever more ready to take alarm than are these slippery quarries, and to land a bagful of valuable snakes is a task that calls for adroitness mingled with a high quality of perseverance.

"Night is the very best time for catching snakes, for it is then that the serpent tribe uncoil themselves and glide about the swamp in perfect freedom. Obviously this sort of thing is not without danger, and after one trial of it, the snake hunter usually prefers daylight. In the moonlight a haze floats above the swamp, and it is like a silvery sea. Within it, the pines are ghosts whose long beards sweep the pools, diamond-backed rattlers rear their ugly heads, racers, moccasins, and orange pink water snakes glide noiselessly, and alligators keep up their loud uncanny bellowing and make the air heavy with their musky odor.

"In daylight the hunter rides in mounted on a mule usually and clad in an armor of heavy brown duck, high top boots, and stout flexible gloves. His weapons are a bamboo stick with a running noose of fine copper wire at the end, and a second cane furnished with a wire net. He always carries a revolver, too, if he is wise.

"Across the mule's back is balanced a short cane stick, and from each end of the stick dangles a good-sized cotton bag. These bags are for the snakes. The mule sagaciously picks his way through the swamp along deer paths which wind in and out, where a single misstep would often tumble him and his rider to a pool swarming with alligators and water snakes. "A snake stalker, of course, attempts to take only the more valuable and strange species of serpents. When he catches the gleam of the right sort of a coat through the rushes, or spies a fine specimen dangling from a limb over his head, he halts and goes into action with his copper-wire noose and bamboo stick. He can, he slips the noose over the snake's neck and draws it taut. Then he gets the thrashing, spitting repetition of twist thumb and forefinger around the neck and pops him into the cotton bag. Invariably in a crisis the hunter throws away copper wires and seizes a snake with his hands, grasping him well toward the head, so that he cannot twist around and thrust his fangs into his hands.

"A rattlesnake is fairly easy to capture, because he is consummately brave, never runs from an enemy, and his warning rattle is unmistakable. Skirt the borders of a palmetto thicket any day and watch the wavering shadows of the foliage on the ground. Presently these shadows, if you watch sharply, seem to dart ahead in a straight line, with a brassy whirr coming from somewhere. The darting line is a diamond-backed rattler, whose curiously marked skin is in exact imitation of the palmetto shade. The diamond-backed is the most deadly of his tribe. In the west the varieties of rattlers were found inhabit barren rocky places and the tall grasses of the prairies. Just now the rattlesnake is hunted mercilessly, for he is valuable to the medical man for his toxins and to the naturalist because out of the eleven species in the United States, the habits and looks of not more than five are well known."

Continuing, Mr. Ditmars said that some snakes are good actors, at least some snakes which he met in South Carolina. One of those captured was a hog-nose snake. It was captured near a cottonfield, and it attempted to deceive its captor by pretending it is dead. Then, if undisturbed, it would show how a snake acted when he was not trying to fool anybody. In playing dead the snake actually rolled over on its back and returned to that position when if disturbed and placed on its sides or belly. Mr. Ditmars told a number of colored men near where it is captured that he would show them what wonderful control he had over snakes. He would first make several passes with his hands over the snake and it would roll on its back dead. Then he directed the spectators to walk away some distance from the snake and he would then collect vitality out of the air for the snake and the snake would come back to life. When the snake saw that no one was near, it turned on its belly and started to crawl away. The colored men were greatly impressed with the great power possessed by Mr. Ditmars over snakes.

In journeying through South Carolina Mr. Ditmars visited a vast wilderness of cane growth, known as the Jack Swamp, which seemed to be devoid of amphibious creatures that day. Mr. Ditmars and his companion, Mr. Snyder, who is connected with the reptile department of the New York Zoological Park, captured two snakes, and in the night while pondering over their good luck, a large snake was seen crossing a stretch of white sand. It proved to be a specimen of the hand-meat of water snakes (*Natrix fasciata erythrogaster*). They then went to the Savannah River, where the woods were extensive and populous with animal life. In the hummocks bordering the low ground numerous

specimens were observed. They found that the only sure way of capturing these creatures was with a net. On peering about for this species they came upon a rattlesnake, which measured over five feet. While stepping on a log in a shallow stream in the low grounds their guide almost put his foot on a cottonmouth snake, which made a lightning-like dart at the guide's foot, but missed its aim and slid into the water. On this day they captured eleven cottonmouths.

A peculiar fact regarding the feeding of these snakes was observed. In the swamps in which they were found, hundreds of thousands of fish had been destroyed by the evaporation of water. In consequence, no food was left for these fish-eating reptiles except their harmless relations, the water snake. They gorged upon these, and in localities where moccasins were found common water snakes were rare indeed. One large moccasin disgorged a freshly swallowed snake immediately after capture. The dead snake and the cannibal were measured, and it was discovered that the moccasin was only a foot longer than the reptile composing his dinner, the water snake measuring a trifle more than three feet.

## The Pigeon's Fate.

BEING old enough at the time to fully appreciate the grand sight of the myriads of wild pigeons as they moved back and forth through the Mississippi valley in the late seventies, it did not occur to the writer when they suddenly disappeared that it meant they had done so for all time.

As the years pass and no satisfactory explanation has been advanced, the subject fairly nettles the thoughtful lover of nature. Superficial humane zealots as usual credit the "cruel" trapshooters with wanton slaughter, which is positively silly when it is remembered that a single flock, one of a hundred that passed in a day, would supply pigeons for trapshooting for several years. That disease exterminated them is not impossible, and is by far more reasonable than the trap or net explanation. Twenty-five or more years of guessing having failed to locate or account for the birds.

The suggestion here offered (for what it is worth), which was brought about by a Welsh rarebit dream, may, if followed up, give a clew to the whereabouts or fate of the birds which sportsmen of the last generation will ever remember as the most graceful and skillful flyers known. The dream above mentioned need not be given in detail, nor could it be at this time; however, the writer, with the aid of the aforesaid "rabbit," dreamed of a pow-wow with a venerable Indian who, when asked what had become of the pigeons, stated, to quote him literally (as dreamed) that "Pigeon heap d—m fool, fly in big water (meaning the Gulf of Mexico), no come back."

I am without any element of superstition, but this dream and Indian affirmation has haunted me for months. I have just returned from the Gulf coast, where, strange as it may seem, the dream has in a measure been confirmed as follows:

Having waded through a slough several times in quest of jack snipe, which were there in large numbers, and having killed and bagged many, I came to an inviting log near the edge of the swamp, which made a good resting place for a tired shooter. While seated there making up my mind whether I should quit shooting or go back after the snipe again, an old negro driving an antiquated mule attached to a creaking, ramshackle wagon with dished wheels, drove up. A few pieces of webbing, some chains for traces and a bridle and reins of common clothesline made a perfectly harmonious outfit.

"Whoa, Jake!" commanded the old man as he rolled up to my resting place. "Good mo'nin', sah. You all been spo'tin' some dis mo'nin'."

I assured him I had bagged a lot of jacks. "I dun hear pow'ful lots-o' gun firin' as I come along back."

His aged and gray head was set with bright eyes, and his old face beamed with good nature. I decided to do some of the questioning, so I started in with an inquiry as to whether Jake, who stood within reach of my seat on the log, had been or was a kicker. His owner assured me he was gentle and "never was a fool mule."

"How long have you lived here, uncle?" I inquired. "I don't live here; I lives up dis road 'bout fo' miles."

"Yes, but how long have you lived in Texas, or near the Gulf?" I asked.

"Good Lo'd! I dun always been here," and, as if to emphasize the statement, his old face wrinkled more than usual.

"Do you remember the pigeons, years ago?" I asked.

"I shore does, sah."

"What became of them?" I asked, recalling the dream.

"Whar you all come from to ast dis nigger such fool things. Of cou'se I knows."

"Well, I don't," I remarked, "but would like to very much."

"You never dun heard of de black fog and the 'norther' on dis beach 'bout twenty-five years ago?"

"I never have; but what has that to do with it?"

"Beg youh pa'don, sah, I guess you all ain't jokin'."

I assured him I was not, and he began the story of the disappearance of the pigeons something like this:

"When me and Tom Clay was out huntin' coons and bob cats one day, de fog come so thick it was most pitch dark in dis woods and we was 'fraid to go to the island where Mars Judge Tobin lived, and we was workin', and jes had to stay right dar in dat timber fo' days and fo' nights—coze we shore would git lost if we rowed de boat in dat fog. Well, de second mo'nin' along come de 'norther' an' dun blowed dis timber most to pieces, but not de fog. By an' bye I hear a sound, I dun heard befo', pigeons was a-flyin' over, and de sound kep up all dat

day till mos' dark. Den da come fallin' thro de trees around us with their wings busted, and heads busted, like they was plumb crazy; an' when da seen our fire da fluttered into it and put it clean out. Yas, sah, dat's God's truf, I dun tole you all. Next mo'nin' all dat could fly started off tor'd the ocean, an' the noise of more a-comin' kep up all day till mos' night. Dat noise was shore mighty bad, an' we dun been 'bout scared to death when de fog lifted, an' we started fo' home in de boat. Den we was scared agin, fo' de bay was mos' covered with dead pigeons an' blood an' feathers, an' mos' every kind of a fish was dar jes helpin' hisself, an' so thick we could jes row de boat. We dun busted right into a nest of sharks feedin' on pigeons, an' one throwed his tail so hard he knocked de oar out of de boat mos' ten feet. Next mo'nin' all the pigeons was dun gone, excep' on de beach was some washed up, an' a pow'ful lot of dead fish, little ones, s'pose got killed in de rush for pigeons. I neber did see a big flock since, an' ain't seen nary one fo' yeahs now."

"Then you think they perished in the Gulf?" I asked.

"I dun seen um, I knows I know it!" he replied.

Will some kind reader help me in this matter and interview some old sea cock who may have met the unfortunate birds further out to sea, and verify this negro's story and the characteristic statement that "pigeon heap fool, fly in big water, and no come back" of the visionary Indian.

NOYNEK.

## A Submarine Battle.

BY TUDOR JENKS.

ON a shallow shore of Long Island, near New York, extend long sandy beaches. These often are interrupted by creeks, or little inlets into which the tide runs at high water, running out again when the tide falls.

Standing on a bridge over one of these runways, I happened to see a big crab making a dinner upon a piece of fish which he held firmly in one claw. Around him, but at a safe distance, were several smaller crabs who did their best to join in the big crab's dinner.

Meanwhile the big fellow had no time to loiter over his meal, for in spite of his clever sparring with his free hand, every now and then one of his small enemies succeeded in making a successful raid, and retreated safely with a bit of the fish.

Still, between attacks, big Mr. Crab was bolting his provisions so fast that the little pirates would soon be defeated unless they could invent a better plan of attack. They had been making quick dashes and still quicker retreats, but the big crab, by wheeling to and fro, and by striking out or snapping his nippers at them, made a successful defense. He had only to turn as if on a pivot, while they must advance and retreat some distance.

Therefore the small fry consulted their ingenuity, and adopted a new plan of attack. One by one they scuttled up stream, keeping near its banks, until they were about eight feet above the defender of the fish. As each reached the right distance he would launch himself into the swiftest part of the current, and let himself be whirled downward.

By the time the young cruiser-crab was opposite the big battleship-crab, he would be going so fast that it was hard to hit him or to grip him, and yet he, keeping head on, and having to make no effort except a single quick grab at the fish, was able to score a frequent success.

No sooner did the big battleship-crab avoid one little cruiser than another was upon him, and his store of food rapidly diminished. Seeing that his defense was overcome, the big fellow gave up any attempts to fight, and devoted himself to eating as fast as possible.

In a few moments the fish was gone, and the battle was over. But it certainly was an uncomfortable way of taking dinner—for both parties to the battle. Civilization has its advantages.

## The Gray Wolf a Fighter.

FROM a private letter written by Dr. Edward L. Munson, of Fort Assinaboine, Mont., we are permitted to quote a sentence or two which gives a notion of the power of the gray wolf, a matter that was referred to in an article recently printed in these columns. Dr. Munson says: "A fortnight ago I ran into an immense old dog wolf which must have weighed 150 or 160 pounds. I had only three dogs with me as the rest of the pack was off after a jack rabbit. The dogs, all fine fighters, all started for the wolf, and he whipped them in one, two, three order, in less time than it takes me to tell it. One he threw over a cut bank, crushed in the chest of another, and gashed the third dog's throat. I do not think that he could have done up three 100-pound wolfhounds as easily, though these dogs of mine are all good fighters and savage brutes, and one was an 85-pound staghound."

## Importing Foreign Birds.

KERRVILLE, Tex.—Editor *Forest and Stream*: The gray partridge (*Perdix cinerea*) has been successfully reared in confinement in France. If it can be done in France it can be done with proper care in America. There are plenty of wealthy men all over this county, who, if it were the fashion, would make their places on a small scale what the Yellowstone Park is on a large one, sanctuaries for native and foreign birds. Suggestions of importing foreign birds and undertaking the acclimatization of desirable game and song birds are too often met with the answer: "We imported the English sparrow, etc." Because we made fools of ourselves once, that is no reason that we should do it again.

# GAME BAG AND GUN

## At the Home of the Uneasy Club.

THIS visit to the birthplace of the Uneasy Club, on the shores of Honey Creek Lake, Iowa, was one full of incidents which brought floods of delightful memories from away back in the early existence of the club when the lake was an ideal one for waterfowl.

Dispatches from the resident member brought the information that for the first time in about five years the old lake was full of water to the brim, the feed for the birds seemed to be fairly good, and there had been, during the first few weeks of the open season, enough ducks to suggest something good later when the flight from the north was on.

When I made my last transfer on the trip of 500 miles to our happy hunting ground, the weather was mild and anything but suggestive of ducks, but when I reached the final railway station, six miles further, there was a stiff wind blowing from the north, and before the club house was reached we were pulling the wraps about us and flinching from the penetrating and sleet accompanying blast.

"This weather must have been ordered for the occasion," said Ed., who had come up to the lake from Omaha a few days before, and drove over to the station for me. "We have had some little shooting, but nothing to what's coming, for the past hour thousands of ducks have been in sight, most of them, however, seeming to have pressing business further south, but there'll be shooting to-night or I don't want a cent."

At the turn of the road, where the first view of the lake and the shack of the old Irish couple on whose land the club house is situated, breaks upon the view, a feeling of sore disappointment came over me, for the shack had gone and a new two-story house, of trim appearance, was there in its place, and a big red barn standing beside the little modest old one which had done such good service for so many years. I had heard of the changes, but still was not prepared for them, and did not feel right until I had turned my back upon that view and looked in the direction of the club house and out upon the inviting expanse of water and rushes. There all was the same as in the olden times. The house looked as though we had said farewell to it only a few days before, instead of several years, and the air was full of the swish and whistle of wildfowls wings.

What a delight it was to push open the door and have it stick, half-way, upon the same strip of warped flooring that used to interfere with its further progress and which we never had time to fix on account of the ducks. There was the old-fashioned box stove into which we used to throw big logs and gather about after a day's hard hunting to relate to one another experiences of the day or other days, and absorb the comforting waves of heat and tobacco smoke. The same general arrangement of trophies and adornments upon the walls prevailed.

However delightful the home-coming and the silent welcome of that old resting place of the Uneasy Club (every board of which its five members had put into place during a summer of hard figuring and scraping together of the small stock of building knowledge possessed by each) very little time was lost in getting into hunting coats and waders and out into a blind, for the birds were coming off the river into the lake for protection from the fierce north wind and sleet which was increasing steadily.

By the time we had placed a large bunch of decoys in good position our fingers were too cold and numb to handle our guns at all, and some minutes had to be consumed in thrashing our hands to restore circulation. Flocks of ducks were in the air all this time and occasional chances for a shot, too tempting to resist, would be offered, and some one would drop a paddle or oar or wooden duck and take a shot at a passing bird or flock, but with rather unsatisfactory results on account of the cold, the unsteady boats or fierce and uncertain wind. By the time we were in shape to shoot, the birds were coming in like unto the olden times, which was the highest praise of which we were capable, and it seemed as if ninety per cent. of all the birds which came down over the line of trees topping the ridge which separated the lake from the Big Muddy set their wings and came straight down to our decoys. The river was covered with travelers which had come down ahead of the storm, and when the wind got too high for them they came into our lake for shelter, and the way they set their wings and came down over us was without a parallel in my whole duck shooting experience. We kept our guns hot until too late to see to shoot with any degree of accuracy, and until we were so cold that we could scarcely distinguish between the rush of wings and the chatter of our teeth. Then we laid the guns down and pulled across to the very welcome quarters in the club house, and with a wonderfully handsome string of ducks of all varieties, from bluebill to canvasback.

How good it did seem after an appetizing supper, the preparation of which everyone had a hand in, to gather around the old heater in the same old home-made easy chairs (more comfortable than anything ever put together for city use), and with the sparks a-flying and the chimney sighing, to recount the many joyous days that so clearly were brought to our minds.

"You know that bunch of bluebills that came almost into our faces coming like the wind and so low that it was impossible to see them until they were too close for a shot, except at their retreating forms? The trick was to turn about in the very unsteady boat, handicapped by heavy, stiff clothing and breast waders or mackintoshes, and do it quickly enough to get not only a glance at the bunch of feathers which is disappearing at the rate of something like 200 feet every second, but to get an accurate line on it with one's gun barrel.

"That reminded me very forcibly of the similar approach of a flock of redheads years ago, when the mighty

hunter and writer Bill and I were in the boat. Bill was standing up to enable him to see a little better over the high rushes, when a fine flock of these junior canvasbacks came right at him, so low and close before they came into view that it was an utter impossibility to draw a bead on them before they were overhead and past and getting out of harm's way with redoubled speed. Bill made one herculean effort to make the quick change of position in the boat, and so intent was he in getting his gun-sight on the retreating flock that he never realized that he was not succeeding until his back and the surface of the lake came in contact. I can see him now, in my mind's eye, as he disappeared under the water, his arms and legs pawing the air trying to get a line on the ducks still, I reckon. Of course he got out all right. You can't keep a good man down.

"And then—as Bill was not there to defend himself—do you remember that morning when Bill got into such a glorious flight of teal down near Mrs. McCune's hog pasture, that for a brief period Mrs. McCune and her hogs were completely forgotten until that amiable Irish lady suddenly appeared with blood in her eye, pointing an old relic of '61 at his head through the fence? It was said that this was the only occasion known when Bill said his prayers. It was a difficult matter to convince the old lady that when pellets made her pigs squeal with pain and rattled upon the roof of her house, the occasion was not ripe for getting down to business with the old musket, but finally they were apparently good friends and drinking out of the same bottle. Bill would let anything drink out of his bottle—if it would save him from a raking fore and aft with a smooth-bore."

Mrs. McCune was a character and a terror to all of the boys who had had the pleasure of meeting her on some of their expeditions to her territory in which the excellent teal grounds of the south end of the lake were situated, but Bill was ever afterward a privileged character there, and added to his reputation as an Indian charmer that of a tamer of wild Irish women—but Mrs. McCune had admirable characteristics which we were made aware of upon better acquaintance, and I regretted exceedingly to learn, a few days since, that she had gone to join that innumerable caravan who have sought their chamber in the silent halls of death.

So passed the evening in the interchange of reminiscences and the morrow came with milder air and cloudless skies and very little to suggest (except a little flurry of ducks in the early morning) the splendid shooting of the day before.

That perfect shooting seems to have been prepared as a farewell to the old club house and lake, for the encroachments of a railway are ruining the shooting there, and George, the resident member, has gone to take up his abode in the irrigated districts of Idaho, where Bill is likely to follow him soon, and Burt finds that the presence of wife and babies now makes a nearer hunting ground desirable. So passes the stamping grounds of the Uneasy Club. BURT.

## The Hungarian Partridge.

ONE does not have to be a very acute observer of the times from the sportsman standpoint to recognize the wave of advancement creeping over the people of this country in all matters pertaining to game, its propagation and hunting. More magazines are devoted to outdoor life and more people read them with interest. Notes on natural history that would have been "turned down" by the majority of readers a few years ago now find more than a passive interest. With each year there is an increase in the number of business men who recognize the "call of the wild" to the extent of arranging a certain date when the gun and dog for the moment usurp the place of dollars and cents.

This digression from the title is called forcibly to mind by a paragraph from the report of Dr. T. S. Palmer in his review of the game protection for 1904, printed in the Year Book of the Department of Agriculture. In speaking of the importation of foreign game into this country, he says, that among the consignments were 192 Hungarian partridges. Go back five years and ask yourself how many readers of FOREST AND STREAM could have given you any information concerning the Hungarian partridge, the capercaillie and other birds of same stamp? I do not mean by this that they are now as common as the barnyard fowl. Quite the reverse. The propagation of these imported birds is carried on with great difficulty. That these difficulties are worth the effort to overcome is well proved by those that have shown the patience and skill in overcoming them. I do not feel embarrassed nor open to the charge of advertisement if I give the history of the Hungarian partridge as seen through the eyes of our game preserve, namely, the Essex Park Game Preserve, situated on the Rappahannock River in the State of Virginia, since our place is not open to the hunter.

In shape, color and characteristics the Hungarian partridge can be well called the big brother to our native Bob White. His size would correspond with twice that of the latter. The taste and color of its meat is the same. In coloring there is one difference found in the Hungarian cock. A splotch of maroon feathers forms a shield on his breast. With erect head he constantly hovers near and around his mate during the time of courtship. The hen, apparently unmindful of everything except the ordinary duties of household life, goes placidly along about her business, nor does she appear to see her lord and master, who keeps pirouetting in front of her, first on one side and then on the other, with his chest thrown well out. He is not polygamous like the English pheasant. His temperament is extremely pugnacious to any other cock that invades his quarter during this period. One or the other must retire or pay the penalty.

In this country the breeding season starts with the end

of May, the same as in the old country. The pairing-off process occurs a month before this, however. Left to her own device the hen will make a setting on about twenty four eggs. She may bring out a second hatch, but this is doubtful. If during the laying season her eggs are surreptitiously removed she will lay as many as sixty. In this connection she shows a trait in this country which she has never exhibited in her native land or in England where she has been propagated; namely, to cover her nest with leaves and twigs. In the old country the nest is always left exposed and the small olive colored eggs blend in color with the sward underneath.

Before the Essex Park Game Preserve started its attempt at rearing this bird, it went to some trouble in finding out the previous efforts of other preserves in its importation and propagation. It could only locate four attempts, and each had ended in failure. Two were made on the part of private individuals and the other two by the Western States. In trying to determine the cause of failure on the part of these four the following causes were found. In two cases the land was unsuitable for the bird to thrive in, being of a mountainous nature, in the other cases the birds were turned out in the wild at once with little or no protection.

Most amateurs who dabble in the propagation of game rarely take into account the natural history of the bird they intend to cultivate. They buy from catalogue as the fancy dictates, regardless of everything except their knowledge or raising chickens or possibly squabs and pheasants. The three are largely advertised as great money-makers. They start at the wrong end of the hobby by trying to force the bird to adapt itself to new conditions and environment instead of making diligent search into the bird's habits on its native heath, informing himself correctly as to its accustomed climatic conditions and range. Having made himself thoroughly conversant with these things his next step is to find as near as possible its counterpart in this country. This counterpart can always be found somewhere in these broad States and their stretches from ocean to ocean. Most failures in rearing game can be ascribed to the above reason alone, all other conditions being carried out to the letter.

I once met a man who had a few acres situated near a little town in New Jersey. He told me at great length of his plans for raising the canvasback duck in confinement. I believe his place was something like a hundred miles from any water except an artificial pond of stagnant water on the place. Up to the present I have hardly noticed any diminishment in the table price of duck in question, although at the time I believed he intended a revolution. A few years ago there was a man from the same State that had a market price on all wing-tipped wild ducks shot on Currituck Sound. I was anxious to learn how these wounded birds thrived in their new quarters and found out from one informed. In almost every case the ruddy, redhead and canvasback dropped away their feather and bone and then gave up their ghost. It is generally a question of how long they will live and they can be sold to some prospective breeder before the time arrives. This does not apply to the common duck such as the mallard. They are easily domesticated, but the taste is no longer that of the wild. A rose by another name does not apply to the case.

To return to the subject in hand, the nature of the Hungarian partridge craves for a big stretch of open land. His flight when flushed may be as great as a quarter of a mile. In all probability it will be less than this, but still he wants the open field. The importer that drops these birds in the mountains will find them running as fast as their legs can carry them, and this at a pretty high rate of speed, for just such open land. On their journey of investigation they will be caught up one by one till none are left to reach the desired goal. Fox, hawk and dog will complete the work of destruction that the man with the gun has missed. He likes hills and wants wood cover but there must be open space where he can stretch his wings and whirl to his heart's content.

Like the quail, he follows by preference the tiller of the soil. Any wheat field will appeal to his appetite, the clover patch will be visited during the day, and if there is any millet to be found he will be the boy to find it. The newly plowed land will be gone over carefully and insect life pursued and devoured. During the heat of the day the covey will rest in the shade of alder or willow down near a lazy stream. If dog or man happens near they will all seek cover and hold their position till the last possible moment. With a tremendous whirring of wings the scattered covey will act the same as his brother Bob White each for himself and the devil take the hindmost.

In captivity they retain all the wildness of their nature as long as they are given the privilege of their wings. This is in contradistinction to the pheasant. After the latter bird recognizes his handler it no longer flushes if its run when he approaches.

This tameness goes to the extent of feeding out of the hand sometimes. It is highly desirable to the breeder of wild game that it be tamed as much as possible, otherwise it is impossible to go near without throwing it into a panic. Very often in cases of sickness it is imperative that the bird be handled. If the bird is not tamed the excitement caused by your attempts to touch it will make the condition much worse. Where the wings of the Hungarian are pinioned or flight feathers are removed, the bird will become very docile and domesticated. This is the way it should be to successfully propagate. Needless to say that the runs during breeding season, or in fact any other, should not be open for public instruction or amusement. No one should ever see them except their handler. This tameness in confinement is lost almost instantly as soon as the bird gains control of his wings. The young chicks, whether raised under bantam or mother bird, will be as "wild as the rest of them."

In looking over causes of death, for this preserve make

an autopsy on such and everyone that dies, the principal cause among the Hungarians can be placed to the door of apes. I am not speaking now of the chicks but of the older birds that were born in their native land. One hundred per cent. of this disease was found in the hens during the time of setting. We can only account for it by the cramped position of the mother bird giving the worm good chance to obstruct the windpipe. On this subject of gapes, the worms found here in Virginia will average an inch in length, almost twice the size of those found in most other places. The change of climate for the first year of the importation will notice a marked degree of non-fertility among the eggs. It is not that the cock is not doing the best he can. Give the same birds a trial a second year and you will notice the difference.

As far as the chicks are concerned they take absolutely to their surroundings, and if anything thrive better than they do in the old country. Who will deny that quail hunting is the finest sport that we have on our side of the water? Imagine your marked bird twice as big as he really is and you have the Hungarian brother. Isn't it worth the effort at cultivation? To many parts of this country the bird is admirably suited and will thrive by its own efforts if given a chance. We firmly believe that is the bird of the future and should be closely watched and studied and every effort made to cultivate and make it of our own.

D. W. WYNKOOP.

ESSEX PARK GAME PRESERVE, MONTAGUE, ESSEX CO., VA.

## Massachusetts Game Birds.

BOSTON, Mass., Aug. 12.—*Editor Forest and Stream:* Joseph P. Love, of Webster, writes "there are no quail whatever," but for partridges the prospect is "fair."

In 1904 an application for quail to be liberated was sent by the town of Webster, an appropriation having been voted in town meeting. The State Association was unable to send the birds on account of the lateness of the fall. The only other town to pass a similar vote, so far as I know, was Cohasset, to which birds were sent, with excellent results, in the opinion of Mr. Southey, to whom the birds were consigned.

Mr. George F. Gaines, Secretary of the Rockland Fish, Game and Gun Club, reports quail very scarce. He says we must stock with quail and put a close season on them all the time," besides providing feed during the winter. He favors a hunter's license of \$1, the money derived to be used for stocking with game.

Mr. A. B. F. Kinney hears of no quail. Broods of young partridges reported generally large, but though this has been a good breeding season he thinks they are nothing as numerous" as they were ten years ago.

H. A. Estabrook, of Fitchburg, expresses the opinion that quail are increasing since the "freeze out" in 1904. They are large and in fine condition. For partridges, he says, prospects are "all any reasonable sportsman can ask." He favors extending the license law making it apply to residents and non-residents as well as aliens.

Representative A. E. Knowlton, a bird hunter, reports on Gardner that quail are scarce and partridges reported plenty.

W. H. G. Wight, of Lowell, a member of the State Association and a man who has been interested in game all his life, declares there are only a few scattering quail, and the partridges have been "cleaned up" by pot hunters. The country about his city, he says, has excellent covers, but they need restocking and strict enforcement of the laws.

Mr. F. B. Green, also a member of the State Association, has extensive forest lands in North Dartmouth, says he has heard quail only once or twice, has seen some partridges; would be glad to restock his covers with quail. A report from Yarmouthport is "fairly good" prospects. The informant has seen four pairs of quail. Very few shot last fall.

Mr. Howland, of Taunton, has not heard a single quail, and has sold his dog. Thinks we must do some stocking and "wait."

Mr. Crocker, of Barnstable, knows of two or three flocks of quail and of partridges; considers quail rather scarce.

Dr. Shurtleff, of Kingston, a South Shore town, reports quail very scarce, partridges abundant.

Senator F. M. Chace, of Fall River, says prospects "not very good." He would favor close time of two years and an appropriation from the State.

A report covering Dover, Medway and Bellingham is to the effect that no quail appear to have survived the winter. These towns are good quail country.

Mr. E. H. Richards, a member of the State Association from Woburn, considers both quail and partridge scarce. Another member, Mr. W. H. Manning, of North Andover (Middlesex county), regards "prospects poor" and suggests the encouragement of fish and game clubs for protection of game and fish, that the commissioners send men out to look after the formation of such clubs and the extending of information on existing conditions, the laws, etc.

A correspondent in North Grafton believes "quail looking a thing of the past."

F. F. Baldwin liberated birds in Hopkinton in 1904 and thinks the prospect encouraging. Says those planted by him did well. Thinks town authorities should be induced to co-operate in the work of the clubs, posting the laws, etc.

President Schofield, of the Groveland Club, Essex county, thinks prospects "fairly good" as compared with other years. A Peabody correspondent says quail are fairly plentiful and partridge scarce. North Eastham, better than last year"; Northbridge, prospects for fall looking good.

The secretary of the Leominster Sportsmen's Club reports quail scarce, and he would limit the bag to four partridges a day and other birds in proportion. "Quail scarce" is the report from South Lancaster, West Bridgewater, Savoy (plenty two years ago), Millbury, Millville, West Stoughton, Montague, Brookfield and Berlin.

Mr. Andrews, of Hudson, member of the State Association, reports quail "few," will be cleaned up in November; pity that month had not been closed."

Mr. Rice, writing from a town in the east central part of the State, says he has located seven young broods of partridge with "from seven to fourteen birds" in each

brood. He says a fox caught the old bird of one family. He knows it for a fact, he says. He tells of a few woodcock and two broods of black duck. Outside of quail, he thinks birds will be more plentiful than for the past two years. He has seen two deer, and a neighbor reports seeing three together.

A pleasant letter from Mr. Roberts, of New York city, informs me that he has just returned from the Tunxis Club preserves in Tolland, Mass., where he saw a deer as large as a three-year-old Jersey heifer, a bald eagle, a crane, besides partridge and woodcock right around close to the club house, but he missed the familiar whistle of Bob White, not hearing a single one.

Perhaps the most doleful report of all comes from Mr. Payson, who has a large tract of land in Lexington. He says Italians shoot "anywhere, everywhere." They are utterly lawless. Says he released partridges (quail?) only to have them driven away or destroyed in spite of the land being posted. He adds, "I try to feed in winter but no use under existing conditions." I trust the alien license law will be so rigidly enforced as to relieve every citizen of the State whose experience is like that of Mr. Payson, and there are many such.

H. H. KIMBALL.

## The Wood Duck.

HANDSOME indeed is the wood duck, in his resplendent spring pelage, his wedding suit, if you please. Scientists call him *Aix sponsa*. When the writer was a boy they were common, generally speaking, throughout nearly the whole of the United States, except that being shallow water feeders they were seldom found on our sea coasts. Non-divers, lovers of partially submerged tree tops, nesting in hollow stumps and in trees sometimes sixty feet above old mother earth, feeding upon acorns, vegetable growths of shallow pond bottoms, the seeds of wild oats and certain other weeds and scattered grains, they furnished our ornithologists with a nut to crack, for how did those young ducklings get to the water sixty feet below the nest in their tree home? The solution of this question occupied the bird men for the better part of a century. Of a verity the wood-duck is among the most interesting as well as most beautiful of our feathered bipeds.

I stole the miller's swan-like skiff and hunted the old mother duck and her dowdy brood on the mill pond, sloughs and old creek beds that in early days were fed by Stillman's Run, long before I dared to steal his gun and count coup on the myriads of feathered and other game with which this section, at that time, abounded. It was a joy and a delight to the boy who sent the little skiff in arrowy flight after the speeding mother duck and her young, to see her gaining cover for the brood, break into flight with squealing notes of distressed mother love, as the flappers quickly disappeared in some friendly shelter, nor was much required to hide them most securely.

Beginning in the days of loose powder, shot and patched bullets, and continuing in a progressive way to the present time, the writer has stood the successful hunter above the great majority of the game of our country, than which no land ever had a nobler heritage. But never has he felt quite the same thrill of pride as when he started down the creek for home, with several of those downy ducklings in the straw hat that he had seen his dear old grandmother (a pioneer product of the American forests primeval) build for him out of wheat straw that he had cut for the purpose. Of course, the trophies of this first hunt were proudly laid at her feet. She commended the skill of the little hunter, but assured him that in spite of anything that we could do, the young wood ducks would surely die, and sent him willingly back to turn them loose at the scene of their capture.

DR. A. J. WOODCOCK.

## Notes from Arizona.

PHOENIX, Ariz., Aug. 5.—White-winged pigeon (*Melopelia leucoptera*) and dove shooting has been fine here for the past four months. The pigeons are much easier to hit on the wing than the dove, being a straight flying bird; they winter in Mexico south of here, and come to the grain fields of southern Arizona in the summer. Last week Messrs. Williamson, Snoke, Stull, Ainsworth, Cassidy, Pinney and Hedger bagged 236 white wings in a couple of hours' shooting in the afternoon. The birds are very fat now and particularly fine eating. The shooters sit in the shade of the big cottonwood trees in a line of flight, and kill the birds as they fly over. The doves are usually more plentiful than the pigeons, both of which are so numerous as to be almost a pest, and there is no closed season on either.

Our quail (Gambel's partridge) this fall will be plentiful everywhere in the valley. Last year was so dry in the early summer the quail did not mate, but this summer they are bringing off two or three broods, which will give abundant shooting.

Under our new game law the deer season opens Sept. 15 and closes Dec. 1, with a limit of three male deer. Non-residents must secure a license to hunt big game, which costs \$10. Game Commissioner Pinney is now having the licenses prepared, which for convenience may be had next month.

The thirteenth annual tournament of the Arizona Sportsmen's Association will be held early in December. There will be three days target shooting, with good purses added, and teams from all the gun clubs of Arizona, as well as a number of outside shooters, will participate. The tournament will be held during or just following the first annual Territorial Fair, the date of which is Dec. 4-9 inclusive. The Phoenix Gun Club will have an election of officers within a few days, and make preliminary arrangements for the tournament, which will be held this year under their auspices.

Very few violations of the deer law are reported this summer. Nearly all the forest rangers are deputy game commissioners, and as they make it a point to carefully examine the outfits of every camping party they meet in the mountains, it has practically put an end to killing deer out of season.

Trout fishing in Oak Creek south of Flagstaff, and in White and Black rivers on the Apache Indian Reservation, has been exceptionally good this summer, and has been enjoyed by a large number of the disciples of the rod and reel.

PHOENIX.

## Birds on Rock Island.

DAVENPORT, Ia., Aug. 12.—*Editor Forest and Stream:* About a week ago I took a short walk over a part of the Rock Island Arsenal island, which lies in the Mississippi River opposite to this city. As I was walking along one of the beautiful but little traveled woodland drives there, I was surprised to flush a ruffed grouse and its young from a large cluster of tall weeds, that were growing in an opening in the woods about ten feet from the road. The old bird flew up quickly into a nearby tree, while the young birds hurried into the thicker woods beyond. Later the old grouse flew around the open space and joined its young at a safe distance from me.

The ruffed grouse, like the prairie chicken, is rarely found in this county. That the ruffed grouse is rare is probably due to the fact that there are now very few suitable covers left for them, and also that a large amount of hunting is done in this county.

The Bob Whites here are doing nicely. On Aug. 7 I came across a flock of about fifteen young ones that could fly fairly well, and were nearly full grown. Another flock of young birds was seen on Aug. 3.

Owing to the protection they receive, Bob Whites are quite numerous on the island. Often they cross over to the Iowa shore, but few nest here, as they seem to prefer the island as a nesting site. About a year ago a pair of Bob Whites was seen running about on one of our principal streets, and cases of their being seen on lawns in the residence portion of the city are not very uncommon. A few years ago a flock of fifteen came into our yard, and after running about for a short time, they flew off into the less thinly settled portion of the city.

DONALD BERRYHILL DAVISON.

## "The Game Laws in Brief."

THE "Game Laws in Brief" in the current edition has been revised to date and contains the laws as in force for 1905.

The plan of the "Brief" is to give all essential provisions of the laws relating to game and fish, omitting the surplusage but retaining everything that may be of use. For instance, the book is not lumbered up with specifications of penalties; it is assumed that a sportsman wants to know the law, and does not want to figure on what he will have to pay or how long he will go to jail if he breaks the law. It happened the other day, though, that a man from Connecticut came into the FOREST AND STREAM office to find out about the Connecticut export law penalty. He was figuring on whether it would pay him to run the risk of taking some birds home with him. When he added up the possible (if not probable) amount of the penalty he concluded "not to."

Apart then from the fine and prison features, the laws are all here, and they are so put as to be understandable by all men.

The "Game Laws in Brief" is an up-to-date, comprehensive, accurate and reliable compilation for the United States and the Canadian Provinces, while the "Woodcraft Magazine" feature has been discontinued, because it has proved impossible to publish successive issues at regular dates. There are in this edition two capital bear stories by Allen Kelly, out of his book, "Bears I Have Met," the volume which contains the original story of "Monarch, the Big Bear," concerning which a few months ago there was a lively discussion in these columns.

## Firearms in Belgium.

CONSUL McNALLY, writing from Liege, Belgium, calls attention to the trade of that city in firearms. He says 2,479,936 weapons—guns, revolvers, etc.—were officially tested, against 1,938,470 in 1903. Of these 891,875 for 1904 and 629,785 for 1903 were single-barreled; 656,327 (1904) and 536,433 (1903) double-barreled; 549,654 (1904) and 483,411 (1903) were revolvers. The increase is credited to the war in the East.

## The President's Spring Hunt.

THE issues of Scribner's Magazine for October and November next will contain articles by President Roosevelt descriptive of his recent hunting trips in the West. One of the articles describes the expedition after coyotes and wolves in Oklahoma and the other the trip for bears and other big game in the Rocky Mountains.

## The Old Home.

AN old lane, an old gate, an old house by a tree;  
A wild wood, a wild brook—they will not let me be;  
In boyhood I knew them, and still they call to me.

Down deep in my heart's core I hear them, and my eyes  
Through tear-mists behold them beneath the old-time skies,  
'Mid bee-boom and rose-bloom and orchard lands arise.

I hear them, and heartsick with longing is my soul,  
To walk there, to dream there, beneath the sky's blue bowl;  
Around me, within me, the weary world made whole.

To talk with the wild brook of all the long ago,  
To whisper the wood-wind of things we used to know  
When we were old companions, before my heart knew woe.

To walk with the morn'ing and watch its rose unfold;  
To drowse with the noontide, lulled on its heart of gold;  
To lie with the night-time and dream the dreams of old.

To tell to the old trees and to each listening leaf,  
The longing, the yearning, as in my boyhood brief,  
The old hope, the old love, would ease my heart of grief.

The old lane, the old gate, the old house by the tree,  
The wild wood, the wild brook—they will not let me be;  
In boyhood I knew them, and still they call to me.

—Criterion.

The Melbourne Sporting and Dramatic has been running a storyette competition, one of the prize-winning yarnlets being the following: A son of Erin, a recent arrival to Australia's shores, was being shown the sights of Melbourne. On a recent Sunday, the Zoological Gardens was their rendezvous, where, after visiting the large and varied exhibits, they came to a group of kangaroos. "And what may these be?" inquired the new chum of a fellow-countryman who had "come out" some time before. "Faith, if me mimicry serves me right, they call 'em Australian natives." "Australian natives!" cried the new chum, in amazement. "Oh! wirra! wirra! And I have a nace married to wan av thim same."

# SEA AND RIVER FISHING

## Disappointment.

I HAVE always longed to catch a big salmon, our delightful experience with Newfoundland grilse in August of last year much intensifying the desire, and was assured that plenty of them could be got in the same waters about July 1. So the rather elaborate preparations necessary for such a trip were promptly begun; guides were engaged; routes and rates decided on and transportation secured; supplies ordered from one St. John's firm to meet us at one point, and fishing tackle from another firm at another point, and my son and I left Cleveland late in June full of hope and confidence. In fact, some extra salt was ordered, so that the surplus salmon not used in camp could be salted and smoked, and we could fish with clear consciences, certain that none of our catch would be wasted.

All the preliminaries went so smoothly that we might well have known that fortune had a bad turn in store for us at the last. Trains were on time; sleeping car berths were to be had at the last moment and usually the last berths; tackle arrived at Port au Basques on time and all right. Fred met us at St. Georges, reporting the other guides waiting at Deer Lake, and all the supplies turned up at the last station, as did trunks and other baggage, without mishap. Then came the reverse of the medal. I had planned the year before to fish the Willow Steady pools on the upper Humber, where my guides had the greatest sport in the previous season. Now there were still great masses of snow and ice on the north slope of the Central Mountains, the Humber was in full flood, making a through route to the headwaters, and there were no fish in the pools at all.

We decided to try Sandy Lake River, where there was such good sport with grilse last fall, and got to the first rapid after two days' delay. The water there was at least three feet higher than in the previous August, the river unrecognizable, and absolutely no salmon to be found, though trout fairly swarmed. Two more wasted days brought us back to Flat Bay River on the western side of the island, a fine salmon stream and ordinarily most productive; but now very low, with only a thin sheet of water purling through a waste of boulders, and so clear that every stone and fish in it was as plain to our sight as we doubtless were to the latter. There are two fine pools just above the railway bridge, one beneath it, and two or three more in the half mile down to tide water, and these we flogged industriously, getting to the water in the early dawn, taking a long rest through the bright hours, and then swinging the rods again till dark, with nothing to show for it all but a few grilse, a good deal bruised from climbing over rocks and an occasional sea trout.

In the lowermost pool were clearly visible ten or a dozen salmon, running from ten to thirty pounds in weight, and every now and then one of the big fellows would roll out on the surface, just to taunt us. Now and again capricious fancy, or perhaps a change of fly, would make one rise to a cast, make a great swish on the water, fill us with hope and then settle back without a touch. So it went for three days until even my guides—good sportsmen and law-abiding citizens—began to drop into lurid language and express unhallowed wishes for dynamite or a net; but we kept our tempers pretty well, flogged away with the big rods, fought flies day and night, and hoped for better things to come.

Now we had an experience of the courtesy of English officers and gentlemen. Our two rods were more than sufficient for this lower river, and it is not customary to intrude on a previously established party, but two or three officers from a gunboat then at St. Georges came down and camped on the lower pools, flailing them night and day. We were told they would only stay for a day or two, so kept away from those pools; but I strolled down, met one of the party and told him that we were in camp at the bridge and had been fishing those pools for three days, but would leave them alone until their party were gone. They expressed regret to have interfered with us and said they were leaving next morning. That afternoon, while I was waiting at the pools above the bridge for the sun to drop a little further, one of this party appeared and promptly caught a grilse out of the pool I was watching. I walked over there and politely suggested that it was not quite fair, after we had left them the best pools, for them to also fish the small and inferior remnant of water in front of our camp, and this officer declared he had misunderstood the matter, apologizing and departed, taking with him the only fish I saw that night. The cap sheaf was put on, however, when the other two men appeared early the next afternoon and thrashed those same pools all over again, to a running accompaniment of curses from my guides, in which I felt rather inclined to join.

This party left the next day, having three large salmon and a lot of grilse from our pet lower pool, and we put in a week more hard work over this and the Red pools, some three miles up the river, without getting hold of a single salmon above five pounds. Then we both grew so sick, tired and disgusted that we would not have stayed a day longer for all the fish in Newfoundland, gave it up, scored the trip a failure and came home. All the way down fishermen fairly swarmed, every available pool, on any river visible from the train, being occupied by one or more men wielding big rods, according to general report with small success.

"Fishing with the fly" carries two meanings, one patent to the general public and another which comes home with particular force to those who have pursued *Salmo salar* in his haunts. The lordly salmon selects for his visits to fresh water the season and the country in which the insect plague is at its worst, and how bad this is only experience will teach. Certainly the hordes

of flies that swarmed about us, and made ordinary comfort attainable only by constant thought and precaution, was far beyond my experience or imagination, large as both of these already were. During the daylight hours, from 5 in the morning to 8 at night in the northern summer, the black fly swarmed, with a thirst for gore that made their personal safety a matter

SEA TROUT.

BROOK TROUT.

of indifference and a persistence that made nets of any kind nearly useless; coming in millions, creeping like a serpent, biting like a bulldog and entirely indifferent to being squashed. The cold nights of the north have caused the mosquito to pretty well abandon the nocturnal habits which he displays in softer climates, and to carry on his pernicious activity regardless of

SEA TROUT,  
17½ in., 2 lbs. 6 oz.

GRILSE.

daylight. Among the trees and bushes they swarm beyond estimating, but the strong winds that generally blow all day keep them pretty well away from open and exposed spots, so that a refuge can generally be found where they are not beyond endurance. They are active until about 9 at night, and start in again with the first light of morning, when they are at their very worst. A faint idea of their numbers will be given by the fact that I once killed twenty-six by a single slap on my guide's back as he sat by a salmon pool.

It is difficult to make it clear how great an annoyance the constant plague is. By keeping all exposed parts well smeared with dope, renewed at intervals of

not more than an hour (we two used nearly a pint of oil of citronella in eighteen days), and using a little tent of mosquito netting, well tucked in, to cover the head and hands at night, one can escape being badly bitten, but the brutes give you no rest, dressing, washing, bathing, or anything else that exposes the body are very difficult to effect without suffering acutely, and it requires a great deal of very good sport to make up for the constant discomfort caused by these wretched beasts. When Moses induced Jehovah to send a plague of flies upon Egypt he showed an expert knowledge of the infinitely disagreeable.

In the Sandy Lake stream we found abundance of bright-colored and active brook trout, so many, in fact, that catching them was soon not amusing; but during the first two days on Flat Bay Brook saw no trout at all. The third morning a handsome silvery fish took my salmon fly, and the trout rod took half a dozen more from the same pool, and after that we generally got several every morning, which I supposed had run in from salt water the night before. These were the famed "sea trout," concerning whose identity with *fontinalis* there has been so much controversy. Naturalists, I think, are now agreed that these are only the common brook trout gone to sea, and that, after a short stay in fresh water, they resume the usual appearance of that fish, but the differences, both in shape and color, are so great that it is difficult at first to accept this view, correct as it probably is.

These fresh run fish were deepest in the center of the body, tapering decidedly toward tail and head, the later being triangular with upper and lower lines nearly straight and muzzle acute. The back was dark sea-green without vermiculations or spots, though the dorsal and caudal bore some lighter mottling. The sides showed some greenish shading toward the top, the rest of the fish being bright silver and the fins streaked with sea-green. Usually there was no red tinge of any kind, though a few specimens showed two or three very faint pinkish spots. The two trout shown in the first photograph were taken at the Red Rock pools, some four miles up stream, on the same morning, and were of exactly the same length, one being a sea trout and the other a typical brook trout. The former had doubtless been in the river for some days and was decidedly darker than the fresh run specimens taken lower down, was 17½ inches long and weighed two pounds and six ounces. The latter was 17½ inches long, weighed two pounds and two ounces, had the body elongated, the head elliptical with upper and lower lines strongly curved, and the muzzle rounded. Back dark greenish-brown, with prominent vermicular markings in lighter shade, sides light brownish-gold with a great number of vivid carmine and pink spots, belly silvery. Fins edged with white and balance red with dark streaks. The whole body was suffused with a strong purplish glow fading to pink on the belly. This fish had evidently not been in the salt water that year if ever.

The second photograph shows the same sea trout with a grilse caught the same morning. Unfortunately the latter was unusually long and gaunt, and therefore much less like the trout in shape than most grilse, but the coloration of the two fish was very similar. Curiously enough all these trout acted like salmon, taking the fly under water, not one making a clean rise or more than a mere break on the surface. The one figured made no splash at all and lay so quiet that I thought the fly was on a stick and started my guide into the pool to clear it, when it seemed that the line was moving very slowly up stream. At first I thought this only the illusion which, when you have been looking steadily at moving water, makes any fixed object seem to move in the opposite direction; but in a moment or two a sudden rush removed any doubt, and it was a good ten minutes before he came to net. The flesh, both of the fresh run sea trout and salmon, was decidedly hard, tough and springy under the teeth, so much so as to make them quite inferior for the table to either the brook trout or to the grilse taken late in August of the previous year.

A. ST. J. NEWBERRY.

## New England Fishing.

BOSTON, Mass., Aug. 12.—Editor *Forest and Stream*: Proprietors of all the hotels at Nantucket have been compelled to find rooms outside in order to accommodate their guests. The influx of summer visitors for the past fortnight is unparalleled in the history of the island. Sailing, fishing and bathing fill the summer holidays with pleasant variety. Many parties have had fine sport in taking large numbers of scup and plaice at the entrance of the outer harbor.

The local fishing stamers, Petrel and Waquoit, have had unusual success during the past week, capturing a number of large swordfish, one of which measured 14½ feet in length. At Chatham there are many new arrivals and few departures. The diversions here are largely sailing and fishing with some shooting of shore birds. This is the height of the season, and all the shore towns on Buzzard's Bay afford an opportunity for combining the pleasures of angling with that of sailing, this being the only body of salt water of any considerable dimensions which is effectively protected from the wholesale slaughter of fish by mechanical devices, such as nets, seines, etc. This has been brought about through the efforts of the Old Colony Club mainly.

The annual meeting of the club will be held on Friday Aug. 25, at Padanaram, South Dartmouth, in the summer station of the New Bedford Y. C. A clambake will be served at Caban's Folly Hotel. The death of Mr. Joseph Jefferson has left the club without a president

and the desire that Mr. Cleveland should be his successor has been expressed by many members of the club.

Reports from Ed. Grant's camps at Beaver Pond and Kennebago indicate no let-up either in the number of fishermen or of fish. Mr. and Mrs. M. W. Waters, of Brooklyn, had fine success at Kennebago with the fly and make the return trip from the woods via the lakes, Dixville Notch and the White Mountains, where the scenery is as fine as can be found in New England. Mr. and Mrs. C. F. Felt, of Lynn, occupy Lynn Lodge at the Barker, and have as guests Miss Dunlap, of Lowell, and Miss Sawyer, of Watertown. They have enjoyed the woods life and its accompaniment, the fishing.

Mr. R. G. Rich, of Boston, left the hotel at Middle Dam at 4 o'clock one morning and returned an hour later with four salmon and one trout.

Mr. C. H. Wiswell, of Boston, who has been for twenty-four years a frequenter of the Rangeleys, brought into Camp Wiswell four good salmon as the result of an afternoon's fishing.

Mrs. Samuel Boothby, of Portland, has to her credit an 8½-pound salmon.

Hon. R. O. Livingston, of New York, when he starts out for "Pond in River," takes rod and camera and returns with a few fish and some fine pictures.

Mr. and Mrs. N. Sutherland, of New York, with their children, are occupying the Bungalow.

Mrs. J. S. Doane, of Boston, recently landed a 4-pound salmon at Upper Dam.

Mr. and Mrs. W. H. Sawyer, of Lewiston, have as a guest at their camp Miss Lowe, of Wellesley, Mass.

Mr. Stephen C. Young, of New York, has taken a 5¼-pound salmon and several smaller ones from Rangeley Lake.

Mr. E. C. Gay's camps and most of the cottages at Clear Water are filled with guests, and some fish are being taken every day.

At Mr. H. G. Brown's camp Mrs. Brown is entertaining her sister, Mrs. E. T. Binnee, of Boston, and her niece, Miss Agnes Lawson, of Brookline. The captain of Mr. Brown's 35ft. launch is Gus Spinney.

The camps on the Megantic preserve have had many more guests thus far than usual, and they make a favorable report as regards the fishing.

The Belgrade Lakes continue to furnish surprises in the number of square-tail brook trout and of salmon. A New York angler got a 3½-pound trout and a 6½-pound salmon. Another from the same city a 6¾-pound salmon, and Mr. Cohen, also of New York, a 5½-pound trout. Dr. E. Palmer, of Brooklyn, took one of 4 pounds, and Mr. M. Peters, of New York, a 5-pound trout. But Mr. A. T. Sansbury beat the catch of Mr. Peters by taking one of 6 pounds.

Commissioner Ring, who has been in many sections of the State this season, says the prospects for partridges never looked brighter at this season. CENTRAL.

## Fish Chat.

BY EDWARD A. SAMUELS.

### Concerning Squid and Other Cutt'ers.

IN FOREST AND STREAM for July 29 I had a short paper treating of some of the lures which are used in the deep sea fisheries in which I inadvertently neglected to mention that best of all baits, not only in July and August, but whenever it is obtainable, the squid.

This curious creature, which is first cousin to the octopus, abounds all along the coast and thence far out to sea, it being abundant in all the waters on which the fishermen ply their vocation, from Massachusetts Bay to Florida, and its numbers are far from meager from Cape Cod to Newfoundland.

Just now it is the favorite bait among the trawl and hand-line fishermen, for it is of a tough consistency, remains well on the hooks, and seems to be a more tempting lure for cod, halibut, etc., than any other.

Great quantities are obtained in weirs and pounds, and when none of these are set the fishermen usually succeed in securing a good supply, which they obtain by employing a peculiar hook or "jigger," which is dropped into the water and played up and down until it is seized by one of the squid, when it is quickly drawn up and suddenly inverted in order that the creature may be dropped into the tub or bucket which stands ready to receive it, and before it has an opportunity to discharge its inky secretion in the face or upon the person who hauls it up.

The squid jigger is a curiously contrived implement, being composed of a great number of small hooks which are arranged in a circular manner on the base of a leaden shaft two or three inches in length, and about a half-inch in diameter, which is painted a bright vermilion color.

This is attached to a stout line and dropped overboard and permitted to sink, and as the leaden top or shaft is heavier than the base upon which are attached the hooks it descends into the water headforemost, the hooks being at the top as it descends.

Now, the squid, on a merely casual examination, particularly after it is dead, seems a flabby creature which could not by any possibility be endowed with the celerity of movement and cruel voracity which many of the predatory marine animals possess, but its appearance belies its real character most astonishingly, for it is really one of the quickest moving of all the creatures which traverse the depths of the ocean, and so destructive are its propensities it has often been called the tiger of the seas.

By aid of its powerful siphon tube it darts through the water with the celerity of an arrow, and such is the construction of this instrument it can shoot forward or backward with equal facility, and by inclining it to the right or left it can spring sideways as easily as in the other directions.

The squids travel in schools and prey upon herring, small mackerel and other fishes which they can easily capture, no matter how swiftly they may flee, and seeing the vermilion jigger in the water—for the squid has a pair of large and powerful eyes—it darts at the moving lure and grasps it greedily, and before it discovers what the character of the object it has seized, really is, it is lifted up, sometimes two or three on a single hook, and dropped ignominiously into the bait tub from which it never again returns until it is utilized by the fisherman for a trawl bait.

Some idea of the great abundance of these cuttles may be formed from the fact that dozens, even scores, of barrels are sometimes taken in a single tide in weirs and other traps, and a hand-line fisherman has been known to have taken from 150 to 200 with the jigger from a single school.

Like many other denizens of the sea the squid is endowed with cannibalistic proclivities, the larger and more powerful ones preying upon the smaller, and for this reason there is no great difference in size in the individuals of a school, for those of different ages, for prudential reasons, school by themselves. The ferocity with which the squids follow a school of young mackerel or herring is remarkable, and the havoc they work is limited only by the supply of victims, but there are reprisals, for the squid in its turn becomes the victim of the matured mackerel, bluefish, bass, squeteague, tautog, kingfish and other predatory species which regard it as an especially tempting *bonne bouche*, preferable to all other creatures upon which they prey.

These cuttles are provided with a powerful biting apparatus which closely resembles the beak of a parrot, and with this they have no difficulty in crushing the shells of lobsters, crabs, etc., which they easily capture, and devour the meat of the unfortunate crustaceans quickly and greedily.

This biting apparatus is capable of inflicting a most severe and dangerous wound; in fact, if a finger should be seized by it the member would be severely lacerated if not severed at a single snap.

Like the other cuttles the squid has the curious faculty of ejecting a dense inky fluid to cover its retreat when pursued, and this, with other fluids contained in the creature, are of such a poisonous nature that the hands of the fishermen who cut them up for trawl baits often become

COMMON SQUID.

OCTOPUS.

CUTTLEFISH.

terribly sore and inflamed, the skin draws back from the nails, which in many instances become so badly injured that they are painful, sometimes in an excruciating degree.

According to Dr. Philip Carpenter, the cuttles have very acute senses. "They have an approach to a brain, inclosed in a cartilaginous skull. They can hear sounds, and evidently enjoy the taste of their food. They have a large fleshy tongue, armed with recurved prickles, like that of a lion. They either crawl on their head, tail upward, or swim, tail foremost, by striking with their arms, or squirt themselves backward by forcing water forward through their breathing funnels. They are ferocious creatures, the tyrants of the lower orders, and do not scruple to attack and devour even fishes. The large kinds are deservedly dreaded by man."

L. L. Hartt, in the American Naturalist, in further describing the characteristics of these mollusks, states that they are distinguished from the others by having a large head, a pair of large eyes and a mouth furnished with a pair of jaws around which are arranged in a circle eight or ten arms furnished with suckers.

"In the common cuttlefish or squid of our coast, the body, which is long and narrow, is wrapped in a muscular cloak or mantle, like a bag, fitting tightly to the back but loose in front. It is closed up to the neck, where it is open like a loosely fitted overcoat, buttoned up to the throat. Attached to its throat, by the middle, is a short tube open at both ends. This tube, or siphon as it is called, is fastened to its throat and can be moved about in any direction."

The animal breathes by means of gills, which are attached to the front of the body inside the cloak and look like the ruffles of a shirt bosom. By means of these gills the air contained in the water is breathed, and they answer the same purpose for the cuttlefish that lungs do for mammals.

I wonder how many there are among the fishermen who cut up the slimy, flabby body of the squid for bait, who associate it with the argonaut and beautiful nautilus, with which it is related, whose wonderful life histories have furnished a theme for romancists and poets from time immemorial?

Pliny and Aristotle both mentioned the argonaut in their works and wove most fanciful stories concerning them, and many modern writers have given these creatures attributes and characteristics which really do not belong to them.

Among the works of English poets Pope's lines:

"Learn of the little nautilus to sail,  
Spread the thin oar, and catch the driving gale."

are familiar to all, and James Montgomery, in his "Pelican Island," gives some verses to the same effect.

Unfortunately, however, the poets' verses, although beautifully rendered, are not correct in a scientific point of view, for the nautilus, etc., do not possess the habits

that have been attributed to them. A writer in Science Gossip, in commenting on this fact, says:

"The highly poetical idea of the animal's hoisting up its sails and scudding before the breeze is not true, but observers say that it does occasionally make use of its other feet as oars or paddles. The female only is provided with the shell we so much admire, and the function of the two broad dorsal arms, which were supposed to be used as sails, is in constructing this."

The cuttlefishes, among which the squid belongs, constitute a group whose study is full of fascinating interest, and of them all none has attracted greater attention than the octopus, whose characteristics have been treated of by many writers. Many are the names that have been bestowed upon it, such as the "sucker," "man sucker," "blood sucker," "devilfish" and "poult," being common appellations. A species of this genus was the celebrated Polpus of the ancients, performing all sorts of wonders and terrible deeds, such as seizing and devouring human beings and even capturing a boat's crew or pulling down a vessel, which was said to have been done by the Kraken.

In describing the peculiarities of the octopus an English writer, Mr. W. H. Booth, says: "As the name implies, the octopus has eight fleshy arms or feet, which on an average are about twice the length of the body, are very muscular and flexible, and taper down to a point little thicker than ordinary twine. Along the whole under surface of these arms is situated a series of circular discs or suckers, of strange construction. These suckers are fixed in pairs, except the first half dozen near the mouth, which are placed immediately over each other, they form the chief means by which the poult is enabled to seize its prey and are of curious construction, for in the hollow of each is a piston exactly fitting the aperture, capable of being worked up and down at the will of the animal.

When, therefore, the surface of this sucker is pressed against any substance the withdrawal of the piston creates a vacuum, and powerful adhesion takes place."

Having seized its victim by encircling it with its arms, the octopus drags the unfortunate animal to the powerful horny mandibles, with which it is furnished, and makes short work of it. The number of suckers possessed by the poult fall but little short of two thousand.

The squid, like the other cuttles, has the power of changing its color like a chameleon, assuming the tint of the bottom, sandy or rocky, over which it passes.

Darwin, in his "Voyage of a Naturalist," in commenting on this faculty, says: "These animals also escape detection by a very extraordinary chameleon-like power of changing their color. They appear to vary their tints according to the nature of the ground over which they pass. When in deep water their general shade is brownish purple, but when placed on the land, or in shallow water, this dark tint changes into one of a yellowish green. These changes were effected in such a manner that clouds varying in tint from a hyacinth red and a chestnut brown were continually passing over the body."

The cuttles have also a phosphorescent glow which is often displayed at night to the wondering gaze of the fishermen as their craft lies at anchor on the star-lighted sea.

### The Decadence of Salmon Rivers.

While I do not wish to be regarded as a crank, or as riding a hobby, that hobby being the decadence of Canadian salmon rivers, I am free to confess that this matter occupies a good share of my thoughts and anxieties, and that I lose no opportunity to secure such facts in relation to it as are obtainable. In a recent issue of FOREST AND STREAM I made mention of the injury that is being done to that noble river, the Miramichi, by excessive netting at its mouth and by poaching in all the pools for scores of miles up the river. A correspondent of one of my friends has recently written him a letter in which occurs the following passage:

"We have no anglers. There are no salmon; they are of the past in the Miramichi River. There have been only two salmon caught above Boiestown this season. I have just come to-day from Burnt Hill. Have been on the river four days and never saw one salmon or grilse. We caught a few small trout and that is all.

"None of those parties who own pools along the river have been here for years, nor in fact any sportsmen. There is nothing to fish for, and unless there are some restrictions made in the fishing at the mouth of the river and in tidal waters there will never be any salmon fishing up the river again."

In commenting on this my friend says: "I am afraid this fine salmon river is doomed to destruction. The Ottawa Government has no interest in its protection, since the New Brunswick Government assumed control of the Provincial Inland Fishery, and this Government

has no interest in protecting riparian fishing from which it derives no revenue. In order to restore their fishing the club would have to protect the whole river above tideway, and this would cost more than it could afford and more than their sport is worth. Netting must be reduced or the salmon is doomed to extinction. There was a fine run of salmon in the Miramichi this season, but you will see by the inclosed letter that none get up to the angling pools. I have had no report from the Restigouche anglers, and do not know what they are doing. The Nepisquit Club do not fish their river this season. They have farmed out their waters to whoever will pay their price, and I understand the demand is brisk. Some of my friends could not get access to the river until August, when the cream of the fishing will have been skimmed."

## Fish and Fishing.

### The Genesis of the Ouananiche.

I MET a very intelligent party of American anglers the other day, who wanted to know from me all about the landlocking of the ouananiche in Lake St. John. The guides had assured them that the fish were actually landlocked salmon, but that was all that they could tell them about their origin, and the fishermen naturally wanted to know how they could possibly be landlocked in water that communicated as closely with the ocean as the majority of our inland salmon rivers do. In the course of our talk on the subject the promise was exacted from me that I would refer to this matter in an early number of FOREST AND STREAM. I do so the more readily that I am constantly finding fresh evidences of widespread error concerning the origin of the fish.

There is a pretty fiction of poetic fancy that the fighting ouananiche is the begotten of the salmon of the sea—the progeny of a superior and more highly developed form of organic life, and that for the mere love of a purer and sweeter home, it has renounced the fleshpots of the briny deep upon which its forefathers thrived and fattened from generation to generation, content itself to suffer physical deterioration and a deprivation of ease and comfort, for a life of constant struggle and heroic endeavor amid the sterner surroundings of a constant fresh water habitat.

Another conception of the life history of this doughty warrior robs it of the glory of a voluntary exile from the salt water home and feeding grounds of its supposed progenitors, and attributes the continuity of its life in fresh water to causes entirely beyond its control. Hence, the theory of landlocking, promulgated by hasty and careless observers, and the contention that this fish has been shut out from the sea by some mighty upheaval of nature, until it has completely lost the habit of anadromy.

These romantic suppositions of the genesis of the ouananiche, which traverse the actual facts and mistake for a comparatively modern development of *Salmo salar*, that which is really its ancestral stock, are disproved alike by the revelations of paleontology and of modern geographical research.

It is exceedingly difficult to conceive how the serious investigator can really arrive at any other conclusion than that the ouananiche is the progenitor of the lordly salmon, and not, as is so often contended, its wayward child.

Its age is uncertain, though it is doubtless older, by an eon or two, than the salmon of the sea, by which it is so often and so erroneously supposed to have been begotten.

The lower or purely marine genera of the salmones were ushered into existence, together with other cycloids, in the cretaceous period contemporary with the deposit of organic remains in chalk formations; existing fossils of these forms settling their geologic time beyond any question of doubt. These first salmonoids made their appearance myriads of ages before the time of the haddock and the cod, and of even the earliest varieties of the Gadidae—the food fishes which now throng the Atlantic coast of North America. The fresh water salmonidae, on the other hand, which, as hereafter shown, necessarily includes our *Salmo salar*, could neither have been created nor evolved very long before the appearance of man upon the earth, since none of their remains have been found in any of the fossils, not even among those of the post-tertiary or most recently formed rocks. They came into existence subsequently to the great glacial or pleistocene period of the world's history, for a cold salt sea, similar to that which to-day washes the base of Greenland's icy mountains, covered, at that time, all but the most elevated portions of the country now drained by the St. Lawrence, and it is a well known fact that in fresh water only are the salmon, the ouananiche, and the other more aristocratic of the salmones inhabiting the Atlantic slope of the North American temperate zone, capable of reproducing their kind.

### Pinnacled Aristocrats.

These salmonoids—which had not attained their culminating point until the human period—represent the highest development of fish life. As corporeal man among the mammals, so are they among the fishes—the most strenuous of strugglers and most ambitious of rivals, whether in love or in war; keen of perception and fertile of resource—dexterous and cunning, animated by an undaunted determination to overcome every obstacle in the battle of life, and constituting the highest types, each in his own sphere, of physical perfection and beauty.

The *Salmo salar* was originally a purely fresh water fish, whose anadromy is a comparatively modern acquisition, is in harmony with the best modern ichthyological research. Mr. J. W. Willis Bund, chairman of the Severn Fishery Board, discredits the belief that the salmon is a sea fish, and that it only resorts to the fresh water to spawn, and points out in support of his theory that other migratory fish which live in the sea and ascend to the fresh water to breed are totally different in their habits from the salmon, in that they run up the rivers, breed at once and then return to the salt water. The most notable of these are the shad and the lamprey, which only remain for a period of three weeks or a month in fresh water before spawning and returning to the sea.

Prof. G. Brown Goode also inclined to the view that the natural habitat of the salmon is in the fresh water, and in support of it referred to the well known case of

the Stormontfield Ponds in Scotland, where salmon have thrived for years in the lakes in which they have been confined. The salmon of Lake Ontario, which were quite plentiful in the big inland sea and in most of its tributaries in the first half of the last century, doubtless remained there all the year round, as the ouananiche does in Lake St. John, and there is nothing to indicate that any of its progenitors had ever known a salt water habitat, or that after enjoying such a luxury, as the increased food supply of the sea would have there afforded them, they would later have contented themselves with a self-imposed exile in fresh water.

Prof. Samuel Garman, of the Museum of Comparative Zoology at Cambridge, Mass., sees nothing by which to distinguish the ouananiche from the salmon of the sea, and takes the fresh water individuals to be the better representatives of the species *Salmo salar*, thus grouping himself with those who regard the Atlantic salmon as originally but a fresh water fish, that has acquired the habit of wandering from the crystal Eden in which it was created, into the salt wilderness of the sea, for the purpose of indulging its voracious appetite upon the more abundant food supply there awaiting it.

Those specimens of the original type which have remained in their early fresh water homes are the ouananiche or so-called landlocks. Their habitat is by no means so limited as was originally supposed. They are not only found in Lake St. John and its tributary waters and in several of the lakes of Maine, but also in Newfoundland, in Norway and Sweden and in several of the rivers and lakes of the Labrador coast. In very few of these waters are they absolutely landlocked.

### The Swedish Landlocks.

Lake Werner, in Sweden, affords one of the exceptions to the rule. The river by which its surplus waters find their way to the ocean has a waterfall quite impassable for any salmon from the sea. Mr. Samuel Wilmot, who saw some of the landlocks from this lake at the International Fisheries Exhibition in London in 1883, described them as "beautiful, bright, symmetrically formed salmon, ranging from 8 to 16 pounds, and identical in every particular with the Lake Ontario salmon of former years, with which," he continues, "I have been familiar during the last sixty years, and great numbers of which I have taken with net and spear from a stream running through my own property, up which they came from Lake Ontario in the autumn months for the purpose of spawning; this Ontario salmon being the winnische of Lake St. John, Province of Quebec, and of the Schoodic lakes in Maine."

The contention of some writers that the progenitors of Lake St. John's ouananiche were imprisoned above an impassable barrier at Chicoutimi by some upheaval of nature which prevented their return to salt water and transformed them from salmon of the sea into ouananiche, is now virtually abandoned. The most casual examination of the waterway from Lake St. John to the sea proves the utter absurdity of such a proposition.

Equally ridiculous is the assertion that the original ouananiche were enterprising emigrants from a former salt water environment, and voluntary settlers amid new surroundings—in other words, a colony of salmon from the sea, which, having ascended to fresh water and become satisfied with its depth and with the abundance of its food supply, concluded to secede from its oceanic domain, and remaining in its new and congenial environment, founded there a kingdom of its own. The refutation of this theory is furnished by the discovery of the ouananiche, both in Newfoundland and in Labrador, in fresh waters to which it could not possibly have ascended from the sea. As already shown, it had not yet sprung into existence when the geographical distribution of many other species of fish was so largely facilitated by the existence of the cold salt sea which overspread the greater part of the Atlantic slope of what is now the Dominion of Canada, and in any case it could not have reproduced its kind under the then existing conditions, since its spawn does not survive exposure to salt water.

There is therefore no other manner of accounting for the presence of the ouananiche in so many wild waters to which it could never have ascended from the ocean, than to accept the explanation to which all modern scientific investigation of the matter points, namely that the specimens found above the great falls of the Hamilton River and in other fresh water lakes and rivers of considerable elevation above the level of the sea, are not immigrants or settlers from the salt water, but the natural inhabitants of the home of their earliest ancestors; while the emigrant is the salmon of the sea, who, when in salt water, is but a stranger and a sojourner as all his fathers were while there.

### A Large Maskinonge.

One of the largest maskinongé caught in Lake Deschenes, near Ottawa, in many a day, was recently killed by George Loveday. The fish measured four feet four and a half inches long and weighed 25 pounds.

E. T. D. CHAMBERS.

### Japanese Fisheries.

IN a note regarding the promotion of fishery trade between the United States and Japan, Hugh M. Smith, Deputy Fish Commissioner, writes:

"The consumption of water products in Japan is enormous. Fish is not only the staple animal food in all parts of the empire, but is the only animal food that enters into the dietary of a very large proportion of the population. In no other country are so many persons engaged in fishing. In a total population of 50,000,000, 3,000,000 people are engaged in this industry, and fully 10,000,000 men, women and children are directly dependent on it. A large part of the catch is sold fresh, but considerable quantities of certain species are smoked, dried, salted, canned or otherwise prepared. No ice is employed in the preservation of fish. This, however, is not serious, as the prosecution of fishing on all parts of the coast, the long coast line, the shape of the islands, and the transportation facilities permit nearly the entire population to receive daily supplies of fresh fish in good condition."

## Striped Bass at Octoraro.

ABOUT ten years ago it became suddenly noised throughout New York and Pennsylvania that there was superb striped bass fishing at Octoraro, Md., and anglers rushed thither to find the most enthusiastic reports more than fulfilled. Curiously enough, a few anglers had known of the striped bass fishing at this point for many years and made no secret of the locality, one of them, the late Andrew M. Spangler, going so far as to publish the place in his little book entitled "Nearby Angling." It remained for a New York sporting goods dealer to visit Octoraro and give it notoriety, and at the same time afford him an opportunity of advertising his really excellent blood worms. Until Mr. Dirckes first trolled his blood worms through the great swifts in the Susquehanna, the approved methods of catching striped bass were eel tail or shedder crabs, but eel tail, while it caught the largest fish, is not satisfying to the man who fishes for numbers, or, indeed, to the man who rows the boat for the fisherman, because he has to row with just double the speed, and shedder crabs caught neither numbers nor large fish certainly. Within two months after the anglers of New York city, Philadelphia and Baltimore discovered what a paradise for striped bass fishing there was at Octoraro, the place was crowded daily, and on Saturdays sometimes as many as twelve and fourteen boats would be working one of the three great pools at the same time, pools which would only comfortably hold four or five boats and in which one, a few months previously, was rare.

On the right bank of the river in Harford county, a comfortable little frame farm house nestles among great maple trees. It is occupied by a Mrs. Caldwell, and she, noting the influx of anglers, took some of them in. As her house is not very large, to the joy of the high class angler, at the outset, she refused to accept guests unless they were recommended by some of her patrons, or could successfully pass the ordeal of an examination at the hands of one of her brothers. But the guest once taken in, finds nothing to regret. There is a bountiful store of perfectly fresh food, exquisitely cooked, there are nice rooms, clean sheets, no mosquitoes, and what is just as important as anything else, Ella, a negro waiting maid whom Mrs. Caldwell has brought up from childhood, as a waitress. To insure accommodations, it is always necessary to write to Mrs. Caldwell to her address, Shure's Landing, Harford County, Md., at least one week before going. On the other side of the river, in Cecil county, there is a house for the accommodation of anglers, kept by a skilled fisherman named Fred Irwin. The surrounding country may be described as a miniature Switzerland. There are gorges, tumbling streams, winding roads, quaint little houses on the hillsides, and a general air of grandness and picturesqueness.

The three great fishing pools are known variously as the Stop Locks, the Dutchman's Pool and Mark Rock. There, when the water is not too high or too muddy and in the right season, are to be found thousands upon thousands of striped bass weighing from 1½ to more than 20 pounds each. The average fish which are caught run from 2½ to 5 pounds, although if it be a lucky day, nearly every boat will have at least one 12 or 15-pounder to show. As far as I know, the heaviest fish caught at Octoraro weighed 27½ pounds.

Mark Rock pool begins at the foot of one of the many dangerous Susquehanna falls and is the largest of the group. The water runs through the middle of the pool at the rate of six or seven miles an hour, and is said to be from ten to fifteen feet deep. The second or Dutchman's Pool is practically a continuation of Mark Rock Pool, being separated from it only by a short shoal of less than 200 feet. It is the deepest of the three pools and is only fishable when the waters in Mark Rock and Stop Lock are too low, and when, by excessive fishing in the upper and lower, the striped bass have been driven to the Dutchman's. It is directly opposite Mrs. Caldwell's house and received its name in the following manner. About two weeks after the New York sporting goods dealer announced the place, a foreign gentleman residing in Delaware went thither fishing, carrying with him a rod strong enough and stout enough to lift a porpoise, and a line which would have held a man-eating shark. Fishing was poor in both Stop Lock and Mark Rock on that day, and everyone said the pool opposite Mrs. Caldwell's was no good for fish at any time. It happened in the afternoon on rowing in to the house that the foreign gentleman, who publicly avowed himself to be a Dutchman, caught a 3½-pound striped bass. The next morning, on coming in to breakfast he repeated the performance, and at noon he did the same thing. Whereupon, despite laughter on the part of all the anglers and the boatmen and the protest of his own guide, he declared his intention of fishing the pool after dinner. He did, all the other fishermen going elsewhere. Within a couple of hours the half-sleepy anglers in the other pools heard a terrific shout, and seeking the cause, they found the foreign gentleman struggling with a huge striped bass. He was winding the reel with all his strength and the rod, stiff as it was, was bent nearly double. He shouted to the anglers who crowded up, "I cannot turn the reel!" In fact, the fish was pulling one way and he the other. Something had to give way, and as the line and the man were the stronger, the fish suddenly came out of the water with a leap and was promptly netted in the foreign gentleman's boat. The fish weighed 18 pounds. Everyone went fishing in the pool that afternoon and everyone caught large numbers of fish, and the pool, which afterward became a favorite, was thereafter known as the Dutchman's Pool.

The method employed for catching striped bass in the Susquehanna River at Octoraro is by means of trolling. A short rod, just stiff enough not to bend too much with the weight of the long line and sinkers, etc., is the best, a rod, say, weighing from seven to nine ounces. Under no circumstances take a sea-casting rod, as the angler will be deprived of one-half his sport. The reel should be a multiplier and should contain at least 100 yards of line. While not necessary, a three-foot double-gut leader is desirable, and the line should be of some dark color, green or brown. A white line should never be used. To the end of the line is attached one or two trolling spoons from which the three-pronged hooks have been removed, and to the lower one, if two spoons are used, should be attached one or two single hooks, any size from 4-0 to

## The Log of a Sea Angler.

BY CHARLES FREDERICK HOLDER.

Among the California Channel Islands—Camp at San Clemente—Fine Fishing—Ancient Inhabitants—Whitelish on the Rod—The Sheepshead.

AMONG the islands strung along the coast of Southern California, a chalice of emeralds in settings of azure, the sea angler finds a new field for strenuous and manly sport with the rod. They are isles of summer, bathed in the seas of eternal spring, and in their peculiar climate lies the secret of their many attractions.

The islands, beginning with the Coronados, the "Desert Isles" of Vizcaino, and including San Clemente, Santa Catalina, San Nicolas, Santa Cruz, Santa Rosa, San Miguel and Anacapa, lie parallel to the coast in a general way, and are from eighteen to eighty miles from it. They are the peaks of an off shore coast range, submerged and separated from the shore by deep and abysmal cañons, and from the land appear like great sea monsters crouching on the surface of the sea of Balboa. They are all swept by the Black Current of Japan, or Kuro Sivo, the Asiatic gulf stream, which flows up the coast of Asia from the tropics, crosses to America, and sweeping down the American coast bears perennial summer upon its crest.

The result, so far as the islands are concerned, is to produce a winter of verdure, the moderate rains of fifteen or twenty miles giving them green slopes, flowers, and a climate something like that of Madeira without its heat.

In the summer come cool and constant winds from the west, giving the angler cool and delightful weather in a land where the palm and other tropical and semi-tropical trees characterize the landscape. We have, then, cool summers, and mild, soft winters, without even frost, which, combined with smooth water on the lee of the island mountains, produces one of the most delightful fishing grounds I have ever found.

It was in 1885 that I first landed at Santa Catalina, and when I saw men landing fishes weighing from twenty to thirty pounds from the beach, fishes which broke big cod lines as though in sport or play; and were played by strong and lusty men ten or fifteen minutes on hand lines before they were landed, I came to the conclusion that I had discovered a sea angler's paradise, and forthwith sent for my rod which, I believe, was the first to bend in these quiet and sequestered waters.

The coast of California is remarkable for its lack of bays, coves or harbors. From San Francisco to San Diego the real harbors number but two—Monterez and San Pedro—and the latter is partly artificial. The coast line in the main is swept by the sea, which piles in upon long sandy beaches, with rocky points here and there, and few if any coves similar to those on the Atlantic seaboard, and as a result, the large game fishes do not frequent the mainland shores in great numbers but are found out in the channel or at the islands, which are the natural feeding and spawning grounds for a series of fishes remarkable for their size, numbers and game qualities.

The islands, which range from twenty miles in length to seven in width, lie parallel to the mainland shore, the north end of Santa Catalina being but eighteen miles from land. San Clemente is about forty miles off shore, and the Santa Barbara Islands about twenty. They form a shelter from the prevailing west wind, and the cañons, which wind down their mountains like rivers of verdure, end in little bays and coves, where the angler might well imagine himself on some inland stream far from the ocean.

Nearly all the islands are private property and permission must be obtained to land, Santa Catalina being the only one having accommodations for visitors, a town and regular steamers every day.

There are few places on the globe where a skipper can guarantee that during a cruise to last from the first of June to the first of October, there will not be a gale, storm or squall of any kind; not even thunder or lightning or a shower of rain, yet this guarantee was offered us as we left San Pedro one June morning for Avalon, thirty miles down the Santa Catalina channel. Our vessel was a fine 70-ton sail and power schooner yacht, trim, fast and seaworthy; and we ran down to Avalon Bay, a miniature bay of Naples, in three hours and anchored off the dock, facing Grand Cañon that almost cuts the island in two here. The bay was a picture with its fleet of launches and yachts, while the little town seemed to reach away up the slopes of the picturesque mountains, the summits of which were lost in the blue haze.

The name Avalon has a romantic association with King Arthur, and the American Avalon is quite as romantic and beautiful, being a perfect half-moon beach, environed by mountains and rocky cliffs. The water is as smooth as glass, and as clear as crystal, while its turquoise blue renders it an object of great beauty when contrasted with the green slopes of winter and early spring. We took our equipment aboard at Avalon—camping outfit and three boatmen and their boats, which were strung out astern and towed. That night we turned in having given instructions to sail at four, and when we came on deck the next morning Santa Catalina was far astern like a great whale on the surface, and San Clemente loomed up ahead on the summer sea. We made the island by 7 o'clock and ran down the east coast, anchoring in Gallagher's Cove, the island having no harbor of any kind. The coast was rocky, lofty cliffs rising all around the south end, and a bed of kelp forming a protecting belt about it.

The tents in the boats were taken ashore by the men and raised on a little plateau hardby the landing, and as no rain was expected, it was an easy matter. In fact, it was a queer camp—no rains, no storms, no mosquitoes, no black flies, nor "punkies," nothing but fleas, which were there, though I did not see them. It was really too good to last, and the old campaigners of the party could not but believe that there was something to be sprung on them at the last moment. The tents were open, the long table without shelter (California fashion), and at night a fine log fire took off the

chill and reminded the campers of the Adirondack smudge they all knew and loved.

While the men were making camp I strolled along the rocky cliffs, no easy matter just there, as they were precipitous, and covered with cactus into which one would roll if a slip were made; yet there were innumerable goat trails which terraced the steepest places and led along shore. A turn around a rocky point and one might have been ten thousand miles from civilization. High cliffs of brilliant colors—the deep blue of the ocean—the sharp olive hue of the kelp beds, the flash or glint of the golden perch below, the cry of the sea eagle, all combined to lend a peculiar romance or atmosphere to the scene and place.

The cliffs rapidly dropped as I made my way north, and in a short time came to a sandy waste of dunes which the wind had tossed into remarkable shapes and over which innumerable sand rivers were running, carving the sand into strange yet beautiful slopes.

Strewn over this sand desert were evidences of human occupation—shells (*haliotis*), burnt wood, bits of quartz, flint chips, black earth telling of *Ketchin evidens*, and here and there a human bone projecting from the sand. Here the island had once been separated and the intervening channel filled with sand, forming a dazzling white isthmus.

Crossing it I found the west side forty or fifty feet above the shore, covered with sand—a singular phenomenon, as there were no sandy beaches at this point, the shore being rock that breasted the sea with a bold front. The sand was covered with a crust-like snow over which were sprinkled thousands of white bleached snail shells that crunched as I walked along. The dunes gradually rose, and it soon became evident that what had been cañons had been filled with sand that had flowed like a river upward from the sea, so that the cañons appeared to be glaciers flowing down from the island hills and mountains.

This vast sand glacier had been occupied by the ancients perhaps thousands of years ago. Everywhere the evidences of human occupation appeared—shells, stones, implements and occasionally huge stone mortars, but all broken and scattered about in reckless confusion. Strolling along, now one hundred feet above the sea, I suddenly came upon a vast pit in the pure white sand. It must have been one hundred or more feet deep, its sides perfectly smooth and at an angle of about fifty degrees.

At the bottom was a single tree—suggestive of the verdure that had once filled the cañon, now blasted—and buried deep beneath the sand glacier. Some strange caprice of the wind had scooped out this pit, which I could only compare to the trap of an ant lion. The gleaming sides—perfectly smooth—presented an alluring jump, and in a sudden reversion to youth I drew back and in a running jump sprang from the edge going thirty feet through the air, striking the soft side of the sand cone and sliding quickly to the bottom in a miniature avalanche. After an arduous climb I reached the surface again, assuring myself that I had no spectators.

So perfect was this pit, so mathematically correct, that it was hard to believe that it was not the work of man, yet the sculptor was the wind of San Clemente.

This sand plateau was literally dotted with evidences of ancient human occupation and presented a fascinating field for investigation, being in reality a graveyard and battleground of the unknown people who once lived here.

Leaving it with reluctance I made a cut across the island hills through manzanita and cactus and crossing the divide saw the camp below me and soon reached it, finding the party at dinner in the open air.

We discussed the original inhabitant, proposed his health and a better acquaintance, and sat about the drift-wood fire late that night listening to the stories of Mexican Joe and other boatmen. Joe was the oldest inhabitant of Santa Catalina, his ancestors were Spanish on the one hand of the Conquistadore stock and Aztec on the other, all of which gave a strong face and an interesting personality.

The sun routed us out in the morning, it seemed nearer at San Clemente, and rose out of a deep red cloud so suddenly that day seemed to come at once, but it was never hot. Over to the east the huge California desert was heating air like a caldron; this rose forming a vacuum and the air all along the coast flowed in there to fill it, creating a constant inshore wind that never failed during the day all summer.

Here human nature and its vagaries asserted itself. Paring onions and potatoes under ordinary circumstances is not an agreeable or exciting pastime, yet these anglers begged from Joe and the other cooks this privilege, and that the breakfast tasted better who shall deny. And as the perfume of that bacon filled the air and the sizzle of potato chips broke the stillness, there was joy indeed. We had routed out the professionals for one morning just to show what we could do, and set a pace we fancied that was hard to keep up. Wild goat chops smothered in onions, fried smelt, cakes, eggs and coffee was the menu, after which we pulled out to the yacht and remembered that we were anglers, not campers. The kelp bed was at least fifty feet wide here, its big broad leaves lying partly on the surface like huge snakes, and just outside of this the yacht swung, and away astern Mexican Joe had discovered a school of fishes, some of which must have weighed 10 or 15 pounds, if guessing counted for anything at San Clemente.

We had what is known as yellow-tail tackle, rods about the weight and size used for striped bass in the East. My rod was longer and lighter than the average.

I had one butt and three sizes of tips in lengths and weights, and for the game in hand I rigged a rod eight feet in length, the tip being pliable and slender, yet sufficiently powerful to lift a 15-pound fish should it have a fit of sulks.

I used a 4-0 O'Shaughnessy hook, with a short wire leader or snell, a No. 16 cuttyhunk line and a Vom Hofe reel that would hold at least 200 feet when wet. We had brought a supply of smelt and sardine bait from Avalon; as it was almost impossible to catch bait at San Clemente, and this small fry was the lure for almost all kinds of game in these waters; but when Mexican Joe saw the fishes astern he shouted for crawfish and pronounced the game "whitefishes."

By tossing over the crawfish shells he soon had these attractive fishes within twenty or thirty feet of the stern where we could see them plainly and mark their many

7-0 will do. The best hook of all to use is the O'Shaughnessy. The lead, which must be heavy enough to sink the spoon nearly to the bottom when the boat is in motion, should be attached to the line about two or three feet above the spoon. As already intimated, the blood worm is the best bait for large and general catching. If two hooks are employed, three or four worms are used, and they are looped from one hook to another, so as to form a wriggling bunch. The boatman will probably put them on the hooks much better than the angler, so he had better be allowed to do the job.

If the fishing is good, it will probably require about 100 blood worms for one day's fishing, and these worms can be secured from sporting goods dealers in New York, Philadelphia or Baltimore. The angler sits in a chair in the stern of the boat and pays out from seventy to seventy-five feet of line, while the boatman zig-zags slowly up the pool and through the "swifts." Unless the bottom is struck every now and then the sinker is not heavy enough, for the striped bass lies among the great rocks at the bottom of the pool. When the top of the pool is reached the boat is turned and goes spinning down through the swifts at the rate of six or seven miles an hour. When a striped bass strikes he does so with an earnestness which indicates that he had fully made up his mind what to do, and the moment the hook is driven into his jaw the fish turns and makes for the Chesapeake Bay at the greatest speed he is capable of. If he be a good-sized specimen he will take out anywhere from fifty to seventy-five yards before he can be turned, and in this connection it is advisable that every angler wear a thumb stall lest the skin on his thumb part company, while he is trying to put pressure on the spool. The angler should be cautioned when at length he can take hold of the handle of the reel to do so with the thumb and forefinger only, because after the fish has once been turned and he is being drawn toward the boat he may suddenly take it into his head to object, in which case, if the fisherman has the handle in the ordinary manner, he may receive a bruised or even a broken finger from the sudden jerk at the second run of the fish.

The fight of a good-sized striped bass will last from five to twenty-five minutes, according to his weight, the water temperature and the part of the pool in which the fish happens to be. The striped bass, when he gives up, does so suddenly and can then be drawn to the net like a wet rag. Apparently he has only three tricks in fighting, and these are the most moss covered used by the black bass. He has a way of shaking his head, and sometimes when the line is close to the boat, of turning on end and trying to strike the line with his tail and so tearing the hook loose. Sometimes he comes to the surface and breaks water without leaping and so tries to free himself of the hook on the slack line. When the fish is first hooked the boatman paddles his boat to the nearest bit of back water, where it can rest quietly while the fish is being played. When the fish are running properly, a day's fishing will yield from twenty-five to fifty. Anglers from New York and Philadelphia will arrive at Octoraro at 5 o'clock in the evening and be taken by the boatman to the fishing grounds and to supper when night falls.

It is not only necessary to secure accommodations a week ahead but it is also necessary to secure the boatman at the same time. Either Mrs. Caldwell or Mr. Irwin will secure boatmen at the request of anglers. As the duties of a boatman are rather severe, he charges \$4 a day for his work.

There is also good striped bass fishing at Conowingo, about six miles above Octoraro, and also at Bald Friars, which is within the Pennsylvania line.

Passengers from New York or Philadelphia must necessarily take the Pennsylvania Railroad to Perryville on the P., W. & B. branch, and there take the Port Deposit branch on the Pennsylvania Railroad. The Pennsylvania train arrives at Peddyville about 4 o'clock in the afternoon and the Port Deposit train leaves about ten or fifteen minutes later.

It is fortunate that an angler may catch striped bass at Octoraro to his heart's content when they are running freely, without much danger of his being denominated a "hog" fisherman, for his boatman will gladly receive as a gift all the surplus fish and can readily dispose of them in the market of Baltimore.

W. E. MEEHAN.

### An Indian Fish Story.

MR. FRED SWINDLEHURST, in the Journal of American Folk-Lore, tells a number of stories which he heard under singular circumstances among the Cree Indians on the shores of James Bay, near the mouth of Pontiac's Creek. A group of these Indians were seated about a blazing camp-fire, silent and moody, enjoying their evening smoke. It was a cold and dark night in autumn. Suddenly one of the men began to relate a story. At first his voice was low and agreeable, but when he came to adventures of war his tones rose and his gestures grew violent. The audience listened to his tales with no sign of incredulity, and occasionally grunted approval. It seems that these stories are told only in the autumn, and that it is supposed to bring bad luck if they are told at any other season. Apparently the proverbial fish story is common to the whole *genus humanum*. We quote Mr. Swindlehurst's record of "A Big Perch" story with his comment:

"Some Indian hunters were camped along the shores of Lake Mistassini. As fish and game were plentiful they were happy and contented. One evening they missed one of their number, and though they searched everywhere could not find him. They had many days given him up or dead, when he surprised them by calmly walking into camp. On their asking him where he had been he told the following story:

"That night you lost me I was at the bottom of the lake, where I saw all kinds of fish, some pretty, some ugly, and some savage. There was one perch so large that he could not turn around in the lake, but had to wim up and down without turning."

The above story has been handed down from father to son, and even to-day Indians refer to the "big perch" just as seriously as if it really existed. Lake Mistassini is 120 miles long and twenty miles wide, so the legend of eclipses the white man's story of the sea serpent.—New York Evening Post.

beauties and charms of color. It was only necessary to unreel the line, the strong current carried it out with the "chum" and then "Zee! Zee! Zee!" the cry of the stricken reel rose on the air.

It is not always true that the largest bait takes the largest fish, but I had baited with the quarter-tail of a crawfish and hooked the king of the whitefishes. It played entirely on the surface, after the fashion of a bonito, or, as a bonito should, swinging out into deep water in a long, splendid resonant rush to the music of the reel, then came dashing back faster than I could reel, cutting the blue water, now tossing it high in the air, trying to reach its home in the kelp bed from which I turned it with great good luck.

This fish was a delight-giver in every sense of the word, and it required all the finesse I could muster to save the line and day. Soon it came alongside, sheering off, displaying all its charms—a radiant and beautiful fish—as Joe lifted it in. Three rods were screaming and few sea anglers have had better sport; and, doubtless, few have even seen this fine game fish that Mexican Joe now held up.

"Mucho bueno, blanquillo!" he cried.

"Caulotatilus," said our scientific angler.

A beautiful creature it was, the principal tint was the most delicate olive, its long dorsal fin, a most sensitive organ, tinted with blue, the other fins blue and yellow or old gold.

It was so richly yet modestly colored that I will not attempt a description, but the impression was of a flash of olive with dashes of blue, orange and pink, a splendid eye rich in color and very expressive.

The head was large, rising in an arch, a fine fish from any point of view or standard. It was a case of fisherman's luck. We had found one of those rare and happy fishing grounds where there is no waiting, where the fishes were impatient to be caught; the bait being seized so near the yacht that we could see the entire play. We caught these big fellows until the tide turned, when they stopped biting. Then we took the catch ashore and divided with the herders—a Robinson Crusoe outfit—that lived or existed in the island, hermits and exiles, yet happy and contented.

The whitefish is one of the common forms of the islands, found on rocky bottoms and where the kelp is thick, and in all sizes from a pound up to fifteen, is a game fish.

I caught one-pounders with an eight-ounce split bamboo rod and fancied I had all the sport a small trout afforded, and as they ranged up to fifteen pounds, one had a wide range of sport with the rod.

While casting into the Blanquillos astern I caught an occasional glimpse of a large fish darting about resembling an amberjack; indeed it was the Pacific amberjack, the amber fish or yellow-tail, *Seriola dorsalis*.

"You never fool him with a pole," said Mexican Joe, laughing at the absurdity of the idea sank into his mind.

"He is the strongest fish for his size that swims. I see one pull a boy off the beach with a hand line." And as we sat around the drift-wood fire that night Joe and the rest told of the wonders of the yellow-tail, and it deserved all their encomiums.

I did not take the old-timer's advice but rigged my rod with a slightly heavier tip baited with a four-inch smelt, and the next morning had him row me up and down the kelp bed near the shore.

Mexican Joe had planned to enjoy himself, and as he lighted one of my cigars and picked up the oars I could see that he was prepared to regale himself with my undoing.

Down the line we went over as fair a trolling ground as one could wish; the deep olive hue of the kelp on one side and above the brown rocks and cliffs climbing into the sky and casting deep shadows; on the other the rich blue of the ocean as smooth as a mirror.

Joe pulled slowly and carefully, casting his eyes to right and left in search of game, while I watched the deep blue of the water, filled with fairy-like shapes of tully fishes and other forms. I thought I saw something big pass, then Joe stopped rowing and—the rod was nearly jerked from my hands. I make the confession boldly, as I saw the trick played later upon an angler. Zee-zee-zee-zee rose on the air, a blaze of sounds suggestive of flying brass filings somewhere within the mechanism of the rod.

I confess to a dazed sensation, but I console myself as I saw a man—able-bodied and lusty—pulled bodily from a high wharf by just such a fish, and after twenty years of yellow-tail fishing I present my compliments to this fish, which for its size has no equal in the sea for hard fighting and staying qualities.

My fish made a dozen or more of tornado-like plunges, each one of which was a nerve tester and which carried it down 250 feet into the blue Kuro Siwo, then it rose with a strange rhythmic tremor coming up the line, and made for the outer sea. In a light boat we might have been towed off shore, but Joe kept the stern to the game and rowed against it while I played it with all my strength, yet I did not bring this gallant fish to gaff for thirty minutes.

It came up to the surface in great bounds; shot around the boat like a trained ringster, plunged down into the deep channel again where it sulked like a salmon, to be pumped up by heart-breaking effort. Slowly it came up, protesting every foot, every inch, repeating its maneuvers time and time again.

I pumped, reeled, played my weary thumb upon the leather pad brake; I gave it the butt until the good rod creaked and threatened to buckle; and gradually the impression gained that this splendid amber fish, this yellow-tail of San Clemente, was playing me.

When it finally came to gaff it encircled the boat several times, it dodged the gaff like a trained trickster, tossing spray full in my face, rejecting all overtures leading to a surrender, but the big reel was merciless and slowly it came in and was gaffed by Joe, who held it up that I might feast my eyes on its beauties and then—tell it not in Gath—let what Mexican Joe said be buried in deep oblivion; then, in the very moment of triumph, the unexpected happened, as it always has. The yellow-tail, by a remarkable convulsion, threw out the hook and incidentally itself overboard. Truly, this is a vale of tears.

Joe, in an heroic attempt to heal my wounds, said that it weighed only 15 pounds, and for once I believe a boat-

man played me false—underestimated the weight of a fish, as if that yellow-tail did not weigh 50 pounds I am a poor guesser. I am no pessimist; I rejoice in its escape, and my trust that the same fish may attach itself to some fresh tenderfoot along the Santa Catalina channel.

I hardly know what to compare the yellow-tail to. The next one gave me quite as much trouble but I landed it in twenty minutes' hard fighting. Comparisons are odious, but the yellow-tail is the bluefish of California though a stronger and a far better fighter than the splendid bluecoat that breaks lines and hooks for a living along the south New England coast. The yellow-tail is the fish of the people, all else may fail; winds may blow or give out, tides may be at the flood or ebb, every impossible condition may hold; it may be Friday on the 13th of the month, you may have left your horse chestnut or rabbit foot at home, but the yellow-tail is biting; it is omnipresent and irresistible.

It seemed to me a sort of mortal sin to kill so beautiful a fish. So we fished and let them go, and as I often hooked the same fish twice and have seen the same one hooked three times in an hour, one's conscience may rest easy, as doubtless the yellow-tails were fishing and hunting for men and anglers that very day and reported a big bag.

The California yellow-tail is shaped like a bluefish but has a larger head in proportion to the body, a powerful jaw and a long, continuous dorsal fin, suggesting its specific name *dorsalis*.

The upper surface, the back, is green in the water, or perhaps an olive hue, but when the fish bursts from the water and comes in it is a splendid peacock blue; a dazzling creature. The fins are gold; a yellow stripe, telling of rank, extends from head to tail along the median line. The powerful tail is yellow or golden, belly silver of the newest mintage, and the eye—a splendid organ—a blaze of color. In brief, the fish is a type of power and aggressive activity.

It is an easy trick to take the yellow-tail in the open sea soon after it has arrived from the Cortez Banks, but the yellow-tail of the bay and dock at Avalon soon become educated, and only one with some skill and finesse can induce this cunning fish to take a hook. I have often met great schools of yellow-tails coming in from the Cortez Banks in April or May. They covered the water for acres and changed the deep blue to gold and green. Once on the ground they would break up and parade the blue waterways along the hanging gardens of these isles of summer. There was no hunting for game at San Clemente. We fished and the fishes came.

Among the hard-fighting fishes was the sheephead—a huge dome-faced fellow with vertical stripes, vivid red and black. Its head was a velvet jet black, its powerful lower jaw pure white, its eye a thing of beauty and expressive of the remarkable intelligence this fish possesses.

I first found this sturdy fish in a golden corner of the kelp forest with a guard of golden angel fishes poising in the arches and loops of the great leaves. I dropped my bait and saw the strike that was hard and a series of prolonged rushes; now out into the channel, then, when turned, coming in with a rush to try to involve itself in the maze of kelp and only coming to gaff after a hard and vigorous struggle. I took these fishes up to 18 pounds, and doubtless the old and large male fishes grow much larger. The females might have been taken for gray snappers, as they bore little or no resemblance to the big-jawed male. Some were a rich pink all over, some pure white, and the very young were beautiful little creatures having blue spots. The sheephead is one of the few fishes that can be tamed, and I have seen one that knew its keeper, came at his call, opened its mouth wide at the signal, and would poise by the side of the tank for its master to scratch its back. This fish rejoiced in the name of "Pat" and was kept for eight years in the Santa Catalina Island Zoological Station. It invariably changed its color when touched or caressed, becoming almost black where ordinarily it was gray. In confinement it completely lost the brilliant red stripes which characterized it in its native wilds, the kelpian forests. This fish was extremely jealous. It fought and killed every fish placed in a tank with it, but finally made friends with a green turtle after satisfying itself that it could not bite it. When the turtle was touched "Pat" would soon show that he did not like it, and he displayed several more or less human attributes.

At San Clemente honors were easy between fishing and exploring the sand dunes for evidences of the early inhabitants, and numerous expeditions were arranged to investigate the mystery that seemed to surround these people that had at one time covered the island with towns and villages.

I found one day on the dune a flat stone and beneath it several large haliotis shells containing beads. Mexican Joe was positive that this marked a grave, so he began to dig down into the pure sand, coming very soon upon a skeleton that had been buried in a sitting position, its head between its knees and lashed with seaweed rope. Over the body was a native flute, made from a deer's leg bone; behind it another, and in front still another. All were inlaid or decorated with mother of pearl fastened on with asphaltum. Doubtless the man was a flute-player of his tribe, a musician of fame, and his people had buried his choice weapons with him.

Not far from here Joe led us to a place he called the "battlefield," where dozens of skeletons and their parts were strewn about. Nearly all the skulls were fractured, violently, and many of the bones were broken, showing that a struggle of some kind had taken place here. Not far away we found the site of a town; the sand was black, charred and covered for a long distance with stone implements, mortars, pestles, grinding or mealing stones, but in almost every instance broken. Some of the bowls were of steatite and two or three feet high, others were of a volcanic rock weighing two hundred or more pounds. Some were ornamented with pearl and there were beads without number. It was very evident that several centuries ago a hardy race had lived here but had been swept away by some cause unknown.

The wind was playing havoc with these bones, uncovering them to-day to cover them again to-morrow. Not far from here we found caves in which were mummified dogs, the walls being covered with a tapestry made of seaweed.

"How is it," I asked of Mexican Joe, "that all these

stone implements are broken?"

"The reason is very evident," volunteered one of our party. "These people were evidently attacked by an invading force, driven away, and their household gods destroyed."

I looked at Joe for confirmation, but a grin broke over his good-natured face. "I don't know who drove them off or where they went, but as for the mortars, I smashed them myself and the rest of the sheep herders helped. We did it to pass away time."

This was a fact—articles which if collected and preserved could have been sold by these men for thousands of dollars. Men who were living on a desert island and receiving but \$10 a month had a fortune within their grasp and did not know it. Such is life in the wild and woolly West, and so much for lack of the archaeological appreciation along the Kuro Siwo.

But this should not be laid up against Mexican Joe—he was merely "built that way," and was, and is, one of the best guides and boatmen in this fair string of islands. We coasted the island, sailed around it, walked over its hills and mountains, fished its waters on all sides, and one bright morning made sail and bore away across the deep San Clemente channel for Santa Catalina that rose out of the haze—like some grim kraken—resting on the surfac of the summer sea.

### Mutations of the Silk Worm.

HOLDERNESS, N. H., Aug. 6.—*Editor Forest and Stream:* A queer statement, the meaning of which I should like to see explained, appears in the interesting paper of Mr. F. E. Eldred entitled "On Fishing Gut" in your issue of July 22.

The author, after showing the various transformations from the egg of the silk worm moth, round to the production of another moth, remarks: "It is curious to note that the animal never dies, only a series of metamorphoses goes on, by which, apparently, distinct forms of life are assumed."

I suppose it is only fair to assume that the author means that from the egg to the final appearance of the moth there is through all the changes continuity of life, but he doesn't say this, as indeed there would seem to be no occasion for doing, and what he does affirm seems to be something very different and very absurd, and to be unequivocally asserted.

C. H. AMES.

### A Fine String of Bass.

THERESA, N. Y., Aug. 11.—Yesterday guide Dave Tyler brought up from Red Lake sixteen black bass and five pickerel (lake pike), the catch of Dr. Glenn Coe, of Watertown, and his father, Dr. David Coe, of this village, who have been at Red Lake the past week.

The catch contained seven large and nine small-mouth bass, the largest of the large-mouth weighed 5¼ pounds, and five others weighed over 4 pounds. This is the second batch of fish they have sent up the past week. The first was composed of nine black bass and eight pickerel, which were distributed among their friends here.

Willis Purdy reported catching eight black bass in Red Lake on Wednesday.

J. L. DAVISON.

### An Appreciation.

AUG. 6.—Hail and greeting to you! I am here on the shores of Squam Lake trying to recover from what was within an ace of prostration by the heat during the Sheolic period we had a few weeks ago. I hope to get vigor enough presently to send you a few squibs, as prompted by good things in nearly every issue of FOREST AND STREAM, I have wanted to do for many a month. The paper gives me the best comfort I get in life—or nearly that—and I always bless you for continuing to send it to me. I'm where I can hear the loons "holler" at almost any hour of the day or night, and it is good for tired nerves.

C. H. AMES.

### Log of a Sea Angler.

OSHKOSH, Wis., Aug. 8.—*Editor Forest and Stream:* I want to tell you how much I have enjoyed the serial recently finished in your publication, "The Log of a Sea Angler," by C. F. Holder. I do not recall in years of reading a more peculiarly fascinating description of a trip through the waters covered by him. To a land lubber here on the inland waters his story comes with a whiff of the bracing salt air, making it doubly interesting and satisfactory. May you continue to publish writings of this most charming and gifted author.

LEWIS ATHERTON.

### New Jersey Fishing.

REPORTS from inland fishing resorts of northern New Jersey announce unusually good sport up to the present time. The fishing at Greenwood Lake is said to have been exceptionally good, and large catfish, wall-eyed pike, black bass and pickerel have been taken. It is said that on Saturday last one angler caught thirty pike-perch. Good fishing was reported last week from Lake Hopatcong, Tuxedo, Beaver Lake and a number of other points.

### It Will Interest Them.

To Each Reader:

If you find in the FOREST AND STREAM news or discussions of interest, your friends and acquaintances who are fond of out-door life will probably also enjoy reading it. If you think of any who would do so, and care to send them coin cards, which, when returned with a nominal sum, will entitle them to one short-time "trial trip," we shall be glad to send you, without cost, coin cards for such distribution, upon receiving from you a postal card request. Or, the following blank may be sent:

Forest and Stream Publishing Co.,  
346 Broadway, New York.

Please send me.....FOREST AND STREAM Coin Cards to distribute to friends.

## CHANGE SEAWANHAKA CUP CONDITIONS.

VICTORY in the recent Seawanhaka Cup races has brought to the Manchester Y. C. a famous trophy. With it has come a well defined responsibility—that of keeping in mind at all times the good of yachting, the motive which prompted the original gift of the Cup. While the trophy remained in the custody of the Canadians, circumstances led away from the possibility of making any change in the conditions, until sport, at first intended to be of the broadest international character, dwindled to mere class competition which few yachtsmen cared to enter.

Almost from the beginning contests for the Cup have been confined to boats of the so-called scow type, of which abnormally long overhangs, light draft and great breadth are the chief characteristics. An easily driven form which increases its length to a great degree at the least angle of heel is thus obtained, but at the sacrifice of all other features deemed necessary in a desirable type.

The scow owes its being to specific conditions rather than choice. It sprang from the cleverness of designers in discovering the possibilities of the restrictions governing competition for the trophy. The Deed of Gift drawn up by the Seawanhaka Corinthian Y. C. in 1895, provided for boats of not more than 25 nor less than 15ft. racing measurement, according to the method of rating then in vogue. That was the old rule, which until recently has stood for the best at hand. Rating measurement was obtained by adding to the load waterline length the square root of the sail area and dividing the sum by two. The weakness of this formula lay in the fact that the waterline was measured with the boat on an even keel, a condition existing only when at anchor or running free in smooth water. It did not take a wise man to discover that increased length, untaxed in any way, would result from drawn-out ends with a waterline kept as short as possible.

The Royal St. Lawrence Y. C. challenger Glencairn I., an extreme scow, came from the Dominion in 1896 and scored a victory in three straight races from the Seawanhaka defender, El Herie. In attempting to regain possession of the trophy in following years it was but natural that challengers should follow lines which had proven successful. The shoal waters of Lake St. Louis, where the cup contests were held, also demanded a boat of little draft. Victory in eight matches on home waters put the Canadians in the position of dictators regarding any change of trophy conditions. The scow was eminently suited to the waters on which their yachting was enjoyed, and thus the type remained to eventually become synonymous with the Seawanhaka Cup. The scow was gradually adopted by yachtsmen on other inland lakes and continues to grow in popularity. It has ceased to be a factor in Eastern yachting.

The past year has witnessed the realization of every yachtsman's dream—the adoption of a general rule of rating. The strong points in the new regulations have been suggested by flaws in the old. Displacement has been recognized as a factor of speed, and length is now approximately that at which a boat is heeled to her best work. Further legislation is planned during the coming year by which scantling restrictions will be determined. A meeting of yachtsmen from all countries to consider a universal rule of rating will take place in London before another season, and the time does not appear to be far distant when a boat may compete the world over with the same rating.

The trend of all yachting progress is in the direction of eliminating the freak and building up a fleet of the marketable and useful type. The boat which will always find a ready place in sport, wherever located, and which will lend its influence in arousing a love of the sea, is the one to be encouraged. Aside from inexpensive classes here and there for beginners, the scow has no place on open water courses. It has been made practically impossible for a boat of the type to compete with any degree of success under the new rule.

The same reasons which brought about the new rule of rating argue in as forceful a manner for a change in the conditions governing the Seawanhaka Cup. Any move which might bar from further competition the sportsmen who have so gallantly defended the trophy for nearly a decade would be regretted; nevertheless, even such a result being unavoidable, the general welfare of yachting is to be taken into consideration. The Seawanhaka Cup is the only trophy for international competition among small yachts in existence to-day. It was first offered as a means of benefiting yachting. Under present conditions its mission is but feebly accomplished, and the field of possible good limited to a small and selected area. An exact reversal of conditions would result were the new rule of

rating to replace the old in the Cup conditions. It is difficult to see how the club holding the trophy can do other than fall in with the line of progress.

Comparatively few small boats have been built this year under the new rule of rating. Those which have come into existence are of a desirable and speedy type, speaking volumes for the restrictions under which they were produced. The five 22-footers owned by members of Gravesend Bay clubs correspond as closely as any to the 25ft. class under the old Seawanhaka rule. They are from the boards of four different designers. The aim of each was to turn out the smartest possible craft under the required limit, and it is significant to note that competition as keen and close as that found in one-design classes has resulted. Reasonable cost and handy size, combined with the other qualities found in boats built under the new rule, make the 22-footers in every way suited to Seawanhaka Cup competition.

The so-called New York Y. C. monotype 30-footers which Herreshoff has sent forth this year to measure into the 27ft. class, are other examples of what the present rule of rating will produce. A boat of 30ft. waterline of good displacement and an excellent turn of speed in all conditions is found in the New York Y. C. "thirties." This size will undoubtedly find favor with yachtsmen desiring for cup competition a craft slightly larger than that found in the 22ft. class.

Under the present conditions governing the Seawanhaka Cup the helmsman and crew must be amateurs of good standing, a stipulation the merits of which become more and more apparent as time goes on. Should the Manchester Y. C., with the consent of the Seawanhaka Corinthians, donors of the trophy, change the Cup conditions so that competition would be open to boats built under the new rule in either the 22 or 27ft. class, and then throw open to representatives from any recognized yacht club the trials to select a defender, the action would certainly meet with popular approval and redound to the everlasting good of yachting.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

HENRY J. GIELOW'S NEW ORDERS.—There is now under course of construction at Robert Jacob's shipyard, City Island, a new cruising motorboat, for Mr. G. W. Lee, New York Y. C., from Mr. Henry J. Gielow's designs. She will be known as Dreamer II., and is an improvement over the Dreamer I., designed by Mr. Gielow for Mr. Lee last season, which boat is now called Sachem II., owned by Mr. F. T. Adams. Dreamer II. is 6ft. over all, 54ft. 8 in. waterline, 10ft. 9 in. breadth and 3ft. 6 in. draft. The motive power will consist of a Standard engine, capable of driving the boat 12 miles per hour. She will be ready for delivery this fall.

Another cruising launch is in course of construction at Jacob's yard for a prominent New York yachtsman from Mr. Gielow's designs. This boat is 58ft. over all, 10ft. 6 in. breadth and 3ft. 7 in. draft. There will be a turtleback deck forward, followed by low trunk cabin with port lights, aft of which is the steering deck. Another trunk similar to forward house will extend over the owner's stateroom, saloon, etc., followed by roomy cockpit. A 50 horsepower Standard engine will be installed, and a speed of 14 to 15 miles per hour is expected. This boat will also be ready for delivery this fall.

Contract for the building of a light draft auxiliary yawl for Mr. Julien T. Davies, Jr., has been awarded to Mr. Willard F. Downs, Bayshore, L. I. The principal dimensions are 55ft. over all, 38ft. waterline, 15ft. breadth and 2ft. 8 in. draft. The plans, which were prepared by Mr. Henry J. Gielow, show a very comfortable and roomy yacht, with large stateroom for owner, saloon, toilet, galley, etc. Delivery is called for on Oct. 15.

Plans and specifications have also been prepared by Mr. Henry J. Gielow for a cabin steam launch for Mr. A. Ahlstrom, Bjorneborg, Finland. This boat is 54ft. over all, 50ft. waterline, 11ft. 6 in. breadth and 4ft. draft, and will be built in Finland. Sullivan triple expansion engine, and a Roberts water-tube boiler will be installed and a speed of about 13 miles per hour will be developed.

Plans and specifications have also been prepared by Mr. Gielow for a motorboat for Mr. John F. Revilliod, Nyon, Switzerland. It is 29ft. 6 in. over all, 29ft. waterline, 5ft. 6 in. breadth. A 20 horsepower French motor will be installed, and a speed of 14 to 15 miles per hour will be attained. This plan shows a torpedo stern model, with a movable cabin forward, and large cockpit aft.

SALES AND CHARTERS.—The following transfers of yachts have been reported by Messrs. Macconnell & Cook: The schooner yacht Wayward, owned by Col. D. E. Austen, to a New York yachtsman. Chartered the sloop yacht Banshee to Mr. Stephen Van Rensselaer, of Elizabeth, N. J. Sold the raceabout Oriole, owned by Mr. B. W. Bunker, of the Columbia Y. C., to Mr. Henry F. Holbrook, New York. Chartered the schooner yacht Oenone, owned by Mr. William Boyce, to Mr. F. C. Carley.

New York Y. C. Cruise.

Glen Cove, Thursday, Aug. 10—Rendezvous Cups.

The weather rather marred the first day of the cruise of the New York Y. C. It was cloudy, muggy and at times wet, and as a consequence of several days of wet weather, many of the boats had been unable to complete their overhauling in time to take part in the first day's racing. The fleet had been ordered by Commodore Frederick G. Bourne to rendezvous off Station No. 10 at Glen Cove in the afternoon, and earlier in the day races were scheduled for the Rendezvous Cups. In order that all might get to the line in time to take part in these contests, the Regatta Committee waited until afternoon before making any preparations to send the boats off, and then nineteen boats, all but two being 33ft. and under, were sailing about near the starting point, off Weeks Point, ready for the signal. Unfortunately Yankee had not been able to get ready, and so there was no class competitor for Mineola; but Mr. H. F. Lippitt was on hand with Weetamoc, and it was only a matter of a few seconds' conference by Mr. W. Ross Proctor and Mr. Lippitt to arrange a race between their two boats, Mineola having to allow Weetamoc full time, which over the course amounted to 6m. 29s. In the 33ft. class were Mimosa III. and Tito. Eleven of the New York Y. C. 30-footers were on hand, and in the class for boats owned by members or sons of members, too small for enrollment, there were the four raceabouts Circe, Cricket, Busy Bee, and Rana.

The committee in charge of the races, Mr. Oliver E. Cromwell, Mr. H. deB. Parsons and Mr. Franklin A. Plummer, who is acting in place of Mr. Ernest Lorillard, were on board the tug Chamberlain, and as the wind was blowing from the W. by S., courses were selected giving the boats leeward and windward work. Mineola, Weetamoc, Mimosa III. and Tito were to go to a mark off Greenwich Point and back, a total distance of 18 1/2 miles. The 30-footers and raceabouts were to go to Matinick Point and back, twice over, a total distance of 12 miles, each leg being 3 miles.

The start for the big class was at 12:45. The first leg was before the wind, and Mineola and Weetamoc both had balloon jibtopsails in stops and spinnakers ready to break out. Captain Barr sent Mineola across soon after the signal, being timed at 12:45:36. The balloon jibtopsail was broken out smartly and then the spinnaker set on the starboard side. Mr. Lippitt had the wheel on Weetamoc, and he kept off until the two minutes allowed to cross had almost expired, and then sent the yacht over the line at 12:46:50. She had a balloon jibtopsail drawing well, but had her spinnaker set to port, so that at the start there was a marked difference of opinion as to the better way to sail these boats. Unfortunately, Mr. Lippitt had made a mistake in the course. He headed Weetamoc further to the north, and soon it was seen that he was going to a mark off Parsonage Point, while Mineola was heading straight for Greenwich Point. Weetamoc turned the mark, gybed, and then reached on toward Greenwich Point; but this had given her at least 2 1/2 miles more to sail. But for this error, she might have won the race. Mineola took in her spinnaker and balloon jibtopsail just before reaching the mark, which she turned at 1:01:05. Then she sent up a baby jibtopsail for the beat home. A short port tack was made and then Captain Barr tacked his boat and stood over toward the Connecticut shore. Weetamoc turned the mark at 2:03, and she took the starboard tack, heading after Mineola. On the way home, the wind freshened and backed more to the S., so that both boats were able to finish with only a few short hitches. A sharp rain squall broke on the way home, making things generally uncomfortable, and the wind freshened, so that Mineola's baby jibtopsail was taken in. It was set again as she neared the finishing line. Mineola finished at 3:08:32, and Weetamoc at 3:32:27.

The next class was started at 12:50. It was a one-gun start, and Commodore Park had managed to send Mimosa III. away in the lead, with Tito close astern. These two had a juffing match for some minutes, but finally squared away, with Mimosa leading. It was very close work with these two all the way to the outer mark. Tito passed Mimosa III. on this leg and turned the mark with a slight lead. They were timed: Tito 2:10:25, Mimosa III. 2:10:45. In two short tacks Mimosa succeeded in weathering Tito, and then gradually forging ahead, won the race easily. Mimosa III. finished at 4:11:20, and Tito at 4:34:06.

The 30-footers, as usual, went over the line well bunched. The order at the starting line was Alera, Neola II., Banzai, Ibis, Dahinda, Atair, Cara Mia, Phryne, Nautilus, Oriole, Linnet. They soon spread out almost in a straight line, and were still close together when the first mark was reached. Phryne was the first to turn, followed by Nautilus and Cara Mia. Phryne kept the lead on the way back, but according to the timing of the Regatta Committee, Nautilus fell back to last place. These times were taken at the end of the first round: Phryne 1:55:37, Cara Mia 1:55:57, Banzai 1:56:03, Dahinda 1:57:25, Ibis 1:57:30, Atair 1:58:08, Alera 1:58:25, Oriole 1:58:27, Neola II. 1:58:52, Linnet 1:59:45, and Nautilus 2:00:06. They went round the second time, and Mr. Harry L. Maxwell cleverly kept Phryne in the lead, while Nautilus moved up and took second place, with Cara Mia third. Phryne finished at 2:55:24, Nautilus at 2:55:43, and Cara Mia at 2:56:21. All except Banzai finished, and there was only 6m. 11s. between Phryne, the first boat, and Linnet, the last.

The four raceabouts made a pretty contest. They crossed the line in this order: Cricket, Rana, Busy Bee, and Circe. Before the wind Circe took the lead and held it to the finish. The times at the end of the first round were: Circe 2:09:18, Busy Bee 2:10:20, Rana 2:10:17, Cricket 2:10:48. Circe finished at 3:20:04, beating Rana 1m. 29s., Cricket 1m. 46s., and Busy Bee 3m. 48s. The summary follows:

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Mineola, Weetamoc, and 30-footers like Mimosa III., Tito, Alera, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include 30-footers like Alera, Ibis, Atair, Dahinda, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include 30-footers like Alera, Ibis, Atair, Dahinda, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Raceabouts like Circe, Busy Bee, Cricket, Rana.

At 5 o'clock the captains met on board the flagship Corona. They were received by Commodore Bourne and Fleet Captain J. D. J. Kelly, and then met for some business. Resolutions of condolence were passed with former Commodore Ledyard, who is compelled to miss the cruise this year through illness. It was also decided to extend to the officers of the British warships that are to visit this port in the fall the privileges of the club.

There was quite a large fleet at the rendezvous. The captains were full of enthusiasm, and every one seemed bent on making this cruise one of the best. The yachts, as usual, were illuminated in the evening, and the picture thus presented pleased the summer colony as well as the inhabitants of the towns in the vicinity of Glen Cove. The yachts noticed at the rendezvous were:

Steamers—Corona, Commodore Frederick G. Bourne; Narada, Vice-Commodore Henry Walters; Apache, Arthur T. Kemp; Celt, J. Rogers Maxwell; Niagara IV., Howard Gould; Taran-tula, W. K. Vanderbilt, Jr.; Arrow, E. F. Whitney; Edithia, John H. Hanan; Riviera, Frederick Gallatin; Kismet, F. S. Smithers; Roamer, N. G. Herreshoff; Mohican, Tracy Dows; Vergemere, George G. Havens, Jr.; Florence, A. H. Alker; Nirvana, William R. Sands; Viking, Jarvis B. Edson; Ariadne, Henry W. Putnam, Jr.; Viking, James D. Smith; Lavrock, W. J. Matheson; Vitesse, Gen. Brayton Ives; Witoco, William T. Colburn; Surf, C. K. G. Billings; Erl King, A. E. Tower; Intrepid, Lloyd Phoenix; Mermaid, W. Ross Proctor; Mayflower, R. E. Robinson; Mirage, C. B. Alexander; Hauoli, F. M. Smith; Ituna, Frederick H. Stevens; Coranto, A. E. Austen; Maspeth, Chris. Meyer; Seminole, F. M. Robins; Ardea, Clarkson Cowd; Rita, Marion Storey; Embla, George Lauder, Jr.; Alert, W. D. Hoxie; Lurline, Theodore D. Buhl; Duquesne, James Gay Butler; Idler, Henry T. Sloane; Elsa II., Evans R. Dick; Normona, Paul G. Thebaud; Illini, F. Golthra; Elsa, Miss Eloise L. Breese.

Schooners—Corona, Arthur F. Luke; Lasca, Robert P. Dore-nus; Agatha, W. S. Eaton; Kiwassa, L. J. Callanan; Emerald, W. E. Iselin; Muriel, Charles Smithers; Quickstep, E. B. Havens;

Venona, Robert Olyphant; Crusader II., Seymour L. Husted; Thistle, Robert E. Tod; Cara II., George E. Ide; Palestine, Henry C. Tinker; Katrina, James B. Ford; Vencedor, Albert V. de Goicouria; Kathelmina, W. J. Curtis; Rosemary, Converse D. Marsh. Yawls—Sybarita, W. Gould Brokaw; Phantom, H. G. S. Noble; Senga, E. H. Shetars; Thora, John P. Donovan. Housboats—The Everglades, Col. Robert M. Thompson; Margaret, Isaac E. Emerson. Sloops—Mineola, W. Ross Proctor; Weetamoc, H. F. Lippitt; Doris S. Reed, Anthony Humma, R. W. Emmmons 2d; Mimosa III., Trenor L. Park; Irolita, Howard C. Clark; Joker, George F. Dominick; Xara, George H. Scott; Pellegrina, Robert E. Toland and twelve of the 30-footers.

Glen Cove to Morris Cove—Friday, Aug. 11.

The harbor start was made at 9 o'clock, and an hour later the Regatta Committee made the preparatory signal from the tug Chamberlain. The starting line was from off mark buoy E, off Weeks Point, at Glen Cove, and the finishing line was S. from the west or outer breakwater at Morris Cove. The distance was 39 1/2 miles, and all yachts were to leave the bell buoy off Loyd's Point to starboard. There was a moderate S.W. wind when the yachts were started, and with the tide running to the E., the prospect of a fast run was exceedingly good. It was a spinnaker race, and preparations were made accordingly. The 30-footers were sent over the line at 10:05, and as usual, were well bunched. Booms were eased to port and spinnakers set to starboard. The Hanan brothers had berthed Nautilus well, and she crossed the line first, closely followed by Cara Mia, Oriole, Dahinda, Adelaide, Neola II., Atair, Minx, Alera, Ibis, Banzai and Linnet. The next classes were sent off to a one-gun start at 10:10. Phantom, Mira and Humma were almost abreast as they crossed, with Humma to windward, Mira in the middle and Phantom slightly in the lead, but to leeward. Irolita was next, followed by Cheemaun, Pellegrina, Nirvana (an old-fashioned ketch), Doris, Lida, Louise and Shark. Doris is a new Herreshoff boat, longer on the water than Humma, but with less sail spread. She went up a class, taking the minimum length as she had no class competitor.

At 10:15 the seventies were sent off. Capt. Barr went for the line with good way on Mineola, and breaking out the balloon jibtopsail, was off at 10:15:48. Then the spinnaker was set and Mineola drew away from the others. Sybarita was next at 10:15:59. Mr. Maxwell did not do so well with Yankee at the starting line. He ranged down the line before crossing, and in doing so killed the yacht's headway, and then the crew was rather slow in handling the light sails. Yankee was timed at 10:16:34, but was much further behind Mineola than the time showed on account of the difference in speed at which the boats were traveling. Weetamoc, having no class competitor, sailed against Yankee and Mineola, and she crossed the line at 10:16:35.

All the schooners and auxiliaries were sent off on the next signal at 10:20. There were fifteen of these, and as fine a lot as has been seen in one regatta for many a year. There was some lively hustling at the line, but all were handled well, and got over without any mishap, although it looked at times as if they were being crowded somewhat. Muriel was first at 10:20:26. Then followed Kiwassa, 10:20:51; Colonia, 1:21:29; Rosemary, 10:21:41; Katrina, 10:21:57. The others were all handicapped, crossing after the two minutes allowed. Vencedor was the leader of these, then came Crusader II., Quickstep, Agatha, Ariadne, Venona, Vergemere, Idler, Lasca, Intrepid, and Normona. As Vencedor crossed, her balloon jibtopsail was broken out, but only one man was on the sheet, and he was neatly lifted into the air and dropped into the water. The yacht had to return to pick him up, but in the meantime, Mr. Clement Marshall's power boat Vampa got him and took him to his yacht. Vencedor then went on. Those yachtsmen who know the waters of Long Island Sound held well into the Long Island shore to get the benefit of the tide as it drew out of Oyster Bay and Huntington Harbor, while the others kept out in the Sound. Sybarita soon led the fleet, followed by Mineola, and astern of her was Yankee, doing very well. Corona took the lead in the schooner classes. Just before noon the leaders were off Eaton's Neck. The order then was Sybarita, Mineola, Yankee, Corona, Lasca, Elmina, Ariadne, Intrepid, Vergemere, Idler, Vencedor. Further inshore were Humma, Doris, Weetamoc, Irolita, and Rosemary.

Corona gradually overhauled and passed the 70-footers, and when off the Middle Ground at 1 o'clock was the second boat in the fleet and not far astern of Sybarita. Lasca was doing well, and so was Katrina, which had taken the lead from the Class C schooners. Yankee had picked up on Mineola, and just after passing the Middle Ground, got on even terms with that boat, and then for 45 minutes there was a tussle between them that was well worth witnessing. Yankee had a little more flow to her balloon, and it was doing better work than that on Mineola; but try as he would Mr. Maxwell could not send his boat into the lead. Sails were trimmed, and re-trimmed on each craft, and changes were made in the trim of the boats by shifting the crews. Finally, when the finishing line was only 3 miles away, Mineola took the lead again, but then she could not get far enough ahead to win the race. She had started 46s. in the lead, and she had to allow 15s., so that to win, she had to finish 62s. ahead. The wind freshened considerably as the yacht approached the finishing line, where the committee on board the flagship Corona were waiting to time the yachts. Sybarita finished at 2:05:07. She had made the run in 3h. 49m. 8s. Corona was the next in at 2:08:42, having made the journey in 3h. 47m. 13s., the fastest time over the course. Then came Mineola at 2:10:44, and Yankee at 2:11, so that Yankee won the race by 45s. Next was Lasca, which had made a fine showing. She finished at 2:14:04. Katrina was next at 2:20:50. The finishes of others were: Muriel 2:23:25, Humma 2:26:05, Doris 2:26:35, Weetamoc 2:28:01, Vergemere 2:29:50, Ariadne 2:30:33, Irolita 2:31:10, Intrepid (carrying a square sail and raffles) 2:31:44, Crusader II. 2:36:44, Rosemary 2:41:20, Idler 2:41:22, Shark 2:42:13, Vencedor 2:43:11, Palestine 2:43:55, Kiwassa 2:47:36, Normona 2:50:28, Agatha 2:50:41, Quickstep 2:52:21, Mira 2:52:48, Venona 2:55:21, Nirvana 2:55:32, Phantom 2:59:08, Lida Louise 3:04:03.

Just before Cheemaun reached the line she carried away her topmast and did not finish. The wind by this time was quite fresh, and the little fellows were staggering along with all they wanted. It had brought up the tail-enders and gave them a big lift, much to the disadvantage of the leaders. The 30-footers made a remarkable showing. Dahinda was the first in. She finished at 3:08:13, having made the run in 5h. 3m. 11s. The times of the others were: Linnet 3:09:12, Minx 3:10:41, Adelaide 3:11:53, Cara Mia 3:12:13, Nautilus 3:13:39, Alera 3:13:47, Ibis 3:15:00, Oriole 3:15:06, Neola 3:16:03, and Atair 3:17:29.

The special cups were given by Commodore Bourne. That for schooners, all sailing in one class, was won by Katrina and the sloop cup went to Dahinda. The summary follows:

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Schooners—Class B, 75 to 90ft. like Corona, Lasca.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Schooners—Class C, 64 to 75ft. like Muriel, Crusader II., etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Schooners—Class D, 55 to 64ft. like Katrina.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Schooners—Class E, Under 55ft. like Kiwassa, Agatha, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Auxiliaries—Under 70ft. like Vencedor, Normona.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Auxiliaries—Over 70ft. like Vergemere, Ariadne, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Yawls—Class G, 82 to 100ft. like Sybarita.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Sloops—Class H, 68 to 82ft. like Yankee, Mineola, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Sloops—Class K, 48 to 57ft. like Humma, Irolita, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Sloops—Class M, 33 to 40ft. like Phantom, Nirvana, etc.

Table with 4 columns: Name, Start, Finish, Elapsed. Rows include N. Y. Y. C. 30-footers—Start, 10:05. Like Alera, Ibis, Atair, etc.

Morris Cove to New London—Saturday, Aug. 12.

Elmina, Mr. F. F. Brewster's new schooner, joined the fleet at Morris Cove. She had sailed over from Greenport in charge of Capt. Lem. Miller. Capt. Dennis had been called away to visit his mother, who is ill and in a critical condition. The run from Morris Cove was made under very favorable conditions. It was a reach almost all the way, although some of the yachts carried spinnakers for part of the time. The wind was from the W. when the preparatory signal was made, and at that time the sun was busily engaged in a fight with heavy water-laden clouds, and it looked as if the sun would win out. The races were started again at 10 o'clock from off the breakwater, and the finish was at Sarah's Ledge bell buoy, 39 miles away. Some changes were made in the classification. The schooner Katrina went up a class, and this made it a race in every class except that in which Sybarita sails. The special prizes were cups offered by Rear-Commodore C. Vanderbilt.

At 10:05 the 30-footers were sent off, and they had booms to port and spinnakers to starboard; but almost as soon as they were over the line, the wind went to S.W., and spinnakers were taken in, as it was a broad reach. Oriole got the best of the start and she was followed closely by Linnet, Minx, Neola II., Atair, Nautilus, Adelaide II., Alera, Cara Mia, Banzai, and Dahinda, in the order named. These boats at once divided in two divisions, those heading to pass north of Faulkner's Island and the other to go to the S. On the next gun Mira got a fine start, being at the line with the signal. Irolita was next, followed by Pellegrina, Lida Louise, Phantom, Doris, Humma and Shark. These last named were a little too soon at the line and had to go outside the committee boat, wear, and go for the line again. While these boats were crossing, Yankee and Mineola were fighting for position, and in the maneuvering Mr. Maxwell did the better work. He had Yankee moving well when the signal went, and drove for the line with her balloon jibtopsail well filled. She crossed at 10:15:37. Mineola crossed at 10:15:52, and as soon as she was over she luffed to get the weather position, but very soon both yachts were on their course, Yankee in the lead and Mineola just to windward of her wake. Weetamoc crossed at 10:15 at the leeward end of the line, and Sybarita crossed at 10:16:15.

Corona led the schooners, getting away at 10:20:25, with all kites set. Rosemary followed at 10:20:41, Muriel at 10:20:54, Katrina at 10:21:34, Elmina at 10:21:47, Kiwassa at 10:21:51. These were all that got across before the handicap. The others crossed in this order: Cacique, Crusader II., Cachalot, Agatha, Vencedor, Lasca, Venona and Palestine.

On the next signal the big auxiliaries started, and their times were: Idler 10:25:56, Intrepid 10:26:09, Ariadne 10:26:23, Vergemere 10:26:52. Normona took the wrong signal. She was last to go, being handicapped 5m.

The wind was moderate, and the tide running to the E. helped the boats very much. At 11:15 the leaders were off Faulkner's Island; Sybarita was ahead. Mineola had, just before reaching that point, passed Yankee. Corona was still ahead of Elmina. Intrepid, conspicuous by her raffles, was leading the auxiliaries, and Katrina was leading the smaller schooners.

The wind lightened somewhat after then, but later breezed on again. Nautilus was the leading boat of the northern division of 30-footers, and appeared to be leading her class, and Minx was the leader of the southern boats. Off Cornfield Lightship at 12:30 Sybarita was still in the lead, but was being pressed by Corona and Elmina. There was no change in the order of the other boats. In the 57ft. sloop class Humma had taken the lead, followed by Shark, Irolita and Doris. Then the wind went further to the W., and spinnakers were set on several of the leaders. Yankee tried hers, but soon took it in again. The wind freshened too, so that those boats that had held to the S. were benefited, and they made up the advantage the northern boats had gained earlier in the race. At 1:30 Sybarita passed Bartlett's Reef Lightship, and swept on toward the finish. Then a sharp rain squall broke, and with it there was plenty of wind. Elmina closed rapidly on Corona, but could not quite get up.

The finishing times were: Sybarita 1:08:05, Corona 1:50:44, Elmina 1:51:23, Mineola 1:58:46, Muriel 2:03:42, Yankee 2:03:44, Lasca 2:04:20, Vergemere 2:09:20, Weetamoc 2:12:18, Humma 2:13:13, Katrina 2:13:50, Doris 2:14:06, Intrepid 2:14:35, Crusader II. 2:15:23, Ariadne 2:18:16, Idler 2:18:28, Irolita 2:19:05, Shark 2:20:25, Rosemary 2:21:04, Vencedor 2:22:09, Agatha 2:29:18, Cachalot 2:30:07, Kiwassa 2:31:55, Mira 2:33:34, Venona 2:34:35, Palestine 2:35:41, Pellegrina 2:37:17, Cacique 2:39:25, Normona 2:43:13, Phantom 2:43:22, Lida Louise 2:43:21, Minx 2:56:31, Nautilus 2:58:00, Oriole 2:58:05, Alera 2:58:33, Banzai 2:59:20, Dahinda 2:59:45, Ibis 2:59:45, Neola II., 3:00:53, Cara Mia 3:01:15, Adelaide II., 3:02:32, Atair 3:03:26, Linnet 3:17:59.

In the 30ft. class Minx had won, and it is probable that she has also captured the Rear-Commodore prize for single-stickers.

In the next class Mira wins easily from Pellegrina, Phantom and Lida Louise. In Class K, Doris is a winner by a good margin. This is a creditable showing, because she really belongs in the class below, and assumes the minimum length of the class above in order to get a race.

Mineola gets the prize for Class H. Venona wins in the small class of schooners, and she also captures the Read-Commodore's prize for schooners. Katrina easily defeats the Class C boats. Corona wins in Class B. The auxiliaries have not all been measured, but it looks as if Vencedor is the winner in the small class and Idler the winner in the larger class.

The fastest time over the course was made by Elmina, and when Capt. Miller gets better acquainted with his craft she will do much better.

It rained on and off all the evening, but that did not prevent the yachts illuminating, or there being fireworks at the Pequot, and all New Londoners were happy. The summary:

Table with 4 columns: Name, Start, Finish, Elapsed. Rows include N. Y. Y. C. 30-footers—Start, 10:05. Like Alera, Ibis, Atair, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Sloops—Class M, 33 to 40ft.—Start, 10:10. Like Phantom, Mira, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Sloops—Class K, 48 to 57ft.—Start, 10:10. Like Doris, Humma, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Sloops—Class H, 68 to 82ft.—Start, 10:10. Like Yankee, Mineola, etc.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Yawls—Class G, 82 to 100ft. like Sybarita.

Table with 4 columns: Name, Start, Finish, Elapsed, Corrected. Rows include Schooners—Class E, Under 55ft. like Kiwassa, Agatha, etc.

Schooners—Class C, 64 to 75ft.

**At New London, Sunday, Aug. 13.**

Sunday was a miserable day for all. Rain squall after rain squall drenched everything, but it did not prevent the sightseers from going down the harbor to see the boats. Several new yachts joined the squadron, and Fleet Captain Kelley announced that since the squadron was organized 192 yachts had reported to the flagship.

The Regatta Committee, which has worked hard, got things in good shape, and from now on everything will run smoothly. An innovation has been made this year, and only yachts that have their measurement certificate filed can take part in contests for cups or for regular prizes. Boats not measured can start, and if it is found when they are measured that they have beaten the regular entries, they get a special prize, but they do not take a prize away from a boat that has complied strictly with the rules.

Mr. Charles Lane Poor, of Mira, has protested the 30-footers because they do not carry boats. This protest affects Dahinda, the winner of the Commodore's cup on Friday, and Minx, the winner of the Rear-Commodore's cup on Saturday. The Regatta Committee decided against Mr. Poor, and it was felt by many that it was a most unjust decision, and that it left an opening for all kinds of evasions.

**Lipton Cup Races.**

Four boats representing three different clubs, started in the fourth annual race for the Lipton trophy, emblematic of the 21ft. cabin class championship of the Great Lakes. The first race was called at the expiration of the four-hour time limit with two legs of the course still unsailed.

The contestants were: Quien Sabe, Columbia Y. C., Commodore F. A. Price et al.; Ste. Claire, Detroit Country Club, Commodore Walker; Mendota, Milwaukee Y. C., Commodore E. P. Vilas; Hoosier, Columbia Y. C., ex-Commodore J. F. McGuire. All but Quien Sabe are old boats, the Price boat having been built to win back the trophy from Ste. Claire, of the Detroit Country Club.

**First Day—Saturday, Aug. 12.**

Light, fluky winds. That tells the story of the first attempt to race for the Lipton cup yesterday. After four hours of more or less tedious waiting for the unkindly god of the winds to turn loose a few choice zephyrs, the racing judges called it no contest, and picking up the contestants at the end of a tow line, the tug Bradwell and the revenue cutter Tuscarora towed them back to their anchorages.

As a test of boats, it was no criterion at all, though what little steady sailing there was, showed Fred Price's new Tams, Le-moine & Crane creation Quien Sabe, to be a wonder in light airs, and brought the Commodore of the Columbia out in the light of unusually good achievement. Beaten to the first mark by 14m., owing to distressing flukes of wind and a bit of a mistake of judgment by which he waited for the wrong puff, while Ste. Claire got the right one, Price sailed his boat well and cut down Ste. Claire's lead until at the end, when at the outside buoy the race was called off, Quien Sabe was less than 4m. behind, having made up over 10m. in the run in from the S.W. stake-boat around the home buoy and out to the N.E. mark.

As these two legs were about the steadiest of the whole race, and at that a shift of wind on the last leg sailed headed the boats when they were pointing directly at the mark, the gain shown by the Price boat is a most encouraging feature, and sailors around Columbia are hoping for more light breezes, seeing a chance to win back the coveted trophy from the Detroit County Club.

The race as a race was a tiresome affair, with constant changes of wind to almost every point of the compass. The judges were delayed at the start, and it was after 2 o'clock when they reached the spar buoy, which served as a permanent basis for the triangle, and the racers were notified that the preparatory gun would be fired at 2:15 with the starting gun 10m. later. At 2:25 the gun gave the signal for the start. The wind had dropped to nothing, and in the ten minutes had boxed the compass. At the starting time it was a light S.E. breeze, and Ste. Claire, which had been hovering on the line ever since the preparatory gun, filled slowly and drifted across. Her actual crossing time was 2:28:50, which gives an idea of how little wind there actually was at the time. Quien Sabe was next across, a minute later, and Hoosier and Mendota were last across. Then began the longest, most tiresome part of the race—the beat back to the mark, two miles to windward. Fluke after fluke put first one boat ahead, then another. At last a squall headed up in the S.W., and it looked as though there might be some wind. At the same time a lightning of the N.E. and the drift of the smoke ashore showed that the wind was trying to force a passage there. Ste. Claire chose the northeast, and Quien Sabe hung on, hoping to catch the south-wester. Ste. Claire won, and when the breeze came—it could not have been over a 3-mile affair at that—Ste. Claire had all the best of the position, and going fast, shot away into the lead.

The second leg was a free run with balloon jibs, and at one time Ste. Claire was able to carry a spinnaker, though it did not help much. Quien Sabe rounded 14m. later and broke out a small spinnaker, carried high like a flying jib, one of George Peare's favorite stunts. It helped some, but had to come down at the end. It was on the third leg of the triangle that Quien Sabe showed such speed. With the Detroit boat still 14m. ahead, Quien Sabe cut down her lead by 6m. on the run in to the home buoy. After rounding into the first leg of the second round Quien Sabe and

Ste. Claire found a light N. wind that enabled them to set their course direct for the mark. It held for half the distance, then swung around to the N.E., dead ahead. The boats went about and split tacks. Price kept on improving his position, and when the race was called off, after the two leading boats had rounded the stake, he had cut down the cup holder's lead to 3m. 42s.

Mendota and Hoosier were hopelessly out of it from the first. They are both heavy weather boats, and the Milwaukee representative is a dangerous candidate if there is anything like a whole sail breeze.

The arrangements were perfect as far as the club was concerned, the weather man being the only one to cause any trouble. The first race was sailed over a triangular course of two miles to the leg, to be sailed over twice. Following is the official time:

First Round.			
	Start.	1st mark.	2d mark.
Ste. Claire	2 25 00	3 52 00	4 29 50
Quien Sabe	2 25 00	4 06 00	4 43 30
Mendota	2 25 00	4 19 20	4 52 35
Hoosier	2 25 00	4 21 00	4 54 00

Second Round.			
First Mark.			
	Start.	1st mark.	2d mark.
Ste. Claire	6 07 30	6 11 12	6 15 00
Quien Sabe	6 11 12	6 15 00	6 18 45
Mendota	Did not reach buoy.		
Hoosier	Did not reach buoy.		

J. W. HANDLEY.

**Stamford Y. C.**

Stamford, Long Island Sound—Saturday, Aug. 5.

The annual regatta of the Stamford Y. C. was held on Saturday, Aug. 5. There were eighteen starters, and the winners were Marguerite, Memory, Madrine (sailover), Heron, Vera and Fly. The Race Committee, consisting of Messrs. R. H. Gillespie, Chairman; J. S. Herrman, John Le Boutillier, Edward Sawyer and Dr. A. H. Schofield, were on board Commodore Ferguson's steam yacht Christabel.

The race was scheduled to start at noon, but the Race Committee decided on a postponement, as the wind was so light. At 1 o'clock a nice S.W. breeze was blowing, and at 1:20 the 33ft. sloops were sent away. It was a procession from start to finish, and Marguerite had such an easy time that the match attracted little or no interest.

Memory also had an easy time of it in the 33ft. yawl class. Cherokee was outclassed. In the 27ft. sloop class Madrine was without a competitor and she took a sailover.

Heron ran away from her three competitors in the 22ft. yawl and sloop class and took her second first prize of the season. Altair was second.

Vera easily defeated Mignon and Hornet in the catboat class. Mignon was second. Fly beat Monday, the second boat to finish in the Stamford one-design class, 6m. 33s. Toy was third. The summary:

Sloops, 33ft. Class—Start, 1:20—Course, 15 Miles.		
	Elapsed.	Corrected.
Marguerite, W. F. Clarke	3 43 46	2 23 46
Eolis, Com. Farrell	4 11 13	2 51 13
Yawls, 33ft. Class—Start, 1:20—Course, 15 Miles.		
Memory, H. M. Raborg	3 43 43	2 23 43
Cherokee, A. G. Thompson	4 09 11	2 44 11
Sloops, 27ft. Class—Start, 1:30—Course, 15 Miles.		
Madrine, S. E. Elliott	4 16 42	2 46 42
Sloops and Yawls, 22ft. Class—Start, 1:45—Course, 13 Miles.		
Heron, John Le Boutillier	4 22 03	2 37 03
Altair, W. M. McCord	4 42 01	2 57 01
Kcnoshi, Robert Mallory, Jr.	5 05 33	3 20 33
Moondyne, Mr. Kenedy	4 58 34	3 13 34
Catboats, 20ft. Class—Start, 1:45—Course, 13 Miles.		
Vera, W. F. Gillespie	4 40 20	2 55 20
Mignon, J. S. Gillespie	5 04 57	3 19 57
Hornet, A. DeNovellis	5 22 22	3 37 22
Stamford One-Design Class—Start, 1:55—Course, 4 1/2 Miles.		
Duck, J. S. Jenkins	3 40 23	1 45 23
Sunday, Edw. Sawyer	3 37 10	1 42 10
Hard Luck, D. Bonner, Jr.	3 45 22	1 50 22
Monday, W. Ferguson, Jr.	3 32 03	1 37 03
Toy, C. B. Castle	3 34 40	1 39 40
Fly, F. C. Edson	3 25 30	1 30 30

**Lake Champlain Y. C.**

Burlington, Lake Champlain—Tuesday, Aug. 1.

The annual regatta of the Lake Champlain Y. C. was held on Tuesday, Aug. 1. A rattling breeze held throughout the contest. The most interesting race was the fifth. Arcadia, owned by Father James D. Roche, of New York city, gave Queen Bess, the 65ft. boat owned by Don A. Dodge, of New York city, and Nameless, Frank J. Spaulding's 30ft. power boat, a 10m. lead. Arcadia won out, leaving Queen Bess some distance in her rear. The course of about six miles was covered in 18m. 30s.

The summary. First race:			
	Finish.		Finish.
Witchcraft II.	1 13 50	Sandolphon	1 18 05
Second race:			
Effort	0 57 39	Robt. J.	1 03 44
Eagle	1 01 20		
Fourth race:			
Witchcraft II.	1 12 30	Sandolphon	1 27 35
Fifth race:			
Dorothy	1 06 14	Lake Bird	1 08 22
Echo	1 07 19		
Special race:			
Arcadia	0 18 30	Nameless	0 32 19
Queen Bess	0 30 08		
Eighth race:			
Tramp	0 37 38	Julia J.	0 40 57
The Warner	0 39 58	Alert	0 42 45

**Atlantic Y. C.**

Sea Gate, New York Harbor—Saturday, Aug. 12.

On the afternoon of Saturday, Aug. 12, Atlantic Y. C. boats in classes M and under had an opportunity to compete for the trophy offered last year by Rear-Commodore E. B. Havens. All started in one division on regular time allowance. The winner proved to be the Class Q craft Saetta, which defeated the New York Y. C. 30-footer Tabasco, first boat to finish, by 5m. 8s. corrected time. A triangular course was covered, which led from the start off Sea Gate to a mark boat off Fort Hamilton, thence down the channel to a bell buoy three-quarters of a mile due N. of West Bank Light and home, an aggregate distance of 7 3/4 miles. The journey was sailed twice, all marks being left to port.

On the first leg spinnakers were carried to the Fort Hamilton mark. The wind was S.W., and windward work was in order down to the bell buoy. In rounding the mark at the Fort, a foul occurred in which More Trouble, Vivian II. and Bobtail came into collision. All hands were delayed at least 3m., and Vivian II. was finally forced to withdraw with a broken martingale. Lizana sailed well on the first round, and had a substantial lead at the end. The leg home was a broad reach, on which spinnakers were carried.

The wind hauled to the W. on the second round. As soon as on the wind after turning the Fort Hamilton Mark, Lizana began to feel the effects of the head tide and a cross sea which had sprung up. Tabasco was given more sheet than the others, and footed by both Bobtail and Lizana. After rounding the bell buoy Tabasco and Bobtail had a fine tussle on the run home. The first named finally finished 11s. in the lead. Quest led Saetta at the end of the first round, but lost the advantage before the finish of the race. Cockatoo II and More Trouble withdrew on the second round, when hopelessly beaten. Bobtail measures in Class N, Tabasco and Lizana in Class P, and the others in Class Q.

The old Class Q boats in the club sailed a race for points on the trophy recently offered by Hendon Chubb. Spots won out by 33s. The inside Association course was covered twice, leaving all marks to port. This gave a reach to Ulmer Park, another to the Marine and Field Club, still another to Fort Hamilton and a beat home. Mary had a good lead on the first round, but lost it by overstanding the mark on the last leg to windward. The summaries follow:

Classes M and Under—Start, 3:05.			
	Finish.	Elapsed.	Corrected.
Tabasco, J. B. O'Donohue	6 14 03	3 09 03	3 00 39
Bobtail, E. F. Luckenbach	6 14 14	3 09 14	3 09 14
Lizana, D. L. Wylie	6 20 03	3 15 03	2 57 39
Saetta, Geo. H. Church	6 22 25	3 17 25	2 55 31
Quest, F. J. Havens	6 23 53	3 18 53	2 56 59
Merc Trouble, W. H. Childs	Did not finish.		
Cockatoo II., Hendon Chubb	Did not finish.

**Buffalo Y. C.'s Cruising Race.**

Buffalo, Port Maitland and Return—Saturday, Aug. 5.

Six boats participated in the Buffalo Y. C.'s cruising race from Buffalo to Port Maitland and return, which started on Saturday, Aug. 5. The distance is about 80 Miles. The 21ft. waterline yawl Lucinda won, Tomahoc was second and Ida third.

The boats started late on Saturday afternoon, the preparatory being fired at 3:30. At 4 o'clock the boats started. Cricket carried all her lower sails and Beppo had two reefs in the main-sail and her storm jib set. Ida, Lucinda, Bessie and Tomahoc each had one reef tied down.

It was a beat to clear Black Rock Harbor, and Tomahoc was in the lead when the boats headed up the lake. After passing the Buffalo breakwater sheets were checked a little, and the boats were able to lay their course for Point Abino. Ida had made a big gain, and she was leading the fleet at sunset, when they passed Point Abino. Bessie started short-handed and put into Point Abino Bay rather than continue with an insufficient crew.

Ida was the first to shake out her reef, but Lucinda and Tomahoc soon followed suit. About this time Beppo ran by Cricket and began to overtake the three leaders. This was before Port Calborne lights were passed.

When darkness shut down the boats lost track of each other, but they picked each other up again when nearing Port Maitland. As each boat passed the lighthouse pier her identity was made known, and they were headed back for Buffalo. The time taken at Port Maitland was as follows: Ida, Tomahoc and Lucinda, 11:18 P. M.; Beppo, 12:50 A. M., and Cricket 1 A. M. The boats had the wind well abeam for the return trip, and it freshened considerably after passing Rock Point. A gaff topsail and a big reaching jib topsail were set on Cricket about 2 o'clock and she made better time, but she was too far astern to ever become dangerous.

Lucinda worked out a useful lead on the home leg and finished a winner at 4:23 A. M., Sunday. The summary follows:

Start, 4 P. M., Saturday.			
	Pt. Md.	Finish.	Elapsed.
Lucinda, Wilson	11:18 P. M.	4 23	12 23
Tomahoc, Harper	11:18 P. M.	4 42	12 42
Ida, Heussler	11:10 P. M.	5 14	13 14
Bcppo, Champ	12:50 A. M.	6 05	14 05
Cricket, Robertson	1:00 A. M.	6 22	14 22
Bessie, Clissold	Did not finish.		

**Penataquit Corinthian Y. C.**

Bay Shore, Great South Bay—Saturday, Aug. 12.

FIVE boats started in the special handicap race given by the Penataquit Corinthian Y. C. on Saturday, Aug. 12. There was a reefing breeze from the S., and the boats covered the 4-mile course three times.

Mr. T. Ridgewood's Arrow carried away her bobstay and withdrew, as did Pinkie, Cornelia and Nindah.

Gracelyn, sailed by Mr. Joshua Robbins, won; Alpheus was second, and Anita third. The summary:			
	Start	Finish.	Elapsed.
Gracelynne	1 42 00	3 42 15	2 00 15
Alpheus	1 47 30	3 55 40	2 08 10
Anita	1 40 00	3 57 00	2 17 00
Emla I.	1 42 00	3 54 35	2 12 35
Lillian	1 42 30	3 58 40	2 16 00

**GAS ENGINES AND LAUNCHES.**

Their Principles, Types, and Management. A Complete and Practical Manual.

BY F. K. GRAIN, M. E.

Bound in cloth, with 123 pages and 20 illustrations. Sent, postpaid, for \$1.25.

THIS compact and comprehensive handbook contains all the information essential to users of the marine gasoline engines, and will be welcomed by the thousands of men now owning and running power boats. Laymen and experts will alike find the book invaluable. It treats of the various types of marine gasoline engines, points out the good in each, and tells how to run them. A knowledge of the contents of this book will help to overcome difficulties and avoid accidents. The most complete book of its kind ever published.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

Corinthian Y. C.

Marblehead, Mass.—Mid-Summer Series.

THE midsummer series of invitation races given by the Corinthian Y. C. of Marblehead, was one of the most successful in the history of the club. On each of the three days there was a good breeze, and the contests were spirited throughout. The smallest number of entries was sixty-three and the largest seventy-four, making these the biggest races that have been sailed in Massachusetts Bay this season. In each class a cup was offered for the yacht taking the greatest number of first prizes. These were won without sail-offs by Myrtle in Class N, Tyro in the 22-footers, Boo Hoo in the 18-footers, Vera II. in the 15-footers and Marvel in the Cape cats. After a sail-off on Saturday, Meemer was the winner in Class M, Carmen in Class Q, Barbara in the dory class and Avanti in the handicap class.

Wednesday, Aug. 9.

A drizzling rain fell all the afternoon of the first day, and the wind was light and streaky, shifting from S.E. to W. by S. Dorel got the start in Class M, with Chewink IV. following and Seboomook to windward. Soon after the start Meemer went through the bunch and made her position secure on the windward leg, with Sauquoit second and Chewink IV. third. In Class P, Opitsah II., an old 21-footer, led the class all around the course, and Theorem did all the leading in Class Q. In the 18-footers Rube had the weather berth at the start, but Tyro to leeward had the better position, with clear wind. Tyro at once went into the lead and kept it to the finish.

Myrmidon, Bat, Boo Hoo and Dorchen were the first to get away in the 18ft. knockout class. Dorchen went through the bunch and led all over the course. There was a close finish for second place between Bat and Boo Hoo, Bat weathering Boo Hoo just before they crossed the finish line. Vera II. had all the best of it in the 15ft. class. Red Devil got the lead in the sailing dories but was passed by Elizabeth F., which won handily. The Cape cats were bunched at the start. Tomahawk went into the lead soon after, and stayed there all through the race, losing first to Hustler on corrected time. Tabasco II. led the handicap class to the finish line, but lost to Loon on corrected time. The summary:

Class M—33 to 40ft. Rating.

Table with 2 columns: Name and Elapsed. Meemer, R. C. Nickerson... 2 09 06; Sauquoit, T. K. Lothrop, Jr... 2 14 39; Chewink IV., F. G. Macomber, Jr... 2 17 30; Seboomook, B. A. Smith... 2 22 20; Dorel, George L. Batchelder... 2 25 03; Louise, E. McWilliams... 2 33 18.

Special Handicap Class.

Table with 3 columns: Name, Elapsed, Corrected. Loon, Misses Wainwright... 1 46 16; Tabasco II., W. H. Hollander... 1 41 28; Nisan, D. H. Woodbury... 1 43 59; Muley Kah, Misses Fabens... 1 47 38; Peggy, A. I. Hennessy... 1 49 22; Tartar, W. D. Quiner... 1 46 59; Coon, E. Quiner... 1 49 34; Geewhiz, W. H. Quiner... 1 49 53; Avanti, Mansfield... Withdrew.

Thursday, Aug. 10.

A rattling S.S.W. breeze favored the competing yachts on the second of the series. It was strong enough to capsize Loon in the handicap class, sailed by the Misses Wainwright. The young women were thrown into the water, but as they are excellent swimmers, they were not in the least uncomfortable, and paddled around until they were picked up by Glint in the same class. Pontiac got the start in Class M, with Chewink IV. under her lee and the rest of the class bunched. Meemer was in a pocket, but she pulled up after they had started, and after the first mark was turned for the windward leg, she went out ahead rapidly, leading to the finish. Sentinel assumed length to make a race for Myrtle in Class N, and Myrtle did all the leading in consequence. Carina II. got the start in Class P and led all over the course. Clotho got the start in the 22ft. class and led to the first mark, when she slipped the jaws of her gaff and the lead went to Peri II. Peri II led for the remainder of the course, with Tyro second. On the reach to the first mark Dorchen took the lead and held it until they were coming home on the windward leg, when Bonitwo pulled ahead and finished first with Boo Hoo second and Bat third. Bonitwo was disqualified for passing a mark wrong, and the race went to Boo Hoo. Vera II. won again in the 15ft. class, and Red Devil took a first in the dory class. Marvel got the start in the Cape cats, but was later led by Argestes. Marvel won first, however, on corrected time. The summary:

Class M—33 to 40ft. Rating.

Table with 2 columns: Name and Elapsed. Meemer, R. C. Nickerson... 2 03 14; Pontiac, George E. Silsbee... 2 04 16; Seboomook, B. A. Smith... 2 05 40; Chewink IV., F. G. Macomber, Jr... 2 12 42; Dorel, George L. Batchelder... 2 12 42; Sauquoit, T. K. Lothrop, Jr... 2 13 15; Louise, E. McWilliams... 2 14 04; Kit, H. B. Whittier... 2 20 27.

Friday, Aug. 11.

There was a moderate S.W. breeze for the third day of the series, and the racing in the different classes was good. Louise got the start in Class M, but Pontiac had the lead before the first mark was reached. She led the class all over the course, with Chewink IV. second and Seboomook third. In Class N, Myrtle again had an easy win from Sentinel. Baggarah and Quakeress sailed a close race in Class P, Baggarah winning by 1/2s. Tyro got the start in the 22ft. class and led all over the course. Nutmeg had second place on the windward leg, but was passed by Rube on the run in. Nibelung beat out Vera II. in the 15ft. class, this being only the second race that Vera has not won this season. Barbara won a close race in the dory class. Raccoon was first to finish in the special handicap class, but lost to Avanti on corrected time. Marvel led all around in the Cape cat class. The summary:

Class E—Y. R. A. 22-footers.

Table with 2 columns: Name and Elapsed. Tyro, W. H. Joyce... 2 15 59; Rube, H. L. Bowden... 2 13 47; Nutmeg, A. C. Jones... 2 14 10; Clotho, C. D. Lanning... 2 15 30; Medric II., H. H. White... 2 16 42; Peri II., Morton Prince... 2 17 33.

Class I—Y. R. A. 18-footers.

Table with 2 columns: Name and Elapsed. Boo Hoo, R. Boardman... 1 16 48; Bat, C. F. Adams 2d... 1 17 42; Hayseed II., H. L. Bowden... 1 19 06; Bonitwo, G. H. Wightman... 1 19 40; Moslem II., B. D. Barker... 1 20 41; Aurora, Pigeon Bros... 1 21 17; Fritter, A. P. Loring... 1 21 20; Nick Nack, C. B. Holmes... 1 24 20; Cuyamel, R. L. Pond... 1 29 35; Moslem, John Tyler... 1 39 48; Dorchen, A. W. Saturday, Aug. 12.

Shifting winds from S.W. to S.E., with squalls marked the annual open race of the Corinthian Y. C., sailed off Marblehead on Saturday, Aug. 12. A N.W. squall postponed the start half an hour, and then courses were laid for a S.W. wind. This shifted later to S.E., so that the yachts had no windward work. Kit was the first away in Class M, the others all being handicapped. Chewink IV. took the lead before the first mark was reached, with Seboomook second, and these positions remained the same to the finish. Medric II got the start in the 22ft. class, but on the first leg was passed by Tyro. Tyro led to the finish, with Medric II. second. Aurora got the start in the 18ft. class, but was passed by Dorchen before the first mark was reached. Dorchen was in the lead at the second mark, but on the last leg, Boo Hoo took the lead, with Moslem II. second and Bat third. Marvel led in the Cape cat class, but lost to Goblin on corrected time. Opitsah II. won in Class P, Soubrette in Class Q and Tabasco II. in the handicap class. The summary:

NEW MEMBERS PROPOSED.

Atlantic Division—L. M. Harvey, New York city, by C. F. Wolters; Charles A. Robinson, New York city, by F. C. Hoyt; Frederick W. Roloff, New York city, by F. C. Hoyt; Charles M. Wells, Brooklyn, N. Y., by C. H. Parson; John Lane Beck, New York city, by F. C. Moore; Herbert Moore, New York city, by J. E. Taylor.

Beverly Y. C.

Wing's Neck, Buzzard's Bay—Saturday, July 29.

THE Beverly Y. C. sailed its 370th regatta off its club house on Saturday, July 29. The event was the fourth Corinthian race of the season. The wind was from the S.W., and at times promised to be strong enough to make a good race, but it proved light and variable.

For the first time this season Shark defeated Humma in the 46ft. class, winning by a margin of 1m. 18s.

There were again two entries in the 30ft. class, Young Miss and Pontiac, and they were sent to Gifford's Ledge and back. Young Miss won by 2 1/2m.

In the 21ft. class there were the usual five entries. The boats were sent first to Dry Ledge, then to Scraggy buoy No. 8, then to Dry Ledge, and then home. Mr. Crane's new Amanita III, won by a good margin, and last year's champion Terrapin took second place.

The 18-footers were sent first to Bird Island, then across the bay to buoy No. 8 off Scraggy Neck and then home. Jap won by a little over a minute.

The 15ft. one-design class was sent first to Abiel's Ledge, then to Dry Ledge, then home. Vim won, and Fly, sailed by Miss Williams, was the first boat sailed by a lady to get home. She took second place.

The judges were Messrs. F. E. Cabot and L. S. Dabney. The times in detail follow:

Table of race results for Beverly Y. C. including 46-Footers, 30-Footers, 21-Footers, 18-Footers, 15-Footers, and various sloop classes with names and times.

Saturday, Aug. 5.

The Beverly Y. C. sailed its 371st regatta on Saturday, Aug. 5. The event was the fifth Corinthian race of the season. In the morning the wind was light and to the S.W. and gave the promise of good weather for racing.

The 46-footers did not appear, and the largest boats to start were the 30-footers, of which there were two. They were sent to Nye's Ledge and back. Young Miss won by a minute and a half.

The 21-footers were sent to Bow Bells and back. At the start the breeze, which had recently shifted, was very fresh and Barnacle soon took the lead, but on the way down the wind lightened and she gradually fell back and was passed by first one boat then another.

The 18 and 15-footers were both sent to Bird Island and back. Hindoo won in the former class, and Mr. Warren's new boat, Seeps, which was sailed by a lady, won in the 15ft. class.

Mr. F. A. Eustis acted as judge. The times in detail follow:

Table of race results for Beverly Y. C. on Saturday, Aug. 5, including 30-Footers, 21-Footers, 18-Footers, 15-Footers, and various sloop classes.

Boston Y. C.

Marblehead, Mass.—Monday, Aug. 7.

THE last Y. R. A. open race of the Boston Y. C. for the season was sailed off Marblehead on Monday, Aug. 7, in a light breeze from S.E. to S. by W. Medic II. got the start in the 22ft. class, but Nutmeg got the lead before the windward mark was reached, helped somewhat by a shift of wind, which let her up.

Class E—22-footers.

Table of race results for Boston Y. C. including Class E-22-footers, Class I-18-footers, and First Rating Class.

Horseshoe Harbor Y. C.

Larchmont, Long Island Sound—Saturday, Aug. 5.

THE races at Larchmont on Saturday, Aug. 5, attracted only the smaller craft, as the bigger boats were on the New York Y. C. cruise. The raceabouts were the largest participants, and all told, there were thirty-six starters.

At the start there was a nice W. breeze, but this petered out at the end of the first round, but it came in again from the same quarter, and the finishes were interesting.

The Regatta Committee, made up of Messrs. Thomas J. Cahill, Chairman; William Stewart Allen, L. W. Forbell and Edward Marble, sent the raceabouts off at 1:15. These boats covered a 5-mile triangle twice. All the boats went over this course twice, except those in the two smaller classes.

It was a beat to the first mark, off Whortleberry Island, a reach to the mark off Execution Light, and a run back to Larchmont.

Rascal II., cleverly sailed by Mr. Hazen Morse, won in the raceabout class, and Cricket was second. Rascal II. led all over the first round, but Cricket got ahead at the end of the first round. Rascal II. regained her lead and won handsily by 50s.

The 27ft. sloops were started at 1:20, and Rascal, one of the old raceabouts, slipped home a winner by over 5m. Only 8s. separated the other three boats in this class at the finish. Thelema was second and Spinster third.

The other winners were: Okee, Hour, Ace, Kenoshi, Grace, Quinsagomond, Vara, and Jokc, sailover.

The summary follows:

Table of race results for Horseshoe Harbor Y. C. including Raceabouts, Sloops, and various sloop classes.

Marine and Field Club.

Bath Beach, Gravesend Bay—Saturday, Aug. 12.

IN line with a desire to encourage racing among all types of boats on Gravesend Bay, the Marine and Field Club offered regular prizes for a race open to yawls on the afternoon of Saturday, Aug. 12. Only three of the cruising rig started, but there are hopes that a larger entry will result when another effort in the same direction is made.

J. H. Ives' La Cubana, a neat and fast little craft, won the race easily from Gaviota and Kate. The latter, although finishing third, very likely gets second prize on corrected time. The regular outside Association course was sailed twice, aggregating 10 nautical miles. With the breeze in the S.W., the journey on the first time around was a series of reaches from the start, off the Marine and Field Club to Fort Hamilton, thence to Craven Shoal bell buoy, to Sea Gate, Ulmer Park, and home. A shift of the wind to the W. on the second round brought a little close-hauled work from Fort Hamilton to Craven Shoal.

Two of the Class RR. sloops sailed for a cup offered by Charles Camp. Delta beat Alpha by 1m. 51s. The inside Association course was used, with windward on one of the four legs. The summaries follow:

Table of race results for Marine and Field Club including Yawls and Sloops.

Eastern Y. C.

Marblehead, Mass.—Tuesday, Aug. 8.

THE last of the series of special open races given by the Eastern Y. C., was sailed off Marblehead on Tuesday, Aug. 8, in light and straky, shifting airs, from S.W. to S.S.E. Class M was sent away in a drift, Medic II. getting the start. She was followed by Tyro and Clotho, with Meemer blanketing them. Meemer, Medic I., Urchin and Kit tacked inshore, while the rest of the yachts stood to the S. Tyro went into the lead by reason of finding a better breeze, but Meemer caught her again and passed her when the wind backed. Meemer led all around the course. Medic I. went up to second place on the second leg and remained second to the finish, with Tyro 4s. behind her. The 22-footers, while competing in Class M, were also in contest for a special cup for 22-footers sailing as one class. Two previous races had been won by Tyro and Clotho respectively, but as there had been some dispute as to rating, it was decided to award the cup to the 22-footer making the best time in this race. Medic I. thus gets the special cup. In Class N-O, Dorel was first away and led all around the course, but lost to Opitsah III. on allowance. Boohoo got the start in Class O-P, but Carina II. passed her on the two beats and led to the finish. The summary:

Class M—33 to 40ft. Rating.

Table of race results for Eastern Y. C. Class M—33 to 40ft. Rating.

Class N-O—25 to 33ft. Rating.

Table of race results for Eastern Y. C. Class N-O—25 to 33ft. Rating.

Class O-P—18 to 25ft. Rating.

Table of race results for Eastern Y. C. Class O-P—18 to 25ft. Rating.

SCHOONER YACHT HOOSIER SOLD.—Mr. Edgar Harding, of Boston, has sold his schooner yacht Hoosier to Mr. A. Morgan, of Larchmont, through the agency of Stanley M. Seaman. The same agency has also sold the auxiliary yawl Vidofner for Mr. C. A. Welch, Jr., of Boston, to Mr. W. C. Wood, of New York. She is a flush-deck keel boat 51ft. over all, 35ft. waterline, 12.3ft. breadth, 7ft. draft, designed and built 1896 by Lawley.

SEA CLIFF Y. C. OFFICERS.—The annual meeting of the Sea Cliff Y. C. was held at the club house on Thursday evening, Aug. 10, and the following officers were elected: Com., Charles E. Silkworth; Vice-Com., Charles E. Berner; Treas., M. M. Dodd; Cecy, C. S. Chellborg; Trustees to serve three years, Rupert A. Ryley, W. A. Morrison; to serve one year, A. H. Rogers, Jr.

STEAM YACHT PRESTO SOLD.—Mr. George C. Boldt has sold his high speed twin-screw steam yacht Presto to Mr. Nathan Straus. Presto was built at Nyack from designs by Mr. Charles D. Mosher. She is of composite construction, 80ft. 4in. over all, 75ft. on the waterline, 9ft. 6in. beam and 2ft. draft. She has two quadruple expansion engines each of four cylinders of 6in., 9in., 12in. and 16in. in diameter by 8in. stroke.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- List of trapshooting fixtures including dates and locations such as Ottawa, Kansas City, Chicago, and various local tournaments.

Sept. 4.—Utica, N. Y.—Riverside G. C. all-day tournament.

**DRIVERS AND TWISTERS.**

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

If the tournament of the Palisade Gun Club, at Edgewater, N. J., Aug. 24, is a success, a similar tournament will be arranged for Sept. 28.

The Bergen Beach Gun Club, Brooklyn, will resume their Saturday shoots on and after Sept. 2. The monthly shoots, held on the second Tuesday of each month, will be held regularly as usual.

We have received a photograph of the prizes which will be shot for on Aug. 19, commencing at 2 o'clock, at the shoot of the Bound Brook, N. J., Gun Club. They number five, four cups and a medal.

The Worcester, Mass., Sportsman's Club, through the Secretary, C. W. Doten, announce a two-day tournament, to be held on Sept. 5-6. A \$50 Parker gun and added money will be extra inducements.

The Clearview and Lansdale gun clubs met in a 25-man team contest, on the grounds of the Clearview Club, Philadelphia, Aug. 12. Each man shot at 25 targets. The totals were, Clearview, 483; Lansdale, 465.

The souvenir programme of the Springfield, Mass., Shooting Club Labor Day tournament is a work of art. The competition is open to all amateurs. Fifty dollars added money and merchandise prizes. Mr. C. L. Kites is the Secretary.

At the three-day tournament of the Consolidated Sportsmen's Association, held at Grand Rapids, Mich., on Aug. 8-10, Mr. W. R. Crosby was high general average with a total of 593. Mr. Otis Felger, an amateur of Grand Rapids, was second with 576.

The Indianapolis, Ind., Gun Club announce an all-day shoot on Labor Day, and a tournament on Oct. 9-10. The programme on Labor Day will consist of ten 20-target events, and one set of traps will be in use for those who desire to shoot for targets only.

The next tournament of the Consolidated Gun Club of Connecticut will be held under the auspices of the Bristol Gun Club, on Aug. 29. An old-fashioned sheep barbecue and fried corn feast will be an open event, best appreciated by those who have partaken of the delicious repast heretofore.

The Penn Gun Club, of Norristown, Pa., announces a shoot on Labor Day. Competition will begin at 1 o'clock. The programme consists of 20-target events, each \$1.50 entrance. Committee members are Messrs. T. V. Smith, A. B. Parker and A. J. Schneipp. The club grounds are at Jeffersonville.

There are ten events of 20 targets, each \$2 entrance on the programme of the Labor Day shoot, to be given by the Indianapolis, Ind., Gun Club, Sept. 4. Competition will begin at 9 o'clock. Moneys will be divided 25, 25, 25 and 25 per cent. High and low average prizes. Mr. Jas. W. Bell is the secretary.

The third annual tournament of the Kentucky Trapshooters' League at live birds, Oct. 3 and 4, will be given under the auspices of the Jefferson County Gun Club at Louisville, Ky. Emile Pragoff is secretary of the J. C. G. C. Frank Pragoff is secretary of the K. T. S. L. Programmes ready Sept. 1.

At the shoot of the Consolidated Gun Clubs of Connecticut, held at Hartford, Conn., Aug. 8, under the auspices of the Colt Gun Club, eight teams competed. New Britain was high with 87, but the score does not count in the series, as being short one man they took in a non-member to shoot along. Rockville was high with 85.

The Palisade Gun Club, of Edgewater, N. J., will hold a grand opening all-day tournament on Aug. 24. Eight events are on the programme, each at 20 targets, entrance \$1.40, \$3 added to six events, \$5 to two events. Totals, 160 targets, entrance \$11.20. Events 3 to 7 will be an optional 100-target race. There are six cash prizes of \$5, \$3 and \$2 for straights and averages. Sliding handicap. Guns and ammunition shipped prepaid to Lovett's Hotel, Edgewater, will be delivered on the grounds free. Mr. A. A. Schoverling, 2 Murray street, New York, is the manager.

A correspondent writes that, "The Rahway Gun Club wishes to claim Sept. 4 (Labor Day) for a grand prize tournament. The entire net proceeds will be given to the Baptist Church in Rahway, N. J., to aid in the building of a new edifice, the old one having been destroyed by fire. Edward A. Mahnken is chairman of the tournament committee, and promises that the prizes will exceed any heretofore offered by the club. Previous tournaments under the same management have proved eminently successful. Programmes on application.

The Somerville, Conn., Gun Club have issued the programme of their second annual Connecticut State championship, to be held on Aug. 22. All shooters are invited. The programme consists of eleven events, of which No. 7 and 8, each at 25 targets, constitute the championship contest. The other events are at 10 and 20 targets, entrance \$1.23 and \$1.80; totals, 200 targets, \$28.80 entrance. Rose system, except in the championship event, which will be class shooting and shot as two 25-target sweeps. Shooting will begin at 9:30. Gold badge, value \$10, to amateur making high average.

The Baltimore Shooting Association will hold its annual target tournament on Tuesday and Wednesday, Oct. 3 and 4. The management is now working on a programme that will be attractive to shooters in every class. There will be big average money for the good shots, and every man who shoots the programme through will be guaranteed his entrance back, no matter how poorly he may shoot. The 25-target merchandise event on the last day will be quite a feature, for there will be many and expensive prizes offered. Write to Secretary J. W. Chew, P. O. Box 941, Baltimore, Md., for programme.

The tenth tournament of the Mt. Kisco, N. Y., Gun Club, fixed to be held on Aug. 23, has ten events on the programme, at 15, 20 and 25 targets; entrance \$1.30, \$1.40 and \$2, the latter entrance pertaining to the merchandise event at 25 targets. Totals, 160 targets, \$14.10 entrance. Shooting will begin at 10:30, rain or shine. Trains leave Grand Central Depot at 8:08, 9:05 and 11:38 A. M. The Secretary, R. W. Gorham, writes us that "The members of the club will not spare time to make this tournament a success. The merchandise event will be the feature of the day. Several valuable prizes have been received already. The trade representatives will do well to attend."

There are twelve events on the programme of the eighth Consolidated Gun Club of Connecticut tournament, at 10, 15 and 20 targets, entrance 65 cents, \$1.22 and \$2.30. Totals, 190 targets, \$17.82 entrance. Rose system, 5, 3, 2, 1. Sweepstakes optional. All shooters invited. The team event, No. 6, will take place about midday. The clubs entered are: New Britain, Waterbury, New Haven, Bristol, Willimantic, Norwich, Hartford, Bridgeport, Rockville. The purse, \$10 from each club, to be divided 50, 30 and 20 per cent. among the three clubs making the highest total scores for the nine tournaments. For programmes and information, address E. R. Burwell, Bristol, Conn.

Mr. Geo. L. Carter, of Lincoln, Neb., has sent us a circular, from which we take the following: Programme: Sept. 28, chicken shooting at Broken Bow; Sept. 29-30, target tournament at Broken Bow, \$125 added; Oct. 2-3, target tournament at Hyannis, \$200 added; Oct. 4-5, grouse shooting at Hyannis; Oct. 6-7, target tournament at Alliance, \$250 added. After the programme at Hyannis the visitors will be entertained by cowboys with roping and tying contest, bronco busting, etc. Geo. L. Carter, of Lincoln, will assist the management in each of these tournaments. For further information and programmes address Broken Bow, F. Miller, Berwyn, Secretary; Hyannis, Thos. McCauley, Hyannis, Secretary; Alliance, Lew A. Shawrer, Alliance, Secretary.

The following, from the Shooting Times, treats of cruelty to crops: "Another pigeon-shooting case was heard at the St. Helens County Court by Judge Shand, last week, when Jas. Speakman, collier, of Dalesrow, Whiston, claimed £5 for the loss of a pigeon shot by Joseph Strettle, farmer, of Whiston. Plaintiff's case was that he was a pigeon fancier, and trained birds for flying in matches and sweeps. On the 16th of last month he was near defendant's farm, and saw defendant in one of the fields with a gun. One of plaintiff's birds flew over the field, and defendant shot at it. The pigeon died the following day from a wound in the crop. It was a red chequered cock, about twelve months old, and plaintiff would not have taken £10 for it. On Easter Monday it won £4 in a sweepstake, and £5 in a match on Whit-Saturday. Defendant denied that the bird was flying when it was shot. It was on the ground pulling up young turnips and eating the seeds. His Honor, in giving judgment for the defendant, with costs, said he was satisfied that the pigeon was on the ground and doing considerable amount of destructive work. The law, therefore, gave the farmer the right to shoot pigeons which were damaging crops."

The programme of the Interstate Pacific Coast Handicap target tournament, to be held at San Francisco, Sept. 15-17, under the auspices of the San Francisco Trapshooting Association, has \$1,500 added. On the first day, the programme consists of nine events, at 15 and 20 targets, entrance \$1.50 and \$2.00, with \$40 and \$60 added respectively. On the second day, there are three events at 15 and 20 targets, and the preliminary handicap at 100 targets, \$7 entrance, handicaps 14 to 22yds.; high guns; \$250 added. On the third day, there are three events at 15 and 20 targets and the Pacific Coast handicap at targets; 100 targets; \$10 entrance; handicaps 14 to 22yds.; high guns; \$400 added. The handicap contests are amateur events. Shooting will begin at 9 o'clock each day. Rose system in the sweepstake events. Entries in the preliminary and Pacific Coast handicap close at 6 P. M., on the day previous to that for which they are scheduled. The handicappers are Messrs. M. J. Iverson, San Francisco; W. H. Varien, Pacific Grove; M. Abrahams, Portland; Guy Lovelace, Los Angeles; F. K. McBroom, Spokane. Mr. Elmer E. Shaner, Secretary-Manager, will be secretary to the committee. Guns, ammunition, etc., forwarded by express must be prepaid and sent to one of the following sporting goods houses: Clabrough, Golcher & Co., 538 Market street, San Francisco, Cal.; Shreve & Barber Co., 739 Market street, San Francisco, Cal.; Olympic Arms Co., 801 Market street, San Francisco, Cal. Mark your own name on the box that goods are shipped in, and it will be delivered to the shooting grounds free of charge.

BERNARD WATERS.

**Clearview—Rambler.**

PHILADELPHIA, Aug. 12.—On the grounds of the Clearview Gun Club to-day a 25-man team race took place between teams of the Clearview and Rambler gun clubs. Scores:

**Springfield, Mass., Shooting Club.**

THE Springfield, Mass., Shooting Club will hold one of their popular all-day shoots at clay targets on Labor Day, Sept. 4. The programme calls for 200 blue rock targets, \$16 entrance in sweeps, \$50 added money. All shooting will be from 16yds. Targets will be thrown from two sets of expert traps, arranged Sergeant system. Interstate rules to govern. Lunch will be served on the grounds. Loaded shells will be for sale at the club house. The shoot will be held rain or shine, the shooting stand being under cover. Targets included in all entrance at 1½ cent each. Professionals and paid experts will be allowed to shoot for targets only. Shooting will commence promptly at 9 o'clock, and continue all day. To the amateurs making highest average shooting the entire programme thirty-five merchandise prizes will be awarded, first being a Marlin repeating rifle; third, Colt automatic pistol; fourth, Smith & Wesson revolver; fifth, Stevens Ideal Rifle.

These prizes represent a cash value of \$154. Purses divided Rose System, four moneys, less than ten entries, three moneys. To reach the grounds, take Indian Orchard or Palmer cars to Red House Crossing, grounds one minute walk from car. Ship guns and ammunition prepaid to C. L. Kites, Sec'y, 416 Main street, and they will be delivered on grounds free of charge. Sweeps optional, any one may enter any event and shoot for targets only. A very attractive programme has been gotten out, which may be had by addressing the Secretary. No time or expense has been spared to make this shoot the best we have ever held, and a good time is guaranteed to all who attend.

**Mount Kisco Gun Club.**

MT. KISCO, N. Y., Aug. 12.—The shooting contest for the John W. Bowron silver trophy, which has been held for the past month, came to an end Aug. 10, when Louis Carson won it twice in succession. This, with his previous winning on Aug. 3, gave him the cup.

Among those with us to-day was Sim Glover. He was in town on business, and in the afternoon rushed to the grounds to see the boys. Every member was very glad to see him. Scores were as follows:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6
Targets:	15	15	25	25	15	10	Targets:	15	15	25	25	15	10
S Glover, 0....	13	14	22	23	..	..	L Carson, 4....	12	11	25	25	13	8
Dr Dunn, 6....	10	11	17	19	10	7	A Burham, 8....	8	9	18	20	9	5
G Sutton, 0....	13	12	21	22	12	10	G Woods, 8....	8	7	17	18	7	5
A Betti, 0....	13	14	23	23	15	10	H Smith, 5....	9	10	22	23	10	8
E Martin, 7....	9	9	21	24	10	6	F Pelton, 5....	..	..	19	20	9	6
R Gorham, 0....	14	12	21	22	13	9	F Boehemer, 8....	..	..	22	18	..	..
R Fay, 7....	10	10	24	24	9	6							

Events 3 and 4 were for Bowron trophy; handicaps apply only in those events. R. W. GORHAM, Sec'y.

**Raleigh Gun Club.**

RALEIGH, N. C., Aug. 10.—Our regular weekly was held this afternoon, and will be, without a single miss, if but two are in attendance. We are going to keep the organization together. This small attendance will pick up some day. Emory H. Storr, a clever representative, dropped in on his return from the Wilson, N. C., shoot, shaking hands with his many friends. We are always glad to have him visit our city and club. The following scores were made:

	Shot at. Broke.		Shot at. Broke.		
Johnson	90	\$4	Barrett	75	71
Storr	75	71	Walters	50	44

R. T. GOWAN.

**Independent Gun Club.**

EASTON, Pa., Aug. 8.—The Independent Gun Club held the third of the series of five shoots for the L. & R. trophy on Aug. 5, when the following scores were made:

Event No. 1, 50 targets, back scores: Markley 46. Event 2, 50 targets, handicap for trophy: Markley (0) 46, W. Maurer (0) 42, Ivey (14) 32, Elliott (10) 32, Sandt (14) 29. The next shoot will be held Aug. 19.

W. R. IVEY, Sec'y.

"Ugh!" grunted Mr. Newlied, "what is this stuff, anyway?" "Why, what's the matter with it, George?" exclaimed Mrs. Newlied. "I made it out of Mrs. Spouter's cook book, and —" "Ah, I guess this is a chunk of the binding I've got here then." —Philadelphia Ledger.

"Dear old Henry! I am glad he is so fortunate." "How fortunate?" "Why, he just told me that marriage was the grandest institution on earth." "Yes, I heard him; but didn't you notice that his wife was present?" —Houston Post.

Pennsylvania State Tournament Expense.

PITTSBURG, Pa., Aug. 9.—Editor Forest and Stream: So many people are under the impression that tournaments of the magnitude of the one held recently at Pittsburg, Pa., under the auspices of the Herron Hill Gun Club, are money-making affairs, and we have received so many inquiries touching on the subject that we deem it advisable for the good of the sport to submit a statement to the trapshooting fraternity, showing receipts and expenditures of our tournament in order that those contemplating giving a tournament under the same conditions may not be misled.

We thank you to publish this statement or whatever part you may see fit, in the columns of FOREST AND STREAM.

Yours respectfully, LOUIS LAUTENSLAGER, Chairman of Committee.

Pittsburg, Pa., Aug. 10.

STATEMENT FIFTEENTH ANNUAL TOURNAMENT, PENNSYLVANIA STATE SPORTSMEN'S ASSOCIATION.

RECEIPTS.

Table with columns for Event No., entries, and amount. Includes Preliminary Day, May 1, and First Day, May 2.

Table with columns for Event No., entries, and amount. Includes First Day, May 2, and Second Day, May 3.

Table with columns for Event No., entries, and amount. Includes Second Day, May 3, and Third Day, May 4.

Table with columns for Event No., entries, and amount. Includes Third Day, May 4.

Table with columns for Event No., entries, and amount. Includes Fourth Day, May 5.

Table with columns for Event No., entries, and amount. Includes Boat Receipts.

Table with columns for Event No., entries, and amount. Includes Recapitulation of Receipts.

EXPENDITURES.

Table with columns for Item, amount, and total. Includes Help, Miscellaneous, and Live Birds.

Table with columns for Item, amount, and total. Includes Recapitulation of Expenditures.

Table with columns for Item, amount, and total. Includes Net cost to Club.

Alert Gun Club.

EASTON, Pa., Aug. 12.—On Sept. 4 the first annual Labor Day tournament of the Alert Gun Club, Phillipsburg, N. J. (opposite Easton, Pa.), will be held. Edward F. Markley, Easton, Pa., is the secretary.

There will be eleven events, composed of 10, 15, 20 and 25 targets, in all 180 targets, and entrance for the total, \$10. Targets will be thrown at a distance of 50 yds., at 1/2 cent each.

EDWARD F. MARKLEY, Sec'y.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Recreation Rod and Gun Club.

MORGANTOWN, W. Va., Aug. 9.—The Recreation Rod and Gun Club of this city, completed a two-day tournament on its grounds, Recreation Park, this evening, and altogether a very successful and enjoyable shoot was held.

The first day was devoted to the regular programme of the Monongahela Valley Sportsmen's League of West Virginia, and the second day was club day, when a mixed programme was shot off for targets, merchandise and money events.

The weather conditions were perfect, and the early predictions that some good scores would be made, were pretty well fulfilled both in the expert and amateur classes, although the attendance was hardly up to expectations, as from inquiries and requests for programmes, we expected at least sixty shooters.

The management is under obligations to the expert squad for valuable assistance rendered, and wishes to thank them for the same. The Peters silver loving cup, donated by the Peters Cartridge Company, and emblematic of the five-man team championship of the League, was won by the team representing the Recreation Rod and Gun Club of this city, with the League record score of 111 out of 125; and as this is the fourth win for this club, the cup now becomes its property, in accordance with the conditions governing this competition.

The Laffin & Rand silver loving cup, emblematic of the individual championship of the League, was won for the month by Elmer F. Jacobs, of the Recreation Rod and Gun Club.

Averages and runs: Longest run first day, Wm. H. Heer, 97; second day, Chas. G. Spencer, 165. Longest run for tournament, Chas. G. Spencer, 93.53 per cent. High amateur average first day, Ed. O. Bowers, 91.43 per cent.; second day, W. A. Wiedebusch, 92.12 per cent. High amateur average for tournament, W. A. Wiedebusch, 90. per cent. Scores follow:

Table with columns for Name, Shot at, Broke, and Total. Lists scores for various participants like C. G. Spencer, W. H. Heer, L. Lawrence, etc.

League team race, five-man teams, 25 targets per man:

Table with columns for Name, Price, and Total. Lists scores for Recreation R. & G. C. and Fairmont G. C.

Mannington Gun Club.

Table with columns for Name, Price, and Total. Lists scores for Long, captain, Heckman, Carnahan, Dunigan, Halfast.

Individual League championship, 20 targets per man:

Table with columns for Name, Price, and Total. Lists scores for Jacobs, Wiedebusch, Halfast.

Tie shot off, miss-and-out and won by Jacobs.

Aug. 11.—The Recreation Rod and Gun Club of this city held its nineteenth regular weekly shoot at Recreation Park this afternoon, with eight guns out. The regular programme was run off and resulted in the winning of the club championship gold medal for the week by John M. Cobun with an average of 88 per cent. for the entire programme. Mr. Cobun also won the officers' goblet for the week with a score of 18 out of 19. The scores:

Table with columns for Name, Score, and Total. Lists scores for No. 1 miss-and-out, No. 2, officers' goblet, handicap, No. 3, club prizes, 25 targets.

Table with columns for Name, Score, and Total. Lists scores for Events: Cobun, Sivey, Jacobs, Dawson.

\*Denotes number shot at in No. 2.

Fourth event, two-man team race, 20 targets per man:

Table with columns for Name, Score, and Total. Lists scores for Dawson, captain, Cobun, Sivey.

ELMER F. JACOBS, Sec'y-Treas.

Bergen Beach Gun Club.

BROOKLYN, L. I., Aug. 8.—The August shoot of the Bergen Beach Gun Club was unfortunate as to weather conditions, light rains prevailing during the afternoon. The trade representatives present were Messrs. F. Schoverling, S. Glover and Bob Schneider. Scores:

Table with columns for Name, Score, and Total. Lists scores for Events: Schorty, Grover, Dreyer, F. Schoverling, Scott, Weiskotten, Duster, H. Bergen, Suydam, Gubring, Wynne, J. H. Welbrock, Schneider, Slavin, Pfender.

Cincinnati Gun Club Tournament.

St. BERNARD, O., Aug. 11.—The Cincinnati Gun Club is giving the amateurs a treat at their annual shoot in September, this year, inasmuch as they are departing from the usual methods. As a prominent amateur advised, in an article published some months ago, we will "give the profits of the shoot to the shooters."

Supt. Gambell has advised the club to adopt some such plan for several years, arguing that the stimulus given to the sport by holding a successful tournament is a sufficient reimbursement for their trouble. This year he has been given carte blanche, so it is up to him to make good, and he is looking to each one of you to help him do it.

Mr. L. J. Squier (better known as "Luther") gave a practical demonstration of the idea at his shoot in Wilmington, and as he is on the tournament committee of our club this year, the amateurs have him to thank for the treat.

This plan of giving all the profits to the contestants will be given a thorough try-out at this shoot, and as the expenses will be comparatively light the amount will be no small sum. All we ask is a good turn-out to let us know you appreciate a "good thing." We will do our best to have you go away with a good word for us.

The majority of the vast army of trapshooters are "wise" to the fact that the club giving a well-managed tournament, where from 100 to 150 shooters attend, makes a profit of \$500 to \$1,000. Why the contestants should be expected to travel hundreds of miles to contribute this amount for the individual welfare of the club is hard to understand, and it is manifestly unfair to expect them long to subscribe to this arrangement.

We will guarantee a smooth-running shoot, the best referees, scorers and pullers with whom you ever came in contact, and it will be the endeavor of those in charge, and all connected with the club to anticipate and satisfy all the requirements of the club's guests on this occasion.

TOURNAMENT COMMITTEE, (by Arthur Gambell).

Bonesteel, S. D., and Vicinity.

BONESTEEL, S. D., Aug. 9.—There has been quite a revival of shooting interest with the advent of the warm weather and inter-city shoots are of frequent occurrence and are always harmonious and thoroughly enjoyable. Half a dozen new shooters have broken into the game, and under the personal coaching of the Secretary are in a fair way to become as proficient as some of the older shooters. The Peters Cartridge Co. medal, representing the championship of Gregory county, is now being shot for every two weeks, and the competition always brings out a good attendance.

At Herrick on the 8th inst., the medal was shot for during the anniversary of the existence of that little city; among the other attractions being base ball, foot races, horse races, speeches, etc. Practice events for the week, some of them being shot at Fairfax, and some at Bonesteel and Herrick, are as follows:

Table with columns for Name, Shot at, Broke, and Total. Lists scores for O. Porter, C. Porter, Thompson, Leach, Spatz, Kelly, Leach.

Championship race at Herrick, 25 targets:

Table with columns for Name, Score, and Total. Lists scores for Leach, O. Porter, Comstock, Thompson, Spatz.

The next shoot will be at Fairfax on the 24th inst., and all shooters are invited to take part. There will be seven sweeps, 15 birds, \$1.50 entrance, and the regular 25-bird race, entrance price of targets, for the Peters Cartridge Company's trophy representing the championship of Gregory county. W. A. LEACH, Sec'y.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Aug. 5.—Smith won Peters Cartridge Co.'s badge. At meeting of the Board of Directors, held Aug. 6, 1905, Dr. S. H. Moore was chosen as President to succeed Mr. C. H. Morris, resigned. Mr. Wm. Armstrong was elected Secretary, effective Sept. 1, 1905, to succeed J. W. Bell, who resigned to take effect on that date.

We have claimed Oct. 9 and 10 as dates for holding our fall tournament. We will also hold an all-day shoot Labor Day, consisting of ten 20-target events. One set of traps will also be used for those who desire to shoot for targets only.

Table with columns for Name, Score, and Total. Lists scores for Events: Parry, Finley, Wands, Moore, Smith, Tripp, Morris, Dixon, Hann, Armstrong, Southern, Sutcliffe, Moller.

J. H. BELL, Sec'y.

PUBLISHERS' DEPARTMENT.

"A Night on the Locomotive of 'the Pennsylvania Special'." The New York Herald's Thrilling Story of a Ride on the 18-Hour Flyer.

Few persons have not felt a desire to take a ride on the locomotive of a fast express train, to sit in the cab with the engineer and feel the throbs of the life-like engine as it rushes over the rails. Such an experience on a mile-a-minute flyer is especially fascinating. It is not given to every one to take such a ride, and this makes the interest the greater and the desire all the more keen.

To tell its readers what a ride on the fastest long-distance train in the world is like, the New York Herald recently sent a reporter from New York to Chicago on the locomotive of "The Pennsylvania Special," the eighteen-hour train of the Pennsylvania Railroad, and published his experience in a late issue of that paper. So fascinating is his story, so full of life and so vividly told, it has been reprinted in pamphlet form with the original sketches and photographs reproduced. It is a remarkable recital of the sensations experienced in the locomotive cab, and of the iron nerve and clear vision which guard the fastest and most notable train the world has ever seen.

A copy of the story will be sent on receipt of a two cent stamp by Geo. W. Boyd, General Passenger Agent, Pennsylvania Railroad, Broad Street Station, Philadelphia, Pa.

Newfoundland is constantly growing in favor as a resort for anglers and big-game hunters, and more and more sportsmen from the United States and Canada go there every year. Yet it is often a difficult matter for these sportsmen to secure that specific and detailed information about where to obtain supplies and their prices, which each desires to have when making up his plans. The advertisement in another column, of Messrs. Ayre & Son would seem to give to intending visitors to Newfoundland the opportunity to get certain information that they need, and those who contemplate the trip will do well to write to Messrs. Ayre & Son, Birch Head, Bay of Islands, Newfoundland.

As will be seen by their advertisement, Messrs. Charles Plath & Son this week offer to anglers some special bargains in reels. The goods advertised are undeniably excellent, and the prices so low that it is worth the while of every angler to inspect the things for himself. The excellent fishing which is reported now from all directions is having very favorable influence on the fishing tackle trade.

Persons owning trout brooks or ponds, or controlling sections of streams adapted for trout, will be interested in the advertisement of the Paradise Brook Trout Co., of Parkside, Pa., who are prepared to furnish trout of all sizes for stocking purposes. They also offer opportunities for fishing, charging for the fish taken by the pound.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

**The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.**

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

## THE FEVER AND A MOSQUITO.

WHEN the presence of yellow fever was reported in New Orleans this year, the announcement was received by the citizens of that city and by the public at large with a calmness which was in marked contrast with the panic which in the past has always attended the coming of the fever. This was because the terrifying mystery of the disease has been taken from it, and methods of coping with it have been discovered. This triumph over yellow fever was the greatest, farthest reaching and most beneficent achievement of the American army of intervention in Cuba. The story is worth recalling.

The fever had prevailed on the island for 130 years. It was carried to Havana in the year 1762 by a band of convicts who were brought from Vera Cruz to work on the fortifications at Havana. Thus obtaining a foothold the disease became a permanent scourge, from which the island was never free. Every month in every year had its yellow fever cases. When the United States intervened in Cuba, it was recognized that one task to be undertaken was the cleaning of Havana, to remove forever the pest-breeding conditions existing there. When the Americans entered the city they found it filthy beyond description. Under the direction of General Ludlow was undertaken the tremendous task of sanitary reform. In a few months the streets had been made as clean as those of any modern city—cleaner than those of most cities of the United States, as they are to-day—and an adequate system had been put into operation for the removal of garbage. If the yellow fever had been altogether a filth disease, these efficient sanitary measures must have been efficacious to reduce the number of victims; and indeed the fever conditions during the first half of 1899, which was the first year of the American occupation, appeared to demonstrate the good results of the sanitary reform. In January there was only one death from fever, in February none, in March one, in April two, in May one, in June one and in July two, a total of only seven deaths in the first seven months. This was accepted by the authorities as a demonstration that the cleansing of the town had eradicated the disease.

There were other conditions which were exceedingly favorable in the fight against the fever. The preceding five years had been years of war, and for the last few months the blockade by American warships had practically put an end to immigration; the non-immune population, that is, of residents who had never had the fever, had been pretty well exhausted; there was no longer very much material left for the disease.

But in August of this year, 1899, conditions were changed; and with the change came a recurrence of the scourge which brought consternation to the authorities and showed them that their fancied security in municipal cleanliness was without secure foundation. Large numbers of Spanish immigrants arrived at Havana, 12,000 coming in between August and December. This meant a new supply of non-immune material, and at once the fever broke out. By December there had developed a severe epidemic which continued into 1900, and despite the fact that the city was as clean and in as good sanitary condition as the skill of the authorities could make it, there were not less than 1,400 yellow fever cases.

The authorities were perplexed and baffled. Their theory had been that yellow fever was a filth disease. They had got rid of the filth, but the disease persisted,

and week after week and month after month found a growing host of victims. The army of the United States had been defeated in the campaign against a mysterious foe, but the victory was yet to be achieved, and achieved by the army.

In the summer of 1900 Surgeon-General Sternberg entrusted to a board named by him the task of studying the infectious diseases prevailing in Cuba. The board consisted of Major Walter Reed, Surgeon in the United States Army, and Contract Surgeons James Carroll, Aristides Agramonte and Jesse W. Lazear, of the United States Army. Arriving in Quemodo in June, the board first devoted its attention to a series of bacteriological investigations, to discover, if possible, the specific bacteria which caused yellow fever, but the investigation was without result.

Experiments were then undertaken based on a theory which had been suggested twenty years before by Dr. Carlos Finlay, a Cuban, of Havana, which was that the yellow fever was conveyed by means of a mosquito, the species probably being *Culex fasciatus*, or as afterward named and now known, *Stegomyia fasciatus*. Of eleven persons under observation at this time who were bitten by contaminated mosquitoes, ten were unaffected and two contracted the fever, one of them being Dr. Lazear, of the commission, whose death followed. The circumstances attending these cases were such as to leave no doubt in the minds of the observers that the disease had been conveyed by the insects, and in a preliminary note read before the American Public Health Association at Indianapolis in October, 1900, the commission announced that the mosquito was the agent.

In November of that year an experiment station, named in honor of their dead comrade, Camp Lazear, was established by the commission one mile from Quemodo, and two experiment houses were constructed, each carefully screened beyond the possibility of the entrance of mosquitoes. Volunteers were then called for to submit themselves to experiment. These voluntary patients were found among hospital attendants, American soldiers and Spanish immigrants, all of them being non-immune subjects. The volunteers stationed in one of the screened houses, termed the infected mosquito building, were subjected to the bites of mosquitoes which had been infected by having bitten yellow fever patients. The volunteers in the other house, designated the infected clothing building, were carefully screened from all mosquitoes, but slept in contact with soiled clothing, bedding and other articles brought direct from the yellow fever hospitals. The first volunteer who was bitten by an infected mosquito and thus contracted the disease was John R. Kissinger, a soldier, of whose heroic conduct we should not fail to recall the tribute paid by Dr. Reed. "I cannot let this opportunity pass," Dr. Reed wrote, "without expressing my admiration of this young Ohio soldier, who volunteered for this experiment, as he expressed it, 'solely in the interest of humanity and the cause of science,' and with the only proviso that he should receive no pecuniary reward. In my opinion, this exhibition of moral courage has never been surpassed in the annals of the army of the United States."

Of the thirteen non-immunes in the infected mosquito building, who were bitten by mosquitoes which had bitten a yellow fever patient at least twelve days previously, ten contracted the disease. Happily, none of the cases terminated fatally. Of the volunteers who slept in the infected clothing building, although they spent twenty nights there in close contact with the bedding, clothing and filthiest articles that had been used and soiled by patients in the fever hospitals suffering with the disease in its most virulent type, not a single one contracted the fever. The experiments were conducted throughout with a thoroughness and care and in a scientific spirit which precluded the possibility of error, and insured the confidence of the scientific world in the results achieved. The tests were accepted as proving beyond question the truth of the Finlay theory that the disease was transmitted by a mosquito. Briefly summed up, the conclusions of the board were as follows:

"1. The specific agent in the causation of yellow fever exists in the blood of a patient for the first three days of his attack, after which time he ceases to be a menace to the health of others,

"2. A mosquito of a single species, *Stegomyia fasciatus*, ingesting the blood of a patient during this infective period is powerless to convey the disease to another person by its bite until about twelve days have elapsed, but can do so thereafter for an indefinite period, probably during the remainder of its life.

"3. The disease cannot in nature be spread in any other way than by the bite of the previously infected *Stegomyia*. Articles used and soiled by patients do not carry infection."

In February, 1901, immediately following these experiments; Maj. W. C. Gorgas, Chief Sanitary Officer at Havana, adopting the findings of the commission, set in operation a systematic campaign to eradicate the disease by exterminating the fever bearing *Stegomyia*. The campaign was twofold, to kill the mosquitoes, and destroy their breeding places. Every new case of fever, as soon as it was reported, was promptly isolated in premises carefully screened with fine wire screens to prevent the mosquitoes from reaching it, and the house in which the case had occurred and the houses adjacent to it were sealed up and filled with formaldehyde for the purpose of killing the mosquitoes. As the mosquitoes breed only in water, systematic work was undertaken to drain stagnant bodies of water wherever practicable, and to put petroleum upon the surface of such waters as could not be drained, to screen cisterns and reservoirs, and to remove, so far as possible, every bit of water which might afford a place for mosquitoes to deposit their eggs.

At the time when the new campaign was undertaken, the fever was raging to an extent and with a virulence as bad as it had ever been in the city at that time of the year. The town was infected in every part, and the non-immune population was probably as large as it had ever been in Havana. Nevertheless, in spite of all this, the good results of the new treatment were almost immediately apparent. In January there had been seven deaths from the fever, in February, the first month of the new campaign, there were five; in March one, in April, May and June, none, one in July, two in August, and two in September. From that month, in 1901, to the present time, there has not been a single case originating in Havana. The triumph over the disease was complete. The surgeons of the American army had accomplished the task set before them, and Dr. Walter Reed, the guiding spirit of the board, had won a name among the great benefactors of the human race.

## SUCCESSFUL FROG CULTURE.

THERE are printed to-day by a fortunate because instructive coincidence two papers relating to frogs. One records the practical extermination of frogs from a river in which they formerly abounded. The other, by Mr. William E. Meehan, Pennsylvania's Commissioner of Fisheries, relates the success of an enterprise of artificially raising frogs in vast numbers. A reading of Mr. Meehan's paper gives abundant reason for accepting frog culture as a thing accomplished. If the term culture shall be objected to, we may at least designate it as frog farming. The plan is simplicity itself. Prepare a suitable place for the planting of spawn, provide food, protect the little frogs from the rapacity of the big ones. There is nothing complicated in the method, and yet the conditions making for success were arrived at only after a series of years of experiment and ingenious devising and close study of the subject.

Mr. Meehan and his associates have achieved success in the new field of food production. Others will follow. Frog growing will become a recognized branch of the work of fish commissioners. The success of Mr. Meehan's work means the contribution of an important and valuable factor to the food supply. His achievement is of wide interest and will have an equally wide and grateful recognition.

GENERAL EMMONS CLARK, whose death occurred on Aug. 9, and the late E. R. Wilbur were life-long friends. General Clark was a constant reader of the FOREST AND STREAM, and it is recalled that at one time, while he was Colonel of the Seventh Regiment, desiring to complete the file of the paper for the armory library, he paid a fabulous price for a single missing number.

## Trappers of Oregon Territory.

FROM about the year 1810 until 1845 the question as to the sovereignty over Oregon Territory was one of constantly increasing interest in the United States and England. Though for much of this time without permanent white inhabitants, the region was known to be vast, to produce some fur-bearing animals, and to have a long coast line which would ultimately give access to a country that might prove rich. At first the question as to who should possess it attracted little attention, but about 1835 American missionaries who had gone there to work among the Indians, began to agitate the question of English or American supremacy, and from that time until the Ashburton-Webster treaty of 1846 great interest was felt in the Territory.

The Americans claimed the country by right of discovery, because in the year 1792 Capt. Robert Gray, of Boston, in the ship *Columbia*, discovered and ascended the river as far as Gray's Bay, and named the river after his vessel. The United States Government claimed also that Oregon was included in the sale of the Province of Louisiana by France in 1803; but this claim had no basis of fact. It claimed it also on the ground of prior exploration, since Lewis and Clark, in the years 1804 and 1805, had explored the *Columbia* to its mouth and reported quite fully on the country. Again in 1810 Captain Winship, of New England, built the first house in Oregon on the *Columbia* River, and in 1811 Astoria was established by John Jacob Astor.

The British, on the other hand, claimed Oregon because Drake had discovered the northwest coast, in latitude 48 degrees in 1578. Captain Cooke had entered the Straits of Fuca in 1778, and Vancouver had surveyed the coast from latitude 30 degrees to latitude 60 degrees in 1792. In 1813, during the war, Mr. Astor's agent sold Astoria to the Northwest Fur Company, and in 1821 it passed from the Northwest Fur Company into the hands of the Hudson's Bay Company. Each nation, therefore, had a number of reasons—satisfactory to itself—for asserting ownership in the territory which extended from the crest of the Rocky Mountains to the Pacific Ocean, and from the northern boundary of the Spanish possessions—where California ends—northward to what was then Russian America.

In the year 1840 an effort was made to establish a local government for Oregon, although at that time it had only about 240 white inhabitants. By this time people in Great Britain and at the seat of the United States Government were actively interested in the matter, and this interest was constantly increased by the return of missionaries, who had much to say about this distant country, and were endeavoring to induce emigrants to settle there.

One of the active writers on this subject was John Dunn, an Englishman, who for eight years had resided in the country as an employee of the Hudson's Bay Company, and who was earnest in his desire that the region should be retained by Great Britain, and should by no means be given up to the United States. In 1844 there was published in London a volume from his pen, entitled "History of the Oregon Territory and British North American Fur Trade; with An Account of the Habits and Customs of the Principal Native Tribes on the Northern Continent." The volume gives an excellent account of the fur trade and the people who were engaged in it, but in his preface Dunn expresses with much fervor his views on the efforts of the Americans to secure the territory known as Oregon, and does not hesitate to express very frankly his opinion of the American character. During his residence in Oregon he had formed very positive views, and he speaks with much indignation of the desire of the Americans to "sweep the Pacific," and spread their internal trade through the Canadas, and the Polar Circles; and banish the Britishers as traders, if not as residents, from the whole northern continent—a boastful threat which they have signally failed to execute.

The knowledge gained by residence in the country led Dunn, on his return to England, to take an active part in the discussion of the Oregon question. He says: "On my return, although I was, from my knowledge of those Americans that traded on the coast, or had squatted in the southwestern part of Oregon, or have lately been employed by the company as trappers, prepared to hear any monstrous assumptions of right set forth by the American populace, through their *loco foco* organs of the press. I did not expect that the respectable portion of the press—much less that their functionaries and ministers of State, even up to the President—would echo the opinions of the rabble that controls the Legislature. But to my surprise I found that the subject was viewed by them through the democratic spectacles.

"At the opening of Congress, in 1843, the President, without any previous provocation to the declaration—volunteered the announcement to the whole world that the whole territory is American, and that American it will be preserved and maintained. But this is not merely the avowal of the President, but the whole current of a most vehement debate runs in support of this fraudulent assertion of a claim. Says the President:

"The territory of the United States, commonly called the Oregon Territory, lying on the Pacific Ocean, north of the 42d degree of latitude, to a portion of which Great Britain lays claim, begins to attract the attention of our fellow-citizens, and the tide of population which has re-

claimed what was lately an unbroken wilderness in more contiguous regions, is preparing to flow over those vast districts which stretch from the Rocky Mountains to the Pacific Ocean."

In 1818 a treaty of joint occupancy of the region had been declared between Great Britain and the United States, but this treaty, instead of settling the question seemed only to give rise to fresh disputes. Dunn gives what he believes to be a fair and dispassionate view of the Oregon Territory, and thinks that his volume will convey a fairer and more concentrated impression than all the American factious books that have hitherto been published on the subject. He regrets that his volume "occasionally portrays some dark features in the American character," but declares "that in depicting the American character, I quote American authority, and that in showing the weakness of their pretensions to the country I quote historical and diplomatical facts—facts not questionable by the Americans themselves."

Of course we all know how the matter finally came out, and that by the Ashburton-Webster treaty of 1846 the Oregon Territory south of the 49th parallel of north latitude, became the undisputed property of the United States. This was far less than the more enthusiastic Americans claimed, for there are still living many men who can remember when excitement on this subject ran so high that the cry "Fifty-four forty or fight" was a political shibboleth.

At the present day Dunn's preface has only a certain curious interest, and now and then through the volume occur allusions to the question of the control of the Oregon, which show his strong patriotic feeling, but in the main the book is devoted to giving a true picture of early life in the fur country. His description of the old-time trappers, or beaver hunters, and of the voyageurs, or boatmen, is well worth reproducing here:

"In the old times of the Canadian fur trade, when the trade in furs was chiefly pursued about the lakes and rivers, the expeditions were, in a great degree, carried on in *batteaux* and canoes. But a totally different class now sprung up—the 'mountaineers'—the traders and trappers that scale the vast mountain chains and pursue their hazardous vocation amidst their wild recesses—moving from place to place on horseback—exposed not alone to the perils of the wilderness but to the perils of attack from fierce Indians, to whom it has become as favorite an exploit to harass and way-lay a band of trappers with their pack horses as it is to the Arabs of the desert to plunder a caravan. The equestrian exercises in which they are constantly engaged—the nature of the country they traverse—vast plains and mountains pure and exhilarating in their atmospheric qualities, seem to make them physically and mentally a more lively, vigorous, daring and enduring race than the fur traders and trappers of former days, who generally had huts or tents to shelter them from the inclemency of the seasons, were seldom exposed to the hostility of the natives, and generally were within reach of supplies from the settlements. There is, perhaps, no class of men on the earth who lead a life of more continued exertion, danger and excitement, and who are more enamoured of their occupation than the free trappers of the wild regions of the west. No toil, no danger, no privation can turn the trapper aside from his pursuit. If his meal is not ready in time he takes his rifle—hies to the forest—shoots his game, lights his fire and cooks his repast. With his horse and his rifle he is independent of the world, and spurns its restraints. In vain may the most vigilant and cruel savages beset his path, in vain may rocks and precipices and wintry torrents oppose his progress; let but a single track of a beaver meet his eye and he forgets all danger and defies all difficulties. At times he may be seen with his traps on his shoulder, buffeting his way across rapid streams amidst floating blocks of ice; at other times may he be seen with his traps slung on his back, clambering the most rugged mountains, scaling or descending the most frightful precipices, searching by routes inaccessible to horse, and never before trodden by white man, for springs and lakes unknown to his comrades, where he may meet with his favorite game.

"This class of hunters are generally Canadians by birth, and of French descent, who, after being bound to serve the traders for a certain number of years and receive wages, or hunt on shares, then continued to hunt and trap on their own account, trading with the company like the Indians, hence they are called *free men*. Having passed their youth in the wilderness in constant intercourse with the Indians, and removed from civilized society, they lapse with natural facility into the habits of savage life. They generally intermarry with the natives, and, like them, have often a plurality of wives. Wardens of the wilderness, according to the vicissitudes of the seasons, the migrations of animals, and the plenty or scarcity of game they lead a precarious and unsettled existence, exposed to sun and storm, and all kinds of hardships, until they resemble the Indians in complexion, as well as in tastes and habits. From time to time they bring their peltries to the trading houses of the company and barter them for such articles as they may require. When Montreal was the great emporium of the fur trade some of them would occasionally return, after an absence of many years, to visit his old associates. There they would squander the long and hard earned fruits of their labors, and after the fit of revelry was over go back to their former toils and the freedom of the forest. Some few of them, however, retained a little of the thrift and

forethought of the civilized man and became wealthy among their improvident neighbors; their wealth consisting chiefly of large bands of horses, scattered over the prairies in the vicinity of their abodes.

"There was another class, the *native Indians* of Canada, who had partially conformed to the habits of civilization and received the doctrines of Christianity, under the influence of the French colonists and the Roman Catholic priests, who certainly diffused more of the knowledge and principles of the Christian religion among the North American Indians than the Protestant missionaries have. These half-civilized Indians retained some of the good, and of the evil qualities of their original stock. Though they generally professed the Roman Catholic religion, it was mixed with some of their ancient superstitions, especially their belief in omens and charms. These men were often employed for a stated time by the company as trappers and canoe men, though on lower terms than were allowed to the white men, but generally in the end they became *free trappers*.

"The voyageurs may be said to have sprung up out of the fur trade, having been originally employed by the early French merchants in their trading expeditions through the labyrinth of rivers and lakes of the boundless interior. They were coeval with the *coureurs des bois*, or rangers of the woods, already noticed, and like them, in the intervals of their long and laborious expeditions, were prone to pass their time in idleness and revelry about the trading posts or settlements squandering their hard earnings in heedless conviviality, and rivalling their neighbors, the Indians, in indolent indulgence and an improvident disregard of to-morrow. Their dress is generally half-civilized, half-savage. They wear a capot, or outside coat, made of a blanket, a striped cotton shirt, cloth trowsers, or leather leggins, moccasins, or deerskin shoes, without a sole, and ornamented on the upper, and a belt of variegated worsted, from which are suspended a knife, tobacco pouch and other implements. Their language is of the same piebald character, being a French patois, embroidered with Indian and English words and phrases. Their lives are passed in wild and extensive roving in the service of individuals, but more especially of the fur traders. They are generally of French descent, and inherit much of the gaiety and light-heartedness of their ancestors, being full of anecdote and song, and ever ready for the dance. They inherit, too, a fund of civility and complaisance, and instead of that hardness and grossness which men in laborious life are apt to indulge toward each other, they are naturally obliging and accommodating, interchanging kind offices, yielding each other assistance and comfort in every emergency, and using the familiar and affectionate appellations of 'cousin' and 'brother' when there is, in fact, no relationship. Their natural good will is probably heightened by a community of adventure and hardship in their precarious and wandering life. No men are more submissive to their leaders and employers, more capable of enduring hardship, or more good humored under privations. Never are they so happy as when on long and rough expeditions, toiling up rivers, or coasting lakes on the borders of which they encamp at night, gossip round their fires and bivouac in the open air. They are dexterous boatmen, vigorous and adroit with the oar and paddle, and will row from morning till night without a murmur. The steersman often sings an old traditional French song with some regular chorus, in which they all join, keeping time with their oars; and if at any time they flag in spirits or relax in exertion it is but necessary to strike up a song of the kind to put them all in fresh spirits and activity. The Canadian waters are vocal with these songs, that have been echoed from mouth to mouth and transmitted from father to son, from the earliest days of the colony, and it has a pleasing effect to see in a still, golden summer evening a *batteaux* gliding across the bosom of the lake, dipping its oars to the cadence of these quaint old ditties, or sweeping along in full chorus on a bright sunny morning down the transparent current of one of the Canadian rivers."

The food of these out-door people was drawn exclusively from the country which they inhabited, and was exclusively animal. They had neither bread nor vegetables, but lived on the mammals, birds and fishes that could be captured. Dunn quotes Mr. Simpson as follows: "On Christmas and New Year's days we entertained our assembled people with a dance, followed by a supper consisting of the best fare we could command. By this time we had, through our indefatigable exertions, accumulated two or three weeks' provisions in advance, and no scarcity was experienced during the remainder of the season. The daily rations served out to each man was increased from eight to ten, and to some individuals twelve pounds of venison, or, when they could be got, four or five white-fish weighing from fifteen to twenty pounds. This quantity of solid food, immoderate as it may appear, does not exceed the average standard of the country, and ought certainly to satisfy the inordinate appetite of a French-Canadian; yet, there was one of them who complained he had not enough, and did not scruple to help himself to an additional supply whenever the opportunity offered—it would have taken twenty pounds of animal food daily to satisfy him."

Writing of the life at Red River, our author presents a brief but spirited picture of buffalo hunting by the Red River half-breeds. He says:

"At Red River the buffaloes are now seldom taken in pounds. Here it may be observed that to a stranger the

wild buffalo bull, with his huge hump, glaring eyes, fierce aspect and long beard, that almost sweeps the ground, when encountered in the recesses of the forest or in the open plain, where there is no chance of escape, is the most formidable animal in America—far more so than the panther or grizzly bear. In the summer and autumn large parties of the half-breed hunters, all mounted on their small Indian horses, which are well broken in to this sport, scatter themselves over the plains, camping generally in the open air, or in tents covered with hides, or under their provision carts. As soon as the buffaloes are perceived the young men gallop after them, and either partially surprise them on the plains or succeed in driving them into some little valley or neck of land, projecting into a lake, where escape is difficult. A running fire then open all along the line. At the first volley the buffaloes scamper off. The hunters continue the pursuit, reloading their guns while their horses are in full gallop, for the sake of expedition the bullets are carried in the mouth and dropped into the barrel without any wadding; their small whips are attached by a band to the right wrist. The horse, with wonderful sagacity, follows of his own accord the animal which his rider has singled out, and brings him alongside, and the rider then discharges his weapon unerringly. The horse then pursues another with similar success. In this way many buffaloes in succession are shot by the same hunter, and hundreds fall in a single race. No sight can be livelier than a camp of successful hunters. They generally pitch in some clump or point of woods, the provision carts form the outer circle, to which the horses are tied, within this fires blaze on every side. The men smoke their pipes or arrange their firearms, while the women are employed in cooking a sumptuous repast. The jest and the laugh circulate freely all around. During the time the men are employed in hunting the females are occupied in drying the spare meat, or converting it into pemican.

"In the winter season this sport assumes a more various character. When the snow is not deep the buffalo may be run on horseback as in summer; indeed, if the herd be numerous they beat such a track with their broad hoofs that they are easily pursued. At other times they are approached by the hunter *crawling* on the snow. He walks up within a certain distance, far enough not to alarm the herd—then prostrates himself on the snow—drags himself along on his belly with his gun trailing after him, and in this way proceeds a long distance before he can get within reach when the buffalo are shy. When fatigued with this laborious and unnatural motion he stops for a time to recruit himself, he then throws up a little heap of snow before him to screen him from his prey. Some of the hunters are said to be so dexterous in this mode of approach as actually to drive aside the old bulls who form the outer guard of the herd, in order to select the choicest of the cows. In order to effect this object he wears the disguise of a close dun-colored cap, furnished with upright ears, to give him the appearance of a wolf, for from constant association that animal is regarded by the buffalo without dread. In the spring of the year, when there is a hard crust on the snow, produced by alternate thaw and frost, the buffalo are frequently run down by the hunters, and stabbed with their daggers, while floundering in the deep drifts, which yield to their weight, but support their pursuers, who are borne up by their snow shoes. In this way, which is the easiest and safest of all, the animals fall a prey even to the boys and women."

GEORGE BIRD GRINNELL.

[TO BE CONCLUDED.]

## The Gila Monster.

EVER since coming to New Mexico I had been hearing of the Gila monster who roamed in the trackless forests of Arizona, as the museum lecturer would have told us had he had one of them on hand to spout about. According to the prospectors who had been in that country and had through some special dispensation escaped alive to tell us about it, the Gila monster there sometimes grew nearly as large, but not quite as large, as a horse; he might just as well have kept on growing until he had got as large as a horse, then it would have taken less time to describe him. The bite of the monster was worse than the bite of a rattlesnake; plenty of whiskey has been known to counteract the bite of a snake, but when whiskey was taken after a monster had bit you it only killed you so much sooner. I have no doubt of it. I have known plenty of whiskey to kill a man who had never been bitten by anything more venomous than a lot of blue mice and red alligators, that he saw running around on the floor of the room he died in.

As the Gila monster is a lizard, and I knew how dangerous a lizard is when it comes to biting—it is not built to bite and cannot bite—I doubted this part of the story. The large ones found on the top of bare rocks in the mountains of southern Arizona seldom need bite at all, a man who was so unfortunate as to get into their neighborhood did not need to be bitten, he just lay down and quit; then the monster leaving him started to hunt some one else to scare to death.

We were going out to that country now and I could see the creature for myself. We had a young man from Ohio in the troop who said he had been a school teacher. We were liable to get and did get men out of nearly all the learned professions. They generally came to the cavalry, it is supposed to be more aristocratic than in the infantry. We had doctors (they generally got to be hospital stewards in time), lawyers, civil engineers, clerks (we could use one of them at his trade, the rest had to build roads and stand guard), telegraph operators and once in a while a stray newspaper reporter, but never a minister. Most of these fellows, if they would only let whiskey alone, need not be here. The school teacher's name was Smith, at least that was his name here, it may have been anything else at home. When he first came to us he took to me. I had a lot of newspapers that I subscribed for and several that were sent me in return for an occasional letter. Smith wanted newspapers. He had not been with us long before he began writing to his home paper, a small country weekly. He told them all about the country around Fort Cummings, New Mexico, where we then were, the silver mines and the Indians. We had no Indians on hand just then, they were supposed to be over at San Carlos, Ariz., but were not always

there, else we would not be here. We were here to keep them there, or try to do it.

I furnished him with Indian information, and knowing the use it would be put to, threw in a few extras. Had he written to his paper as I did to mine, describing the country in language that a school boy could understand, and when naming a river or mountain that had an Indian or Spanish name giving the pronunciation as near as possible in brackets, his letters would have looked better. I showed him my letters, but there was not scientific information enough in them to suit him.

He found out that I knew the college names of a few of our birds and animals and began to get them for his letters.

At last we got to the lair of the Gila monster. We were camped up at the head of the Gila River in New Mexico. Those big ones don't live here, they are found, if anywhere, further west over in Arizona. I have looked for them there, though without finding any nearly so large as a horse. Some of them bit me. Maybe I am immune to them. The first one I found was only a foot long. I caught him in a slip noose, and after trying to get him to bite a stick, then my finger, I let him go again. The largest one I ever found here measured only eighteen inches over all, and something less on his waterline. He kept his head up when traveling.

Smith wanted their scientific name, and I did not know then that they had one. Since then I have learned that it is *Heloderma*. That lizard shall not suffer for a name, nor you either, I thought, and said: "He has only been described by one naturalist so far as I know. He is not very well known yet. That man calls him *Spundulikus cimupalog*."

"Spell it," Smith told me, getting out his note book at the same time.

I was afraid to spell it; he might see through the sell. So taking his book I wrote it.

He sent off his letter and I had forgotten all about it when two or three weeks after one mail day he came to me with the paper.

"Are you quite sure you gave me the proper name for the monster?" he asked.

"I am. What is wrong?"

He handed me the paper. His letter was here, so was my name for the monster just as I had written it, but it was followed by an interrogation point that must have been taken out of the lower case of a font of job type. We had no trouble seeing it, and both of us knew what it meant.

"That editor of yours don't seem to think we have it correct, does he? Now take that and spell it slowly, Smith. Divide it into syllables and see what you can make out of it?"

He did so, then throwing the paper down, said: "This is a mean trick. That is what I make out of it. The next time I come to you for any more names you will know it."

"Oh, come any time you happen to think of it. If I have not the exact article you want I can make it while you wait. The fact is, that thing has not got a name, or if he has I don't know it. That being the case, I or anyone else is at liberty to give him one. I am not well up in Latin so I used hog Latin."

He never would take any more "scientific" names from me, but that did not prevent him from borrowing my FOREST AND STREAM and hunting for them.

CABIA BLANCO.

## Sport in New Zealand.

BY "SPORTSMAN."

### A Mixed Bag.

NEW ZEALAND, that sunny land of the South Pacific, what memories one can recall, of the good sport and keen sportsmen, to be found in those islands of the forest and the Maori. During some years' residence in that quarter of the globe I had many opportunities of enjoying the various field sports to be met with, from stalking the lordly red deer to spearing the large river eels by torchlight. Many and various are the animals and birds in the forests and along the sea coast, and nearly all are within the reach of the ordinary mortal who is devoted to sport and outdoor recreation. The red deer country, or countries I should say, as there are three or four large herds scattered over the islands, resembles to a great extent that of the Scottish forests, though devoid of the heather and heath, but still very rough and rocky in most parts and covered here and there with dense patches of bush, and a day's stalking on these hills requires a deal of doing. Fallow deer are plentiful and can be shot on sight, but a license is necessary for the red deer and a limit to the number of heads taken off the ground is also prescribed.

The fishing as a whole is excellent, and quite on a par with the English trout fishing; the brown and rainbow varieties of these fish are to be met with in many of the creeks, more especially in the more strictly preserved waters. Eels abound in all the streams and lakes, and some of these grow to a huge size. They form a regular form of diet to the native Maoris, who catch quantities, and then smoke and dry them. The shooting is good in nearly all parts of the country. The English pheasant, quail, both brown and Californian, bo-kekas or swamp hens, duck, black swan, hares and rabbits are all to be met with in the different localities, not to mention the huge flocks of pigeons which, at certain seasons of the year, haunt all the bush country, more especially when the pine and tawa berries are ripe on the trees. As another source of sport and amusement we must not forget to mention the wild pig. These animals are the descendants of the original pigs, liberated on the islands when first discovered by Captain Cook. They have since those early days increased enormously, and now swarm all over the more heavily timbered lands, as also in the more open fern country. They afford capital sport, and occasionally an old boar will give you a run for your money in the form of a little danger and excitement before you can lay him low. These pigs are very good eating; in many of the more unsettled districts the farmers depend almost entirely on these animals for their supply of fresh meat.

Perhaps a short account of a day with the gun, over dogs, would be not inappropriate here.

As myself and a friend had agreed to allow ourselves a week or two's holiday free from the troubles of farming and stock raising in general, we wrote to some shooting acquaintances living on the coast of the North Island, asking them to join us for a few days with the gun and dogs in the surrounding country. Receiving an answer in the affirmative, we started from our house, situated about fifty-four miles from the coast, early one morning in September. As we were living at the extreme limit of the Government road, which runs up there from a small town on the coast, about sixty miles south, we had to do the trip riding on bush ponies and along the narrow trail which runs right through the heart of the forest land. We had an uneventful ride to our destination, relieved only by off-saddling once in the middle of the day for lunch at a clearing in the bush.

Reaching our friend's residence, close down by the seashore, we turned out the ponies and got everything in readiness for an early start on the following morning. The house itself was a large, roomy place, with a shady veranda running round it, and in front a large garden with really a well kept lawn for that part of the country. The surrounding land consisted of flat maize fields and low, rolling hills, fern and brush covered, bounded some miles back by the higher and rougher district at the foot of the endless expanse of standing timber. These high lands, sloping down to the level of the maize fields below were cut up here and there by deep gulleys, covered with a thick growth of birch trees, interspersed with fern and scrub, and affording excellent shade and cover for the pheasants which frequented them. The picturesque Maori whares (pronounced warry) or huts thatched with the dry flax leaves scattered here and there, added an additional charm to the already beautiful landscape. The large salt water pools down by the shore, fringed with rows and rows of reeds and rough grasses, always yielded up their quota of duck and waterfowl with now and then a black swan.

Jumping out of bed next morning, just as it is beginning to get light, we make a substantial breakfast and proceed to get together our paraphernalia for the day's shoot. Everything is at last ready, luncheon packed away in a capacious game bag, and cartridge belts filled, and we start away accompanied by two red Irish setters and an old cattle dog of my own, very handy at retrieving, and also most useful for running pig, if we happen to get into their locality. Leaving the house we took the narrow track up the hill behind, passing a native Maori sitting outside his little wooden house, who gave us the usual native salutation of *ten-a-koé*, or good-day, and also told us where he had seen pheasants at no great distance.

Spreading out in line and letting the dogs range ahead the three of us walk steadily forward at last reaching the top of the hill. Here we debouch on to a large flat covered with fern and tea tree scrub, or to use the native name, *maruka*. The dogs, a little wild on starting, now steady down again and presently one of them stops dead in his stride, one fore-leg lifted, looking a perfect picture as his keen nose snuffs the tainted air. The other dog, some yards away, is ably backing his companion. My friend gives the word and they move slowly forward. Again coming to a dead stand, we walk in and put up the birds, two hens and a cock. Bang, bang, bang, the two hens fall, but the old cock scuds off downward untouched, the two dogs dropping to the shot, as well trained ones should. We ought to have bagged the three, but never mind, our nerves will be steadier after a shot or two, so picking up the slain we continue on our way.

Two more shots and another brace are obtained on the flat and then we begin the descent to the river just below, working the slope as we go. One of us goes down a side track to the river flat, so as to be ready to receive any birds which may go high over the river. The two remaining above proceed to scramble down the rough hillside clothed with birch trees and thick patches of scrub, when a whirring of wings sounds close by, and I have just barely time to get a snap shot at a cock pheasant as he flashes over the tops of the trees on his way toward the river. A shout from below warns me that I have got him, and after firing one more ineffectual shot at another bird as he flies out of the thick undergrowth, we find ourselves on the edge of the river below, where our friend joins us with the cock, which fell dead close by him.

As the sun is by this time showing considerable power we sit on the river bank for a few minutes and light our pipes, while the dogs with lolling tongues lie down in the shallows grateful for the cool water after their warm trip through the rough fern country. Being by this time at the far side of the hill behind the house, which same is about two miles away, we get on our feet again and walk down the road which follows the course of the river, until we meet the cross road lower down, where we find one of the boys from the farm waiting with our ponies, as we had left word for them to be brought round in order to save us a long walk to the next ground we intended to try.

Climbing into our saddles we canter along toward the high hills at the foot of the heavy bush some four miles to the north of the river flats, intending to hunt out all the gulleys as we go along. Now the road runs up a long, broad valley, the sides of which are cut up by innumerable ravines and old water courses, filled with a pretty thick growth of birch trees and scrub, a favorite haunt of his lordship the pheasant. Our plan of campaign was this: We tied up the ponies on the roadside at the bottom of each of these ravines, and then one of us took the dogs and worked them down from the head of the gully while the other two of us waited below, one on each side, to take the birds as they made down hill to the shelter of the maize fields. The shots thus obtained were some of them very pretty and also difficult, as they often flew high overhead and came at a tremendous pace into the bargain. We worked our way in this manner nearly to the head of the valley, and as we had grassed four brace, we decided to leave the remainder and so turned back to work the maize fields below the road. Total bag so far 6½ brace pheasants and one hawk, of the large harrier variety, who met his death by offering a most tempting shot as he rose from the carcass of a dead sheep on which he had been feasting.

Leaving the high road we take a narrow trail among the maize and rough grass paddocks, at last reaching a

small creek, where we decide to refresh the inner man, and so off-saddle and let the ponies go free. They at once go to the water and then settle down to graze close alongside us. We squat down on the soft, dry grass and tackle the sandwiches which form our lunch with the cool, clear water from the creek. The last bite disappears and then pipes are set going and we bask in the sunshine, feeling a little lazy after our morning's tramp. The day is simply perfect, a warm sun and a clear blue sky with just enough breeze to rustle the tall rushes by the creek. Overhead a large hawk wheels lazily to and fro, seeming to know just when he is out of range. Now and then a rat splashes into the water from some retreat on the bank, and the tués or parson birds, so-called on account of their glossy black plumage and white frill of feathers round their necks, flit here and there through the scrubby trees around us.

At last pipes are knocked out and we saddle up again and ride toward a native pah or small village close by, consisting of small thatched houses with a crowd of pigs and mongrel curs running around in all directions outside. We are hailed with a chorus of wild barks and snarls from the dogs, who are at last silenced by their owners, with whom we have a few minutes' conversation, most of them speaking English more or less fluently. We take leave of them at last and proceed on our way toward a large field of maize, bounded on one side by a rough grass paddock. Here we tie up the horses to the wooden fence rails, or in Colonial parlance, we hang them up and decide to run through the standing maize for any outlying pheasants. The corn cobs are about ripe for plucking, but the natives have as yet not started work in this field, so the thick stems are close together and the leaves and cobs rattle as the dogs brush through them.

We employ the same maneuvers here as up in the valley, one takes the dogs and drives the birds out toward the open paddock, where the other two are ready to receive them. The man with the dogs gets an occasional shot, but owing to the thickness and height of the corn stalks he does not get very tempting chances. The birds run ahead under the sheltering maize, till obliged to take

wing, and then offer some nice shots to the waiting gun. Here we manage to account for three more brace of pheasants and also three California quail which the dogs flush just as they come out into the open. As by this time the afternoon is beginning to advance we decide on trying a large swampy paddock with a dense patch of marnuka scrub in the middle of it, for bo-keka or swamp hen. These birds resemble the coot in appearance. Their heads are brightly marked with red, the back is covered with fine blue feathers, and the breast white. Their short, stumpy tails are also white, and they are kept in continual motion, up and down, as the birds walk around. They fly with a slow flapping flight, but the pace is very deceiving to the gunner, as they generally seem to be going far slower than is really the case. We pursue the same plan here as in the maize field, though the scrub is very dense and hard to scabble through. The two in waiting keep close in the shelter of the scrub, but these white-tagged hens are the cutest of the cute, they fly forward, settling here and there in the low trees on the approach of the dogs, but never come quite near enough the open for a shot. They seem to know something is wrong and keep doubling back in the scrub again and again, and we cannot persuade them to leave their shelter. However, we manage to down three of the wily creatures and our friend in the scrub gets one, bringing the grand total up to four birds. We pick up the dead and get back to the ponies again, one of which has managed to rub his bridle off against a fence post and stands there looking rather sheepish as we adjust it.

Climbing into our seats again and stuffing the birds into the game bags fixed to the rings on the saddles, we make tracks down the trail leading to the sea shore, intending to try for a rabbit or two among the sand hills on our way home. Coming out of the last paddock, before we reach the shore, a rather amusing incident occurs. We noticed a large hawk settle behind a fence some hundred yards ahead of us, my friend made an attempt to get near enough for a shot, by galloping his pony as hard as he could tear, up to the fence. Just as he arrived at the said fence he pulled up the pony and the hawk got up;

he raised the gun, but the mare objected to firearms and swung round; he pulled her back and sent her over the low obstruction in pursuit, letting off both barrels at the hawk to an accompaniment of violent bucks from his mount. The hawk escaped.

This little escapade over we emerged on to the sand hills and sat down to wait till a little before dusk, before tackling the bunnies. As it is a trait of the Colonial that he will never walk if he can get anything to ride, that is, if the nature of the ground allows of riding at all; we stuck to our mounts and cantered after my old cattle dog, as he pushed up the rabbits from among the furze bushes. As only one of the horses was used to being shot over, the game was fast and furious while it lasted, and though the total bag was only five rabbits, we had a heap of fun for our money. My friend's mount being a newly broken mare, she promptly bolted at the first barrel he fired, but as galloping in deep sand gets somewhat irksome to the most fiery of steeds he soon pulled her in.

The shadows were now beginning to fall in earnest, so we picked up the slain and started for home along the hard sand at the water's edge. It was a lovely evening, the sinking sun casting a yellow glow over everything, with the sea washing gently on the shore and the ponies snatching at their bits when they felt the hard sand under their feet. We cantered on without a sound to be heard but the crunch of the iron-shod hoofs and the murmur of the surf. Pulling up as we near the house a small flock of ducks come in over our heads making for one of the large pools on the shore. My friend sees them in time, though his mount shows his decided objection to the business, manages to secure one of them, thus closing our day's sport. Total bag, 19 pheasants, 3 quail, 4 swamp hens, 1 hawk, 1 duck and 5 rabbits; not a large count in these days of big battues and record bags, but entirely satisfactory to those who participated in the shooting, and with the variety and beauty of the scenery, coupled with the pleasure of watching two good dogs work, making ample amends for any deficiency in the number of the slain.

## NATURAL HISTORY

### Frogs of the Illinois River

My object in writing anything on this subject is simply to call attention to the mighty changes that may be wrought in the animal life occupying peculiar rivers by natural means. The Illinois River is a peculiar river, very peculiar. It is but little more than a great slough, having but twenty-one feet fall in its 220 miles, from La Salle to its mouth, with a very sluggish and at times hardly perceptible current, and its bed throughout this entire length is a muddy, nasty, slimy silt from say five to forty feet or more in thickness. Its width in low water averages about 700 feet, in high water two to eight miles, and the overflowed bottom lands have a surface very similar to the bed of the river. Therefore all life of temperate climes, both animal and vegetable, that found a congenial home and an abundance of food in the richest of mud was found along its course before the advent of the man with the gun in well-nigh unequaled abundance. All inland waterfowl, from the tiny plover to the magnificent swan, found along it perfect feeding grounds, and many of them a perfect place in which to breed. Fish of many species fairly swarmed within its waters in myriads, and size far beyond what the newer generation along its banks would dream of. Water breeding and other insect life was correspondingly plentiful; Illinois malaria and "skeeters" were a great terror to the early settler.

How vast the change in this great mass of life to-day, wrought wholly by the occupancy of its shores by the man with his gun and other surroundings. The waterfowl life of summer time has nearly or entirely disappeared. Scarcely a duck dare risk the rearing of her downy brood in the widest and most impenetrable of its marshes. The graceful swan in her semi-yearly migrations no longer dares to rest her weary pinions on the widest of its lakes; she knows the man with the gun is omnipresent. What was only a few years ago a vast morass stretching over thousands of acres, the perfect home of the turtle, the frog, the coot, the rail, the heron, etc., is now solid land. If the muskrat believed in the adage, "In numbers there is strength," he felt that he was safe from all harm.

#### Frogs.

Yea, frogs, for it is in memory of the dear departed bullfrog that I indite these lines—I mean the great and the largest frog pond found in Western waters. This most toothsome animal was in early times found everywhere along this great slough and the great marshes adjoining in an abundance only equaled in proportion to their sizes by the mosquitoes and the muskrats. His sonorous voice was to be heard on every side, so plentiful were they that I have often heard their voices when congratulating each other on a hot day in June just before a rain at a distance of two miles from the river. The voice of this frog at such times is a sonorous bass, modulated roar of two syllables, best explained by a little story. In early times we had here a long, "slab-sided," powerful fellow by the name of Bill Owens. Bill's father ran the grist mill where we all had ground the wheat for our daily bread. "Uncle Rod" at times would leave Bill alone to look after the mill. There was a vast amount of bullfrogs along the stream that turned the mill. Bill was very fond of these, also of whiskey. He was also very expert in capturing the frogs. When he got a good mess he would take them to town and trade them to the tavern keeper for whiskey. Whiskey was only "two bits" a gallon in those old times. When left in charge of the

mill Bill would often become both dry and hungry and slip off and "go a-frogging," leaving the mill to tend itself, then if he was successful with his frogging he would come home some time in the night as drunk as a king. The boys of the neighborhood, after taking notes of Bill's failings, would persecute him by following him at a safe distance and bellowing after him in a deep bass voice like that of his favorite frog:

Bill Ow-e-n-s,  
Bill Ow-e-n-s,  
Got dh-r-unk,  
Got dh-r-unk.

Then every frog along the river would take up the refrain. This proved too much for poor Bill's nerves and he concluded that he must kill and eat all the frogs or quit getting drunk. The first was too great a task for even so powerful a man as he, so he became a sober man.

When I was a boy, we had here a French quadron barber and cook who was the second man to eat frogs in this neighborhood, and he taught all of us young fellows how to hunt, cook and eat them. Our plan was to take a small boat and shove it gently along through the lily pads, until we would espy a frog sitting patiently with his eyes and mouth just above the surface waiting until some insect would hover within reach of his long, slimy, lightning-like, elastic tongue. This tongue can be thrown out some five to six inches or more, and so quickly as to be impossible for the eye to see even its flash through the air. We would shoot them with very light loads of powder and shot. As soon as we would have a great plenty for a big feast, George, the Creole, would fry and serve them up in the best French style. Were they good? I would work harder to-day to get such a mess than for any other food in the world.

Some years ago I had a housekeeper who was very fond of game, but had often expressed contempt of frog eating. One day I had been along the river frogging; the frogs were very scarce, but with great care and perseverance I secured four fine ones. Going home I found the cooks all gone, the house deserted. Thinks I, I will play the cook myself and have a feast like the old time ones back of George's barber shop. In due time I had them fried to a turn, and was just sitting down to enjoy them, when in came the housekeeper. She smelled them. They smelt good. Said she, "What have you got?"

"The hindquarters of some woodcock," said I, "considered by all the best game bird in the world."

"Let me taste," said she.  
I handed her a big ham, and she agreed with all that the "woodcock" is the best of all birds. The next day she was pestering me to go out and kill "some more of those delicious birds." I have said that now along this river bullfrogs are very scarce. They disappeared from our river almost entirely at one time as far back as 1852-'53, and very suddenly. What caused their disappearance has been a question to which it was hard to find a satisfactory answer. I knew that feral life was subject to the ravages of virulent, deadly epidemic and contagious diseases, but could hear of no example of disease stopping a life so nearly completely over so wide a region as this disappearance of our frogs.

For fear that some may have begun to form wrong conclusions, I will state emphatically that I did not kill and eat them all; that Bill Owens did not return to his cups and his frogs, nor the Creole, nor we boys make any serious inroads on their numbers. No, something more potent and terrible than any of these used them up far worse than the Jews did the Philistines. What

was it? This is the question that for years I have striven to solve, to my own satisfaction at least.

For a long time I thought that the disappearance of the bullfrog from the Illinois River was perhaps caused by the introduction into its waters of some new form of life that fed upon the frog, its young or its eggs to such an extent as to nearly annihilate it. To give a coloring to this theory there was a new form of life that made its first appearance in the Illinois River suddenly and numerous about that time, namely, the fish known as the croppie, which is said by those who should know, was first introduced to the great Mississippi waters from the Great Lakes through the Ohio and Erie Canal as soon as completed. It is certain that it was not known in Illinois waters until about thirty odd years ago. Finding a congenial home here it bred very fast and became very numerous. It is a fish that loves wide, shallow, still waters with a muddy bottom, the same waters where we found our frog, its eggs and its young. The young or tadpoles of our bullfrog, if my observations have been correct, pass two seasons or a year at least in the tadpole or embryo stage—at least they pass one winter as tadpoles, as does also the young of our green-backed smaller creek bullfrog, for I have observed myriads of both in the water in the dead of winter. The croppie we all know feeds ravenously on small fish, and it is very probable that it also feeds on the fish-like young of our frog, but I do not know this to be a fact. If such is the case, anyone who has studied the interaction of lives on each other, especially sedentary lives, knows full well that one will often nearly annihilate another by feeding on its individuals, eggs or progeny. Therefore, I readily accepted it as a theory, that the introduction of the croppie had caused the nearly complete disappearance of our frog. But theory will not answer the purpose in the science of natural history. Facts, known facts, and they alone, will fill the bill. If I could prove that the croppie preyed extensively on the eggs or young of our frog, the question would be settled, but I could not.

But as time and years rolled on, a fresh and unread page of nature's workings and means of bringing about wonderful and unlooked for changes in life subject to her laws and forces was opened before our eyes, and it was one which proved that the nearly complete annihilation of a species or many species of sedentary life is a thing she may readily cause by natural forces. For instance, the winter of 1881 and 1882 was one of extreme cold, continued without a break for a comparatively great length of time. The Illinois River at that time was at a low stage. The intense cold covered it with an unbroken coat of ice of twenty-four to thirty-four inches in thickness, and it remained in this condition for about two months, or, in other words, this river of not very pure water, and this water overlying the vast area of its bottom composed of a thick layer of mud, decaying, putrid animal and vegetable matter continually evolving gases poisonous to all animal life, was hermetically sealed up by this impervious coating of ice, so that these poisonous gases could not escape into the air. The result of this was that the free oxygen naturally belonging to the water was soon entirely appropriated and used up by the myriads of animal life occupying the water, and its place was taken by the poisonous (to animal life) carbonic acid gas exhaled by them, and by the same and sulphuretted hydrogen, marsh and other poisonous gases being continually set free in the water by the great mass of underlying putrefying mud. This state of affairs re-

sulted eventually in what? Why, the utter annihilation of all, yes, I will say all life, from the tiny crustacean to the great buffalo or catfish then occupying that water, for no animal life can live without a supply, a modicum of oxygen. But bear in mind that I do not hold but that such life as buries itself deeply in the mud in autumn and completely hibernates, may have escaped, but I do not believe that it did. The weaker and more tender of animal life died first; soon this dead animal matter began to putrefy, adding its poisons to the deadly waters. As the river began to close up with the ice, the more completely, day by day, the poor smothering fish crowded in myriads to the few air holes left. So thickly did they pack themselves around such places to imbibe the life sustaining oxygen that they could be thrown out on the ice by thousands with pitchforks. But soon the intense cold sealed over hermetically nearly all of these holes, with the result, of course, of the death of all exposed animal life in the river, undoubtedly our bullfrogs went with the rest.

Is there any proof of this being the fact? Yes. An abundance of proof, for we who were out on the river in the early days of the following spring fowling, found floating on the surface millions of dead fish, turtles, frogs and species of water insect life. No creatures seemed to escape this general fate except the very few that had passed the winter near large springs whose thermal waters did not freeze over. The fish were all killed. "You are mistaken there," speaks up old Joe, a fisherman of thirty years' standing on the river. "Fish were more plentiful in the Illinois River the summer of 1882 than they had been for several years before."

Correct, old man, but you must remember that most of our fishes are somewhat migratory, and that our little river here is a part and parcel of the greatest river system in the world, and that these fish of 1882 had good reason for ascending our river that spring because they found it so thoroughly stocked with fish food, the dead life floating down.

But what proof have we that a similar destruction of life occurred from the same causes about 1853 to 1855? The proof of this hangs on a very slender though a strong thread. It is this: One March, near those dates, after a very long period of extreme cold weather, I went on the river skating with a party of boys. After the violent exercise we became very thirsty. Having an ax along we concluded to chop through the ice for water. The ice was very thick. When we reached the water it came bubbling up, but gave off a fearful stench, so strong that none of us could drink of it. This smell was exactly the same as that of the river water in 1881-2, and I have no doubt that the effect on the life in the water was the same.

The people of Peoria in particular, and others along the river in 1882 gave the Chicago sewage the entire credit for the pollution of the waters of the river. The city of Chicago, to free the Chicago River of its smells, established huge pumping works to pump the water from the Chicago River into the Illinois and Michigan Canal, from which it flowed into the Illinois River, and this gave color to the idea that our river was contaminated wholly in that way; but the water thus pumped into our river had but very little effect if any on the river, as I think I could, and have, clearly demonstrated. I have given the bullfrog the post of honor for the reason that his habits are eminently sedentary, as the Irishman said about him: "See the dhirty, slimy craythur, when he shtands up he sits down." BYRNE.

LACON, Ill.

### Depredations of the Cow Bunting.

SYRACUSE, N. Y., Aug. 18.—*Editor Forest and Stream.* The following notes, taken in leisure hours, regarding that parasite, the cowbird, may prove of interest to some of the many readers of your estimable journal.

I have come to the conclusion that the cowbird is a greater cause of the decrease in our song birds than either the bluejay or red squirrel, or even domestic cat.

At Cleveland, O., in May of this year, I made a careful study of this subject. In five nests of the wood thrush I found on examination in each nest three thrushes' eggs and one cowbird's. I removed the cowbird's eggs. On visiting the nests a second time I again found in each nest a cowbird's egg, and again for the third time this was repeated. I am glad to say that at length, in this case, the thrushes were successful in hatching and rearing their young. Had I not taken the cowbird's eggs, there would, of course, been no young thrushes. I have always found this lovely thrush a conspicuous sufferer in this respect, but more so this summer than in other years.

A remarkable thing about these same thrushes' nests, every one of them had, as a sort of foundation, more or less old newspaper, which I did not like to see, as it made the nests too conspicuous, and liable to be pilfered by boys or other mischievous persons; so as gently as possible I removed the paper, the birds sitting close on their nests all the time; they were most gentle and confiding. And here, I think, is where the cowbird makes her mark, selecting to deposit her egg those nests whose owners are least likely to object.

I came to Syracuse in June and renewed, as time and inclination permitted, my bird observations. I found every pair of thrushes feeding and caring for young cowbirds, but not one young thrush have I seen. I regret to say that the beautiful scarlet tanager is also a sufferer from this pest. Every pair of tanagers coming under my notice were accompanied by young cowbirds. The yellow warbler also, and even the friendly little chipping and song sparrows do not seem to escape. Here, also, I found the Wilson thrush, very numerous in swampy woods, but did not find any nests—this thrush being more secretive than its cousin, the wood thrush. I am unable to say, therefore, whether it is also a sufferer from the cowbird.

In Ohio the beautiful rose-breasted grosbeaks were quite numerous, and were nesting when I left. I wonder if the cowbird molests this species?

The red squirrel is generally condemned for its destruction of birds' eggs and young. My observations do not bear out this statement. They were quite numerous, as also the striped chipmunk, where my thrushes' nests were situated, but not in a single instance was a nest molested.

I am told by a well known authority that the cowbird lays its egg in the nest. I cannot see how this bird can enter a tiny nest like that of the red-eyed vireo, or yellow warbler. I have never seen the operation performed, but I have noticed a cowbird standing on the edge of a nest and gazing with interest at its contents.

In these thrushes' nests I found but three eggs. Now, my observations are that this thrush lays four; therefore, I conclude that the cowbird removes one in order to make room for her own. I have also noticed on other occasions that the cowbird's egg is hatched at least two or three days before its victim's, giving the young cowbird that much start, and as it is therefore stronger it ejects the rightful occupants in course of time.

The warbler family were well represented in the spring

migration in Ohio; the myrtle and black and white creeping varieties leading the van, followed a few days later by the black-throated blue, black-throated green, chestnut-sided, Canadian and hooded species, the bay-breasted bringing up the rear. The northern water thrush—a warbler—was by no means rare and was in full song.

The goldfinches and cherry waxwings are unusually numerous here this summer. Owing to their late nesting habits they undoubtedly both escape the unwelcome visitation of the cowbird. This waxwing seems a persistent hawk for flies—which I think is not always the case—darting from and returning to same branch after the manner of the flycatchers.

If only the cowbird would pay some attention to the English sparrow what a blessing it would be. But, alas! no. It must forsooth select our brightest songsters. But, Mr. Editor, I must conclude these notes ere you will be after me with the "big stick." JOHN M. COATES.

### A Hawk's Revenge.

BROOKLYN, N. Y., Aug. 4.—*Editor Forest and Stream.* The following little incident may interest some of your readers:

I was walking near a piece of woods recently, and noticed eight or ten crows pursuing a hawk. The hawk was sailing along a little below the noisy crows and came directly toward me. Suddenly he seemed to have lost patience with his tormentors, and in a flash he darted up, grabbed one crow by the vitals and came to the ground within a rod of me, clutching the crow so tightly that when I ran toward him he seemed to have some difficulty in getting loose from his quarry. The other crows all flew off, amid tremendous cawings, and the hawk finally sailed away, while the unfortunate crow made a feeble effort to fly and then expired.

I do not know whether or not this is a common procedure by hawks, but in the scores of times I have seen crows pestering them, I never before saw the hawk assume any other attitude toward the crows than a sort of mild toleration, and I never supposed that they cared any more for eating crow's meat than the unsuccessful candidate does. F. H. C.

[To "eat crow" has, of course, passed into a proverb, and many are the changes that have been rung on the theme. Perhaps the most common of these allusions is the political one referred to by our correspondent. Nevertheless, it is a fact that young crow is quite good eating—about as good, for example, as young pigeon. Of course, the excellence of any viand depends on the taste of the eater. One man regards onions as delicious, while another cannot eat them; some people are repelled by green peas, green corn, eggplant, and so on. On the other hand we have always been taught that in England rook pie was a most dainty dish; and the rook is a not distant relative of the crow.]

However, all this has nothing to do with the interesting observation made by our correspondent. We have occasionally seen a hawk when pursued by crows make a dash at one of his tormentors, but the crow always seemed perfectly well able to avoid the attack. We have found the remains of crows that had evidently been caught and partly eaten by hawks or large owls, and once saw a marsh hawk dart at one of three crows which were sitting on the top rail of a fence. The crows, however, showed no fear, but threatened the hawk with their bills when he came too close, and his courage was not equal to making a serious attack on them.]

### Autobiography of a Shooting Coat.

It is a far cry to the days of my youth. I am old now, the end is not far off, yet I look back to my young days without a sigh of regret for their vanished delights. Mine has been a well filled life, full of incident and adventure. The scars I wear are honorable scars.

My earliest connected recollections are of a time when I reposed with dozens of my fellows, stacked high on the shelves of a gun store. I was a stout youth, fashioned of crisp olive drab ten-ounce duck. I remember rubbing elbows with a very conceited chap in the stack next to mine. He was a corduroy lad, and held aloof from us ugly ducklings, though to be sure we had corduroy collars and cuffs, and were undoubtedly entitled to claim cousinship with him.

It was a dull and sleepy existence, enlivened only when a group of gunners idled away an occasional hour of the close season, telling of sport they had had, of trips they had taken, of bags they had made. Sometimes a rat-tailed pointer would leap on top of us, and curl down for a nap. From my shelf I could see the long rows of guns in the racks. Thus early in life I was introduced to the talk of the field and to the things of the field. The long summer passed. Crisper nights and shorter days proclaimed the approach of autumn. Then one day a clerk called: "Here's a 38," and I was snatched from my stack and tried on by a chap I had often noticed among the gunners who sometimes gossiped there. It was a fit, as those things go, and then my life began in earnest.

My new owner tossed me into a chest containing a lot of other canvas duds—and such duds! I will never forget the faintness that came over me at my first scent of blood, for the other duds were streaked with stains of it here and there. And the awful gamy smells and oily smells. At least I thought them awful at that time, but I have since learned to love them. I shrank back in a corner of the chest, aloof in my crisp spotlessness. "Hello," said a pair of khaki trousers, gruffly. They were a sight. "He's been getting a new coat, eh?" the trousers continued. "Well, youngster, you need breaking in, and

you'll get it soon enough, I'll warrant." Then silence.

There came a day soon after that when the khaki trousers and I, with a lot of other duffle, were dumped into a carryall, and put aboard a train. He was there, with a lot of his mates, carrying gun cases and shell cases and what not. The engine bell was clanging, dogs were yelping and all was confusion. Somebody's shells were missing. They were found at last. The train started. In the smoker where I was I soon learned from the talk going on around me that the morrow would be the opening of the season. Everyone seemed to be in high spirits. "You'll catch it to-morrow," chuckled the khaki trousers.

"I detest a new shooting coat," said my owner in the dawn of the next morning. No need to dwell on the incidents of that first day a-field, with its constant succession of shocks and surprises. By evening my right shoulder was pounded to a frazzle, my skirts spotted with blood, and mud, and grime, my crispness gone in places, my pockets bulging with a motley assortment—and in my game pockets a lot of beautiful birds, quail they were, with a most pungent odor. I was beginning to like it. How tired I was, though. This all happened years ago.

The friends of my youth would not know me now. My buttons gone, my seams ripped in places, my right shoulder actually worn through. My color is nondescript. Originally I was an olive drab. Then came a day when I was dipped into a nasty hot mess, and came out like a bit of Erin—green, a streaked, uncertain green, for canvas does not take dye well. "Just the color of tules," said my owner to the dyer, holding a bit of rush against my sleeve. Those were the days we spent with the ducks, shooting them from the tules that ran out in points on the lake.

The green faded in places, and to it were added a trace of the muck of the swamps, the blood of game, and gun oil and powder grime. The year for me was divided into two seasons—the autumn and winter, when we, my owner and I, spent the days in the duck blinds, or tramped the marshes for snipe and the uplands for quail; and the spring and summer, when we went into the rugged cañons of the mountains, where the trout streams tumbled and roared over the ledges and boulders. I learned what a

creel was (and how the willow basket frayed my side). I learned to love the scent of the pines, the song of the mountain stream, and to watch the play of the rod. I learned to stalk the deer, though a little of that went a long way. For it was too hard work, the sun was too hot, and the buckthorn gave me some awful rents. At night I was folded and laid at the head of my owner's blankets, and served him for a pillow.

The days I love best to dwell upon, and those that are indelibly impressed on my memory are the ducking days; when he and I rowed out to the blinds in the starlight and prayed that the wind might blow. That half hour's wait for the dawn, with the old briar going, and the ducks stringing in to the lake from their night on the grain fields; the call of the geese, and the clear bugle of the sandhill crane. How well I recall it all. There was usually ice on the boats, and he always turned up my collar on those mornings, and buttoned my wristbands.

\* \* \* \* \*

Yesterday he took me down from the peg in the closet where I have hung this long close season, and he looked me over—lovingly, carefully. I felt his eye take in every rip, and note each missing button. The hole on my right shoulder was the worst of all. I hoped he'd pass that by, for it is really the gun's fault.

He sat down and lighted his pipe, then took me on his knee and searched my pockets, one by one. "A snipe feather, this," he mused. "What beautiful chocolate pencils. And this dotted one I'll warrant is from the breast of a greenwing drake. \* \* \* How good that sage and pennyroyal smells." He had found some dried sprigs of it in one of my shell pockets. "I must have gotten that the day Val and I went plover shooting. \* \* \* This is where the wire fence caught me when I was chasing that wounded Canada." A long silence while he smoked his pipe out, a far away look in his eyes. Then suddenly, "I wonder if you will hang together for another season, old chap?" Then he hung me on the peg in the closet again.

I wonder if I will? ROBERT ERSKINE ROSS, LOS ANGELES, Cal.

## Chamois for the Rockies.

Editor *Forest and Stream*:

I clip the following from the editorial columns of the *Sacramento (California) Union*:

"The latest proposition advanced by those who are eternally planning to introduce new varieties of animals and plants is to establish chamois in the Rocky Mountains. In the districts where chamois would have any chance of survival whatever is found a larger and finer creature, closely akin to the chamois, known as the Rocky Mountain goat. In all ways is the American animal superior to its European cousin. In some cases approaching 400 pounds in weight, covered with a shaggy coat which gives it the appearance of a small buffalo, it is a creature worthy the effort of any hunter. But the Rocky Mountain goat, because of inadequate protection, is fast becoming extinct. It would seem that the common sense thing for those who advocate the importation of chamois to do would be to devote their efforts to the saving from extermination the more desirable native variety. Nature has provided for every portion of our country mammals, birds and fishes well adapted to the needs of the locality, and the introduction of foreign animals simply means, in case they survive, the crowding out of some native form."

The well intentioned editorial voices a sentiment which is more widespread than is usually supposed, but which, I think, would be reversed were the subject given profounder study and thought. I am heartily in favor of having animals from other worlds introduced into our woods and mountain fastnesses, our prairies and swamps. It has ever been a dream of mine to found a society for the promotion of the idea, but when, years ago, I broached the project I was almost invariably repressed with an assertion or reply denoting infeasibility. The nuisance of the imported English sparrow was pointed out to me, as well as the fact that the rabbit when introduced into Australia became a pest there. Examples of the miscarriage of benevolence in attempts to introduce plants and fish were also held up to show me the futility of my "Quixotic schemes," as they were often termed. Finally I dropped exploiting my hobby, but yet have nursed the idea of once again endeavoring to form a plan for concerted action of persons who might possibly be in sympathy with me, to place the project in action.

It is therefore pleasing to me to read that a proposition to establish chamois in the Rocky Mountains is seriously entertained. In my judgment that enterprise should receive the hearty support of every sportsman. It is feasible, laudatory and desirable. A nomadic residence of twenty-five years in the Far West has given me opportunities to study and observe conditions pertaining to the introduction of new animals. Our prairies, forests and mountains need replenishing. I can clinch my arguments with facts for those who are doubters or skeptics, and if *FOREST AND STREAM* will give me the space I shall be glad to furnish data to overrule all objections to the restoration and rehabilitation of our natural game preserves. And the sooner we begin in this good work the better, for I would like to reap the benefit of the effort, as well as to see results thereof handed down to posterity.

There are important economic questions involved also; one of them being in the necessity to foresee the problem that is framing itself as to how to provide sustenance for this nation which is growing so rapidly in population. Even now the prices of meat, fish, game and poultry is at times prohibitive to the masses. Our pastoral resources, on the other hand, are getting to their limits of acreage for production, though the introduction of the automobile in displacing the horse will enable us to devote a greater acreage to the raising of cereals, etc., for the direct use of man.

But our barrens, plains and deserts, not adapted to fostering or supporting domestic stock, may be made of service by the introduction of a variety of game. But the selection and disposition or distribution would have to be made judiciously and intelligently. It is of itself a science.

And let those who fear that the chamois, for instance, would crowd out the cimmarron (Rocky Mountain sheep) or the mazama (Rocky Mountain goat) allay their fears at once. There is plenty of room. And by all means let us have a variety. Let us make the Rocky Mountains a perfect magazine of game, especially of the cervine and allied tribes. If they get too numerous and threaten to overrun civilization, why, let's organize "drives," round 'em up, and slaughter 'em at wholesale as they do rabbits once in a while in Idaho and Colorado.

In the past fifteen months the writer has traveled over a large portion of the mountainous region of five counties in northeastern California, to wit: Butte, Nevada, Plumas, Sierra and Yuba counties, covering an area of about 4,000 square miles. What struck me most forcibly was the almost entire absence of big game in large areas that once teemed with it. I made one trip last fall by wagon from Gibsonville to Fall River, twenty-six miles, and every mile through a forest of pristine beauty, and in all of that day's drive we saw not a single specimen of any kind of game, neither large nor small, and not even a rabbit, squirrel or chipmunk. Near Pilot Peak, in the other direction in the head waters of Nelson Creek, an important tributary to the Middle Fork of the Feather River, is Grousehill. At one time grouse were there in thousands. Now a hunter would be lucky if after a day's diligent search he found a brace of them. Doves were once very plentiful in Nevada county, and it was easy for many years, to bag a few thousand for the annual camp stew at Indian Springs of the Nevada County Sportsmen's Association. But at the stew last month a paltry 300 doves were brought in and the deficiency had to be made up with veal and chicken. It was stated that forest fires had driven the doves out of Nevada county.

Deer are seldom seen nowadays in any of the counties named above where once there existed districts where the winter's meat for whole communities was derived from deer. Killing them out of season has about exterminated them hereabouts. Bear, however, are so plentiful in this portion of the Sierra Nevada Mountains as to be a nuisance to stockmen (cattle, sheep and horse growers), as well as to ranchmen. The latter find it necessary in some places near Downieville to keep traps set at all times, and ruthlessly kill bears and feed their carcasses to the hogs.

The Old World ought to be ransacked for animals for installation in the Sierra and Rocky Mountains. Europe,

Asia and Africa could give us rare specimens. Especially desirable would be the ruminants of the Nearctic division. There is a great variety of antelope suitable for the lower altitudes. Not only give us the chamois or ibex, but also let us welcome the springbok, musk-deer, haartebeeste, or any animal that has a hoof, either solid or cloven. Even the wild boar from the Black Forest might be an acceptable innovation in the forest reserves of the Sierra Nevada Mountains, especially that portion where the oak thrives, and acorn mast is plentiful. Let us have a variety of game.

WM. FITZMUGGINS.

## The Maine Moose Problem.

Editor *Forest and Stream*:

The moose problem in Maine is a perplexing one and has been for the last few years. Those best acquainted with the facts relating to moose feel the approach of their possible extinction. To make certain the perpetuity of this noble race and still allow the honest and conscientious sportsman to take a reasonable amount each year requires no small amount of wisdom. Notwithstanding the fact that good wardens and other good game protectors are to be found in nearly every portion of Maine's hunting grounds; this monarch of the Pine Tree State is slowly but surely wending his way to where the birch bark horn will no longer decoy him. Sad but true are these words, unless proper measures shall speedily be adopted to cause an increase in the numbers. Here is the problem. How can it be done? Surely not by the methods now employed. To my mind, it is only a matter of a few years when there will be few if any moose left worth hunting.

The law provides that one moose can be taken by any hunter each year, but that one must be a bull. Here is where the trouble lies. I believe that one moose is enough for any hunter in one year, but when the law says that that one must be a bull, I maintain that the law is in the wrong. Nature has provided that a certain number of each sex of all animals shall exist to propagate their species. Interfere with that provision and you reap disaster. Now then, the law in Maine does not allow you to shoot a young moose, but you must take the very best specimens. When you do this you leave only the small bulls and few in numbers. It is a well known fact that a calf runs with its mother until it is a year old. Now, if in a certain territory where moose abound and there are only a few small bulls, and these the offspring of some of the cows in that same locality, there is much danger of interbreeding, which is not conducive of a healthy progeny. No man of sound judgment would allow interbreeding in his domestic stock, and if with the law you force such a condition upon our moose what can be expected but a deteriorated race?

Change the law so that any hunter can take one moose, be it bull, cow, calf or what not, and you will equalize the killing so that nature can carry on her wonderful work with much less interruption than under the present system.

TSCIENNETTO.

## Possession of Foreign Game.

Editor *Forest and Stream*:

Possibly the attorneys for the defendant in the Silz case, lately decided, and discussed in your editorial of a recent date, overlooked that part of the opinion of the Court of Appeals of this State in *People vs. Bootman*, 180 N. Y. 1, which discussed the present law on the subject of the possession of game in the closed season. It may be recalled that one of the principal reasons why, in the *Bootman* case, the court held that defendants had not violated the law was because the statute in force when the alleged offense involved in that case was committed, failed to say, clearly, that it applied to game imported into the State at a time when its possession then was lawful, and then disposed of during the closed season. The court said, referring to the present law: "While the Legislature did not act in time to affect this action, it has since removed all doubt as to its previous intention, by so amending the Forest, Fish and Game law as to provide that 'Wherever in this act the possession of fish or game, or the flesh of any animal, bird or fish is prohibited, reference is had equally to such fish, game or flesh coming from without the State as to that taken within the State' (L. 1902, ch. 194). That amendment, when read in connection with the Lacy Act, and the decisions of the Federal Courts, removes from the region of discussion the question considered in the *Buffalo Fish Co.* case in relation to the application of the Forest, Fish and Game law to imported game, which was decided, and the effect of the Commerce Clause of the Federal Constitution, which, although discussed, was not decided. *Matter of Rohrer*, 140 U. S., 545; *Vance vs. Vandercook Co.*, 170 U. S., 438. \* \* \* The right to pass laws for the protection of game being conceded, as in view of authorities it must be, the method of affording protection is necessarily within the direction of the Legislature. It may provide a close season for the taking of game, and may prohibit the possession or sale of game during that season. It may close the game market throughout the State during the period of prohibition, in order to remove the temptation from poachers and pothunters who are not apt to run the risk of taking game out of season if they cannot sell it. To do this effectively it may be necessary to close the market as to game taken without the State, as well as within, for there are no marks by which birds killed in Michigan can be distinguished from those killed in New York. When enacting a game law the Legislature may provide for its ready enforcement, not simply by making the possession of game during the closed season presumptive evidence of a violation of the statute, but it may go further and, in order to prevent evasion, fraud and perjury, may prohibit the possession of game in this State during the closed season, even if it were taken in another State and brought here during the open season. The action of Congress has taken away all question of interstate commerce, so that the State can act with entire freedom, and can prevent the shipment of game into or out of its own territory; and if game is imported it can regulate and prohibit the sale thereof. Such provisions are warranted by the police power, and

are not in conflict with either the State or Federal Constitution."

It seems to me that this declaration of a well established principle of game law is applicable to the Silz case. It is quite true, as contended by the defense in that case, that the purpose and object of our statute was to protect the game of our State, but it is equally true, and a fundamental principle of law, that, conceding that the Legislature has the power to do a certain thing, the means by which it shall be accomplished rests with the Legislature. If that body reasonably determines, as it has done in the present law, that in order to protect our game, it is necessary that the possession or sale of all game during the close season shall be prohibited, then its decision on that point is final. The necessity of such a provision has almost universally been conceded. If we allow the sale of imported game we not only increase the temptation to kill our own game but we place a premium on the violation of the game laws of other States, and if we fail to prohibit the export of game we add another temptation to those who wish to destroy our own game. It may be that, incidentally, a hardship is imposed in the Silz case, but that is merely an incident to the enforcement of a just law, and such a question appeals to the law-making power only. With the wisdom or expediency of such laws the courts have nothing to do.

NEW YORK, Aug. 1905.

JOSEPH B. THOMPSON.

## Hunting in the Adirondacks.

It was on a cold, frosty morning about the last of September that I started with my guide on a hunting trip in the Adirondack mountains. The mist was just rising from the lake, and in places around the shore could be seen patches of beautifully colored leaves which had failed to escape the touch of the late frost.

The call of the loon could be heard out on the lake, which was broken occasionally by the splash of a trout as he leapt from the water seizing some unfortunate fly. On the bank one might hear the bark of a red squirrel as he hopped briskly from pine to pine chattering to himself all the way. Slowly the fog lifted and as the sun rose over the mountains, Ben, for this is the name of my guide, announced that the grub was in the packs, so taking a blanket and what duffle I needed, we stepped into a nine-foot boat, and rowed to a landing at the southern end of the lake. Here we got out, and after tying a yoke in the boat, Ben shouldered it and his pack, while I carried my own pack, the blankets, two rifles and an ax.

Ben took the lead noiselessly up the trail and I followed close to his heels. After walking about four miles we came to a large creek, and followed it up a short distance to a small cabin. Ben announced that this was to be our camping place, so pushing open the door we entered, and found it contained three beds, a small cook stove, several cooking utensils and some heavy dishes. The small porch in front had been gnawed to pieces by the hedge hogs that made their nightly visits to the camp. After chopping a supply of wood Ben prepared dinner, which was comprised of boiled potatoes, bacon, pancakes, for which all Adirondack guides have a reputation, and a few brook trout which I managed to take from the creek with a fly.

After dinner was over and the dishes washed Ben sat on the front porch, his feet crossed over the railing, his arms folded, while he puffed leisurely at a large corncob pipe, and peered vaguely out across the creek and into the thick woods beyond. Thus he sat for some time while I ran a ramrod through my rifle barrel and filled my cartridge belt with shells. Suddenly he arose and shouldering his rifle summoned me to follow. It was now about 5 o'clock and the sun was fast setting in the west, giving a purple hue to the mountains across the creek, and tinting the clouds with gold. Lifting the boat that had been set beside the camp, Ben walked down an indistinct trail to the creek where he once more lowered the boat and pushed it silently into the water. Stepping to my side he requested me to be as quiet as possible and to take good aim before shooting. I stepped into the bow of the boat facing the front, while Ben sat in the stern and paddled.

Not a sound could be heard from the paddle which moved slowly back and forth in the water urged by the skill of expert hands. Slowly we went with the current for nearly a mile. The sun had already disappeared behind the mountains, and we could begin to feel the chill of the coming night. Suddenly we came to a sharp bend in the creek, which was heavily wooded on both sides. Just around the bend we could distinctly hear the splash of some animal wading through the water. I turned slowly and looked at Ben, who had stopped paddling and was holding the boat perfectly still, while his head was bent slightly forward. His face bore an expression of great expectancy, and his gaze was directed with alertness in the direction of the bend. He pointed his finger toward the sound and motioned for me to be on the alert, so lifting my rifle I prepared for a shot at whatever our game might be. The chill seemed more penetrating than ever, and over my body came a cold perspiration.

With one great effort I threw off my nervous feeling, at the same moment Ben gave a sweep of the paddle and the boat swept slowly around the bend. There in a patch of deer grass stood a large doe with her back toward us, and feeding leisurely, while she switched her white tail from side to side. I had taken aim at her and was about to fire when a hissing sound from Ben caused me to lower my gun and turn around. A nod from his head toward the shore caused me to look in that direction, and there, half hidden by a bush, stood a large eight-point buck. I raised my rifle once more and as I did so the deer stepped out and stood in a broadside position near a large pine tree.

"Quick! quick!" whispered Ben, so taking a careful aim I fired, and as I did so the doe bounded into the underbrush on the other side of the creek and whistled off into the woods. The buck made a short leap and fell. I threw another shell into the barrel of my rifle, and as I did so the buck rose again and started to run. I was about to bring my rifle to my shoulder to finish him, when I was startled by a shot from my guide and the buck fell dead in his tracks, a bullet through his heart, while the one I had shot had struck a little below. Ben cleaned the deer, and in about half an hour we were back to camp enjoying a good square meal. M. DIXON DODD.

# SEA AND RIVER FISHING

## Frog Farming.

### Pennsylvania Experiments in Practical Frog Culture.

BY WILLIAM E. MEHAN, COMMISSIONER OF FISHERIES,  
COMMONWEALTH OF PENNSYLVANIA.

IN May or June, 1904, there appeared a four-line news item sent out by the Associated Press, throughout Pennsylvania, announcing that the Department of Fisheries would receive applications for tadpoles or frogs, to be planted in suitable waters in the State. The announcement was made on the authority of the Department of Fisheries, and the department, not imagining that any great excitement would follow, had the State printer prepare only about one thousand blank forms. To my amazement, within a few hours of the publication of the notice, letters began pouring in, asking for blanks, and within a week, the entire one thousand was exhausted and still the mail was swelled by demands for frogs. Newspapers in all parts of the State began publishing comments in their editorial columns, and even the great dailies of Philadelphia and Pittsburg had leading editorials and editorial paragraphs commending the department for what they called the new departure. Papers in other States referred to Pennsylvania's work in frog culture, and even some magazines wanted to know about it. Fishculturists all over the country evinced a lively interest, and began besieging the department for literature on the subject.

It was generally assumed by the fishculturists that the frogs, which were distributed under the announcement by the Associated Press, were from spawn taken from cultivated frogs; but this was a mistake, although the department has been experimenting for several years in practical frog culture, and about the time of the announcement, had apparently succeeded in carrying a large number of frogs through the winter in a small pond and in securing spawn therefrom. But the spawn of the tadpoles distributed was from wild frogs and was gathered from the marshes of the peninsula which divides Presque Isle Bay from the main body of Lake Erie.

The spawn was gathered without orders by Mr. A. G. Buller, Superintendent of the State Fish Hatchery of the city of Erie, and he did so, knowing the interest which I was taking in frog culture and in procuring them for planting throughout the State.

The spawn was in all stages of incubation, some of it so far advanced that hatching took place between the marshes and the hatching station. When gathered it was placed in a small pond ten feet square, having only about a foot of water, at the Erie hatchery. The temperature was about 65 degrees, and the green eggs hatched inside of two weeks. Almost immediately after being hatched, the little tadpoles attacked the gelatinous mass from which they issued, and in an incredibly short time, devoured it all. As soon as it had all disappeared, the little tadpoles began on any refuse animal and vegetable matter which was in the pond, and that was cleaned up very quickly.

Mr. Buller then secured some dead fish from the market and threw them into the ponds. They attacked this food ravenously. Within five minutes after they were given a dead fish, the body would be completely covered by a living mass of wriggling tadpoles, which they would seldom leave until nothing was left but the bare skeleton. There were some 30,000 tadpoles in this little pond, and they devoured about twenty-five pounds of fish weekly. On one occasion, they completely stripped the flesh off a sixteen-pound carp inside of four days. The water remaining warm, the tadpoles grew with wonderful rapidity, and about the first of July or about six weeks after they had hatched, the hind legs began to appear, and shortly after, the forelegs broke out. Almost simultaneously with the appearance of the forelegs, the tadpoles ceased to feed on dead fish or any dead matter whatever, and appeared to subsist almost entirely on the contents of their tails, which is supposed to be absorbed, as fish absorb the material in the yolk sac attached to fish fry.

About the time the tail was absorbed the tadpoles began to seek live matter and would take nothing else, their preference seemed to be for insects and spiders, but, strange to say, they would not touch maggots. To assist in gathering insect life, small boards were anchored at intervals on the pond and on the ground on the edge and smeared with molasses or honey. The frogs soon found these places out and thousands upon thousands gathered around, seated on their haunches, and as myriads of flies and bees dropped to eat the molasses, they were seized by the long tongues and swallowed. Despite the vast number in this small space, the little frogs grew rapidly until the middle of July, or when they were less than three months old, they were 1½ inches to 2 inches each.

To fully illustrate the extreme voracity of the tadpole, I will give an incident which occurred in a tadpole pond at the Wayne county hatchery this spring. There were about 30,000 tadpoles in this pond. They had had nothing to eat for about thirty-four hours, excepting what they might gather from the bottom of the pond, then a four-pound black bass, which had died in the bass pond, was thrown to them. The fish was purposely thrown in a spot where there were no tadpoles. In a few moments, there was a great disturbance among the little creatures about six feet away. They began performing all sorts of evolutions, turning, twisting, wriggling around and around, until they formed almost a perfect ball, every moment the mass increasing in size and reeling toward the dead fish. Within three minutes, the mass of writhing tadpoles had reached the food and had fastened themselves to the body. In quicker time than it takes to write it, every tadpole

seemed to be aware of the presence of the food and all of them turning and twisting in the same manner as already described, made their way to the morsel. The mass was so great that before any other food could be thrown to them and so relieve the excitement, several hundreds of them had been killed. The tadpoles in that pond cleaned up that four-pound bass in a little more than four hours.

Experience in tadpole rearing has convinced the department that 30,000 is the utmost limit which can be safely carried in a pond ten feet square. If any considerable number more than that is attempted, it is almost certain they will be seized with a disease, which, unless checked, will sweep them all away within twenty-four hours. We lost the contents of two ponds containing about 100,000 last spring at Erie in less than thirty-six hours. The period of incubation varies according to the temperature of the water, the same as is the case with fish, only if anything, it is more pronounced. In like manner, tadpoles hatched in extremely cold water will be much smaller than those hatched in warm water. Tadpoles hatched in warm water will completely change their form and become perfect frogs inside of three months. Tadpoles hatched and retained in water of 50 degrees or less may retain their tadpole forms for twelve months before changing into frogs.

Pennsylvania's experiments in retaining mature frogs in ponds for breeding purposes have extended over a period of five years, and until this last year, the results were uniformly failures. It was easy enough to keep forty or fifty frogs in a pond ten feet square or about that size, but not more, partly where they were confined so that they could not get away. Finally we constructed a pond about fifteen feet long and six or eight feet wide with a depth at the breast of about three feet. The bottom of the pond sloped upward toward the back, until it reached the surface of the ground. The breast of the pond was so built that when filled with water, it would partially overflow the ground for some five or six feet back at the upper end, where grass was allowed to grow. The bottom of the pond was soft muck of considerable depth. Around the pond, leaving a space of about three feet on each side, was erected a fence made of mosquito wire netting and boards. A twelve-inch board was set on the ground nailed to posts about four feet high. The wire netting was nailed to the upper edge of the board and this wire netting was about thirty-six inches wide, making a fence, as I have stated, of about four feet.

As frogs are notable climbers, it was soon necessary to devise some means to prevent them from getting over the top of the fence. The superintendent of the Erie hatchery nailed a strip of muslin about six inches wide along the top of the fence at right angles, extending inward. He found, however, to make this effective, that he had to nail a narrow strip of wood along the fence, otherwise the small frogs in climbing to the top would push under the muslin, just as a boy would climb under the walls of a circus tent, and so escape. The superintendent of the Corry hatchery placed a strip of muslin about ten inches wide around the pond at acute angles, extending inward. He found the same trouble, as did the superintendent at Erie. The superintendent at the Torresdale hatchery nailed a twelve-inch board, flat, extending inward all around, and that was too much for the frogs. It was the most effective device.

In the pond described, built at Erie, 250 frogs were placed in the spring of 1904. Boards smeared with molasses were placed in the grass around the pond and the frogs lived contentedly throughout the summer, devouring so many bees from a neighboring apiary that the owners made vigorous protest. When late fall arrived, the frogs took to the muck at the bottom of the pond, where they remained all winter. It was necessary to have a depth of not less than three feet of water in the pond, on account of the excessive cold winter. If the water were to freeze to the bottom, the frogs would probably be killed even though they were in the muck. When the spring of 1905 came, the frogs emerged joyously from their long sleep and soon thereafter proceeded to spawn laying. The 250 frogs deposited spawn which produced, as estimated, seventy-five to one hundred thousand tadpoles. Fed on dead fish, the tadpoles waxed fat and strong, when suddenly they began to disappear in a most mysterious manner. After a diligent search, one half of the frogs having disappeared, the attendants discovered four huge water snakes in the enclosure, and their plump bodies indicated that they had been living high on tadpoles.

Strange to relate, the violent death of the snakes did not prevent a great decrease in the number of tadpoles remaining, indeed, in a short time everyone had disappeared, to the amazement of the superintendent and myself. The mystery was not explained for more than two weeks, when there came a hurry call from the superintendent of the Wayne County Hatchery for the applications for frogs on file in the office, he stating that unless he received them at once he would have no little frogs to distribute, because he had caught the old frogs in the pond devouring their progeny. The mystery of the disappearance at the Corry Hatchery after the snakes had been killed became clear. It therefore becomes evident that in carrying on the work of frog culture, it will be necessary to have the pond in series of twos, that is to say, a pond for breeding frogs and a pond for the tadpoles. As soon, in fact, as the spawn is deposited it would be best to remove it at once from the pond in which the large frogs reside and deposit it in the pond in which there are no such creatures and where they can hatch with perfect safety and be cared for better until shipping time arrives.

The shipping of frogs is exceedingly simple and inexpensive as compared with the shipping of fish, about 250 can be placed in a twenty-gallon shipping can. No water whatever should be placed in a can, but instead the bot-

tom should be covered with a thick layer of moss. If the regular shipping can for fish is used it will be necessary to cover the top with mosquito netting, otherwise when the cans arrive at their destination the applicant will probably find nothing but empty cans, the little frogs during the journey having clambered the sides and made their escape through the hole in the lid. Frogs will carry in this manner we know for two days, and probably longer without any attention whatever.

If tadpoles are shipped instead of frogs the can may be filled about one-quarter with water and the tadpoles shipped safely. A messenger is not necessary in this case for aeration is not required, and, in fact, the probabilities are that tadpoles would enjoy the high temperature better than they would aeration.

Since the Department has begun the distribution of frogs, hundreds of letters have been received from people asking for information concerning the incubation and what is necessary to do. As far as possible we have given them in a brief form the preceding information, and we have added that in all probability at least three acres of ground covered with ponds would be required for a profitable frog farm. This, of course, is more or less speculative, although it is doubtful if a less area would produce satisfactory returns. The one drawback to successful frog culture appears from the fact that it is largely experimental as yet; that it is most likely that under the most favorable conditions it would require at least two or three years before they would be marketable. While much easier to care for than trout and some other fishes, they certainly have their enemies; not only would they be attacked by snakes and mature frogs, but the tadpoles themselves, as well as the frogs, are an easy prey to predatory birds; hence, it becomes obligatory on the part of the prospective frog culturist to build small ponds so that the top can be covered with netting which will keep the birds out.

## A Flying Trip.

It was my first chance at Florida fishing. Things were so arranged that I had but seven days in which to go to Daytona, attend to business for a day and a half, and get back at my desk. An hour's notice to get packed up, but then an hour is plenty of time to get ready for a week's trip. The midnight train on the Seaboard Air Line from Jersey City Wednesday. Three hours to spare to go through the Capitol at Washington on Thursday morning. (This is a habit, and one with a particle of patriotism in their make-up could never stop over at Washington without visiting the Capitol.) Jacksonville at 8.30 A. M. Friday, Daytona on the Florida East Coast R. R. at 1.30 P. M. My, but it was hot this first week in April; nightly frosts in New York, 90 degrees in the shade here, and mosquitoes! well, I should say so, millions of them, and no presto along.

My business was all fixed up by Saturday 3 P. M. and I was negotiating for a ride up the beach to Ponce Park, when a launch owner kindly agreed to give me a ride up the river as far as his hotel, which was a short quarter of a mile from my destination, the Pacetti House. I took the wheel as he started the engine, and he seemed to be willing that I should keep it. Before he went to sleep these were the directions I got: "From here to that point up there a mile on the left the water is all the same depth; when you get to the point hug the bank for a couple of miles, then cross over ahead of a bunch of stakes and keep along the right shore till you see a bank of oyster shells sticking out, cross over again a couple of hundred feet above the point and hug the left bank till you see the lighthouse, then steer for that." And he went to sleep.

The old engine chugged away without missing an explosion, occasionally we would stir up a school of mullets which would go skipping out of the water in silvery streaks, dividing to the right and left. Lazy old pelicans flapped by us in dignified line, and now and then an egret or white crane stretched out an inquiring neck from the safety of a shell bank several hundred yards distant. The monotonous chug of the engine and the fresh steady breeze made my eyes heavy, several times I just caught myself nodding, but luckily kept awake. The trip of sixty-four miles was made without a mishap, and we were soon fastened up to the little dock of palm logs. The sandy patch through the dense tropical foliage to the Pacetti House showed in several places the smooth marks of gigantic rattlesnakes which abound in this jungle; luckily none were seen, though once the rasping of a couple of dead palm leaves in the breeze caused a hasty side step. A supper of broiled sea trout, fried crevalho and channel bass, potatoes and hot muffins was disposed of and then I took a walk out on the little wharf in front of the house. There was a piece of line with a hook attached lying on the wharf but no bait. Looking down on the edge of the shell bank I spied a hermit crab; by tip-toeing along in shallow water he was easily secured, but his house resisted repeated attacks with the heel of my shoe, finally with the aid of a heavy iron bolt I got him out and putting him on the hook dropped it down alongside one of the piles. Immediately there was a nibble, then a sharp tug and I had a 2-pound sea bass flapping on the wharf. It was getting dark and there was no more bait, so I quit reluctantly.

The following day was Sunday, and though ordinarily I am not given to Sunday fishing, still in this case it was excusable. It was arranged that I was to go in a launch up the inlet to the Spruce Creek trestle, fishing on the way and flag the train for Jacksonville, which passed at 3 in the afternoon. My companion was Gomez Pacetti, a school teacher, scholar, gentleman and expert fisherman all in one. A nice pailful of live mullet had been caught and after a hasty breakfast away we started. The first stop netted us each a sea trout weighing about 5 pounds. We could have filled the boat with sea trout at this place

had we been so disposed, but we were after channel bass. At the second stop I put on a big mullet and made a long cast toward a spot pointed out to me. Immediately the line started to play out, and after a run of about twenty feet I brought the rod back with a hard strike and felt the hook sink into something big. The line played off under my thumb and the stout rod bent to the breaking point.

"You have got a big one," said Gomez, quickly reeling in his line.

And then there was a battle. I am not an expert fisherman, if I had been there might have been another story to tell. The bass was a mighty one, little by little he took my 300 feet of line, and though I fought for every inch of it, I could not turn him. Gomez saw my line was gone when it was too late to pull up the anchor. To save the rod I pointed it toward the taut line and snap, it was gone. My face must have betrayed my feelings, for Gomez said:

"Never mind, we will get hold of another one shortly."

But we didn't, though we got several more big sea trout. By this time Spruce Creek trestle was reached. We still had an hour for dinner, and picking out a clearing in a palm grove extending to the water's edge, Gomez ran the boat in, and in less time than it takes to write it, he had out the frying pan and soon we were sitting down to a dinner of broiled and fried trout, fried potatoes, muffins and guava jelly served on palm leaf plates. Delicious does not begin to express the quality of that fish. I shall never forget it. Shortly after we went off to the trestle, for we heard the train whistle for New Smyrna, the station a few miles below us, I took my badly sunburned face on the train and was soon bowling toward the north with the record of my first Florida fishing trip impressed indelibly on my memory. C. G. BLANDFORD.

## Fooling an Educated Trout.

EVERY whilom reader of our paper is more or less familiar with the Castalia or Cold Creek trout stream, some thirty miles east of Toledo. It is recognized as one of the finest artificially stocked streams in the country, and about a ton of *fontinalis* (actual weight) is annually taken from its upper waters alone. But notwithstanding their great numbers, it is no easy task to take the ten pounds daily limit, since constant association with their great enemy has made them wary and suspicious to the highest degree. Only the fly and artificial bait are permissible in the stream, and the fish soon become acquainted with a new lure so that each in turn speedily loses its seductiveness. Some of the older trout under this schooling acquire a cynical character, not unmixed with a high estimate of their own acumen as well as a deep-rooted scepticism regarding any food forms that have the least hint of connection with a nine-foot leader.

It was one of these gentry that frequented the upper stream just above the club house. He took no pains to keep himself concealed, but might be seen almost any bright morning lordling it among a lot of smaller fry, and always on the alert to snap up any choice but unattached tid-bit that struck the water by accident or design. But as for fly or spoon or spinner, or any of the wonderful and impossible contrivances with which the tackle dealer beguiles the unsophisticated angler—you couldn't beguile him with the most subtle creation in the catalogue. Oswald used to say that this particular trout had acquired the habit of watching the rod on the back-cast, and that he had learned to calculate to the fraction of a second the time of the resultant fly on the water. But Oswald always did have a vivid imagination.

One morning last week, however, Kenyon had come in from fishing, and was resting from his labors at the club house. It chanced to be the hour for giving the fish in the breeding ponds above their breakfast, and the keeper was just starting up to serve the morning meal, carrying a toothsome bucketful of chopped liver and a long-handled spoon. As he passed along the bank he flirted a spoonful of the hash into the open stream near where our cynic lay, and he rose promptly to the occasion and the liver. Why shouldn't he? The keeper and his bucket he had often seen before, and the long-handled spoon bore no more resemblance to a fly-rod than does a walking stick to a double-barreled gun.

Kenyon watched the operation with an awakened interest and then he thought something. Next he ransacked his fly-hook for a dark red fly, the which when found he bent on the end of his leader. But he waited till the keeper returned with his bucket and long-handled spoon, and to that official he gave a series of careful instructions. Again the keeper walked up along the bank with the spoon and bucket, and as he came to the vicinity of the big trout he waved the empty spoon toward the water just as if—well, just as he had done before. A few feet behind him was Kenyon, who waved his rod simultaneously and the dark red fly fell on the water at the very time and place the spoonful of liver would have fallen—if there had been any to fall.

As for the big trout, he didn't wait. He evidently was feeling aggrieved because he had failed to obtain his share in the previous distribution, and he met that fly on the surface of the water with a promptness and energy that surpassed all his previous efforts. He made a magnificent fight, and when he was finally netted he weighed—hang it all! What difference does it make how much he weighed? Judged by his brain, and that is the only thing that counts, he was at least a hundred-pound fish.

Oswald says that the man who worked this confidence game on an old denizen of the stream would never have fooled him if the trout had not become confused. He was a lightning calculator and could carry on one mathematical operation with great rapidity and accuracy. But when he undertook to calculate the cast from the rod and the cast from the long-handled spoon at the same time he got his data all mixed up, and the result was inevitably disastrous. But then we all know Oswald.

It is earnestly to be hoped that the fanciful atmosphere which Oswald and Clarence Brown have attempted to throw around this incident will not have the effect of creating any doubt in the minds of the reader as to its veracity. The main facts—the basic, vital facts of the capture occurred exactly as they are narrated, and of the truth of the story the editor can have as many affidavits as he is willing to pay for.

JAY BEEBE.

TOLEDO, Ohio.

## Grand Tracadie Once More.

MANY places may be found in Newfoundland and New Brunswick and in the region between Quebec and the Gulf of St. Lawrence, where the general fishing is grander, where the imperial salmon holds his sway and the princely trout runs in record sizes, but for a quiet family resort, one easily reached and where there are neither black flies nor the privations of camp life, Prince Edward Island can be honestly recommended.

The island is somewhat larger than our own Long Island, but what a "difference in the morning," as it were, especially during the heated term—and fully as much in winter, although then the contrast redounds to the advantage of our New York island. It is easily reached in a two-days' journey by the fine express steamer plying between Boston and St. John, N. B., and connecting by rail and boat with Summerside and Charlottetown.

This July it was again my good fortune to revisit Grand Tracadie, about which I sent an article to the *FOREST AND STREAM* two years ago. This Beach is on the gulf shore some 15 miles from Charlottetown, and one can be accommodated at the Acadia, a fine little hostelry, or at a quiet family boarding house kept by Capt. MacDonald and on whose fishing smack I had many a pleasant sail. Taking an early breakfast before sunrise, then sailing 8 or 10 miles out on the clean, dark-blue waters of the gulf, we come to the nets set for the nightly run of mackerel. While the skipper and his mate are taking up and resetting the nets, one has an opportunity of handling for the cod, haddock and hake. I tried rod and reel on these as commended by Bickerton in his "Deep-Sea Fishing," but must confess that far more pleasure and fully as much sport is obtained by the use of a pickerel trolling line of strong braided linen, a well-tempered sproat hook and a cigar-shaped sinker of a pound to a pound and a half; this latter may be used in sections, allowing addition or diminution according to the strength of the tide. The professional fishermen use heavy cod-lines and sinkers of from three to five or more pounds. The lighter line offers less resistance to the water, requiring less weight to keep it down and accordingly affords far more play to the fish. Beside the additional sport, one will also secure many fish whose biting would be almost imperceptible in a more clumsy rig, and "cod-fishing" will cease to be ridiculed as a mere back-breaking business without any claims to angling. However, it is fair to add that in the spring and fall when the run of fish is larger and they are biting more voraciously, a heavier outfit would be more practical. I also used a two-foot snood of many stranded gut and found it answered very well. I would also recommend clams for bait rather than pieces of mackerel which are the orthodox lures of the native fishermen.

The harbor, which is safe for rowboats, affords all the flounders and blue-perch one would care to take.

These perch are similar to, though somewhat larger than, the New England cunner, are savage and adroit nibblers requiring skill in their capture, and make excellent pan-fish.

At Campbell's Pond in the neighborhood can be obtained some very good brook trout, mostly anadromous or sea-run.

Measuring the actual time engaged in fishing by days of eight hours each, I spent eight days for all three kinds of angling; these netted me 222 cod, haddock and hake; 165 flounders and perch, and 32 trout, weighing respectively and approximately 700, 53 and 7 pounds.

W. H. R.

NEW YORK, Aug. 1905.

## Fish and Fishing.

### Fishermen and Flies.

FLIES have their season as well as fish. Not only the favorite flies with fishermen and for fish, but those which delight to torture man and constitute the chief *bête noir* of the angler in the northern woods. A disregard for these seasons in the selection of artificial lures for fish often plays a large part in what is popularly supposed to be but fisherman's luck. And a failure to take into account the mosquito, the sand fly and the black fly season in the woods may cause untold misery to usurp the place of pleasure, although some old campers become in time practically immune from the effects of fly bites, and others are perfectly content and happy in the midst of the insect pests when thoroughly well anointed with their favorite dope.

The other day I visited the newly opened up fishing territory north of Lake Temagami, shortly after a Toronto paper had drawn such a sorry picture of the ravages said to have been wrought by the flies with a fishing party from that city. The story did not read as if it were very much overdrawn, for in the description of the havoc wrought by the fiery little insects, I recalled some of my own experiences in years gone by, when as a tenderfoot I had boldly plunged into the woods in the very thick of the fly season. In the course of nearly a fortnight's camping experience, however, in the same territory as that in which the flies had been so bitterly complained of, we experienced scarcely any annoyance whatever from the insects, except in one marshy place in which we were compelled to camp by approaching nightfall, and in several instances we slept with the tent door wide open and without making a smudge of any kind. I have generally found that the worst season for flies in the north woods is just about the time when the best of the spring fishing for trout is falling off, and this particular period I usually endeavor to avoid. After the first few days of July there is a perceptible falling off in the intensity of the fly scourge, and by the end of the month I have usually found it to be practically over.

Returning fishermen from the woods in the Lake St. John country report the same absence of flies at present there as our party found in northern Ontario, and in open spaces swept by the breezes, like the Grand Discharge of Lake St. John, there is naturally a general freedom from this plague.

The end of the fly season is testified to here by the increased number of anglers from the New England States and from New York, who are at present passing through

Quebec to the northern part of the Province. Some of them are now accompanied by their rifles, indicating that they intend to remain in the woods until after the opening of the hunting season on Sept. 1.

There are indications that the ouananiche fishing of Lake St. John, which usually falls off somewhat in the middle and end of July, and must then be sought in the northern feeders of the lake, is again good in the Grand Discharge. Mr. W. H. Boardman, editor of the *Railroad Gazette*, of New York, told me the other day that he had enjoyed much better fishing there recently than he was led to expect from what he was told by the hotel people before he crossed over the lake. His fish, moreover, were of a very good size. On his way up to Lake St. John, Mr. Boardman was the guest for some days of the Metabetchouan Fish and Game Club at Kiskisink, and very much enjoyed the sport which he had there, especially the trout fishing in the Metabetchouan River, which he found very good.

Lake Edward has again been yielding some fish of extraordinary large size. The other day Mr. and Mrs. Chase and Mr. J. Quinn, of New York, brought to Quebec from this lake, fifteen speckled trout, of which the smallest weighed 2 pounds and the largest 6 pounds, and other anglers have been equally successful there of late. The Ouatchouan River at Lake Bouchette has also been yielding excellent sport to a number of fly-fishermen, among whom was the Hon. S. N. Parent, until lately Prime Minister and head of the fish and game department of Quebec.

### The Temagami Country.

Though known to American sportsmen for some seasons past, Lake Temagami has never before this season seen anything like such a stream of visitors as is now pouring into the place from all sides. Hitherto it could only be reached by a round-about canoe and portage route, the present being the first summer for direct railway communication to the lake. Though nearly 500 miles due north of Buffalo, the railway run between the two points is not much more than fourteen hours. For those who may object to the touch of civilization which the railway brings, there is practically untrodden wilderness enough, in all conscience, stretching away from Temagami station to James Bay, to satisfy the most exacting admirer of nature's solitudes. Two hotels, one at Temagami station, the other at Temagami Island, fifteen miles down the lake, were crowded with people when I visited them about a month ago, a few weeks only after their erection. Heavy strings of black bass and pike-perch were being brought in at all hours of the day, besides enormous gray lake trout, and yet few of the people about the hotels seemed to go any distance from them for their fishing. For the first few days of an extended tour made by our party into the northwest and northern parts of the Temagami region, we saw a few different canoeing and camping parties, but for the remaining eight or ten days not a soul was seen by us until we reached the Hudson Bay Company's post at Matachewan. It will be a long time before the well stocked waters hereabouts will experience the results of over-fishing. I did my best to obtain some reliable records of the big fish of this part of the country. The Indians of Temagami claim that the record lake trout or *namaycush* of that lake, so far as their actual knowledge goes, was a 52-pound fish. One of 24 pounds was captured a few days before our visit by Mr. Bogart, of New York, near the Keewaydin camp on Manitou Island. These fish, notwithstanding the low temperature of the water in these high latitudes, are only taken by deep water trolling with very long lines, during the heated period. It is noteworthy, in this connection, that while the fish are taken in much more shallow water in both the early and late parts of the season, and the catches run very much larger, it is by the deep water fishing that the largest fish are secured.

I am thoroughly convinced that there is much more and much better brook trout fishing in these waters than is generally supposed; not necessarily in the larger lakes, like Temagami and Lady Evelyn, but in the higher and smaller ones and in the many streams by which they are fed. I had an illustration of this at Helen Falls, only a little more than twenty-four hours' journey by canoe and portage from Lake Temagami. We camped within a few hundred feet of the falls for the night and after supper and a smoke I proposed to try the running water below the cataract for *fontinalis*. My companions, who had visited the territory before, and who knew that there was good trout fishing further on, were not hopeful enough of good results to make the attempt. It was already dusk and we had had a hard day's work. But the period of twilight is a long one so far north, and my Indian paddled me out to the current below the falls, while my companions arranged their blankets and went to bed. Before they were asleep I was back in camp with thirteen trout averaging a pound each in weight. We had been fishing for less than an hour, and for more than a quarter of that period I had whipped in vain the beautiful looking oily water, partly covered with foam, just below the falls. I might have returned empty-handed to camp had my attention not been attracted by the rise of a good fish in the dark corner of a little bay just beyond the pool into which the cataract poured its waters. The disturbance of the water was close beside a patch of lily pads in all the glorious white bloom that distinguished them as *Nymphaea tuberosa*, and a few strokes of the paddle brought us near enough to the scene to enable us to discern the white moth at which the trout had apparently risen in vain. Or may there not have been at least another moth there a moment before, at which the fish did not rise in vain? In any case, the first cast in the vicinity of the lily pads was rewarded by an immediate rise to the Parmachenee Belle, and I was fast to a pound and a quarter trout. It was growing dark and there was no time to dally with the fish. He was brought to the net with all possible celerity, and the next cast gave me a double rise, though only one fish was landed. At almost every attempt I had a rise, and sometimes two. I suppose that I had killed my dozen fish in less than half an hour from the time of the first rise. Then there came another double which wound up the sport. It was too dark to be able to see what we were doing. George Friday, the Indian, undertook to lift the fish into the canoe. One he secured, but in the darkness he was so much handicapped, that the larger one—always the larger one in orthodox versions—disappeared, carrying away with

him my lucky Parmachenee Belle. It was the only one of my cast that it was at all reasonable to expect the fish to see in the dark, the others being a brown hackle and a dark claret. I had no white moth and no other Parmachenee Belle in my hat, and had left my fly-book ashore. It was even too dark to see how to properly attach a fly, and besides, we had all the fish in the canoe that we could use in our next two meals, notwithstanding the voracious appetites of the Indians.

It is but fair to add that the conditions were most favorable ones. After a very hot day, the evening was cloudy. A very slight shower had fallen just before I fished, and a heavy thunder storm, which had threatened for some time, came on soon after I had secured the fish beyond the reach of mink or any other thief of the kind who might otherwise break through and steal, and had rolled myself up in a blanket for the night.

Next morning we tried the same pool again. It is probable that the conditions were less favorable. It is certain there were less fish in that particular pool. That plenty were still there was evident from the fact that we had many rises. But they were neither so strong nor so numerous as on the preceding evening. Nor were the fish as large. Not one of them was killed. We caught a number of them, but we had enough for food and returned alive to the water all that were caught that morning.

We passed many beautiful trout waters. That some of them were well stocked with fish we proved to our own satisfaction. That others were, too, I have not a shadow of doubt, though lack of time—through the mistake of undertaking to cover too great a stretch of country in the time at our disposal—prevented us from fishing many waters where the trout were rising freely around us, and others where we saw no actual signs of the fish, but where nature belied herself if the water was not well stocked with trout.

The fact of the matter is that the bass are so plentiful in the nearby and most accessible waters of this region, and afford such good sport to the anglers who are satisfied with it, that comparatively few of the sportsmen who visit Temagami ever take the trouble to look after the brook trout at all.

We had other experiences at Temagami, but these must be told another time. E. T. D. CHAMBERS.

### The Chicago Tournament.

THE Chicago Fly-Casting Tournament, held at Garfield Lake, on Friday and Saturday of last week, was well attended, and resulted in making new world's records in several of the competitions. In the long-distance fly-casting Mr. E. J. Mills, of New York, broke all records with a cast of 120 feet, outdistancing by two feet Reuben Leonard, who took second. The score of Mr. Mills was by 9 feet better than the club record cast of 111 feet, made by Mr. Mansfield, of San Francisco.

Mr. Leonard took the long-distance salmon casting trophy with a score of 141 feet. The world's record in this is a cast of 150 feet, by Enright, of England, and the previous American record was the 145-foot cast by Hiram Hawes. Mr. Leonard would have exceeded his actual performance had he been unhampered; there was not sufficient space behind him, and each time he was impeded by striking the bushes in the rear.

In bait-casting, for delicacy and accuracy, Mr. H. G. Hascall broke the world's record with a score of 98 1-15, closely pressed by Mr. Leonard and William Stanley, of Chicago, who tied on 98.

The weather was favorable on both days; a shower interfered with the first event of Friday, but otherwise the days were beautiful. Everything passed off smoothly. The club deserves unstinted praise for the perfection of arrangements and the admirable manner in which the meet was conducted.

The numbers of competitors was unprecedented, sixty-two taking part in the first event; and the work throughout was of high average. There were many fair contestants, the most skillful of whom, Mrs. Bartholomew, of Kalamazoo, rivalled the men.

There was a notable difference in the styles of the Eastern and Western casters. In bait-casting the Western men cast with the bait wound up close to the tip of the rod, while the New Yorkers had the bait from a foot to eighteen inches away from the tip. In fly-casting there was much more vim to the Eastern casts, with less dependence on the wind to carry out the line.

It was impossible to complete the work in two days, and the sixth event was postponed to Sunday morning. Very many competitors left the city Saturday night, and the event was in consequence not well filled. There were some who objected to casting on Sunday.

#### AUGUST 18—FIRST EVENT—LONG DISTANCE FLY-CASTING.

No limit to rod or line. Ten minutes allowed to cast fly to greatest possible distance. No time allowance for replacing fly.

Winners.—E. J. Mills, New York, 120 feet, first. Reuben Leonard, New York, 118 feet, second. F. N. Peet, 108 feet, third. John Waddell, Grand Rapids, Mich., 107 feet, fourth. H. G. Hascall and A. C. Smith, tied for fifth at 104 feet.

#### SECOND EVENT—DISTANCE AND ACCURACY FLY-CASTING.

There shall be three 30-inch rings, distant 50, 55 and 60 feet from the edge of the casting platform. There shall be made five (5) casts at each ring. If the fly falls within the ring or on the rim of same the cast shall be considered perfect. For each foot or fraction of a foot outside the ring a demerit of one shall be made. The sum total of such demerits, divided by the number of casts, shall constitute the demerit per cent. The demerit per cent. deducted from the 100 shall be the percentage. Not more than one minute will be allowed in which to extend the line to 50-foot ring. When the contestant has extended his line and is ready, he shall call "score," and the next cast thereafter shall be counted. When five successive casts have been made at 50-foot ring, the Captain shall announce "next ring." Contestant must then lift his line, and if he so desires can make not to exceed five "dry casts" before dropping his fly at the 55-foot ring. A like procedure will be followed between 55 and 60-foot rings. Should contestant whip off his fly at any time after calling "score," he will be allowed to replace fly and proceed. For this purpose he may "work out" to point where fly was lost, call "score," and resume scoring at point where scoring stopped. The same procedure will be permitted if contestant's line is fouled through no fault of his. No cast shall count after judges notify contestant that fly is lost.

Winners.—H. G. Hascall, 99 2-3, first. F. N. Peet, 99, second. R. Leonard, New York, 99 11-15, third.

I. H. Bellows and H. W. Perce tied for fourth at 98 7-15.

E. J. Mills, New York, 98 3-15, sixth. E. R. Letterman, 97 13-15, seventh.

#### THIRD EVENT—ACCURACY AND DELICACY FLY-CASTING.

(Dry Fly.)

There shall be three 30-inch rings, distant 35, 40 and 45 feet from edge of casting platform, and there shall be made five (5) casts at each ring. If the fly falls within the ring or on the rim, the accuracy shall be considered perfect. For each foot or fraction of a foot outside the ring a demerit of one shall be made. The sum total of such demerits, divided by the number of casts, shall be considered the demerit per cent. The demerit per cent. deducted from 100 shall be the accuracy per cent. In addition, there shall be kept an account of delicacy. The delicacy per cent. shall be determined by the judges and the referee, in manner indicated below.

Contestant will be allowed thirty seconds to extend his line by "dry fly" casting to 35-foot ring. Scoring shall begin the first time the fly strikes the water. When contestant has made five (5) casts, captain will announce "next ring." Contestant must then lift his line and in not less than one nor more than five "dry fly" casts, reach the 40-foot ring. Scoring to begin the first time the fly strikes the water. A like procedure shall be followed between 40 and 45-foot rings. No cast made without a fly shall be scored. If fly is lost, contestant may replace same, and in not more than five "dry fly" casts resume his scoring. Not more than two "dry fly" casts will be allowed between scoring casts, except between rings, as stated. All casting shall be done from the reel. Contestant will be allowed to start with loose line and leader equal to length of rod, and may strip line but once in every retrieve, and must retrieve last cast. A perfect cast is: (1) Fly to fall by its own weight without a splash. (2) Fly and leader to strike the water in advance of line with minimum disturbance of surface. (3) Retrieve must be made with minimum disturbance of surface. (4) The grace and ease of contestant, his "dry fly" casts, back cast and manner of extending line, shall be scored for style. A demerit shall be scored for each failure to properly execute Nos. 1, 2 and 3, and for lack of "style," as outlined in No. 4; and five (5) points shall be deducted for each demerit scored. The total of delicacy demerits, divided by the number of casts, deducted from 100, give the delicacy per cent. The accuracy per cent. and delicacy per cent., added together and divided by 2, determine the final percentage.

Winners.—F. N. Peet, 99 1-6, first. A. C. Smith and H. G. Hascall tied for second at 98 23-30. L. H. Bellows, 98 1-3, fourth. J. Waddell, 97 12-30, fifth.

#### SATURDAY, AUGUST 19.—DELICACY AND ACCURACY BAIT-CASTING.

(1/2oz. Weights.)

There will be a target provided for this event with a center or bullseye thirty (30) inches in diameter, and so arranged that it can be located at distances of 60, 65, 70, 75 and 80 feet from casting point on platform to exact center of bullseye. There shall be made three casts at the target at each of the distances, viz., fifteen casts in all. If casting weight falls within the 30-inch center, or bullseye, the cast shall be considered perfect. For each foot or fraction of a foot away from the 30-inch center, a demerit of one shall be made. The total of such demerits, divided by the number of casts, shall be the demerit per cent. The demerit per cent., deducted from 100, shall constitute the percentage. In case contestant casts with drag or click, captain shall call "foul" and contestant shall be allowed another cast. The 1/4oz. casting weights provided by the captain shall be used in this event. If weight strikes iron rings or outside edge of circular wooden float, cast scores as though just inside of said ring or edge.

Winners.—International championship, H. G. Hascall, Chicago, 98 1-15 per cent.

First prize—William Stanley, Illinois Bait and Casting Club, 98 per cent. Second prize—Reuben Leonard, New York, 98 per cent. Third prize—E. B. Bartholomew, Kalamazoo, 97 14-15 per cent. Fourth prize—G. A. Hinterleitner, Chicago, 97 11-15 per cent. Fifth prize—L. N. Place, Illinois Bait and Casting Club, 97 10-15 per cent. Sixth prize—Tilden Robb, Kalamazoo, 97 10-15 per cent. Seventh prize—F. N. Peet, Chicago, 97 10-15 per cent.

#### FIFTH EVENT—LONG DISTANCE AND ACCURACY BAIT-CASTING.

(1/2oz. Weights.)

In this event, the center of bullseye will be located at distances of 60, 70, 80, 90 and 100 feet from casting point on platform. Three casts shall be made at each distance. The casting weights are to be the 1/2oz. weights provided. Scoring and other conditions to be the same as for Fourth Event.

Winners.—Diamond trophy, E. R. Letterman, Chicago, 98 7-15 per cent. First prize—E. R. Owens, Kalamazoo, 98 3-15 per cent. Second prize—O. J. Loomis, Chicago, 98 2-15 per cent. Third prize—H. W. Perce, Chicago, 98 per cent. Fourth prize—A. Rabbers, Kalamazoo, 98 per cent. Fifth prize—W. E. Kidder, Kansas City, 98 per cent. Sixth prize—N. C. Heston, Chicago, 97 9-15 per cent. Seventh prize—All three contestants, Naylor, Stanley and Bramhall, tied with a percentage of 97 8-15.

The salmon casting for a championship cup given by the club was won by Reuben Leonard with a cast of 141 feet.

#### SIXTH EVENT—LONG DISTANCE BAIT-CASTING.

(1/2oz. Weights.)

The casting in this event shall be done on the lawn in a V-shaped court, which is to be laid out as follows: From the casting point two diverging straight lines are to be laid out at an angle which shall cause them to be 30 feet apart at a distance of 100 feet away from the casting point. Diverging lines to be continued indefinitely at the same angle. Contestants each to make five (5) casts, in turn, one cast at a time. If casting weight falls outside the court, the cast shall be scored 0. Length of cast to be computed from casting point to where weight falls inside of court. The sum total of the five casts in feet, divided by the number of casts, shall be the average and constitute the score of the contestant. All casting to be done from ground level. The casting weights used are to be the 1/2oz. casting weights provided. Conditions concerning free running reels and casting with click or drag as outlined in Fourth Event to prevail in this event.

Winners.—Diamond trophy—E. B. Bartholomew, Kalamazoo, 183 49-60 feet. First prize—F. T. Rhodes, Kalamazoo, 178 40-60 feet. Second prize—L. G. Tooley, Kalamazoo, 176 24-60 feet. Third prize—D. W. Osborn, Kalamazoo, 167 46-60 feet. Fourth prize—A. Rabbers, Kalamazoo, 161 52-60 feet. L. G. Tooley was awarded a Bristol rod in the special prize contest, regardless of his average with a score of 104 8-12 feet.

The next annual championship tournament is being planned to be held in Kalamazoo, Mich.

#### THE MANY-USE OIL

The famous Reel oil that never clogs the action.—Adv.

### Chicago Fly-Casting Club.

CHICAGO, Aug. 14.—Below are scores for the contest Aug. 12:

	1/4oz. Bait.	1/4oz. Bait, Re-entry.	Delicacy. & Acc'y, Fly.
Becker	97 2-15	97 14-15	98 18-30
Bellows			
Dean	95 4-15	95 4-15	
Dilg	96 8-15	97 2-15	
Heston	96 10-15	97 12-15	
Hinterleitner	97 10-15		
Letterman	98 3-15	98 5-15	
Loomis	97 8-15		
McCormick	95 10-15	92 8-15	
Naylor	96	94 13-15	
Peet	97 12-15		98 22-30
Smith	97 2-15		98 15-30

B. J. KELLENBERGER, Sec'y-Treas.

### The Fishing Gazette.

NEW YORK, Aug. 18.—Editor *Forest and Stream*: I have just returned from the Pacific coast after an absence of two months, and note your statement in the obituary of the late William C. Harris, that "afterward he published the *American Angler* which was followed by the *Fishing Gazette*." The deceased at no time during his career had anything to do with the *Fishing Gazette*, either as publisher, editor or contributor.

G. E. JENNINGS. [The *Fishing Gazette* published by Mr. Harris was not the *Fishing Gazette* published by Mr. Jennings.]

### Belgrade Lakes Fishing.

BELGRADE LAKES, Me., Aug. 15.—Mr. F. L. Bickmore took three square-tail trout in Great Pond this morning weighing 5.4 and 2 pounds respectively, and seventeen 3-pound bass in the afternoon. The 5-pound trout is a male, and has been sent to a taxidermist for mounting.

### A New Munchausen.

ONE of our readers, whose veracity is above question, tells the following: "The terrible news comes from the western part of the Cherokee Nation that a boy climbed a cornstalk to see how the corn was getting along, and now the stalk is growing up faster than the boy can climb down. The boy is clear out of sight. Three men have undertaken to cut the stalk down with axes and save the boy from starvation, but it grows so fast that they can't hack twice in the same place. The boy is living on nothing but raw corn, and already has thrown down over four bushels of cobs."—Checotah (I. T.) Times.

"THE ART OF CHESS," by the famous master of the great game, Mr. James Mason, is now in its third edition, revised and enlarged. It contains 460 pages of chess literature. It thoroughly treats of every factor of chess, from the most elementary to the most profound. All the different openings and gambits are demonstrated, explained and compared with clearness and painstaking thoroughness. The best manner of finishing games, when only one or two pieces or more are left to each player, is also fully and clearly illustrated. "Chess Openings," by the same author, contains 120 pages, treats of about eighty different openings and gambits, of value alike to the beginner and the advanced student. Horace Cox, Windsor House, Finch Lane, London, publisher.

### Cabia Blanco.

CLEARFIELD, Pa., Aug. 18.—Editor *Forest and Stream*: By reference to your editorial columns this week I learn with deep regret of the death of Cabia Blanco, who died on last Saturday at Erie, Pa.

For many years I have been a reader of *FOREST AND STREAM* and among the many writers who have endeared themselves to your readers, I take it that Fred Mather, Nessmuk and Cabia Blanco were among the most prominent. There have been others, possibly as prominent and as interesting writers, but just now, while I pause for a moment, these three stand out prominent as contributors to *FOREST AND STREAM*. For several years I have thought of writing to Cabia Blanco for a photograph of himself, and I trust that you can see your way clear to secure one and publish it for your readers.

These men whom I have mentioned, together with others, are dead, and it seems hard to fill their places. I have Fred Mather's "Men I Have Fished With," Nessmuk's "Woodcraft," but I do not know that Cabia Blanco ever wrote any books. He certainly was an interesting writer, and he knew Indians and Indian life as few men have known them. I never read anything he wrote that was not intensely interesting, and after I had traveled extensively over the West and visited many places referred to in his letters, his stories of adventure became more interesting to me. I regret exceedingly his death and his loss is a personal one to me and to the many readers of *FOREST AND STREAM*. If I had known that his home was at Erie, Pa., I would have hunted him up ere this and become personally acquainted with him. His story of how he took his name of Cabia Blanco was intensely interesting, his breaking of the white pony and his many other Indian stories and stories of adventure were entertaining because they were true. He must have been a soldier above the ordinary rank in intelligence, and I have no doubt he was a brave man.

When I next visit Erie, Pa., I shall visit the Soldiers' Home and take pleasure in dropping a flower upon the grave of the old soldier, the hunter and Indian fighter, Cabia Blanco. Peace to his ashes. FRANK G. HARRIS.

BUTLER, Mo., Aug. 19.—Editor *Forest and Stream*: Cabia Blanco is dead. I closed the paper and through my mind a few of the many fine descriptive articles written by our old friend passed in review. We will all miss him, who will take his place? He wrote so true to life that one could almost see the very things he wrote of. Peace to his ashes. May the Supreme Architect of the universe, whose book he had read on the sea and on the land, give him a resting place in the valley of perpetual sunshine. FRANK H. CROWELL.

The Kennel.

The Cry of Hounds.

I HAVE heard people say, who hunted in the middle and at the beginning of the last century, that in their younger days foxhounds had much finer voices than at the present time, and I believe this to be a fact. One cannot help noticing that the modern foxhound (with a few exceptions in most packs) has not the voice of a hound at all, but makes a yapping noise, hardly to be distinguished from the bark of a sheepdog chasing a rabbit; and though people, from force of habit, still continue to write about "crashes of music" and "bursts of melody," alas! they seldom or never hear them. There is none of the bell-like clamor made by the true hound, and such as we still hear in the fell packs of Westmoreland and Cumberland—and no stouter or faster hounds are to be found anywhere.

Many people seem to think that hounds cannot run so fast when they are making a good cry, but this, I am sure, is not the case. Fell hounds always throw their tongues, no matter how fast they are running, whereas the ordinary foxhound is not expected to make music when running hard, and does not do so. I have seen fell hounds and ordinary hounds of the best blood running together in all sorts of countries, both flat and hilly, and can confidently state that the former are faster, tenderer nosed, more self-reliant, and infinitely more persevering than the latter, while, with regard to their music, there is, of course, no comparison.

Yelled, on the view, the opening pack;  
Rock, glen, and cavern paid them back.

I am afraid that if a pack of our modern foxhounds found themselves in the picturesque situation described in the above lines, "rock, glen, and cavern" would remain practically silent. Why should they be less musical than their ancestors, or than the old-fashioned hound who still flourishes in the Lake District and other parts of the country? I think that the reason is that most breeders of hounds nowadays are so bent upon producing what is thought to be the perfect hound of the show-bench type, and so much attention is paid to make, shape, and even color, that, so long as he is not actually mute, they do not mind if his voice is merely a squeak. The modern hound must not have a trace of throatiness if he is to be considered good looking, and one cannot help thinking that breeding all throatiness out of hounds has had a prejudicial effect upon their voices. In old pictures one notices that many of the hounds are decidedly throaty, and the fell hounds of to-day are most of them slightly so. In my own humble opinion, this adds to, rather than detracts from, their beauty; but I know that not many people will agree with me on this point. Good shape is, of course, essential to a hound, for without it he can

neither run far nor fast; but there is no reason why he should not have a good voice as well. There are a few packs in England—notably some woodland ones—whose hounds have a good and musical cry, but I fancy that if these were heard after listening to a pack of hounds of a hundred years ago, or, let us say, the Ullswater, Blencathra, or Coniston hounds to-day, their voices would sound poor and weak.

Apart from all questions of sentiment, it is often very necessary to be able to hear hounds a long way off. Who has not experienced the exasperating way in which they will sometimes make a sharp turn down a fence-side, and, if one is not very close to them, slip away unperceived and unheard, and are seen no more that day? Or how often do they get away quickly from a wood, leaving the greater part of the field, who, not having seen them, could not hear them, at the covert side? This would not occur had the hounds voices like those described by Shakespeare:

Never did I hear  
Such gallant chiding; for, besides the groves,  
The skies, the fountains, every region near  
Seemed all one mutual cry; I never heard  
So musical a discord, such sweet thunder.

How greatly the pleasures of cubhunting would be enhanced had one but hounds with better voices to listen to. The pleasure that one derives from hearing a really musical pack in full cry is so great that I confess I often wonder how people can put up with the chorus of squeaks and yaps to which they are obliged to listen, when they might have the real thing. Surely a hound's voice, such a beautiful and thrilling sound as it is, is as important an attribute as a faultless shape, or an evenly marked back.—A. B. S., in Field (London).

Foxhounds and Harriers.

It is a natural, and perhaps excusable weakness, that almost all "doggy" men are inclined to imagine the particular breed in which they are interested the most interesting. Those whose business and pleasure it is to superintend the breeding, and in due course ride after, foxhounds and harriers, go even a step further; they place them on a pinnacle above all other dogs, and will not even allow them to be classed within the category. To call a foxhound or a harehound a dog betrays ignorance of the sport and ignorance of the breed, and I remember the present master of the Hurworth (Mr. W. Forbes) informing a farm laborer who had told him "t' dogs had gone out at t' other side ov t' cover," that "we have no dogs—they're hounds," with no small emphasis on the last designatory word. John Jorrocks, the immortal, was equally particular, and in one of those famous sporting lectures of his, he counselled the young sportsman to "beware of calling 'ounds dogs, or sterna tails. Such a slip would make the M. F. H. turn tail on you directly."

It is not, however, with the peculiar and by no means uninteresting nomenclature of the sport with which I

would deal, but rather with the foxhound and harrier, which is, even more interesting. Regarding the sports mentioned there is no small degree of ignorance, and one finds, too, that very few people who have made dogs their study—and they are by no means few—who are conversant either with the actual work, life, or idiosyncrasies of these most interesting species. Indeed, I have heard doggy people on many occasions declare they cannot discover a redeeming feature in the hound, and allege he is sullen, morose, unintelligent, ever sombre and undemonstrative. All I can say is let these people go to a meet in white breeches, and dismounting, speak to one or two of the hounds they know, to which they are known, and they will discover to the cost of the afore-mentioned white breeches whether or no the foxhound is undemonstrative. That he usually carries with him a thoughtful air I admit, but this is born of his large head, his drooping ears, and large dark eyes, more than a real love of losing himself in day dreams or in the realms of thought.

Dog stories are cheap, and this is no place to air exaggerations, for though anglers may tell their tall stories to brother fishermen, we of the doggy world know just how far to go with our yarns. Still, I will relate what is more a fact than a story, and which is one nail in the coffin of any suggestion that the foxhound lacks intelligence. A few years ago the Sinnington hounds, in Yorkshire, were trencher fed, that is to say, instead of being kept permanently in kennels at a considerable expense, individual sportsmen, farmers and others each kept a hound. I forget for the moment which are the Sinnington hunting days, but say Mondays and Fridays. On the evening preceding these days the hounds in the outlying districts were gathered up and kennelled at Kirby Moor-side all night. They needed no feeding that evening, nor, of course, the next morning, for hounds, like horses, hunt on an almost empty stomach. The hounds near the kennels were left till the morning, when a blast or two on the horn was sufficient to call them up. Where one finds proof of the intelligence, however, is here. On the proper hunting mornings the hounds would sit and wait the sound of the horn, and were it a frosty morning, and hunting in consequence impossible, they would trot away down on the Monday and Friday morning to the kennels to satisfy themselves on the point, and then return to their homes, as they did—and do yet with the Goathland and Farndale hounds, which are still trencher fed—after the day's sport is ended, dropping their sterna and leaving their comrades at the nearest cut to their homes.

But one need have no difficulty in stating a hundred and one evidences of intelligence, the very control which they essentially recognize, the understanding they display of the human language, and the knowledge they display of the habits and eccentricities of the animal they hunt, not only convince me of a superb intelligence, but also that animals do think, and have a good deal more brain power (in addition to instinct) than we human beings, in our conceit that we alone are the thinkers and brain possessors, give them credit for.—J. Fairfax Blakeborough, in Our Dogs.

Canada Cup Races.

BY CLUTE E. NOXON.

FOR the first time in the history of the Canada's Cup that trophy has been successfully defended. Iroquois, the 30ft. yacht designed by Mr. Charles F. Herreshoff and representing the Rochester Y. C. in the series of races just finished, defeated the Canadian challenger Temeraire, the creation of Mr. William Fife, Jr.

For the second time since the Cup has been contested for, a period covering ten years, it has required the sailing of the entire five races to decide the championship. In 1903 Rochester and Toronto clashed, their respective boats being Irondequoit and Strathcona, and it was not until the fifth race had been sailed that Irondequoit was able to lift the Cup.

The match was one of the most notable ever held on fresh water. It brought to the harbor of Charlotte yachtmen from every club on both sides of the lake, and a fleet of pleasure yachts that taxed the accommodations of the port. Both designers, Fife and Herreshoff, were present throughout the entire series and watched carefully the performances of their craft, aiding in every way possible skippers and crews in their efforts to win the Cup.

It was a case of a light weather boat against a heavy weather craft, and the intervention of a Sunday, undoubtedly saved the treasure for the Rochesterians, for had the easterly blow that set in on that day delayed its coming twenty-four hours, Temeraire, with her long keel and extra tons of ballast, would have defeated Iroquois in three straight races. But the fates were with the Americans. The first day's race was sailed in calms, catspaws and fitful breezes; the second and third races were sailed in strong winds from the east that put the tucks and storm canvas on Iroquois while the Fife boat stood up under full sail. A day of heavy swells and no wind following the blow was the cause of the postponement of the fourth race, and then came two beautiful August days with the most delightful of wholesail breezes. Iroquois did exactly what she was expected to do, while Temeraire lived squarely up to her reputation in the blows, showing also a good turn of speed in the lighter airs.

When Iroquois was first launched she was heavier by a thousand pounds, but in order to make her trim to her lines and more evenly balanced, her keel was twice pared down and several hundred pounds of deadwood removed. Prior to this she had made a most remarkable showing in windward work in heavy weather, but it was to make her faster in the light airs that the reduction of lead was deemed advisable.

For three days the high winds continued and then dropped, leaving Temeraire with two victories to her credit, and one for Iroquois. Then once more Iroquois showed the way around the course and won the fifth and deciding race that carried the supremacy of the lakes.

The judges of the races were Messrs. E. H. Ambrose, of Hamilton, Ont.; Charles Van Voorhis, of Rochester, and W. P. Stephens, of Bayonne, N. J.

First Race, Saturday, Aug. 12.

Long before the start, which was scheduled for 11 o'clock, racing crews and skippers busied themselves aboard the rival yachts, putting on the last touches before they lined up for the gun. Not a breath of air was stirring, not a ruffle disturbed the waters of the lake.

By 9 o'clock sail was up on every craft. At 9:30 the launch to mark the course was sent out towing the flag floats, and a few minutes later the power yacht containing the judges and press dropped down the river. Then came the lightest of puffs out of the S.W. As the breeze picked up Iroquois broke out her anchor, with Skipper Lorenzo G. Mabbett at the helm. Five minutes later came Temeraire with Skipper E. K. M. Wedd. Out beyond the lights the judges gauged the weather, and immediately sent the launch off on the first leg of the triangle, which would make a balloon reach to the mark, a spinnaker run to the second flag and a close reach or easy beat home.

At 10:30 the half hour gun was fired, and the contestants came alongside the judges' boat for instructions. The ten-minute gun was fired at 10:50 and the jockeying commenced. By a skillful maneuver Wedd got Mabbett under his lee, but Iroquois wiggled out and showed her taffrail to the challenger. Balloon jibs went up in stops as they neared the line, and 15s. after the gun the defender shot across, Temeraire following on the weather berth 13s. later. Quickly ballooners were broken out in the breeze, which had now picked up to five or six miles an hour. The ballooners on Temeraire lifted while the light canvas on Iroquois stood full. Iroquois gradually drew out a lead until several boat lengths separated them. Turning the mark the defender led by 59s. Once around Wedd was the first to try a spinnaker, but it failed to draw and quickly came in. A few minutes later Mabbett ran his out and it filled away nicely, spilling into the balloon jib.

Half way down the leg the wind commenced dropping and the yachts drifted slowly along with barely steerage away. Iroquois led by an eighth of a mile, creeping inch by inch in the calm. She rounded the mark 1m. 1s. ahead of Temeraire, and then commenced the beat home. The wind had again picked up slightly and hauled farther to

the S., which made it an easy beat back to the line. Both Mabbett and Wedd went wind hunting on this leg and split tacks for fifteen minutes in an effort to pick out a streak of air. Iroquois retained the lead, however, and gradually worked away. The breeze freshened still more and Iroquois got down to her rail as Mabbett headed for the line. Temeraire got into a favorable slant not far from the line and gained on her rival, the defender rounding only 43s. in the lead. Up the lake they went again, the fluky wind heading them off as it swung around the compass. A big bank of thunder clouds rolled down from the S.W. before the yachts got to the mark, and while they were still tacking a short rain squall hit them. It looked windy for a few moments, but the rain swirled on down the lake leaving a flat calm.

The judges' boat had a long wait at the mark to take the rounding time, which showed Iroquois 1m. 30s. in the lead. The second leg was even worse, the yachts covering the distance of 3 miles in 1h. 30m. Both Mabbett and Wedd were at their wit's end to keep their craft moving. They trimmed in and eased off; they tried balloon jibs and spinnakers, light working canvas and reaching headsails. Eventually Iroquois got the better of it and luffed around 2m. 43s. ahead. The last leg was the flukiest of all. A light draught coming in from the N. put a wrinkle on the water, and Wedd, feeling it first, ran out the spinnaker. Slowly he began closing up the gap that separated the two boats, while Iroquois hung limp. The puff went by. Temeraire catching Iroquois and she too soon began to foot. Suddenly it died out again and Wedd headed up, looking for another stray streak of wind. Iroquois in the meantime had been carried far enough in shore to catch the edge of a new breeze springing up out of the S.W., and under working jib and staysail made a slant for the mark. The breeze grew stronger, and in a few minutes Iroquois had a ripple under her bows, while Temeraire, now far in the rear lay passively in a calm. Another catspaw drifted in from the N. and filled the spinnaker, but the defender was nosing her way for the line, which she crossed to the accompaniment of whistles, shouts and the waving of flags; 12m. 50s. later Temeraire swept over under spinnaker, having come along on the incoming breeze from the N.

	Start.	First Mark.	Second Mark.	Home.
Iroquois	11 00 15	11 24 15	11 54 48	12 30 57
Temeraire	11 00 28	11 25 14	11 55 49	12 31 45

Second Round.				
	First Mark.	Second Mark.	Finish.	
Iroquois	1 33 57	2 59 37	4 02 50	
Temeraire	1 35 29	3 02 20	4 10 46	

\*Elapsed time: Iroquois 5.02.41; Temeraire 5.15.18.  
Iroquois won by 12m. 37s.

**Second Race, Monday, Aug. 14.**

Yachtsmen awoke on the second day of the racing series to find the blow that had piped up out of the E. on Sunday still raging, and the prospects of a Canadian victory excellent. The second race was slated for a windward and leeward course of 16 miles with the start at 11 o'clock. There was a heavy sea running as the launch stood out to lay the windward mark. The sun shone brightly before the start, but disappeared behind a bank of clouds before the racers went out, and the rest of the day was a gloomy, cold and disagreeable reminder of fall. Iroquois went out at 9:45 under single reef, staysail and jib. Temeraire followed with whole mainsail and working jib. Wedd outjockeyed Mabbett as they stood for the line and crossed with a lead of 15s. On the wind the challenger almost immediately demonstrated her superiority in a blow, both outpointing and outfooting Iroquois as they thrashed to windward.

Iroquois labored greatly at a disadvantage. Under the single reef, working jib and working staysail she seemed to balance badly and constantly payed off. Her high freeboard also presented a tempting side to the seas, and in 5m. Temeraire had worked well up to windward. It was a dead muzzler to the outer mark, and the wind picked up to 15 miles an hour. They made a long tack down the lake and two short hitches to get around the flag, Temeraire leading by 3m. 38s. Gybing around, spinnakers and balloon jibs went flying out, the American crew getting out the light canvas 2m. faster than the Canadians. Iroquois picked up 30s. on the run, but as Iroquois swung around Temeraire was again way up to windward, while Wedd was driving her for all she would stand. After rounding, Temeraire made a short hitch to get up to weather, and then came about, while Mabbett kept along on the same tack, but sagging off to leeward up the lake. It was on this tack that the staysail on Iroquois acted badly. The jib backed the staysail, which in turn put a tremble along the mainsail. By 12:30 the wind was blowing from 18 to 20 miles an hour, and Iroquois staggered badly under the big head canvas. The challenger now led by over half a mile, and after a few short legs, again rounded the outer buoy 5m. 34s. ahead. Iroquois' crew gave another fine exhibition of spinnaker drill, getting it out and drawing in in 1m. 15s., while the canvas handlers on Temeraire made no effort to hurry things. Iroquois again picked up on the run, gaining 30s., but she was hopelessly beaten to windward, and finished 5m. 4s. behind.

First Round.			
	Start.	Outer Mark.	Home.
Temeraire	11 00 15	11 46 02	12 11 37
Iroquois	11 00 30	11 49 40	12 14 42
Second Round.			
	Start.	Outer Mark.	Finish.
Temeraire	12 58 26		1 21 47
Iroquois	1 04 00		1 26 51

Elapsed time: Temeraire 2.21.47; Iroquois 2.26.51.  
Temeraire won by 6m. 4s.

**Third Race, Tuesday, Aug. 15.**

The third day's racing was a repetition of the second. It looked in the early morning as though it would turn out to be Iroquois weather, the wind blowing in from the E. at the rate of 9 or 10 miles an hour with every indication of shifting to the S.E. But the clouds again closed in and grew threatening, the wind freshened and the long seas on the lake rolled higher and higher. It was a trying day for skippers and crews. The seas constantly broke over the boats, the wind shifted to the N.E. and grew suddenly cold, and reefs on Iroquois were put in and shaken out all around the course. Both Temeraire and Iroquois got over the line almost with the gun, the defender slightly leading but to leeward. The course was triangular with the first leg laid to windward. Temeraire immediately assumed the lead and showed the way around the first mark by 2m. 54s. The breeze strengthened materially at this buoy and the next leg was a run. Temeraire got out her spinnaker and footed fast for the second mark, but when Iroquois got around the wind began hauling to the N.E. and made it a reach. Temeraire, with her spinnaker, had dragged out a lead of three-quarters of a mile before she was obliged to douse it. Both boats gybed around the second mark, Temeraire leading by 3m. 16s.

Shortly after gybing Iroquois lost her balloon jib sheet, the canvas going high in the air. It was quickly recovered, and a few minutes later the peak was slacked for a reef. Meanwhile, Temeraire was lifting out for home under working canvas, gaining steadily. No sooner was the reef put in on Iroquois than the balloon again went soaring. Notwithstanding all this hard luck, Iroquois lost but 14s. on the reach home, Temeraire rounding 3m. 35s. ahead. On the wind again it was thought Temeraire would surely double her lead, but Mabbett kept right after his rival and nursed Iroquois into the wind without pinching her too much. Wedd kept Mabbett fully an eighth of a mile in his lee, but when the mark was turned he had gained but 36s in three miles of dead bucking. On the way to the second mark Temeraire lost her balloon for a few minutes, and Iroquois improved the time by picking up rapidly, gaining 40s. on the reach. The Canadian challenger had too big a lead now to lose the race except by accident, and Wedd, not caring to take chances, came about instead of gybing. In doing so, the preventer backstay got foul of a spreader and he had to luff up to clear it. Mabbett ran down on the mark and in a wind that had breezed up to 18 miles an hour, made a smashing gybe as he rushed after the fleet challenger. A nasty squall came tearing up the lake as the boats headed for home. Iroquois made a last effort to overhaul her rival, but the distance was too short and the Canadian crossed the line a winner by 2m. 28s., losing 1m. 3s. on the reach home.

First Round.				
	Start.	First Mark.	Second Mark.	Home.
Temeraire	11 00 15	11 31 46	11 54 41	12 14 35
Iroquois	11 00 00	11 34 45	11 57 57	12 18 10
Second Round.				
	Start.	First Mark.	Second Mark.	Finish.
Temeraire	12 53 07	1 14 09		1 32 32
Iroquois	12 57 18	1 17 40		1 35 00

Elapsed time: Temeraire 2.32.32; Iroquois 2.35.00.  
Temeraire won by 2m. 28s.

The storm abated on Tuesday night after Temeraire had won two creditable victories. Always after a three days' blow from the E. on Lake Ontario there is a long swell. Consequently, on Wednesday morning, while

there was a light breeze blowing from the N., the force of the heavy waves was too great to admit of sailing. The judges were determined to give the boats a trial, however, and the skippers were ordered to go to the line for a start. In between the piers of the harbor the waves were long and high, and both yachts were obliged to pass a line to launches to get out. They were taken to the line and the judges deliberated. Neither boat could get steerage way and rolled wildly in the seas. Finally, after over an hour's work in trying to send them away, the judges decided to postpone the race.

**Fourth Race, Thursday, Aug. 17.**

In the early morning of the day of the fourth race there was little wind and the lake was flat. Half an hour before the start a 3-mile breeze was blowing from the N.W. and the yachts ambled about the line.

The course was a beat to windward of 4 miles, and a run home, twice around. They got the gun at 11 o'clock, and Iroquois, well into the windward position, went across 22s. later, leading Temeraire by 16s. Iroquois pointed high, her working jib and staysail sheeted flat. In the light air the challenger simply could not head up and keep moving. Wedd pinched her hard to keep her pointing, but the starving process was costly, and in 15m. Iroquois had increased her lead to 200 yards. Finally Wedd rapped the Canadian full and soon drew up abreast, but fully an eighth of a mile to leeward. Up near the mark both boats went about on the port tack, having covered two-thirds of the weather leg on a single tack. The wind had dropped to a mere draught, and the lake was streaked with soft spots. Gradually working in closer to the buoy Iroquois went back to starboard and stood for the mark. Temeraire hung on for the weather berth, and the big lead of the defender widened perceptibly. A little flutter on the water to windward of the mark, indicated the coming of a freshening breeze, and Iroquois was the first to feel it. Skipper Mabbett got back to port to catch the new slant and round the flag, but a current in the lake at this point swept her off the course, and another short hitch was necessary to do the trick. Temeraire, meanwhile, by working well over to weather, made only one tack in getting to the flag, and rounded 2m. behind.

The crew of Iroquois gave an exhibition of light canvas drill as the Rochester boat squared away for home, both spinnaker and balloon going out together just 25s. after rounding. Temeraire used only a spinnaker on the run leaving the working jib up. Iroquois now held the lead by an eighth of a mile, but the wind had been again hushed to a whisper, and the chances for finishing within the time limit seemed doubtful. Temeraire had moved well down the line on the dying breeze, and when within half a mile from home her big spinnaker worked a blanket on the defender. Closer came the challenger until the lead was a mere matter of boat lengths. As the defender neared the mark, a catspaw breezed in from the N., sending her out from under the challenger's lee. Both skippers gathered in their spinnakers together and gybed as they rounded the mark, Iroquois leading by only 36s.

On the second beat to windward, which was more of a close fetch, the yachts were favored with a slant that picked up each minute. From a slight ripple on the lake it kicked up to choppy sea. Again Iroquois pointed high for the mark, Temeraire going wide on the wind, and losing steadily. Wedd made a valiant effort to keep his boat high, but there was a bad flutter to the jib, and he was compelled to rap off, falling far to leeward. The behavior of Iroquois in the strengthening breeze was admirable. With never a tremor in her jib and staysail, which set stiff and hard, the Herreshoff creation worked into the wind, heeling well down, her crew spread flat along the lee rail. Closing in on the weather mark, Mabbett put his helm over for the port tack and swept around 2m. 40s. in the lead. Under balloon jib and balloon staysail the defender ran for home with the challenger coming half a mile behind under spinnaker. Under this canvas Temeraire gained slightly but continually had to bear off the course to keep the spinnaker drawing. Iroquois, leading her rival by a good margin, poked her bow over the line, winning the fourth race by a flat 3m. and putting the contestants on even terms for the Cup.

First Round.			
	Start.	Outer Mark.	Home.
Iroquois	11 00 22	12 25 58	1 19 48
Temeraire	11 00 38	12 27 58	1 20 24
Second Round.			
	Start.	Outer Mark.	Finish.
Iroquois	2 03 12		2 35 14
Temeraire	2 05 52		2 38 14

Elapsed time: Iroquois 3.35.14; Temeraire 3.38.14.  
Iroquois won by 3m.

**Fifth Race, Friday, Aug. 18.**

The last and deciding race of the series was one of the best. The day was perfect, the sun shining brightly and a gentle breeze from the E. and S.E. tempering the heat to a comfortable degree. Excitement and interest over the outcome of the race had been worked to a high pitch, and every craft in the harbor that would float was pressed into service, carrying thousands of sightseers out on the lake. The course, according to the Cup conditions, was triangular, with the first leg laid to windward if possible. At 10 o'clock the breeze had hauled to the S.E. and made it impossible to lay a weather leg from just off the harbor, so the judges' boat and the Naval Reserve launch stood out about two miles into the lake to get the correct triangle. Half an hour later the wind had shifted away around to the N.E. and the start was delayed until the judges could decide just what kind of a wind it was going to be. If it kept hauling, every leg would be to windward. Finally a few minutes before 11 o'clock the launch started out to log the first side of the course, heading N.E. by E. The yachts came by for instructions, and the skippers were told that the thirty minute gun would be dispensed with, the ten-minute and starting guns only being fired.

The start was exciting. The wind was light, about 5 miles an hour, but with strength enough to admit of sharp jockeying, and both Wedd and Mabbett calculated carefully, as they maneuvered about the line. Mabbett got down a little too far to leeward as the time narrowed, while Wedd snuggled into the weather berth, ready to start his sheets as the gun sounded. At 11:15 the report rang out, with Temeraire over first 10s. later, Iroquois following only 5s. in the rear. The baffling wind had

again swung around to the S.E. while the weather mark lay N.E. by E. Neither skipper had apparently paid any attention to the launch that had gone with the dinghy to set the first buoy, although each had his steering directions. They had been warily watching each other, and as Wedd stood up to weather, Iroquois got the backwind of the challenger and came over on the port tack in a hurry, making a short hitch for the windward berth. Temeraire continued along on the starboard tack to leeward now, but a hundred yards in the lead.

Everyone aboard the judges' boat was puzzled by the erratic course of the skippers. Why they should thrash to windward when the mark lay off to leeward was a problem solved only by the hauling of the wind, but as they worked along on the wind it was decided best to let them fight it out, although the judges' boat broke out anchor and ran for the first mark at full speed. Wedd was the first to notice the error. Quickly easing his sheets he swung Temeraire around and headed for the buoy with the wind on his starboard quarter. Even then Mabbett hung up to weather, and when, easing off a few minutes later, he commenced reaching for the mark, he found himself 200 yards behind. Mabbett's hitch to weather saved him; the wind again shifted to the E. carrying Temeraire off to leeward, while Iroquois, heading high, bore down on her rival and closed up the gap. Approaching the buoy Temeraire came about to get around, while the defender laid her course for the mark. Wedd was on the port tack as Iroquois closed in, and was obliged to head up crossing the Rochester boat's stern as she gybed around the buoy, 1m. 11s. in the lead.

On the second leg, which should have been a spinnaker run, both yachts carried nothing but reaching sails, and it seemed as though they were heading way off the course. Mabbett was the first to locate the buoy and broke out his spinnaker quickly, Wedd following in 30s. The challenger drew up on her rival as they neared the flag. Creeping up on the stern of Iroquois, Wedd sprang a successful blanket on the American, and then shot up on the starboard quarter where he put a bad slump in the balloonjib of the defender. The wind was very light and streaky, the spinnakers had been gathered in, and the ballooners were carried far forward on spinnaker poles. Approaching the mark, Iroquois got her light canvas in quickly and under working headsails footed away from the challenger, turning the mark 57s. in the lead, having lost 14s. on the run. Mabbett gybed over as he rounded, and quickly rapping into the wind, got up to weather. It was an easy beat home, with a couple of short hitches and a long leg. Wedd was the first to commence tacking, Mabbett meeting him on every hitch and keeping him well to leeward. The wind had freshened to about 7 miles as home was neared, the yachts heeling to their rails with Iroquois leading by 200 yards. Around the flag they went at a minute after 1 o'clock, not a second's time having been gained or lost on the buck to windward, Iroquois' lead being exactly as it was at the second mark, 57s.

This was close racing, and the steamers tooted long and loud as the yachts started away on the second round. The first leg was another reach with balloon jib and staysail set on Iroquois and a balloon only on Temeraire. The light headsails on both boats dragged them along rapidly. Directly for the buoy Iroquois headed, gybing around 1m. 27s. in the lead. With the same canvas up they reached for the second mark, the balloon on Temeraire yanking out at the tack and soaring high above the masthead. A working jib was quickly hoisted while the kiting canvas was being captured, Iroquois meanwhile dragging out a lead that seemed impossible of recovery. Half way to the mark Mabbett ran out a spinnaker as he headed up for the flag, Wedd following half a minute later. The wind had dropped back to 4 miles again. Iroquois rounding 2m. 36s. ahead.

It was a beat home, the boats taking four tacks to make it. The wind again brushed up strongly as they approached the line, blowing from 10 to 12 miles an hour. On the port tack and well up to windward went the Cup winner. The gun announced a new champion of the lakes. Temeraire crossed 2m. 15s. behind.

First Round.				
	Start.	First Mark.	Second Mark.	Home.
Iroquois	11 15 15	11 51 49	12 31 45	1 01 18
Temeraire	11 15 10	11 53 00	12 32 42	1 02 15
Second Round.				
	Start.	First Mark.	Second Mark.	Finish.
Iroquois	1 22 48		1 49 05	2 17 14
Temeraire	1 24 15		1 51 41	2 19 28

Elapsed time: Iroquois 3.17.14; Temeraire 3.19.29.  
Iroquois won by 2m. 15s.

**CRUISING RACE MANHASSET BAY Y. C.**—On Saturday, Aug. 26, the Manhasset Bay Y. C. will give a cruising race which is open to cabin yachts not over 45ft. over all, and enrolled in any recognized yacht club. From the starting line off Manhasset Bay Y. C. house to and around Middle Ground Light, the Light to be left on starboard hand, finishing off Manhasset Bay Y. C. house. All Government marks to be passed on channel side, disregarding buoys on Middle Ground shoals. Distance of 80 miles.

The start shall be over a line between the committee boat and a mark boat flying the club burgee. Warning signal at 3 o'clock P. M., red ball; preparatory signal at 3:05, white ball; starting signal at 3:10, blue ball.

Finishing line same as starting line, leaving the committee boat on the starboard hand. At the finish the committee boat will show two red lights at the masthead at night.

There shall be no restrictions as to sails or crew, except that no boat entered shall carry more than one paid hand.

The first prize will be a cup valued at \$100, offered by Mr. Howard Gould. The second prize will be a cup valued at \$50, offered by Mr. George E. Schank. The third prize will be a cup valued at \$30, offered by Rear Commodore R. W. Bainbridge.

Yachts entered shall be in cruising trim, and shall carry or tow a dinghy. No means of propulsion, other than sails, shall be used. Entries must be received by the Race Committee of the club not later than Friday, Aug. 25.

Except as above specified, the race will be sailed under the rules of the Yacht Racing Association of Long Island Sound.

Race Committee: Messrs. Fred. A. Hill, chairman, Henry C. Ward and H. H. Hogins, Jr.

British Letter.

PLYMOUTH REGATTA WEEK.—Once reckoned among the chief fixtures of the season, racing in the West of England has of late years steadily declined. This year the racing in the beautiful Plymouth Sound was fixed for the last week in July, as the beginning of September was found too late in the season, but the fixture was a mere ghost of those of former years, and the only racing of real interest was that in the 52ft. class. With the exception of a small handicap class the racing was otherwise purely local. Sonya was absent from the 52-footers, being got ready for the Solent races. The others had four races provided for them, in three of which all started, Britomart not taking part in the fourth. Moyana won the first three matches and Maymon the fourth. The remainder of the events call for no comment, but it does seem a pity that racing should be practically dying out at the beautiful deep water ports of the West of England. There was a time when big fixtures were held annually at Penzance, Falmouth, Plymouth, Dartmouth and Torquay, all of which places afford excellent open, deep water courses. Momet's Bay regatta, as the Penzance fixture was called, and Falmouth fixtures are extinct as far as big racing goes. Plymouth appears to be following suit, although there are five days set apart, and Torquay and Dartmouth regattas are practically moribund. If the big classes would forego the pleasures of Ostend and stick to the Irish regattas, working back via Plymouth to Cowes, all might yet be well, but, of course, it rests entirely with yacht owners as to whether the British regattas are to be failures or successes. Their misguided support of the German races reduced the Clyde fortnight to very low water, until this year, and if they would follow up their example of ignoring Kiel by cutting out Ostend they would be able to support their own country's racing. If the Yacht Racing Association had kept up the status of class racing and not killed it through their own gross neglect, this state of affairs would never have come about, for class racers make it their business to do the regular round of the regattas. There seems little hope of improvement until proper scantling rules are framed and owners once more build to the rating classes.

THE BELGIAN REGATTAS.—The Ostend International Regatta, which has been an annual fixture for about thirty years, was this year supplemented by a regatta at Antwerp. After the conclusion of Ostend there were a series of races from that port to Flushing on July 24. In the race for yachts exceeding 100 tons, the German Emperor's schooner Meteor, Navahoe, Susanne and Valdora elected not to start, as the weather looked dirty. The German-owned schooner Hamburg sailed the course alone. In the smaller handicap Creole, Rosamond and the Belgian cutter Angele sailed, the latter taking the prize on handicap. The following day the smaller class had a match from Ternengin to Antwerp. Rosamond passed a mark on the wrong side and gave up, and Creole beat Angele easily. The regatta came to a conclusion on the following day when Rosamond won and Angele took second prize. The ex-52-footers had races on all three days. Senga, Nan and Gauntlet each scoring a win.

COWES WEEK.—Racing at Cowes has opened this year with great éclat owing to the presence of their Majesties the King and Queen, and of the warships of Great Britain and France which are anchored side by side in the Solent. For many years the Royal Yacht Squadron was the only club which gave races during this week, but latterly the Royal London Y. C. has held its annual Cowes function on the first day of the week, which was heretofore an off day, and, as usual, the Royal London opened the ball this year on Aug. 7 with a series of handicap matches, and a race for the 52-footers. A fine entry was secured for the big class exceeding 100 tons for a prize presented by Mr. M. B. Kennedy, owner of the yawl White Heather. Ten big vessels were entered, but White Heather and the German Emperor's schooner Meteor did not start. Navahoe was the scratch boat, the others being Brynhild, Merry Maid, Valdora, Therese, Susanne, Hamburg, Adela. Owing to the presence of the warships the boats were sent round the island. The wind was shifty and uncertain. Brynhild led the fleet home, but Merry Maid was within a few seconds of Navahoe and easily saved her time for first prize. Therese taking the second and Valdora the third. Great interest was taken in the 52ft. match, for Sonya had once more joined the ranks, but was again compelled to give up when leading. Maymon won with Moyana second. In the handicap for yachts not exceeding 100 tons six boats started. The light and shifty breezes suited the modern 65-footer Zineta and she was easily able to clear all her allowances and secure first prize, Creole taking the second. In the race for the ex-52ft. class Gauntlet pulled out a long lead, but Viera just saved her time for first prize, Gauntlet taking the second. In the small handicap class the scratch boat Nan went ashore, and the prizes were won by three South Coast one-design boats, L'Amoureuse, Eilun and Jean.

On Aug. 8 the Royal Yacht Squadron began its four days' regatta. There were only two events, the first a handicap match for His Majesty's Cup, open only to yachts belonging to the R. Y. S., and a race for the 52-footers. There was a better lot of boats than usual in the King's Cup race. Satanita, Meteor, Brynhild, Cetonia, Cariad and Lulu taking part. Meteor was placed at scratch, but in the long turn to windward to the Lynington Spit Buoy, Satanita opened out a long lead. Lulu lost her masthead and gave up. Satanita was first boat home, but Lord Dunraven's ketch Cariad, with a long time allowance, won the cup with 55s. to spare. The four 52-footers were joined by the ex-52-footer Gauntlet. Sonya and Moyana had a pretty race for first place, the American boat proving victorious through her superiority to windward, and she beat Moyana by 1m. 18s. Sonya led nearly all day and her victory was thoroughly well earned. The Royal London Y. C. gave, as is their custom, some races for the Solent classes, and the Motor Y. C. at Cowes had four matches for motor boats. In the first event, for boats not exceeding 30ft., Napier II. had a walk over. In the second race Pallas beat Quick-silver on time allowance. The third race was won by Eglina, a 25ft. launch, subject to measurement. The fourth was for bona fide cruisers. Only two boats turned out, Napier Major, Mr. G. F. Edge, and Pleione, Capt. R. T. Dixon, the latter winning easily. E. H. KELLY.

Log of Endymion.

Southampton to St. Johns.

SAILED from Southampton, England, on Tuesday, July 25, at 10.30 A. M. and proceeded down Southampton water with light breeze over the quarter, carrying lower sails, topsails and jibtopsail. As wind and tide were in our favor we stood out the eastern channel of the Solent. Throughout the afternoon we beat down the channel with a light head wind and considerable fog. The fog lifted in the evening, but we were practically becalmed all night.

Wednesday, July 26, the fog shut in again and light head winds prevailed.

Thursday, July 27, began with fog and light airs, but at noon the fog lifted and the wind freshened so that the Lizard bore abeam at 3 o'clock, and three hours later we were off the Scilly Islands, Bishop's Rock Light bearing abeam at 9 o'clock.

Friday, July 28, morning clear with light east wind and smooth sea and ship carrying lower sails, topsails, staysail and large jibtopsail. Position at noon, Lat. 49deg. 42min. N., Long. 8deg. 35min. W. Distance, 140 miles. Wind increased during night and both fore and mainsails were double reefed.

Saturday, July 29, shook reefs out of fore and mainsail in morning, and throughout day had head winds and moderate sea. Position at noon, Lat. 50deg. 21min. N., Long. 12deg. 59min. W. Distance, 170 miles. Wind increased during afternoon and single reef was tied in foresail and double in mainsail. Weather very unsettled and squally. Passed a full-rigged ship bound east with everything set.

Sunday, July 30, shook reef out of foresail at 8 A. M., and at noon shook one reef out of mainsail, leaving single tied in. Wind and sea moderate. At 4 P. M. shook reef out of mainsail and set topsails. Position at noon, Lat. 51deg. 39min. N., Long. 14deg. 14min. W. Distance, 107 miles.

Monday, July 31, head winds and moderate sea. Position at noon, Lat. 50deg. 46min. N., Long. 16 deg. 15min. W. Distance, 80 miles.

Tuesday, Aug. 1, morning light breeze and smooth sea, ship carrying all light sails. Wind increased steadily throughout day and glass falling. Just before dark main topstaysail and reaching jibtopsail were taken in. Then mainsail was lowered and maintry sail set. Wind increasing rapidly and sea making up. At midnight foresail was double reefed and jib taken in. Toward morning try sail and forestaysail were taken in and ship was practically hove to under double reefed foresail until morning. Position at noon, Lat. 50deg. 22min. N., Long. 18deg. 21min. W. Distance, 85 miles.

Wednesday, Aug. 2, maintry sail and forestaysail were hoisted at daybreak and ship ran under these sails with double reefed foresail until noon, when it became necessary to heave her to under try sail and double reefed foresail on starboard tack with oil bags over weather side. Soon after the maintry sail was lowered, double reefed and set again. The wind was blowing at least 80 miles an hour and there was a very heavy confused sea. Even under the scrap of sail carried the schooner was hove down so that the lee rail was three feet under water at times, and the decks were awash with spray taken aboard to leeward and washed to weather as she rolled. Not a single sea broke over her or was taken aboard solid, and she made fine weather of the worst gale the ship has ever been through. Position at noon, Lat. 50deg. 37min. N., Long. 21deg. 34min. W. Distance, 138 miles.

Thursday, Aug. 3, remained hove to all night with sea increasing. At 8 A. M. the reefs were shaken out of the maintry sail. Through the day the gale moderated, and at 6 P. M. ship was filled away on course under maintry sail, double reefed foresail and bobbed forestaysail, the sea still very heavy. Position at noon, Lat. 49deg. 57min. N., Long. 22deg. 36min. W. Distance, 48 miles (drift).

Friday, Aug. 4, set full forestaysail and jib at 4 A. M., and at 8 A. M. took in maintry sail and set full mainsail, both topsails, topmaststaysail and reaching jibtopsail. Position at noon, Lat. 49deg. 57min. N., Long. 25deg. 58min. W. Distance, 130 miles.

Saturday, Aug. 5, fresh breeze and moderate sea and carrying all lower sail. Position at noon, Lat. 49deg. 20min. N., Long. 30deg. 16min. W. Distance, 172 miles.

Sunday, Aug. 6, head winds and moderate sea, carrying lower sails with single reef in mainsail. Position at noon, Lat. 48deg. 44min. N., Long. 32deg. 16min. W. Distance, 91 miles.

Monday, Aug. 7, light N.E. winds and smooth sea, carrying four lower sails and topsail. Wind hauled slightly to eastward in afternoon, and under topmaststaysail and a big reaching jibtopsail the ship logged 80 miles from noon to 8 P. M. Position at noon, Lat. 48deg. 12min. N., Long. 35deg. 56min. W. Distance, 138 miles.

Tuesday, Aug. 8, southwesterly breeze and smooth sea. Position at noon, Lat. 48deg. 24min. N., Long. 39deg. 32min. W. Distance, 142 miles.

Wednesday, Aug. 9, fine S.W. breeze and smooth sea. Considerable fog until 5 P. M., when it cleared. Saw several whales spouting to the northward and at 6 P. M. sighted a large steamer hull down to the southward, and soon after saw a large iceberg showing above the horizon off the lee bow. Fine sunset and a beautiful moonlight evening. Position at noon, Lat. 48deg. 33min. N., Long. 45deg. 23min. W. Distance, 239 miles (best day's run).

Thursday, Aug. 10, light airs all night and practically becalmed in morning. Fog and light airs throughout forenoon. Position at noon, Lat. 48deg. 20min. N., Long. 47deg. 45min. W. Distance, 93 miles.

Friday, Aug. 11, light head winds and smooth sea with fog in early morning. Clearing toward noon, and afternoon clear with fine breeze and smooth sea. Sighted land at 2 o'clock, and at 4.30 were close in under the bold, rocky shore of Newfoundland and right at the mouth of the narrow entrance to St. Johns harbor.

New York Y. C. Cruise.

New London to Newport, Aug. 14.

A NICE breeze from the E. by N. was blowing when the yachts left New London Harbor at 9 o'clock. This meant that it would be wind for the greater part of the journey to Newport. It was a reach from the starting line off Sarah's Ledge buoy to Race Rock, then a beat to the Whistling buoy off Point Judith and then a reach to the finish off Brenton's Reef Lightship. The preparatory signal was made promptly at 10 o'clock, and five minutes later the 30-footers were sent off. Dahinda was the first at the line, with Atair a close second on Dahinda's weather quarter and Nautilus next. Then came Banzai, Linnet, Ibis, Oriole, Cara Mia, Neola II., Alera and Minx. The scrapping for position had been as keen as usual, and they were sailing fast in the steady breeze. At 10:10 the next division of sloops was started. Pellegrina was first at the line, followed by Doris, Irolita, Humma, Shark, Mira, Phanton and Cheemaun. While these boats were crossing, the 70-footers were maneuvering for position, and Mr. Hary L. Maxwell, who was sailing Yankee, had succeeded in placing that boat to windward of Mineola, and both were reaching for the weather end of the line. Just as the starting signal sounded Capt. Barr bore off with Mineola, preferring to take the end of the 2m. allowed, and Mr. Maxwell not caring to go over so far ahead of his rival, reached toward the southern end of the line. In doing this, he threw away the advantage he had gained in the maneuvering. Sybarita was first over at 10:15:05. Then Yankee crossed at 10:16:09. She could have taken the starboard tack, and by standing in for the windward end, caught Mineola again and forced Capt. Barr to keep clear, but Weetamoe was just ahead of Mineola and Mr. Maxwell thought that boat would bother Mineola somewhat. Weetamoe crossed at 10:16:11 and Mineola at 10:16:30. Mineola luffed and soon drew through the lee of Weetamoe and sailed closely with Yankee, but just to windward of that boat's wake. The schooners were next to be sent off. Corona was the first at the line, being timed at 10:20:17. The little Venona was on the weather quarter of the bigger yacht and crossed at 10:20:18. The others were timed as follows: Rosemary, 10:20:52; Cacique, 10:20:53; Palestine, 10:20:54; Elmina, 10:21:02; Katrina, 10:21:09; Mavis, 10:21:37; Agatha, 10:21:40; Kiwassa, 10:21:56; Cachalot, 10:22:00. The others were handicapped and crossed in this order: Muriel, Vencedor, Valmore, Quickstep, Normona and Lasca.

The auxiliaries were next, and their times were: Vergemere, 10:25:29; Idler, 10:25:52; Intrepid, 10:25:57; Ariadne, 10:27:00.

All were on the starboard tack, and the wind being favorable, all were doing well. A few minutes after crossing the line Katrina carried away her bowsprit and, signalling for permission to leave the fleet, went over to Greenport for repairs. The 30-footers turned Race Rock in a bunch, the leaders being Dahinda, Nautilus, Cara Mia and Neola II. Humma and Doris were neck and neck in the second division, and Yankee led Mineola. The boats got the first of the tide running to the E. in the race, and it was quite rough, so that Neola put back and was towed to Newport. The smaller sloops stood well in toward the Fisher's Island shore and worked along in short tacks, while the larger ones held the port tack well to the southward. Mineola was to windward of Yankee when they hauled on the wind, and she made a short starboard hitch and then stood off shore again and took the lead. Weetamoe kept the inshore division and for a long time seemed to be doing very well. At 11:30 o'clock the leaders were off the eastern end of Fisher's Island. Sybarita was the leading boat in the fleet, and just astern of her was Vigilant. The old cup defender was not racing, because her centerboard was jammed, but she was doing very well. Humma was leading in her class, with Shark under her lee and a little astern of Doris. The 70-footers were standing to the S., with Mineola leading. Corona was just a little ahead of Elmina, and these two boats were working between those in under the shore and those that had kept well to the south. Humma and Shark tacked off shore, and Doris held on the starboard tack until she had crossed the wakes of her rivals and then she stood out.

The off-shore boats got a better breeze than those in-shore. This was shown by Sybarita. She held well in toward Watch Hill and then stood out and had to pass astern of Mineola, when that yacht headed in.

It was half past twelve when the 70-footers tacked. They were well over toward Block Island and could lay their course for the Whistling buoy. Doris, too, had stood over toward these boats and the move was of great benefit to her. Mineola passed the Whistling buoy off Point Judith at 2:18:00, Sybarita at 2:19:10. From there it was a reach to the finish, and the yachts set reaching jib topsails, and the schooners carried main topmast staysails. On this point of sailing Sybarita passed Mineola, and she finished the race at 3:07:01. Mineola was next at 3:03:34, and then came Yankee at 3:05:26. Weetamoe lost considerably by keeping on the shore, and she did not finish until 3:37:25. Corona and Elmina made a close fight all the way, and the fact that Elmina beat Corona on elapsed time is a credit to Capt. Len. Miller, who had not been on board the yacht until the day before the race. Corona finished at 3:42:54, and Elmina at 3:43:31. Muriel was the next boat in at 4:00:20. She was a winner in her class. Next came Lasca at 4:00:40. The auxiliary Intrepid was next at 4:07:42, also a winner, and then came Doris at 4:13:18. She had taken the lead from Humma and Shark in the long tack she made to the S. and was a winner. Humma finished at 4:15:01. Vergemere was next at 4:18:56, followed by Shark 4:20:08, Irolita 4:23:20, Idler 4:35:56. Cara Mia was the next boat, finishing at 4:41:57. She led the 30-footers and had sailed a remarkable race. It was just the sort of day the 70-footers should have beaten the 30-footers badly, but the 30-footers had stuck close to the bigger boats and were well within their time. Ibis finished at 4:44:05; Kiwassa, 4:44:41; Vencedor, 4:45:07; Rosemary, 4:47:53; Mira, 4:48:30; Ariadne, 4:49:14; Palestine, 4:52:06; Cachalot, 4:54:15; Dahinda, 4:55:59; Nautilus, 4:56:46; Pellegrina, 4:58:38; Valmore, 4:59:04; Agatha, 5:04:42; Minx, 5:10:11; Oriole, 5:12:09; Venona, 5:12:33; Atair, 5:13:25; Mavis, 5:18:16; Alera, 5:24:10; Linnet, 5:28:57, and Cacique, 5:31:31. The summary follows:

Yawls, Class G—82 to 100ft.—Course, 40 Miles.				
	Start.	Finish.	Elapsed.	Corrected.
Sybarita	10 15 05	3 01 01	4 45 56	4 45 56
Sloops, Class H—68 to 82ft.				
Mineola	10 16 30	3 03 34	4 47 04	4 47 04
Yankee	10 16 09	3 05 26	4 49 17	4 49 01
Weetamoe	10 16 11	3 37 25	5 21 14	5 11 45
Sloops, Class K, 48 to 57ft.				
Doris	10 10 00	4 13 18	6 03 18	5 51 48
Irolita	10 10 00	4 23 24	6 13 20	6 02 20
Shark	10 10 00	4 20 08	6 10 08	6 10 08

THE MANY-USE OIL FOR POWER BOATS. Sample Free. Write The Many-Use Oil Co., New York.—Adv.

Cara Mia	4 41 57	6 36 57
Neola II	Withdrew.	
Alera	5 24 10	7 19 10
Minx	5 10 11	7 05 11

The special prizes for this day's run were cups offered by Commodore Bourne. Cara Mia won the sloop cup and Muriel won the schooner cup.

These special cups have caused two protests to be made. Charles Lane Poor, of the Mira, protested the 30-footers. He maintained that they were not in cruising trim and did not carry boats and consequently could not race against boats that were in cruising trim, and which complied with the rules, as far as carrying boats was concerned. The 30-footers Dahinda, Minx and Cara Mia had captured the special prizes on the three first runs. The other protest was against Venona. It was by Mr. W. S. Eaton, of Agatha, who claimed that Venona was launched subsequent to Jan. 1, 1905, and that she should rate at the top of her class. This protest has not yet been decided, but that against the 30-footers the Regatta Committee denied. Prior to the cruise, Mr. W. B. Duncan, Jr., on behalf of the owners of the 30-footers asked the Regatta Committee if the 30s were considered in cruising trim. The committee looked into the matter very carefully and decided that they were cruisers, and that they need not carry boats. This decision has not satisfied Mr. Poor, and he has written to the Regatta Committee and to Commodore Bourne, asking for a reopening of the case.

Newport, Aug. 15.

The Astor cups were to have been sailed for on Tuesday, Aug. 15. The entries were Schooners Corona, Muriel, Valmore; sloops and yawls Sybarita, Mineola, Yankee, Weetamoc, Doris, Mira, Nautilus, Mimosa III.

A storm from the N.E. made things generally very unpleasant. The yachts started out early with club topsails aloft, but as soon as they got outside they returned to the harbor and these big sails were lowered. The storm increased in force. The rain fell in torrents, and at noon the Regatta Committee called the races off for the day. Capt. John Jacob Astor's steamer Nourmahal, while trying to work her way out of Brenton's Cove, ran on the rocks. She was pulled off in the evening and the next day went to New York to go in drydock for repairs.

Mineola also met with a mishap. She was sailing about off Beaver Tail, carrying a small club topsail and with sheets pinned in flat. She got a hard knock down and sprung her mast. She went to Bristol the next day for a new spar, and Mr. Proctor announced that she would be not able to take part in any more races of the cruise or in the ocean race of the Eastern Y. C.

Newport, Aug. 16.

The N.E. storm lasted all day and kept the yachts in the harbor. At noon it was announced that the fleet would not proceed, and a meeting of the captains was called for the afternoon. At that meeting it was agreed that if conditions were favorable, a start should be made at 6 o'clock the next morning for Vineyard Haven, and that, after reaching that port, the fleet should continue on over the shoals to Marblehead.

Run to Vineyard Haven, Aug. 17.

The plans for an early start were changed, and the harbor signal was not made until 8:45 o'clock, and an hour later the Regatta Committee gave the preparatory signal for the start of the racers.

The starting line was at Brenton's Reef Lightship and the finish was to be off West Chop, at Vineyard Haven, 37 miles away. The boats were to leave the Vineyard Sound Lightship on the port hand. By the time that signal was made the storm had entirely disappeared. A light wind from the N. by E. was blowing and the sea was smooth. The first division of sloops was sent off at 9:55, and they crossed the line in this order on the port tack: Humma, Mira, Doris, Irolita. Sybarita's signal was made at 10 o'clock, and the schooners and auxiliaries were started at 10:05, but by that time the wind had died away altogether and the boats did not have steeerage way, but just drifted with the tide. All were handicapped. They crossed the line in this order: Elmira, Latona, Muriel, Agatha, Cachalot, Sybarita, Cacique, Venona, Katrina, Intrepid, Idler, Lasca, Vencedor and Corona. The last-named did not get away until 10:39:30. As she crossed the line the new Invader, owned by Mr. Roy A. Rainey, passed close to the lightship, evidently with an idea of getting a line of the sailing qualities of that boat as compared with Corona. All the vessels had light sails and held in toward the Newport shore. By noon the leaders had reached West Island. Elmira was leading about half a mile ahead of Muriel. A quarter of a mile astern of that boat was Humma. Then came Vigilant, Sybarita, Doris and Mira. Two miles further back was Agatha and Venona, and further off shore Vencedor, Katrina, Corona, Idler, Intrepid and Lasca.

The wind had come from the S.E., but it was chiefly the tide that helped the boats. At 1:30 o'clock a S.W. wind struck in. Elmira was still the leader at that time, being about 2 miles E. of West Island, but she was far in toward the shore and she did not get the benefit of the change until long after those boats that had kept further out. It was a day of flukes and luck. Humma was the luckiest of the fleet. She soon picked up a nice breeze and, sailing along, took the lead and passed the Vineyard Sound Lightship at 3:33:05. Sybarita was next at 3:48:21. Then came Doris at 3:52:33; Muriel, 3:53:33; Corona, 3:57:11; Invader, 4:00:35; Mira, 4:05:15; Elmira, 4:07:40, and Lasca at the same time, but to windward of Elmira. Jib topsails were changed for balloons for the reach through Vineyard Sound, and the prospects of the yachts finishing then were exceedingly good. They had a tide to buck though, and later, when the leaders were off Tarpaulin Cove, the wind died out again. The Regatta Committee remained out long after sunset to take the time of the boats, but at 8:30 o'clock declared the race off, as no boat had finished. The racers drifted into the harbor later on and anchored.

Vineyard Haven to Marblehead, Aug. 18.

The run over the shoals to Marblehead was an informal one. Commodore Bourne, on Colonia, and Vice-Commodore Walters, on Narada, got under way early in the morning in order to be in Marblehead Harbor in time to salute the Eastern Y. C. flag. Colonia made the trip in 7h. Some of the sailing craft, including Mira, Corona, Katrina, Elmira, Muriel, Doris, Shark, Agatha, Crusader II, and Mimosa III, started out under sail in a light E.N.E. wind. They had a fair tide over the shoals, but later the wind died out and several of them took tows. The steamers and auxiliaries reached Marblehead Harbor in the afternoon and evening and the sailing craft did not arrive until midnight or after. The next day all hands were too tired to race, and most of the boats remained at anchor.

Marblehead, Saturday, Aug. 19.

There was a meeting of the fleet captains on board the flagship Colonia in the afternoon, and after the usual votes thanking Commodore Bourne and the flag officers, the fleet disbanded.

The Astor cup races were declared off. These cups were given by Capt. Astor to be raced for during the cruise, but no day for the races could be arranged. Capt. Astor, with the consent of Commodore Bourne, has given the cups to the Regatta Committee to arrange for races under new conditions. The committee announced that they would be offered for races to be sailed off Newport sometime in September, at a date following the races off Glen Cove for the Autumn cups, which will be sailed for on Sept. 9. The Astor cups will be sailed for on Sept. 12 or 13, and will be for boats in racing trim. Following these races will be contests for cups offered by Vice-Commodore Henry Walters, which were offered for the run from Newport to Vineyard Haven which was not finished. They will also be for yachts in cruising trim.

RECENT SALES.—The following sales are reported through the office of Mr. Stanley M. Seaman: Sloop yacht Rosalie, Mr. George C. Carson, Philadelphia Corinthian Y. C., to Mr. Henry F. Parmelee, New York Y. C. Rosalie was designed by Mr. William Gardner and built in 1903 by the Holmes Shipbuilding Co. She is 65ft. over all, 43ft. waterline, 14ft. beam, 8ft. draft. Auxiliary yawl Dawn II, for Dr. E. N. Brandt, Larchmont Y. C., to Mr. William Hanson Hodges, of Baltimore Y. C. Dawn II was designed and built in 1903 by Messrs. Read Brothers, of Fall River, and is 60ft. over all, 40ft. waterline, 14ft. 5in. beam and 5ft. 5in. draft. She is equipped with a 20 horsepower Standard motor, and will be used for cruising on Chesapeake Bay and vicinity. Knockabout Cicada for Mr. A. B. O'Neil, of New York city, to Mr. A. Almquist. Knockabout Elise for Mr. A. F. Bowen, Newport News, to Mr. C. W. Grandy, of Norfolk, Va.

Lipton Cup Races.

MR. FRANKLYN H. WALKER's fine little boat Ste. Claire, of the Detroit Country Club, carried off the Lipton cup again this season in impressive fashion. Not a single race went to any other boat, three straight being the record of the Detroit sailors.

The series were a tremendous disappointment to the Chicago and Milwaukee sailors who had hoped to make a better showing. The defeat was particularly humiliating because it was able to trace its cause direct to the lack of those qualities which should be most prized by yachtsmen.

The management of the Price-Lorimer-Mills-Osborn syndicate boat, Quien Sabe, has been harshly criticised. Commodore Price, the managing owner, was more interested in his big new yawl, Juanita, than he was in Quien Sabe and failed to make the most of the new Tams, Lemoine & Crane 21-footer. That the boat is able is beyond question. Her hull is finer drawn than Ste. Claire's, also designed by Crane, and she is to all purposes the better boat, but badly fitting canvas and lack of interest in her welfare caused her defeat. Up to the day before the race her crew had not been selected, and the men who sailed her, while they did what they could, had not that perfect team work which is so essential in handling light canvas on a boat of this type. Quien Sabe was not out of the harbor for weeks before the race, and laying at anchor she soaked up so much water that when the measurers put the tape on her she was found to be so close to the danger line that one of her crew had to be left off to keep her from going out of the class.

Mendota, the Milwaukee boat, was no better handled, and her old canvas had been more or less pulled out of shape in the many hard blows she had been sailed in.

In contrast to the slovenly handling the Lake Michigan boats were given the work of Ste. Claire was a joy. Her new mainsail was the admiration of every sailor on the lake, and her light canvas, by Messrs. Wilson & Silsbee, elicited much admiration. Her crew, which Commodore Walker appointed early in the season, had worked day and night in preparation for the event, and the way they handled the boat was a revelation to the easy-going Chicago men.

Mr. Alpheus Jennings, who had the stick on the Walker boat, sailed three capital races and seemed to get all there was in the handsome little cruiser.

First Race—Monday, Aug. 14.

After the fiasco of Saturday, Aug. 12, the first race was postponed until Monday, Aug. 14. The course was an equilateral triangle of 2 miles to the leg to be sailed over twice. When the boats reached the starting line, 2 miles off the Van Buren street gap in the Government breakwater, they found a fresh N.E. breeze blowing at the rate of about 14 miles an hour. A mishap aboard the judge's tug caused the starting gun to go off prematurely, and the boats had to be notified of the mistake. When they finally got the signal to go ahead, Ste. Claire was hovering on the line and shot across in the smoke of the discharge. Mendota was second, 10s. behind, and Quien Sabe had to go about on the line, being headed the wrong way when the gun went off. Hoosier, the fourth entry was last across. Ste. Claire and Mendota stood off on the starboard tack, but soon after crossing the line Hoosier split tacks with the leaders and Quien Sabe followed suit. The thrash to windward showed Ste. Claire at her best, and she gradually drew away from the rest of the fleet. Mendota was 1m. 15s. behind at the end of the 2-mile beat, while Quien Sabe was nearly 8m. to the bad. The second leg was a spinnaker run, and Mendota picked up a few seconds on the run. Ste. Claire's spinnaker fouled in the spreaders, and while it was being hauled down and the mess cleared away, the Milwaukee boat picked up a little.

The second leg was a balloon jib run, and the boats held their relative positions pretty steadily without any gains in particular.

The beat out on the second round of the triangle enabled Ste. Claire to open up a big gap. Splendidly handled she drew away from Mendota, and the race developed into a procession. Price, who had been steering Quien Sabe, disgusted at his poor work, turned the stick over to Mr. U. J. Hermann, a member of his crew, but the change was not enough to enable the syndicate boat to make up any of the lost ground, and she was hopelessly beaten, although Mendota's mistake in holding on the starboard tack long brought her back to Quien Sabe. Here is the time for the two rounds:

	First Round.	2d Buoy.	3d Buoy.
Ste. Claire	2 44 25	3 01 18	3 19 50
Mendota	2 45 40	3 02 25	3 20 50
Quien Sabe	2 52 02	3 09 29	3 57 37
Hoosier	2 54 34	3 11 55	3 38 08
Second Round.			
Ste. Claire	4 07 07	4 25 42	4 43 52
Mendota	4 13 45	4 31 32	4 48 42
Quien Sabe	4 23 12	4 42 58	5 01 51
Hoosier	4 26 12	4 45 10	5 05 44

Second Race—Tuesday, Aug. 15.

The second race was sailed over a windward and leeward course of 3 miles to the leg, course to be sailed over twice. As on the day before the wind was fresh from the N.E. with a heavy lump of sea running. Supporters of the Milwaukee boat saw in it a great chance for the Cream City boat to win, but again Ste. Claire demonstrated her superiority by going out from the start and opening up a gap in the first thrash to windward. Quien Sabe held on better under the handling of "Sport" Hermann, but could not quite hold the slippery Detroit boat. Brown used the best judgment on the beat, and was first to go from the port to the starboard tack. He gained quite a bit by it, as when Ste. Claire, after overstanding the mark quite a bit, came down to the first buoy, the Milwaukee boat had made up much lost ground. Ste. Claire was first over, with Quien Sabe second, over 3m. behind and Mendota third. The Hoosier was hopelessly out of it. On the run down the wind Ste. Claire increased her lead and the others held their relative positions. On the second thrash to windward Ste. Claire opened up a still larger gap, and at the end she was leading by nearly 7m. Quien Sabe held on to second place, evening up the percentage with Mendota. Hoosier's boom was split and she retired from the race. The sensation of the day was the wonderful showing of La Rita, which has two wins on the Lipton cup to its credit. While it was generally thought that La Rita was out of the struggle and no longer able to compete for the trophy, and had not been entered, Peare sailed over the course after the contestants. Starting 2½m. behind the four racers, he was first around the outer mark, beat Ste. Claire on the run down the wind, and after waiting for her at the finish line, again beat her to the outer mark and sailed home, reaching the finishing line nearly 3m. ahead of the Detroit boat.

That evening at the banquet given to the visiting yachtsmen Peare issued a challenge to race the Detroit boats Ste. Claire and Spray. As La Rita has lengthened out on the waterline, so as to be no longer eligible to the class, the Detroit yachtsmen did not accept the challenge, but told Peare that if he could get his boat back into the class again there were two fine trophies in Detroit which he could sail for, the Walker cup and the Country Club cup. As it will be impossible to bring the old boat back into the class, it is futile to discuss the possibilities of a match race. Here is the official time record of the race:

	1st Mark.	2d Mark.	3d Mark.	Finish.
Ste. Claire	2 51 40	3 15 59	4 09 45	4 32 59
Quien Sabe	2 54 55	3 20 54	4 16 05	4 39 19
Mendota	2 55 48	3 20 55	4 23 00	4 48 20
*Hoosier	3 04 54	Did not finish.		

Third Race—Wednesday, Aug. 16.

The deciding race was sailed Wednesday afternoon over a quadrilateral course, of 3 miles to the leg. As in the previous races, Ste. Claire demonstrated her superiority. Herman got the best of the start, shooting the Price boat over the line in the weather berth, with Ste. Claire half a boat length ahead of him, but under his lee, and Hoosier third. The wind was fresh from the N.E. with a good-sized sea running, and the first leg was a broad reach. Ste. Claire and Mendota broke out balloon jibs, but as the boats got further out in the lake, the wind hauled a bit to the E. and made it a close reach, so that Quien Sabe with a working jib did better work. She worked out to windward and assumed a nice lead. Half way down the leg the other two followed suit and took off the light canvas and then Mendota picked up astonishingly. She forged ahead and crossed the turning buoy 15s. ahead of Quien Sabe, while the Walker boat was 20s. behind. The Chicago 21-footer, Hoosier, started 12m. late, Commodore McGuire sending her to the starting line for the sake of keeping the percentage table unchanged.

The second leg was a thrash to windward, and Ste. Claire's superior ability in going to windward was again demonstrated. She took the lead from Mendota before the journey was half done and rounded the second mark 1m. 15s. to the good. Mendota had held her lead over Quien Sabe and increased it a good bit, the Price boat showing poor form in windward work owing to the fit of her mainsail. The run to the third mark was a reach, and the positions were not changed. Ste. Claire rounded with over a

minute's time to spare, and setting balloon jib and spinnaker, finished the race in a smother of foam and canvas, a glorious sight to the spectators at the finish line. Mendota was second, with Quien Sabe third. Hoosier finding herself badly out of it, cut the course and finished with Quien Sabe. Following is the official time for the race:

	1st Mark.	2d Mark.	3d Mark.	Finish.
Ste. Claire	2 29 06	3 21 40	3 51 00	4 21 40
Mendota	2 28 31	3 23 55	3 52 23	4 23 02
Quien Sabe	2 28 46	3 26 28	3 56 10	4 27 27
Hoosier	Did not finish.			

Percentage on series: Ste. Claire, .300; Mendota, .200; Quien Sabe, .175; Hoosier, .75.

The race was highly successful in every particular. The arrangements were perfect, and Chairman Quinland of the Regatta Committee was the recipient of many congratulations. For the first time in the history of the Lipton cup there was not a single protest filed on any race, the work judges deserving special commendation. These officials were Dr. Wadsworth Warren, of Detroit Country Club; ex-Commodore Rollin B. Mallory, of the Milwaukee Y. C., and W. L. Shepard, of the Columbia Y. C.

Wednesday night an informal hop was held at the Columbia club, and Commodore Price presented the Lipton trophy to the Detroit yachtsmen, together with the handsome gold emblem and the souvenir fobs for the crew of the winner.

Quien Sabe is to be sold at auction. The syndicate which built her has announced that the boat is for sale, and as she is a fine little craft, she will undoubtedly fetch a good price.

Dr. Warren Wadsworth, one of the judges, is the owner of Dusty Sydes, the Detroit motorboat which finished first in the race to Mackinac for the Day cup. He has protested the award of the trophy to Erin, on the grounds that the handicap allowed her is too great and not in keeping with the horsepower the boat has developed. The protest has been taken up by the power boat club and will be duly acted on.

J. M. HANDLEY.

Yachting Fixtures for 1905.

**Inland Lakes Y. A. Regatta.**

Oshkosh, Wisconsin—First Day, Monday, Aug. 14.

Oshkosh has again carried away the Class A championship of the Inland Lakes Yachting Association, Glyndwr capturing the event for the Oshkosh Y. C. The Class B championship goes to White Bear, Barracouta having secured a majority of points in the series of races sailed.

The regatta opened Monday under inauspicious circumstances. A driving rain and wind swept the lake, and it was decided to postpone the sailing of the race for the Felker cup, which is generally the opening event of the week. The two class races were sailed, however, and the Class A event furnished a thrilling struggle between two Lake Winnebago racers—Winnebago, of Neenah, sailed by Steve Davis, son of Mr. W. L. Davis, one of the best known figures in western yachting circles, and Glyndwr, of Oshkosh, sailed by Will Bray. Winnebago led most of the way, but on the two legs of the triangle, which allowed free sailing, Glyndwr drew ahead, and at the end was over a minute to the good. Seven boats started and all finished, which was considered remarkable in view of the heavy sea and furious rain storm which prevailed. The Class B boats had a hard time of it, and three of seven starters did not finish. The race was easy for Priscilla, of Council Bluffs, which led all the way, winning by 2 1/2 m. from Barracouta, the White Bear candidate. Here is the official record of the races:

Class A—Start, 3:00.		
	Finish.	Elapsed.
Glyndwr	4 49 36	1 49 36
Winnebago	4 50 55	1 50 55
Albatross	4 54 06	1 54 06
Pats	4 57 59	1 57 59
Alpha	4 58 24	1 58 24
Warrior	5 00 02	2 00 02
Charlotte	5 02 24	2 02 24

Class B—Start, 11:00.		
Priscilla	1 18 08	2 18 09
Barracouta	1 19 43	2 19 43
Oshkosh, Jr.	1 22 59	2 22 59
Pathfinder	1 24 03	2 24 03

Second Day, Tuesday, Aug. 15.

Tuesday a bright sunshine and a fresh wholesome breeze went a long way toward atoning for the asperities of the opening day of racing. The waves had flattened down and condition favored fine sport. The Oshkosh boat, Glyndwr, again proved her superiority. Davis gave the local boat a hard rub for the first mile or two of the first leg, 2 miles to windward, but at the outer mark Bray was ahead, and he kept that way to the end. After the first round, the course was sailed over three times, Winnebago dropped back and Alpha, of White Bear, became the contender. She never became dangerous, however, and Glyndwr won by over 2m, with Alpha second and Winnebago third. In the Class B event Barracouta, of White Bear, turned the tables on Priscilla and won with plenty to spare with Pathfinder second and Priscilla third.

Following is the way the timers and judges figured it out:

Class A—Start, 3:00.		
	Finish.	Elapsed.
Glyndwr	5 32 33	2 32 33
Alpha	5 34 35	2 34 35
Winnebago	5 41 16	2 41 16
Albatross	5 41 47	2 41 47
Charlotte	5 46 21	2 46 21
Warrior	5 48 08	2 48 08
Pats	5 49 05	2 49 05

Class B—Start, 3:05.		
Barracouta	5 54 27	2 49 27
Pathfinder	5 55 59	2 50 59
Priscilla	5 59 35	2 54 39
Oshkosh, Jr.	6 11 31	3 06 31
Leucothea	6 11 41	3 06 41
Flying Fox III.	6 15 17	3 10 17

Third Day, Wednesday, Aug. 16.

Wednesday was the big day of the week, being Oshkosh day, and a holiday in the city. The club house lawns and verandas were crowded to their utmost capacity all day, and the park overlooking the course was thronged from early morning to night-fall. The two races of the regular Inland Lake Association Regatta were sailed in the morning, and again Glyndwr proved her superiority, winning with 2m. and more to her credit from Albatross. The course was an equilateral triangle of 2 miles to the leg to be sailed over twice. The wind was fresh with quite a bit of sea running. Winnebago got the best of the start, but Alpha soon took command and led around the first time. On the beat to windward on the second turn the local champion assumed the lead, however, and after that the result was never in doubt. The Class B race went to Pathfinder, of Minnetonka, which had no trouble in disposing of its competitors. Barracouta was second and Priscilla third.

In the afternoon the race for the Felker cup was sailed. This is a perpetual challenge trophy. It has no bearing on the class championship races, and the victory of Winnebago does not affect its standing for the Class A honors. Nine yachts started in the event, and it provided a spectacular and exciting contest. At the finish with the boats rushing to the finish line under full head of canvas, with spinnakers and balloon jibs pulling like wild horses, the steamboats cut across the course. Glyndwr in the lead had to head way off the course to avoid a collision, and Winnebago, which was close behind, managed to swing clear. Before the Bray boat could get back on the course, Winnebago had finished and won the race. Glyndwr crossed 19s. behind, with Oshkosh, last year's champion, third, over a minute back. Here is the result of the day's work:

Inland Lake Race, Class A—Start, 10:00.		
	Finish.	Elapsed.
Glyndwr	12 05 36	2 05 36
Albatross	12 07 41	2 07 41
Alpha	12 07 47	2 08 47
Warrior	12 09 39	2 09 36
Pats	12 09 52	2 09 52
Charlotte	12 10 36	2 10 36
Winnebago	12 11 01	2 11 01

Class B—Start, 10:05.		
Pathfinder	12 33 35	2 28 35
Barracouta	12 24 58	2 19 58
Priscilla	12 28 40	2 23 40
Oshkosh, Jr.	12 31 17	2 25 17
Flying Fox III.	12 33 02	2 28 02
Leucothea	12 33 30	2 28 30
Klickitat	12 36 48	2 31 48

Felker Cup Race—Start, 3:00.		
Winnebago	5 05 22	2 05 22
Glyndwr	5 05 41	2 05 41
Oshkosh	5 07 09	2 07 09
Charlotte	5 07 49	2 07 49
Alpha	5 08 07	2 08 07
Wahkita	5 08 07	2 08 53
Albatross	5 09 08	2 09 08
Warrior	5 10 39	2 10 39
Pats	5 11 33	2 11 33

Fourth Day, Thursday, Aug. 17.

Thursday's races were sailed in a 20-mile gale from the S.S.E., with a sea running that looked big enough to swamp every boat in the fleet. The Class A race resulted in a great victory for the sturdy Alpha of the White Bear Y. C.

The Class B race went to Barracouta, also of White Bear, which showed that the White Bear boats are by far the best sea boats of the fleet. Barracouta's victory was the result of a decision by the judges ruling out Pathfinder, the Minnetonka representative. Both boats started from the wrong side of the starting line and had to be recalled. A series of fouls occurred, which brought out protests from the skippers of both boats. The judges decided in favor of Barracouta, but the skipper of the Minnetonka has appealed his case to the Executive Committee.

Alpha substituted a small suit of sails for the occasion, and this is credited with her fine showing. She led all the way and won easily by over 4m. The course was a 2-mile to windward and return, to be sailed over three times. Here is the official record:

Class A—Start, 3:00.		
	Finish.	Elapsed.
Alpha	4 25 15	1 25 15
Glyndwr	4 29 56	1 29 56
Albatross	4 32 04	1 32 04
Pats	4 33 43	1 35 43
Winnebago	4 33 55	1 35 55
Charlotte	4 45 20	1 45 20
Warrior		Withdrew.

Class B, Summary—Start, 10:00.		
Barracouta	12 32 47	2 32 47
Priscilla	12 39 00	2 39 00

Oshkosh, Jr.	12 39 37	2 39 37
Leucothea	12 46 22	2 46 22
Klickitat	12 47 31	2 47 31
Flying Fox II.	12 48 44	2 48 44

Buttinski did not sail, and Pathfinder was ruled out, her time not being taken.

Fifth Day, Friday, Aug. 18.

The final day's racing, Friday, closed the eighth annual regatta of the Inland Lakes Yachting Association and proclaimed the winners in the two events. The judges had to do a lot of figuring to find the winner in Class B, and after much figuring of percentages, decided that Barracouta, of White Bear, had won most points. Glyndwr was beaten in the final race, but she had accumulated four firsts in as many races, and had the championship in her class cinched. With the title she becomes possessed of the Norton cup for one year, with the possibility of its becoming the permanent possession of Mr. Bray if he can win the championship again next year. The morning race for the Class B boats was sailed in a stiff 15-mile breeze, and Pathfinder showed the way around, winning by over 2m, with Barracouta second and Flying Fox, of Fox Lake, third. In the afternoon the wind flattened down to a light, puffy zephyr that was none too steady. The course was a triangular one, the first leg a spinnaker run, the second a beat, and the third a spinnaker run. Winnebago won in fine style, with Albatross second and Alpha third. Glyndwr finished last. The time record follows:

Class A—Start, 3:00.		
	Finish.	Elapsed.
Winnebago	4 36 51	1 36 51
Albatross	4 39 17	1 39 17
Alpha	4 41 29	1 41 29
Charlotte	4 43 55	1 43 55
Warrior	4 45 12	1 45 12
Glyndwr	4 49 40	1 49 40
Pats	5 08 59	2 08 59

Class B—Start, 11:00.		
Pathfinder	11 56 20	2 56 20
Barracouta	11 58 45	2 58 45
Flying Fox	12 00 32	2 00 32
Oshkosh, Jr.	12 00 54	2 00 54
Priscilla	12 05 54	2 05 54
Leucothea	12 08 22	2 08 22

Klickita carried out its mast and did not finish. J. M. HANDLEY.

**Newport Y. R. A.**

Special Series for New York Y. C. 30-Footers—Aug. 16, 17, 18, 19.

ONE of the best series of races by small yachts ever held at Newport was sailed during the past week by the new 30ft. class of the New York Y. C., for cups offered by the Newport Y. R. A. The event provided some close and exciting racing, and much interest developed among local yachtsmen, as well as among members of the club present in Newport during the week. For the first day's race this meant practically every one, as the big fleet, on its annual cruise, was detained at Newport an extra day on account of the heavy weather, and all hands who felt inclined were enabled to follow an event, which under the regular schedule would have taken place while the fleet was on its run to Vineyard Haven.

Four races were held, the last being of special interest, inasmuch as three of the old class of Newport 30-footers went up against the new boats. These were Carolina, Pembroke Jones; Eleanor, G. Widener; and Breeze, W. G. Roelker, Jr. As was anticipated, the old boats proved better than the new class, and the race was the best of the series.

Eleven entered the first race, and on the second day the boat owned by Mrs. Alfred G. Vanderbilt, as yet unnamed, started with the others.

First Day, Wednesday, Aug. 16.

The opening event was one of the most exciting races ever sailed in Narragansett Bay. There was almost a gale from the N. E. Out of the eleven starters only seven finished, the other four meeting with accidents that compelled them to withdraw.

The race was one long to be remembered. The owners had wished to have the first race outside, but with the high wind and heavy sea this was deemed unwise and it was decided to send the boats over the Dyer's Island course up the bay, frequently used by the Newport 30-footers. It proved a fine course, making a dead beat to windward and a run homeward. At the outer mark there was wind and sea plenty.

Capt. Woodbury Kane's schooner yacht Penelope acted as committee boat, and the starting line was off Permanent wharf at Fort Adams. Other craft in the bay were close reefed, but the little racers carried full sail, and they made a most interesting sight as they flitted about jockeying for a position at the start. Dahinda got across the line first, securing the windward berth. She was closely followed by Neola II. and Oriole, and the rest, excepting Nautilus, were well bunched. Nautilus was fouled at the start and crossed the line more than a minute after gun fire. After crossing, the yachts had a broad reach to Rose Island, and they held their relative positions, but as soon as they hauled on the wind for the thrash to the outer mark, there were some changes. Dahinda had the first mishap, being in second place when the seas carried away her fore hatch and the water poured in so fast that she had to give up the race and put for home.

Minx sprung her mast and withdrew. Nautilus carried away her jib sheets, putting her out of the contest. Banzai fouled Oriole and withdrew. Oriole rounded the mark first and was followed in order by Cara Mia, Neola II., Ibis, Carleta and Alera. Oriole maintained her lead on the homeward run, and although she carried away the jaws of her gaff near the finish, she continued and crossed the line 59s. ahead of Ibis.

The Regatta Committee in charge of the event consisted of Messrs. Woodbury Kane, C. L. F. Robinson, Max Agassiz and A. T. Kemp. The summary was as follows:

Start, 2:11.		
	Finish.	Elapsed.
Oriole	4 15 27	2 04 27
Ibis	4 16 26	2 05 26
Cara Mia	4 18 02	2 07 02
Carleta	4 21 08	2 10 08
Neola II.	4 21 36	2 10 36
Alera	4 22 06	2 11 06
Linnet	4 26 03	2 15 03
Atair		Did not finish.
Dahinda		Did not finish.
Banzai		Did not finish.
Nautilus		Did not finish.

Second Day, Thursday, Aug. 17.

The Dyer's Island course was again chosen for the second race, which was sailed under conditions just the reverse of those of the previous day, there being a light S. wind and smooth water. Again there were eleven boats in the contest, Mrs. Vanderbilt's unnamed craft taking the place of Linnet, with Mr. Pembroke Jones, owner of the old champion Carolina, at the tiller. The start was made off Fort Adams wharf at 2:10 and Banzai was first across the line, closely followed by Neola II. and the rest of the fleet, well bunched, the Vanderbilt boat being last. All started with spinnakers to port, but after reaching Rose Island the wind hauled more to the S. and they had to gybe over with spinnakers to starboard. The tide was favorable, and despite the light wind, the boats made good time. They were well bunched at the mark, Nautilus rounding first and maintaining the lead on the beat homeward, winning by a little over 8m. The summary, start, 2:10:

	Finish.	Elapsed.
Nautilus	5 29 34	3 19 34
Alera	5 37 46	3 27 46
Cara Mia	5 37 55	3 27 55
Atair	5 40 00	3 30 00
Oriole	5 45 53	3 35 53
Ibis	5 47 27	3 37 27
Carleta	5 48 09	3 38 09
Neola II.	5 48 11	3 38 11
Vanderbilt boat	5 53 44	2 43 44
Dahinda	5 54 28	3 44 28
Banzai	5 59 49	3 49 49

Third Day, Friday, Aug. 18.

For the third race the boats were sent out seaward, with a course from Fort Adams to Beaver Tail, and then to Salt Rock and return, a distance of 15 miles. There was a stiff breeze, and it would have been a close and exciting race, only that a shift in the wind spoiled the windward work. There were twelve starters and Neola II. won the race, with Oriole only 14s. behind. The Agassiz schooner yacht Kirin was the committee boat.

The boats made another close and pretty start, so close, in fact, that it was hard to maneuver, and three, Banzai, Nautilus and Atair, were forced over the line ahead of the gun and were recalled. In this way Oriole secured the start, but on the reach

to the first mark, Neola II. got the lead and held it to the finish. A tow of barges caused some bother on the return trip through the Narrows, and changed the relative positions of the boats to some extent, but not enough to make any difference in the leaders. The summary, start, 2:10:

	Finish.	Elapsed.
Neola II.	4 02 23	1 52 23
Oriole	4 02 37	1 52 37
Cara Mia	4 03 14	1 53 14
Linnet	4 04 16	1 54 16
Nautilus	4 06 24	1 56 24
Banzai	4 06 46	1 56 46
Vanderbilt boat	4 06 57	1 56 57
Carleta	4 08 07	1 58 07
Ibis	4 08 43	1 58 43
Dahinda	4 09 13	1 59 13
Atair	4 09 37	1 59 37
Alera	4 12 18	2 02 18

Fourth Day, Saturday, Aug. 19.

In the final race of the series three of the old Newport 30-footers entered, and figuratively speaking, they trimmed the new class, although the race was a close one, and there was only 7m. difference between the winner and the last of the fourteen boats that participated. Pembroke Jones' Carolina, sailed by her owner, romped in 22s. ahead of Oriole, and the other two old boats, Eleanor and Breeze, came in third and fourth respectively, both within about a minute of the winner. Judging by this race, the Newport boats have superior speed, as was predicted by all who had watched the work of the new class in the previous races of the series.

It was the most exciting contest of the four, and was sailed in a strong S.E. wind. The course was up the bay to Briggs' Ledge, off Wickford, the longest course yet sailed. Mrs. A. G. Vanderbilt sailed on her boat, which was handled by H. O. Havemeyer, Jr. Eleanor was sailed by E. V. R. Thayer, Jr., and Banzai by Reginald Brooks. The schooner yacht Kirin was again used as committee boat.

Alera crossed the starting line first, closely followed by Carolina, and the rest were so closely bunched that it was hard to tell which had the advantage. The boats had a reach to Rose Island, where sheets were hauled and they then stood up the bay to a mark in Coddington Cove. On this reach Eleanor secured the lead with Carolina second. From the Cove it was a run with spinnakers to the outer mark across the bay and there was little change in the relative positions of the boats. On the beat back to the mark in Coddington Cove Eleanor still held the lead, with Carolina second and Oriole third. After rounding this mark, there came a lively luffing match, during which considerable time was lost, and when they again stood squarely on their course, Carolina had the windward position, with Oriole second and Eleanor third. These positions were held to the finish, and it was a close race. The summary follows, start 2:10:

	Finish.	Elapsed.
Carolina	4 47 41	2 37 41
Oriole	4 48 03	2 38 03
Eleanor	4 48 23	2 38 23
Breeze	4 48 46	2 38 46
Cara Mia	4 49 32	2 39 32
Alera	4 49 43	2 39 43
Neola II.	4 49 58	2 39 58
Nautilus	4 50 24	2 40 24
Ibis	4 51 14	2 41 14
Carleta	4 51 33	2 41 33
Vanderbilt boat	4 52 12	2 42 12
Dahinda	4 52 37	2 42 37
Banzai	4 53 12	2 43 12
Atair	4 54 58	2 44 58

As the result of the series, Oriole won one first and two seconds, Nautilus one first, Neola II. one first, Alera one second, Ibis one second and Cara Mia one second.

F. H. YOUNG.

**East Gloucester Y. C.**

Gloucester, Mass.—Thursday, Aug. 17.

Two Y. R. A. open races were given by the East Gloucester Y. C. on Thursday, Aug. 17. A race had been scheduled for the afternoon before, but as there were not enough boats present, it was postponed until Thursday morning. In the morning there was a little breeze, but it petered out in the afternoon, so much that only the smaller classes finished. The light breeze of the morning was much to the liking of the old Medic, and she sailed a close race with Tyro, winning by 14s. Swallow won by quite a margin from Vera II. in the 15ft. class. Teaser won a good race in the dory class. Seboomook and Kit were together at the line in the start of the first handicap class. Seboomook went out ahead and led around the course in a close race with Nereid. Osprey took first place in this class on corrected time with Nereid second. In the second handicap class Clithero won handily.

Only three classes finished in the afternoon race. Vera II. in the 15ft. class, led until the last leg, when Cigarette took the lead and finished first. Barbara won in the dory class, and took a special cup offered for dories. Clithero again finished first in the second handicap class, but lost to Owaissa on corrected time. The summaries:

**FORENOON RACES.**

Rhode Island Y. C.

Annual Cruise, Aug. 12-20.

THE fourth annual cruise up Long Island Sound by the Rhode Island Y. C. was made during the week of Aug. 13-20, the fleet making its rendezvous in Newport Harbor the evening of Aug. 12. The cruise was highly successful, although only about thirty boats continued with the fleet throughout the week, as against the fifty that participated in last year's cruise.

The first day's run, on Sunday, Aug. 13, was from Newport to New London, a distance of 42 knots. The day was gray and lowery and the sea was heavy, making rough work for the smaller craft for a time. Three sharp showers were encountered west of Point Judith, and altogether the run was tedious, wet and uncomfortable. The wind died out and less than half the sailing fleet reached New London that night, the rest putting in to Stonington and proceeding early in the morning.

Monday's run was to Thimble Islands, 32 knots, where the fleet remained until Wednesday morning as guests of the Sachem's Head Y. C. The day was beautiful and the run was a fine one, but rain set in at night and a heavy E. storm Tuesday caused the abandonment of the regatta planned as a feature of the visit. However, dances were given at the Sachem's Head club house both evenings, and a fine luncheon was given to the visitors Tuesday afternoon, and despite the bad weather, the fine hospitality of Commodore Peck and his club made the visit of the Rhode Island fleet one of great enjoyment. The bonds of fellowship between the two clubs were still more firmly cemented and a joint cruise is talked of for next year.

Wednesday the fleet made the run back to New London, in the face of a northeaster, although there was no rain. That evening the mid-summer mess dinner of the club was held at the Fort Griswold House.

A fine run to Block Island was enjoyed Thursday, a distance of 24 knots. The sloop Lady Mary ran on a ledge near Wicopesett Island, off the E. end of Fisher's Island, and remained there over night, hard and fast. She was hauled off the following morning and rejoined the fleet at Newport Saturday.

The fleet ran back to Newport in fine weather Friday and remained there till Sunday morning. A theatre party at Freebody Park was given by Commodore Rogers Saturday evening, and was attended by about 140 of the yachtmen.

Sunday morning the cruise ended with a run back to the Prudence Island station, where the fleet disbanded and a clambake was enjoyed at the club house.

Aside from the mishap to Lady Mary, there were few accidents worth mentioning, except that the yawl Navita was disabled at the start by being rammed by a launch in Newport Harbor, and with a section of her starboard planking smashed, was obliged to abandon the cruise.

Some very good racing resulted on the several runs. S. M. Nicholson's fine sloop Ishkoodah led the sailing fleet on every run but one, the cat Wanderer IV., sailing as a sloop, securing that honor on the run from New London to the Thimbles. The latter craft did great work on the cruise and proved herself a phenomenally fast boat, either as sloop or cat. On the first two runs she raced in the small sloop class. Then she was rated with those above 40ft. over all measurement. On the fourth run she was given an arbitrary racing length of 35ft., which was relative to making her assume an over all measurement of 46ft., as the method on this cruise was to add one-half the overhangs to the waterline length. The following day she was given the minimum over all length of the class, 40ft., which gave a sailing measurement of 32ft.

Wanderer IV. is 24ft. waterline length and 34ft. 6in. over all. Despite the handicap imposed by the extra length assumed, the boat made a great showing, and on the day of racing with a 40ft. over all measurement, she finished within 3s. of Ishkoodah on corrected time.

By the conditions of the cruise, as was the case last year, no boat was allowed to take more than two prizes. These were handsome cups offered by Commodore Rogers. The sloops Ishkoodah, Millie, Wanderer IV. and Sachem, the yawls Wanderer and Amorita and the cat Emeline each won two cups, and one each was taken by the sloops Micaboo and Dixie, yawl Rahnee, cat Onaway and launch Tuscora.

In the management of details on the cruise Commodore Rogers was assisted by Fleet Captain George W. Evans and Messrs. F. S. Noch and C. M. Dunbar of the Race Committee, and to their combined efforts the success of the week was due in no small measure.

F. H. YOUNG.

Eastern Y. C.

Marblehead, Mass.—Friday, Aug. 18.

ON account of the non-arrival of many of the yachts of the New York Y. C. fleet, the power boat races of the Eastern Y. C. on Friday, Aug. 18, were not as interesting as was expected. Winton sailed her first race in these waters, and although she won in the first class, her time was nothing remarkable. Blink sailed alone in the second class launches. In the third class Tai Kun went into the lead soon after the start and led all around the course. Her rudder was broken on the first round, and she was steered over the rest of the course with an oar. All classes were sent over a course of 12 miles. The summary:

Launches—First Class—Over 50ft. Rating.			
	First Round.	Second Round.	Elapsed.
Winton, L. R. Spears.....	0 18 31	0 17 35	0 36 06
Hupa, C. H. Clark.....	0 21 45	0 21 39	0 43 24

Saturday, Aug. 19.

The late arrival of many of the yachts of the New York Y. C. fleet, and the non-arrival of others was the innocent cause of the postponement of the annual regatta of the Eastern Y. C. in which the yachts of the New York Y. C. were invited to compete. The crews of the yachts which were in the harbor were so worn out with their experience with the gale at Newport and the subsequent

weary sailing in calm weather, that the owners decided not to race. In order to satisfy those who wanted to take advantage of a fine breeze, a race was arranged in classes M and N. There was a steady E. breeze, with a lively little hobble to the sea, which made conditions perfect. Chewink IV. and Mecmer were across the starting line together in Class M, Mecmer being to leeward. A little astern of them was Mira. Mecmer pulled through Chewink's lee and led all over the course, beating Chewink IV. and Mira on all points of sailing, although the latter two used spinnakers on the last leg, while Mecmer had a torn balloon. Chewink IV. made better time than Mira on the first reach, and on the windward leg Mira made a little better time with spinnaker set. In Class N, Dorel, which had mixed things up somewhat in an endeavor to start with the larger class, was first across the starting line, with Mimosa III. second. Mimosa III. soon pulled through Dorel's lee, however, and gained on all of the boats in the class throughout the remainder of the race. The summary:

Class M—33 to 40ft. Rating.		
	Elapsed.	Corrected.
Mecmer, R. C. Nickerson.....	1 50 21	1 46 32
Chewink IV., F. G. Macomber, Jr.....	1 54 21	1 49 22
Mira, Charles Lane Poor.....	1 54 35	1 50 46

Class N—27 to 33ft. Rating.		
	Elapsed.	Corrected.
Mimosa III., Trenor L. Park.....	1 57 59	1 47 09
Opitsah III., W. F. Whitney.....	2 15 32	1 59 11
Dorel, George L. Batchelder.....	2 11 34	2 01 33
Carina II., H. S. Wheelock.....	2 22 23	2 06 02

Notwithstanding the run of hard luck which the New York Y. C. encountered from Newport to Marblehead, there was a good-sized fleet in Marblehead Harbor on Saturday evening, when a general illumination was ordered. Many yachts of other clubs visited the harbor, so there were about 300 yachts present on the last night. The big steam yachts of the New York and Eastern fleets made a fine showing with their electric displays, while there was more or less illumination among all of the yachts in the harbor. Upon signal given at 9:15, there was a general display of red fire throughout the harbor, which, with the many colored lights on the yachts, made the scene one of rare beauty. The yachtmen of the New York and Eastern clubs made the best of the situation, while the members of the Boston and Corinthian clubs and the townspeople were only too eager to help out, and all hands are to be congratulated upon the showing made.

Start of the Eastern Y. C. Ocean Race.

Marblehead, Mass.—Monday, Aug. 21.

IN a very light breeze, blowing about S.E., five yachts crossed the starting line in the ocean race of the Eastern Y. C. from Marblehead to Halifax to-day.

Two classes filled, both schooners, in the largest of which Corona and Elmina are the competitors. The other class was Class E, in which the entries were Hope Leslie, flagship of the Eastern Y. C.; Agatha, owned by Mr. W. S. Eaton, of the same club, and Black Hawk, owned by Mr. C. E. Gibson, of the Boston, Y. C.

On account of the light air, two of the schooners were towed to the starting line, off Marblehead Rock, by the committee boat, and the start was delayed 20m. to enable others to get to the line.

Elmina and Corona came to the line, with Elmina a little ahead and in the weather berth. She was too soon, however, and had to go about, while Corona was at the line when the whistle blew. Corona took plenty of time in crossing, while Elmina was handicapped 13s. Both crossed on the starboard tack and stood to the eastward, a short beat out to Halfway Rock being necessary before the yachts could lay their course. Corona stood well over to Satan Ledge before tacking out. Elmina tacked out some minutes after, and Corona was first around Halfway Rock, and when they were last seen was apparently making the best of her advantage at the start.

Hope Leslie was across the line first in Class E, but Agatha had the weather berth. Black Hawk was handicapped 53s. All crossed on the port tack and stood to the eastward. Agatha was first to tack out and Black Hawk followed her, while Hope Leslie stood further toward Satan. Agatha was apparently the first to turn Halfway Rock, with Hope Leslie second and Black Hawk third.

The 30-footer, Sauquoit, owned by Mr. T. K. Lothrop, Jr., crossed the starting line with the smaller schooners. She had no competitor, however, and so her time was not taken by the committee. Mr. Lothrop was very anxious to compete and in the absence of a competitor determined to go along anyhow. The summary of the start:

Class B.			
	Rating	Allowance	Start.
Corona, A. F. Luke.....	86.95	0 26 39	10 31 00
Elmina, F. F. Brewster.....	89.90	Scratch.	10 32 00

Class E.			
	Rating	Allowance	Start.
Hope Leslie, Laurence Minot.....	55.22	Scratch.	10 35 42
Agatha, W. S. Eaton.....	47.61	2 56 00	10 35 59
Black Hawk, C. E. Gibson.....	35.70	8 11 28	10 37 00

Beverly Y. C.

Wing's Neck, Buzzard's Bay—Saturday, Aug. 12.

THE Beverly Y. C. sailed its 372d regatta off its club house, Saturday, Aug. 12. The event was the third club race of the season, which is a race restricted to yachts owned by members of the club, but in which the yachts may be sailed by professionals.

There were no 46-footers or 30-footers to start, and therefore the 21-footers were the first class to be sent away. At the time they started, the wind was from the S.W., of at least 15 knots velocity, and it remained about constant throughout the afternoon. The 21-footers were sent to Bow Bells and back, and the heavy Barnacle, carrying, at once took the lead and gained steadily throughout the race, finishing 7m. 32s. ahead of Radiant, which boat was in turn a long ways ahead of last year's champion, Terrapin, and Mr. Crane's new Amanita III. These last two boats had a close race, in which Mr. Crane won by a small margin, but Terrapin protested Amanita, which protest has not yet been acted upon.

Three 18-footers started and were sent to Bird Island and back. Wanderer won, with Hindoo second.

The 15-foot class were sent over the inside course, Beverly Y. C. buoy No. 2, Mosher's Rock and return, twice around. Miss Dabney, with the heavy-weather boat, made a very good showing, and beat all the fleet, finishing nearly 2m. ahead of the second

boat, which was a new one, Tobey, and owned by Mr. James Jackson, who recently joined the club.

Mr. Charles H. Taylor, Jr., acted as judge.

The times in detail follow:

21-footers—Course 14, 11¼ Miles.		
Barnacle, W. E. C. Eustis.....	1 56 42	
Radiant, Mrs. C. M. Baker.....	2 03 14

Flickamaroo, Miss E. B. Emmons.....	1 40 59	
Peacock, Robt. Winsor.....	Disabled.	

Bensonhurst Y. C.

Bensonhurst, Gravesend Bay—Friday, Aug. 18.

THE N. Y. C. C. representative, Ogeemah, won the second race for the Bensonhurst Perpetual Challenge trophy for Class Q boats enrolled on Gravesend Bay, which was held on the afternoon of Friday, Aug. 18. She defeated More Trouble, the Bensonhurst Y. C. defender, by 52s. corrected time over a triangular course of 10.35 nautical miles. Ogeemah also captured the first event, which was sailed on Thursday, July 27. According to the governing conditions the organization winning two races secures temporary possession of the trophy, holding the same subject to challenge. The N. Y. C. C. thus becomes custodian of the cup. Sailing in the colors of the Bensonhurst Y. C. last year, Ogeemah successfully defended the trophy.

Four boats started in the deciding race of the match. The challenging Brooklyn Y. C. was represented by Ojigwan, and the Marine and Field Club sent Quest. The Atlantic Y. S. boat, Saetta, which started in the first race of the series, was an absentee on Friday. The course selected led from the start off Fort Hamilton, across the channel to the Black Can buoy off Swinburn Island, thence to Buoy No. 2 down the harbor, and home. In the S.E. breeze blowing, the first leg proved to be a reach, the second to windward with a favorable tide and heavy sea, and the last a broad reach home, on the greater part of which spinnakers were carried to starboard.

From the start More Trouble showed great speed, especially on the parts of the course sailed with eased sheets. She finished 2m. 41s. ahead of Quest, 8m. 6s. in front of Ojigwan and 8m. 53s. ahead of Ogeemah. The latter got an allowance of 9m. 47s. for the course, which was more than enough to win. Commodore Arthur C. Bellows, original donor of the trophy, will present a miniature to Alfred Mackay, owner of the winning boat. The summary follows:

Sloops, Class Q—Start, 3:05.			
	Finish.	Elapsed.	
More Trouble, W. H. Childs.....	5 08 04	2 03 04	
Quest, F. J. Havens.....	5 10 45	2 05 45	
Ojigwan, George E. Reiners.....	5 16 20	2 11 20	
Ogeemah, Alfred Mackay.....	5 16 29	2 11 59	

Corrected time, Ogeemah, 2:02:12.

Saturday, Aug. 19.

THE Bensonhurst Y. C. gave an open regatta on Saturday, Aug. 19. Twenty-one boats of all classes started, the winners being Vivian II., Tabasco, Saetta, Spots and Beta. It was the fourth and next to the last event to count on the class championship of Gravesend Bay for the season of 1905, the final race of the series being scheduled to occur under the auspices of the N. Y. C. C. on Saturday, Sept. 9.

A fine breeze blew throughout the event from the S.E. and several mishaps occurred to further enliven matters. Cockatoo II. lost her hollow mast for the second time this season, just before the start of the race. During the contest Bobtail ran on the bell buoy at Craven Shoal, one of the turning marks for the larger boats, and Lizana brought up against a scow which almost put her bobstay out of use and spoiled all her chances of winning.

The regular Association courses were covered, leaving all marks to port. It was a broad reach from Ulmer Park to the Marine and Field Club, and another reach to Fort Hamilton. From there Classes P and above went out to Craven Shoal and then to Sea Gate, getting a reach on the first leg and a few windward hitches on the second. The other racers had a stiff windward leg from the Fort to Sea Gate. From there all hands had a reach home.

The features of the day were the excellent work of the N. Y. Y. C. 30-footer Tabasco and the Class Q boats Saetta, Miss Judy and Spots. The summaries follow:

Sloops, Class N—Start, 3:05.			
	Finish.	Elapsed.	
Vivian II., S. E. Vernon.....	4 23 47	1 18 47	
Bobtail, E. F. Luckenbach.....	Disqualified.

GAS ENGINES AND LAUNCHES.

Their Principles, Types, and Management. A Complete and Practical Manual.

BY F. K. GRAIN, M. E.

Bound in cloth, with 123 pages and 20 illustrations. Sent, postpaid, for \$1.25.

THIS compact and comprehensive handbook contains all the information essential to users of the marine gasoline engines, and will be welcomed by the thousands of men now owning and running power boats. Laymen and experts will alike find the book invaluable. It treats of the various types of marine gasoline engines, points out the good in each, and tells how to run them. A knowledge of the contents of this book will help to overcome difficulties and avoid accidents. The most complete book of its kind ever published.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

Huguenot Y. C.

New Rochelle, Long Island Sound—Saturday, Aug. 19.

The eleventh annual regatta of the Huguenot Y. C. was sailed on Saturday, Aug. 19, and it was the best race the club has given in many years.

Before the start of the 33-footers there was a collision between Nike and Mystral. The bigger boat came off unharmed, but the Mystral lost her mast and had her gear badly chewed up.

The 33ft. sloops and yawls covered a 15-mile course, going twice over a 7 1/2-mile triangle. The 27 and 22ft. sloops and the raceabouts went three times over a 3 3/4-mile triangle, while the other starters covered this course twice.

Commodore Park's old crack, Mimosa I., now sailing under Mr. T. M. T. Raborg's colors, went out of her way and rounded another mark, losing considerable time thereby. This mistake gave the race to Nike.

Memory had a sailover in the 33ft. yawl class. Rascal withdrew in the 27ft. sloop class and Montauk finished alone.

Invader, Jr., showed the way to her five competitors in the raceabout class and beat Nora, the second boat, 35s. Busy Bee was third.

Heron withdrew in the 22ft. class, and Paumonak and Okee fought it out alone. The former had an easy time of it and won by nearly 9m.

Hamburg was Ace's only contender in the 18ft. sloop class, and Ace won again by a large margin.

Dod was the only starter in the 15ft. class, and she went over the course alone.

Vava and Fanny had a good race in the 15ft. catboat class, and the former won by 19s. Joke, the only other starter, was outclassed.

Houri had an easy time in disposing of Vaquero, the only other boat to start in the Larchmont 21ft. class.

Kenoshi beat Owatanna by over 8m. in the Indian Harbor one-design class. Owatanna lost her rudder, and her skipper continued the race, steering with an oar.

Wister led Arozina all over the course in the Manhasset Bay one-design class. Pup did not finish.

Quinsigamond, the little boat with the big name, had a walk-over in the Horseshoe Harbor one-design class.

The summary:

Table with columns for class, boat name, start time, course, finish time, elapsed time, and corrected time. Includes classes like Sloops, 33-footers, Yawls, Raceabouts, Sloops, 27-footers, etc.

Annisquam Y. C.

Annisquam, Mass.—Aug. 18 and 19.

Good breezes favored the Annisquam Y. C. in its series of two Y. R. A. open races, sailed in Ipswich Bay on Friday and Saturday, Aug. 18 and 19. On Friday the breeze was light from the S. Medric II. got the start in the 22ft. class, but on the first broad reach Urchin took the lead, with Medric II. second.

On the second leg Medric II. got the lead again and held it to the finish. Tyro finished second. In the Cape cats, Marvel won by almost 5m. from Stranger. Aurora got the start in the 18ft. class, with Fritter second and Hayseed third.

At the end of the first round Aurora led, with Hayseed second and Fritter third. On the second round Hayseed and Fritter both passed Aurora, finishing first and second. In the 15ft. class, Vera II. had things all her own way. Teaser won in the dory class. In the first handicap class Alice and Maud got the start, with Seboomook second.

Alice and Maud led at the first two marks, but on the windward leg, Seboomook got the lead and increased it on the second round of the course. Clithero led around in the second handicap class. Essex won in the power boat class. The summary:

Table with columns for class, boat name, start time, course, finish time, elapsed time, and corrected time. Includes classes like Class E-22-footers, Class D-Cape Cats, Class I-18-footers, etc.

Power Boats.

Table with columns for boat name and elapsed time. Includes Essex, E. G. Young, It, H. Haskell, Ronomore, O. B. Perkins, etc.

Saturday, Aug. 19.

With a rattling E.N.E. breeze, which gave the boats all they wanted under whole sail, the second race of the Annisquam Y. C. on Saturday, Aug. 19, was an immense success. In the 22ft. class the boats were bunched at the start, with Tyro to windward.

Table with columns for boat name and elapsed time. Includes Nutmeg, A. C. Jones, Tyro, W. H. Joyce, Rube, H. L. Bowden, etc.

Table with columns for boat name and elapsed time. Includes Stranger, F. E. Dawes, Hayseed, H. L. Bowden, Fritter, Caleb Loring, etc.

Table with columns for boat name and elapsed time. Includes Vera II, H. Lundberg, Ventus II, Keith Pevear, Tabasco, Jr., H. H. Wiggins, etc.

Table with columns for boat name and elapsed time. Includes Elizabeth F., H. W. Dudley, Crescent, R. E. Burnett, Zaza II, Gordon Foster, etc.

Table with columns for boat name and elapsed time. Includes Seboomook, B. A. Smith, Osprey, C. R. Hanson, Alpha, J. Leary, etc.

Table with columns for boat name and elapsed time. Includes Winona, Talbot Howe, Quakeress, J. H. Hammond, Clithero, W. Dean, etc.

Table with columns for boat name and elapsed time. Includes Essex, E. G. Young, It, Howard Haskell, Winona, G. W. Tarr, etc.

Table with columns for boat name and elapsed time. Includes Another Old Maid, S. P., Josephine, I. H., Empress, S. P., Alleen, I. H., etc.

Sewell Cup Race.

Seaside Park, Barnegat Bay—Saturday, Aug. 12.

The annual race for the Sewell cup was sailed off the Seaside Park Y. C. in a fluky S. breeze on Saturday afternoon, Aug. 12. The boats covered a windward and leeward course twice. A total distance of 12 miles.

The race won by Another Old Maid, a mahogany boat, designed by Mr. Charles D. Mower and built this spring by the Huntington Mfg. Co., of New Rochelle. She is fitted with bilge boards and double rudders.

All told there were nine starters. The Seaside Park, Island Heights and the Bay Head yacht clubs, each being represented in the match by three boats.

Another Old Maid made useful gains early in the race and was never headed. Empress, an earlier Mower production, made better time than Another Old Maid on the first round, but she was never dangerous. She was the last of the nine boats to start, and had she been better berthed, she might have shown up better.

The races for the Sewell cup are the most important matches sailed on Barnegat Bay, and every year more interest in them is taken. The summary follows:

Table with columns for boat name, time, and other details. Includes Another Old Maid, S. P., Josephine, I. H., Empress, S. P., etc.

Beverly Y. C.

Beverly, Delaware River—Saturday, Aug. 12.

The Beverly Y. C. held its second series race on Saturday, Aug. 12. The winners were Fiona and No. 1. The race was sailed in a wind that shifted from S.E. to S.W., and the boats finished in a heavy squall. The summary:

Table with columns for boat name and elapsed time. Includes Fiona, J. Perkins, Carolyn II., John Hamer, Gertrude, G. W. Holloway, Priscilla, P. S. Clarkson, etc.

Duxbury Y. C.

Duxbury, Mass.—Saturday, Aug. 19.

In the regular race of the Duxbury Y. C., sailed in a fresh N.E. breeze on Saturday, Aug. 19, Menace won in the 18ft. class, and Nautilus in the handicap class. The summary:

Table with columns for boat name and elapsed time. Includes Menace, J. H. Hunt, Osprey, A. R. Train, Gem, L. B. Goodspeed, Kittawake, Maxwell, etc.

Manchester Y. C.

West Manchester, Mass.—Monday, Aug. 14.

In a moderate breeze from the S.E., the Y. R. A. open race of the Manchester Y. C. was sailed on Monday, Aug. 14. Medric had the windward berth in the start of the 22-footers, with Peri II., Nutmeg and Tyro under her lee. Reaching to the first mark, Tyro went into the lead and stayed there throughout the race, with Medric in second place. Boo Hoo got the start in the 18ft. class, but was passed off Misery Island by Fritter, Moslem and Dorchen. Of these three, Dorchen had the lead when the first mark was turned. On the windward leg Fritter took the lead, and Boo Hoo was second, with Dorchen dropping back to fourth place. On the last leg, Fritter held her lead, while Dorchen went up to second place. In the 15ft. class Princess got the start and led to the first mark, but on the windward leg Cigarette took the lead and held it to the finish. In the handicap class Tarpon got the start and led all over the course. The summary:

Table with columns for class, boat name, elapsed time, and corrected time. Includes Class E-22-footers, Class I-18-footers, Class T-15-footers, M. Y. C. Handicap Class, etc.

Crowhurst Cup—Tuesday, Aug. 15.

On account of the storm, there were only three yachts ready to start in the open race of the Manchester Y. C. for the Crowhurst cup, presented by Mr. Francis M. Whitehouse, on Tuesday, Aug. 15. There was a stiff E. breeze blowing, which necessitated single reefs for all three, and there was quite a little hobble to the sea; but as the boats were sent inside, the conditions were by no means severe. Opitsah V. got the start, while Khalifa was handicapped by lack of crew. She was further handicapped by not being able to set a spinnaker, which sail might have altered the result of the race. Opitsah V. pulled away from Khalifa on the run to Little Haste, but on the windward leg home Khalifa reduced her lead. Opitsah V. again pulled away when they went off the wind, and Khalifa cut down the leg lead on the second beat. Last year Opitsah V. won a leg in the cup on a fluke, and this year it was practically handed out to her. Having won two races, Mr. Sumner H. Foster, owner of Opitsah V., becomes owner of the cup. The summary:

Table with columns for boat name, elapsed time, and corrected time. Includes Opitsah V., S. H. Foster, Khalifa, R. F. Tucker, Moslem, John Tyler, etc.

West Manchester, Mass.—Saturday, Aug. 19.

The fifth sailing tender race of the Manchester Y. C. was sailed on Saturday, Aug. 19, in a brisk E. breeze. Mr. N. Wigglesworth got the start and led all around the course, with Mr. F. W. Fabyan second. The summary:

Table with columns for boat name, elapsed time, and corrected time. Includes N. Wigglesworth, F. W. Fabyan, A. F. Bemis, R. W. Smith, H. S. McKee, C. E. Cotting, I. H. Read, H. G. Wigglesworth, etc.

Hingham Y. C.

Hingham, Mass.—Saturday, Aug. 19.

The first race of the Hingham Y. C. was sailed on Saturday, Aug. 19, in a brisk N.E. breeze. Mildred II. was the winner in Class A, Clara in Class B, and Trilby in the power boat class. The summary:

Table with columns for class, boat name, elapsed time, and corrected time. Includes Class-20ft. and Over, Mildred II., S. P. Moses, Holly II., W. H. Childs, etc.

Table with columns for class, boat name, elapsed time, and corrected time. Includes Class B—Under 20ft., Clara, J. H. Glidden, Rattler, J. Sumner Fowler, etc.

Table with columns for class, boat name, elapsed time, and corrected time. Includes Class C—Power Boats, Trilby, Samuel Ross, Wompatuck, Ralph C. Stoddard, etc.

Winthrop Y. C.

Winthrop, Mass.—Saturday, Aug. 19.

A club race of the Winthrop Y. C., with a class for Crystal Bay yachts, was sailed off Winthrop on Saturday, Aug. 19, in a fresh E. breeze. Scamper finished first in the 21ft. class, but lost to Opeechee on corrected time. Hattie was an easy winner in the 15ft. class. Aspinquid won in the Crystal Bay class. The summary:

Table with columns for class, boat name, elapsed time, and corrected time. Includes 21ft. Class, Opeechee, F. W. Gilmore, Scamper, Byram & Tewksbury, etc.

Table with columns for class, boat name, elapsed time, and corrected time. Includes 15ft. Class, Hattie, L. T. Harrington, Sprite, M. Dempsey, Elf, Mr. Wells, etc.

Table with columns for class, boat name, elapsed time, and corrected time. Includes Crystal Bay Association, Aspinquid, Bloomfield Bros., Yankee, F. Atwood, etc.

Nahant Dory Club.

Nahant, Mass.—Saturday, Aug. 19.

The first ladies' race of the Nahant Dory Club, sailed on Saturday, Aug. 19, in a brisk E. breeze, was won by We Still Live, sailed by Miss Rosamund Fay, with Sprite, sailed by Mrs. Winthrop Hodges, second. The summary:

Table with columns for boat name, elapsed time, and corrected time. Includes We Still Live, Miss Rosamund Fay, Sprite, Mrs. Winthrop Hodges, etc.

Hall, care of Bank of Commerce, Cleveland, O. Executive Committee—Thomas P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O. Board of Governors—Henry C. Morse, Peoria, Ill.

How to Join the A. C. A.

"Application for membership shall be made to the Treasurer, F. G. Mather, 164 Fairfield Ave., Stamford, Conn., and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

PUBLISHERS' DEPARTMENT.

There is a constant and increasing demand among owners of large places in this country for birds and animals to stock their places. Many people want to restock with native varieties; others do not care what animals they introduce. The beautiful pheasants from Asia are favorites among ornamental birds. People interested in these matters would do well to write to Cross, the Menagerie, Liverpool, England, who, as shown by his advertisement elsewhere, is in a position to supply almost anything in the line of birds or mammals.

Rifle Range and Gallery.

Fixtures.

Aug. 24-28.—Sea Girt, N. J.—National rifle and revolver matches. Aug. 29-Sept. 9.—Sea Girt, N. J.—National Rifle Association and New Jersey State Association. Sept. 1-10.—Annual out-door championship of the United States Revolver Association. J. B. Crabtree, Sec'y, Springfield, Mass.

Ohio Rifle Notes.

On Sept. 1, the Preble County Hunters' Association will hold its tenth reunion on the rifle range at Eaton, O. The shooting will begin at 10 A. M., and continue all day. Animal targets will be used, 100yds., offhand, open, plain or peep sights. Entrance fee \$1. Forty valuable merchandise prizes will be given to the highest scores. The Preble County Rifle Club will hold its regular quarterly shoot on the same day and at the same place. The club contests will be open to those taking part in the Hunters' shoot on payment of \$1, 90 per cent. of which will be divided into prizes for the highest scores. Creedmoor targets will be used, 100yds., offhand, open, plain or peep sights. Refreshments will be served on the grounds. At this meeting hunting parties will be organized and plans perfected for the annual trips to the various big game regions of the country. Every effort is being made to make this reunion the best in the history of the Association, and all hunters and riflemen are invited to be present.

The new championship medal of the Jackson Township (O.) Rifle Club was put up for the first time at the regular monthly shoot on Aug. 12. This contest is at 100yds., offhand, four shots, possible 48, and was won by Mose Pence with 46. J. Johnson was second with 45. Other winners of the club medal this season are: Jan. 14, April 8, M. Pence, 45, 46; Feb. 11, J. W. Leshar, 47; March 11, Geo. W. Izor, 46; May 13, June 10 and July 8, J. Johnson, 45, 44, 44. The 20-shot match followed; five events of 4 shots each, possible 48, 100yds., offhand; four money prizes in each and four money prizes in the aggregate. Clemmer and Pence tied on 220 out of 240 for high total, and the latter won first prize in the shoot-off. Johnson, 216, Leshar 200, Izor 203. Izor won first prize in the first event on 47. Leshar in the second on 44. Clemmer in the third on 47. Pence in the fourth on 45. Johnson in the fifth on 47. High totals in this match so far this season have been made by the following: April 8, May 13, and June 10, Johnson 236, 221, 219; May 6, Pence, 222; July 8, G. O. Chrismer, 225.

Rifle Notes.

After touring the Adirondack region, giving exhibitions of marvelous skill with the rifle, Mr. and Mrs. Frank E. Butler (Annie Oakley) are now sojourning in Maine. We acknowledge with thanks the receipt of an invitation to witness an exhibition shoot at Bangor, Me., on Aug. 26. Concerning Annie Oakley's wonderful skill as exhibited on this tour, the Portland Daily Advertiser states: "In regard to her shooting abilities some idea of her wonderful work can be entertained when the fact is known that to drive tacks with bullets, clip the ends from postage stamps at a considerable distance, cut a thread with a bullet and to put a hole in a coin thrown high in the air are feats that she accomplishes with ease. When in vaudeville with her husband, it was part of the act, and neither of them calls it dangerous, to stand opposite him and shoot a peanut from the top of his head. 'It was even more spectacular,' Miss Oakley observed, 'to shoot an apple from his head and much easier of course. My husband on more than one occasion laughingly remarked that it was an easy way to have his hair parted.'"

New England Military Rifle Association.

THE tournament of the New England Military Rifle Association was held at Wakefield, Mass., Aug. 15-18. The company five-man team match, limited to New England, distances 200 and 500yds., 7 shots at each range, \$7.50 entrance, was won by Co. D, 1st Maine, with a score of 287. Battery B, of Cambridge, came next, with a score of 283. The scores of the Co. D, 1st Maine team were:

Table with 3 columns: Name, 200yds., 500yds. Sergt Marston 3344544-27 4553525-29-56 Corp Tubbs 5454444-30 3545445-30-60 Sergt Dougherty 3434544-27 4453445-29-56 Capt Nash 4444454-29 5344555-31-60 Sergt C A Marston 4334343-24 5444554-31-55

Total 287. The Bancroft trophy, for six-man teams from any New England regimental battalion, distances 200 and 600yds., 10 shots at each range, had thirteen contestants. The match was shot in a rain storm. The scores:

Table with 3 columns: Name, 300yds., 600yds., Total. 5th Mass. 247 226 473 1st Corps of Cadets 240 234 472 1st Co. H. 227 192 419 2d N. H. 243 168 411 1st Conn. 182 148 330

The Essex county match, individual squadded match, New England only, 200 and 500yds. rapid fire, 10 shots at each range. High score was made by Private James Durward, Co. G, 5th Mass., as follows:

Table with 2 columns: Distance, Score. 200yds. 5555455533-45 500yds. 5555555555-50-95

In the Gov. McLane trophy, squadded match, 500yds. ten counting shots, high scores were:

Table with 2 columns: Name, Score. Lieut Bullard, Battery F, C. C. A. 5555455555-49 Private Harrison, Co. F., 2d Conn. 5555555554-49

In the Hayden trophy, individual squadded match, 200yds., Pvt. Wise was first with 33 points; Pvt. Sweeny, Pvt. Gibson, Pvt. Durward and Sergt. Sweeny were 32 each.

The O'Keefe trophy, distance 600yds., squadded match, was won by O. M. Berg with a score of 48; Sergt. M. P. Stiles, second, with 48. The New England Interstate match was begun on Aug. 17. The conditions were 12-man teams from each of the New England States; 200yds slow fire; 200yds. rapid fire at the F target; 500yds. rapid fire at the F target; 600yds slow fire, 1000yds. slow fire and one skirmish run at the G target; 10 shots at each of the known distances; 20 shots in the skirmish run.

For a trophy donated by the New England States the Massachusetts team was victorious with scores as follows:

Table with 5 columns: Name, 200 Yds., 500 Yds., Skirmish Score, Total. O M Sergt Berg 38 34 82 115 269 Lieut Underwood 41 42 32 107 222 Pvt Wise 36 31 77 123 267 Corp Simonds 44 38 54 113 249 Sergt. DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Bound Brook, N. J., Gun Club announces that their next monthly shoot will be held on Sept. 16.

At the two-day tournament of the Carlisle Gun Club last week, Mr. J. M. Hawkins was high gun each day. For the two-day general average, Mr. T. D. Hackett was second.

In a team match on Aug. 19, seventeen men on a side, in the first of a series of matches between Coatesville and West Chester, Pa., on the grounds of the latter, Coatesville was defeated by a score of 333 to 297.

A press dispatch recounts that the Kaiser recently watched a shooting match from one of his war canoes. The targets were six old torpedo boats, and the guns were navy small caliber. There was an omission concerning the kind of traps used.

Fourteen events constitute the programme of the New Haven, Conn., Labor Day tournament, Sept. 4. The events are at 10 and 15 targets, 65 cents, and \$1.22 entrance. Totals, 175 targets, \$13.09 entrance. Shooting will commence at 9 o'clock. Targets 1 1/2 cent. John H. Gould, Secretary.

Richard H. Gosman, Secretary, writes us that target shooting will be resumed on Thursday and Saturday afternoons, on the grounds of the Queens County Gun Club, Hunter's Point avenue, Long Island City, after Sept. 1. Targets, 1 1/2 cent. The grounds are situated within a half mile of Thirty-fourth Street Ferry.

The Cumberland (B. C.) News, of recent date, recounts that the local gun club has suffered from the vandalism of certain marauders who break locks and other parts of the club property, besides disarranging the mechanism of the traps so that they work badly, all of which denotes that the higher civilization has reached British Columbia.

The fall opening shoot of the Ossining, N. Y., Gun Club, Sept. 4, is open to members only. The main event is at 25 targets, 50 cents entrance, and first prize is the Hunter Arms Co. medal, value \$10; second prize, a pair of opera glasses, value \$6, donated by Messrs. Schoverling, Daly & Gales. Shooting will begin at 2 o'clock. C. G. Blandford, Captain; G. B. Hubbell, Secretary.

At the shoot of the Chicago Trapshooters' Association, Aug. 17-19, Mr. W. R. Crosby missed 6 targets out of the 600 shot at in the three days, which is below his usual good form. He made a run of 214, which is trifling, compared to some of his recent prior performances. However, there is no doubt but what this redoubtable shotgun artist could settle the war between Russia and Japan, single-handed, if placed on the firing line.

At the Interstate shoot at Kansas City, Mo., Aug. 16-18, under the auspices of the O. K. Gun Club, Hon. T. A. Marshall was high in the event at 25 pairs. He scored 45 in that event, which was a sterling performance. He was closely pressed by the renowned gladiators Messrs. Fred Gilbert, R. O. Heikes, W. H. Heer, J. S. Fanning and Alva Wilson, each of whom broke 43. The averages on the first day were as follows: Professionals—First, Fred Gilbert, 191 out of 200; second, W. H. Heer, 186; third, Harold Money, 180. Amateurs—First, Wm. Veach, 192; second, Alva Wilson, 180; third, Ed. O'Brien, 178. On the second day, in the special event at 25 targets, use of both barrels, Fred Gilbert at 21yds., and A. C. Holmes at 18yds., broke straight. High averages, amateurs, were: Wm. Veach 183 out of 200; second, Ed. O'Brien, 179; third, E. A. Arnold, 178. Professionals—First, W. H. Heer, 193; second, Fred Gilbert, 191; third, R. O. Heikes and Harold Money, 187. On the third day, in the special event, 25 targets and 10 pairs, handicap rise, T. A. Marshall and W. H. McGee tied for first on 40 out of 45; second, Chris. Gottlieb, 39; Fred Gilbert third, 38. Amateur high averages—First, Ed. O'Brien, 181; second, Wm. Veach, 175; third, E. A. Arnold, 173. Professionals—First, J. S. Fanning, 187; second, Fred Gilbert, 186; third, W. H. Heer, 184. General averages for the three days: Amateurs—First, Wm. Veach, 550 out of 600; second, Ed. O'Brien, 538; third, E. A. Arnold, 528. Professionals—First, Fred Gilbert, 568; second, W. H. Heer, 563; third, R. O. Heikes, 548.

BERNARD WATERS.

Indianapolis Gun Club.

INDIANAPOLIS, Aug. 19.—Hunter was high gun for Dupont trophy. This trophy is shot for under distance handicap, 16 to 20yds. Moller won Peters badge. Scores:

Interstate at Kansas City.

KANSAS CITY, Mo., Aug. 19.—Only the intense heat interfered with the opening day of the Interstate Association's trapshooting tournament at Kansas City, Mo., Aug. 16 to 18, under the auspices of the O. K. Gun Club, at the Schmelzer Shooting Park. The attendance was good, and more than ordinary interest was shown by those who took part in the tournament.

The tournament opened at 10 o'clock and continued to noon, six events being finished when an hour's intermission was taken for luncheon. In the afternoon the events were shot in good time, and came to a close just as a heavy wind and rain storm struck the shooting grounds.

There were twelve regular events on the programme. The first, second, fourth, fifth, seventh, eighth, tenth and eleventh were at 15 targets each, and the third, sixth, ninth and twelfth were at 20 targets each.

Besides the regular events, there were two special events on the programme. The first was one of 25 pairs, in which there were nineteen entries. T. A. Marshall was high man in this event with 45 out of a possible 50. R. O. Heikes, W. H. Heer, J. S. Fanning, Fred Gilbert and Alva Wilson were in second place with 43 to the credit of each. Ed. O'Brien was third with 41, and E. A. Arnold made 40.

The second special event was that for the Schmelzer cup, and it had fifteen entries. The conditions were 10 targets, entrance 50 cents. Six men tied with straight scores, and in the shoot-off, miss-and-out, Fred Gilbert won.

Among the amateurs, Wm. Veach was in first place for the day with a score of 192 out of a possible 200; Alva Wilson was second with 180 and Ed. O'Brien third with 178. Among the manufacturers' agents, Fred Gilbert was first with 191, W. H. Heer second with 186, and Harold Money third with 180.

The second day of the tournament was attended by a large crowd of spectators, and more different shooters took part than on the first day. The shooting as a whole was of a good average, although no records were ever in danger of being broken. The programme but slightly varied from that of the day before, there being twelve regular events of 15 and 20 targets each, and two special events. The first special was a 25-target handicap event, use of both barrels. Fred Gilbert at 21yds., and A. C. Holmes at 18yds., broke 25 each. J. S. Fanning (19) broke 24; Wm. Veach, W. H. Heer and R. O. Heikes, at 20yds., E. A. Arnold at 19yds., and L. Sherman and W. B. Cosby at 16yds., broke 23 each; Chris. Gottlieb and Harold Money, at 19yds., R. W. Murray, at 17yds., and C. Kleinhaus at 16yds., broke 22 each.

The second special was a 10-target event for a Schmelzer cup, and it had sixteen entries. Six broke the entire number, and in the shoot-off Gilbert won.

Among the amateurs, Wm. Veach was again in first place for the day with 183 out of a possible 200; Ed. O'Brien was second with 179, and E. A. Arnold third with 178. Among the manufacturers' agents, W. H. Heer was first with 193, Fred Gilbert second with 191, and R. O. Heikes and Harold Money tied for third with 187.

The third day of the tournament was an unfavorable one for the shooters. The scores made were below those of the two previous days, but considering the rain, cloudiness and high wind, the shooting as a whole was remarkably good. The regular programme consisted of twelve events, and several special events were added. The main special event was one of 25 targets, handicap rise, use of both barrels, and 10 pairs at 16yds. T. A. Marshall and W. H. McGee tied for first place with 40 out of a possible 45. Chris. Gottlieb was second with 39, and Fred Gilbert third with 38.

Among the amateurs Ed. O'Brien was in first place for the day with a score of 181 out of a possible 200; Wm. Veach was second with 175, and E. A. Arnold third with 173. Among the manufacturers' agents, J. S. Fanning was first with 187; Fred Gilbert was second with 186, and W. H. Heer third with 184.

For general average among the amateurs, Wm. Veach was in first place with a score of 560 out of a possible 600; Ed. O'Brien was second with 538, and E. A. Arnold third with 528. Among the manufacturers' agents, Fred Gilbert was first with 568, W. H. Heer second with 563, and R. O. Heikes third with 548.

The cashier's office was in charge of Fred C. Whitney, of Des Moines, Ia., than whom there is no better in this particular line.

The scores of the three days follow:

Aug. 16, First Day.

Table with columns for Events, Targets, and scores for various shooters like Harold Money, Wm Clayton, E. A. Arnold, etc.

Aug. 17, Second Day.

Table with columns for Events, Targets, and scores for various shooters like Harold Money, A. C. Holmes, E. A. Arnold, etc.

Table with columns for Events, Targets, and scores for various shooters like R. O. Heikes, B. Eisenhour, C. B. Adams, etc.

Special events. No. 1 was at 25 singles, use of both barrels, handicap. No. 2 was cup event, 10 singles. Ties miss-and-out; all at 16yds.

Table with columns for Events, Targets, and scores for various shooters like Fred Gilbert, T. A. Marshall, B. Eisenhour, etc.

IN NEW JERSEY.

Montclair Gun Club.

MONTCLAIR, N. J.—The Mountainside Gun Club, of Orange, will visit the Montclair Gun Club on Saturday Sept. 2, their team shooting against the Montclair team. This is the ninth match in the series of team races between the clubs composing the North New Jersey Shooting League, but the first time for the Orange club to meet Montclair in the present series.

Among the prizes at stake are \$50 in gold, a silver loving cup presented by the Dupont Powder Co., and a gold watch fob, the gift of J. H. Lau & Co.

Besides the team race, there will be five other events for silver prizes. Shooting begins at 1:30 P. M.

The grounds are located corner Grove street and Bellevue avenue, Upper Montclair.

Bound Brook Gun Club.

Bound Brook, N. J., Aug. 19.—An enjoyable little shoot was held at the Bound Brook Gun Club on Saturday afternoon. Mr. Neaf Apgar made high professional average, while Mr. S. Glover was only one behind. Mr. Von Lengerke was third, and last came Nicol. Mr. Cox, of Detroit, Mich., and Mr. W. Slater, of Rahway, were tie for high amateur average.

The cups the club put up as prizes were scattered pretty well around the country, when they were put up on the shelf at night. The first one went with Mr. Colquitt to South Orange. The second will finally rest at Tennessee as soon as Mr. H. T. Nelson returns home. The next two were taken to Newton, N. J., by Mr. Woodward and Mr. Crow.

The medal was won by Mr. Cox, of Detroit, Mich. Mr. Hoey won the club event for the silver loving cup, and Dr. J. B. Pardoe won the Hunter Arms Co. medal. The Doctor now has two wins on it.

The club will hold its next monthly shoot on Saturday, Sept. 16.

Table with columns for Targets, Scores, and names of shooters like Dr. Gardiner, Colquitt, H. Von Lengerke, etc.

Club race, for cup, handicap: Apgar 23, Hoey (2) 25, Pardoe (2) 17, Martin (6) 18, Stelle (4) 17, E. E. Roberson (5) 20. Hunter Arms Co. medal, 20 singles and 10 pairs: Apgar 36, Hoey 26, Pardoe 36, Martin 28, Stelle 22.

F. K. STELLE, Sec'y.

Mountaineers' Gun Club.

CHATTANOOGA, Tenn., Aug. 17.—Herewith are the records made by the shooters in the Mountaineers' tournament, finished Aug. 16: The experts were Col. Anthony, and Messrs. Chas. Spencer, Walter Huff, J. H. Hightower, Harry Hall and W. J. Borden.

Table with columns for Events, Targets, and scores for various shooters like Col. Anthony, Spencer, Huff, etc.

Experts did not contest for cup or purses.

Springfield, Mass., Shooting Club.

SPRINGFIELD, Mass., Aug. 12.—The Springfield Shooting Club had a practice shoot yesterday afternoon which was attended by eleven shooters, not as many as usual, as vacation time caused several to be absent. W. H. Snow was shooting in good form, and averaged 89 per cent. He also won the semi-monthly prize, a box of cigars, which was put up in a 15-target event for high gun. Snow and A. and L. Mistryer were tied on 14 each in this event, and in the shoot-off at 10 targets, Snow won. The Peters cup contest and merchandise race for three prizes are to be shot during the season, added target handicap in cup contest, and in the merchandise race the shooters are divided into three classes, A, B, C. The scores follow:

Table with columns for Events, Targets, and scores for various shooters like Chapin, Kites, Latham, etc.

Event No. 6, 15 targets, semi-monthly prize, box of cigars:

Table with columns for Brk. Hdp. Tot'l. and names of shooters like A. Mistryer, L. Mistryer, etc.

Shoot-off of tie at 10 targets:

Table with columns for Brk. Hdp. Tot'l. and names of shooters like Snow, A. Mistryer, etc.

Event No. 7, 25 targets, Peters cup contest:

Table with columns for Brk. Hdp. Tot'l. and names of shooters like Snow, Kites, etc.

Event No. 8, 25 targets, three merchandise prizes, three classes, A, B, C:

Table with columns for Brk. Hdp. Tot'l. and names of shooters like Class A—Snow, Class B—Lathrop, etc.

MISFIRE.

Frantz's Shoot.

SENECA FALLS, N. Y., Aug. 16.—I append herewith scores made to-day in Jack Rabbit system shoot, held on my grounds here. This is the first shoot held here in a number of years. Scores:

Table with columns for Events, Targets, and scores for various shooters like Knapp, Dalley, Knox, etc.

Sheepshead Bay Gun Club.

SHEEPSHEAD BAY, L. I., Aug. 17.—Seven participated in the medal contest, of whom Messrs. Weiskotten and H. Bergen did not contest for the medal. The handicaps and scores were: Montanus (5) 25, Williamson (8) 24, Capt. Dreyer (13) 25, Carolan (14) 25, Finckbender (15) 25. In the shoot-off at 25 targets, Dreyer was high with 22, but withdrew in favor of Carolan, who scored second with 20, thus the latter was the winner of the medal for July and August.

The weather was delightfully pleasant. Other scores were:

Table with columns for Events, Targets, and scores for various shooters like Montanus, Williamson, etc.

Sorrow entered a man's house, one rainy day, and the man said to himself, "I know what I'll do, I'll strike up a song, and that'll fix my visitor." And it did. For Sorrow said, "A man who can't sing any better than that is a whole world of sorrow all by himself."—Atlanta Constitution.

THE MANY-USE OIL

Cleans smokeless powder residue and foulness from Guns.—Adv.

# U. S. Government Ammunition Test.

Accuracy test of Krag-Jorgensen .30-Caliber Cartridges held at Springfield Armory by order of the Ordnance Department, United States Army.

**TESTED**—Ammunition of all the American Manufacturers.

**CONDITIONS**—10 and 20 shot targets, muzzle rest.  
10 and 20 shot targets, fixed rest.

**DISTANCE**—1000 yards.

**RESULT and OFFICIAL REPORT: U. S. Cartridges excelled all others**

### WESTERN TRAP.

#### Cincinnati Gun Club.

The weather on Aug. 19 was rather unpromising. A heavy downpour lasting till about 2 o'clock, kept many away from the grounds, but no rain fell during the balance of the afternoon. Fifteen scores were shot this week in the Schuler prize contest, which is nearly finished. Four full scores were made. Bullerdict was high gun in actual breaks with 47. Krehbiel heads the list including the shoot of Aug. 12, his score being 350 shot at, broke 265, per cent., 75.7. Score, including handicap, 326, 93.1 per cent. Gambell second with 92.3 per cent; shot at 350, broke 300, score 323. He has 85.7 per cent. in actual breaks. Ahlers third, shot at 406, broke 341, 85.2 per cent.; score 369, 92.2 per cent.; Randall shot at 500, broke 438—87.6 per cent.; score 400, 92 per cent. Barker and Lytle came next with 91.8 per cent. each. Randall is high man in per cent. of actual breaks. Hesser second with 87.1; Harig third with 86.8. In the team races Bullerdict made high individual score of 47. Barker and Randall only 1 behind with 46 each. A few practice events were shot. Maynard broke 190 out of 215, and 90 out of his last 100. He was the only one to make a straight 25 to-day.

Roanoke was at the grounds to-day, after a long absence caused by ill-health. Don Minto, another of the old-time regulars, was also on hand, but was hardly in his usual form. John Falk proposes to hunt doves on Labor Day, instead of breaking clay pigeons with the rest of the boys:

Schuler prize shoot, 50 targets, handicap: Bullerdict (4) 50, Herman (5) 50, Falk (10) 50, Myers (24) 50, Tuttle (9) 49, Lytle (22) 49, Krehbiel (4) 48, Maynard (3) 47, Pohlar (4) 47, Gambell (1) 46, C. Dreihls (3) 46, Orr (4) 46, Randall (0) 44, Barker (1) 44, Kep-linger (8) 39.

Team match, 50 targets:

Gambell	.....20 23—43	Randall	..... 22 24—46
Dreihls	.....21 21—42	Barker	..... 22 24—46
Don Minto	.....21 20—41	Bullerdict	..... 21 22—43
	62 64—126		65 70—135

Match, 50 targets:

Gambell	..... 20 23—43	Barker	..... 23 21—44
Dreihls	..... 24 21—45	Bullerdict	..... 23 24—47
	44 44—88		46 45—91

#### Ohio Notes.

The Columbus Gun Club expected to have the well-known expert Mr. W. H. Heer as a guest on Aug. 12, but were disappointed, as he was unable to attend. Fifteen members took part in one or more of the fourteen events of the day. Hayden was high gun with 197 out of 245. Jack Smith, 152 out of 185; Woodcock 126 out of 165; H. E. Smith 98 out of 115. H. W. Shaull joined in the sport for the first time in a long while. His rest seemed to have done him little harm, as he broke straight in the 15-target event and finished with 63 out of 75—84 per cent. In the match for the Columbus Sporting Goods Co. trophy, H. E. Smith was high with a full score of 50 including his handicap. He was also high in actual breaks, with 43. Hayden was second with 42 actual breaks. Thurman (10), Borger (10), Shattuck (10), and Wagner (19) came second with 47 each including handicaps. Hayden (2) third, 44. Jack Smith (2), Woodcock (5) and Wells (14) fourth, 42 each. The secretary is hard at work preparing for the Labor Day shoot. There will be twelve events, nine of these will be sweeps and three will be for merchandise prizes, five in each event, with a special prize for high and low gun shooting entire programme.

The Kendallville, Ind., Gun Club will give a two-day tournament on Sept. 12 and 13. Besides a number of handsome trophies to be shot for the club will give \$150 added money.

The Dayton Gun Club held their regular weekly shoot on Aug. 18, thirteen members being present. In the six 25-target practice events Craig was high with 110 out of 125, his score including a straight 25 and one 24. Carr second with 98. La Rue broke 80 out of 100. Cord and Ike third with 66 and 64 out of 75 respectively. In the handicap event at 25 targets, handicap of added targets, eleven men tied on 25 or better including their handicaps. Dorst was high in actual breaks with 24, his handicap of 6 giving him a total of 30. La Rue (6), Lindemuth (3), Cord (3) and Craig (3) broke 23 each. Whitacre (4), Ike (3) and Dial (3) 22 each. Carr (6) 19, Woodburn (8) 18, Dickey (5) 21, their handicaps putting them in the tie. In the first tie Cord (2) broke 25 straight, Dorst (4) 21, Lindemuth (2) 24, Ike (2) 24. In the second shoot-off Dorst (4) broke 21 and Lindemuth (1) 24. The others dropped out, and there was not time for another shoot-off. The wooded hills which formed the background and which have always been a bugbear to shooters, have been eliminated. The shooters now face to the southeast, and have an unobstructed sky background, not excelled on any grounds in the State. The requests for programmes of the tournament to be held Sept. 4 and 5 have been numerous.

The grounds of the Rohrer's Island Gun Club were well filled with shooters, many of whom brought their families with them to enjoy the hospitality of the club on Aug. 16. Practice shooting began early in the day. The medal event had fifteen entries. This is at 25 targets, with handicap of extra targets. Hanauer and Miller qualified in scores of 25 or better, and in the shoot-off Hanauer won with 10 straight to Miller's 7. Two six-man team races were shot. Phil Hanauer and Wm. C. Oldt were captains. Oldt's team won both matches, the first, at 15 targets per man, by 67 to 61. The second, at 10 targets per man, by 47 to 42. Thirteen 15-target sweepstakes were shot, 50 cents entrance, three moneys, 50, 30 and 20 per cent. Oswald was high gun with 156 out of 195. Craig 152, McConnell 147, Carr 139, Oldt 137. Five of the cracks shot in four sweeps, two at 15 and two at 10 targets, \$1 and one money. Craig and McConnell tied on 39. Oswald and Oldt, 37 each. Carr 34. Carl Hanauer showed his father Phil a trick with the scatter gun, beating him, 13 to 12, in a 15-target match. E. J. Budenthal, president of the Dayton Sharpshooters, made his first attempt at trapshooting to-day, and scored 50 per cent. Joe Hohm was present for the second time this season. His eyes are in better shape, and he shot about his usual gait.

A bountiful dinner was served at 1 o'clock. Lunch was on the table all day, and the boys all knew where to quench their thirst. The wind bothered at times, causing trouble even to the best of them. W. E. Kette had charge in the office, and five minutes after the close of an event the money was ready for the winners.

The series of twenty handicap shoots of the Greenville Gun Club closed on Aug. 14. The conditions were 50 targets, distance handicap, 12 to 22 yds., for ten merchandise prizes, and the club medal. A. W. Kirby won first prize, a fine shotgun, and club medal with 682 out of 1,000. McKeon second prize, Winchester rifle, 617. Eidson third, Marlin rifle, 594. The following were the other prize winners, and had their choice of remaining prizes in order given: Hartzel 588, Warner 580, Ayers 560, Limbert 559, McCaughey 541, Huddle 505, Wolf 449.

With the object of ascertaining the best shots of the gun clubs outside of Cleveland in northern Ohio, the Cleveland Gun Club will present a handsome loving cup as a prize to the member of each club making the highest average at the Labor Day shoot. The club must have at least three members contesting. At this shoot events 3, 5, 6, 8 and 9 will be for merchandise prizes, four in each, 75 cents entrance. Event 11 is for the northern Ohio five-man team championship trophy, presented by the club, placed in competition for the first time.

#### Garfield Gun Club.

Chicago, Aug. 19.—The appended scores were made on our grounds to-day on the occasion of the fourth trophy shoot of the third series. In the club trophy event, Dr. Reynolds won in Class A on 23 out of 25, singles; Al Smedes won Class B on 23 out of 25. Ostendorp won Class C on 14 out of 25.

In Dupont cup contest Stone won Class B on 19 out of 20 singles. T. L. Smedes won Class A on 18, Ostendorp won Class C on 8.

In the Hunter Arms Co. contest, 10 singles and 5 pairs, Eaton won Class A on 18, Stone Class B on 17, Ostendorp Class C on 16.

The day was a fairly good one for target shooting, only we had to shoot between showers. Attendance fair, nineteen shooters taking part in the various events of the afternoon:

Events:	1 2 3 4 5 6 7	Events:	1 2 3 4 5 6 7
Targets:	25 20 20 10 10 10 10	Targets:	25 20 20 10 10 10 10
Stone	..... 17 19 17 9 8 8 ..	Geotter	..... 18 14 9 .. 7 ..
McDonald	..... 23 17 16 8 10 10 ..	Bryson	..... 17 15 13 .. 5 ..
Gould	..... 15 13 12 6 6 6 ..	Eaton	..... 17 16 18 .. 9 ..
Howe	..... 17 14 .. 5 6 ..	T L Smedes	..... 21 18 14 .. 6 ..
George	..... 19 16 16 8 8 9 10	Parker	..... 22 17 14 .. 6 ..

Dr Meek	..... 22 17 15 9 5 9 9	Morrel	..... 12 16 .. 6 8
Al Smedes	..... 23 12 16 9 8 10 ..		

No. 1 was the trophy event. No. 2 was the Dupont cup. No. 3 was the Hunter trophy. Dr. J. W. MEEK.

#### In Other Places.

THE Terre Haute, Ind., Gun Club has purchased one of the latest style automatic traps and will hold shoots regularly in the future.

The Barry, Pa., Rod and Gun Club has been organized for preservation, protection and propagation of live birds. There will be regular shooting at the traps.

A new gun club has been organized at Burr Oak, Mich., the start being made with fifteen members.

The Keystone Gun Club, Lebanon, Pa., will shoot three matches with Middleton Club. The loser will pay for all targets. It should be interesting, as there are good shots in each club.

The Memphis, Tenn., boys at the traps are in a spirited contest for a hammerless shotgun. It takes three times winner to own the gun. So far Ed. Brook and A. W. Clark are ahead each with two wins to their credit. W. E. Love, P. M. Patterson, Dr. Taval, Van Vleet, B. C. Crook and Dr. Slocks one each.

The annual gun club barbecue was held at Princeton, Ky., on Thursday last, and was of the old-fashion, there being roast mutton for all. There was target shooting in the afternoon, and the scores were not so good as they would have been on a less full stomach.

A new amateur gun club has been formed at Hamilton, Ohio. All amateurs and all who desire to learn to use the shotgun are invited to participate.

At Perry, Okla., there was a special shoot recently in honor of Harold Money, who is visiting the town of this territory. He, with others, was shooting well at 25 targets, viz., Money 24, Neal 24, Appleman 24, Harris 24, Houston 25.

It is reported that at a shoot held at Shamokin, Pa., where the purse was \$80, Charles Tobby made 15 out of 17, and Ropp scored but 4. Well, talk about a "walkover." What strange matches are shot here in Pennsylvania, 17 targets. In live-bird shooting it is often 5, 7 or 9 birds for purses from \$100 to \$500.

At the East Side Gun Club, Saginaw, Mich., the best scores were made by Ed. Carpenter, F. Baumgartner, G. E. Openo, J. Ropp and R. Schmidt.

The Victor Gun Club was organized at San Rafael, Cal. Victor Sartoria is President, J. W. Fogi Vice-President and Harry Martin Secretary. This club is organized more for game shooting than for the traps.

The club house of the Seattle, Wash., Gun Club was burned recently. All indications point to incendiarism. A new house will be built at once, possibly new grounds will be selected.

Walter Holmsberg, a 40 per cent. man, won the silver medal at the meeting of the West Duluth, Minn., Gun Club. Nelson shot a score of 90 per cent. The day was fine, little wind, many ladies graced the occasion.

The Iron River Gun Club has been reorganized in the Michigan Peninsula, and will give a tournament on Sept. 4. There will be \$500 in purses, same being under the management of Joseph Kelly and L. A. Johnson.

The annual trapshooting tournament of the Brandon, Manitoba, Gun Club was held in early August, and was a success. There were thirty-five shooters, representing the towns of Winnipeg, Fort Garry, Killarney, Portage La Prairie and Sowus. All present were loud in their praise of the programme furnished by the local club. Fort Garry won the team shoot, with Brandon second. The last medal shoot for the season was held by the Seattle,

Wash., Gun Club last Sunday. A big crowd was present, and Ed. Ellis won the A medal. Steel got the \$10 cash prize with an average of 8.

The Valley Brogle Gun Club will hold a meeting at the Central House in Wheeling, W. Va., to arrange for the fall shoots.

The Marietta, Ohio, Gun Club will hold its first shoot on its own ground the second week in September.

The St. Mary's, Ohio, Gun Club will hold a shoot during August. Some of the best shots in the State will be present.

Local sportsmen at Canova, S. D., have organized a gun club. Many of the farmers have joined. The object is to preserve the prairie chicken until the proper season for shooting.

There will be a shoot at Mishawaka Gun Club, St. Bend, Ind., Thanksgiving Day, the prize being a fine hammerless shotgun.

The Evelith Gun Club, of Duluth, Minn., was defeated by the Virginia team on last Sunday. Duluth members were F. B. Deugherty, Albert Roher, John Warn, Leo Shapiro, Frank Campbell, James A. Robb, W. J. Smith, Dr. E. K. Medior, Sam Shapiro and H. Van Nostitz.

The Golden Gate Gun Club, San Francisco, held their August shoot with thirty participants at Ingleside. There was a splendid showing for this time of year, when deer and dove shooting, not to mention the trout streams, are so strong an inducement for the sportsman to forego the attraction of the city. In the champion class M. O. Feudner won with 94. In the first class W. S. Walters won with 79; second class by W. P. Jacobson, 78. Otto Feudner won the Beckart medal with 92.

The Limited Gun Club, Indianapolis has enjoyed a season of renewed interest this year. All their shoots were well attended, including many women and children, who were interested spectators. The last shoot held included a match between T. H. Parry and J. W. Wands for the Grand Hotel cup. Many of the out of town shooters participated in the open events.

There was a practice shoot held at Wellsville, Ohio, on last Thursday for the purpose of organizing a gun club. It is hoped that the permanent organization will be realized.

Good scores were made at the last Fort Worth, Texas, Gun Club shoot. The trophy was won by Childress with 47 out of 50. Kenney came second with 43. J. C. Day made 70 out of 75.

A barbecue and gun club shoot was given by the Bryan, Texas, shooters the first week in August, a team shoot being the feature. The Brazos bottom team won from Bryan with 10 to spare out of a possible 278 targets. John K. Parker made the best individual score.

Members of the committee on rules for the Houghton, Mich., Gun Club are, viz., William Parsons, Samuel Bryant, Jr., R. S. Trevarthan and Michael Messner, Jr.

The Harvard Gun Club, San Antonio, Texas, has decided that the trapshooting interests are best solved by calling a meeting promptly on Sunday morning at 10 o'clock. Mrs. Topperwin was high score, her shooting being very remarkable. Out of 100 targets she made 94, with a run of 63 straight. Mr. Dodds was the only one coming near her, and he made 90.

The Tabon, Ia., Gun Club held a shoot Aug. 15, one of the features being a five-man team race for clubs only.

At Lincoln, Neb., the club known as the Smartville Gun Club will hold shoots on Wednesday of each week.

The Tunnelton, W. Va., Club is reported hard at practice in order to meet the Kingwood marksmen in a club contest.

Last Tuesday the Lead, S. D., Gun Club held their regular shoot for the trophy.

The West Side Gun Club, Watertown, S. D., lately held a shoot at which 400 live birds were used as targets. New grounds have been fitted up.

The London Mills, Ill., Gun Club has assumed such proportions that on Friday last the members held an all-day tournament.

Announcement is made that the Pontiac, Mich., Gun Club will hold club shoots regularly on Friday afternoons.

The members of the Gun Club at Aberdeen, S. D., have called a meeting for the purpose of opposing the proposed coursing event. They are of the opinion that coursing will put the farmers in a hostile attitude and that they would oppose hunting, and that, in fact, a coursing meeting would spoil the entire hunting season.

On the first day of the Audubon Gun Club tournament, Audubon, Ia., with a programme of 200 targets, there was Fred Gilbert with 198, C. B. Adams 192, H. G. Taylor 196, R. Barber 193. Their report states that C. E. Petty of the home town scored 188 and was high amateur, and yet it will not appear to our readers how H. G. Taylor and R. Barber are barred from the amateur class.

Glen Konvalinka, the Iowa boy shot, made a remarkable score at the Mason City tournament. A boy of eleven summers, yet he shot the entire programme of 400 shots and equalled many old shots with a score of 350. He has for several years made regular trips to the lakes shooting with his father in the marshes.

If you had been one of the lucky ones who attended the supper given by Charley Grumm at Clear Lake, Ia., to the shooters you would have discovered that Charley is far from being a "dead one." Long live the memory of such old-time shots.

Here is the way the local scribe of the Mason City, Ia., Globe-Gazette made mention of shooters entered for their tournament: "Fred Gilbert, Storm Lake (Spirit Lake); Charles Butt (for Budd); Charles (for Chris.) Gottlieb; Tom. Weitmeyer (for H. W. Vietmeyer); E. (for C.) A Young. Others were mentioned, but these were the incorrect list to show how the scribe was misinformed.

When the second shoot was held by the North Side Milwaukee Gun Club for the powder trophy it was J. Heiser who proved the winner with 47 out of 50.

There is enthusiasm in some of the members of the A. C. Gun Club, of Fargo, N. D. They are now meeting on Friday instead of on Saturday. At 25 targets Kimberly made 23, Holly 15, Grest 14, Van Es 12, Churchill 9. But there is an end to trapshooting when the game shooting opens Sept. 1 in North Dakota.

The Bismark, N. D., Gun Club held a shoot Aug. 18 and 19. A general invitation was extended to all shooters of the State to participate.

At the shoot held Thursday by the Troy, Ohio, Gun Club Charles Smith, with 21 out of 25, won the trophy. Otto Smith was second, and J. M. Fulkerson third.

W. D. Stannard, won the high gun at the Badger Gun Club, Janesville, Wis., with 243 out of 265. Tom Malana, of Rockford, won the medal for high amateur score with 242.

Watertown, Wis., Gun Club held a shoot Aug. 20. A gold medal for county championship was the attractive event.

Another popular outdoor sport has been taken up by the faculty of the agricultural college at Fargo, N. D., that of target shoot-

ing. A club has been organized and the proper officers have been selected. The enthusiastic and very efficient sportsman, Dr. L. Van Es, is the president.

At South Bend, Ind., the Mishawaka Gun Club held its initial shoot on the new grounds last Thursday. Dr. Holtzendorff and Amos Hall led in the cup series. All are pleased with the new site.

Some of the sportsmen of Lawton, Oklahoma, are very outspoken in their estimation of some shooters who have killed young prairie chickens before the law was out. They say, "No true sportsman will so far forget himself as to violate any of the game laws." If the game is properly cared for there is every reason to believe that Comanche county will be a paradise for the lover of dog and gun.

We have it that the Abe Gun Club, Troy, Ohio, held a match Saturday. The wind was high, scores low, as John Wolf won first with 18 out of 25.

Despite the warm weather there was a good attendance at the weekly shoot of the Multomah Rod and Gun Club on the Irvington grounds, Cortland, Ore. At the last shoot scores at 100 targets were: Abraham 96, Carlon 94, Ellis 94, Hame 87, Mrs. Young 76, Collier 76, Mrs. Collier 11 out of 40.

The Lewiston, Ill., Gun Club will hold shoots regularly, and all are invited to attend. The club issues special invitation to the ladies to honor the club with their presence.

When the Greenville, Ohio, Shotgun Club met on last Monday it was Mid. Lambert who carried off the honors.

Jamestown, Ohio, Gun Club, on Wednesday last beat the Sabina and Bloomington clubs and retained the trophy. Scores: Jamestown 91, Sabina 85, Bloomington 84.

At the Clarksville, Ia., shoot Gilbert made 195, Taylor 194, Budd 190, Barber 187, Adams 178, Slimmer 178, Moore 152, Brockway 149, Wilcox 144, Gottlieb, 177, Campbell 162, Vietmeyer 144.

Much enthusiasm is evinced at the club events at Stratford, Ont., at the last meeting. K. C. Turnbull won the cup, scoring 20.

G. Easdale defeated W. J. Johnson in a challenge shoot at the St. Hubert Gun Club, Ottawa, Can. He broke 91 out of 100, while Johnson got 88.

The Worcester, N. Y., Gun Club was reorganized Tuesday evening, there being about fifteen members present. Earl Wright was chosen President; Dr. A. S. Peters Treasurer; Omer M. Slood, Secretary. All arrangements have been completed for holding weekly meets.

Last Thursday there was an impromptu match at West Jefferson, O. Dell Gross beat the local man, E. P. Boyer, with 96 to 86 out of the 100 targets shot at.

Arrangements have been made for the coming together of the Grinnell and the Marshalltown, Ia., gun clubs, in a contest for the State trophy. Marshalltown will journey to Grinnell and shoot on their grounds. This should be a close and interesting shoot, as the teams are nearly evenly matched.

Robert Styan on last Saturday at Sodus, Ill., defended his title to the cup of the club by defeating Dr. Renfrew and Buck Hubbard.

Annual election of the Clear Lake, S. D., Gun Club resulted as follows: L. P. Stutenroth, President; Morton Adams, Secretary; G. M. Sheppard and George Eichinger, Referees; Harold Haynes official scorer.

The Springfield Gun Club, London, Canada, held a shoot on Monday which was well attended, and fairly good scores were made. All the events were handicap. The winners were Day, Nevills, Glover, Breckow, Simcox, Blackwill, Nicholson.

The Anderson, Ind., Rod and Gun Club were pleasantly encamped on Lake Manitou, at Rochester, where they royally entertained visitors. The members are Frank Hamlin, Rob Abhol, John Stewart, L. Connelly, H. Schendleman, Jos. Haugh, Thos. Grogan, Fred Fuller, Wm. Moore, James Ralston, Thos. Harcum, Wm. Elwell and J. A. Baker.

The members of the Lake Charles, La., Gun Club, are improving fast since the occupancy of the new grounds. G. W. Lock made 24 out of 25, C. B. Spooner 22, J. W. Gardiner 21, Dr. C. Williamson 18. Other shooters were W. H. Simmons, J. H. Mathien, F. Gunn, Dr. Fisher and W. C. Brandt.

Great preparations are being made for the Interstate shoot, to be held at San Francisco, Sept. 15, 16 and 17. The grounds will contain at least five traps and not less than 200 shooters may be expected to enter.

Shooting interests at Waupun, Wis., are on the boom. Last Sunday there was a large attendance. Adolph Luebke got first prize, E. Weinbrenner second, H. Schelpfeffer third.

The regular shoot of the Forest Park Gun Club, Atchison, Kans., was held Sunday. In the cup shoot, Rich Daugherty did not miss, and Alva Clapp failed on but one.

At the Highland Park Gun Club, Goshen, Ind., shoot last Saturday, I. F. Taylor, of Chicago, made a fine record, getting 44 out of 50.

The shoot held at New Moorefield, O., was a success. The championship of seven counties was up for settlement and Holding and Losh tied and will hold same in partnership. Mrs. Sadie Morgan was official score-keeper.

The twelfth annual tournament of the Marion, O., Gun Club evoked much interest. D. D. Gross was present and made second high score. J. A. Penn, Toledo, was high, 175; J. H. Mason, third, 171.

The Harvard, Ill., Gun Club held the first tournament, Aug. 15-16. Alex. Vance, of Capron, Ill., was the manager. The committee on arrangements was composed of C. M. Davis, Dr. C. M. Johnson, E. Lyle, Axtel, Fred Dean and Ellis Price.

Part of the members of the Crown City Club, Dunkirk, Ind., held their shoot last week. Bert Kusser was high.

Some good scores were made by the members of the Bloomington, Ill., Gun Club. Bender won Class A medal on 23 out of 21. E. K. Crothers shot at 135 and broke 124, McBarnes 150, 124; McDermend 135, 115; C. Bender 100, 88; Botts 100, 88; Smith 100, 73; Radbourn 60, 52; Boettger 60, 42; Fienig 50, 43; Austin 50, 35.

St. Paul, Minn., Gun Club is now getting ready to make a bid for the next G. A. H. Visitors report that the grounds are very good, and that the location would be a good one.

The Mangum, Okla., Gun Club was organized July 17. E. C. Moore was chosen President, and Dr. C. H. Hall Secretary. A series of competitive shoots is under way for a loving cup.

Bob won the gun put up by the Highland Gun Club, Duluth, Minn. He shot three ties with Mr. Porter before he became the winner. There is another gun yet to be decided, and the attendance is large and much interest is taken.

Walter Holmberg, shooting an average of 40 per cent., won the Hurst medal at the West Duluth, Minn., Rod and Gun Club championship shoot, held last Thursday.

The name Silver Springs Club, Milwaukee will be new to our readers.

Little Falls, Minn., Gun Club will hold its shoots regularly each Monday evening.

The standing to date among the members of the Baton Rouge, La. Gun Club, is as follows: Chas. D. Reynolds 786, Armand Klennper 76, Wm. McCausland 76, John Fister 73, H. Von Phul 72, C. C. Parish 72, Banks Powell 68, B. S. Parker 64, W. M. C. Whittaker 61, Robert Raymond 60, Klank Klempeter 59, A. M. C. Jackson 46, E. Cazedessus 53, Jos. Staring 52, R. L. Gayer 49, S. J. Powell 48, F. B. Jones 48, R. S. Johnson 46, Dr. T. P. Singlebury 40.

L. A. Tyler was high man in the Salem, N. D., Gun Club up to the last shoot, but there he fell down, and others at present are his superiors.

The Central Gun Club, of Duluth, Minn., will pay \$100 for the conviction of dog thieves who are stealing valuable dogs in that city.

The Iron River, Calumet, Mich., Gun Club will hold a tournament Sept. 4. This will be a start with a rush, as \$500 will be the purse, this considering that the club has just been reorganized.

Weather reported hot in Minnesota, yet the Minneapolis Gun Club kept busy. At the last shoot, Mrs. Johnson won the Cohen cup and Class C medal. Callender, Palace cup and Class B medal; Parker Peters cup and Class A.

The shooters in the State of Minnesota are busy taking out their hunting licenses, for the fall shooting promises well. Sept. 1 and after there will be little attractions in that State, and the Dakotas for clay pigeons.

The gun club at Des Moines, Ia., is busy now with a powder trophy. Holgerson won the third contest, while Patterson made 49 out of 50, and came second. Further, Patterson made 96 out of the 100.

A charter has been granted to the Taylor Rod and Gun Club, Scranton, Pa. The subscribers are Louis E. Reed, Arthur Sweet, William Fairdough, Frank Decker and Henry Goodman.

There were thirty-four members of the St. Paul Rod and Gun Club at their last shoot. Frank Novotney won a point on the gold button with 25 straight. Schulstead won Class B button. Novotney won the tie for the Schulstead medal. Some of the best scores at 100 were: Novotney 93, Peiss 92, Murray 83, Hamilton 81, Wilk 79, Schulstead 79, Bazille 75, Manischura 72.

O. A. Felger, the local marksman, made a grand-stand opening at the tournament held last week at Grand Rapids, Mich. In the day's shoot he scored 190 out of 200 targets, and was only beaten 2 by Wm. R. Crosby. W. D. Stannard 188, and R. O. Heikes 187.

There was something doing at the "Shoot Slow" Gun Club, of

St. Joseph, Mo., Sunday last. The badge went to D. M. Wade, 22 out of 25.

H. C. Hirschev, the Minneapolis gun expert, only missed 11 targets out of 400 at the shoot at Duluth. Parker, of Minneapolis, made 370, Morrison 381.

The best scores made last Friday by members of the Oakes, N. D., Gun Club, were: George Wilson and H. Johnson 22, J. W. Bush and Chas. L. Marshall 21, L. Shabina and Al. Howell 20, J. W. Filsbie 18, W. T. Brown 15, B. J. Lehman 14. This was considered the first real practice this year. The interest is increasing, and the State laws will be enforced, and woe be to the offender who shoots game out of season.

Chicago Trapshooters' Association.

CHICAGO, Aug. 19.—Aug. 17, 18 and 19 were the days chosen for a tournament at Chicago. The programme issued invited all trapshooters to attend this tournament; and they came, from all the Central and Western States.

This Trapshooters' Association was organized about two years ago, for the sole purpose of encouraging the sport of trapshooting. It has succeeded, not only in holding many successful tournaments, but has a membership of some 300.

It must be borne in mind that this Association uses and has leased the old grounds famous the world over as those of "Uncle" John Watson. It should interest all your readers to know that honest John W. honored the "target smashers" with his presence during the second day. He was pleased to meet with all the old-timers, but clay saucers no doubt looked tame to the old veteran who ran a shooting park for years and furnished pigeons of the kind that no man ever killed 100 straight.

The "good old days" are gone, John. Nothing but clay saucers for pulling the trigger on in this great State of Illinois.

Well, money talks. So \$500 added money brought together sixty of the good shots, and each fired his 200 shots and went home to reflect, some over the money won, others how they missed the "easy things," and others to nurse a sore arm.

The rules and conditions called for a per cent. division, viz.: 35, 30, 20 and 15. It was only the 20 straightists who got much of anything above their entrance money. All events were 20 targets, a total of 200 for the day.

A drawing card was the average money, \$100 each day, to the seven high averages; then on the total three days, \$100 to the high scores and \$100 to the eight low scores shooting through.

The weather was good, not warm, but hazy on the second day, with variable winds, such as have been the downfall of many a pigeon shooter on the same grounds.

Of the grounds, little need be said. They are level and large enough for holding the G. A. H., or say 500 shooters. Only a small portion of the grounds are used, with three traps set up. The grounds are easily reached by steam and electric cars, being but 30 minutes from the city by the suburban express trains.

The gentlemen in charge have had much experience in the tournament line. Where could you get better than E. B. Shogren and Fred H. Lord. Then the superintendent of the grounds, F. H. Teeple, is a hustler, and besides attending to the squad hustling, he keeps the grounds in fine condition, and runs the lunch and refreshment counters.

Only two traps were used, and with these the shoot was finished early in the day. The office work was kept well in hand, and most of the shooters were paid off before leaving the ground.

Prof. Wm. R. Crosby came in a little late, but he came on strong in the shooting line. He missed but one out of 180, and then dropped two in the last 30, and closed with 197. Frank Riehl was second with 189 and Wm. Stannard close up with 187.

The amateur high average winners were Geo. Roll 191, R. R. Barber 190, L. C. Barkley and L. E. Parker tied on 189. Other winners will be found in the scores published for each day.

Second day the professionals remained in about the same positions. T. Bill Crosby came with a rush and made 200 straight, something phenomenal for this ground. He made a run of 214 and only missed 3 out of 400. Frank Riehl shot a great race, and lost but 5 for the day, and was a good second. Old man Budd was 10 behind, yet third man in the professional class with 185. W. D. Stannard made 183 and W. H. Cadwallader 180.

While this class of men usually have the greatest following, there were others doing fine work. R. R. Barber, the G. A. H. phenom., only lost 6 for the day, and his next competitor was Kit Shepardson, of La Grange, Ind., 189, he being tied by W. S. Hoon, the Jewell, Ia. topnotcher. Claud Binyon, of Chicago, was just 1 to the bad, or a total of 188. A. Moller, of Antigo, made 186, and Winesberg, J. Young, H. Clark and Ed. Scott made 185.

The weather was not so good as on the first day. There was more wind and more haze.

The third day did not start off well, but after the fog had cleared away, the sun shone bright, and there was little wind, so that the scores for the most part were very high. Riehl, Budd and Crosby shot through early, to catch the afternoon train for the Indian shoot at Spirit Lake, Ia. Crosby made another fine score, same as the first day, 197, thus with a total of 600 shots, he missed 6—just an even 99 per cent. Frank Riehl did well also, and missed but 7, which puts him a good second in the expert class. Budd had a few bad half hours, and fell away from that of yesterday. W. D. Stannard, the Chicago expert, followed Riehl, and made 193, while Budd fell away to 181.

The grand total average for the three days and 600 targets was: Crosby 594, Riehl 577, Stannard 577, Budd 563.

There was quite a change in the amateur shooting for the day. The G. A. H. double winner went down to 184, but landed the general three days' average with 568. It was Hugh Clark, of Wabash, Ind., good one, who fooled 'em all with 194, and thus landed second average. Kit Shepardson maintained his even pace, and with 187 for the day took third with 561. Claud Binyon made one more than the second day, 189, and came fourth with 558. Mr. Hoon, the small man from Iowa, made 556. George Roll did not hold up his first day's score, and came with 554.

The scores for the three days follow in detail:

Aug. 17, First Day.

Table with columns: Events, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, Broke. Lists scores for various shooters on August 17.

Aug. 18, Second Day.

Table with columns: Events, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, Broke. Lists scores for various shooters on August 18.

Aug. 19, Third Day.

Table with columns: Events, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, Broke. Lists scores for various shooters on August 19, including a summary of averages for professionals and amateurs.

THE MANY-USE OIL.

Prevents rust on guns in hot, cold, wet or dry weather.—Ady.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

MS, \$4 A YEAR. 10 CTS. A COPY. }  
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, SEPTEMBER 2, 1903.

VOL. LXV.—No. 10.  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be received. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

**The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.**

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

## A MASSACHUSETTS BIRD STUDY.

WE have more than once spoken of the excellent work done by Mr. Edw. Howe Forbush in connection with the State Board of Agriculture of Massachusetts, and his recent report to that board is well worth reading by all who are interested in our birds. It has to do with the decrease of certain birds and the causes for this decrease, and gives a number of suggestions for bird protection. The matter of the report is compiled from the author's observations, and those of the persons replying to 400 circulars sent out by him to naturalists, secretaries of game, game protective associations, officers of various societies and commissions, sportsmen, market hunters and intelligent observers generally.

As might be expected, the majority of these observers take the view that our small birds have decreased, a decrease which is far the greatest in the neighborhood of centers of population. The larger birds, including the game birds, are certainly decreasing, but some of these larger birds—as for example, the gulls and terns—have slightly increased within the past two or three years, owing to the passage of new laws and their enforcement. We may all listen respectfully to the opinion of so good an authority as Mr. William Brewster, who passes a great deal of his time afield and who says that birds do not appear to be decreasing generally, but there has been a decrease among swallows, martins, night hawks, birds of prey and certain waterfowl.

Man and man's works are the chief cause of the destruction or diminution of our birds. His rude interference with the balance of nature, added to the injury wrought by their natural enemies, increases the destruction of the birds to a point where it is greater than the annual increase.

While opinions are of no great value unless backed by evidence, the trend of feeling expressed by the observers consulted by Mr. Forbush is interesting. Of his 217 replies it was found that 82 assigned the diminution of birds to "sportsmen, or so-called sportsmen"; 70 to "Italians and other foreigners"; 62 to "cutting of timber and grubbery"; 57 to "market hunters"; 32 each to "bird shooters and trappers" and "egg collectors, boys and others"; 18 to "milliners' hunters"; 17 to "draining marshes and meadows," and 16 to "gun club and hunting contests."

Each observer will naturally generalize from the conditions with which he himself is cognizant, but reasons given for their opinions by the observers have a value; for example, one reporter writes that there are now at least seventy-five hunters provided with bird dogs, where thirty years ago there were only three dogs in his town. The improvement in firearms, from the flint lock, through the percussion cap, the breech loader and the pump gun, renders the efforts of each gunner far more destructive now than formerly. In Massachusetts wildfowl shooters during the open season live on the ground frequented by the birds, and by the aid of trained live decoys often succeed in decimating the flocks which pass them.

The destruction caused by foreigners affects chiefly the small birds and those larger birds which are not game, such as herons, hawks, owls and crows. These foreigners come to this country under the impression that this is a free land, where each man may do what he pleases. They regard the shooting of small birds as "sport," and as we all know frequently resist the officers of the law who attempt to check their depredations.

In offering suggestions for the better protection of the birds the correspondents made a multitude of suggestions

which are grouped under four heads, which may be termed educational, legislative regulation of shooting, bounties, and miscellaneous. Of these the first two contain many ideas worthy of consideration, the third, which has to do with bounties, may be passed over, for it has been pretty well determined that bounties are ineffective; but in the miscellaneous suggestions is found the excellent and practical recommendation to establish State reservations where birds shall be protected.

The Commonwealth of Massachusetts has already taken noteworthy steps in this direction, and it may be hoped that the work so admirably begun may be carried much further. Not only Massachusetts alone, but every State in the Union should have a multitude of reservations to be left in state of nature, to be protected from injury by the public, and where the birds themselves shall be protected from enemies of whatever sort. It is possible, in time, to bring back many of our native birds in their old abundance, and we believe that this will ultimately be done. The sooner it is done the better.

## THE TROUT OF GOLLEY BROOK.

THE delusion that private waters may be converted into public waters by the simple expedient of putting into them fish from the State hatcheries is manifested anew in a case which came up last week in the Rome, N. Y., city court. The circumstances as developed at the trial were these:

The New York game law contains a provision that in any town in which fish may have been placed at the expense of the State, the Forest, Fish and Game Commission may, on the request of the town board, "prohibit or regulate the taking of fish from public inland waters therein," for not exceeding five years from the time the fish were planted. Printed notices of the prohibitions are to be posted along the shores of the waters affected, and whoever shall fish in violation of the prohibition is declared to be guilty of a misdemeanor.

Taking advantage of the opportunity assumed to be afforded by this law to improve local trout fishing conditions, the Rome Fish and Game Protective Association applied for a consignment of fry from the State hatcheries to be placed in a stream known as Golley Brook, and at the same time petitioned the Commission to close the brook as to fishing. This was done; the fish were put in, and in November, 1903, the stream was declared closed for a term of three years, and was posted with legal notices to that effect.

Last July a Rome attorney, Elliott O. Worden, went fishing in Golley Brook, and when Asa Golley, the owner of the land from which the stream takes its name, cited the law to him the fisherman retorted that he was not worried about being arrested, but was worried as to whether he could get a mess or not. Mr. Worden assumed the role of one who was standing up for his rights. It is claimed for him that he fished in Golley Brook because he believed that the Commission had no authority to forbid his doing so, the stream not being within the classification of "public waters."

The character of the brook was described by several witnesses at the trial. Asa Golley, a witness for the prosecution, testified that the brook was not a navigable stream and that logs could not be floated there. "When the meadows are filled with high grass," he said, "the tops of the grass will meet over the brook, the brook being so narrow. There are arms of the brook in the town of Lee and the courses have been changed by the farm owners by plowing ditches, making more convenient courses. Golley Brook is made up of several little springs having their source from the side hill, not over three-quarters of a mile away from where Worden was fishing."

Counsel for the defense claimed that the brook was not "public inland waters," but a stream subject to private ownership, and in fact was inclosed private property. Charles Wengetz, a witness for the defense, testified that throughout most of the brook as it flowed through his land he could step across it; in a test made on the morning of the trial, in a distance of 396 paces along the brook, a stick fourteen inches long, used to span the width between the banks, "got stuck fourteen times, so that he had to dislodge it." Wengetz and Edward Lasha, owners of adjoining farms through which Golley Brook flows, testified that they had not authorized the posting of the stream on their property.

Lasha, on whose farm the fishing was done, said that

he had invited the defendant, Worden, to fish there on the occasion for which Worden was arrested.

The private character of the water appears thus to have been demonstrated. Apparently no attempt was made by the prosecution to show that it was a public inland water for any other reason whatever than that it had been stocked by the State with fish, and that such stocking had made it public.

The court took this view. As quoted in the printed report of the case, "the court said he had his notion about it. He said John Golley owned property through which Golley Brook flowed and had given his consent to have it stocked by trout from the State hatchery, and that the town board of Lee had made application to have the stream closed, and that the proper notices had been posted prohibiting fishing in that stream, and that the requirements of law having all been lived up to, he held the brook to be public inland water and found Mr. Worden guilty of a misdemeanor in violating the law, section 156, in fishing there on July 18 last." A fine of \$10 was imposed, but sentence was suspended pending appeal.

If the Golley Brook was truly described by the witnesses whose testimony we have quoted, it is manifestly not a public but a private water.

If it is private water the planting in it of fry from State hatcheries cannot make it public.

If it is a private water the State cannot close it to fishing.

If the Rome Fish and Game Protective Association members want to improve the fishing in Golley Brook by closing it for a term of years, they may do this legitimately by planting fry in it and persuading the land owners through whose farms it flows to post the stream and keep fishermen out. They would be obliged, however, to purchase the fry from private trout culturists, for the law forbids supplying fish from the State hatcheries for stocking private waters. Nor does such an arrangement with the farmers appear feasible just now, for taking umbrage at the Worden prosecution, some of the land owners have posted Golley Brook on their own account, declaring it to be their private property, and warning trespassers to keep out.

The tendency of the times is toward the more comprehensive and stricter closing of all private waters against promiscuous public fishing. The angler who finds himself shut out from streams once free to him may feel chagrined and outraged, and that he is deprived of what custom has made him consider his rights. But the changes are inevitable. There is no halting its progress. The fishing of the future, as to stream fishing for brook trout at least, will be in waters owned or leased by the fisherman, or in which he pays for the temporary privilege of fishing, or fishes as a guest. It behooves us to make up our minds to this, to reconcile ourselves to the change, and to cast about to make sure of our own personal, individual opportunities by prudently looking out for number one. In doing this we shall act most wisely if we shall depend on the ancient and well established principles of land ownership and property rights, and not put our faith in freak products of the legislative mill, such, for instance, as a law declaring that the stocking of private waters with fish from public hatcheries throws those waters open to the public.

## A BETRAYAL OF TRUST.

THAT is a most extraordinary condition of affairs in the Adirondacks which is described by Mr. Raymond S. Spears in his story of the sale of State lands by officials whose duty it was to protect the people's interests. The State Constitution forbids the sale of lands in the Forest Preserve. In the face of that prohibition, if Mr. Spears be right as to his facts, parcels have been handed over to the wood alcohol manufacturer and other private purchasers. Among the lands of which the State has been robbed is a strip bordering on Ampersand Pond, one of the most famous beauty spots of the whole Adirondack region.

The charges made by Mr. Spears are not general but specific. They are serious and demand an answer. If such transfers of public property into private hands have been made, the officials who have betrayed their trust should be punished; the contracts being illegal should be annulled, and to the people of the State should be restored the lands of which they have been defrauded.

## Trappers of Oregon Territory.—II.

(Concluded from last week.)

DUNN describes the ways of the Columbia River Indians and tells of their custom of flattening the head: "There prevails a singular custom among all the tribes about the lower part of the Columbia—the flattening of the forehead, and compression of the whole head, which gives them a hideous appearance. Immediately after birth the infant is laid in an oblong wooden trough, by way of cradle, with moss under it. The end on which the head reposes is raised higher than the rest. A padding is then placed on the infant's forehead with a piece of cedar bark over it; it is pressed down by cords, which pass through holes on each side of the trough. As the tightening of the padding and the pressing of the head to the board is gradual the process is said not to be attended with much pain.

"The appearance of the infant, however, while under it is shocking; its little black eyes seem ready to start from their sockets, the mouth exhibits all the indications of internal convulsion, and it clearly appears that the face is gradually undergoing a process of unnatural configuration. About a year's pressure is sufficient to produce the desired effect. The head is ever after completely flattened, and the upper part of it, on the crown, seldom exceeds an inch in width. This is deemed a mark of beauty and distinction, like small and crippled feet among the Chinese ladies of rank.

"All their slaves, whom they purchase from the neighboring tribes, have round heads. Every child of a slave, if not adopted by a member of the tribe, must be left to nature, and therefore grow up with a round head. This deformity is, consequently, a mark of their freedom. On examining the skulls of these people several medical men have declared that nothing short of ocular demonstration could have convinced them of the possibility of moulding the human head into such a form.

"Though the Indians about the head waters of the Columbia and in the other regions bordering on the Rocky Mountains are called 'Flat Heads,' the name does not result from such a characteristic deformity, for all these people have round heads; but appears to have been originally given them from caprice, or from an observance of some similarity in disposition or habit, between them and the savages of the coast at the mouth of the river. The best supported opinion is, that they were of the same original stock with the lower tribes, but discontinued the custom."

The fishing on the Columbia, the establishment at Fort Vancouver, its inhabitants and its farm are all told of most interestingly. It was here, we believe, that the first fruit trees were planted in Oregon, a region since most famous for fruits of all description.

It will be remembered that in several of the old books written of this far western country, and the travelers who passed through it, mention is made of James Bird, the half-breed son of an employe of the Hudson's Bay Company. This man died on the Blackfoot Reservation in northern Montana only a few years ago, and his children and grandchildren, most of them now nearly pure Indians, are still living in that country. One of his escapades is related by Dunn:

"Mr. McKay, one of the principal officers in charge of the Hudson's Bay Company's trapping party in the Snake country, is a gentleman of great intelligence and natural astuteness, and also of good feeling, and is quite as much at home in the prairies and wildernesses as he is in a fort. I recollect a story related by him, in 'bachelors' hall.' He was speaking of a son of a Mr. Bird, a gentleman some years ago in the service of the company. This young Bird (and a wild *bird* he proved to be) received a fair education and could converse in French and English. He was some time in the company's service, but, finding the work too hard for him, joined the Blackfoot Indians, and was made a chief, and he took several daughters of chiefs for his wives and became a man of some note and respect. He received, among the trappers, the nick-name of *Jemmy Jock*. He had then been living with the Indians twenty years, and was much disliked by the American trapping parties; in fact, it has been said that the Americans did once offer \$500 for his head, as they supposed he had been a leader among a tribe of Blackfeet when an American party was cut off by him.

"Mr. McKay said he was once encamped in the plain, and imagined that the Blackfeet must be in the vicinity of the camp, by various marks. He accordingly at night gave strict orders to the Canadians on watch to keep a good lookout, which they did, with rifle in hand. But this *Jemmy Jock*, dressed as a Canadian voyageur, managed to enter the camp unobserved, walked up to the chief man on watch, and, addressing him in Canadian French, said that he had received orders that the horses which were in the camp should be turned out to graze.' The watchman, taking it for granted that the order came from McKay, ordered the horses to be let out. But before long the camp was roused by the loud whoop of the Blackfeet; some of the horses were mounted, and others driven off before the marauding party; the poor trappers being left to make the best of their way through the plains as they could. Sometimes in traveling through the plains the company's trappers fall in with a letter, tied to a stick, left by this humorous half-breed, to announce that he has camped at this spot with his party a short time previously—sometimes giving them good in-

formation, and sometimes intending to mislead and play them a frolicsome or mischievous trick."

After a more or less polemical chapter, devoted largely to showing that the Americans in Oregon are all wrong, and the British subjects all right, Dunn passes on to a capital review of Oregon, as it was then known, and this is followed by a description of Astoria, subsequently Fort George. Included in this is a description of the loss of the ship *Tonquin*, and of the sale by Mr. Astor of Astoria. Then comes a description of the extension of the British sphere of influence, from southwestern Oregon to the north of the mouth of the Columbia, and a description of that country and its products. The whole is very interesting as a picture of the early condition of the country.

At Milbank Sound in 1833 the author and his companions, occupying a recently completed fort, came very near having a fight with the Indians. A man had deserted the post, and had joined the savages, and the traders, in an endeavor to get him back, took the chief of the Indians prisoner and held him, threatening that unless their man was given up they would send the chief to Vancouver. The whites had no water in the stockade, and, as Dunn says:

"On a particular day, seeing no Indians about, we proposed to allow some of the men to go out with buckets to get water. Mr. Anderson and myself went outside to see after them while Mr. Manson kept a lookout within the inclosure from a high temporary watchtower. We had not been out many minutes when, looking around the bay and on a point of land about a quarter of a mile to the southward, we perceived a fire. At that instant several Indians rose up, gave the war-whoop, and the fort was then surrounded with hundreds of these savages—some armed with knives, others with guns and axes. Mr. Manson cried out to arms. Mr. Anderson and myself rushed as fast as possible to the fort, and then to the bastions, from whence we commenced firing along with the men that remained in the fort. This threw the Indians into confusion and made them retreat with some loss of life into the woods. The whole of our outside men escaped unhurt into the fort, with the exception of two. One of these was a half-breed, who was surrounded by eight Indians. He was cut in the shoulder severely by an ax aimed at his head, after this blow he managed to wrest the ax from the Indian and keep his assailants at bay; but another Indian coming up with a gun was in the act of shooting him when Mr. Anderson rushed to the fort gate, and, with his rifle, shot the Indian. The others decamped and the half-breed made his way into the fort. The other, a Canadian, had before the disturbance fallen down with an ax in his hand, which had injured him. This man they took prisoner, dragging him, face downward, to the water-side and placed him, tied hands and feet, in a canoe, it being that night their intention had we not had their chief in custody, to have burnt him. During the night they kept up a continual whoop and firing of guns, but kept a long distance from the fort, fearing we should get our big guns to bear upon them. Having this poor fellow in their possession all night they brought him in the morning under the fort and announced a desire to speak to us; and finding their chief was safe, said if we would give their chief freedom they would return our man. The deserter they persisted they knew nothing of. Finding we could not get back the deserter we proposed to give them their chief, provided our man, whom they had taken prisoner, was returned; and likewise we proposed that they should give us two inferior chiefs as hostages. This was done for a guarantee to prevent any of our men from being attacked by them in case they were compelled to go out of the fort. This was agreed to. The chief having been let free our Canadian returned next morning, and the two Indians were kept as hostages to insure safety to our men on quitting the fort for business. The Indians requested us to hoist our flag as a signal of peace. They informed us that one or two Indians had been wounded in the previous conflict and wished to know if they came, since peace had been proclaimed, whether we would dress their wounds. To this also we willingly consented, and the patients were restored quite recovered. This conduct on our part in receiving and healing their wounded made a very favorable impression on them and they exhibited every pacific disposition. We kept, however, within the fort for several weeks until their vindictive feeling would completely have cooled down, and by that time we became mutual friends. Trade then again commenced at a brisk rate, and we went on building and clearing ground as usual, for the completion of the fort and the preparation of our little farm. As I began to speak their language so I increased in favor with them."

In one of his concluding chapters the author discusses further the relative claims of Great Britain and America to the Oregon Territory. The points on which he bases his claim are three—prior discovery, taking formal possession after discovery and settlement. The British discoverers whom he names are Cooke, in 1777; Berkeley and Dixon, in 1787; Lieutenant Mears, in 1788; Vancouver, in 1792, '93 and '94; Broughton, who in 1792 entered the Columbia River and proceeded up it 100 miles; Mackenzie, in 1793. He speaks also of the Spanish explorers, one of whom, in 1775, discovered the Columbia. As to American explorers he quotes Washington Irving, who speaks of Captain Gray who took his ship *Columbia* in 1792 into the river of that name, and up as far as Gray's Bay. Captain Gray, after proceeding to sea, fell

in with Vancouver and gave him a chart. The author refers also to the explorations of Lewis and Clark, whom he speaks of as American citizens but does not appear highly to regard their discoveries.

Dunn makes quite an elaborate argument in favor of Great Britain, and it is a pretty good argument, too; but, of course, at this distance of time it is interesting only as a curiosity. He winds up his chapter by a quotation from a message of the President to Congress, saying that the United States have always contended that they had a right to the whole region of country lying on the Pacific embraced between 42 degrees and 54 degrees 40 minutes of north latitude, winding up with this mouth-filling paragraph:

"Commentary on so false and monstrous an assertion as this is thoroughly useless. If concession be made to this claim they will, by and by, claim as far as the pole. In a word, nothing will satisfy them short of the extinction of British power and influence throughout the northern continent of America. And it only remains for the British Government and the British people to consider whether they will tolerate this."

Writing of the missionaries and their influence over the savages, whom they hope to convert, he declares that before the conquest of Canada the Jesuit missionaries propagated the principles of the Christian faith among the remotest tribes, and did it successfully, and he believes that had not Canada been conquered by the British, "Christianity—perhaps Christianity in a bad form, but yet Christianity in all its elements—better than no Christianity at all, would have been diffused throughout the continent"; and he laments that since the conquest of Canada very little has been done toward the conversion of the natives in the interior and west. He believes that the natives should be Christianized through the instrumentality of the Church of England, or even of British dissenters, because, if so converted, they would, as a whole, attach themselves to Great Britain; but as this has been neglected by British missionaries it seems to him probable that the natives will be converted by those missionaries who swarm into the country from the United States and so the British hold upon their affections must soon be enfeebled. Finally, he declares that "The American missionaries are used by the American Government, and fairly represented by the American writers, as political instruments in exercising their influence with the natives to attach them to republican institutions and to make them the passive recipients of all sorts of anti-British antipathies, and thus the Americans hope to recover the position in the country which they lost by their want of integrity or energy as traders."

GEORGE BIRD GRINNELL.

## My First Black Bear.

THE winter before I was five years old a young uncle at my request taught me to read, and by the following spring had me able to read in my mother tongue about as well as I can read in it now. Soon after I had learned to read I got hold of several books about Indians, "Peter Parley's Tales" was one of them. They told me all about Indians and some more, as I afterward found out when I had got to be an Indian (by brevet) myself.

Now, I wanted to see these Indians and their country, and the Great American Desert, that took up so much of the map between the Mississippi River and the Rocky Mountains. I did afterward find the Indians but failed to find the Desert; it had been moved, probably. I studied for years after I had got to be a little older to hit on a plan to go West, and at last I thought I had it.

Early in the spring of 1855 the recruiting officer at Pittsburg, my native city, called for recruits for the Mounted Rifles—it is the Third Cavalry now—and he wanted trumpeters also, and as I could read music now and make a noise on a cornet (I thought then I could play it) I applied for a position as trumpeter—they called them buglers then; the bugler has since left the regular army and has gone to the volunteers, he is only a trumpeter in the regulars now. But I struck a snag here right at the start. I could not enlist unless I brought my mother to give her consent. I was only sixteen years old.

I might as well ask her consent to let me hang myself, and knowing that, I did not ask her but wrote out her consent myself, then lest this officer might ask me to write, when he enlisted me, I had a boy friend of mine sign for my mother and then tried again. It would not work. I must bring my mother, he told me.

I was bound to go West, though. Had not Horace Greeley told us to go there? So I next found an old river steamboat that was going to St. Louis, and shipped on her as a cabin boy. We got to St. Louis in good time—that is good time for this boat, she never was in a hurry going anywhere. And now I was in the West, or a part of it, at least. The Indians and buffalo and Great American Desert were still farther west. I held a council with myself, and as the boat was going to New Orleans next, I concluded to remain on her a while, the Indians and buffalo could be found later on, I thought.

I was right. I found them both when I came to look for them, and kept on finding the buffalo for the next twenty-four years, and did not stop finding Indians for the next thirty years. The last bunch of them I ever found must have been mad about something, for they got behind rocks and trees and shot at us for two hours.

We made the trip to New Orleans and back, then put in most of the summer between St. Louis and Memphis.

This boat was what would be called a tramp now. She went wherever she could get a cargo that paid. About the first of September we took on a load of Government stores at St. Louis to be taken to Fort Snelling, in Minnesota Territory it was then, and took these stores up to St. Paul. Here the captain concluded to tie up for the winter. It was rather early yet to quit, I thought, but then I was not the captain, only the cabin boy. The captain owned two-thirds of the boat himself, and his probable reason for tying up here was that he did not want to winter at St. Louis. I could not blame him. Since then I have seen numbers of fine boats torn away from their landings there and crushed like eggshells when the ice came down in the spring.

The crew was paid off and all left except the watchman. I was in the West now, and likely to stay there or else walk home. The railroads had not got quite up to St. Paul yet, or I might have "jumped a freight." I probably would have done it. The watchman was anxious to keep me with him, and the captain told him to do so, then said to me: "You stick to my boat, Johnny, and when you get old enough I will make you a mate."

"I am afraid I could never learn to swear hard enough, sir, for a mate," I told him.

"Oh, yes, you can. You can do your share of swearing now. I have heard you at it when things did not suit you. Stay here and I'll ship you in the spring again."

St. Paul at that time was only a small town, hardly more than a trading post. Governor Ramsey, the first Governor of the Territory, was the great man here; he lived here. I was still stopping on the boat, when one day I went up town to see some Indians that had come in to trade. They were the Dacotas, or Sioux, as we call them. They call themselves Dacotas, and they were the first wild Indians I had ever seen.

While I was looking at them here a young man came up and began to question me, and after I had told him where I had come from, how I had come from there here, and how anxious I was now to go somewhere else, he offered me a job driving a wagon for him, then told me about himself, telling me that there were four of them and that they meant to remain out here a year hunting.

That suited me. I was willing to remain out here two years hunting, and closed the contract with him right then, though I expected now to be frozen half to death this winter, I had heard so much about this cold country up here, but thought that if these young men could stand it I could. As it afterward turned out, we camped out all winter, and I did not suffer any more from cold weather here than I would have done at home.

These men were all gentlemen's sons, what was still better as far as it concerned me they were all gentlemen themselves and always treated me well. They were stopping at the hotel here. It would have been a tavern farther East, and in a day or two after I joined them we got ready to go on the hunt, or rather continue it, as these men had been hunting out here since last July, they told me. They had four very good saddle horses and two heavy ones that hauled my wagon. The wagon was a stout farm wagon nearly new, it had only been in use since last July, and we had it loaded up to the cover. It carried our camp outfit, tents, baggage, supplies—a big lot of them—and what forage we could find room for. We had not room for much of it, but until we had left the last settler behind us they bought more from time to time.

These men had been driving the wagon turn about, but wanted a boy to do the driving. I might have done that and nothing else had I felt inclined to shirk my work. These men would never order me to do anything. I was only a boy, but I did my full share of all that had to be done in camp. I was anxious to keep this job, these men were going now to the country I wanted to see so bad—a part of that Great American Desert. They had plenty of firearms, rifles and shotguns. All guns then were muzzle-loaders, of course, and they let me use these guns whenever I wanted them. I knew how to use them; I had been using guns ever since I was able to hold one up to my shoulder, and had owned a boy's shotgun for several years now; it was a cheap affair and about as safe as a section of gas pipe would be, but I did not know that then, and I kept it going, in season and out of season. We had no game wardens then, and I could kill rabbits in January or July, and it took all my pocket money for powder and caps. I dispensed with shot, using slugs instead, they cost me nothing but the labor of making them.

Each of the men of the party carried an old style Colt's dragoon pistol. They were heavy rough affairs, or would be now. They were all right then. There were two of these pistols in the wagon; they were extra. I got one of them and put it on a belt and it went wherever I did; I would not go 100 yards from camp without it. My carrying this pistol was one of the standing jokes in camp. The men were continually asking me what I meant to shoot with it, and I always said a bear. I was always looking for that bear, and at last I found him, or he found me; I have never been able to determine exactly which of us it was that found the other; all I know is it would have been better for the bear had we not found each other.

When we left St. Paul we traveled about southwest for a while, going only a short drive each day, then camping, and if we found a good camp for grass often stopping there several days. The party was not in a hurry to go anywhere and took good care of the horses.

We found settlers here for a while after leaving St. Paul, and when we did we would stock up with forage and any supplies we could get. We knew that farther west we would not have much chance to get any, the country there then had no settlers, though they were coming in now. We had been out some time and had got west of where Stillwater now is, when one morning we moved camp a few miles to a place where the men had been when out hunting the day before. We got into the new camp at about 10 o'clock, and made camp to remain a few days at least.

This camp was in a wide bottom that had a good crop of grass, and there was a small swamp that seemed to be fed by a spring up on the bank above us. The place had been used as a camp by Indians the summer before. Their wickiups, small brush lodges, stood here yet in every direction. I used them later on for fire wood.

Just behind camp was a low ridge that ran up and back

200 yards, and behind it was a rather high hill. The ridge was closely covered with bushes, and a narrow path led through them; it began just at camp and led to the spring; I thought the squaws had probably made it. So as soon as we had got our tents up I took a tin bucket and started to find the spring, the swamp water was not fit to use. I found the spring at the foot of this high hill, the path led to it as I had thought it would. I carried down several buckets of water while one of the men got our dinner ready.

In the evening after supper, when we were all seated around camp the men were telling about what each had seen to-day, they had hunted each one by himself. One said that he had run across bear tracks not far from camp, and judging by the size of the tracks the bear that made them must be as big as an ox. He meant to hunt up that bear in the morning; it had been too late to do it to-night after he had found the tracks, he said. These men were continually finding bear tracks, always somewhere near camp, then sending me out with a double-barreled shotgun to thrash around through bushes for an hour hunting bears while they stayed in camp and laughed at me, so I thought that this was only another bear for me to hunt to-morrow, and paid but little attention to the story.

I got up now to go and get a bucket of water before it had got to be any later; it was almost too late now, it was getting dark in among those bushes up on the hill. Strapping on my pistol I took the tin bucket and threw a tincup into it, when Mr. Remington, our leader, says: "You have water here, have you not, Johnny? I would not go after any more. Let it go until morning."

"I have more time now, sir. I had better get it now." "But it is getting late, and that bear may be up there." "If he is I will sicken him, sir. I want a bear."

"Now, see here, Johnny, this man who had seen the tracks told me if that bear is up there you let him go, he is my bear, I don't want him shot; I mean to hunt him myself to-morrow."

"Yes, sir; then if I see him I'll tell him so, and send him down here; then you can hunt him to-night."

After I had got part of the way up the path I found it to be so dark in here that I was more than half inclined to go back and wait until morning, but if I did the men would laugh at me, so I kept on.

I had got about two-thirds of the way up, and just ahead of me about thirty yards the path made a sharp turn to the left; the spring was about thirty yards more beyond the turn. Just now some animal came around this turn, I could see the bushes sway as he forced his way through them; this path had not been made wide enough for him. It was so dark near the ground that I could barely see him, but he looked to be as big as a horse.

The bear story flashed across my mind, and I let go of the bucket and it dropped on the rocks, the tincup in it making a terrible racket. The bear got on his hind legs and his head reached clear above the bushes. I could see it plainly against the sky. My first thought was to give a yell, then run, but I thought that if I did then the bear would just grab me and eat me up. I did not know as much about black bears then as I do now. Had I run he would not have followed me a foot; he was as badly scared as I was. He could not have been worse scared, though. Since then I have hunted bears and killed them, and hunted others and lost them, but never had one of them try to hunt me. The male will fight nothing unless he is cornered or thinks he is, for his size he is the most cowardly animal on the footstool. The female, if she has a cub following her, and she generally has, will often put up a fight; but I have met one that ran and left her cub the moment I fired at her. I took her cub alive, then hid myself and waited all forenoon for her to come looking for him. She did not come.

I did not run, but hauling out the old pistol raised my left arm in front of my face for a rest, as though I were firing at a target, then raising the hammer took steady aim at his head and fired, then fired again, and had just fired the third shot when the bear fell with a crash, tearing down the bushes as he struck them. I have him now, I thought, but kept on firing until my pistol was empty. By this time all the men were up here.

"What are you firing at?" Mr. Remington asked me. "At a bear, I think, sir. Whatever it is it is lying up there in the path; I killed it."

They could not see it now, nor could I, and I knew where to look for it, but the bushes were down there, the bear had not got away. Drawing his pistol, Remington walked up there, then called out, "Yes, it is a bear, and the largest one this side of sunset, too."

The other men who still stood here began to laugh; they thought I had been firing at a bush, of course, and that Remington was keeping up the joke.

"Come up here, you fellows," he told them, "and see if you can find anything to laugh at here."

We all went up now. The bear was lying across the path, his head and shoulders on top of the bushes he had broken down when he fell, while his hindquarters were shoved in among the bushes on the other side of the path. He may not have been the largest one in this country, but I have seen quite a number since then and never have seen one that was much more than half his size.

They dragged him around so as to get him into the path, or as much of him in it as the path would hold. He still lay on top of the bushes on either side. Then, after we had examined him I went and got my bucket to go after the water. When I came up to them again Mr. Remington asked me if my pistol was empty.

"Yes, sir," I told him, "I gave him the whole six while I happened to think of it."

He handed his pistol to me, taking mine and saying: "Carry mine until I get time to load yours."

I remained with these men until late the following summer, but never after this heard any funny remarks about carrying a pistol, nor was I ever sent out again to hunt imaginary bears with a shotgun, loaded with No. 8 shot probably. I had found my bear now and killed him.

After I came back from the spring, we went down and moved some of the horses that were staked out nearest the fire further back, so that they would not see the bear when we brought him down. Then we got the bear down, and it took the whole five of us nearly an hour to do it. Then while I kept dragging in brush from the wickiups and piling it on the fire to make a light, the

men got the skin off, and I had a chance to see where I had hit him. One of my shots, the first one, I think, had taken him just below the left ear and had passed out at the top of his head. Another had gone in at his breast and missing his heart by less than an inch had buried itself in his backbone, going nearly through it. The other four shots were all misses, they had all been fired after he fell, as he was falling when I fired the third shot.

I had heard of the ability of these bears to carry away half a ton of lead; this one had got about two ounces then lay down with them. He was very fat, and I thought from his size that he must be very old; but Mr. Remington said that he was not over four years old, and he knew, as he was a surgeon by profession. When the skin was off Mr. Remington asked me what I meant to do with it.

"You can have it," I told him. "I don't want it." They all wanted it now.

"We will settle this," Remington said. "I'll sell it, and the highest bidder takes it; the boy takes the money. But remember, gentlemen, that whoever does get it is going to pay about all that the skin is worth for it. I want the boy to get paid for his bear. Start it up now."

They started it at \$5 and ran it up by bids of \$1 and \$2 to \$45, only three of them bidding on it so far, Mr. Remington had not bid at all yet, then they stopped. "Well, go on," he told them.

No, they were waiting to hear from him now, they said. "Fifty for me then. Go on now." No, he could have it, they were through.

I heard them say afterward that they might have sat and bid there all night, he would have had the skin in the morning. He offered me the money now.

"No, sir," I told him, "keep it for me. I don't want it until we go home."

This Mr. Remington was the oldest man in the party, though he was only twenty-six, none of the rest were over twenty-two. He and they had all been through college and he had studied medicine since and was a good surgeon, and a geologist. He taught me nearly all I know about our rocks and their age. He and the others would sit for hours around the fire at night talking about the early races in this country, the mounds and their builders, where our present Indians had come from, these mountains and valleys here, how and when they had been formed, and about our planets and whether or not they were inhabited. Remington claimed that most if not all of them were inhabited, and his arguments went far to convince me that they are. I could understand most subjects that they argued about, I had read about them myself. Remington had got up this expedition himself, the others were his guests; but when we came to stock up from time to time, they always insisted on paying their share.

We stretched the hide next morning and a few hours afterward a small party of Sioux, three families, came along, and finding us in camp, went into camp themselves close by. We gave them some flour, cornmeal, coffee and sugar, and the squaws, taking the hide, tanned it, and I afterward saw Mr. Remington refuse \$100 for it on our way home. It was not worth it, though. He probably paid me more in the first place than it really was worth; but he wanted it and could afford to keep it.

We tried cooking bear steaks, but I did not like them and never have been able since to cook bear meat to suit me. The men did not care for it, so I let the squaws have it, and the Indians soon got rid of it all.

CABIA BLANCO.

*Note to the Editor.*—The Gatling gun that I lugged around with me on this expedition I had always supposed to be a Colt's "Texas Ranger," but when I was stringing the rough notes for this story together, a man who claimed to be posted on dates, told me that I was away off, that Colt had not invented his pistol then. As I did not want to kill a bear with a pistol that had not been invented yet, and make a fool of myself at the same time, I wrote to the Army and Navy Journal to find out and was told that the first Colt pistol called the "Texas model" had been put on the market in 1838. That settles that. I shot him with a Colt after all. Mine was not as neat as some of Colt's productions that I have since carried, but it was no doubt an improvement on their model of 1838; that model had seen daylight just a year ahead of me, and Colonel Colt had not been asleep since then I suppose. I had had an intimate acquaintance with Allen's "pepper box," and had just missed shooting myself by about half an inch with one of them a year before I formed part of this expedition, but I had never had a Colt's before this.—C. B.

[The conclusion of the hunt will be told next week.]

## Selling Adirondack State Lands.

*Editor Forest and Stream:*

The administration of the Adirondack forest lands has always been sufficiently amazing, as anyone knows who read the newspapers during the time when Middleton was being turned out of the Forest Commission of New York. People read without surprise, but with much indignation, about the way in which Adirondack State lands were being skimmed by thieves in the pulp and lumber business. That the State allowed the thieves to keep the pulp after 20 or 30 cents per cord had been collected in "fines." Now the State is going to charge \$2 per cord, apparently, for that is what the State is suing for. The fact that pulp wood is worth \$4 a cord, and that no punitive fine is collected, as a rule, is interesting to the casual reader.

But while we all knew that timber was being stolen, and that a man who tried to stop it was "marked" by the rascals, it was supposed that the land itself wouldn't be stolen, for the State Constitution forbids that. It was believed to forbid the sale of State forest lands also; but these things seem to have been charming fancies for the pleasure of those who may die before they are enlightened as to the real facts of the case.

Above Northwood, Herkimer county, is the old Hatter place, one that is famous among backwoodsmen of that locality because of ruffed grouse in the hardwood growth on the hillside, and because of the woodcock in the alder beds on the flats. Ducks are killed every year in the coves, or bayous, on part of it, and a runway through the open lot is passed by deer several times a week.

A good interesting piece of land is this old Hatter

place. Half of the lot belonged to the State. For many years it was called the "State lot"—fifteen or twenty years that I know of. For the ones who wish to know just where this State land is, according to the map, it may be said that it is described in the "List of Lands in the Forest Preserve, 1901," published by the Forest, Fish and Game Commission of New York, as follows:

"Herkimer County, Town of Ohio, Remsenburg Patent, Lot 79. Sub. 3, per map of Stephen Smith 2d, in partition suit of Mary Shearn vs. Nicholas McIntosh. Mortgage, 100 acres."

The Adirondack map, published by the Forest Commission in 1902, shows this bit of land printed in red ink, denoting that it is State land.

A year ago, I was told at Northwood, that the wood alcohol man there was "going to buy that land." I said I didn't think it was possible, because the State Constitution amendment forbids the sale of State lands to individuals or corporations.

"Well, you know what money will do in politics," was the pessimistic answer.

This year, through the kindness of Secretary Whish, of the Forest Commission, I received the new State map of the State lands in the Adirondack region. I recalled the conversation with the Northwood woodsman, and on looking at the lot No. 79 I found that it was not red in the eastern half of the land, which had been State property so long.

The boast of the man looking for hardwood to ram into the retorts seemed to have come only too true. However, I had hopes that perhaps it was a typographical error, and wrote forthwith to Secretary Whish, of the Forest Commission, asking "How about it?"

Secretary Whish, who is always glad to answer questions, especially when they relate to the Adirondacks or Catskills, wrote back immediately:

"He (Superintendent Fox, of the Forests) says in reference to the old Hatter place, Lot 79, Remsenburg Patent, that the State Land Board sold it to the Finch Chemical Company without consulting the Commission. In former reports, he says, he had protested against such acts but without apparent success."

Evidently the State Land Board has committed the outrage against which protested hundred of thousands of voters who put in the Constitution an amendment for-

bidding the sale of land in the forest preserve. Here is a case where State lands are alleged to have been sold to a private corporation, those lands being a part of the Forest Preserve for the integrity and maintenance of which public sentiment is overwhelmingly favorable.

People wanted the forest lands reserved to maintain the water supply, to preserve the game, and, most of all, to keep it open for the public health and pleasure. And yet, right here is a case where forest land, with hardwood upon it, was sold to a company engaged in making wood alcohol and charcoal, the most destructive thing to forest lands, next to fire and the water overflow.

Then I compared the map of 1902 with the map of 1905. I was prepared to find land which was once "red" State land, but which now seems to have slipped through the fingers of the State Land Board into "white" or private ground. Anyone can compare the two maps if he wishes. There are many places where State land appears to have become private. I will point out one more of them only. It is up to the State authorities to explain how it is that this thing is so, and it is up to the societies which have the best interests of the State at heart to put their lawyers on the trail of the men who have State land in their possession, by virtue of their office, or otherwise.

No lake in the Adirondacks is more famous than Ampersand Pond. It has been frequently described by men of lesser strength who fished in it. But the best writers about the Adirondacks have told of it, and its beauties are told of in classic tales of the mountains. If any lake in the Adirondacks should be left open to the public this one ought to be.

It is in the town of Harrietston, Franklin county, and is located in the extreme north end of township 27. According to the map of 1902 the northeast quarter of township 27 belongs to the State. There is a little block of land in the northwest corner of the township, also State land. Part of the land around Ampersand Pond is "white," or private. But the south and southwest and west sides of the lake border on "red," or State lands. Due south from the lake is a large, roughly triangular piece of State land, bounded by the meanderings of the mid-stream of Ward's Brook. This triangular piece of land joined the northeast fourth of the township, which is all State land.

The map of 1905 shows a beautiful piece of work of

the surveying kind—if the map is any criterion. All the triangle of State land has become "white"—private ground. The block of land to the southwest and west of Ampersand Pond has been shoved due west against Township 26. White Lily Pond (the other "Ampersand Pond") has been shoved down from the State land of Township 24. By this neat little bit of business Ampersand Pond becomes a body of water completely surrounded by "white" land. That is to say, it is now a fact, according to the reckonings of common people, that Ampersand and White Lily Pond are "preserved" from the public.

If any act of the State Land Board, or whatever board is responsible for this change in the map, should be investigated, this one should be. It looks to me as though the most noted of Adirondack ponds had been juggled out of the hands of the people into those of some private outfit.

It is probable that excuses of various sorts will be offered for the changes. In looking up the description of the Ampersand Pond lands one finds that the map of 1902 was evidently wrong as regards the exact location of the land. Nevertheless the description of the land as it appears in the "List of Lands in the Forest Preserve" states distinctly that State land is bounded on one side by "Ampersand Pond or lake."

"Col. W. F. Fox says he has protested against such acts in former reports." For time out of mind Colonel Fox has been trying to get things so fixed that "judicious lumbering" could be carried out on State lands. Efforts have also been made to have things so fixed that State lands could be exchanged for private lands elsewhere. Evidently things have been so fixed that the best parts of the Adirondacks can be reverted to the ownership of private individuals or corporations, while Colonel Fox genially and gently "protests in his reports." The only reports of Colonel Fox that I have ever seen were beautiful things said about the Adirondack lumber industry, and signs posted conspicuously on stumps saying "Look Out For Fire."

It is perfectly evident that people who care to have the Adirondacks preserved for public health and public profit and public pleasure have something else to look out for besides "Fire."

RAYMOND S. SPEARS.

LITTLE FALLS, N. Y., Aug. 24.

## NATURAL HISTORY

### Bears of New York City.

SINCE those ancient days when the youthful David, guarding his father's flocks, slew a lion and a bear, and that other occasion when forty and two of the juvenile children of Beth-el were torn by two she bears at the request of the choleric, but no doubt kindly natured, Prophet Elijah, bears have always had a very great interest for children, whether of lesser or of larger growth.

It would hardly be supposed that bears, big, ferocious and numerous, are to be found in New York city, mixed up with a population of Americans, Europeans, Africans and Asians, gathered from the four quarters of the globe, but that is the fact. Here in New York we have what is perhaps the largest collection of living bears in the whole world, and certainly the best shown collection. This is found at the park of the New York Zoological Society in the Bronx, where are now to be seen no less than thirteen species, comprising thirty-six individuals.

Bears are found all over the world, south as well as north, though they do not seem to be abundant in the tropics. The writers of classical antiquity mention bears from Africa, Herodotus speaking of Libyan bears, and Pliny of those of Numidia. However, up to the present time no bear is known from Africa, although in the mountains of Abyssinia there is an unidentified animal which may belong to this family. Nor are there any bears in Australia, that land of queer mammals, where, to be sure, we should not expect to find them. However, in Asia, Europe, and North America, bears are common enough. They are found also in South America among the high mountains of Chili, as well as in the great island of Borneo.

The biggest bear that we know of is one of the great brown bears found in Alaska. He is said to be the largest carnivorous mammal in the world. The polar bear, confined of course to arctic regions, makes a very good second. He is truly carnivorous and is much longer, slimmer and generally more adapted for life in the water than his heavier relatives of Alaska which live on a mixed diet of vegetables and fish. The tiniest bear in the world is the Malayan sun bear, which is short-haired and stands hardly taller than a big fox terrier. It has, however, a big, strong head, and feet armed with claws, which, for the size of the animal, are enormous, and one might easily imagine that it would make a very unpleasant antagonist for an unarmed man.

Though of course the bears are carnivores, they are obviously very different from dogs and cats. While the dogs and cats walk on their toes, the bear plants the whole sole of the foot on the ground. This seems to give him a clumsy motion, but it must not be thought from that that he is not swift of foot. On the contrary, many a man has learned that his saddle horse in which he took considerable pride was not swift enough to overtake a bear, and some, to their sorrow, have learned that their horses were not swift enough to get away from a bear.

If the feet and methods of locomotion of the bear are unlike those of the dog and the cat, so also are his teeth. While the dental formula of the bear is the same that it is in the dog, there is a great difference in the character of the teeth; this is especially true of the molars, which in the dogs and cats are adapted for the division of flesh; that is to say, certain of the molars possess sharp cutting edges, which passing by the similar cutting edges of the molars in the other jaw, divide the food, which is

flesh. In the bears, on the other hand, the same teeth are much more flat, broader and adapted for crushing rather than for cutting food. Moreover, the lower jaw of the bear is articulated to its skull in such a manner as to permit of a sidewise motion adapted to the grinding up of food. This is hardly needed in the true carnivores, who require only to tear their food into fragments small enough to be swallowed and then bolt it.

The bear is of course a vegetarian. He eats roots, berries, fruit, grass, insects and such small creatures as he can catch or dig out of their burrows—chiefly mice, ground squirrels and perhaps woodchucks. Rarely he kills the larger animals, but it must be only rarely.

The polar bear, however, is an exception to this rule. It lives in a country where roots and berries are scarce, and during by far the greater portion of the year it must depend for subsistence on the animals which it kills.

The mental characteristics of the bear are always interesting. In its wild state it is characterized by extreme keenness of hearing and smell, and by extraordinary alertness and caution. Twenty-five or thirty years ago the bear still retained the impression that he was the monarch of the American woods or fields. He was then often found in the open at various times during the day, busy about his ordinary avocations. But since that time constant pursuit has made the animal so extraordinarily cautious, that it rarely ventures out during the daylight, except in districts most remote and where it has not been at all hunted.

In captivity the bear is easily tamed, and usually affectionate. It is ready in learning tricks, but, like all wild animals, it may be subject to panic frights, during which it may possibly use its great strength to the injury of the human being who has to do with it. Nevertheless cases of this kind occur very rarely, and while a bear is hardly to be recommended as a pet, there is nevertheless much pleasure got out of the occupation of watching and studying one.

As might be supposed, the Zoological Society's collection is rich in American bears, no less than sixteen of the specimens being natives of this continent. There are two specimens of the Kadiak bear, supposed to be *U. middendorffi*; one Peninsular bear (*U. merriami*), from the Alaska Peninsula; four grizzly bears from Colorado, southern Alaska, Wyoming and Mexico, and nine bears of the black bear type, representing New York, Pennsylvania, Virginia, Florida, Ontario, Canada, Wisconsin, Mexico, Colorado and Wyoming. Besides these, are two splendid polar bears, which although from Nova Zembla, may fairly be called American, since the species is found throughout the Arctic of the old world and the new.

From the old world there are eight species, represented by eighteen individuals. Of these, two Syrian bears from Asiatic Turkey represent the bears of Scripture already referred to. This species is still found in the mountains of Palestine, and though not now very numerous, is still held in high respect there. In the time of the Crusades, bears were numerous in Palestine, and as they were never interfered with, were very bold. They are said to have frequently killed human beings for food, and there is a record of one which, while trying to carry off a woodcutter during the time of the siege of Antioch, seriously wounded Geoffrey of Bouillon, who went to the woodcutter's defense.

The brown bear of Europe is another well-known old world form, represented here by two specimens. It is

widely distributed over northern Europe and Asia, but of course has been exterminated in many localities. In the time of the Romans it was still found in Britain, whence it was taken to Rome for the sports of the amphitheater. In northern Europe it is still hunted and a considerable number are killed each year. There are many shooting territories still for rent in central and northern Europe where bears may be had—in some cases to the number of fifteen or twenty in a season. This is the form of bear commonly taken about over the country by wandering Italians. The bears are said to be easily tamed, but now and then they turn upon the keeper and do some damage.

Far less well known are certain species from the further East, such as the hairy-eared bear (*U. piscator*) from northwestern Mongolia, the Himalayan black bear (*U. torquatus*) from Japan, the Japanese bear (*U. japonicus*) from Japan, the Yezo bear (*U. ferax*) from Yezo, Japan, and the sloth bear (*U. labiatus*) from India. This is a species of the far East, and one of its names is given on account of the large and well-haired ears. On account of its pale color, which is light brown, fawn or nearly white, it is sometimes called the Isabella bear.

The Himalayan bear is a curious and handsome species. It is a small animal, and has very long hair on the side of the jaw and neck—giving the effect of a ruff about the neck—very large ears and a chin which is white. The range of the species until within the past few years has been considered somewhat southern, ranging north from eastern Persia, but it has lately been found in northern Japan.

The Japanese bear is a very small animal, being not much larger than the sun bear. It is shy, timid and generally carries the impression of being greatly abused and injured.

Far better known than any of these is the sloth bear of India, which has long been hunted by the shikarees of that country, and which is often tamed and led about by strolling jugglers. It is a very mild and gentle animal, readily becomes attached to its master, and learns to perform some tricks. The sloth bear is black in color, with very long shaggy hair, but on the breast and on the face there is some more or less clear white. It has very long hooked claws and no incisor teeth. These teeth are lost at a very early age, and all trace of them disappears. For this reason the zoological position of the sloth bears was for a time uncertain, and some naturalists even called it a sloth.

Perhaps the most curious and quaint among all the bears is the sun bear, called in parts of India *bruang*. Its appearance it is so grotesque as to be really attractive, and when tamed it becomes a very capital pet. In his great work on the "Mammals of India" Dr. Jerdon says: "The sun bear is generally found at a considerable elevation, 9,000 to 12,000 feet and often close to the snow; but in winter it descends to 5,000, and even lower sometimes. It lives chiefly on fruits and roots, apricots, walnuts, apples, currants, etc., also on several grains, barley, Indian corn, buckwheat, etc.; and in winter chiefly on various acorns, climbing the oak trees and breaking down the branches. They are very fond of honey. Now and then they will kill sheep, goats, etc., thus occasionally eating flesh. This bear has bad eyesight, but great power of smell, and if approached from windward is sure to take alarm. A wounded bear will sometimes show fight, but in general it tries to escape. It is said sometimes to roll itself into the form of a ball, and then roll down

teep hills if frightened or wounded. If met suddenly where there is no means of escape it will attack man at once; and, curious to say, it always makes for the face, sometimes taking off most of the hairy scalp and frightfully disfiguring the unfortunate sufferer. There are few villages in the interior where one or more individuals thus mutilated are not to be met with.

"The bruang has a smallish head and a short neck, which is very strong, enabling it to tear up the great plantains. It is also destructive to the coconut groves. As this nut and the banana constitute so largely the subsistence of the natives, the animal is regarded as a pest. When tamed it shows so much affection and has so many idiosyncrasies as to make it an amusing and prized pet. Even when a caged captive it is in constant motion, and this is not the painfully monotonous, automatic movement of the white bear, so indicative of a sense of deprived freedom, or the mild melancholy of the captive honey bear, but it is an activity which seems the irrepressible outcome of a brimfulness of life. Although in many of its aspects this restlessness is ludicrous, it is really amiable animal gush. At any rate, it makes the bruang a star card in the menagerie. It will walk upon its hind legs as if for a constitutional that meant business, when most unexpectedly the promenade is arrested, and, still standing on its hind legs, the flexible body goes into a series of indescribable contortions. Putting the head on the floor, and tilting the tailless end in the air, it goes over and comes down in a heap, thus achieving a somersault to a degree clumsy and ludicrous. Then comes a pause, as if for the moment it had exhausted its talent in the line of ursine gymnastics. Now, unconsciously, as some humans do, it turns buffoon. Mounted on its hindlegs, swaying its pliant body as if it were a billow of sarcoid, gesticulating with its forelimbs, protruding its long tongue to an inordinate extent, then fetching it in with a jerk and a clucking sound—this clownish role is a source of merriment to the spectators. Perhaps this good temper it is that makes the bruang more entertaining than the honey bear, albeit the inimitable facial pranks of the latter.

"If 'my Lord Mayor's fool' was accounted a wise man by the epicures because 'he knew what was good,' then was Sir Stamford Raffles' tame bruang well endowed with worldly wisdom. Though a patron of learning, the founder and first president of the Zoological Society and a famous author, yet Sir Stamford is more widely known by his graphic story of his tame Malayan bear, which, notwithstanding its being often cited, it would be culpable in us to pass by. At any rate, a brief extract must be given. Says the Knight: 'He was brought up in the nursery with the children, and, when admitted to my table, as was frequently the case, gave proof of his taste by refusing to eat any fruit but mangosteens, or to drink any wine but champagne. The only time I ever knew him to be out of humor was on an occasion when no champagne was forthcoming. He was naturally of an affectionate disposition, and it was never found necessary to chain or chastise him. It was usual for this bear, the cat, the dog, and a small Blue Mountain bird, or lory, of New Holland, to mess together and eat out of the same dish. His favorite play-fellow was the dog, whose teasing and worrying were always borne and returned with the utmost good humor and playfulness. As he grew up he became a very powerful animal, and in his rambles in the garden he would lay hold of the largest plantains, the stems of which he could scarcely embrace, and tear them up by the roots.'

Much more interesting to us than any of these foreign bears are those of our own country of which there are a good many. Time was—and it is not so very long ago—when it was believed that outside of the polar bear there were only two bears in North America, the black—with its color phase of brown, usually called cinnamon bear—and the grizzly, which ranged from the Missouri River across the great plains to the shores of the Pacific. Within a few years all this has been changed. We are told that there are several species of black bears, as many of grizzly bears, and we know now, as we did not then, much about the great brown bears of Alaska, and a little about the queer glacier bear, and have a few specimens of a new bear described by Mr. Hornaday called Kermode's bear. This is a white bear of very small size, and has been spoken of as a possible albino of the black bear; but it would seem that too many specimens have been taken to make this possible, for albinos are not common. This species—if it be one—appears to be confined to the coasts and islands of northern British Columbia. It was described in the last Annual Report of the New York Zoological Society.

The range of the different forms of black bear is greater than that of any of our American bears. They are found all through the United States, and well up into Canada on both slopes of the continent. To the primitive Indian this was a considerable source of food, and its grease was highly esteemed. In autumn, winter and very early spring, bear hunting was an occupation to which the Indians greatly devoted themselves; yet, although the Indians believed that the bear possessed some secret power, and though they made every effort to secure them, after killing one, they always performed some form of sacrifice and addressed the bear, explaining why they had killed it, offered the pipe to it so that it might smoke, and finally put up the skull on a pole above the earth so that it might not be dragged about or treated disrespectfully by other animals.

The black bear—if we may say so—is sometimes brown, and when brown it is called the cinnamon bear. This was formerly regarded as a species distinct from the black bear, and it is possible that there may be a brown bear of the black bear type which is a good species. On the other hand, it is well known that in litters of bear cubs there are sometimes two colors, black and brown. Again, it is known that the brown or cinnamon form is much more abundant in certain parts of the country than others, and that there are certain regions where it is never found.

If the black bear has been the longest known of the American bears it is certain that the grizzly has been the most feared. It is much the largest and strongest of the carnivorous animals found in the United States, and we may imagine that in primitive times it was rarely interfered with by the Indians. Their rude stone-headed arrows could hardly reach the vitals of a grizzly bear, even though shot by the strongest Bowman, for the inch or two of loose hair, the thick hide backed by a layer of

fat and this again by tough muscle and bone, would tend to protect the heart and lungs of the animal so that every chance would be against the man who attacked it. It can hardly be doubted that a long and inherited experience of seeing all living creatures run away from him had taught the grizzly of the plains that he was invincible and had given him a tremendous courage; and so when the first white men went out on to the plains and met this beast which had always been the ruler of the country he ranged in, they found an animal not in the least afraid of them and quite disposed to attack them without waiting to be interfered with. The early accounts of the grizzly bear come as we all know from the writings of Lewis and Clark, who called them "white bears" and sometimes "gray bears," and for many years after their journey trappers passing over the plains found these white bears not at all disposed to get out of their way, but on the contrary, entirely ready to take the aggressive. Moreover, their numbers were something quite astonishing, for food was abundant, they had no enemies.

All the early books tell of the numbers and boldness of these bears. Pattie, writing of the year 1820 or thereabouts, tells how when traveling through the buffalo range on the upper waters of the Arkansas in what would now be perhaps western Kansas or eastern Colorado, he counted 150 white bears in one day. On another occasion, while he was standing guard at night, he heard a disturbance among the picketed horses, and after a little while discovered that a bear had come into the herd and was eating up a horse. He shot it, and his comrades ran out to learn the cause of the disturbance, and when the bear saw them it charged upon them, caught one man and tore him so that he died a few days later. This is all of the plains.

Grizzly Adams and Mr. Allen Kelly have told us something about the size and ferocity of the California grizzly, a beast, however, which the vaqueros of California armed with a rope used to handle without much danger or difficulty. Pattie describes the way in which they used to be captured in his day, and tells also of the fights that the Californians used to arrange between bulls and bears, the two animals being tied together by a rope. The victory did not always come to the bear. This mention of bull fights reminds us of a tale related by a Blackfoot Indian and published some years ago in the book, "American Big Game Hunting," of a battle between a grizzly bear and a young buffalo bull. In this case the bear was killed by the bull. The tale was related by an eye-witness.

Bears of the grizzly type are found—or used to be—from the southern United States all along the mountains through northern Alaska. Just how big they grow we none of us know, but it cannot be doubted that their weight has been greatly overestimated. We have heard people talk about 1,000-pound grizzly bears, but it may be gravely doubted if they ever grow so large. The enormous bear captured in the Yellowstone Park for the National Zoological Park at Washington weighed, if we recollect aright, when captured and very fat, 768 pounds.

Of the habits and of the hunting of the great brown bears of Alaska we have been told much by a few men who have devoted months and years to hunting in Alaska. Perhaps the best accounts of the bear in Kadiak Island and on the Alaska Peninsula are those by Messrs. W. Lord Smith and James H. Kidder, published in the volume, "American Big Game in Its Haunts." Of these brown bears there are supposed to be six species, all of large size, all brown in color, and all of them fish-eating bears. Formerly very abundant, they seem now to be growing much less numerous, and we are told that the Kadiak bear, which of all of them had the greatest reputation for size, is verging toward extinction. Within the past year or two herds of sheep have been introduced on Kadiak Island, and the bears and the sheep do not appear to get along well together. The result of this will certainly be that the bears, although at present protected by law, will shortly be exterminated. Of these brown bears two may be seen in the Zoological Garden. They are now six years old and were captured in the Copper River district of Alaska in 1899, and then weighed about eight pounds each. In November of the same year they weighed about ninety pounds each, and now, at the age of six years, are ponderous specimens. The coat is long and shaggy, they stand high at the shoulders, have short muzzles and wide heads. One of the animals which has now entirely shed its coat is very dark brown; the other, not yet shed, is reddish in color. Just which species these bears belong to is uncertain. Possibly they are the Kadiak bear or perhaps one of the other forms. There is no way of determining that except by looking at their skulls, and those we cannot at present get at.

Nowhere in the world are to be found such splendid bear dens as those in the Zoological Society's park. They are of great size; in each one there is room enough for half a dozen bears without any crowding. They are built partly on a high ledge of rock, in which the sleeping apartments have been excavated; each one is provided with a swimming pool, and in each one the bars—the fence which confines the bears—are set in the midst of a stone wall wide enough for the bears to walk on. They are open on all four sides. All this means that the bears have an opportunity to climb and wander about over a considerable area, that they can see their neighbors and the public, and that in hot weather they can go in swimming. It would be hard to imagine animals in confinement more cheerful and good natured than these. They are constantly playing, chasing each other and sparring; they are provided with playthings, and, on the whole, are busy and so happy.

Very different is the condition of the bears in many of the gardens of Europe. They are confined in dens which have solid walls either on all sides forming pits, or at least on three sides, so that the animals can look out only at the public in front of them. The floors are likely to be wet, and the whole inclosures damp. They get little or no sunlight, have nothing to interest them, and for these reasons they are subject to a variety of diseases not found here, and are unhappy and cross. America may fairly congratulate herself on being, in the matter of bear dens, as in so many other matters, far in advance over the old world.

A part of the good condition of the Zoological Society's bears is undoubtedly due to the way in which they are fed. Twice a week they receive meat and fish, but the bulk of their diet consists of bread and of green vege-

tables. Among the latter are green corn, tomatoes, squash and apples, with no doubt occasionally other vegetables. The bears seem to be most fond of the bread, and pounce on that at once, tearing out the soft inner portion of the loaf and greedily devouring it. Some of them at once run with the loaf to the water and dip the bread in it to soften it. The food of the polar bears is chiefly fish and meat, though they, too, get some bread and vegetables, but they naturally are most eager for the animal food.

It is amusing to note the excitement that prevails in the bear dens at the approach of the keepers pushing the cart of food. The largest and most dignified bears merely stand up and look; those less in size run races about the dens, while the little tiny bears lift up their voices and yell with anguish, because the food is not at that moment before them.

## The Natural Enemies of Birds.

BY EDWARD HOWE FORBUSH.

From the "Special Report on the Decrease of Certain Birds, and its Causes, with Suggestions for Bird Protection," in the Fifty-second Annual Report of the Massachusetts State Board of Agriculture.

IN the opinion of many correspondents, the natural enemies of birds do no appreciable injury, while others consider them the chief cause of the decrease of birds. It is noticeable that some sportsmen and gunners complain particularly of hawks, foxes, crows, skunks and weasels. At first sight it might seem that those most responsible for the decrease of birds were trying to shift the blame; but we must remember that those who are most in the woods with the birds are most likely to observe their destruction by their natural enemies.

Under normal conditions, the natural enemies of birds are also their friends. There is no better proof of this than the statements made by the early settlers at a time when game birds were here in great abundance. Eagles and hawks were then far more numerous than they are now. Evidently they produced no appreciable effect on the numbers of game birds.

Hawks which feed on birds will overtake the crippled, sickly, least active or most conspicuous birds. This results in a survival of the wariest, strongest, most active and least conspicuous individuals—in a word, the fittest. It prevents the spread of disease and the propagation of weakness and unfitness; it preserves the race. This is true to a much less extent of the effect of shooting, for a charge of shot will overtake the strongest as well as the weakest—the fit as well as the unfit. Hawks, owls, foxes and other so-called enemies of birds also protect birds in another way. The horned owl, no doubt, now and then kills a grouse; but it also kills the skunk and crow, which destroy the grouse eggs or young. Hawks may kill game birds as well as other birds; but they also kill squirrels, crows, jays and weasels, the enemies of these birds. All this may be true of the hunter also; but hawks, owls, foxes and weasels kill, in addition, field-mice, deer-mice and shrews, all of which might otherwise increase unduly, and become very destructive to eggs and young birds. No one knows how often the nests of birds are broken up by deer-mice. They climb trees like squirrels, nest in hollow trees, and may be as great a danger to birds as is the dormouse of Europe.

Shrews are notorious flesh-eaters, and possibly may be very destructive to ground-nesting birds; while held-mice, when pushed for food, are among the most destructive rodents known. These creatures probably feed mainly at night; their habits are not well known. They can be held in check by natural means only, hence we must beware of destroying the animals that feed on them. Acknowledging, as we must, that under natural conditions the natural enemies of birds are useful, there is no doubt that under the artificial conditions produced by man some of them may at times need artificial check. Under natural conditions the crow is certainly a valuable force in nature; but when we have destroyed the raccoons, the larger hawks, owls and eagles—the only creatures besides man, perhaps, which serve to hold the crow in check—then we must also check the increase of the crow, or, wanting sufficient food, it will become very destructive to grain, fruit, fowls and smaller birds. In like manner we have destroyed the wolves, which formerly kept the fox in check; we must, then, check the fox, lest it, increasing, attack our fowls and the game and insectivorous birds. For this reason, it is well that the fox and crow are not protected by law.

Partly because of the fact that the natural enemies of birds may sometimes need an artificial check, and partly because the injury done by them is often much magnified, it seems best to publish some evidence of their comparative harmfulness, under the conditions now prevailing in this Commonwealth.

The natural enemies of birds, noted as harmful by the observers who have contributed to this portion of the report, may be arranged in the following order, with reference to the number reported each: Cats, eighty-two reports; foxes, fifty-eight; crows, fifty-four; English sparrows, thirty-nine; hawks, thirty-four; jays, twenty-six; owls, twenty-two; the elements, twenty-one; weasels, seventeen; skunks, six; snakes, three; pheasants, three; minks, three; orioles, three; chipmunks, two; raccons, one.

### Cats and Dogs.

The destructiveness of the cat is noted not only by the greatest number of observers, but, with remarkable unanimity, nearly all who report on the natural enemies of birds place the cat first among destructive animals. The domestic cat, then, introduced, fed, pampered and petted by man, leads the list, and sometimes leads even the sportsman in number of birds killed per day.

Mr. Brewster tells of a day's hunt by four sportsmen with their dogs, in which they killed but one game bird, a Bob White. On their return at night to the farm house where they were staying, they found that the old cat had beaten their score, having brought in, during the day, two Bob Whites and one grouse.

Reports of the cat's destructiveness come from every county in the State. Cats in good hunting grounds will average at least fifty birds each per year. I have recorded heretofore the destruction of all the young birds

\*This subject was quite fully treated in my last special report, and will not be further noticed here.

in six nests and two of the parent birds by one cat in a day. Cats kill for the sake of killing, and destroy more birds than they can eat. They take a savage pleasure in playing with their prey, and torturing it in the most cruel manner. Cats are also more destructive than other animals, because so much more abundant.

A friend who was raising pheasants was obliged to kill over 200 cats in a few years. Game birds suffer much from the cat, but the smaller birds suffer more. Cats are far more destructive to birds than the fox, for they climb trees and take the young out of the nests. They easily catch young birds which are just learning to fly. They frequently catch the adult birds upon the ground when they are feeding, or when they are drinking or bathing. The most harmful characteristic of the cat is its tendency to revert to a wild state.

If a dog loses its master and cannot find its home it seeks to form the acquaintance of a new master; but the cat is quite as likely to take to the woods and run wild. It then becomes a terror to all living things which it can master. Whoever turns out or abandons a cat or a kitten in the country has much to answer for. Proofs of the destructiveness of cats are not wanting. They were introduced on Sable Island, off the coast of Nova Scotia, about 1880. They ran wild, and, multiplying rapidly, exterminated the rabbits which had been in possession of the island for half a century.\*\*

On Aldabra Island, about 200 miles northwest of Madagascar, cats are common. They have decimated the birds, having exterminated a flightless rail, an interesting bird peculiar to this group of islands. Cats are also numerous on Glorioso Island, and, as a consequence, the birds on this island are even less common than on Aldabra.†

Dogs destroy comparatively few birds, but some dogs will eat every egg they can find. Some dogs catch and kill young and even adult game birds. Dogs, like cats, kill other animals for sport. They are not nearly so expert at catching birds as cats, but they chase and molest birds even where they cannot catch them.

### Robin, Sparrow and Worm.

SAYRE, Pa., Aug. 25.—One of the pleasant incidents connected with a recent brief outing at Ithaca consisted of observing, just at nightfall, a congregation of robins, old and young, upon a close-mown lawn. I counted thirty-five robins with a considerable number of English sparrows keeping them company. The robins hopped joyously about the weedy sward, stopping every two or three hops and tilting their heads comically to a listening attitude, which, upon the development of certain "ground signs," apparent only to their trained perceptions, was instantly followed by a hard thrust of the beak into the soil, then a lusty upward pull, with a wriggling worm of substantial girth and length as a customary reward.

Meanwhile, the marauding sparrows were not inactive, and at every least opportunity the sturdy Britishers would grapple with the loose end of the captive worms and put up the hardest sort of a struggle for possession. As a result of their bulldog tenacity and impudent combativeness, and a strength that appeared enormously out of proportion to their size, these natives of Johnnie Bull's fog-wrapped isle were more often than not equal partakers with the redbreasts of the delectable morsels. My hostess informed me that the robins visit the lawn nightly, often in companies of fifty, and nearly always accompanied by a following of sparrows fighting for a share of the evening meal.

### Eyes That Shine in the Dark.

MEDLIN, N. C., Aug. 5.—Editor *Forest and Stream*: About six years ago I wrote to you, in jest, a little comment on the old hunter's saying that there are only two large mammals whose eyes will not shine by reflected light, namely, man and hog.

I write now in earnest to report the case of a man whose eyes do "shine in the dark" like a cat's. He is a Carolina mountaineer and neighbor of mine, Walt Proctor by name. His eyes are gray, the irises small, and the pupils more sensitive, I think, than normal. He has a nervous affection of the eyes, causing him to roll them frequently and blink. His ordinary expression is staring. When sitting in a dark room I have seen his eyes flare as a lamp approached, precisely as the eyes of a deer or a cat will shine under such circumstances.

HORACE KEPHART.

### The Real Old Florida Mosquito.

THE yacht *Mystery*, Capt. Charles Meloy, with Engineer W. J. Kroune, and others of the Florida East Coast Railway extension operations aboard, returned to port yesterday afternoon from the lower coast where they have been for the past week or ten days. The *Mystery* came directly through from West Key with the exception of a few stops yesterday at the various camps of Key Largo and Long Key.

In speaking of the trip Captain Meloy said that the mosquitoes were so bad that they dared not go ashore at any of the camps, but had to anchor in the stream while boats from the shore came out to them. They burned ten pounds of insect powder on the trip up, and had to keep the boat closed and screened to keep out the pests, that literally filled the air.

The men at the camps are protected as much as possible with screen and smudges, huge fires and smokes being burned all the time in order that the men can pursue their work of grading. Old settlers announce without hesitation that the mosquitoes are the worst this year that they have ever been, and they predict that there will be no relief until the fall hurricanes set in.—Miami (Fla.) Metropolis, Aug. 19.

### Cabia Blanco.

ROME, Ga., Aug. 21.—Editor *Forest and Stream*: It was with deepest regret that I read in your last number of the death of Cabia Blanco. I had learned to search out his contributions and read them first, knowing that I would find them both interesting and instructive.

Some twenty years later than the time of his narrative it was my good fortune to spend several years in the West, a larger part of this time was spent among the scenes of his stories, and that fact has made them doubly interesting to me. I know enough of the times and country of which he wrote, to say that his description of the West, its people and their life, was most true. I sincerely hope that *FOREST AND STREAM* has a reserve store of his writings, which they will continue to publish.

With best wishes for the continued success of your splendid paper.

J. W. HARVEY.

[We have several unpublished manuscripts of Cabia Blanco's, which we shall print in forthcoming numbers.]

# GAME BAG AND GUN

## A Day with the Pheasants.

Tom and I have always been close friends. Referring to this not long ago, Tom, who is a stenographer in the office of a cement company, said that our friendship was "cemented."

For many years we have hunted together, and we never failed to have a good time. We are no game hogs nor pot hunters, therefore we are not chagrined when our hunting coats do not bulge out with an abundance of game. Since we understand each other almost to perfection, and know full well what constitutes true sportsmanship, we can feel satisfied if a day's hunting nets no more than a single bird, or rabbit, or squirrel.

Long before the season opened last fall both Tom and I were taken with the gunning fever. There was nothing but think hunting, talk hunting, and write hunting. The days seemed to pass by exceedingly slow. But lastly, the woods began to take on their autumn robes and looked as if there had been poured upon them from large pitchers great quantities of richest hues. The gray autumnal haze rested along the hills, and ever and anon could be heard the distant but clear call of the Bob White. One morning frost was on the "punkin," the corn and the grass. Our hunting blood began to course faster through our veins, and fancy and imagination running riot held before our mental eyes scenes galore of stubble, heath and forest where the quail would run, the rabbit bound and the pheasant drum on an old log.

For several years Tom and I had taken our hunting trips to a somewhat wild section about twenty-five miles north of here, where relatives of mine reside. The place has been always alluring to us, and, although we never secured much game there, we always came away with something, and with minds made up to go there again. So of course last fall we decided to visit the "old camping ground," as Tom delights to call it. The long looked for day finally arrived. With full hunting paraphernalia I repaired to Tom's house, and we prepared everything for the great "shoot" on the morrow. We counted our shells and jokingly remarked what this or that shell would bring down. Guns were examined to see that they were all right, so if we would miss we could not lay the blame on the weapons. We turned in at 11 o'clock for a few hours' sleep, and promptly at 2 the alarm clock, not a foot away from my head, began drumming away for dear life. Sleepy as I was, at first impulse I felt like knocking it over, but I quickly realized that it meant us good and did just what it was expected to do.

When I nudged Tom in the ribs with my elbow he evidently thought, in his half-awakeness, that I had spied game, for he sleepily said: "Did you find him?"

While I fed the horse Tom prepared lunch. That having been disposed of we loaded our guns, coats and shells on the buggy, hitched up and were off. The early morning air was brisk and bracing. The frost sparkled in the bright silvery moonlight that lit up hill and vale. Several times rabbits bounded across the road, and we were almost tempted to get our guns out.

We had to cross a high mountain, and when we came to the foot of it Tom and I alighted to lighten the load for old "Doll." As we trudged along Tom said: "Kill-deer (Tom always calls me that, though I never shot a deer) do you remember that song we used to sing years

ago, 'When Up the Mountain Climbing?'" I said I did, and there in the stillness of the bright moonlight night, with the wide valley lying peacefully at our feet, Tom and I burst forth in song. The duet that rang out on the night air, that leaped from crag to precipice, and that echoed and re-echoed from mountain to valley, would have graced many a stage.

We traveled about eight miles on the other side of the mountain and by dawn had reached our destination. The horse was put away, and we were taken to a steaming breakfast, for which the long ride in the brisk morning air had given us good appetites. When breakfast was over it did not take us long to don our hunting togs and shoulder our guns. We had no dogs, since neither of us owned any, and to shoot over a strange dog does not work well.

We made our way to a stubble field behind the barn, and when we came to the end of it a big rabbit jumped up not more than ten yards ahead of us. He took but three or four bounds before Tom laid him low. As I picked him up, I made a remark that proved true afterwards. "Let us look him well over, it might be the only one we get." We worked out a number of fields without finding anything, and came to a little woods. We heard the bark of a squirrel, and as I sneaked around to locate it, I almost stepped on a rabbit. As it ran away I emptied a shell at him but missed. I saw the squirrel, shot at it, and thought I saw it drop. But it disappeared on the other side of the trunk, and I have not seen it to this day.

We trudged all the rest of the morning without seeing fur or feather. We returned to our host's for a sumptuous dinner of buckwheat cakes and fresh sausages. Talk about your meals at Delmonico's! This dinner of ours beats those all hollow. While we held an impromptu smoker and related our morning's work our host told us of a wood of young pines where we might possibly find pheasants. We heeded the suggestion and went there. As we crossed an old log bridge over a small creek there suddenly darted out from under the bridge a pheasant whose whir-r-r as it sailed up the valley I can hear yet to this day.

After half an hour's tramping we came to the pine woods. As we entered we saw several grapevines, and concluded, on examination, that it was a feeding place for pheasants. We kindly thought the birds might not be far away, and while we stood there planning what course to take, a pheasant whirred out from a small pine. We both fired, somewhat alternately. Tom had the last shot and the bird dropped. It was a nice pheasant, so plump and so beautifully marked. "Almost a pity to shoot it," remarked Tom, as he let it drop into his pocket.

I left Tom, and by a circuitous way reached the farther end of the woods. I looked carefully on every pine tree expecting to see a pheasant somewhere. Suddenly one flew out of a small spruce right at my feet. I sent the right barrel after it but missed. As the bird circled and crossed an opening of an old wagon road I gave the pheasant the left barrel and it came down. The report of my shooting had started another bird, which flew through the woods toward Tom and close enough to him that he shot it on the first try. I wriggled around under the low pines for almost an hour without seeing any more game. Everything was quiet in Tom's direction. I sat down on the soft pine needles which covered the

ground to the depth of half an inch, and concluded to wait and rest. I drew my bird from my pocket and was reveling in my luck when I heard that whir again so far away. I looked in the direction of the sound and saw a bird alight hardly fifteen yards away. I rose, craned my neck every which way to get a good look at the bird when off it flew. Up went my gun, and bang, bang, the bird was mine. Tom was now making his way toward me, and started two birds out of a pine. He brought one of them down, and I missed the other as it flew past me. We sat down and started to rehearse our adventure. We had five pheasants, all big, plump birds. Pipes were lit and the smoke from them encircled our heads. We drank in the fragrance of the sweet pine odors, and gazed in nature as our hearts desired. Thus we sat there for perhaps half an hour, till the cool shadows began to fall over the valley and hillside.

"Well, old boy," said Tom, as he slapped me on the knee, "I guess we have to be going." I nodded assent and as I scrambled to my feet I noticed Tom's tall, straight figure standing aside of me, rigid, and his eyes slowly coming up to his shoulder. His big black eyes were beaming. I stepped behind him, and peeped over his gun. Way off, probably eighty yards, there was a pheasant sitting on a tall pine. "To far, Tom," I whispered. But he made no answer. The next moment he fired, and the bird dropped. We ran up and found it dead. A single pellet of No. 4 shot had entered the bird's head and killed it.

We started back through an old wagon road. I noticed a grapevine some fifteen yards in from the path and we said simultaneously, "There might be a pheasant." We approached slowly and carefully, and saw two pheasants sitting on the vine picking off the grapes. I was taking the one on the right and Tom the other one. I counted up to two when off flew the pheasants. Tom went to the right and mine took a bee-line away from us. Tom dropped his with the second barrel, and I missed but did not kill it. We hustled in the direction where we thought we saw it come down, but had to hurry about twenty minutes before we found it, when I killed it.

It was growing dusk and we hurried back to the house. Our host had fed our horse, and a supper awaited us. Of course we were too hungry to say "no" to that. Half an hour later we were on our way home, with hunting fever somewhat abated, and wishing many returns of such happy day.

Camping in Louisiana.

WHEN the "Cannon Ball" stopped at Eldorado that Saturday morning the small group of negroes gathered in the store platform, watched with interest to see what important personage would alight from the train, as Eldorado was only a small station and the fast express was seldom known to stop, and then only for some one who had a "pull." Fortunately, we were in this category, so the before-mentioned dusky aggregation beheld quite a party disembarked, to-wit, Mr. Austin and his young son, Howard, Mr. Lancaster, Tripod, Charlie and Tom, the negro cook and "chambermaid," respectively, and the writer. The camping outfit, provisions, a skiff and a duck boat had been shipped three days before by freight, and Mr. Lancaster had been assured by the railroad people that they would be waiting for us when we arrived, the distance from Vicksburg being only 25 miles. What, then, was our surprise and disappointment to find that nothing had been seen nor heard of our traps. We immediately resorted to that most handy instrument, the long-distance phone, and after about an hour's wait, ascertained that the lost articles had never gotten away from the river bank opposite Vicksburg and could not reach us earlier than about 10 o'clock at night. We had expected to be in camp that afternoon and to put in Sunday in locating the best ranges. Our intention had been to launch our boats in the river, which ran within 300 yards of the station, and row down about fifteen miles to an old camping site of Mr. Lancaster's, where he had found a good many turkeys a year before, but after interviewing an old trapper who was familiar with the surrounding woods for miles, we decided to load our traps on two of the plantation wagons and haul them across a neck of land about two miles in width that would put us some eight or nine miles up the river, which made a big bend at this point.

After dinner Tripod and I set out to explore the proposed camping site. We declined the proffered horses, as we are both good walkers, and at the end of half an hour were standing on the river bank two miles away. A small bateau was found and we paddled across. Tripod scrambled up the bank and disappeared into the woods, while I kept to the boat, paddling close to the left bank of the stream, under the heavy overhanging timber. Pretty soon I saw a black squirrel high up on a cypress tree just at the water's edge. With as little commotion as possible I brought the boat nearly under the tree and waited. Soon his head appeared and the next moment he was floundering in the water and the next was lying in the bottom of the bateau. I paddled about half a mile up stream and then turned back, but saw only squirrels, bagging four. It was beginning to grow dark and I was afraid Tripod had missed his way, but soon heard him halloo not 100 yards away, and in a few moments we were on the other side trudging back by the light of a young moon. Tripod said that he had flushed four turkeys not a quarter of a mile from where he left the boat, and marked them in a cypress brake, and proposed that we get out early the next morning and try to get some meat. So 4 A. M. found us retracing our steps over the frozen ground, and at the first gray streak of dawn we had taken up our positions, I just in front of an old cypress stump and he about 100 yards to the rear. Tripod had cut short the careers of quite a number of wary old gobblers, but I had yet my first to kill, so he generously placed me in the most favorable position. He had his "call" along, and as soon as we were properly stationed, gave a few yelps. No response. Another trial. Same result. By this time I was nearly frozen, having been motionless for some minutes. Another yelp from Tripod and my heart still when a well-defined answer was heard away off in front. Then the male began in earnest, Tripod, "yelp! yelp! yelp!" Turkey, "yelp! yelp! yelp!" and so on, the answering game sounding closer each time until he was within 150 or 200 yards, and I could not tell which yelp came from Tripod and which from the turkey, so perfect was the imitation. Talk about buck ague, it is not a circumstance to turkey ague. I strained my eyes to get a glimpse of the turkey, but that first glimpse was not had, for, either hearing the beating of my heart or detecting a false note in the call, the turkey did not come in sight, but turned back when nearly within range, and let us know, by a few desultory yelps, that he was getting further away. After an examination of the surrounding woods, it developed that we had, in the semi-darkness, gotten a little too far down into the brake and out of the feeding range, and that this probably had excited his suspicions and made him afraid to come on.

After making a wide detour of some four or five miles for the purpose of exploring the woods, we re-crossed the river, and as we landed heard the negroes shouting to the mules and the wagons bumping over the half-frozen backshot. Dinner time found us in camp and pretty well fixed up. A lot of hay had been brought from the plantation, and this was spread out in the sleeping tents, between which a fly was stretched for the dining room. When we thought that dinner was over and were about to leave the table for the camp-fire, Mr. Austin said, "Hold on, boys, wait just a minute." He then disappeared into the main tent and presently reappeared, bearing two big mince pies. It was just two days after Christmas, and Mrs. Austin had filled up a large basket with all sorts of good things; and after that we were never in a hurry to leave the table until Mr. Austin had visited his basket.

As it was Sunday, Mr. Austin said that he and Howard would paddle up the river a few miles just to take a look around and not do any hunting; but the rest of us were less careful of our souls and determined to see if we could bring some meat into camp. It was agreed that the three of us should converge, just after sundown, about the brake where the turkeys had been seen, and try to locate their roosting place. I was to take a stand at the east end, Tripod on the opposite side about half way down and Mr. Lancaster at the west end. I crossed the river and hunted up the bank, shooting (at) squirrels with a .22 Marlin rifle, occasionally getting one, and as the shadows lengthened, turned my steps toward the cypress brake. Taking up a position on a log, I waited and watched. The woods

were fairly alive with squirrels, scampering about, chasing each other from tree to tree, some sitting not thirty feet away and chattering vociferously. The turkeys must not be frightened, however, so they were unmolested. Soon an owl's hoot sounded from the opposite side of the brake, and was answered by another away off in the woods. Thought I, "Tripod, you can fool me on the turkey call, but I know you from an owl," and moved up a little to put more distance between us and get a better position. Just then was heard, about a mile away, apparently, "bang! bang! bang!" the reports being only a few seconds apart. It sounded from the wrong place to be one of our party. It was growing so dark, and I had seen no turkeys, so I abandoned my stand and made toward camp. Reaching the river bank, I hailed Charley, who brought the skiff and ferried me over.

I found Tripod in camp, he having just come in from the opposite direction. "Didn't you hoot over by the brake a little while ago?" I said.

"No, I got so far from the brake that I didn't try to make it back."

"So it was an owl that I heard, and not you. Fooled again."

"Didn't you hear me shoot away down toward the railroad?"

"Was that you who shot three times just after sundown?"

"It was; and I got my meat. It was so dark in the woods that I could hardly see the sights when a spike buck walked from behind a fallen tree about seventy-five yards off. He bounded off at the first shot, but the second staggered him, and the last brought him down. Who'll go and help bring him in?"

Volunteers were not lacking, and we were soon at Tripod's heels. How he did it was a marvel to the rest of us, but in the dim light of a quarter moon he walked a mile through the woods and as straight to the deer as if he had followed that path every day for a year, and he had never been in these woods before that day. With an ax and some rope, a sort of hand-barrow

quick motion, as throwing up the hand or turning the head suddenly, is immediately detected by everything in the woods within eyeshot; but a very deliberate movement is apt to go unnoticed and ordinarily attracts no more attention than a twig waving in the breeze. Never get behind a tree and look out, or you will be sure not to get a shot. Stand in front of the

"LOADED" BUT SOBER.

tree, and if properly dressed you will blend with it and not be seen unless you move. Never wear a coat in the woods, as it drags the bushes and interferes with sneaking. If you get too cold and want to move about a little, or wish to change your position, take a few deliberate steps, then stop and look carefully about the woods, take a few more, etc."

As day began to break, the squirrels came out and took the woods. One little fellow ran down a tree a few feet away, scampered through the leaves and up the other side of the tree that I was leaning against. He perched on a limb overhead, and began to drop bark on me. Several others came crawling head first down a pecan tree, fifteen feet in front, eyeing me closely, and when a slight movement was made they all "vamoosed" in a great hurry. But bigger game was in mind, and the squirrels frolicked about with perfect impunity, and a seeming knowledge of their safety.

When I was almost frozen stiff and had seen no deer, a cautious move was made down a depression, where the walking was comparatively clear. After a little, I stopped again, cocked rifle in hand, as I always carried it. A careful search of the bank of the slough to the right revealed nothing of unusual interest, and I was just bringing my eyes around toward the ridge on my left when I was almost electrified to see, not fifty yards away, leisurely taking his way along, a big buck with a splendid pair of antlers. He was crossing the ridge at a slight angle, his course lying diagonally across mine. The deer was in quite a thicket of saplings, and I was afraid that if I tried to shoot through them, the ball might hit a tree and have its force spent or be deflected. About thirty feet in front of him there was a comparatively open space, and I cautiously raised my gun toward this point, and about the time I got it to my shoulder, the deer stepped out into the space. When I shot he fell, but was up again in an instant, pursuing his course at the same gait as if nothing unusual had happened. While he was falling and getting up I had thrown another cartridge into the rifle and now brought it up again, as deliberately as before. Just as I got it in position the deer reached another comparatively open space, and I let him have it again. He dropped in his tracks. I had immediately thrown in another cartridge, as before. The buck lay on the

CAMP VENISON.

or litter was made, upon which the buck was placed and the homeward march began. It was a pretty heavy lift, but we finally got it into camp.

When the sun rose next morning it found me backed up against a big tree, where I had been for over an hour, moving nothing but my head and eyes, and nearer an icicle than anything else. I had never hunted deer before, my shooting having been confined to quail, ducks and squirrels. Tripod was my instructor and I was making as apt a pupil as I could, considering that the thermometer was about 20 degrees Fahr. Under his tutelage, I had donned several suits of heavy underwear, put over these a pair of rusty old trousers and a

THE TRAPPER AT HOME.

dead-grass flannel top-shirt, a pair of long woolen socks, into which my trousers were stuffed, rubber-soled tennis shoes and a skull-cap, tree bark color. I wore no coat, but had on a pair of dog-skin gloves, which I had worn in spite of protest and pronounced disgust.

"You can't shoot in those!"

"I've done it many a time when hunting quail, and if nothing else stands between me and killing a deer, I wouldn't like to be in the deer's place."

My instructions were to stand in front of a tree with my back to it and not move any more than was absolutely necessary; to turn my head slowly from side to side and search the woods for game. "Let all of your movements be deliberate," went the directions. "Any

ground kicking, with his back to me. I advanced cautiously to within twenty yards of him and put another bullet into the back of his neck. He stopped kicking. I walked around him and saw that he was still breathing. I had heard so many stories of dead deer getting up and running away that I was not willing to take any chances on this, so placed the muzzle of the rifle (a .38 Winchester) a foot from his heart, and drove a bullet through him. And then, and not till then, did I begin to get excited. It was the same sensation that I experienced when at ten years of age I killed my first rabbit. I lifted up my voice and released it. Two hours before I had heard a single shot, probably Tripod; but now he must have gone to camp,

for I could get no response. I was afraid to leave the deer for fear I would be unable to find it again, not being the woodsman that my brother is. Finally I hit on a scheme that promised success. I hung my handkerchief up as high over the deer as I could reach and started toward camp, marking my trail by sticking bits of paper on bushes at intervals of seventy-five or eighty yards. Coming out at last into an old field, I marked well the point where I left the woods and hurried on to camp. Tom was its only occupant. I penciled a note to the manager to send a mule, and started him off with it, and just then Tripod hove in sight. "Did you get him?" he asked.

"Yes, and he's a whopper."

"I heard you shoot and then your calls for me, but the wind was against me and I couldn't make you hear my answer. Are you sending for a mule?" I responded in the affirmative, and he said, "Well, send for two." He then told me how he had jumped a buck and two does, shooting at the former, how they disappeared behind some bushes before he could get another shot, and how he heard a fall with a great crash such as might have been caused by an elephant, and found the deer about 200 yards away in a fallen tree-top, stone dead. It was another spike buck.

By dinner time both deer were in camp. Only twenty-four hours in camp, and three fine bucks to our credit.

Just across the chute, only a few hundred yards away, was the camp of an old trapper and fisherman. His habitation consisted of a tent fly with a bunk inside and a pantry made by elevating an ordinary wooden box on poles just outside the tent. The edges of the fly were several feet above the ground, so that the wintry winds had free access to the inside. Although old, gray and deaf, the old man did not seem to suffer from exposure, and was doubtless pretty thoroughly hardened. He would sit by our camp-fire with us in the evenings and relate the experiences of his wild life, and would occasionally take a meal with us. He knew every inch of the woods for miles around, and talked entertainingly of his nomadic existence.

We learned of some outrageous slaughter by certain game hogs from New Orleans who had been in camp a few miles down the river several days before our arrival. They hunted with dogs and killed nineteen deer during the week of their stay. Louisiana has since passed a very good game law, requiring non-residents to take out a license, prohibiting the killing of does and turkey hens as well as fawns, and limiting the number of bucks and gobblers that can be killed by one person in a season. Much to my regret, I had to leave camp the next day and return to civilization. The rest of the party remained for several days longer, but added only squirrels to the bag, our three bucks being the only big game killed. Tripod scorns squirrels when there are any deer or turkeys about, and continued to hunt big game, but had no luck. Mr. Austin and Mr. Lancaster saw eight or ten deer drinking on the river bank or crossing the stream, but could never get quite close enough for a shot.

All of our friends had venison for several days after my return home, and a pretty pair of antlers hangs over my mantle, under which are two enlarged photos, one of the deer on the mule, and the other a view of our camp, which was dubbed "Camp Venison."

Jo Bo.

LOUISIANA.

### The Elusive Wild Turkey.

THE wild turkey (like the red man) has almost entirely disappeared under the influence of civilization and the modern firearm. You seldom hear of a turkey being bagged these days, through sections that abounded with them as recently as twenty-five years ago. The would-be Nimrod must be sharp and altogether patient if he ever hopes to bag the wise American bird. I well remember my first experience in wild turkey shooting, which occurred some ten years ago in the Santee River swamp and goes to show how one will be led into counting full-grown gobblers before the eggs are even hatched.

I had been wild duck hunting all the morning with no great success, and was in the act of crossing a slough or waterway via a log about the size of one's leg, when I noticed the leaves about me had been scratched into little piles and dust sprinkled thereon. Although I had never seen the like before, I needed no one to tell me turkeys had been using this place not only as a feeding ground, but had been taking dust baths just as domestic hens do. I had often heard old hunters tell how they had baited a place such as this, and after building a blind, had succeeded in killing as many as seven at one shot, so thought I, "I will do likewise," and away I went for some shelled corn, and getting about a quart, crawled back about 200 yards only to find the birds had not returned.

I then set about preparing for a sunrise slaughter the following morning. I dug a trench about eight feet long by three inches wide and scattered the corn in this. A large log partly hidden by scrub cane served me for a blind. It was twenty feet from one end of my trench and from behind it one could get a raking shot along the entire trench.

I was in my blind an hour before daylight crouched in a most uncomfortable position, with the mercury about twenty above. Every minute seemed an hour, and I began to fear that should the turkeys come I would be unable to cock my gun, for my fingers were becoming absolutely numb from the cold. After what seemed an hour of daylight at last began to appear, but no turkeys;

turkeys, 8.30 nothing doing. The sun came out somewhat. About 9 or thereabout of rising and stretching my limbs having been in one position I heard the unmistakable

of my gun inch towards my right in attaining and

After one or two more put-puts, down came a fine old gobbler, then another, and another, until the ground in front of me appeared to be one mass of red legs, green and brown feathers and gobbler beards. First one then another, then two would eat, but I was determined to wait until several were eating at a time when I could get their heads in line. At last the opportunity came; at least a dozen began eating the corn at once. Now came the ticklish moment. On bringing my eye down along the barrel I found my gun-sight ranged too high, and the only remedy was to raise my body higher, which would never do, or back further away from the log, which would also bring me in good line. I decided to adopt the latter course and began moving back inch by inch until my gun covered about the center of turkey population, then clinching my teeth together I pulled both triggers at the same instant.

There was a tremendous explosion, the recoil kicking me entirely over on my back. If the reader ever shot black powder early in the morning in a swampy place, he knows what was doing in the matter of smoke. I could see nothing for some seconds, but the whole swamp seemed to be one mass of flapping turkey wings, dead leaves and dust, to say nothing of the blue powder smoke. I ran out from behind my blind expecting great slaughter to meet my excited gaze, but not a feather of a turkey was left to tell the tale.

I was dumbfounded, what on earth could have kept me from killing at least six fine turkeys. I examined my shells, thinking possibly no shot were put in them, but found them O. K. After rubbing my eyes and walking around I went back to the log over which I had shot, and what do you think I found? In backing away from the log, trying for a better range, my gun muzzle had come slightly below the upper curvature of the log and had blown away a clean groove about the size of my wrist across the top of the log. Such of the shot as were not rendered useless were deflected far above the turkeys' heads. This also accounted for the gun kicking me with such a vengeance.

Since then I always advise a novice to shoot the first turkey he sees, even though it be a small hen. "A bird in the hand is worth two in the bush." W. O. H.

### Quail of the Mexican Llanos.

TAPACHULA, Mexico, Aug. 4.—*Editor Forest and Stream:* The papers you sent me were duly received; many thanks. I do very little hunting these days, as up here in the coffee district there is not much to hunt, and the trip down to the coast is a long and tiresome one. A few weeks ago a friend and myself went on the llanos for a quail shoot. We had no dogs, but each of us had a vaquero to do the retrieving. We rode about twenty yards apart in order to find the bevies. In about two hours' shooting we killed forty quail, one pigeon and four rabbits. At least half of the game was killed from the saddle. I do not think a dog could be used on account of the heat and the very high grass.

The quail here are the Bob White, a little smaller, and the male a much darker colored bird than those in the United States. Some years ago, I think in 1895, I shot and presented to Mr. Nelson and Mr. Boardman, who I believe were collecting for the Smithsonian Institution, a number of these quail, so I suppose you must know all about them. The call is exactly like the quail I knew as a boy in North Carolina. On these llanos, just below Tapachula, they can be found in vast numbers. I have flushed with two or three vaqueros riding alongside of me several hundred in a three or four hours' ride. When the grass is burned off in March they can then be killed in great quantities. Even then I doubt if a dog could be used, as he would get foot sore in a short time.

On these llanos there are clumps of bushes about thirty feet high which do not burn, and here the quail are to be found. All one has to do is to send in his Indian boy to flush them out. They will then fly to the next nearest clump. One takes his stand between these clumps and you have fine shooting. I have myself alone killed sixty-seven in one evening's shoot. You must make the boy flush slowly so as to give you time to reload.

I use a Parker cylinder bore, No. 12 gauge gun for quail and a Greener choke bore for ducks and turkey. The guns weigh 7½ pounds each. I use nitro powder and No. 9 and No. 6 shot. We also have splendid duck shooting, which I will tell you about later. GUATEMALA.

[The quail of which Guatemala speaks is very likely *Colinus minor* Nelson, though there are so many members of the family *Perdix* in southern Mexico and in Central America that this is little more than a guess.]

### Coon Hunting in the Autumn.

JERSEY CITY, N. J., Aug. 26.—*Editor Forest and Stream:* In FOREST AND STREAM of Aug. 5 "Hermit" gives a very interesting account of the strategy of a mother raccoon, where, at the risk of her own life, she brings "Hermit's" pets to a safe hiding place, then led off the hounds and, I am glad to note, lost them.

The hounds in question, as I take it from "Hermit's" account, gave tongue while on the track, which gave the coon time to scheme out plans for safety. Had they been thoroughbred coon dogs, that give tongue only when treed, "Hermit" would have seen the extermination of his pets. A good coon dog coming upon that family of coons, with scarcely any warning, would have sent the young up the nearest tree and mother coon would not leave them to go any great distance.

Coon hunting is a sport indulged in by few. I have heard it said that a man must have a depraved taste for sport to enjoy it; and that reminds me of a story I heard told by a friend of mine from Maryland. George always enjoyed coon hunting and kept two good hounds for that purpose. One night as George started out on a coon hunt with a party of friends, his father hailed him, saying: "George, say George, why do you boys want to tramp the woods all night for coon, when you might just as well run out our cat up one of these trees and drink your whisky right here."

With one or two good companions and a first-class hound I can enjoy any night in the fall after coons, and I firmly believe that if sportsmen in certain sections would tie up their bird dogs for a season or two and use coon or fox hounds instead they would accomplish wonderful game protection.

With the passing away of Cabia Blanco, of whose death I read with regret, FOREST AND STREAM loses an interesting and ready writer. His articles, written in a simple and entertaining manner, carried with them a charm that I, and I dare say, every other reader of your valuable paper enjoyed very much. I sincerely hope that some time in the near future we may see his writings put up in book form, to find a place alongside those of Fred Mather, two sportsmen and writers of a class that are fast passing away. OTTO KIM.

### Montana Jottings.

CHOTEAU, Mont., Aug. 14.—*Editor Forest and Stream:* Mr. J. M. Wharton, manager of the Clarke Electric Lines in Butte, recently visited Kalispell to purchase a buffalo from the Conrad herd for the museum at Columbia Gardens in Butte. Mr. Wharton selected a yearling bull, which the next day was shipped to Butte, where it will, no doubt, prove a great attraction.

Henry Good, who lives near Whitefish, was fined \$100 by Judge Erickson, at Kalispell, on the charge of killing deer out of season. The deer was actually killed by Mr. Good's brother, but the meat was found in his possession, and while he was only technically to blame for the killing, he assumed all responsibility when Mr. Lownds, the game warden, called on him in regard to it, and he paid the fine.

During the first three days of July there were turned into the several bounty inspectors of Teton county a quantity of the scalps of stock-destroying animals. These scalps were of coyotes 45, coyote pups 369, wolf 1, wolf pups 2. Of these skins 216 were presented at Cut Bank, 105 at Dupuyer, 81 at Choteau, 12 at Conrad, and 2 at Lowry. BIRD.

### THE MANY-USE OIL

This unique oil polishes stock and barrel. Use it.—*Adv.*

### Camp-Fire Flickerings.

"That reminds me."

### How Jim Brown Did Up Old Man Millet.

DURING my experience in Texas I heard many yarns about the "old days," mostly told by the light of the camp fire. Some of them are well worth repeating, and I shall try to give one of the best as nearly as I can remember it.

The hash-knife outfit was in cow camp one evening in what was called the West Pasture, a block of land containing about 18,000 acres. The day's work was done, and we were sitting around the camp fire after supper. Everyone was comfortably tired. The boys had just started singing, when an old fellow, commonly called "Jim," rode up. He unsaddled his pony, and sitting down among us began talking over the range conditions. Some influence had made him reminiscent. As the general conversation died away he turned to the crowd:

"Boys, did you all ever hear how, back in the seventies, Waggoner's foreman, Jim Brown, did up old man Millet? Millet, you know, owned this same ranch at that time."

As no one said anything, he continued: "Brown was one of the nerviest men on the range at that time. He had to be to hold his job. Millet was a hard one. It used to be said he wouldn't have a man work for him who wasn't wanted for something by the law. He had started in a small way, but by lifting everyone's cattle within 100 miles he had got his herd up into the thousands.

"Now, Brown had a bunch of fat steers in the Wichita Breaks, which he was fixing to round up and ship that spring. Before he got round to it, though, some of Millet's boys got over into that part of the country, and running into the cattle rounded up what they could find and brought them back to their headquarters right here on Elm Creek.

"Brown got wind of this and decided to get those steers back. Millet, however, had never been known to let go anything he fastened on to, so it was a risky proposition, with big chances of gun play. Brown took a bunch of his boys, and hearing that Millet was rounding near Elm Creek, he rode over to look on.

"Now, as it happened, old man Millet had gone over with his wife to watch the cutting. He was sitting in his buggy, his wife beside him, when Brown rode up with his boys. Jim always carried his shotgun slung to his saddle horn, and it proved useful that day. Taking in the situation at a glance, he rode over in front of Millet, jerked out his shotgun, and layin' it over his knees, turned to his boys, saying: 'Jump right in, fellers, and cut them out. The first man that shoots, old man Millet's mine.'

"His boys proceeded to 'jump right in.' To add to the tension, one of them who was heading a steer back of Brown, shot straight down at his feet. Brown didn't move, and after his steers were bunched sent them along. He waited till they had got a good piece up the trail, then hung his spurs in his pony and loped after them." MONTE.

### Whistling.

Negroes and boys may whistle in the street,—  
The boys because they're void of better sense,  
And Africa's sons because kind Providence  
Has gifted them with pipes complete,  
For oft they make a music rather sweet.  
Indeed, I listen with a sort of pleasure  
When they perform in harmony and measure,  
And beat the time with swiftly moving feet.  
And even men may whistle when they hear  
A tale that's somewhat marvelous and tough;  
In case like this it may be well enough  
To make their incredulity appear;  
Yet still I think most sensible men with me  
That whistling is a boy will heartily agree.

THE current edition of the *Game Laws in Brief*, sold everywhere, contains all the fish and game laws a sportsman ought to know. It is complete, accurate and up-to-date.

# SEA AND RIVER FISHING

## Meditations of an Angler.

### III.—The Old Mill Pond.

THEY, the Powers, called it a mill pond—they, the big of body but small of mind, whose power consisted of their size and the many years it had taken them to acquire it. To us who really knew, it was an ocean as boundless as the realms of our imagination and as deep as that other sky you could see on a still day far, far down below in the dark depths of the water. And on this ocean sailed many beautiful ships, a fanciful fleet of dreams, that sometimes touched at our port, and bore us away, so far away, to lands not shown on any mariner's chart.

They with the eyes that could not see, knew nothing of these beautiful ships. Perchance they may have at one time in their lives, but it had been so long ago that they had forgotten how to distinguish one of these wonderful vessels when it sailed majestically into port; neither did they know the magic watch word, without which no one could take passage on any of these boats. To them a piece of drift wood floating by, or a dead leaf being lightly blown along the surface of the water meant nothing more than was outwardly visible to the uneducated eye. They could not know, nor did we expect them to, that that dark piece of drift wood was in reality a large ocean-going vessel—a galley most likely, from the looks of her—bound for the land of Ophir or one of the "Delectable Isles," or that the dead leaf was a graceful, white-winged shallop, outward bound into the great unknown, and that we had only but to choose which one should be ours.

I wonder if we could recognize our own fleet of ships to-day. It is only a few of the favored ones whose vision remains clear and undefiled through all the long years.

This mill pond—for the sake of harmony we shall so designate it—was altogether different from any mill pond that ever shed its waters over an old, moss-covered, wooden dam. You probably know of a pond somewhere just as different in its way, but it is very doubtful if its "way" would compare favorably with this one of ours. Ours was a wonderful body of water.

At one end was the old stone mill, standing there like the ruins of some ancient castle. To the best of our belief it had always stood there unchanged and unchangeable, and would always stand so long as the foundations of the world remained unmoved. It was a big, square, stone structure, with yawning openings in place of doors and windows, enveloped in the gloomy atmosphere of desolation. I have never seen a building of its kind since that seemed so big. It was a peculiar building. At night it was three times as big as it was in the day time—especially if one had to pass it alone.

Of course it was haunted, haunted by the worst "hant" that ever scared a boy half to death. None of us ever saw the ghost, or whatever it was. To look upon it would have been—well, there is no telling just what would have happened. To doubt its existence would have been like doubting the Ten Commandments. We were conscious of its awful presence, always, and seldom ventured alone within the walls of its dwelling, even when "stumped" to do so in the cheerful light of day.

Some envious one will doubtless rise up and declare that this hant was no worse than some hants he used to know about before he reached the folly of man's estate; but such a one knoweth not whereof he declareth. Of course there were other hants—lots and lots of them. In my youth I considered myself quite an authority on the subject. I knew of half a dozen—favorites of ours, as it were—that could have more than stirred the quills on a fretful porcupine; but it—this awful thing of the mill which we never dared even whisper about, nay, hardly think about—it, with one chilling breath, would have made a fretful porcupine look like a par-boiled possum. A fellow had to have his nerve with him, I tell you, to pass that mill alone after dark. You dared not run, because there was an ugly tempered dog on the other side of the street who considered running, after business hours, a deliberate challenge, an excuse to attack you basely in the rear.

But hant, and dog and all, the mill, with its mill-race crumbling slowly to decay and the water gates closed for all time, added much to the attractiveness of the pond itself. And beside the mill was the old wooden dam, slimy and slippery and green with age, over which the water splashed in a thin, transparent sheet, or roared tumultuously in a torrent, according to the temper of the pond itself and the condition of the weather. This old dam was all that could be desired, although the Powers had declared it forbidden ground. In the spring of the year it was a famous place for redhorse, and suckers. That was the only season when we, emboldened by numbers, became very familiar with the dam; and an air of solitude at all times brooded over the place.

On one side of the pond, not far from the mill, there was a row of willows, large, wide spreading trees with their branches hanging low, far over the water. The largest of these trees held a place of its own in our small world. It was a trysting place or a rendezvous, a castle or a humble cot, a full-rigged ship—four-masted with all sails spread—or a more modern railway train that traversed anywhere and everywhere at a wonderful rate of speed. Indeed, it was all things to all of us at all times. Only in the dull moments, when over-worked imaginations flagged and life became devoid of entertainment for the nonce, did it really assume its proper semblance of a tree.

I remember something that happened to me in this very tree one time that left an indelible impression upon my mind, likewise my heart. One large limb of the tree extended far over the water. For the edification of a young and beautiful matron whom I secretly adored, and intended to win and wed so soon as I had put her objectionable husband out of the way, for her edification, I say, I was "playing smart" on the slippery surface of this limb, with a recklessness born of blighted hopes and a heart surcharged with unrequited passion. She cautioned me to be careful. I laughed a mirthless laugh, or at least I tried to make it mirthless. I know it sounded throaty. I would show her how lightly I valued my ruined life. And I showed her. I think I essayed to "skin the cat." I know that I landed flat on my face in a foot or two of mud and water.

Whether it was her heartless laughter or the sudden wetting that dampened my ardor, I have never fully decided. Sufficient unto the day. From that time on I avoided her, and for the space of three weeks renewed my attentions to Annie, the washer-woman's seductive daughter—she whom I had so lightly cast aside for this other fickle, cold-hearted woman.

At the foot of this big willow tree was a small boat house and a pier. Both the boat house and the pier possessed possibilities not unlike those of the tree. Father Noah would have raved with envy could he but have seen us voyaging on the flood in our wonderful ark. Imagine his chagrin, if he had taken us for castaways floating about on a boat house, and had hastened to our rescue, when he got near enough to discover what we really were. It would have been a good one on him. We often admitted as much to one another.

It was off this pier that I caught my first fish, I think, because my earliest recollection of baiting a hook carries me back to this particular spot. You might care to hear about it, and why I remember it. I could not manage the slippery angleworm, and in my impatience I absent-mindedly did as I should have done had I been threading a needle. I wet the thread. That moment will remain fresh in my memory so long as memory shall endure. We learned to swim at the pier, aided and encouraged by its protecting presence. Indeed all of our adventures in the aquatic world centered around the place.

There were times when you could lie flat down on your stomach at the end of the pier, and gaze so far down into the water that you knew you were getting your first glimpse of China. For a long time I secretly wondered why the pond did not fall through and drown China.

It would take volumes and many tomes to contain a full chronicle of all the deeds performed beneath the shade of this big willow. Like the great oaks immortalized in history, this big willow will always hold its place undisturbed in the memories of some of us who fought, bled and all but died beneath its spreading branches.

There were other parts of the pond that had their points of interest, like the deep hole, where we feared to go in swimming, and the railroad bridge which we were ordered to shun under penalty of chastisement most dire by the Powers. The deep hole possessed terrors of its own that made any further warnings on the part of the Powers superfluous. That part of the pond, where the railway track and embankment lay, had no attraction for us, save that it was forbidden ground, therefore not to be entirely ignored. Above the bridge was what we called the Upper Pond, where the inlet entered, after meandering through some miles of pasture and meadow land.

Such was the pond. It may have been a mile long, or twenty. We knew not, neither did we care. To us it was a body of water of ever-varying dimensions; sometimes a mere lake, at others a measureless ocean. As much of it was ours as we cared to claim, and there was always enough to go around.

Of course we had a boat, or the use of one which was the same thing. It was a plain, home-made, flat-bottomed affair, not much to boast of in the way of appearances, but altogether sufficient for our needs and requirements. Some inventive genius had persuaded the owner of the boat that he could attach a labor-saving device—his own invention—to the stern in the form of a propeller, whereby much comfort would accrue to the owner, and incidentally, I suppose, much glory to the inventor.

The latter devoted himself to his task for weeks. I have a dim recollection of how we watched him at his labors with feelings akin to awe. He bored two holes in the stern below the waterline for some mysterious reason not comprehended by us at the time, nor, as I have since come to believe, clearly understood by himself, unless he had a grudge against the owner. After boring the holes, and doing some things to the inside of the boat that he ought not to have done, the inventor relapsed into his former normal state of obscurity from which he never again emerged, except once when he gave us a mean dog—but that has nothing to do with the boat.

The holes were a great success. They defied all our efforts at corking and caulking, consequently we generally had a plentiful supply of water in the boat, which, however, was not a matter of very great inconvenience to a boy.

That old boat figured in many of our adventures by sea, and by its aid we learned many important things. We were not supposed to use it save under the protecting auspices of one of the Powers; but whenever the Powers slumbered in a false security begotten of our temporary innocent doings, we had a way of

capturing the ship and escaping with our prize, all unbeknown to our unwatchful enemy. Once safely under way, like gallant freebooters of yore, we could steer our course wherever there seemed to be a chance of seizing upon richly laden merchantman; or if in a dangerous, reckless mood we would ravage the coast.

There was the clan of McLaughlin, headed by the peg-legged Chief Paddy, ably seconded by that old termagent he called his wife; Chief Paddy, who looked upon the bottle when it was full, and never ceased gazing until naught but an odor remained. His wife was a witch, and we knew it. She had two large bumps on her head which her scant hoary locks failed to conceal. Whether these bumps were due to nature or to an ebullition of spirits begotten in Chief Paddy's overheated brain we never knew. We leaned to the latter theory.

The lands of the McLaughlin's bordered on the coast, and once we had scaled the precipitous heights, against which "the loud-sounding sea" thundered and roared, their vast domain with its acres upon acres of "peraties an' cabbages" lay spread out before us at our mercy, unless the old lady McLaughlin discovered us from her watch tower, in which event we stayed not on the order of our going, for we greatly feared the bane of her evil eye.

Further up the coast was the Murphy crew, with our mortal enemy, Timothy, at the head of it. We called him—what was it we called him? I remember now. Timothy Ticklebreeches. That was it, all honor to him who invented the cognomen! How often did we hurl the hated sobriquet in his teeth from the safe shelter of our own back yard. I feared him with a great and wholesome fear, accentuated by a keen sense of guilt. Well do I remember the time I fell into his hands.

I was fishing in the deep hole, all intent upon the business in hand. Suddenly I heard a heavy step. I looked up and there he was before me, the much-dreaded Ticklebreeches. Why I did not die of fright right then and there I know not. He seized me by the scruff of the neck and my posterior extremities, and swinging me over the pool, told me, with an oath, that he was going to drown me. He did not, of course, but the effect was the same. That was a harrowing experience.

Yes, Timothy Ticklebreeches was a powerful man; one much to be feared, and bitter was the feud between us. But his pig pen was near the high water line, and it was rare sport to bombard this same pig pen from the lofty poop deck of our noble ship, and hear the pigs squeal and run about; and then when the Lady Murphy came screeching to the rescue with her long, bony arms waving in the air and her sunbonnet streaming out behind (we were almost certain that she had been born with the sunbonnet on), with a loud defiant chorus of "Old Timothy Ticklebreeches," to bring the ship around to the breeze, and continue on our devastating way.

We were monarchs of the high sea, and little did the Powers suspect that the innocent-looking craft which they called a rowboat, was, in reality, the dreaded "Black Avenger of the Spanish Main."

"Mother, may I go out to swim?"

"Yes, my darling daughter;

Hang your clothes on a hickory limb,

But don't go near the water."

That is one of the first poems I ever learned, outside of Mother Goose. It is always associated in my mind with a long, tough, pliable switch or a thin-soled, equally pliable slipper and great bodily pain, fleeting, it is true, but none the less poignant while it lasted. Paradoxical as the poem may seem to be, it is no more so than the commands of some of the Powers, "You must not go in swimming until you have learned to swim," said they.

The part that always bothered me about the poem was the "darling daughter." In my day daughters did not indulge in the manly sports to any great extent. However, as it is the only swimming poem I ever knew, it will have to stand for an introduction.

The school where we acquired "much wuthless information," and some that was not so worthless, stood on the shores of the pond. The playground ran down to the water's edge, and was divided therefrom by a tall board fence. It was a thoughtless, unkind act for the founders of the school to have selected such a location for a temple of learning; unkind thus to thrust temptation in the thorny path of erring youth.

You remember, as well as I do, that if you held up two fingers on the sly, it meant, "Let's go in swimming."

Imagine yourself back there in that schoolroom. It is a warm June day. The nerve-racking silence of the room is broken by a hundred tempting sounds that drift through the open window from the outside world, calling you, with insistent voices, to come out and play. There is the rat-tat-tat and clear, challenging cry of the red-headed woodpecker. You know where his nest is; the trouble is you can't get at it. And then comes the chirp of a robin or the soft liquid notes of a bluebird, and many other calls that you are familiar with. In the midst of it all a delicious sound of barking and snarling and yelping suddenly greets your ears, and you know that a dog fight is on somewhere in the neighborhood, and you curse fate for chaining you here at a stupid desk.

After the dog fight has subsided, perhaps a lazy bumble bee will fly in at the window, and having created a mild sensation by buzzing about the room, go whizzing out through another window. You groan inwardly, and wish that you were the woodpecker, or the robin, or the bumble bee or even the dog that

"got licked" just now—anything, if you could only be out of doors where you belong.

In the midst of these vain longings, the boy across the room catches your eye and immediately holds up the fatal two fingers. The bargain is made then and there. What matter if the Power with authority vested in himself over your individual person has commanded you to come straight home from school, and perform some menial task, like weeding the garden or some such thing? The swimming hole is calling you with all its Siren voices.

The school room now becomes an institution especially devised for the torture of all those who would swim, and when the reluctant hands of the clock at last announce your freedom, you can hardly restrain a shout of joy. The mandate of the Power has no weight with you now, and you seek the swimming pool by a devious route to avoid detection. With the first plunge in the water the cares of the day are washed away and forgotten, and happiness reigns supreme.

And in the evening, just at supper time, when you return and would fain efface yourself, and avoid unwelcome attentions from the family circle, but without success, what do you care after it is all over? You had your fun, and the aftermath can be considered inversely in the nature of a quid pro quo.

The "crick" or inlet that flowed into the pond possessed swimming features not to be overlooked. There was a bend in the stream which appealed to us strongly. Why, is another question. We had to walk a long way to get to it, but once there we were satisfied. It abounded in blood-suckers, and mud turtles were not unknown. There was not much room in which to disport oneself, and we always came out of it dirtier than we went in. I fail to remember what its attraction was unless it was the dirt, but at times we preferred it to all other swimming holes. It was the innocent cause of many a misunderstanding between the Powers and ourselves.

There always came a season of the year when certain fishermen wanted live bait for lake fishing. At such a time they would approach us with fair sounding words and the air of philanthropists, and engage us to supply them with minnows at the munificent sum of one-half a cent a piece. Enough minnows at half a cent a piece will make a man wealthy, and naturally we always figured "enough" as the limit to the number we proposed to catch.

Hopefully would we sally forth the next morning. Hopefully would we spend all of the wealth-to-come before we reached the fishing grounds. Patiently would we toil all day long, lugging the pails that grew heavier and heavier as the hours slipped by, and what would be our reward? After fishing like Isaac for three days, if we caught a hundred minnows we were in luck. That meant 16 2/3 cents apiece for the three of us.

The recollection of this enterprise—for strange to say it was of frequent occurrence—is very painful to me, because it shows a sad lack of judgment on our part. Why, we could earn half a cent a shoe for brushing flies from the horses at the blacksmith shop, and the work was easy and instructive, not to mention perquisites in the form of horse-shoe nails and such things. Surely we should not have allowed ourselves to be led astray by this dream of riches the fishermen created for our undoing. Vanity of vanities! What need had we of wealth with only a small portion of our own vast kingdom as yet explored.

Did we ever explore all of our kingdom? No, we never did. Such kingdoms are never fully explored. It would take much longer than the golden days allotted to us in childhood to discover more than a tithe of our possessions. It is only when the golden days have fled that we realize, with a sigh, all the good things that were ours which we failed to garner in. But the old mill pond yielded much treasure trove to us, and the half can never be told of all its possibilities. Probably, nay, assuredly I should lose my bearings if I went back there now and attempted to live the joyous past anew, or even to discover one of our many beautiful ships that sailed our untroubled seas. I have forgotten how. We all forget, more's the pity.

Like voices in a dream come the echoes of those days when all life was very real to us, and when faith in all things was our sacred creed. Blessed is the man that has saved one link from the broken chain of years to connect him with that good time, for it may serve him as an open Sesame to a half forgotten world where even an old mill pond may become a mighty ocean, and a dead leaf on the water a white-winged shallow ready to bear him wither-so-ever his heart desires.

FAYETTE DURLIN.

### Susquehanna Bass Fishing.

SAYRE, Pa., Aug. 25.—Bass fishing on the Susquehanna River at all points where bass are usually taken has been excellent of late, and many fine creels of black, and the locally known yellow bass, have been taken. At Union Springs, on Cayuga Lake, I hear black bass are being caught in goodly numbers. In fact, the bass fishermen are now enjoying a fine harvest of sport, with a promise of good fishing to continue for some weeks to come.

M. CHILL.

### "A Flying Trip."

OSSINING, N. Y., Aug. 25.—*Editor Forest and Stream:* In the little article printed this week under the heading, "A Flying Trip," some one has changed the distance from Daytona to Ponce Park from 14 to 64 miles. A trip of 64 miles in a small launch in less than two hours would be a flying trip, indeed. CHAS. G. BLANDFORD.

### Genesis of the Ouananiche.

SUSSEX, N. B., Aug. 20.—Mr. Chambers' paper in issue of 19th inst. on "The Genesis of the Ouananiche" is an excellent one, and I am quite in accord with his opinions. It contains much valuable information.

W. H. VENNING.

### THE MANY-USE OIL

Oils, gun locks, revolvers and reels. Just right.—*Adv.*

## Newfoundland Notes.

SINCE last writing, your correspondent has been along the whole length of the railway line from end to end, and has seen some angling and anglers. The number of American visitors is increasing each year; the present season has been a record one up to date. The visitors included all kinds and classes, from the Hon. Elihu Root, Secretary of State, to the young angler with his brand new "dux-back" outfit, bent on for the first time.

It is really surprising the numbers who came along this season. Twenty anglers got off at one station, the day I was coming through. At another station six or seven American gentlemen got on to run seven miles to a salmon pool along the line, and there were three times as many ladies and children on the little station seeing them off. The ladies and children were all brown and bareheaded, and seemed to be in the ruddiest health and the highest spirits. The fun and the banter and the various injunctions from car to station, and vice versa, enlivened the whole train, and when the mighty hunters got aboard the train, willing hands were stretched out to take their traps and duffle upon the brakes, where they rode till they came to their salmon pool.

Secretary Root, and his two sons, and Col. Sanger spent several days among the salmon pools and got good sport.

Numbers of other professional men from various parts of the United States fished at different places along the line.

We stopped off at Nardini's for a couple of days, and while there Peter Benoit, the guide, came down with twenty-one salmon and grilse as the result of a day and night's fishing. Next day I went up for a couple of hours with Peter, but as I had to catch a train, I was in a hurry and did not get up to the best pools. We succeeded though in getting seven grilse and salmon, and had a good morning's sport.

Our next stop was at Bay of Islands. Here we met several parties, who were outfitting for a trip along the line. Among others were Mr. and Mrs. P., of Lakeville, Conn., and Capt. G., C. I. V., England. We spent a very pleasant day with the former, and were present with them at a very interesting luncheon on Wood's Island, and regretted very much when the time for parting came. They camped up on Sand Lake River, and enjoyed the sport. Capt. G. was a veritable nimrod. He had shot and fished in nearly every part of the world—killed a bigger elephant than Selous in Africa, was familiar with Norway, and had shot wapiti and mountain sheep in the United States. Like a good Englishman, he held up his end in the Boer war, and, judging from his height and muscle, hardened by incessant outdoor exercise, must have proved a tough proposition to many a guileless South African. His prowess as a hunter was only equalled by his modesty, and your correspondent is indebted to a gentleman who knew him very well, for these and other particulars.

We took the Reid, N. F., coastal boat Glencoe and went down the shore. Among the passengers were two parties of American ladies and gentlemen. They were delighted with the trip. The running into the different little sea ports, the variety and beauty of the scenery, supplied interesting subjects for conversation, and for the large number of cameras that were brought into requisition.

A trip on one of these coastal boats is a great treat. The little ships are well fitted with all modern marine improvements; the service is up-to-date, and the officials are courteous. For anyone wanting a sea trip in smooth water, with any amount of variety, a run along the coast in one of those little steamers leaves nothing to be desired.

We camped for ten days on one of the best salmon and sea trout pools in Newfoundland. This pool has the great advantage of not being easily accessible to the ordinary angler out for a day or two, so we had the exclusive use of it just the same as if we were proprietors. We left the ship and were rowed seven miles up the north arm and then tramped four miles up to the pool and pitched our camp in an ideal spot. We were early for the sea trout, and got only a fair catch, and we were just a little late for the salmon. We should have gone some miles further up stream to get them. Nevertheless, the first morning's fishing in the upper pool resulted in my hooking a gamey nine-pounder. I had forgotten my net and was by myself with a shelving bank and no beach to land him. I held him for thirty-five minutes and the only thing that troubled was that when I got back to the camp without him, I'd be greeted with the usual incredulous smile. This spurred me to extra care, and eventually I killed my little fish and got him in a fissure of the rock and landed him. Within the next hour I landed, with the assistance of the guide, four other salmon and grilse ranging from 3½ to 5 pounds—one fellow particularly, a 4½-pounder, gave me nearly the best sport I had ever enjoyed. He went over the whole pool, and jumped ten or twelve times, and nearly exhausted the line on my reel. After that the weather got bright and clear, and the fish sluggish. We used to watch them lying in the pool, and tried in vain all the flies in the book. Hurling across their very noses they would not look at them. However, we used to get a few at early morn and dewy eve, and this kept us in good spirits. Just before we broke camp it rained some, and the first large installment of sea trout arrived. We had good fishing the last evening we were there, and if we had been ten days later, instead of earlier, we would have all the fishing we wanted. My share of the spoils was a large firkin of preserved salmon, grilse and sea trout.

But if I had not caught a single fish, I would still have enjoyed the outing. It is an ideal place to camp, and we were fitted up like a modern hotel. The surroundings are beautiful, and we were in the center of the caribou country. The deer in winter are there in thousands, and a hunter camped where we were, could get his choice of heads or he could get easily the most unique photograph in America. The thought that struck me was that it was an ideal place for the erection of a clubhouse, and as the gentleman who accompanied me is the proprietor of 100 acres, in fact, the only timber land near the pool, and as he is desirous of disposing of it, I would not be surprised if some reader

of FOREST AND STREAM in the very near future, had a log-cabin hunting lodge here for the very best shooting and fishing on the island. It is one of the very few places left—that is, not overrun with the ordinary anglers who spend only three or four days on a pool and whip it to death.

The reports from other parts showed that the fishing was good. Mr. W. Warren and two other gentlemen fishing on the Humber caught seventy-seven salmon, the largest weighing 13 pounds. They saw hundreds leaping the falls. There were ten rods fishing there, and at times they'd all be hauling fish together.

Mr. F. I. Morris, with two others, caught 160 pounds of sea trout at Placentia, and had great sport. Mr. J. Rooney and another caught fifty-three salmon at Salmonier, and reported several other parties equally well fished.

I append two extracts from late local papers, which are self-explanatory—dozens of other clippings at hand repeat the same tale:

"Capt. Gillett, who is on the west coast fishing, landed a salmon weighing 25½ pounds at the Dumping Pool, Harry's Brook. He is charmed with the sport he has had and purposes sending the fish to London to show his friends."

This one is from the humorous contributor of the Trade Review, which sometimes descends from discussing the price of the bag and the barrel and quintal of fish, to note other happenings. Incidentally it may induce some next year's June brides to come along this way for a 12-pound fish:

"A breezy correspondent to a sporting journal (says the Fishing Gazette) thus 'booms' a popular Maine summer resort: 'A young honeymoon pair came here last season fishing, and took a 6¾-pound grilse. This summer they are back again with a little baby of identically the same weight as the salmon.' If it is any inducement to honeymooners, we can safely say that 12-pound fish and ditto babies are more in our line in Newfoundland."

## Grace's Quarters.

BALTIMORE, Md., Aug. 23.—There is a popular idea in the minds of most fishermen that the further away from home one goes the better fishing; in fact, many believe that it is absolutely impossible to find good fishing of any sort within miles of Baltimore, and will therefore put themselves to considerable time and expense each year journeying away from Maryland waters in search of suitable fishing grounds, which, in all probability, could be found within easy reach of their home, did they but know it. "But to think of a place is one thing, and to know it is another," said Mr. George Schaaf, president and captain of the Moonhouse Social Club.

Every frequenter of the Gunpowder, roam as much as he may, will finally fix on one particular portion of the river as his favorite. All do not choose the same locality, for from a fishing standpoint one place is as good as another; and so in this instance our members are partial to Grace's Quarters, where they camp yearly.

The club was formed several years ago by hard working young business men of East Baltimore, who yearly long for this week of their vacation. It is composed of the following members: Mr. George Schaaf, president and captain, and the Executive Committee of Messrs. George Fink, William Fehle, William Frostburg, Harry Miskimon, George Hannauer, Edward Eisenhut, William Eisenhut, George Zang, F. Quaty, William Gaffey, John S. Gittings, V. Gallenz and John Forster. They are all there, and we have "slathers" of fish when the river is in condition; it's real sport, yet fish are funny critters, and have their off days for biting.

"When they will, they will,  
You may depend on 't;  
And when they won't, they won't,  
And that's the end of it."

Grace's Quarters, Md., was the home of the late president of the Pennsylvania Railroad. It is beautifully located and admirably laid off, being within a short drive of Chase's Station, on the P., W. & B. R. R., over roads that have a strange mixture of luxury and wildness. The writer had the pleasure of visiting the shore. It was an ideal day, when the crisp morning air sets the blood a-tingle and the dewy cobwebs flash like diamonds in the rising sun, the purple haze haloes the distance and the walk more than repays for the labor expended, the stride is longer and more tireless, the appetite keener for it amid such picturesque scenery, which is one of the peculiar attractions of the place; and the greeting and the good time I had were a combination hard to beat.

The boys were out amid their native surroundings, and there was excellent fishing that day, the catch comprising white and yellow perch, rock or striped bass, jack tailors, young bluefish, bullheads or cattiees, eels and soft and hardshell crabs. They have a well built cabin, with a central building of unique construction used for a dining room. The culinary department—presided over by a genial "South befo' de war" darkey, James Chew, as rugged a bit of human timber as one can find in a month of travel. To hear old Jim spin a yarn of Massa Thompson killing ducks and catching fish is to get a taste of something not yet reduced to print. He is an expert in such matters as cornpone, Maryland beaten biscuits, fish, soft crabs and chicken suppers that are a delight to critic and epicure.

The glorious sunset as we saw it, transforming the trees and water courses, was a glowing panorama until it faded away. One cannot afford to miss becoming acquainted with the versatile manager, Mr. Joseph Newkirk. He serves to make the visitor forget that he is a guest, he is one of those men one occasionally meets in position of large responsibility, a thorough sportsman with both rod and gun, one who seems neither inflated by his success nor harassed by his many cares.

Grace's Quarters has offered hospitality to a great many different anglers and a most enjoyable fellowship pervades the angling camp. Quiet refinement is the keynote of this quaint, complete country home, and after a visit of even brief duration one fully understands why the members and guests return year after year.

"It's a jolly old life for a week or two,  
With a bunch of good fellows and nothing to do."

JOHN T. HIGGINS.

## The "Old Angler" at His Best.

Editor Forest and Stream:

Most of your readers know the "Old Angler" simply as a keen controversialist, but I wish to present him now at the age of eighty-four years as an inventor and a discoverer. Just imagine! In evidence I inclose for your inspection a trio of salmon flies which you will admit are deftly tied and superior at least to the average shop fly. They were tied as patterns for the instruction of a youngster who has contracted the *cacoethes tiendi* in connection with the desire to go fishing. The "Old Angler" calls him "his boy," and speaks well of his proficiency, for he says: "He is a quick learner, and I will shortly send you some more, some of his work, and more of my own, for I find that I am recovering some of my old deftness in the art." But the merit of the work (which requires delicate manipulation and keen eyesight) is not in its delicacy, beauty and accuracy, as fly-casters say, but consists in the fact that the flies are tied with fine wire loops instead of with gut loops, an entirely new innovation, and the wonder is, as the old man himself says, that the wire was not universally adopted long ago for salmon flies, or indeed, for all flies except the smallest trout flies, though he adds by way of accounting, that "the wire loop doubles the life of the fly, and that professional fly-dressers probably want their goods to wear out soon, so as to keep the market open for a continuous demand." It is certainly a remarkable achievement, this feat of invention and fabrication, and I would fain do the venerable record-breaker honor by giving his name were I not forbidden. However, every one knows the "Old Angler" as a prodigy of mental vigor and a Hercules in polemics, and so I would let his case rest right here were it not for his discovery, which is one of the most remarkable in scientific investigation and ought to be exploited.

In mention thereof it may be said that very little additional is likely to be learned in the life history of the salmon, so that when an observer adds something quite out of the ordinary it should be fully recognized. What the "Old Angler" has discovered then is what concerns the function of the hook on the male salmon's lower jaw. This has been a matter of speculation for decades, since it pertains only to the one sex. I myself inferred that its use was in some way associated with fecundation, which is as near any ichthyologist every came to a correct solution of the puzzle. But now the "Old Angler" says, "I am convinced that the function of this male hook is to rupture the membrane which closes the mouth of the oviduct, leading from near the gills to the vent. The old notion that the female deposited her eggs in the ridd or furrow, and that the male followed her, shedding his milt over them, is all wrong. The fish are side by side in the ridd, and the jets of ova, as they issue from the female, are met by simultaneous jets of milt from the male, and it is my belief that the ova are as thoroughly and effectively vivified in the natural process as they can be by any artificial manipulation. The female does not extrude all her ova into one ridd. The ova in the upper part of the lobes are ripe days before the ova in the lower part of the lobes, and several ridds are made, and several days occupied in the process. This part of the life history of the salmon is that least understood."

CHARLES HALLOCK.

## The Old Colony Club.

BOSTON, Mass., Aug. 25.—*Editor Forest and Stream:* The annual meeting and clambake of the Old Colony Club was held at Padanarum, South Dartmouth, on Friday, Aug. 25. This is an event of much interest to the summer people as well as the natives of towns bordering on Buzzard's Bay. In spite of a rainy morning with no indications of favorable weather for an outing, more than one hundred members made the trip in special electric, starting from Buzzard's Bay, passing through Wareham, Marion, Mattapoisett, Fairhaven and New Bedford and reaching the station of the New Bedford Y. C. at 12 o'clock.

The yacht club had extended to the Old Colony Club the use of their premises for the occasion. At the business meeting Gerard C. Tobey, Esq., of Wareham, was elected president by the unanimous vote of the meeting. Messrs. Charles S. Hamlin, Dr. Maurice H. Richardson and Thomas Jefferson, vice-presidents; Charles H. Taylor, Jr., secretary-treasurer; Charles P. Horton, W. A. Nye, George I. Briggs, John I. Bryant, George W. Fish, N. H. Emmons, G. W. Jones, Col. H. E. Converse, John W. Delano, Edward Hamlin, Theophilus Parsons, Edward Atkinson, Louis Bacon, B. H. Anthony, James L. Wesson, F. E. Elwell, B. F. Gibbs, H. Stockton, Laurence Minot, T. C. Thacher, Horace S. Crowell, members of the Executive Committee.

A resolution on the death of Joseph Jefferson, which had been engrossed, was adopted by a standing vote.

The report of the treasurer showed a balance on hand of \$992.32. The sum of \$100 was appropriated toward the expense of opposing the establishment of a leprosy colony on Penikese Island. The secretary reported that the Executive Committee were able to defeat the bill to permit the taking of menhaden for bait, which was reported upon adversely by the fish and game committee of the Legislature last winter. He also stated that some similar bill would probably be brought forward next winter, and on his recommendation the Executive Committee was authorized to take the necessary steps to secure its defeat.

After the business meeting the members repaired to Laban's Folly Hotel nearby, where the clambake was served. After dinner President Tobey presented Hon. C. S. Hamlin, who delivered an address on "Penikese and the Leper Colony," in which he reviewed in detail the various steps by which the Board of State Charities was authorized to make provision for the care of the five unfortunate persons in this State afflicted with leprosy. Although the island has been purchased no lepers will ever be placed there if the members of the Old Colony Club can prevent it. Mr. Hamlin's address was received with marked tokens of approval.

Mr. Augustus L. Thorndike, of Brewster, explained how the plan to place the lepers in the neighborhood of his town was frustrated, and condemned the Penikese location. Senator H. A. Harding, of Chatham, explained

and heartily condemned the manner in which legislation to permit the taking of the island was obtained. All the speakers expressed the opinion that as it was due to the neglect of United States officials that the lepers are here, it is incumbent on the Federal Government to make provision for their proper care, and that one of the Massachusetts Senators had stated that on the reassembly of Congress such action would undoubtedly be taken.

Dr. George W. Field, chairman of the fish and game commission, spoke upon the "Artificial Propagation of Shellfish and Crustaceans." Rev. Allan Hudson, of Brockton, in a very jovial way entertained the members for a few moments, after which, assuming a more serious tone, he paid a touching tribute to Mr. Jefferson, and said he thought the noted actor should have a monument erected to his memory on Buzzard's Bay. The last speaker was Gen. Charles H. Taylor, who after alluding in a feeling manner to the club's loss in the death of Mr. Jefferson, read a poem appropriate to the occasion.

The club has for its main object the protection of the fish in the bay from the destruction incident to the use of seines, nets and pounds. Its membership of about 200 is composed of the solid men among the permanent residents of the towns and those who have summer homes on the shores. That it is a power to be reckoned with on Beacon Hill was abundantly shown two years ago, when the American Fisheries Company employed the late Attorney-General Hosea M. Knowlton to aid in an effort to repeal the law against seining menhaden in the bay. It was a bitter fight. Mr. Knowlton was able to get the bill through the committee but no further. CENTRAL.

## Chicago Fly-Casting Scores.

THE winning scores of the Chicago international fly and bait-casting tournament, Aug. 18, 19 and 20, were given in our issue of last week. We supplement that report with the full record of scores as follows. For the full conditions of each event, see last issue:

First Event—Long-distance fly-casting:	
Feet.	Feet.
E. J. Mills.....120	A. C. Smith.....104
R. C. Leonard.....118	I. H. Bellows.....102
F. N. Peet.....108	C. F. Brown.....88
John Waddell.....107	W. T. Church.....83
H. G. Hascall.....104	

Diamond trophy, E. J. Mills; first prize, R. C. Leonard; second, F. N. Peet; third, John Waddell; tied for fourth, H. G. Hascall and A. C. Smith.

Extra Event—Salmon-casting for distance:	
Feet.	Feet.
R. C. Leonard.....141	H. G. Hascall.....121
A. C. Smith.....135	F. N. Peet.....118
E. J. Mills.....129	John Waddell.....105

Second Event—Distance and Accuracy fly-casting:	
Per Cent.	Per Cent.
H. G. Hascall.....99 10-15	A. C. Smith.....97 12-15
F. N. Peet.....99	W. T. Church.....97 11-15
R. C. Leonard.....98 11-15	C. F. Brown.....97 9-15
I. H. Bellows.....98 7-15	John Waddell.....97 5-15
H. Wheeler Perce.....98 7-15	W. McCown.....96 11-15
E. J. Mills.....98 3-15	G. A. Hinterleitner.....92 10-15
E. R. Letterman.....97 13-15	

Diamond trophy, H. G. Hascall; first prize, F. N. Peet; second, R. C. Leonard; third, and fourth, H. Wheeler Perce and I. H. Bellows, by agreement on the tie; fifth E. J. Mills; sixth, E. R. Letterman.

Third Event—Accuracy and Delicacy fly-casting, dry fly:	
Per Cent.	Per Cent.
F. N. Peet.....99 5-30	John Waddell.....97 12-30
H. G. Hascall.....98 23-30	C. F. Brown.....96 24-30
A. C. Smith.....98 23-30	E. J. Mills.....96 15-30
I. H. Bellows.....98 10-30	W. T. Church.....95 1-30

Diamond trophy, F. N. Peet; first prize, A. C. Smith won on the cast-off of tie; second, H. G. Hascall; third, I. H. Bellows; fourth, John Waddell.

Fourth Event—Delicacy and accuracy bait-casting, 1/4-oz. weight:	
Per Cent.	Per Cent.
H. G. Hascall.....98 1-15	F. D. Rhodes.....96 12-15
R. C. Leonard.....98	H. D. Armstrong.....96 10-15
Wm. Stanley.....98	H. R. Winfield.....96 9-15
E. R. Bartholomew.....97 14-15	A. Rabbers.....96 7-15
G. A. Hinterleitner.....97 11-15	D. W. Osborne.....96 6-15
N. C. Heston.....97 10-15	W. J. Jamison.....96 5-15
Tilden Robb.....97 10-15	A. C. Smith.....96 4-15
F. N. Peet.....97 10-15	E. L. Mason.....95 13-15
L. N. Place.....97 10-15	J. R. Duncan.....95 11-15
O. J. Loomis.....97 8-15	F. P. Naylor.....93 10-15
H. Wheeler Perce.....97 7-15	J. W. Bramhall.....93 10-15
O. E. Becker.....97 4-15	E. J. Mills.....93 7-15
E. R. Letterman.....97 2-15	C. F. Brown.....93 6-15
G. A. Davis.....97 1-15	H. C. Chapman.....92 3-15
E. R. Owens.....97 1-15	John Waddell.....90 14-15

Diamond medal, H. G. Hascall; first prize, William Stanley; second, R. C. Leonard; third, E. R. Bartholomew; fourth, G. A. Hinterleitner; fifth, L. N. Place; sixth, Tilden Robb; seventh, F. N. Peet.

Fifth Event—Distance and accuracy bait-casting, 1/2-oz. weight:	
Per Cent.	Per Cent.
E. R. Letterman.....98 4-10	Reuben Leonard.....96 5-10
E. R. Owens.....98 3-10	D. A. Dean.....96 4-10
O. J. Loomis.....98 2-10	J. D. Rhodes.....96 4-10
H. Wheeler Perce.....98	J. R. Dishington.....96 3-10
A. Rabbers.....98	B. L. Shotts.....96 3-10
W. E. Kidder.....98	A. Van Bochove.....96 2-10
N. C. Heston.....97 9-10	W. J. Jamison.....96 2-10
F. P. Naylor.....97 8-10	E. M. Towne.....96 2-10
J. W. Bramhall.....97 8-10	Chas. F. Browne.....95 8-10
Wm. Stanley.....97 8-10	B. F. Flegel.....95 8-10
H. G. Hascall.....97 7-10	L. N. Place.....95 8-10
I. H. Bellows.....97 7-10	P. J. Van Ornum.....95 7-10
C. F. Brown.....97 5-10	W. T. Church.....95 7-10
Wm. McCown.....97 5-10	W. W. McFarlin.....95 6-10
A. C. Smith.....97 4-10	A. H. Barnes.....95 5-10
F. N. Peet.....97 2-10	A. Wagner.....95 5-10
E. B. Bartholomew.....97 2-10	John Waddell.....94 9-10
F. W. Heminghaus.....97 1-10	E. J. Mills.....94 9-10
P. J. Linderman.....97 1-10	Arthur Webb.....94 7-10
L. J. Tooley.....97	B. J. Jackson.....94 7-10
E. M. Wertenberg.....96	Mrs. E. B. Bartholomew.....94 5-10
G. A. Davis.....96 9-10	Mrs. F. D. Rhodes.....93 7-10
O. F. Botsford.....96 8-10	E. B. Miller.....94 7-10
E. L. Mason.....96 8-10	J. D. Rowland.....93 3-10
C. W. Keiser.....96 8-10	E. P. Sperry.....93 3-10
J. E. Ammen.....96 8-10	F. W. McAnany.....93
Tilden Robb.....96 7-10	F. G. Worden.....92 9-10
G. A. Hinterleitner.....96 6-10	H. B. Noyes.....91 4-10
D. W. Osborne.....96 5-10	H. G. Armstrong.....89 2-10

Diamond trophy, E. R. Letterman; first prize, E. R. Owens, of the Kalamazoo "bunch"; second, O. J. Loomis; third, A. Rabbers; fourth, W. E. Kidder, Kansas City; fifth, H. Wheeler Perce; sixth, N. C. Heston; seventh, William Stanley; eighth, F. P. Naylor; ninth, J. W. Bramhall.

Sixth Event—Long-distance bait-casting, 1/2-oz. weights:	
Feet.	Feet.
F. B. Bartholomew.....183 49-60	R. J. Duncan.....124 47-60
F. D. Rhodes.....178 46 60	Frank Bush.....118 47-60
L. J. Tooley.....176 24 60	C. A. Hinterleitner.....118 19-60
D. W. Osborne.....167 46 60	H. E. Rice.....113 12-60
A. Rabbers.....161 52-60	John Waddell.....105 52-60
Tilden Robb.....159 3-60	C. F. Brown.....103 28-60
E. M. Wertenberg.....153 43-60	Edgar Roseman.....91 24-60
E. R. Letterman.....142 10-60	F. N. Peet.....89 31-60
Wm. McCown.....137 33-60	A. C. Smith.....86 31-60
H. G. Hascall.....132 52-60	F. P. Naylor.....43 24-60
E. B. Miller.....127 20-60	

Diamond trophy and world's record for this event, E. B. Bartholomew; first prize, F. D. Rhodes; second, L. J. Tooley, who also was awarded the special prize for the longest single cast, he having scored 194 feet 8 inches; third, D. W. Osborne; fourth prize, A. Rabbers.

## The Kennel.

### Fox Hunting in Tennessee.

BEFORE the war no part of America carried out the English traditions of this fascinating pastime as did the South, and to-day, although lacking in organization and systematic work, we have here some of the best breeds of dogs for practical uses in the country. Around Nashville we have some good packs of dogs and more enthusiasts of the royal sport. This coterie keeps up its meetings all the year round, and only the hot, dry spells of some of the summer months find them complaining, like the farmer, of the bad times of the present and the grand times of the past. Nearly all are hard-working business and professional men, and they get nervous and unfit for work, they say (to their wives) unless they get a run or two during the month. It needs but to see the comradeship of such a party as we got together last night to prove the truth of this.

We left the city at 4 o'clock, and several eyebrows went up as my overcoat was seen under my arm, for it was then blazing hot. A trolley ride to the country home of Professor Draughon and then a good dinner, and then the harnessing of the dogs into their own wagon—to keep them fresh—and we were off, leaving violet clouds and an orange sunset in the west as our steady but brisk fox-hunting mare carried us toward the south. The Professor had to complain a little of the warmth and of the lack of rain—it never does to have all conditions favorable when our favorite horse, gun or dog is put to the test; but the clapping hoofs of our equine abettor sounded so cheerful that he could not put hope out of my heart, and I saw the faint crescent of the new moon come out against the sky with more than my usual pleasure at this sight.

All good men and animals have their peculiarities and special ailments, and our mare had hay-fever, for we had scarcely come upon a hay field, the cocks standing in ample outlines against the twilight, when she began to sniff and shake her head. She finally stopped, turned around her head and began to scratch her nose against the shaft of the buggy. This was repeated to her infinite relief several times and all was well by the time we reached our meeting place. This was at Professor Alfred Ferrell's, and Mr. Dale and Mr. Ashworth also were waiting for us under the trees. I was quite lost in the flow of technical dog talk which followed. I had no idea of the many points which seemed from the energetic asseverations of my friends to be of the most vital importance. We might have still been in the discussion, but one man had no dogs to praise and he said, "Let's go."

Within a mile or so, as we trotted comfortably down the pike, we heard the joyful cry of our Blue dog (I don't know why he was called Blue). He was leading the trail and the Professor stood up in the buggy and looked over his way with great satisfaction. The pack was soon working vigorously, and then broke out in the fierce quick notes which indicated close pursuit. My hunters were able, by their intimate acquaintance with the neighborhood, to follow the line of the chase as though looking at it. Here was the picket fence, there the bad bluff where some faults were being made, now again come the exultant waves of savage melody. Reynard was evidently as game as his pursuers, for he led them almost to the city out of mere love of the race, we thought.

Finally somebody else's dog got after a young fox, and so great is the idea with dogs and men of just stopping by the way to snap up the other good thing, that even the Blue dog fell into the snare and left our entertainer of the night free to seek some dewy bed of grass to rest and smile at our discomfort.

The night fell cool and my overcoat was needed, the stars had grown pale, and the great trees of the Ayres estate, in which we were hunting, seemed to hang in heavier shadows on the night—there was nothing left for it but to drive home dozing and starting up at the strange outlines appearing all along, which darkness always gives to the most familiar objects.

EDGAR MAGNESS.

NASHVILLE, Tenn., Aug. 5.

### Points and Flushes.

THE premium list of the Richmond County Agricultural Society's first annual dog show, Fair Grounds, Dongan Hills, S. I., Sept. 4-7, can be obtained on application to the Secretary, Edward P. Doyle, Port Richmond, S. I.

### Musical Roosters.

THE following comes down from Le Sueur: "John E. Noyes, a retired merchant of Le Sueur, has a fine, large black Minorca rooster that every time it raises its voice crows a tune. There is no mistake about it, and the many musicians who have listened to his efforts all unite in bearing out the statement and in recognizing the tune he crows, which is 'The Maid Has Lost Her Shoes.' This is no made-up story, but is true, every word of it, and is directly vouched for by Mr. and Mrs. Noyes and by one of the teachers in the public schools here, who is a student of nature and close observer of animals."

Now here is a study in "new nature" worthy of the attention of its brightest student. Who taught this rooster to sing instead of to crow? By what system of evolution did he arrive at this stage of musical development? A Brahmin would solve the problem off-hand by stating that it was simply a case of the transmigration of a musical soul into the body of a rooster.

The crowing of a rooster has from time immemorial been the bane of the life of the sleepy farm hand, a sort of agricultural alarm clock as it were. Now, whether the situation would be ameliorated by having a rooster awaken you to the tune of "Hiawatha," "Bedelia" or "Dooley" is a question. Would it not be better to leave bad enough alone.

24. San Francisco, cruise.

A MISTAKEN IMPRESSION.

THE kaleidoscopic season of racing which the present year has brought forth has blinded many yachtsmen to conditions as they really exist. Unwarranted decrease in interest and a pessimistic attitude toward the future have resulted. There has never been a time when the agents which go to make vitality in the sport have been more actively at work. The general adoption of a uniform rule of rating by the leading clubs of the East has placed yachting in our waters on a firmer footing than has ever been the case before in this or any other country. An increase in the number of long distance events for boats of cruising type has developed something more than a knowledge of mere harbor sailing. American genius and seamanship have been tested and not found wanting in three international events—the struggles for the Canada and Seawanhaka cups and the transatlantic journey for the trophy offered by the Emperor of Germany. These achievements will go down in history and be read long after the victories and defeats of this year are forgotten. There is every reason to believe that the signs of health are not merely of momentary nature. The racing and building of this year have demonstrated that no mistake was made in adopting the new rule. Friends now stand where enemies were once entrenched, until to-day the owners of boats, heavily taxed by the new formula, are about the only interested ones who do not regard the advent of the new regulations as a boon to yachting. Building should be greatly on the increase during the coming winter. The uncertainty existing when almost every organization had its pet method of measurement has been effectivly removed. Now a yachtsman can place an order for a craft knowing that he will be able to sail at any of the prominent clubs with the same rating and a good chance of meeting class competitors. Such conditions not only tend to encourage the building of new boats, but assure the disposal of such craft at any time at a fair price. With only a few weeks more before hauling out time the horizon is clear and the brightest prospects are held out for the season of 1906.

POWER BOAT LEGISLATION.

THE American Association of Masters and Pilots of Steam Vessels is endeavoring to secure the co-operation of the Department of Commerce and Labor in asking Congress to pass laws which bring all power craft under the regulation of the Government Steamboat Inspection Service. Boats under fifteen tons are now exempt from Federal jurisdiction. One of the claims made is that many small craft are handled by unlicensed pilots in such a manner as to be a menace to navigation, showing no side lights at night and in other ways violating the ordinary rules observed by boats of all classes. It is to be regretted that the latter charge is not without foundation. With the development of the easily operated marine motor the number of power boats has grown rapidly within the last few years. Too often have owners fallen into the mistake of thinking that the handling of the wheel and the operation of the engine is all the knowledge required to fit one for successful motor boating. The possessor of a power creation, however small, should make it a duty to learn at least the ordinary rules by which water traffic is regulated. Few people would think of driving through a crowded street without conforming to the rules which time and custom have laid down for horse drawn vehicles. No less a reason exists for a thorough knowledge among power boat men of the regulations governing traffic at sea.

Seawanhaka Conditions.

MONTREAL, Que., Aug. 21.—*Editor Forest and Stream:* The writer, with others, was much surprised at the tone of the leader in your issue of 19th inst. in reference to the Seawanhaka international race. In arguing for a change in the rules governing these races for the challenge cup you refer to the type of yacht developed in the past as being altogether undesirable, and suggest that such yachts as the Gravesend Bay 22-footers or the Herreshoff 30-footers should rather be encouraged. As the Canada Cup provides races for yachts as small as the 30-footers, most yachtsmen, I feel sure, would like this cup to continue to be for the encouragement of day boats, which will always differ materially from cabin yachts. If this is so, the question is whether the boats developed heretofore for these races have proved to be suitable and desirable day boats.

The writer has had the good fortune to have had some experience of the yachting all over the English speaking world, including Australia and New Zealand and many years on the Clyde, but after becoming acquainted with these Seawanhaka yachts I have no hesitation in deciding in their favor, and for the following reasons:

1. SAFETY.—A keel boat which is not wholly and carefully decked in may prove a veritable death trap, foundering in a quite moderate sea or going down after being struck by a squall. The Seawanhaka boats have ample buoyancy when filled with water, and have enormous initial stability.
2. ROOMINESS.—It is possible to comfortably carry more people in one of these yachts than in any other yacht of similar size.
3. COST.—These yachts are much less expensive than ballasted yachts of similar size, and as the future of yachting depends largely upon the opportunity afforded the younger (and usually less affluent) members of our clubs, this question should be carefully considered.
4. SPEED.—There is no doubt that in this quality the Seawanhaka yachts have no rivals afloat. The ability to "get there" is to-day more than ever necessary in our yachting. This small class lends itself much better to the development of speed than does any other.

Even if these claims of superiority were wholly unwarranted it seems to me that Uncle Sam should hesitate to make any change in the conditions governing the Seawanhaka Cup racing until he introduces a more desirable type in the America's Cup contests, the rules in these races being so localized that yachtsmen abroad have now definitely refused to submit themselves to them.

I hesitate to refer to one other point but will only just mention it. This cup has become famous through the contests waged over it in the present type of yacht. If the type is radically altered the cup at once loses all value as an international trophy, as that value is wholly due to its history in connection with the Royal St. Lawrence Y. C. The suggestion of shutting out that club from all future contests is altogether unworthy of a sportsman.

SCOTSMAN.

[The possibility of the Royal St. Lawrence Y. C. being forced from further competition is by far the strongest argument put forth by "Scotsman" for a retention of the present Cup conditions. In the editorial to which exception is taken the "suggestion of shutting out that club from future contests" was not made. The exact words were:

Any move which might bar from further competition the sportsmen who have so gallantly defended the trophy for nearly a decade would be regretted; nevertheless, even if such a result be unavoidable, the general welfare of yachting is to be taken into consideration.

If through the introduction of the keel boat members of the Montreal club, because of purely local conditions, should find it impracticable to again race for the cup, there would be no remedy for such a result, although it would be regretted the world over. "Scotsman" fails to grasp the breadth of treatment necessary when considering the general good of all yachting.—Ed.]

Chicago Letter.

THE sensation of the past week in Chicago yachting circles has been the announcement that Mr. Fred A. Price, commodore of the Columbia Y. C., stung by the criticisms brought about by his neglect of the chances of his organization in the Lipton Cup series of races recently contested here and won by the Detroit Country Club 21-footer Ste. Claire, has decided to quit the racing game for good. It was also rumored that Mr. Price had decided to resign from the commodoreship of the Columbia Y. C., but this rumor is unfounded. While it is extremely doubtful whether he would be a candidate for the office again, even if it should be offered him, he is not likely to throw down the burden of his responsibilities at the present time.

While Mr. Price's methods and personality have not endeared him to a majority of club fellows, he has many staunch friends who recognize that he has done more for the yachting game in Chicago than any other individual member of any club here, and they regret to see him step down and out of active competition. His warring spirit has been for competition and aggressive development. He has led the Columbia Y. C. through some narrow and arduous paths to a degree of success, and has brought into the sport many men of money and influence. He has been liberal in building and buying yachts to uphold the glories of the organization which honored him by repeatedly electing him to its highest office, and he has lavished his time in promoting the interests of the club. He owns now two of the best boats on the lake—the famous old sloop Vencedor, for years queen of these waters, and the handsome new auxiliary yawl Juanita, one of the biggest and finest cruisers on fresh water.

That Mr. Price is a bad loser he himself admits. It is his main fault and it is this trait that caused him to lose interest in the new Lipton Cup defender, Quien Sabe, when she did not show up as well as he hoped for her.

"I am out of racing," Mr. Price says. "I shall not give up the game, for I enjoy it too well. I will confine myself to cruises in Juanita when I can spare the time from my business, which is growing to such proportions that I really cannot take as active an interest in yachting as I did formerly."

Quien Sabe was sold at auction on Aug. 21 and bought in by Mr. Allan H. Pirie, a Chicagoan who is better known in yachting circles on the Sound than he is in these waters. Mr. Pirie had hopes to get the beautiful little 21-footer into condition to take her to Detroit to race for the Walker and Country Club cups, both of which are open to this class. He found that the alterations necessary to put her in winning shape would not be completed in time for the event, so he gave up the idea and will try out the boat so as to get her in shape for the next Lipton Cup races. Chicago will be represented in Detroit by Yo San, formerly owned by Commodore Price and now the property of Mr. David Hammond.

Yo San has been in Mackinac all summer where Mr. Hammond has been residing and is now on the way to Detroit. The boat is faster than ever before and Columbia sailors hope she may win some of the honors from the Michigan sailors.

She will be well sailed as Mr. Hammond has developed a crack crew with "Billy" Avery as skipper, himself, Frank Kehoe, Sam Avery and Ray Thorne as crew. This crew is remarkable in that it is composed of five of the fastest and best swimmers in Chicago, all of them being members of the famous C. A. A. swimming and water polo team, which has an unbroken string of western victories to its credit, only the New York A. C. ever having lowered its colors.

The fourth leg in the series for the National Sportsman's Cup was sailed on Aug. 26, five 30-footers of the Columbia Y. C. being sent away on the short-end course at 2:30 o'clock. Columbia finished first, but lost out on time allowance to Privateer. Gloria finished third. In the cruising class but two yachts accepted the issue, Jeannette leading Charlotte R. to the finish line by 15m.

The yachts were started from the club house in a light, puffy wind that changed frequently from E. to N.E. Privateer crossed the line first, Gloria, Nymph, Columbia and Smuggler following in order. At the last minute the judges decided to change the course of the race from the regular Columbia run around the two cribs to a leeward and windward race around the four-mile crib and return. The first leg was a beat to the crib, Privateer leading more than half the way to the mark before the Columbia, pointing higher, could overtake her.

Rounding the crib the Columbia led by 4m., and from that point she always held the others safe. Privateer was second. On the run to the gap, the finishing line, Privateer picked up 3m. of the time she had lost on the first leg and came within an ace of winning from Columbia without time allowance.

Columbia crossed the line at 4:43:25, but lost first place to Privateer, which made up all but 20s. of the 3m. lead Columbia had gained on the first leg. Privateer finished at 4:43:47 and Gloria was third at 4:49:11. She only beat Smuggler in 4s.

The Chelsea clock seems in a fair way to become the property of Jeannette, which has won two legs in the series for the trophy. Charlotte R. was the only other starter in this class. They took the same course as the 30-footers, Jeannette finishing at 5:04:10 and Charlotte R. at 5:18:25. Following is the standing of the competitors for the Sportsman's Cup:

	Former Points.	New Points.	Total
Columbia	12	4	16
Nymph	10	1	11
Privateer	6	5	11
Smuggler	8	2	10
Gloria	0	3	3

J. M. HANDLEY.

## Onkama Sailing Club.

THE first annual cruising race of the Onkama S. C. proved a great success in every way. Outside races on courses long enough to make navigation an important element will henceforth hold prominent places in this club's schedules. The race was from Manistee, Mich., to Kewaunee, Wis., straight across Lake Michigan, a distance of 59 miles. The start was made on the evening of Aug. 5 in order that the skippers should be thrown entirely on their own resources in the matter of navigation. The finish showed that this was the controlling factor.

Four yachts, all of the cabin yachts of the Onkama S. C., sailed the race. They were the 21-footer Eleanor, late of Chicago; the Togo, an old-fashioned sloop, 33ft. over all, and the two little cutters, Lydia Pinkham and Belle Marie. It was the Pinkham's first race, and her mast was stepped only the day before the start. The two last named are 20ft. waterline, but are unusually able little craft.

As in all Onkama S. C. races, arbitrary handicaps were imposed. Eleanor and Togo allowed Lydia Pinkham 30m. and Belle Marie 60m. Lydia Pinkham allowed the last named 30m. It was arranged that the start should be made by casting off lines from the Manistee Pierhead, because there is insufficient room for maneuvering inside, and darkness made it impossible to start outside of the channel. The first yacht to finish was required to report to the life saving station a Kewaunee and take the times of the succeeding yachts. The start was set for 10 P. M.

Contrary to expectations, the weather was favorable to a quick and easy passage. The course of W. by N.  $\frac{1}{4}$  N. brought the wind on the beam. It was a fine moonlight night with enough haze to obscure a craft distant a hundred yards or more. The sea was smooth. Pinkham was first out in the weather position with Togo under her lee. Eleanor quickly showed her quality by passing through Pinkham's weather, and she was not passed during the race. On Belle Marie an immense balloonjib was set, and as soon as she cleared the pierhead it scooped up a hoghead or more of water. It was apparent that the wind was not fair enough to make it advantageous, so in it came. The time thus lost was made up in a few minutes, and the little cutter threatened to pass between Pinkham and Togo, when the former got things more to her liking, and slowly drew ahead until she disappeared in Eleanor's wake, one point above the charted course. Then for an hour or more the two stragglers engaged in a luffing match. Unable to weather Togo, Belle Marie finally accepted a leeward position, and fell off on the true course.

Never was an outside race sailed under more enjoyable conditions. The breeze freshened and drew more fair after midnight. There was nothing to do but hold the course, smoke, and listen to the swish of the little seas that lapped along the starboard side.

Morning dawned fair with the wind still holding fresh and the water smooth. On board Belle Marie we first made out a yacht slightly ahead and five or six miles to windward. She was Lydia Pinkham. Dead astern was a sail that afterward was hidden by the sun. This was Togo, though we didn't suspect at that time that we had left her so far in the night. To help out on sail we carried our No. 2 jib upside down to fill the space under the staysail. About 5 o'clock land was made out, and from that time all hands were busy looking for signs of port. Kewaunee does not show up well from the lake, but Algomah, nine miles to windward, looms large. We easily made out the latter town when about fifteen miles from land, and held a course a few miles to leeward. Two of the yachts we knew were further from Kewaunee than we, and both gave us time. Eleanor we supposed had already made port, and we could hope for no better than second position at the best.

But a little later a sail was made out against the green of the Wisconsin hills. Could it be Eleanor, squared away before the northeast wind, looking for her port after holding some miles too high? This was our suspicion, and such soon proved to be the case. When convinced of this we put our helm up, got out a spinnaker, and soon were racing down wind. Finally Kewaunee was made out, and we were able to time Eleanor as she entered. Twenty-five minutes later we rounded the pierhead, and received a salute from the fog station. Togo, coming through the haze in the east on a better course than ours, was saluted eighteen minutes later. Pinkham, we knew, had mistaken her port. She came down the beach about an hour later.

It appears that on Eleanor a course one point high had been held in the expectation that the wind would draw to northwest on the further shore. The course was covered much faster than was anticipated, and not until it was seen at a distance of less than half a mile that there was no fog station on the piers at Algomah, whither she pointed, did her crew realize their mistake. With Pinkham the blunder was ludicrous. She sailed into Algomah, a new port to all on board, and finding no other yacht in the harbor, a ringing cheer was given for victory. "Look out, or you'll be on a rock," sung out a man on the bridge. "Well, where in blazes are we?" demanded her skipper. "In Algomah," was the disheartening reply. "Down helm, ready for stays, out we go," said Pinkham's skipper.

At 4 o'clock the same afternoon, with a fresh northeast wind, all four yachts started on a cruise to Ludington, the course being about S.S.E. and the distance 63 miles. This time there was a sea running, and Togo soon took up her rightful position near Eleanor, leaving the two cutters in each other's company and far astern. All carried double reefs but Belle Marie, which swung full sail. But as the wind increased toward sunset, we snugged down to two reefs and No. 3 jib. At the same time Pinkham reduced to three reefs in mainsail and no headsail, and the two larger yachts to three reefs and small jibs.

The moon rose with a threatening ring around it, and at 10 o'clock the wind backed two points and made a rough cross-sea. At 11 o'clock it was dead ahead, so we went on to the starboard tack, which was held until 7 in the morning. It was a night well calculated to try out small craft. The wind switched just enough to keep the seas extremely rough, and the yachts that escaped solid seas were thoroughly drenched with crests.

A good view of the Michigan coast was made out at 7

A. M. and we found ourselves about 20 miles west of Arcadia, or 25 miles northwest of Manistee. Going on to the port tack we fetched a lee under Big Point Sauble just before noon, and sailed to Manistee in smooth water, arriving at 2 P. M. Pinkham came in at 4:30 and Togo at 5 P. M. Eleanor was so far ahead of us that when her position was made out early in the morning she was close to Point Betsie. She entered Frankfort at 8 A. M. and sailed to Manistee the succeeding day.

All of the boats had made fairly good weather on what was a decidedly trying run, for it is no joke to be headed in mid-lake by half a gale of wind in a yacht 20ft. long on the waterline. All of the skippers and crews, eighteen in all, were strictly amateurs. Further outside racing is scheduled for the present season, and next year the chief event will be a handicap race to Kewaunee and return without stopping, to Onckama, the club's home port, a distance of 120 miles.

HERBERT L. HARLEY.

## Eastern Y. C.

### Ocean Race—Marblehead to Halifax.

THE ocean race of the Eastern Y. C. from Marblehead to Halifax resulted in victory for Elmina in the large schooner class, and for Hope Leslie in the smaller schooner class. The start of this race has already been given in these columns. Corona got away first in the larger schooner class, while Hope Leslie was first to start in the smaller schooner class, with Agatha on her weather quarter. Elmina, Corona and Hope Leslie arrived at Halifax on Wednesday. Elmina arrived first and Hope Leslie, while Corona was about seven hours behind Elmina. Corona had led Elmina all the way, in light breezes to squalls, from S. to S.W., until she had reached the Nova Scotia coast and lost the race through failure to pick up the whistling buoy off Sambro Head. It is evident that Hope Leslie led her class all the way. Black Hawk, the smallest boat racing, reached Halifax on Thursday. Agatha encountered fog and put in to Bar Harbor.

The little sloop Sauquoit had a tough time of it. The balloonjib was split, and after passing Cape Sable four reefs were tucked in the mainsail. Sambro buoy was passed, the boat running some 30 miles beyond it, and heaving to for hours until the fog cleared. Sauquoit was given a special prize, as she had no class competitor.

At 9:30 o'clock on Tuesday morning Corona's balloonjibtopsail was blown clear out of the bolt ropes by the strong S.W. breeze. She was then 160 miles from Marblehead and 167 from Halifax. She had Cape Sable Light abeam at 1:15 P. M. and at 4 o'clock Elmina was sighted between four and five miles in her wake. Both were carrying spinnakers to starboard at that time. A thick fog set in at 6 o'clock. It lasted all Tuesday night and most of Wednesday.

The following excerpt from the log of Corona shows what a baffling time the boat had before getting into Halifax Harbor:

Tuesday.—7:30 A. M., light fog; 8:15, fog very thick; 9, log 152½ miles; 1:15 P. M., Cape Sable Light, bearing N.E. by E., distance 5 miles, log 212½ miles; 3, log 227½ miles; 4, log 236¾ miles; 4:45, log 244 miles; 6, thick fog, log 257¼ miles; 8, fog still continues with wind freshening; 10, still foggy, log 307 miles.

Wednesday.—12:30 A. M., strong breeze, S.S.W., no sign of Sambro whistle buoy or Sambro gun, about 15 miles E. of Sambro whistling buoy, strong swell on; 6, thunder, lightning and rain storm, clearing away the fog, log 348 miles, Hope Leslie about N.E.; 8, log 361 miles; 11:30, Pennant Point whistling buoy ahead; 12:40 P. M., Sambro buoy abeam to port, log 387½ miles; 2:20, Chebucto Head, still foggy; 3, clearing, log 404 miles.

The official summary of the race follows:

Schooners—Class B.		Start.	Finish.	Elapsed.	Corrected.
		Aug. 21, A.M.	Aug. 23, A.M.		
Elmina, F. F. Brewster	10 32 00	8 25 18	45 33 18	45 53 18	
		P. M.			
Corona, A. F. Luke	10 31 06	4 51 02	53 19 56	52 53 17	
Class E—Schooners.		Aug. 24, A.M.			
Hope Leslie, L. Minot	10 35 42	11 27 31	48 51 49	48 51 49	
Black Hawk, C. Gibson	10 31 00	9 51 14	70 14 14	62 02 46	
Agatha, W. S. Eaton	Did not finish.				
Sloop Class.		Aug. 24, A.M.			
Sauquoit, T. K. Lothrop, Jr	10 36 52	11 51 58	72 15 06	72 15 06	

### ON BOARD BLACK HAWK.

MONDAY, the day of the start, dawned bright and clear, but with the wind in the east, where it had been for over a week. The large number of prospective entries dwindled down to five starters, Corona and Elmina in Class B, and Hope Leslie, Agatha and Black Hawk in Class E. The preparatory gun was fired at 10:20, and the one starting the big schooners at 10:30. The Class E vessels started at 10:35. The wind was E., very paltry. All stood off shore to clear Half Way Rock. Then all but Black Hawk went to the starboard tack and stood along the shore as far as Gloucester. Black Hawk stood out to sea until she could clear Thatcher's Island on the other tack. This proved a mistake, as at Eastern Point the other vessels were a mile or two ahead. Thatcher's Island was passed at 5:30 and the wind hauled to S.S.E., enabling us to lay our course for Cape Sable. It increased to a good sailing breeze, and Black Hawk commenced to get a good move on.

Monday night was a beautiful one, the wind holding true and strong and hauling gradually to the S.S.W., so that we set the balloon jib at 10:30. This sail was kept on the boat until noon of the next day, when the wind became a little too strong.

Tuesday was bright and clear until afternoon, when we suddenly ran into a fog bank. Black Hawk reeled off 8 and 9 knots all day long, the wind being just abaft the beam and with every sail set.

At noon the owner took observations for latitude and longitude, which tallied within a mile or two with the dead reckoning. This exact knowledge of our whereabouts was of great value when along toward night we ran into thick fog and realized that we should have to round Cape Sable and its dangerous outlying rocks entirely by dead reckoning. We passed by the Cape about 9 o'clock, plowing along with rail awash, every sail still set and the fog very dense. We passed

a tug about this time, which reassured us as to the safe extent of our offing.

At 10:30 we swung off E.N.E. for Halifax. At dawn we had some severe thunder showers, one squall compelling us to get down our upper canvas and mainsail in a hurry. The fog shut in again after the showers, while the wind remained S.W. and very light.

At 11:50, Wednesday morning, we made the buoy off La Hare River and laid our course from there for the whistling buoy off Sambro Island. The wind was very light all day and finally flattened entirely when we were a few miles west of Sambro Light. The fog disappeared about 8 o'clock, and the rest of the night was a drift with barely steerage way. At sunrise we were off Chebucto Head, the first land to be seen since leaving Cape Ann.

For several hours we drifted along up Halifax Harbor until within half a minute of the finish we got a S.W. full sail breeze and swept across the finish line in fine style, receiving salutes from the Halifax Y. C., the assembled yachts and the cruiser Canada. Black Hawk finished at 9:51. We found that the Elmina, Corona and Hope Leslie had arrived before us, Agatha and Sauquoit being still unheard from.

NORMAN L. SKENE.

## Plymouth Yacht Club.

PLYMOUTH, Mass., Aug. 25.—Ladies' day with the Plymouth Y. C. was celebrated by a picnic at the Gurnet. With members and their friends the party numbered over 200, and the sailboats, launches and other boats connected with the club were called into use to transport the party. Baseball and other sports occupied part of the time. Dinner was served in the pavilion. During the afternoon, through the courtesy of Captain Rogers, of the Gurnet Life Saving Station, the crew gave a practice drill, including the capsizing of the surf boat. This drill was much appreciated by all the party, many of whom had never seen anything of the kind before.

The twin lighthouses were also open to the party, and the workings of the light explained to the visitors. These lights were one of the earliest established light stations on the Atlantic coast. A southwest wind made the return trip a bit rougher than the trip of the morning, but the celebration of the day was carried through without any mishap and was voted by all as one of the best outings the Plymouth Y. C. ever had.

The motor boat Glissando, of the Fall River Y. C., winner of second prize in the recent motor race from New York to Marblehead, was a recent visitor in our harbor, putting in here for the night on the return trip after the race. The boat attracted considerable attention and most favorable comment, both on the comfortable, yet compact, arrangement of interior, and upon the ease with which the boat was handled and moved through the water.

F. H. C.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

YACHT SWEETHEART LAUNCHED.—The new gasolene yacht Sweetheart, built by the Gas Engine & Power Co. and Chas. L. Seabury & Co., Cons., for Mr. H. C. Sauer, of Philadelphia, was recently launched at the Morris Heights yards, and was taken away by the owner, who will use her in the vicinity of Chesapeake Bay. This yacht was designed primarily for day cruising service, and is built along lines similar to large launches of a special type, of which this season the Seabury Company have built several. The general dimensions of the new yacht are 65ft. over all, 56ft. on the waterline, 12ft. beam, and 3ft. draft. The construction of the boat is first-class, and the very best materials have been used. The forward cabin is divided into two compartments. Going aft from the saloon a passageway on the starboard side leads into the main cabin and dining saloon. A large galley compartment is located forward of the dining saloon on the port side. The motor room is amidships located on the port side of passageway. The motive power consists of two latest pattern Speedway 6 x 6-inch gasolene motors, four-cylinder, four-stroke type, which will give the yacht a speed of 10½ miles an hour. A military mast is fitted over the forward deck.

JAMES HOGARTH DEAD.—James Hogarth, father of the well known Clyde skippers Archie and William Hogarth, was recently drowned by the sinking of his fishing smack after a collision. Two other men on the foundered vessel were saved. It is supposed that Hogarth became entangled in some of the gear or rigging. The deceased was over 70 years of age.

ATLANTIC Y. C. RACE TO FIRE ISLAND.—Conditions have been announced for the Atlantic Y. C. race for schooners to Fire Island and return, which starts from Sea Gate on Saturday, Sept. 2. Former Vice-Commodore Frederick D. Underwood offers a valuable cup for first prize. Competition is open to schooners in any recognized club in classes E or above, all sailing in one division on regular time allowance.

RECENT SALES.—The sloop Ondawa, formerly raced by Mr. Henry J. Roberts, has been sold to Col. David E. Austen. The latter recently disposed of his schooner Wayward to Mr. C. Augustus Seton. Messrs. J. H. & W. D. Haviland have sold the sloop Bonito to Mr. J. Bertrand, of the Stuyvesant Y. C. To take the place of Bonito Messrs. Haviland have bought the yawl Sakana of Mr. Robert McCreery.

BELLE HARBOR Y. C. INVITATION REGATTA.—The new Belle Harbor Y. C., whose station is at Rockaway, announces an invitation regatta to be held on Saturday, Sept. 2. Racing length will be computed by the old rule. The Atlantic, Brooklyn, Marine and Field, Bensonhurst, Bayswater, Bergen Beach and Canarsie Y. C.'s have been invited to compete.

Royal Nova Scotia Yacht Squadron.

Halifax, N. S.—Saturday, Aug. 26.

The famous Prince of Wales cup, presented to the Halifax Yachtmen in 1880 by the present King of England as a perpetual challenge trophy, was sailed for on Aug. 26 over a course of 30 miles, and won by Frederick F. Brewster's new schooner Elmira, competing in the colors of the New York Y. C.

The other American yachts entered were Corona, the schooner Hope Leslie, flagship of the Eastern Y. C., and the schooner Cossack, also of the Eastern Y. C.

While all the boats entered were competing for the Prince of Wales cup, the entries were divided into four classes, and in each class a silver bowl with handles was offered as a special prize by the Royal Nova Scotia Y. S., under the direction of which the race was sailed. The winners of these cups were Elmira, Gloria, Cossack, and the 33-footer Princess, a Crowninshield designed boat, built at Port Hawkesbury. The cups become the property of the winners, but the Prince of Wales cup must be returned next year to be raced for at Halifax.

The course was over two sides of a right angle triangle, 7 miles on the base and 8 on the perpendicular. The wind was S.E. at the start, later shifting to E. by S. The first leg was a close reach, then came a beat of 8 miles, a run of 8 miles and a reach home. The breeze was strong and steady throughout the race.

Corona took the lead at the start, and for 2 miles sailed a neck-and-neck race with Elmira, which she finally passed, forcing her way by to weather. Elmira at once luffed out and tacked, making a short hitch. The tack proved unnecessary, as the yacht could lay their course easily for the turn after getting free of the land.

At the first turn Corona had a lead of a minute and a half. On the wind Elmira pointed higher, and in the 8-mile beat made good her loss, with four minutes added. On the run and reach of 15 miles home the lead was not changed. It remained four minutes at the turn and practically the same at the finish.

Gloria was nearly five minutes behind at the finish, though she sailed a good race for a boat of her length. The smallest entry was one of the Duggan scows, which came from Sydney, and owing to her low rating, it was thought she might snatch the prize. Chances were against her, and she was distanced by the big schooners. The summary:

Table with columns: Class, Name, Elapsed, Corrected. Includes entries like Elmira, F. F. Brewster, N. Y. Y. C., Corona, A. F. Luke, E. Y. C., Hope Leslie, L. L. Minot, E. Y. C., Gloria, J. K. L. Ross, R. C. B. Y. C., Cossack, Henry A. Morse, E. Y. C., Hermes II., I. L. Lovitt, Y. Y. C., Princess, G. Wright, R. N. S. Y. C., Menotah, S. Allen, Chester Y. C., St. Lawrence, E. Mosley, R. C. B. Y. C., N. Y. M., Bethune, R. N. S. Y. C.

The race sailed on Friday in Halifax Harbor for a silver cup presented by Commodore Laurence Minot, of the Eastern Y. C., in recognition of the hospitality of the Royal Nova Scotia Y. S., was won by the cutter Gloria, owned by J. K. L. Ross, son of James Ross, of the Dominion Steel interests, and sailed by G. Herrick Duggan, the well-known designer of Seawanhaka cup defenders. The wind was light from the N., and Gloria led all over an 8-mile course, after passing the 33-footer Princess, a Crowninshield boat, which took the lead at the start, but lost it in a short time owing to her throat halliards parting. The race was open to local boats only.

Manhasset Bay Y. C.

Cruising Race, 70 Miles—Aug. 26-27.

SEVENTEEN boats of all classes entered the cruising race of the Manhasset Bay Y. C., which was started on the afternoon of Saturday, Aug. 26. Of these, fifteen were sloops, one a catboat, and the other a yawl. The course lay from the start off the club station at Port Washington, L. I., to Middle Ground Light, Stratford Shoal, and return, a distance of 70 nautical miles. Time allowance was figured according to measurements under the new rule. The winner of the event proved to be J. A. Mahlstedt's Okec, a boat of the 22ft. class, sailing in the colors of the New Rochelle Y. C. She was one of the smallest in the fleet. Finishing sixth, Okec defeated on corrected time, Stuyvesant Wainwright's N. Y. Y. C. 30-footer Cara Mia, first to finish, by 52m. 46s., thus securing the cup valued at \$100 offered by Mr. Howard Gould. Cara Mia got the \$50 cup offered by Mr. Geo. E. Schank, as second prize. Third prize, a cup valued at \$30, offered by Rear-Commodore R. W. Bainbridge, was won by L. D. Huntington, Jr.'s sloop Gauntlet.

Considering the short time at hand to secure entries for the race, the number of starters is quite remarkable, and a tribute to the committee in charge of the event, which consisted of Col. Fred A. Hill, Chairman; E. M. McLellan and Charles E. Bancroft. The race was started at 3:10 P. M. from the steam yacht Alera, owned by Vice-Commodore Cowl. The breeze was blowing north at the time, giving the boats a reach to the Sound. Alera was first over, followed by Cara Mia and Gauntlet. Maid of Meudon and Satanita were late in getting away.

The wind hauled into the N.E. before the yachts had run out of the bay. On rounding the point off Plum Beach, it was found to be almost dead ahead and blowing fresh, making windward work to the Shoal. The wind was fagged out by sundown and retired. It was almost a dead calm for some hours. When the breeze returned, it was from the S., and the racers who had hung to the Long Island shore, were better off than the others. Cara Mia was first to turn the light, at 3m. after midnight. The times of the others were: Alert 12:48:00, Mimosa I. 12:55:00, Alera 1:08:00, Maid of Meudon 1:16:00, Okec 1:22:00, Alyce 1:45:00, Heron 1:45:00, Acushla 1:55:00, Firefly 1:58:00, Elver II. 2:00:00, Gauntlet 3:01:00.

The wind freshened on the journey home, the boats finishing in the same order as the light was turned. Cara Mia crossed the line at 5:23:47 A.M., and Gauntlet, the last of the fleet to finish, was timed at 8:08:10. Measurements of some of the boats were not forthcoming. Of those received, the N. Y. Y. C. 30-footers Cara Mia, Maid of Meudon, and Alera, were rated at 26.69. Alert measured 30.13, Mimosa I. 27.5, Heron 20.12, Okec 18.92, Gauntlet 16.53, and Acushla, scratch boat, 35ft. In the matter of time allowance, the thirties got 1h. 12m.; Alert, 33m. 5s.; Mimosa I., 1h. 3m. 4s.; Heron, 2h. 33m. 5s.; Okec, 2h. 59m. 2s., and Gauntlet, 3h. 44m. 6s. The summary follows:

Table with columns: Name, Finish, Elapsed, Corrected. Includes entries like Cara Mia, S. Wainwright, Alert, J. W. Alker, Mimosa I., M. T. Raborg, Maid of Meudon, F. W. D. Guthrie, Okec, J. F. Mahlstedt, Alyce, H. A. Jackson, Jr., Acushla, G. E. Ray, Heron, J. Le Bottillier, Firefly, Guy Standing, Gloria, H. D. Brown, Elver II., G. A. Enell, Gauntlet, L. D. Huntington, Jr., Satanita, C. A. Fairchild, Grace, C. P. Pearson, Hanley, C. Mallory, Marguerite, W. F. Clark.

Power Boats at Long Branch.

Saturday, Aug. 26.

CHARLES PETERSON'S Dream won the final race for the championship motorboat cup, held off Highland Beach, Long Branch, on Saturday, Aug. 26. The Flying Dutchman was second. The Peterson boat had already captured one race for the trophy. Another had gone to J. J. McKenzie's Ludo on corrected time. The latter did not compete in the deciding event, being disabled. The summary of the race, including two other events, follows:

Power boats, 20ft. and under, 3 miles: First Joseph S. Mount, of Seabright, Mount; second, Hartwig Bush, Newark, Outing; third, Phil Bowers, Jr., Newark, Agnes. Time 15m. 4s.

Power boats over 30ft., 1/2 mile: First, Ben Doughty, of Atlantic Highlands, Three Links; second, Peter Cornwall, Highlands. Time, 18m. 34s.

Automobile boats, 16 miles, last race of series for championship cup: First, Charles Peterson, Highlands, Dream; second, Charles Peterson, Flying Dutchman. Time 1h. 6m. 12s.

A. P. B. A. Challenge Trophy.

Chippewa Bay, N. Y.—Aug. 24, 25 and 26.

THE motorboat Chip, owned by J. H. Wainwright, of Philadelphia, and competing as the Chippewa Y. C. defender, won in three straight races of the series for the American Power Boat gold challenge trophy, which was decided on Chippewa Bay on Aug. 24, 25 and 26. Ten boats started in the first race, six in the second, and five in the deciding event of the match. The cup offered, by Commodore Frederick G. Bourne, of the New York Y. C., for the boat making the best average corrected time for the series, was won by H. A. Lozier, Jr.'s Shooting Star II., competing under the colors of the Manhasset Bay Y. C.

The ten original starters in the first race were Chip, Chippewa Y. C.; Shooting Star, Manhasset Bay Y. C.; Flip, Hartford Y. C.; Skeeter, New York Y. C.; T. Z. R., Frontenac Y. C.; So Long, Thousand Islands Y. C.; Flying Dutchman III., Rhode Island Y. C.; and Inveise, Riverton Y. C. Chip, Inveise, T. Z. R., Shooting Star, Flip, Skeeter and So Long started in the second race. The latter broke down, and the others finished in the order named. In the deciding event were Chip, Inveise, Shooting Star, Flip, and Skeeter. The finish of this race was exciting, Chip gradually overhauling Inveise and winning by only 2s.

At the conclusion of the races, which were well attended throughout, J. H. McIntosh, secretary of the American Power Boat Association, officially disbanded the cruise of the organization. The committee in charge of the challenge trophy races consisted of S. G. Averell, Chippewa Y. C.; R. H. Eggleston, Thousand Islands Y. C., and Paul Dashiell, Annapolis.

Hempstead Harbor Y. C.

Long Island Sound—Saturday, Aug. 26.

THE fourteenth annual regatta of the Hempstead Harbor Y. C. was sailed over courses on Long Island Sound on the afternoon of Saturday, Aug. 26. Thirty-eight boats started in the different classes, all but seven of which finished. The winners were Neola II., Nora, Rascal, Answer, Ace, Hour, and Broadbill. A fresh N. E. breeze gave the starters plenty of work. Two accidents were recorded during the day. H. I. North's Sea Cliff one-design boat Kim capsized when going to windward. Neither the skipper of the boat nor the crew of one man appeared to swim well. The regatta committee, led by John J. White toward the overturned craft to her moorings. F. L. Babbitt's sloop Spinster carried away her throat halliards and withdrew.

As usual, a great deal of interest in the event centered in the struggle among the N. Y. Y. C. 30-footers, for which Com. John S. Appleby offered a special prize. Eight of the class started, the others being in the cruising event of the Manhasset Bay Y. C. and at Newport. Neola II. won, beating her competitors by a large margin. Atair was second boat, 6m. 44s. away. Dahinda was third, 17s. after Atair.

Eight of the raceabouts started, Nora finally winning out from Pretty Quick by 2m. 24s. Ace led the 18-footers, and Hour took the measure of the Larchmont 21-footers.

The course for the larger boats was from the club house at Glen Cove, around the Old Hen buoy; thence around Parsonage Point buoy; from there across the Sound to Matinick buoy, and from there to the starting point. It was a reach to the first mark, a beat to the second, a reach to the third and a run home. The summaries follow:

Table with columns: Name, Finish, Elapsed. Includes entries like Neola II., George M. Pynchon, Cord Meyer, Dahinda, W. Butler Duncan, Jr., Nautilus, Hanan Bros., Ibis, O'D. Iselin, Banzai, N. P. Lawton.

Table with columns: Name, Finish, Elapsed. Includes entries like Pretty Quick, A. B. Alley, Nora, Adrian Iselin, Invader, Jr., Roy A. Rainey, Rana, Howard Willetts, Cricket, Macy Willetts, Rascal II., S. E. Hopkins, Busy Bee, R. T. Wainwright, Indian, William Gardner.

Table with columns: Name, Finish, Elapsed. Includes entries like Rascal, J. J. Dwyer, Spinster, F. L. Babbitt, Maryola, H. E. Sayre, Rogue, J. M. Macdonough.

Table with columns: Name, Finish, Elapsed. Includes entries like Answer, D. B. Abbott, Altair, H. T. McCord, Paumonak, F. B. Currier, Wa Wa, F. K. Sturges, Kenoshi, R. Mallory, Jr.

Table with columns: Name, Finish, Elapsed. Includes entries like Lounde, R. Wildigg, Hambug, M. Goldschmidt, Amoo, P. L. Howard, Ace, R. N. Bavier, Fannie, C. O. Iselin, Mayita, W. E. Douglass.

Table with columns: Name, Finish, Elapsed. Includes entries like Hour, J. H. Esser, Vaquero, W. Stump, Dorothy, L. G. Spence.

Table with columns: Name, Finish, Elapsed. Includes entries like Prinnetta, W. S. Silkworth, Sport, C. E. Verner, Broadbill, A. H. Pirie, Petite, A. M. Wildigg, Tramp, D. Wood, Kim, H. I. North.

Y. R. A. of Gravesend Bay.

First Annual Run—Aug. 27.

THE first run of the Associated clubs of Gravesend Bay, which was held on Aug. 27, was most successful. Upward of forty boats were held on Aug. 27, was most successful. Upward of forty boats were crossed the Lower Harbor to New Dorp, where dinner was served to 150 people. F. J. Hayes, commodore of the run, offered two cups for the journey home, one for the boat finishing first, and the other for the one making the best corrected time. The start was made off the Long Pier at New Dorp, West Bank Light was left to port, and the finish was off Sea Gate. S. E. Vernon's Class N craft finished first and won both cups. Only a small part of the fleet entered the race. The summary follows:

Table with columns: Name, Finish, Elapsed. Includes entries like Vivian II., S. E. Vernon, Maydic, W. H. Childs, Tabasco, J. B. O'Donoghue, More Trouble, W. H. Childs, Anona, Menton Bros., Quest, F. J. Havens, Spots, R. C. Veit, Ojigwan, G. E. Reimers, Karma, J. Erskine, Gamma, A. H. Platt.

Corinthian Y. C.

Marblehead, Mass.—Saturday, Aug. 26.

THE club race of the Corinthian Y. C., sailed on Saturday, Aug. 26, in a moderate N.E. breeze, brought out rather a small number of starters. In Class M, Chewink IV. got the start and led all over the course. In the 18ft. class, Boo Hoo got the start and led the class all around. Soubrette won a close race from Carmen in Class Q. The summary:

Table with columns: Name, Finish, Elapsed, Corrected. Includes entries like Chewink IV., F. G. Macomber, Clarina II., H. S. Wheelock.

Table with columns: Name, Finish, Elapsed. Includes entries like Boo Hoo, E. A. Boardman, Moslem II., R. D. Barker, Moslem I., John Tyler, Privateer II., C. E. Adams, Cayamel, R. L. Pond.

Table with columns: Name, Finish, Elapsed. Includes entries like Soubrette, R. L. Mott, Carmen, C. H. Johnson.

Y. R. A. of Massachusetts Percentages.

The following are the percentages of the Y. R. A. of Massachusetts classes, as compiled by Secretary A. I. Bliss, up to Aug. 22, not including Eastern Y. C. and Corinthian Y. C. events:

Table with columns: Name, Total, Average. Includes entries like Tyro, W. H. Joyce, Rube, H. L. Bowden, Medic II., H. H. White, Peri II., Dr. Morton Prince, Nutmeg, A. C. Jones, Chewink V., Cheney & Lanning, Medic, George Lee, Urchin, John Greenough, Cicinda, Cheney & Lanning.

Table with columns: Name, Total, Average. Includes entries like Class D—Cape Catboats, Marvel, I. M. Whittemore, Josephine, F. H. Smith, Hustler, H. W. Robbins, Stranger, D. E. Dawes, Argestes, George H. Wilkins, Goblin, R. M. Lothrop, Necturus, C. O. Whitney, Mcodyne, Shaw Bros., Dorothy III., Frank F. Crane, Saltair, C. C. Collins, Thelga, L. E. Crosscup, Ocean Eagle, T. Lanc, C. C. G. H. Carey, Tomahawk, W. Leighton, Mildred, F. H. Coleman, Nancy Hanks, G. W. Lane, Clara Lee, E. W. Emery.

Table with columns: Name, Total, Average. Includes entries like Class I—18ft. Knockabouts, Hayseed, H. L. Bowden, Bat, Adams Bros., Bonitwo, G. H. Wightman, Fritter, Caleb Loring, Dorchen, A. W. Finlay, Mirage II., J. W. Olmstead, Aladdin, G. P. Keith, Boo Hoo, R. Boardman, Hayseed II., H. L. Bowden, Moslem I., John Tyler, Myrmdon, John Noble, Nicknack, E. B. Holmes, Yankee, F. W. Atwood, Aufoia, F. L. & H. W. Pigeon, Cuyamel, A. W. Godfrey, Gertrude II., H. E. Lynch, Little Miss, B. S. Fernier, Aspinquid II., A. E. Whittemore, Privateer II., C. E. Adams.

Table with columns: Name, Total, Average. Includes entries like Class T—15-footers, Vera II., H. Lundberg, Cigarette, M. P. Prince, Ventus II., C. K. Pevear, Tabasco, Jr., H. H. Wiggin, Princes, J. P. Prince, Swallow, Harris Hammond, Nibelung, E. G. Loring.

Table with columns: Name, Total, Average. Includes entries like Class X—Dories, Barbara, Blaney & Wardwell, Elizabeth F., H. W. Dudley, Zaza II., Gordon Foster, Frolic II., W. G. Torrey, Teaser, R. R. Smith, Bessie A., J. S. Hodges, Bugaboo II., H. B. Ingalls, Spray, H. L. Wing, Nisiah, D. H. Woodbury, Crescent, R. E. Burnett, Pointer II., E. C. Melzard, Catspaw, R. E. Melzard, Red Devil, E. H. Curtis, Khaki II., L. H. Brown, Question, Guy Gardner, Spider, Ara G. Besse, Dolphin, L. J. Magrath.

South Boston Y. C.

South Boston, Mass.—Saturday, Aug. 26.

THE third and last of a series of interclub races between yachts of the South Boston, Columbia and Winthrop yacht clubs was sailed under the auspices of the South Boston Y. C., on Saturday, Aug. 26, in a brisk N.E. breeze. In Class A there was a hot race between Thialfi and the old Herreshoff sloop Violet. Violet crossed the finish line 2s. ahead, but lost to Thialfi on corrected time. Chewink II. got the start in Class B and led all around the course. Poor Boy and Comet were first and second in Class C, but were protested. The summary:

Table with columns: Name, Finish, Elapsed, Corrected. Includes entries like Class A, Thialfi, Dr. Wilbur Soule, S. B. Y. C., Violet, A. J. McKee, S. B. Y. C., Nelka, J. Embree, Col. Y. C., Grandee, A. H. Baker, Col. Y. C., Tourist, Stebbins & Vanneman, Col. Y. C., Rival, W. S. Nickerson, Col. Y. C.

Table with columns: Name, Finish, Elapsed, Corrected. Includes entries like Class B, Chewink II., Bamber Bros., S. B. Y. C., Kit, H. B. Whittier, Win. Y. C., Harriet, A. T. Lincoln, B. Y. C., Hermes, C. A. Heaney, Win. Y. C., Emma C., F. D. Perkins, S. B. Y. C., Laura N., A. Nicholson, S. B. Y. C.

Table with columns: Name, Finish, Elapsed, Corrected. Includes entries like Class C, Poor Boy, James Perry, C. Y. C., Comet, H. B. Green, C. Y. C., Owaissa, Walter Kelly, S. B. Y. C., Opeechee, F. P. Gilmore, W. Y. C., Eli, R. S. Wells, W. Y. C., Madeline, George A. Nash, W. Y. C., Florence R., Capt. Garrity, C. Y. C., Unome, C. H. Lothrop, C. Y. C.

New Rochelle Y. C.

Special Race—Saturday, Aug. 26.

THE last club race of the season was sailed Saturday afternoon, Aug. 26, and a light easterly wind, combined with a choppy sea, made the conditions anything but satisfactory, and a good time impossible.

Four classes filled, the principal interest being in the catboat class, in which six boats started. Thorea in the yawl class beat Grace II. easily. The latter was handicapped several minutes at the start, and was not well handled throughout the race. Thelma led Firefly all around the course, and was minutes ahead at the windward mark, but Firefly picked up all but 40s. on the run home.

Two prizes were offered in the catboat class. One, the regular class prize, and a special prize open to all the entrants with the exception of Joke, which some of the owners claimed did not comply with the spirit of the rule. Nimble led all her competitors around the first two legs of the course, but running into a soft spot near the finish, was passed by some of the others, and barely won on her time allowance. The following is a summary of the race:

Table with columns: Name, Finish, Elapsed, Corrected. Includes entries like Yawls—Start, 2:30—Course, 3/4 Miles, Thora, J. P. Donovan, Grace II., John Landon, Sloops—Start, 3:45—Course 3/4 Miles, Thelma, A. E. Black, Firefly, G. P. Granberry, Regular Sloops—Start, 3:45—Course, 3/4 Miles, Dod, D. E. Dealey, Clutha, J. L. Mitchell, Bubble, H. W. Lloyd, Catboats—Start, 3:30—Course, 4/4 Miles, Joke, C. C. Converse, Nimble, J. D. Sparkman, Spray, C. C. Hiscoe, Nymph, A. F. Moneuse, Catharine, J. B. Ricketts, Idler.

**Beverly Y. C.**

Wing's Neck, Buzzard's Bay—Saturday, Aug. 19.

The Beverly Y. C. sailed its 373d regatta on Saturday, Aug. 19. The event was the sixth Corinthian race of the season. The wind blew strong from N.E. all day, and at 1 o'clock, the hour set for the race, the puffs must have reached as high a velocity as 20 miles per hour. Like all N.E. winds in Buzzard's Bay, this one was puffy, and varied slightly in direction, but held strong throughout the day.

For the first time this year, four of the restricted 25-footers came to the starting line. They were sent to Bow Bells and back. The race in this class proved very interesting. May Queen was somewhat handicapped by having too much sail, and Mr. Forbes' White Heron was able to get ahead of her when nearly home; but in the light winds beating up under Wing's Neck, May Queen took the lead and won by 42s.

The 21-footers were sent to Bow Bells and back. Barnacle found the weather just to her liking, and left the other boats from the start of the beat home, beating Terrapin, who was second, by 5½m. Terrapin, Radiant, and Amanita III. had a close race all the way home. At one time Amanita III. was ahead, and at one time Radiant was ahead, and finally Terrapin got the lead and held it.

The 18-footers were sent to Bird Island and back. Jap won by 2m. 52s.

The little one-design boats were sent to Abiel's Ledge and Mosher's Rock and return. Miss Warren in her new boat, Seeps, won, with Margaret Codman's new Yalu second.

The judges were Messrs. Charles Whittemore and L. S. Dabney. The times in detail follow:

25-footers—Course 14, 11¼ Miles.	
May Queen, D. L. Whittemore.....	2 09 52
White Heron, R. E. Forbes.....	2 10 34
Thorana, T. B. Wales.....	2 13 53
Nokomis, A. Winsor.....	2 14 12
21-footers—Course 14, 11¼ Miles.	
Barnacle, W. E. C. Eustis.....	2 06 02
Terrapin, L. S. Dabney.....	2 11 43
Amanita III., Joshua Crane.....	2 12 00
Radiant, Mrs. E. C. Baker.....	2 12 55
Edith, Clark King.....	2 14 55
Illusion, C. M. Baker.....	2 15 38

**Cape Cod Y. C.**

Provincetown, Mass.—Aug. 24, 25 and 26.

The South Shore circuit of Y. R. A. open races opened at Provincetown on Thursday, Aug. 24, with a fair field of starters, a good S.W. breeze prevailing. Nutmeg led the 22-footers around the course until the last leg, when her skipper mistook the course, and she was passed by both Tyro and Rube, Tyro winning. Osprey, a Duxbury 18-footer, a new production from the lines of Messrs. Small Bros., won in the 18ft. class from Hayseed by half a minute. Marvel continued her list of wins by leading the Cape cat class to the finish. Rambler won in the handicap class. The summary:

Class E—22-footers.		Elapsed.
Tyro, W. H. Joyce.....	2 02 25	2 03 40
Rube, N. L. Bowden.....	2 03 40	2 04 20

Peggy II., Miss Gormley.....	2 27 30	2 21 30

Friday, Aug. 25.

The second race of the Cape Cod Y. C. series on Friday, Aug. 25, was sailed in a light easterly breeze. In the 22ft. class Tyro and Medric II were across the line too soon and the start went to Peri II. Peri II. led until the windward leg was reached, and after passing this, Tyro took the lead and won by over 5m. In the 18ft. class Mirage II. got the start, with Hayseed second. Hayseed soon went to first place and held it to the finish. Kittawake, a Duxbury boat, finishing second. Arawak, a local boat, was the winner in the Cape cat class, and Rambler took her second win in the handicap class. The summary:

Class E—22-footers.		Elapsed.
Tyro, W. H. Joyce.....	2 23 10	2 23 10
Peri II., Dr. Morton Prince.....	2 28 18	2 28 18
Rube, H. L. Bowden.....	2 28 30	2 28 30
Medric II., H. H. White.....	2 28 36	2 28 36
Medric I., George Lee.....	2 28 53	2 28 53

Class I—18-footers.		Elapsed.
Hayseed, H. L. Bowden.....	2 24 20	2 24 20
Kittawake, F. R. Maxwell.....	2 45 44	2 45 44
Mirage II., J. W. Olmstead.....	2 48 49	2 48 49

Vim, C. Rice.....	2 51 50	2 51 50
Winnetuxet.....	2 03 20	2 03 20
Peggy II., Miss Gormley.....	Withdrawn.	Withdrawn.

Saturday, Aug. 26.

A capsized mark caused trouble in the last race of the series, sailed on Saturday, Aug. 26, in a brisk N.E. breeze. Medric II. got the start in the 22ft. class, and led to the first mark, but on the windward leg Nutmeg took the lead and kept it all over the course. Medric II. crossed the finish line first, but it was claimed that she did not turn the mark off Long Point, which the others found with difficulty. In the 18-footers, Hayseed led all over the course, although Osprey II. and Mirage II. were across the finish line before her. The reason was failure to turn the Long Point mark, which the owners of the first two boats in admitted. Marvel won in the Cape cat class, Peggy II., sailed by Miss Gormley, in the handicap class, and Owl in the dory class. The summary:

Class E—22-footers.		Elapsed.
Nutmeg, A. C. Jones.....	2 19 30	2 19 30
Peri II., Dr. Morton Prince.....	2 25 09	2 25 09

**Atlantic Y. C.**

New York Harbor—Saturday, Aug. 26.

The second race for the cup offered this year by Rear-Commodore E. B. Havens for Class Q boats in the Atlantic Y. C., was sailed on the afternoon of Saturday, Aug. 26. The winner proved to be W. H. Childs' More Trouble, which defeated F. J. Havens' Quest by 2m. 23s. Geo. H. Church's Saetta won the first event for the cup, which was sailed on July 1. Three victories are necessary for permanent possession. The old Class Q boats in the club sailed a race for the usual prize, and for points on the trophy offered by Hendon Chubb, which goes to the one making the best record for the season. Spots beat Wraith by 1m. 50s.

The new boats went three times over the regular inside Association course, aggregating 11.43 nautical miles. The other racers covered the distance twice, thus sailing 7.62 miles. All marks were left to port. In the N.E. wind of full sail strength which was blowing, the first leg to Ulmer Park from the start, off Sea Gate, was to windward. The next, which led to the Marine and Field Club mark, that to Fort Hamilton and then the one from the Government station, home, provided a series of reaches. Charles D. Mower, designer of More Trouble, was on board that craft for the first time since her racing season began. The summaries follow:

Sloops—Class Q—Start, 3:05.		Finish.	Elapsed.
More Trouble, W. H. Childs.....	5 11 53	5 11 53	2 06 53
Quest, F. J. Havens.....	5 14 16	5 14 16	2 09 16
Cockatoo II., Hendon Chubb.....	5 14 41	5 14 41	2 09 41
Class Q—Special—Start, 3:10.		Finish.	Elapsed.
Spots, R. C. Veit.....	4 43 04	4 43 04	1 33 04
Wraith, Calvin Tompkins.....	4 44 54	4 44 54	1 34 54
Trouble, W. A. Barstow.....	4 46 09	4 46 09	1 36 09
Mary, Max Grunder.....	4 47 33	4 47 33	1 37 33

**Seawanhaka-Corinthian Y. C.**

Oyster Bay—Saturday, Aug. 26.

Six of the Seawanhaka 15-footers raced over the regular club course on Saturday, Aug. 26. Wee Ween, owned by R. L. Cuthbert, proved to be the winner, beating C. W. Wetmore's Sabrina by 25s. The summary follows:

Seawanhaka 15-footers—Start, 3:05.		Finish.	Elapsed.
Wee Ween, R. L. Cuthbert.....	4 17 32	4 17 32	1 12 32
Sabrina, C. W. Wetmore.....	4 17 57	4 17 57	1 12 57
Fly, W. E. Roosevelt.....	4 18 50	4 18 50	1 13 50
Grille, B. G. Weeks.....	4 19 35	4 19 35	1 14 35
Bairn, W. J. Matheson.....	4 20 20	4 20 20	1 15 20
Imp, S. L. Landon.....	Disqualified.	Disqualified.	Disqualified.

**Bensonhurst Y. C.**

Gravesend Bay—Saturday, Aug. 26.

The second, and what proved to be the last race for the cup offered this year by Rear Commodore J. B. O'Donohue, of the Bensonhurst Y. C., for boats of any recognized club in classes F and above, was sailed on the afternoon of Saturday, Aug. 26. All of the starters competed in one class on regular time allowance. D. S. Wylie's Lizana, proved to be the winner of the race, beating on corrected time Vivian II., first boat to finish, by 4m. 36s. The cup goes outright to the craft scoring the greatest number of points in not more than three races. Lizana won the initial event on the morning of July 4, and at the end of the second race had enough points to insure victory without a third contest.

A 13-mile course was sailed from the start, off Ulmer Park, across the channel to Old Orchard Shoal Light and return, leaving the outer mark on the starboard hand. In the N.E. breeze blowing, it was a spinnaker run out and a beat home. J. B. O'Donohue's N. Y. Y. C. 30-footer Tabasco, which was second on corrected time, sailed by far the best course going out, judging; the tide well. Coming home, Edgar F. Luckenbach's Bobtail and Lizana showed the best judgment. The victory of the latter is undoubtedly due to the excellent manner in which she was handled. After Vivian II. at the finish came Tabasco, followed in the order named by Bobtail, Lizana and Anona. Vivian II. as scratch boat, allowed Bobtail 4s.; Tabasco and Anona 7m. 7s., and Lizana 14m. 40s. The trophy is a fine loving cup with horn handles. The summary follows:

Sloops—Class P and above—Start, 2:35.		Finish.	Elapsed.	Corrected.
Lizana, D. S. Wylie.....	5 10 24	5 10 24	2 35 24	2 20 44
Tabasco, J. B. O'Donohue.....	5 05 06	5 05 06	2 30 06	2 22 59
Vivian II., S. E. Vernon.....	5 00 20	5 00 20	2 25 20	2 25 20
Bobtail, E. F. Luckenbach.....	5 06 00	5 06 00	2 31 00	2 30 56
Anona, Menton Bros.....	5 29 35	5 29 35	2 54 35	2 47 28

**East Gloucester Y. C.**

Gloucester, Mass.—Monday, Aug. 21.

The Y. R. A. open race of the East Gloucester Y. C., postponed from Thursday, Aug. 17, was sailed on Monday, Aug. 21, in a light and fluky E. wind. Urchin got the start in the 22ft. class, but was passed by Tyro and Medric on the first leg, Tyro turning the buoy first and Medric II. second. On the windward leg Medric II. went by Tyro and led until after the first round had been completed, when Tyro took the lead again and held it to the finish. In the 18ft. class, Aurora got the start, but was passed by Fritter, which led on the first round. Soon after completing the round, Hayseed went ahead and led to the finish. Seboomook took the lead in the handicap class soon after the start, and held it until the first mark was turned, when Osprey got the lead by a lucky streak in the wind. On the same leg the second time around Seboomook got a fluke, which gave her back her lead, and she held it to the finish. The summary:

Class E—22-footers.		Elapsed.
Tyro, W. H. Joyce.....	2 42 55	2 42 55
Medric, George Lee.....	2 45 42	2 45 42

**Conanicut Y. C.**

Jamestown, R. I.—Friday, Aug. 25.

The eighth serial race of the Conanicut Y. C. was sailed off Jamestown, Aug. 25, in a fairly good easterly wind. The feature of the race was the winning of the 21-footer Bohemia, which was admirably handled by her owner, Miss Woodward. There were four classes, and the other winners were Amorita, Minnow and Constance. The summary:

25ft. Knockabouts—Start, 3:10.		Elapsed.
Amorita.....	2 00 58	2 12 31
Rowdy.....	2 07 10	2 12 31
21ft. Knockabouts—Start, 3:15.		Elapsed.
Bohemia.....	2 28 33	2 31 47
Grace.....	2 30 53	2 31 47

**GAS ENGINES AND LAUNCHES.**

Their Principles, Types, and Management. A Complete and Practical Manual.

BY F. K. GRAIN, M. E.

Bound in cloth, with 123 pages and 20 illustrations. Sent, postpaid, for \$1.25.

THIS compact and comprehensive handbook contains all the information essential to users of the marine gasoline engines, and will be welcomed by the thousands of men now owning and running power boats. Laymen and experts will alike find the book invaluable. It treats of the various types of marine gasoline engines, points out the good in each, and tells how to run them. A knowledge of the contents of this book will help to overcome difficulties and avoid accidents. The most complete book of its kind ever published.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

30-Footers at Newport.

Saturday, Aug. 26.

THE old class of Newport 30-footers again demonstrated superior speed in a contest with the Herreshoff boats of New York Y. C. one-design class, sailed off Newport, Saturday afternoon, Aug. 26. The race was for a cup offered by Mr. William G. Roelker, and five boats participated, Caroline, Breeze, and Eleanor of the old ones, and Oriole and Linnet of the new class. Mr. Pembroke Jones' Carolina won the event, defeating Oriole by about a minute.

The race was made quite a society event, and a large party went out to watch it as guests of Vice-Commodore Henry Walters, on the steam yacht *Narada*. A strong N.E. wind was blowing, and the boats were sent out to Brenton's Reef Lightship and return, this making a run out with spinnakers, and a beat back against wind and tide. The start was made in Brenton's Cove at 2:30. On the run out the racers kept well together, Eleanor being first to round the mark. Oriole, Carolina and Breeze followed in close order, while Linnet had withdrawn. As soon as the boats hauled on the wind, Carolina slowly worked into windward position, and had the fleet beaten before it was half way home. The summary:

	Finish.	Elapsed.
Carolina, Pembroke Jones.....	4 30 00	2 00 00
Oriole, L. Delano.....	4 30 59	2 00 59
Breeze, W. G. Roelker, Jr.....	4 31 29	2 01 29
Eleanor, G. Widener.....	4 31 51	2 01 51
Linnet, A. T. French.....	Did not finish.	

F. H. YOUNG.

Rhode Island Y. C.

Pawtuxet, R. I.—Saturday, Aug. 26.

THE annual club cup regatta of the Rhode Island Y. C., scheduled for Aug. 26, proved the smallest racing event in the history of the club, only one class, the 30ft. cats, filling. The sloops *Ishkoodah* and *Micaboo*, and two Herreshoff auto boats were ready to race, but no opponents showed up in their respective classes, and after waiting in vain for an hour and a half for further entries, the Race Committee gave it up and started the 30-footers alone. The failure of the regatta was only a pronounced example of the general lack of racing enthusiasm that has been manifest to a greater or less extent among the local clubs throughout the season.

There was a stiff breeze from N. by E., affording the best of racing conditions. The boats were sent over a short leeward and windward course, at enough of an angle, as it happened, to give very little beating on the homeward stretch, and the distance was covered in quick time. *Wanderer IV.* was an easy winner, defeating her opponents by 4m. corrected time. The summary:

	Finish.	Elapsed.	Corrected.
Wanderer IV., H. J. & D. W. Flint..	4 35 30	1 05 30	1 05 30
Mblem, G. E. Darling.....	4 41 20	1 11 20	1 09 31
Elizabeth, Posner Bros.....	4 42 00	1 12 00	1 10 11

F. H. YOUNG.

ETCHING OF ATLANTIC.—We are indebted to Messrs. Edward Smith & Co., 45 Broadway, New York city, for a half-tone etching of Mr. Wilson Marshall's schooner *Atlantic*, winner of the transatlantic race for the cup offered by Emperor William of Germany.

NEW ROCHELLE Y. C. CRUISE.—Members of the New Rochelle Y. C. are looking forward to the three days' cruise, which starts from the Echo Bay station on the afternoon of Sept. 2 at 2 o'clock. A meeting on board the flagship will decide the destination of each day's run.

Canoeing.

A. C. A. Amendments.

STAMFORD, Conn., Aug. 25.—*Editor Forest and Stream:* In accordance with Article XII. of the Constitution, the following amendments will be offered at the next meeting of the Executive Committee of the American Canoe Association, viz.:

By-Laws, Chapter I., Section 2, amend the last paragraph by inserting the words in brackets:

Every member attending a camp shall pay for camp expenses; for general camp \$2, and for a division camp such sum as may be determined upon by the Executive Committee of the division, provided such sum does not exceed \$1. [Associate members, attending a general camp, shall pay for camp expenses \$2. Members visiting a general camp and leaving the same day, shall pay for camp expenses \$1; but a second visit of this sort shall make the member so visiting liable to pay for camp expenses an additional dollar.] Visitors, when accompanying members, may be admitted to the general camp at the discretion of the commodore, and to the ladies' camp on the invitation of an associate member and at the discretion of the committee governing it; provided, that if they spend more than two nights in camp [they, or] the member introducing them, shall pay \$3 each, the same dues and camp charges as regular members. But this shall not preclude the [free] admission of any of the immediate family of a member [who are minors. Minors, not accompanied by their parents, must be cared for by a member or an associate member, and they shall pay \$2 each.]

FREDERIC G. MATHER, A. C. A. 796.

A. C. A. Membership.

Fixtures.

Sept. 1-10.—Annual out-door championship of the United States Revolver Association. J. B. Crabtree, Sec'y, Springfield, Mass.

Ohio Rifle Notes.

THE Englewood, O., Rifle Club held their regular contest for the club's championship medal on Aug. 19. Frank Fetters and M. T. Hampton tied for first on 30, but were prevented from shooting off by the heavy rain, and will do so at the next meeting. The shooting was at 100yds., ofhand, four shots, possible 40. W. H. Kerr was second with 28, Less Leiber 25, H. R. Iddings 23, Joe Hoover 17, Web Jay 9.

Attendance at the monthly cup shoot of the Dayton Sharpshooters on Aug. 24 was not so large as usual, but the scores were better than at any previous meeting this season. John F. Beaver, the club veteran, 79 years young, won the cup with 120 out of a possible 125. He won the cup several times last season, and his score is only one short of the highest score which has been made in the past four years. Gus H. Sander was second with 112, John Rappold 104, G. R. Decker 93. The cup shoot was muzzle rest, 200yds., five shots. In the free-for-all, same conditions, 3 shots, possible 75, five cash prizes, Gus H. Sander was first with 73, E. J. Bundenthal 65, Wm. Kuntz 64, John Rappold 63, G. R. Loudenbeck 48. In 30 consecutive shots, Gus H. Sander made 21 or better each shot. His highest card of 3 shots was 73 out of a possible 75. John L. Theobald, President of the Dayton Gun Club, the first time he ever fired a rifle, muzzle rest, 200yds., scored 23, 19, 24—66 out of a possible 75. The day was hot, and the members so appreciated the shade afforded by the shooting shed that they each agreed to plant a forest tree on the range this fall, and German township will supply the maple trees free of charge.

The fall re-unions of deer hunters' associations will start in at Eaton on Sept. 1, the Prebec County Rifle Club holding their quarterly shoot on the same day. Five matches will be shot on animal targets, 4 shots on each, 100yds., ofhand, possible 48. Ten merchandise prizes in each event. Open to all riflemen.

The Gratis Rifle Club's monthly medal shoot and 20-shot match, 100yds., ofhand, money prizes, will take place Sept. 2.

On Sept. 9 the Jackson Rifle Club will hold its monthly medal and 20-shot match, 100yds., ofhand.

The Greenville Rifle Club was the first to call a re-union of the deer-hunters, and their annual meetings have always been largely attended. The re-union this year will take place on Sept. 15, and there will be ofhand and rest matches for merchandise and cash prizes, and ofhand matches at 100yds. for money prizes. Animal targets will be used.

The Englewood Rifle Club holds its medal shoot on Sept. 16. The Overlook Rifle Club, of West Milton, will hold their regular medal contest on Sept. 27. The club expects to arrange for a hunters' re-union on that date.

The Dayton Sharpshooters will arrange for an all-day rifle tournament in September. There will be ofhand matches at 100yds. for cash prizes, and for cash and merchandise prizes, at 200yds. ofhand and muzzle rest. The annual King shoot, cup contest, and free-for-all will be held late in October, the exact date to be announced later.

Claude Weaver, of Arcanum, is preparing for a deer hunt in Minnesota. His party will leave about the last week of October, and establish a camp north of the west end of Lake Superior, where moose, bear and deer were plentiful last season. The season opens Nov. 10, and the party will remain until Dec. 1.

Jones Leatherman and Wm. Orth, of Dayton, have ordered new Winchester in preparation for their annual trip after big game. They will go with a party into Canada, north of Lake Superior. They intend to be in camp by Nov. 1, and will spend the time, until the season opens, in getting acquainted with the country.

National Rifle Association of America.

THE great tournament of the National Rifle Association of America and the New Jersey State Rifle Association began on Aug. 24, under the most favorable conditions of weather, large attendance and competition. Firing began a while before 9 o'clock. In response to the bugle call, 657 riflemen gathered at the firing points.

Only twelve had completed their scores in the National individual match, when competition, at 6 o'clock, ended for the day. A heavy fog delayed the start in the morning. A light wind blew across the range in the morning, which increased to gusty, stiff wind during the day.

The conditions of the National individual match were: Open to the Army, Navy, Marine Corps, organized militia of the States and Territories and the District of Columbia, and to members of the National Rifle Association and affiliated clubs, military or civilian. Kinds of fire, slow, rapid and skirmish. Distances, slow fire, 200, 300, 500 and 600yds., ten shots. Rapid fire, 200 and 500yds., ten shots. Skirmish fire, two runs. Prizes, gold, silver and bronze medals and cash prizes to the number of twelve. In the match were 649 contestants. This match was not finished till Monday. Saturday morning, the temperature was cold and bracing, with a 20-mile wind, which gradually decreased in force during the day.

The individual championship, the competition of which lasted four days, was won by Private James Durward, with a score of 430 out of a possible 500. His different scores were: Slow fire, 176; rapid fire, 80; skirmish fire, 174. First skirmish run, 83; second run, 91. He also won the gold medal for the highest aggregate score in skirmish fire.

The individual pistol match was won by Lieut. R. H. Sayre, of Squadron A, with a score of 237 out of a possible 250. First Lieut. Jens E. Stedje, Fourth Cavalry, was only one point less, 236. T. Anderson, of New York, and G. Cook, of Maryland, were third with 234. Owing to the great number of contestants in the different events, the competition proceeds slowly.

Cincinnati Rifle Association.

CINCINNATI, Aug. 20.—The regular practice shoot of the Cincinnati Rifle Association, 200yds., ofhand, German ring target, are as follows. Light, changeable wind:

Freitag .....	19 22 21 21 21 21 20 18 22 22—207

The Zettler Annual.

THE thirty-first annual shooting festival of the Zettler Rifle Club of this city will be held on the ranges in Union Hill Park, Union Hill, N. J., Sept. 27 and 28, from 10 A. M., until 6 P. M. each day. Every rifleman is invited to take part, and the prize list day is most attractive. This time the Zettler club has made an innovation which will meet with the approval of all progressive target shooters. It is that any rifle and all forms of sights will be admitted on even terms, the only restriction being that high power ammunition and jacketed bullets may not be used. This is the first time that any New York club has come out flat for magnifying sights in an important competition outdoors, and it is safe to predict that other clubs will follow suit in their prize matches, both indoors and out. All shooting will be at 200yds. Ofhand. On the ring target twenty-one cash prizes and four premiums are offered, the highest ones being \$50, \$40, \$30 and \$25, respectively, and the lowest \$1. On the bullseye target there will be eighteen prizes, highest \$20, and several premiums. A Zettler trophy goes to the winner on the special free ring target.

All of the above will be open to allcomers. The target of honor, for twenty cash prizes, will be open to members only, and the ladies' target of honor will be open to the wives, sisters, mothers and sweethearts of members, while the judges' target will be restricted for two trophies. Gus Zimmermann, the club's president, has returned from Europe, where he passed the summer. His health has been greatly improved by the rest and the waters.

Central New York Rifle Association.

AUBURN, N. Y., Aug. 15.—On Aug. 3, there was organized the Central New York Rifle Association, with Dr. A. A. Stillman, of Syracuse, N. Y., as President; S. E. Hillger, of Auburn, N. Y., as First Vice-President; Louis Merz, of Syracuse, as Second Vice-President, and F. S. Hawes, of Ithaca, N. Y., as Secretary and Treasurer.

A trophy shoot will be held by the Association on the range of the Recreation Rifle Club, of Auburn, N. Y., on Labor Day, Sept. 4, the contestants consisting of teams from the affiliated clubs.

In addition to the tournament, the local club, under the rules of the Association, conduct a prize shoot, and the programme, as far as perfected, contains only cash prizes, provided by the club.

Both the Association and the club feel that a successful issue will materially aid in promoting rifle practice.

A. H. UNDERWOOD, Sec'y.

New York Schuetzen Corps Outing.

THE annual outing and shoot of the New York Schuetzen Corps will be held September 13-15 inclusive. A special train, carrying the members and their friends, will depart from the Grand Central station in this city Wednesday morning, Sept. 13, at 9:45 o'clock, its destination New London, Conn. The Pequot House and Cottages will be headquarters, and the shoot will be held there, in New London. Further information may be obtained from Bernard Kumm, the corps' secretary.

- Oct. 18-19.—Ossining, N. Y., Gun Club shoot, \$50 added. C. G. Blandford, Capt.

DRIVERS AND TWISTERS.

The Rochester, N. Y., Gun Club has cancelled their tournament dates, Sept. 4 and 5.

Mr. H. W. Carpenter advises us that the Parker Gun Club, of Meriden, Conn., have decided not to give a shoot on Sept. 4.

The tournament to be held at Medford, Oregon, Sept. 22-23, has a programme of ten events each day, at 15, 20 and 25 targets. The totals are, each day, 200 targets, \$20 entrance, \$225 added. General average for men, \$100; for women, \$50. Total added money, \$600.

The annual Labor Day tournament of Messrs. Knox & Knapp, Auburn, N. Y., has a programme of ten events, 15 and 20 targets, the four latter having \$2 each added. Totals, 170 targets, \$2.95 entrance, \$8 added. Class shooting, 40, 30, 20 and 10 per cent. L. C. Smith gun and other prizes in event 7. Shooting will begin at 9:30.

The Lowell, Mass., Gun Club offers an interesting programme for their Labor Day shoot, namely, twelve events, 15 targets each. Events 7 and 8 constitute the five-man team shoot. Open to all organized clubs. To first team, \$15; second, \$10. To four high amateurs and one low amateur shooting through the regular programme, \$15. Targets, 1½ cent.

In the contest for the individual State championship of Connecticut, at the shoot of the Somersville Gun Club, Aug. 22, Mr. H. C. Barstow won with the excellent score of 46 out of 50, a 92 per cent. performance. He also won the Mullerite medal with a 91 per cent. performance, 182 breaks out of 200 of the programme. Bradley was close up with 181; Finch was third with 180.

The Coatesville, Pa., Gun Club have issued the programme of their Labor Day tournament, their first annual, Ten events, at 10, 15 and 20 targets are provided, with a total of 150 targets, \$10 entrance. Class shooting. Thomas Spackman is the Secretary.

The annual Labor Day tournament of the Scranton, Pa., Rod and Gun Club has a programme of ten events, each of which is at 20 targets, alternately \$1.50 and \$2 entrance. Three dollars is added to each event. High amateur, \$5. Sliding handicap. Class shooting. Competition will commence at 9:30. Ship guns to Bittenbender & Co., 126 Franklin avenue. H. Cullen is the Secretary.

The programme of the Rahway, N. J., Gun Club Labor Day shoot has seven events. Of these, six have four valuable merchandise prizes each. The events are at 10, 15 and 20 targets, entrance 50 cents, 75 cents and \$1. There is a special ladies' contest, tickets 25 cents for three shots. A beautiful cup, value \$7.50, will be presented to the amateur and professional who makes the highest average in all the six events.

D. W. Hallam, Secretary, informs us that "The Dover Sportsman's Association will have a prize shoot on Sept. 20. Twenty-five dollars in cash will be given. One hundred and eighty targets. Five dollars for best above 80; \$5 for best between 70 and 80; \$5 for best between 60 and 70; \$5 for best between 50 and 60; \$5 for best between 40 and 50. Targets 1 1/2 cent. Lunch can be bought on the grounds. Shells for sale. Street cars pass the door. Shooting at 10 A. M."

E. J. Loughlin, Secretary, writes us that "The programme of the Riverside Gun Club, of Utica, N. Y., which is scheduled for Labor Day, will consist of six 15-target events, with a total entrance of \$6.15, targets included. Moneys divided 40, 30, 20 and 10. No handicaps. Included in the programme are the club trophy events for the Hunter Arms loving cup and Mullerite gold medal. Free merchandise prizes will be awarded under handicap rules. Shooting will commence at 12:30 o'clock. Grounds at foot of Washington street, near New York Central Depot."

The Secretary writes us: "The management of the Palisade Gun Club has been requested to arrange a 100-bird target race, entrance \$10. Targets extra, at \$2. Distance sliding handicap, 19 to 22yds. All start at 19yds. To be shot in five strings of 20. Nobody barred. Five entries to fill. Five entries, one money; five to nine entries, two moneys; ten entries, three moneys. High guns. Oct. 3, 1 P. M. Three amateur experts have posted a forfeit of \$2. Money returned if not shot. Send forfeit to A. A. Schoverling, Secretary, 2 Murray street, New York."

BERNARD WATERS.

Dominion Tournament.

THE Dominion of Canada Trapshooting and Game Protective Association's fifth annual tournament, held Aug. 16-18, had a programme which offered abundance of competition. This tournament was conceded to be the most successful one ever held in Canada. The management ran smoothly without a hitch throughout. Much praise was bestowed on the Association for its excellent work. The aggregate for the three days follows:

Table with columns: Name, Shot at, Broke, Per Cent., Shot at, Broke, Per Cent. Lists names like T. Upton, W. Thompson, D. Wilson, etc.

F. A. Heney match—First prize, \$25, C. G. Thompson. Second prize, \$15, A. H. Westover. Third prize, \$10, T. Upton, W. J. Johnstone, J. Dodds, T. M. Craig, G. Singer, ties.

C. J. Booth match—First prize, \$25, G. M. Dunk. Second prize, \$15, and third prize, \$10, Dr. Wilson, M. Fletcher, J. H. Thompson, N. G. Bray, A. D. Bates, A. H. Westover, ties.

Members' match—First prize, \$25, McMackon. Second prize, \$15, and third prize, \$10, Thos. Upton, L. A. Duff, ties.

Ahearn & Soper match—First prize, \$25, and second prize, \$15, G. M. Dunk, L. M. Craig, ties. Third prize, \$10, M. Fletcher, W. L. Cameron, ties.

Ketchum & Co. match—First prize, \$25, George Singer. Second prize, \$15, and third prize, \$10, T. Upton, D. McMackon, T. M. Craig, ties.

Lefever Arms Co. match—First prize, Lefever hammerless gun, T. Upton. Second prize, \$15, G. W. McGill. Third prize, \$10, Dr. Wilson, T. M. Craig, ties.

Parker Bros. match—First prize, Parker hammerless gun, T. A. Duff. Second prize, \$15, and third prize, \$10, W. J. Johnstone, T. M. Craig, ties.

Isaac Hollis & Son match—First prize, Hollis hammerless gun, G. Singer. Second prize, \$15, G. M. Howard. Third prize, \$10, T. Upton, T. M. Craig, A. H. Westover, ties.

Cogswell & Harrison event—First prize, Cogswell & Harrison gun, C. G. Thompson. Second prize, \$10, and third prize, \$10, W. Slaney, T. M. Craig, G. Dumont, W. A. Smith.

Aggregate winners—The Grey cup, for high aggregate, T. M. Craig, Sherbrooke. Second high aggregate, the Dupont cup, Thos. Upton, Hamilton. Novice high aggregate cup, donated by F. W. Carling, G. M. Howard, Sherbrooke, Que.

High run—Longest consecutive run of kills was made by W. J. Johnstone, Ottawa, 99 and not out.

High average first day—First, \$25, C. G. Thompson; second, \$15, P. Wakefield; third, \$10, G. Dunk, G. Howard, W. H. Ewing, ties.

High average second day—First, Kynoch cup, T. M. Craig; second, Kinkore cup, G. W. McGill.

High average for third day—First prize \$25, second \$15 and third \$10, G. Dunk, M. Fletcher, W. A. Smith, ties.

Two-man team championship of Canada; entrance \$4; high guns; four moneys for every ten entries:

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like St. Hubert G. C., Ottawa, Sherbrooke G. C., etc.

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like Hamilton G. C., Hamilton, T. Upton, etc.

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like Montreal G. C., D. J. Kearney, etc.

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like Sherbrooke G. C., T. M. Craig, etc.

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like St. Hubert G. C., Toronto, J. H. Thompson, etc.

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like Eight-man team, championship of Canada, G. W. McGill, etc.

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like St. Hubert G. C., Ottawa, J. F. Higginson, etc.

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like St. Hubert G. C., Ottawa, F. A. Heney, etc.

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like St. Hubert G. C., Ottawa, W. J. Johnson, etc.

Buffalo Audubon Gun Club.

BUFFALO, N. Y., Aug. 26.—The Buffalo Audubon Club held its two days' tournament, Aug. 25 and 26. The weather conditions were favorable, except that on the first day the strong wind made the shooting difficult. The club had three traps in position under cover, tents erected for the accommodation of the shooters, and every thing in shape to handle a much larger entrance than they received. Out-of-town shooters were present in goodly numbers, but for some reason the local entries were comparatively few. While the shoot was not a success in matter of attendance, in every other respect it was all that could be desired, and the committee and members who handled the shoot feel pleased with the satisfaction expressed by the contestants. It seemed that all went away satisfied.

In addition to the \$200 added to the sweepstakes by the club, two fine cups were given for first and second average. The first cup was won by Mr. G. M. Dunk, a Canadian shooter, with a score of 356, and second by Mr. C. G. Dalley, of Baldwinville, N. Y., with a score of 353. F. D. Kelsey, of East Aurora, did the best shooting for the Audubon club, with C. S. Burkhardt, C. S. Sidway and G. P. McArthur following him up. These were the only Audubon men to shoot through the entire programme, although Mr. Hart, a member of the club, but now a resident of Lorain, O., was close after the leaders.

The trade was represented by Mr. Stull, Luther Squier, J. M. Hawkins, J. H. Cameron and G. R. Ginn.

Events: Targets: 1 2 3 4 5 6 7 8 9 10 Broke.

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like R. G. Wheeler, C. G. Dalley, etc.

Events: Targets: 1 2 3 4 5 6 7 8 9 10 Broke.

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like Wheeler, Dalley, Kennedy, etc.

Selbyville Gun Club.

SELBYVILLE, Del., Aug. 28.—The Selbyville Gun Club, of Selbyville, Del., held a shoot at Fenwick's Island, Md., in conjunction with their camp meeting, held at that place on Aug. 14, 15, 16, 17, 18 and 19. It was a success, and the most peculiar part of the shoot was that there was not a representative from any gun, shell or powder company at the shoot, and there was only one shell and one powder used by all of those participating, and they were there from South Carolina to New York.

It might be proper to tell the shooting public the many pleasant features connected with this shoot at this camp meeting. It is situated on the beach almost on the division line dividing Delaware from Maryland, about 245 miles from New York, near the Fenwick's Island Lighthouse. The camp meeting is held in a beautiful oak grove, possibly covering four to five acres of ground, lying between the sea and a beautiful river at the head of Ally White Bay. This bay and river are noted for the abundance of fish, wild geese and ducks that constantly inhabit its waters. While there I saw four of the farmers come ashore with over 400 pounds of fish, caught within three hours with

hook and line—sea bass, weakfish and croakers—and they seemed to think they didn't have any extraordinary luck. Twenty-five cents was the price for a water pail of the finest live fish that one can buy, no matter where one goes.

This small gun club is composed of men in Selbyville, and farmers of its vicinity. Bank presidents, doctors, directors of Baltimore Trust Co., storkeepers, ministers, school teachers, farmers, and, in fact, most every calling of life in that beautiful country is represented. While its membership is not large, it has about thirty-five in good standing. The president is Mr. L. J. Holloway, a retired artisan, who devotes most of his time looking after his beautiful farm. It seems, however, that the Selbyville Gun Club receives more of his attention than the farm does. Mr. Holloway is handicapped by the loss of his right eye, and the sight of the left one is partly gone; but with all these defects, he leads the rest in proficiency, often breaking 22 out of 25 targets. Mr. Holloway shoots from the right shoulder with the stock of his gun nearly cut in half, so as to lay his head low down on the stock for the purpose of seeing with his left eye, and with an old 34-inch open barrel, standing at 14yds., he smashes targets in good time. The club uses that distance as a handicap; open gun 14yds.; choke, 16yds.

The shoot was conducted skilfully. All were welcome who cared to shoot, and as for fine scores, it was almost impossible to make them, the wind blowing a gale and throwing the targets 65yds. measured.

A new member gave the club three prizes. Some hot competition for them goes without saying. The spyglass was won by Mr. R. B. Hudson, 33 out of 50. Mr. W. T. Hudson won the cigar smoker with 34 out of 50, and Mr. J. E. Evans won the car protectors with 31 out of 50. All these scores are very creditable by such young shooters in a gale of wind, and birds thrown too hard in my judgment. Somewhere near 12,000 targets were thrown from expert traps.

The Selbyville Gun Club went to Berlin, Md., and beat the Berlin Gun Club a few weeks ago, in a 100-bird race. Each shooter averaged 82.

The Snow Hill, Md., Gun Club has challenged them for a race, and a hot time is expected. Franklin City, Va., Gun Club is going to try their hand with the Selbyville boys soon. Let all come who care to come.

Aug. 15, prize shoot, 50 targets: L. J. Holloway 34, R. B. Hudson 33, V. E. Simpler 29, C. W. Floyd 33, W. T. Hudson 35, G. Shockey 27, W. F. Long 23, W. J. Hudson 18, O. F. Gilbert 33.

Aug. 16, prize shoot, 50 targets: W. T. Hudson 34, J. E. Evans 29, L. J. Holloway 23, G. L. Long 31, F. Hickman 26, Cal. McCabe 21, V. E. Simpler 24, Wash. Long 28, C. W. Floyd 47. Floyd did not shoot for prize.

Aug. 17, prize shoot, 50 targets: E. V. Baker 19, G. Long 28, L. J. Holloway 29, V. E. Simpler 27, J. G. Townsend 26, J. E. Evans 31, G. Davis 24, O. Gilbert 23, W. T. Hudson 25, W. F. Long 25, E. Whley 29, C. W. Floyd 43. Floyd did not shoot for prize.

Boston Shooting Association.

BOSTON, Aug. 26.—The last shoot of the Lafin & Rand cup series was held at Wellington, Mass., on the grounds of the Boston Shooting Association on the above date. The fine weather conditions brought out a large attendance. C. W. Doten, of Worcester, made high average and won the cup given by the manager for the greatest number of targets broken in the programme events. Kirkwood won the cup. Final scores for cup:

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like Kirkwood, Brown, Morse, etc.

Programme events:

Table with columns: Name, Shot at, Broke, Per Cent. Lists names like Chase, Doten, Conner, etc.

Christiana—Atglen Gun Club.

ATGLEN, Pa., Aug. 26.—The all-day shoot and third meet of the Lancaster Trapshooters' League was held here to-day:

Table with columns: Name, Shot at, Broke, Av. Lists names like Elliott, Benner, Shissler, etc.

Third Lancaster County League race, five-man teams, 125 targets per team, for Peters trophy and individual prize: Christiana-Atglen—Benner 20, Jebb 22, Ludwig 21, Mattson 22, Wilson 22; total 107; 85 per cent.

Excelsior—Klein 16, Gundle 21, Haunnicker 12, Gerfin 14, Renier 51; total 78; 62 per cent.

Elizabethtown—Shissler 20, Cobel 18, Kersey 21, Steiner 17, absentee 12; total 88; 70 per cent.

Pequa—Andrews 18, Leamon 18, Anderson 18, Reiker 22, Bonham 19; total 95; 76 per cent.

Bob White—Ressler 22, Barr 20, Krick 17, Clark 20, Leamon 19; total 98; 78 per cent.

WM. R. FIELDS, Sec'y.

Pleasure Gun Club.

ENGLEWOOD, N. J., Aug. 27.—The members of the Pleasure Gun Club, of Englewood, N. J., expect to make their Labor Day shoot the best the club has ever had. The programmes, which have been sent out, include twelve events at 15 and 20 targets each. Moneys divided in the usual manner; \$5 is offered to first and \$2.50 to second amateur high averages shooting the entire programme. Lunch will be served to shooters, and nothing will be left undone which will tend to make the shoot a success. Shooting begins at 11 o'clock.

C. J. WESTERVELT, Sec'y.

The Mamma—Why don't you say grace, Marguerite? Marguerite—Because it's hash again, and I've already said grace twice on it this week.—New Yorker.

He—I dreamt last night I proposed to a pretty girl. She—What did I say?—Judy.

THE MANY-USE OIL.

Coating on guns and reels keeps rust off.—Adv.

Paskamansett Gun Club.

NEW BEDFORD, Mass.—On Aug. 19 the all-day tournament of the Paskamansett Gun Club was held. About 300 visitors were present. It was an invitation shoot, and some of the best shots from all New England participated. A high wind blew all day. High average for the day was won by Mr. Churchill, of Boston, who broke 132 targets out of a possible 175. Mayor Eugene Ree, of Manchester, N. H., won the second high average, scoring 131 out of a possible 175 targets.

Table with columns: Events, Targets, Name, Shot at, Broke, Av. Includes names like E. E. Reed, Churchill, W. H. Hughes, etc.

Dalton Gun Club.

DALTON, O., Aug. 22.—At the shoot of the Dalton Gun Club, Aug. 17-18, the weather was fine, but the attendance was not what was promised us or expected. C. O. Le Compte was high gun. F. D. Alkire was high amateur. Trade was represented by D. D. Gross, C. O. Le Compte, John Winchester Taylor, and Mr. McNeil.

Table with columns: Name, First Day, Second Day, Total. Includes names like Le Compte, Alkire, Snow, Gross, etc.

Palisade Gun Club.

EDGEWATER, N. J., Aug. 24.—The tournament of the Palisade Gun Club had twenty-seven participants. Mr. J. A. R. Elliott was high in the general average. Each event was at 20 targets, \$1.40 entrance, \$3 or \$5 added. Total of added money, \$45; merchandise, \$35. Sliding handicap. The professionals present were Messrs. J. A. R. Elliott, A. A. Schoverling, Neaf Apgar and Sim Glover.

Table with columns: Name, Shot at, Broke, Total. Includes names like J. A. R. Elliott, Hopkins, H. Bruggmann, etc.

Hell Gate Gun Club.

AUG. 22.—The birds were medium quality, yet they were a good average lot, some very good, some slow. This shoot was for the months of April, May and June, 1905. Scores: Dr. A. H. Davis, 26. J. A. Belden, 28. Peter Garms, 28. L. H. Schorty, 30. John Klenk, 28. R. Baudendistel, 28. P. Albert, 28. John H. Voss, 30. C. Lange, 28. John Schlicht, 28. W. C. Wilson, 28. J. H. Wellbrook, 28. J. P. Dannefeler, 28. Phil Woelfel, 28. H. Forster, 28.

Connecticut Championship.

SOMERSVILLE, Conn.—The second annual Connecticut State championship tournament of the Somersville Gun Club was held at their grounds on the day advertised, Aug. 22. The attendance, while good, was not what had been expected, probably owing to an error in the Associated Press dispatches announcing the date as Friday, Aug. 25. As it was, however, most of the shooters present shot the entire programme, and about 5,300 bluebirds were trapped.

The day was all that could be desired—a day for good scores, and good scores were made. The targets were thrown a uniform distance from each trap. The trade was represented by G. M. Wheeler, J. A. R. Elliott and Hood Waters. The regular programme called for 200 targets, 50 of which, events 7 and 8 were for individual State championship. Three cash prizes, \$20, \$10, and \$5, were offered and guaranteed by the club in this event. H. C. Barstow, the well-known amateur of Rockville, broke 46 and won without a tie. L. H. Bradley, of Bridgeport, and Harry Metcalf, of Rockville, both familiar names on the score sheets of Connecticut shoots, tied for second and third on 45 each. They agreed to shoot off the tie on the next 15-target event, and as the score shows, Bradley went straight and won second, and Metcalf third. Metcalf, it will be remembered, was last year's winner of this event, and made them go some to beat him this year. Barstow also won the Mullerite medal offered for high average for the day, breaking 182, or 91 per cent.; Bradley followed close with 181, and Geo. C. Finch, of Thompsonville, a member of the Somersville Gun Club, was third with 180.

For the professionals, Elliott broke 181, Waters 178 and Wheeler 168. Good shooting was done by Messrs. Chapin, of Brookfield, Mass.; Le Noir, of Springfield, Mass., and Dr. Moore, of South Manchester, Conn. Events 7 and 8 were also shot as two separate sweepstakes, three moneys, percentage system, high guns to win. This for the accommodation of shooters from Massachusetts who were not eligible to compete in championship stake. Several Connecticut shooters fattened up the purse, and as there was nothing deducted for targets, it looked like easy money for the man who could shoot. The first string, event 7, showed Barstow, H. Metcalf, Dr. Moore and Chapin tied on 22 each, and they divided the entire purse. In event 8, Barstow pulled up to 24, and along with Jordan, of Springfield, divided first and second money. Finch and Harry Metcalf, breaking 23 each, had to be content with third money divided. Snow 23, Burke 23, and Pease 24, shot for targets only. The scores follow. Stars indicate professionals and others who were not eligible to shoot for the State championship.

Table with columns: Name, Shot at, Broke, Per Cent. Includes names like Barstow, Bradley, Elliott, Finch, Waters, Le Noir, etc.

Cincinnati Gun Club Tournament.

ST. BERNARD, O., Aug. 25.—The article published in the sporting journals throughout the country relative to the "Profit and Loss" account of the Herron Hill Gun Club may lead those contemplating attendance at our tournament to believe that our war cry of "all the profits paid to the shooters" will amount to nil. Therefore, I ask you as a favor to give the following statement space in your valuable paper.

In the first place our club is enabled to give a tournament as large as any yet held in the United States without expending any large sum of money in fitting the grounds, and so forth. Our grounds are thoroughly equipped for trapshooting in every sense of the word, and we are prepared to throw as many targets in a given time, if not more, than any club in the country. Under the present arrangement with Mr. Gambell the club is under no extra expense for help, outside of the office force, and through the assistance of the manufacturers, and our local business men, we will be enabled to defray this and all other necessary expenses.

To be brief, we expect to charge two cents for targets, and notwithstanding the fact that we give away one cent for every target thrown at the tournament, anticipate clearing, over and above all our expenses, between \$600 and \$800. This amount, through the system devised for the distribution of purses, will revert back to those amateurs who take part in all the events. There will be no cause to complain of our treatment of visiting shooters, or of our manner of running the shoot.

Tournament Committee, By Arthur Gambell.

Rochester Rod and Gun Club.

ROCHESTER, N. Y., Aug. 23.—In the competition for the Lafin & Rand cup, open to all, several visitors joined to-day. The event is a handicap, an allowance of targets added. Ten more shoots will be held. The privilege to make up back scores is accorded. Re-entries may be made by the payment of 25 cents, the re-entry money being divided at the end of the series in prize money. Scores:

Table with columns: Name, Brk. Hdp. Tot'l. Includes names like Kelly, Kershner, Stoddard, Rickman, Hinkson, Clark, etc.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Aug. 12.—Sutcliffe won Peters Cartridge Company's badge. Finley was high gun for Dupont trophy. Events: Parry, Hunter, Armstrong, Moore, Harcourt, Wands, Finley, Britton.

THE MANY-USE OIL CO.

New York City, will send Free Sample. Write now.—Adv.

Springfield, Mass., Shooting Club.

THE practice shoot of this club on the afternoon of Aug. 19 was well attended, but owing to a strong east wind blowing, the scores ran lower than usual. Kites was high with an average of 76 per cent., with Snow close behind with 75 per cent. The weekly prize event, a 15-target race for a hunting coat as prize, resulted in two ties. The first between Lathrop, Cady and Andrews, who were all tied on 15. On the shoot-off at 10 targets Cady and Andrews again tied on 10, but owing to a misunderstanding, this tie was not shot off, but will be at the next shoot. The Peters cup contest and the merchandise race for three prizes of equal value have two more shoots to run. Added target handicap in cup contest, and in the merchandise race the shooters are divided into three classes, A, B, C. Scores in these three handicap events follow:

Table with columns: Name, Brk. Hdp. Tot'l. Includes names like Cady, Andrews, Lathrop, Kites, A. Mysterly, etc.

Shoot-off of tie at 10 targets: Cady 8, Andrews 7, Lathrop 7, Mysterly 7.

Table with columns: Name, Brk. Hdp. Tot'l. Includes names like L. Mysterly, Kimball, Kites, Andrews, Snow.

Three merchandise prize race, 25 targets: Class A—Snow 19, Kites 17, Cheesman 13. Class B—Hawes 19, Lathrop 17. Class C—L. Mysterly 15, Kimball 14, A. Mysterly 14, Cady 10.

Table with columns: Name, Shot at, Broke. Includes names like Kites, Snow, L. Mysterly, Kimball, Lathrop, Andrews, Puffer, Hawes, Cheesman, A. Mysterly, Chapin, Cady.

Ruffsdale Gun Club.

THE Ruffsdale Rod and Gun Club, Ruffsdale, Pa., held an all day shoot and corn roast at Ruffsdale, Pa., on Aug. 18. This was one of the most enjoyable shoots and social functions ever held in western Pennsylvania. The social feature was participated in by the wives and sweethearts of the members of the club. A noon a lunch was spread consisting of an old-fashioned corn roast and all the delicacies of the season. Three hundred and seventy-five people enjoyed the spread. R. S. Deniker and his charming daughters were especially interested in making everybody feel at home. The shooters of western Pennsylvania who did not attend missed one of the best days' sport ever held in western Pennsylvania. The trade was represented by Chas. G. Grubb, A. B. Kelly, of Scottdale, took first honors. Following are the scores:

Table with columns: Name, Shot at, Broke. Includes names like Kelly, Deniker, Baker, W. Smith, Hale, McGlashan, Miller, Carroll, Andrews, J. Smith, Neill, Lowe, L. Suter, Brown, C. Suter, Wigger, Kiehl, Donahue, Poole, W. S. Kelly, Hubbs, Chain, Davis, McFarland, Ward.

Gregory County Sportsmen's Association.

BONESTEEL, S. D., Aug. 25.—The bi-monthly tournament of the Gregory County Sportsmen's Association was run off at Fairport on the 24th inst. There were two 10-bird and five 15-bird events, \$1 and \$1.50 entrance respectively, and the 25-bird event, No. 1 for the Peters Cartridge Company's emblem, representing the championship of Gregory county. The attendance was not large, but all the old-timers were there, and quite a number of spectators among them several of the fair sex. The day was ideal for shooting, and the new trap worked to perfectly, only two broken birds out of the 700 thrown. Mr. Carl Porter won the championship trophy with the good score of 24 out of 25, and also won his average for the day with 112 out of 120, a 93.5 gait. Leach was second average, and Thompson third.

The next shoot will be at Bonesteel on Wednesday, Sept. 1, when the same programme will be run off. As we have a number of young shooters just breaking into the game, a large attendance is expected. We will use Rose system, four moneys, and this will give everybody a chance at the money. Following are the scores:

Table with columns: Name, Shot at, Broke. Includes names like C. Porter, Leach, Thompson, Spatz, O. Porter, C. Law, W. Law, Fitzgibbons.

Norwich (Conn.) Shooting Club.

THE prize shoot held on Saturday afternoon, Aug. 12, was attended. The following visitors were present: Messrs. P. Ames, Mason, Watrous and Goddard from New London; Ed. Dakin, from Wilimantic; Chapman, from Westerly, R. I.; Dakin, from Worcester, Mass. The prizes awarded were a set of bird carvers, Mr. Watrous; stag horn corkscrew, Mr. Edgerton; China dish, Mr. Post; silver fork, Mr. Mitchell.

Table with columns: Name, Shot at, Broke. Includes names like J. A. Mitchell, Edgerton, Post, Watrous, Prest.

Scores at less than 100 targets: Mintz, 19 out of 50; Gate, 25; Olcott, 18, 25; Ames, 50, 75; A. S. Brown, 20, 25; Chapin, 51, 75; West, 16, 50.

Independent Gun Club.

EASTON, Pa., Aug. 21.—Below find the scores made at the L. & R. trophy. The next shoot will be held Sept. 1, which will be the final contest for the trophy. Event No. 1, 50 targets, back scores: J. Maurer (2) 41, Richard (8) 41. Event No. 2, 50 targets: E. Markley (0) 48, W. Maurer (1) 48, J. Maurer (4) 44, G. Elliott (14) 34. W. R. IVEY, Sec'y.

### WESTERN TRAP.

#### The Indians' Greatest Pow-wow.

SPIRIT LAKE, Ia., Aug. 25.—The hills and dales that surround Spirit and Okoboji Lakes in the State of Iowa have echoed like unto a skirmish line. Where the white man warred with red men for possession of this great land and water in Northern Iowa, during the past four days there have been fifty gunners assembled near the banks of these two lakes, and each fired 1,000 shots through a scatter gun.

After going to Indiana last year to shoot, it was decided that, though the name of that State was similar to Indian, that they would meet this year on the shores of their past maneuvers, and thus the seventh annual shoot was held in Chief "Back to the Woods," backyard, which is in Spirit Lake town, though almost a mile from the lake proper.

In all the years past that the shoots have been held at Arnold Park, Okoboji, the shooting has been over the water, and as many objected to this, the chiefs of the home brigade sought to remedy it and a ground was chosen where there was no water in sight. Yet there was a poor background. There were trees that made shooting very hard when at No. 2 set of traps.

The weather was on the usual order that generally prevails on the lakes—strong wind. Yet there was no rain to interfere, and the wind not so strong as on other occasions, when the shoot was held at Okoboji. The wind and background caused many of the misses to be recorded. The full detailed scores are herewith printed. Look them over and see that the very best shots of the world were there, and that they all shot poor at times; also, that the poor shots shot uniformly poor.

There were two automatic traps used, and they gave good satisfaction, save that at times the targets would break rather frequently. This was, no doubt, caused by rough handling in shipment.

The squaws and papooses were present in goodly numbers, and they were a pleasant part of the meeting. You will find their names elsewhere. They were present during the day on the shooting ground, cheering on their "braves" and entertaining during the evening with music and dancing, together with boat excursions and steamboat rides.

These gatherings are noted for their display of good fellowship, and it is truly wonderful how well the ladies enter into the spirit of the occasion. Most of them like to fish, and before and after the shoot they are royally entertained with fishing, and then the fish fry that follows is something that should be seen and entered into to be appreciated. You should taste fish that are fried in hot butter in an hour or less time after they are caught.

As to the shooting, there was quite an exciting race, as between chiefs Heap Talk, Kinne Kennic, Drink Water and Wise Sachim. Each of these had their day. Drink Water held the honors for three days, but the foxy Heap Talk got the honors for the most dead mud pies. Kinne Kennic had a cold and was not at his best. The last year's addition to the ranks, Wise Sachim, set them all a pattern, as he slaughtered 145 straight.

On the first day, Wm. Heer showed that his eastern summer tour had not caused him to forget his cunning in the west, and he lined out 194 for the day. He had a partner in the race. Gilbert was busy, and he held a mighty heap big game sack, and when the evening shadows had gathered about the lake, it was interesting to hear him relating to young Tom Marshall and Miss Annie Oakly how he had 193 dead ones in that overloaded game sack.

That good pair of Indians who hail from Minneapolis were an even stand off with 188, Young 186, Confarr and Huntley 185, Taylor 184. All together there were seventeen who made 90 per cent. or better. They were all shooting for the money this time, and yet there were times when many of the Indians did not get into the money.

Second day found Heer still forging to the front. He shot a peculiar race. He ran the first four events straight, then lost two in the fifth and three in the sixth and then went straight in the last four events, rolling up the great score of 195, and yet, "Hoot man," and how vos it? There were others! The Wise Sachim came on strong and made seven straight scores and three 19s, and finished with 197. And still there was another warwhoop. T. Bill got going and made the extra score of 196, so Heer was not even second fiddle. How the mud pies did suffer—little profit in the pick-ups.

Dick Merrill got a line on 'em for this day and got above 95 per cent., and there came one who is not an Indian, and by not "stubbing his toe" more than seven times, finished with 193, and he was Huntley from Sioux City, Ia.

On this day the contest for the Mallory cup was held. The scores of it, together with the handicap, is shown in scores for this day. Being a handicap shoot, it cut down the scores in a measure, as 47 was best score made, save one, and that came as a surprise, yet was a very popular win. Where on the face of the earth can you find a more popular man than Richard Merrill, of Milwaukee? He has not shot much of late years, so the handicap committee put him at 18yds., and there was nothing left of the whole fifty targets, save very small pieces of the "spheres."

Third day opened up bad for the "pie" busy. During the night a very heavy storm raged, and when the shoot opened the mist and wind were a stumbling block even to the eye of an Indian, and there were those present having eyes like an eagle's. Gilbert forged to the front and won out high average for the day, and as Heer went to the bad, laid the foundation for high general average. Don Morrison, by way of a little diversion, ran 145 straight, and yet by losing four in the first event, one in second and three in third finished with 193. They say that Bill Heer came out with a heavy coat and could not handle his gun properly. He fell away so badly that he did not make a straight for six events and finished as low as 182, being tied even at that with T. Bill Crosby.

Pop Heikes was trying out a new gun, and with it came off two ahead of them. It was said that Pop Heikes broke his gun, and it was a good thing, as then he improved in shooting. Huntley came within one of 95 per cent. for this day, but the rest fell away, owing to wind which was changeable, though strong, from the north.

The last day Gilbert was a busy lad and held his steady smashing consistently, and though 192 was placed on to score, yet the tall Kansas cyclone came away with two to the good. They had a partner in Huntley, a she made 193. This man has them all guessing. Morrison had a few ups and downs and fell much behind his other scores, and had to be content with 94 per cent.

When the last shot had been registered on the regular programme there was a cessation of the firing line until H. Hirschev could figure up the total score, for, be it here recorded, that Fred Whitney, the Chief Quick Figure, was for some reason not present at the shoot, this being his first failure to show up.

Then the excitement began. All the squaws began to crane their necks and the papooses to fly around with much anxiety, for the cups were to be won. The first cup was won by Gilbert on a straight score of 50. While Heer made 48, none of the others in the 94 class went below 47. Pop Heikes had plenty of company in the 90 class, and it required a shoot-off to decide, and he decided it with a win.

W. A. Waddington won the less than 80 per cent after a shoot-off with Henshaw.

There was a hasty retreat for dinner, and a preparation for the fish fry, which was next in order, an account of which will appear in next issue.

Chiefs present: F. E. Mallory, Chief Tell 'Em How; S. T. Mallory, Chief Life Saver; J. F. Mallory, Chief Hole Digger; John Burmister, Chief Back to the Woods; Jack Fanning, Chief Ball Seal; Chris. Gottlieb, Chief Slob; Herman Hirschev, Chief Little Hatchet; W. R. Crosby, Chief Kinne Kennic; Russell Kleine, Chief Toboggan; Fred Gilbert, Chief Heap Talk; S. S. Johnson, Chief Allaboard; Charlie Young, Chief Sparrow; Charles Budd, Chief Dago; Roll Heikes, Chief Bald Eagle; Tom Marshall, Chief Long Talk; Frank Riehl, Chief Piazza; Chan. Powers, Chief Wipe Stick; Don Morrison, Chief Wise Sachim; Dick Merrill, Chief High Kick; Guy Burnside, Chief Spoon River; Bill Heer, Chief Drink Water; Geo. Loomis, Chief No Talk; "Pat" Adams, Chief Three Scalps; H. S. McDonald, Chief Hoot Mon; Elmer Shaner, Chief No Hair.

Squaws and papooses: Sid. Mallory, Crosby, John Mallory, Budd, Johnston, Mrs. McDonald, Riehl, Gilbert, Shaner, Burnside, Burmister and Kleine. Papooses, Lillian Crosby, Irene Burmister, Ethel Mallory, Annie Oakly Gilbert, Thomas Marshall Gilbert, Gilbert Loomis, Karl Burnside, Clarence Crosby, Pauline Kleine and Karl Kleine. Several group pictures were taken of the Indians, and squaws separate, and with the bucks in their Indian costume. These will be much appreciated as souvenirs.

Those present not Indians were L. E. Mallory, Bradford, Pa.; H. G. Taylor, Meckling, S. D.; E. R. Hickerson, Moberly, Mo.; E. E. Barber, wife and boys; E. F. Confarr, Livingston, Mont.; Henry Steege, Waterloo, Ia.; G. Gottsch, Worthington, Minn.; Dr. C. E. Cook, New London, Ia.; W. A. Waddington, Lincoln, Neb.; S. A. Smith, Hartley, Ia.; J. H. Tamm, Denison, Ia.; N. S. Hoon, Jewell, Ia.; G. A. Rober, Manning, Ia.; Geo. Kehm, Fort Dodge, Ia.; P. Ohrt, Manning, Ia.; S. M. Huntley, Sioux City, Ia.; J. B. Barto, Chicago; Fred Slocum, Alcester, S. D.; E. G. Wallace, Marshalltown, Ia.; E. C. Henshaw, Okoboji, Ill.; Joe Konvalinka and Glenn, Mason City, Ia.; Claud Binyon, Chicago; Geo. Hughes, Fonda, Ia.; H. Sherman, Kansas City; P. R. Patch, Hartley, Ia.; H. B. Gundemeyer, Manning, Ia.

The scores in detail, 200 targets each day, follow:

Fourth Day, Aug. 25.

Table of shooting scores for the fourth day, Aug. 25, listing names and target counts.

Summary table of total scores for the four days, listing names and cumulative scores.

Table of scores for the first, second, and third class cups, listing names and scores.

Winners of average cups: Fred Gilbert, first class, 50 straight; Rolla Heikes, second class, 48 out of 50; W. A. Waddington, third class, 43 on a tie.

Cincinnati Gun Club.

August 25 was pleasant and cool, with a stiff breeze, which bothered the shooters considerably, though no one complained.

Table of scores for the Cincinnati Gun Club, listing names and scores.

Ohio Notes.

Only six men took part in the weekly shoot of the Springfield Gun Club on Aug. 19. The day was rainy and decidedly unfavorable for shooting.

the tie 9 out of 13. Cain scored 25 out of 29, and 6 out of 10 in the tie. The sport ended with six sweepstakes, five at 15 and one at 10 targets, 50 cents entrance; four moneys in Nos. 1 to 4, and two moneys in Nos. 5 and 6.

At the shoot of the Urbana Gun Club, E. W. Holding won the cup emblematic of the individual championship of Champaign county with a score of 24 out of 25.

The regular shoot of the Fayette Gun Club, Lexington, Ky., was held on Aug. 24, only thirteen members being present.

Garfield Gun Club.

Chicago, Aug. 26.—The appended scores were made on our grounds to-day on the occasion of the fifth trophy shoot of the third series.

Table of scores for the Garfield Gun Club, listing names and scores.

In Other Places.

There are some game sportsmen in Pennsylvania. A match was made last Thursday at Locust Gap between Bodeman, of Locust Dale, and Tom Klinger, of Locust Gap.

Scores made by the members of the Green Cove Springs, Fla., Gun Club, each at a possible 25: Niell Jackson 18, W. L. Hendricks 20.

Harvey McMurchy was at Fulton, N. Y., last week, and George Lewis and Isaac Chapman, who are in his class as members of the gun club, held a tryout at 50 targets.

The shoot to be held between the Marshalltown and the Grinnell, Ia., gun clubs will not come off until Sept. 25, as many of the Marshalltown team are away from home.

Shooters of the West are congratulating Charles Spencer on his great score, made at Morganstown, W. Va.,—165 straight.

The first annual tournament of the Janesville, Wis., Badger Gun Club was held last Sunday. Though no scores were given, it is reported that the day was ideal.

The Rock Valley Gun Club, Lemont, Ill., held a tournament Aug. 27, which was expected to draw well, as there were 200 targets on the programme, and some fine prizes up for competition.

SIDE LIGHTS OF TRADE.

Winchester factory loaded shells won at the tournament of the Dominion of Canada Trapshooting and Game Protective Association, held in Ottawa, Aug. 16-18.

PUBLISHERS' DEPARTMENT.

The beauties of Lake Temagami and the opportunities it offers for sport are only just beginning to be known, but their importance in the public mind is likely to increase.

Bobby's father had given him a shilling and half a crown, telling him he might put one or the other in the contribution plate.

Buffalo Bill's hunting lodge, which is advertised in another column, lies just to the east of the Yellowstone National Park, which it reaches by a beautiful wagon road and trail through the Sylvan Pass.

The constant inquiries about lotions and oils to prevent mosquitoes biting seem to be answered in the advertisement of Mosquitoit published in our advertising columns.

Advertising Tip.

Don't be discouraged—keep on tryin', An' you will get yer wish; Sometimes the very shortest line Pulls up the biggest fish.

THE MANY-USE OIL.

Preserves the new blue finish on Guns. Try it.—Adv.

## MORE NATIONAL PARKS.

THE fine progress made in setting aside forest reserves under the Act of 1891 is something on which every American may congratulate himself. In less than fifteen years vast tracts have been reserved from settlement to be used by the people at large as adjuncts to the water supply of the West, and as carefully guarded sources of timber supply for the neighboring public. This is all as it should be—a great advance over old methods.

Forest reserves are good and useful, but their purpose is wholly utilitarian. Their game may be hunted; cattle may be grazed on them; settlers may take up claims on non-forested areas within their borders; prospectors may run over them, sinking holes for mineral, or washing the gravel bars and running the mud into their streams. In the few National Parks which we possess, on the other hand, these utilitarian pursuits are forbidden. Like the parks in our great cities, they are set aside as breathing places for the people, pleasure grounds which every one may visit and enjoy with the utmost freedom, so long as he does not encroach on the rights of his fellows. The game, the fish and the timber belong to all, and hence are subject to such rules and regulations as seem for the greatest good of the greatest number. For reasons well understood by all, the game may not be pursued or harmed; but visitors may use timber for fuel or fish for food.

Our important National Parks have commonly been set aside in rough mountain regions, characterized by great beauty of natural scenery. The towering peaks, lofty cliffs, and rough rock slides of the Yellowstone, the Yosemite, or the Crater Lake parks offer little to attract the permanent resident; on the other hand, at certain seasons of the year they are visited by great multitudes of people, who derive very great pleasure from them, and who pay out much money, which passes into the hands of those who aid them to enjoy their trips.

The American people have too few places of this kind, and this is coming to be well recognized by thoughtful persons. There are certain regions which are so incomparably more beautiful than others that they ought by all means to be protected and saved for the public by the Government, just as the Yellowstone Park has been saved and protected.

Such spots too often lie far from the beaten track followed by money-grubbing man, and are therefore unknown to people who might talk and write about them and so call them to the public attention. They may lie in States or Territories where those residents who give any thought to the beauties of nature and the happiness and welfare of coming generations are few, and the vast majority of people are more occupied in chasing the almighty dollar over the prairie and trying to throw a rope over it than they are in thinking of what may happen ten or twenty years from now. The people residing in the States in which lie the areas which should be made National Parks are obviously those who should petition Congress for the legislation required to establish such parks, yet too often the very people who would be most benefited by such legislation are the last ones to think of the matter.

Of the seventeen National Parks of the United States, five are military, on the sites of battles of the Civil War, six are more or less wild and natural, and three are wholly artificial. The Yellowstone Park with its two million acres, and the Yosemite of one million, are by far the best known. These National Parks lie in Wyoming, Montana, California, Washington and Oregon, though Montana's interest in the Yellowstone is a narrow one. Colorado has no park, and neither have Idaho, Arizona or New Mexico, though in each there should be one.

Mr. Hamlin Garland, the eminent novelist, has recently been hard at work trying to arouse in Colorado a public sentiment which shall call on Congress for the setting aside as a national park of the region west of Gray's Peak, the White River Plateau. This beautiful region is almost the only one in all Colorado that is as yet unmarred by the encroachments of civilization. Pick and ax have as yet done little to scar its hills and mesas, and the effort to save the region is worthy of all praise and should succeed. It may be hoped that Mr. Garland's written and spoken eloquence may serve to stir the Coloradans to action.

A region which should be set aside as a National Park without delay is the Grand Cañon of Colorado. It is

true that the puny efforts of man cannot do much to injure such stupendous natural works as have here been wrought. Nevertheless the Grand Cañon ought to be under the control of the Government and properly protected by it.

Still another country—practically without inhabitants, yet marvelous in its wonderful beauty and grandeur—is that known as the St. Mary's country in northwestern Montana, lying in the main divide of the Rocky Mountains between the Great Northern Railroad and the Boundary line. It is a region of marvelous lakes, towering peaks, vast glaciers and deep, narrow fiords. Few people know these wonderful mountains, yet no one who goes there but comes away filled with enthusiasm for their wild and singular beauty.

All these parks might be set aside by Congress at practically no present expense, since the work of improving them could be postponed almost indefinitely. President Roosevelt has more than once expressed an earnest wish that all of these regions should be made National Parks, but he recognizes, as every one must, that the demand for such legislation must come from the people of the regions where these areas are situated, and may well enough feel, as others do, that if the inhabitants of these States or Territories do not care enough about the matter to move actively, no branch of the Government can be expected to do so.

## LOST IN THE WOODS.

WHEN one considers the many millions of people scattered over the United States, it would seem that getting lost on the prairie or in the woods was likely to become a forgotten art, and yet it is not so. Every summer the newspapers are filled with accounts of men, women and children who get lost, and remain out of doors for a longer or shorter time, finally to be recovered in a condition of more or less misery. A vast amount has been written about getting lost in the woods, how to avoid being lost, and how to find oneself when lost; but, so far as we have been able to study this literature, it contains very little that is practical.

Advice to children, to women and to people who have spent little of their time out of doors is not likely to be of great value, and these are the very people who are likely to get lost. On the other hand, the man or woman who is familiar with outdoor life knows a certain number of essential things about being lost, and does not need to have these repeated. One of the most frequent recommendations by persons writing on this subject is that the traveler should remember in which direction he is going, so that when he desires to retrace his steps, he may do so by going in the reverse direction; but how is this to be done? Nothing is easier than to lose one's sense of direction when getting out of known surroundings, but on the other hand, a few simple suggestions, if recollected, may help one to keep his direction. A compass is a good thing, but to be of much use it must be frequently consulted, and the distances varying from a direct course must be computed. In a more or less open country there are usually land marks, hills or mountains, noteworthy and easily recognizable, trees on elevations, water courses or other natural physiographic features which one may use as guides. On the other hand, if the country is wooded, the sun must be the guide, and if this is obscured and one has lost his sense of direction, he should simply camp until he gets it back again. Often the timber looks all alike, and in a burned over forest in the Western mountains, if the sun is hidden, one may stand among the slender gray tree trunks thirty or forty yards from camp and absolutely lose his sense of direction, finding his way back only by listening for the camp sounds.

It is on the sun that we must chiefly depend for direction if we become lost. We know that it rises in the east, sets in the west, and is in the south at midday. At this time, it casts a very small shadow, and a person of slight powers of observation can notice this. He is likely to know where the sun was when he started from camp in the morning, and thus to recognize the direction in which he at first traveled. If he knows the points of the compass when he finds that he is astray, he should be able to reverse his morning's direction and to go back toward camp.

In a mountainous country all springs and brooks and creeks flow toward some main river, and along the main

rivers are usually roads, settlements and other unmistakable evidences of human beings. To be sure, there may be sections where the following down a stream will involve a long and tiresome journey through tangled swamp and forest; but, on the other hand, a journey down the stream may be the speediest way of finding camp or some one who can tell you where camp is. When going into camp, it is always well to acquire from your guide, or from some one who is familiar with the country where you are to be, all the information possible about the region—what streams are in it, what river do they flow to, what sort of country do they pass through.

In old times the men who traveled over the then trackless plains and mountains came at last to be as observant as an Indian of the features of the landscape. Almost unconsciously they counted the streams they crossed, calculated the directions in which they flowed, compared them with other points where they had crossed them, noticed the hills, the bluffs, the rocks, and the trees in the river bottom, and at the end of the day's march could, if so disposed, draw a very correct map of the country passed over.

Nevertheless, it was possible for the oldest trapper and for the old-time Indian to become lost, if land marks were not seen, and there was nothing to give the sense of direction. The heavenly bodies are a better guide than any compass. But if they be obscured and there are no land marks, one cannot travel. There is no inherent sense of direction or peculiar wisdom of locality in the trained persons that travel so readily through regions which possess absolutely nothing recognizable to the newcomer; it is simply that certain powers and senses inherent in us all have, in these special individuals, been brought out and trained to a very high degree.

## A VANISHING GAME BIRD.

THE general prospects this season for good prairie chicken shooting—one of the keenly popular upland sports with dog and gun—seem in the main to be unfavorable. Undoubtedly there are small areas here and there, mere nooks in comparison to the whole vast prairie habitat of the pinnated grouse which contain birds aplenty, and which will afford ample sport for the favored few who have access to them; but for the hundreds of chicken shooters who take their chances without preliminary investigation, much failure and disappointment are in store.

The reports, from many of the prairie districts where the pinnated grouse in times past were in abundance, or at least plentiful enough to afford good sport, indicate an unusual scarcity.

Undoubtedly the destruction of the pinnated grouse is greater than its reproduction. This decrease in its numbers seems to be steadily progressive with the passing years. The area of the habitat of species also is gradually diminishing, though this is not manifested by the entire and sudden extermination of the chickens in a certain section, nor their sudden abandonment of it.

The changes from abundance to dearth come about gradually. Some sections, in former years, which afforded sport for weeks, in later years afford sport for days only. From abundance, the supply becomes meagre. Oftentimes, the changes from plenty to poverty, the lamentable results of extermination or abandoned habitat, are not noticed by the sportsman till he is confronted with the fact when diligent seeking for sport afield with dog and gun ends in failure.

The enormous decrease in the numbers and the decreasing habitat of the prairie chicken are not realized by the younger sportsmen of the present time. Nor do the older sportsmen realize it by any comparisons of more recent years. A comparison of present conditions concerning chicken shooting with those which obtained fifteen or twenty years ago, will bring into conspicuous relief the progressive decrease which has resulted in the scarcity of the present. Twenty years ago the habitat of the prairie chicken, beginning in western Louisiana and Texas, extending through the prairie region of the Middle South and West, far up into British America, and plentifully stocked with chickens, was far in excess of the prairie chicken habitat of the present. Plentiful as were the birds then they occupied a lessened habitat and were far less in number than they were when Audubon, in a visit to Kentucky, wrote of them as being so over plentiful there and destructive to crops that they were little short of being a pest.

## THE SPORTSMAN TOURIST

### My First Black Bear.

(Concluded from the issue of Sept. 2.)

I DID not at that time know anything about the different bands this Sioux tribe is split up into, but I think these were Teton Sioux. I had a boy friend among them and he called himself a Teton. They had a good bunch of ponies, and seemed to be very well fixed, for Indians. There was a boy in one of the families who was about my age. He and I formed a close friendship, and did all our hunting in each other's company. He taught me to handle and ride their ponies, and when we got to the buffalo country, taught me to kill buffalo.

I had read all about these Sioux, and had been told how mean they were, and I would no more have thought of lying down at night with a Sioux and going to sleep than I would think of doing it with the devil. But at that time if we were off on a hunt and had got too far from home, the Sioux boy and I would hunt a good place to camp, stake out our ponies—I rode one of his—then build a big fire and wrap ourselves in the same blankets and go to sleep. I was in no danger; that boy would no more think of hurting me than I would of hurting him.

When Mr. Remington found out what kind of people these Indians were he was anxious to keep them with us. They knew every foot of this country, and could tell us where we could go with the wagon, and where we could not. There was a chain of mountains to the west of us that we would have to cross; the map said they were there, and we afterward found that in this case the map was correct, if it was not in regard to the desert. The mountains were just where the map said they were; and the Indians piloted me across them. They were the Laramie Mountains. Then again, we were always in danger of having our horses stolen by Indians; the only Indians we were likely to meet here were the Sioux and Crows. The Crows would not touch a white man's horse; they have always been our friends; and while these Sioux were with us no band of Sioux would plunder us. These were about the only Indians I have ever seen that were not continually begging "chuck-a-way." They never asked for anything. If a squaw wanted something—and they seldom did—she would come to my fire, fold her hands, then stand there until I asked her what was wanted. It was generally salt; we had plenty of it and she always got it.

Another thing that we had plenty of was smoking tobacco. There was half a barrel of it in the wagon. It is called long-cut now; it was cut-and-dry then, and was sold in bulk, there being no tax on it then. We carried it for Indians, the men hardly ever using it.

The Indian men and boys wanted it and got it. A handful of it would last the whole crowd a week. They smoked it in cigarettes and tried to get me to use it that way, but I had no use for cigarettes.

When Mr. Remington found that these Indians were not begging from morning until night, he told me to let the squaws have anything they wanted, if we had it to spare; and I did so, but they would not ask for it.

They used bows and arrows to hunt with. They had two old muskets of the kind the Hudson's Bay Fur Company put out then. These had no doubt been out since the year 1 A.D., and looked to be dangerous only to the man who would try to use them. They had no powder for these, and got none from me; I did not want to see them kill themselves. But we shot ten times as much game as we could use; they got it, and got all our furs and skins. The squaws were kept busy part of the time taking care of them.

I kept no account of time, but think we crossed the mountains down near their northern end some time in January, or probably later than that, as we kept close to the mountains, camping at the foot of them until about the first of April.

We were in the Laramie Plains now, and began to meet buffalo. We also met a trader here, and got about all the supplies he would let us have. We did not meet him any too soon, either, as my wagon was nearly empty and Mr. Remington had about made up his mind to go to Fort Laramie after supplies. This trader came from there, and was on his way north to trade with the Indians.

The only traveling we did for a long time now would be to move camp from time to time to find fresh grass and more wood. We and the Indians hunted buffalo now, the Indians getting the robes and most of the meat.

The first time I went for the buffalo I was mounted on an Indian pony—I never tried to kill them from one of our own horses. My Indian boy chum singled out a young cow, then telling me where to hit her, sent me after her. The pony carried me almost on top of her, then pointing my pistol—the one that I had shot the bear with—right where the boy had told me to, and almost close enough to touch the cow, I fired. The cow plunged forward and fell, while my pony carried me almost an eighth of a mile before I could pull him up; then I rode back to the cow, and getting off my pony, stood on top of her, wishing that I had a daguerreotype (there were no photographs then).

We had visits every once in a while from Indians. They were generally Crows, and they did not seem to be in love with our Dacotas; in fact, as I afterward found out, had we not been here these Dacotas would not

have come here at all—at least not this small party. One of the Crow chiefs paid us a visit one day when there was no one at home but me; the men were off on foot, hunting. I entertained him, gave him and his party a spread of coffee, bread, boiled ham and crackers, then proceeded to stuff him with an imaginary account of what great chiefs we were. He wanted to know what the Dacotas were doing here. "They are our guides. The Great Chief who lives here has them to show him the straight road. This Great Chief has been sent here by the Great Father in Washington to look at this country and see if the Indians are well and happy. When I go back to the Great Father, shall I tell him that Little Bear is well?"

Yes, he wished I would. Do I see the Great Father often?

"Every day when I am at home. We all see him. We are his chiefs."

Millard Fillmore was the Great Father then; I had never seen him in my life.

The chief gave our horses a critical examination. Had he not been a Crow I should have been right at his heels lest one of these horses might get stuck to his fingers; but I did not go near him. My big team horses seemed to please him best. He called me out to know if these were the Great Father's horses. They had no brand on them, he said—he had been looking for the "U. S."

"No," I told him, "they belong to the Big Chief here. They cost many dollars. Little Bear has hardly ponies enough to buy one of them." I gave him and his men a present of tobacco, and they got ready to go, when Little Bear wanted to know if we could not send those Dacotas home to their own country. He could show the Big Chief the road now.

"Our road will be back in the Dacotas' country; can Little Bear show us the road there?"

Yes, he could; all over the Dacotas' country; he knew it all.

"But maybe the Dacotas won't want you there." I knew that the Crows and Dacotas were bad friends.

"I am a Crow," he said, slapping his breast. "I don't care if the Dacotas want me. I go."

He met us again later on, after we had sent the Dacotas home. We were not going into their country at all now, but were in his country, and I had to invent another story to account for our still being here. He kept us company for several days, and he gave me a history of the Cheyennes. He seemed to take a fancy to me, and wanted me to stop with his band, but Mr. Remington told him that the Great Father would not allow it. I had told Remington about the story I had dished out to this chief when he had been at our camp before, and Mr. Remington corroborated everything I had told them. We were all great chiefs, even if I was driving a wagon.

A few days after the chief had paid us his first visit we were joined by two troops of cavalry that were out on scout from Fort Laramie.

These were the first real soldiers I had ever seen. We had some at home—the National Guard, as they are called now; they were the Uniformed Militia then—but they were only playing soldiers. These fellows, though, were the real ones that I had read about; they could fight Indians. I and my Indian chum put in half of our time in their camp trying to do everything that they did.

There were three boys in the two troops. There should have been four, but one of the troops was a boy shy. These were the "wind jammers"—trumpeters. I got one of their trumpets—they called them "bugles" then, and the Indian boy and I kept it going from morning until night. We dare not sound it in their camp, but we could in our own camp, only a few hundred yards away. There was no danger here of my raising a false alarm when I ground out, "Boots and Saddles," or "Assembly."

The captain of the troop that was short of a boy tried hard to enlist me; but I was in the West now, and not half so anxious to "hunt the flag and take a blanket" as I had been a year ago, or as I often was years after this.

A trick that these troopers were at every day was vaulting over a bare-backed horse. They caught his mane in the left hand, then resting the right hand on his withers, would spring clear over him; then tell me to do it. After a few trials I could, if I took one of their fifteen hands high horses. A hand, four inches, in the height of the horse made a great difference, though; I always would land on the horse's back when I took a big horse.

We lost our Indians here. The ranking captain, who was in command of the squadron, ordered them back to their own country again. It seemed that they had no business on this side of the Laramie Mountains. Mr. Remington offered to be responsible for them and see that they went home when we did; but the captain said that as much as he would like to let them go, for he knew them and said that they were all right, still he had no option; his orders were to keep each band where they belonged. He could not do it always, he said, but must try.

The Indians started on their return, loaded with robes, furs and dried meat, and all the rough supplies their ponies could carry. They had been lucky. They could not have come here at all had it not been for us.

The officers told me that the Crows would have run them off long since had we not been here.

We kept the cavalry company for a while; then struck out for ourselves, and in the next few months traveled over what are now the States of South Dakota, Wyoming, Nebraska and Kansas. It was all Indian territory then, except probably Kansas, which had been made a separate territory, I believe, and late in August we brought up at West Port, Missouri; it is Kansas City now. Here the expedition disbanded, Mr. Remington selling his whole outfit for more than he had paid for it a year ago. They kept only their favorite shotguns, and sold everything else in a lump to a party of men who were going up through what is now Montana and Idaho on a prospecting trip. I came very near going also; they wanted me to go, and had it not been for Mr. Remington, I should have gone. He persuaded me to go home. Our horses were in splendid order, every one of them. I had always had a great liking for a horse, mule or dog, and although I did not know it then, I have since found out that I can do about what I please with either of them. I have never found a dog which, no matter how cross he was, would not obey me and follow me if I wanted him to do it; and never have had one offer to bite me—and I have handled horses and mules that no one else could do much with. I rode cavalry horses for twenty years and never had one for any length of time without teaching him to do about all that a horse can do. I had a horse taught to fold his legs under him, lie down, then let me lie behind him and fire across his neck or back. This was years before our officers took it up; they have since drilled this in the cavalry.

When I took charge of these two team horses, I began to make pets of them right away. They had no names. I named one John and the other Charley. They soon knew their names and would answer to them. I groomed them every day, whether they were working or not; fed them sugar and scraps of bread, and after I had them a short time never tied them out in the daytime unless the buffalo were around us, but let them run loose. When I wanted them, all I had to do would be to call them up to me.

We were very ragged now, but the men got themselves clothes here. They got me two suits of everything I could wear, from caps to shoes; then Mr. Remington paid me off, counting out \$150 for me, \$50 for the bear skin and the rest for wages; he had promised me only \$8 a month if I suited him; he paid me \$10. We went from here to St. Louis by water, the men paying my fare in the cabin with them.

We had to wait in St. Louis a week before we got a boat that was bound for the Ohio. They were going to Pittsburg, if the water would allow them—it gets low at this time in the year—and they meant to pay my fare home. They kept me with them in the hotel here. When the boat got in I found that the steward wanted a cabin boy, and slipped with him.

We could not get any higher than Cincinnati, so we took the railroad here and at Pittsburg I bade my friends good-by. They were going on East, and I never saw them again.

I had seen the West, about which I had read so much, and now there was still another part of the globe that I had been reading about and wanted to see next, but I did not see it just then; I had to wait eighteen years before I saw it. I had been reading "Robinson Crusoe," "Cook's Voyages," and "The Mutiny of the Bounty," and wanted to visit the islands they told about.

In 1874, going to San Francisco, I shipped on a steam whaler bound for the South Pacific, but did not ship as a cabin boy this time, and in the course of a year visited the most of the islands. CABIA BLANCO.

### Cabia Blanco.

CLARKSDALE, Miss., Aug. 30.—*Editor Forest and Stream:* A crippled hand has prevented me earlier from obeying the impulse to send tribute to the memory of Cabia Blanco, the announcement of whose death in your number of Aug. 19 made a painful impression upon me, as doubtless it did upon many others of your readers.

There have always been some names among the contributors of FOREST AND STREAM that were sought out first by me on opening a new number of the magazine, whose narrations were read first and with eagerness, as being the cream of the current contributions. Among these specialized names that of Cabia Blanco was conspicuous. I do not know that I could give any better evidence of the esteem in which he was held by myself than this simple statement affords.

A feature of Cabia Blanco's writings, which chiefly gave them value, was the air of verity pervading them, which carried assurance to the mind of the reader that his narratives were relations of adventures that really transpired, and with the surrounding circumstances truly chronicled.

The absence of this quality of verity utterly vitiates the most ingeniously contrived story, purporting to be a recital of actual happenings, a defect that no writer is ingenious enough to conceal from all who read his fictitious lucubrations. It is to be hoped that all of FOREST AND STREAM's contributors shall continue to follow Cabia Blanco's valuable example in this respect hereafter.

## Early Fall Days.

THE days are growing shorter and the evenings long and cool, while in the atmosphere there is a haziness that obscures the distant landscape and seems to impart to the whole country side an appearance of rest and contentment, for this is the season of abundance—the merging of summer into fall—when all nature seems to be resting from its recent labors.

The grain and the hay have been gathered into stacks or placed under cover; the corn stands erect in long stately rows as yet unscarred by the harvesting knife; the potato fields lie brown and withered awaiting the coming of the farmer's plow to reveal the rich treasure stored beneath. Along the hedgerows the goldenrod is assuming a richer hue each day, and the thistle is industriously launching its tiny airships with their precious burden, and on every hand is heard the incessant chirping of insects.

Long since the redwing blackbirds have started their migration to the southland, and now the kingbirds are leisurely following them, drifting along from fencepost to dead twig, from dead twig to telegraph wire, but ever facing the south; down in the meadows the bobolink is gorging himself from the full ripe heads of the wild grasses, as he sways gently back and forth, up and down in seeming unison with the chorus of crickets.

No longer the woods echo to the bell-like note of the wood thrush, nor the full rounder song of the robin, and we might imagine them deserted but for the subdued call of the chickadee and the soft meow of the catbird sulking in the underbrush, while from the tree-tops comes the occasional twitter of a small creeper or warbler as it flits from branch to branch seeking its dinner of insects and grubs.

This is the season when the old hound becomes restless and continually whines to be released and allowed to follow the trail of the fox or the rabbit; when the staid old house cat deserts the kitchen porch and wanders a-field in search of birds and young rabbits; when the sportsman unpacks his guns and overhauls his stock of shells, for the signs of the coming fall seem to awaken in both man and beast that inherent love of the chase that descends to us from our forefathers. This is the time when we look up our old hunting companions and swap yarns of previous days a-field; of a nice bunch of quail on so and so's place; of a brood of woodcock in such and such a swamp; or of a couple of fine partridges we saw in such a clearing. Soon we will get past the talking stage and nothing but a day a-field will satisfy us, so when the next cool day arrives we call the pointer or setter and start out to see for ourselves just how the game did make out in the breeding season. But how disappointing most of these first rambles are: The vegetation is too dense, the mosquitoes and small flies are murderous, every few steps when in the woods and brush we have to wipe spider webs from the face or hatbrim, and all the while the perspiration is running down our backs in rivulets. Coming to a piece of low swampland near the edge of a high woods where we expect to find a few woodcock we enter and flounder around for half an hour, now pulling a foot out of the soft black mud, now tearing our way through a patch of matted briars, until finally our patience is entirely exhausted and we bolt in a direct line for the nearest highway, vowing that never again will we go on such a trip so early in the season, only to find ourselves doing it all over again the next year.

But how quick these early fall days do fly. Over night there comes up a strong northwest wind, and on taking a stroll in the morning we find the woods and fields literally alive with highholes, and then indeed for the first time we realize the fall is at hand, and in another week or ten days it will be time to look for our favorite game bird—the English snipe. Then in quick succession comes the open season for other game—partridge, ducks, quail, etc.—and almost before we realize it, comes the first of the year, and sadly we clean and oil our guns and stow them away. J. H. H.

## Floating Down the Mississippi.

### A Convict Camp in Louisiana Swamps.

A FEW years ago the Louisiana convicts were farmed out to contractors who built levees for the State and nation. The contractors were some of them at least worthy of the name by which they were known—"nigger drivers." One of them in particular was a true descendant, in spirit at least, of the old-time slave-ship captains who saw their victims die with no other qualms than the thought of how much money they were losing. It is said that convicts under this contractor committed suicide and broke away in spite of buckshot rather than endure the awful tasks to which they were subjected under form of law.

The work the contractor did was building levees. "Life men" did not last long under him, and if the unfortunate's term was long, it was a life sentence to go to this fiend's camp—and go the convict must if he was so allotted. The contractor was a big, burly man, having mixed blood of Spanish, French and white ancestry in his veins. Perhaps he was as strong as any man in his camps. He carried a rawhide whip, and the long lash came down on the shoulders of the toiling victims, especially in the late afternoon of a summer day when the life had been sweat from all the men by shoveling and wheeling the barrows up the board inclines to the top of the levees.

"The worst camp on the river," this man's was said to be. Deaths and escapes were more frequent in it than in any other in the State. One day the contractor ordered a negro who was weak and sickly to pick up a piece of iron. The iron was too heavy for the convict's strength, but he worked his fingers under the thing and strained to lift it, the contractor's whip coming down on the man's shoulders to encourage him. Time and again the man tried to lift the iron, but without avail, and the whip came down on him harder than ever.

A big yellow man was breaking up the ground a few feet away. He had a pick in his hands for the work. No man had turned to see the whipped sick man, but the cries

were heard for half a mile along the levee. The yellow man suddenly turned and drove the pick down through the contractor's skull and down into his body. He let the handle of the pick fall as the contractor went over dead and said:

"They'll hang me, boys, but by God, they'll treat you better after this."

The yellow man was hanged, of course. But soon afterward the convict farming out system was stopped, for the cruelty to which the yellow man's emphatic deed called attention was too gross for Louisiana to allow. So the life of the convict was rendered less desperate, and his overseers were changed to the men who have pity in their hearts and no such lust for gold as was the contractor's.

Capt. B. L. Barrow was in charge of the camp I came to. He had 163 prisoners, fifteen line guards and three night guards. Of the convicts two were white, one the bookkeeper (life) and the other the hospital steward (seven years). They were both in for murder.

Those other whitewashed buildings which I had seen were convict camps, one devoted to sugar making and the other to cotton, I think. The men with shotguns, whom I had seen were simply the grim-jawed guards put there to shoot down the men in case they broke for the woods, and in one corner of the grounds was a kennel where two long-eared, hanging-lipped bloodhounds lived and awaited the time when some man should get past the dead line into the wilderness.

It was no picnic grounds, and however gentle spoken, mild-eyed and tender-hearted Captain Barrow appeared to be, he was there to keep the malefactors from further opportunity to commit crimes against the public, and his task was to keep them at work in the useful occupation of building levees.

Captain Barrow was proud of his men. "They send us extra good ones here," he said, "levee work is extra hard work, and these men know they're picked men. They'd much rather come here than go into the shops. It's better living out here in the woods than cooped up in the walls of a stone prison." Not only was I in a convict camp, but it was an aristocratic one, where the convicts were above the common herd. These negroes walking around, or squatting on the bare ground were desperate, long-term men for the most part. They came from all walks of negro society, and the genuine razor men were there.

A searching study of the faces did not reveal many of the countenances one would associate with horrid crimes. Most of the men looked good natured and a large portion of them were smiling and engaged in horse play of a rough sort—wrestling, boxing and bumping against one another. Occasionally the little boxing play becomes real fight, upon which the guards step in and break it up. This was Sunday, and the day when they could rest.

One of the men was enough like a lumber camp gambler I had seen just below Greenville to have been his brother. Below his convict stripes were bright blue socks and patent leather shoes, beginning to wear down and break apart with the tough lifting of wheelbarrow loads of dirt, run up the steep sides of the new levee. He hadn't been in long. Most of the men wore buckle shoes from the State shoe factory—shoes of coarse leather, and put together in rough fashion by State protegés with records. At the toes were humps in the leather where the weight of the men came as they ran the barrows up the inclines.

Several of the convicts were unmistakably roustabouts. The roustabouts of the Mississippi have figures unmistakably different from those of "town men" or from plantation men. There is a swing and a snap to their gait, their shoulders are broad and their hips narrow, and they walk with a half trot which is almost a dance, imported from central Africa. They were not mixers with the other camp negroes, holding themselves aloof, as befitted men whose wages are \$90 a month when they are on the river. They get into trouble through killing men and stealing. Probably not more than thirty of the prisoners were up for murder or cutting people.

The grounds were nearly square. One side was along the edge of the water, the other a rod from the swamp forest, and the ends were also against the matted wilderness. At the down stream end, in the rear corner, was the dormitory—a large white building barred at the windows and having mosquito netting over the opening in order to keep out insects. End on to this building, and in the corner toward the bayou, was the dining room, a mere peaked roof over long tables with benches beside them. Along the bayou side were several officer and guard cabins. At the up stream end were the store house, a wash house, cook house, and in the rear was the small, little used hospital. In the center was the parade ground, with a pump in it. The water for use internally is boiled.

The place is cared for by the convicts. Everything is done by them. Cooks prepared the beef, vegetables, pone, bread and other things eaten. A cup of delicious coffee was brought out for the visitor and the others while we talked. The pert young negro who served the cups was spoken of as "Bridget."

"He's our water boy," Captain Barrow said. "He carries water to the levee workers. It isn't the easy task it might seem, keeping 170 men from growing thirsty under this swamp sun. None of the men have easy tasks. That isn't what they're here for."

One had no difficulty in believing that work was hard, but the men looked healthy. Their cheeks were lean, but they had the unmistakable bearing of working men. Each convict had a little box in which he kept his trinkets—extra clothes, pipe, tobacco and the like. The boxes are always locked, and the convict carries the key. If he didn't things would be stolen instantly.

After a time Captain Barrow called for Joe. "We'll have some music," he said. It was some time before Joe was located, and then he came. He was one of the few melancholy men in the camp. There was no trace of a smile on his face, and he came as he was bid with a slow, unresisting tread.

"Let's have some music, Joe," Captain Barrow said. Joe went to the quarters and returned with a guitar. A huge, rough-faced man was summoned from the groups, and he, too, secured a guitar. Camp stools were brought for them and they sat down, the big fellow protesting that he couldn't play, "I sho' cayn't, cap'n, hones' I cayn't, cap'n—"

Joe tinkled the strings of his instrument and the coarse yellow man finally leaned over his instrument and the hum of strings coming to harmony followed. Then they played. Joe was listless for a time, but gradually he stiffened under the inspiration of the harmony, and his fingers quickened. One could see the groups of men in all corners of the yard straighten out and begin to draw in toward the source of music. They remained at a distance, however, until Captain Barrow said: "Come up closer, boys, where you all can listen."

They closed in and stood in a semi-circle before us, patting their feet on the ground and leaning to catch the strains. Joe had been a town boy, playing in some negro dive for a living. He did murder and was sentenced for life. Music was his only pleasure, and his guitar he kept carefully and practiced when he could. The other musician was also in for murder. The music was thrilling and sweet, but the running notes and the fingering of Joe were heart breaking, they were so tender and sad, so nearly utterly hopeless.

Then a gray-haired old negro came out and sang—a twenty-year man, I believe. His bowed head and trembling frame and mournful tones were in keeping with the religious hymn he rendered from memory. A quartette was picked out by the Captain, and they sang—a murderer and three thieves.

"Give us something livelier—what you singing church music for?" Captain Barrow asked.

"Big Foot Sal" and similar songs followed, but though the music was lively, the men were not happy songsters. Nevertheless they enjoyed the opportunity, and the murderer and one thief showed unmistakable pleasure in the singing.

Of the men standing around, one had a tooth brush in his hat band, another some toothpicks in his hair, a third stubs of pencils, pins and other trinkets. Several had cigarettes over their ears.

"Now let's have some dancing," the Captain said. Two or three of the onlookers attempted to get out of sight, but they were called back and proved to be the camp jiggers. One of them was a red-sweated thief who asked for jig instead of clog music.

Then they danced in pairs, beginning by lifting themselves on their heels, and then gradually working into faster and more energetic stepping. The jiggers were all thieves, and the best of them all was a roustabout who was able to stand the levee work better than the others because he was a hard worker on the river.

One Pete tried to do a double-shuffle, but compared to the performance of the others, his was so miserable a failure that the convicts shouted, "Go home, Pete, good-bye now."

It was a good opportunity to observe the bad men of the negro race, and further study of their countenances revealed strange mixtures of blood. At least two were Mongolian—Chinese?—half-breeds, several were Italian, one lank, hooked-nose man was plainly Hebrew; a very comical face was one which had a snub, flat nose, a flat face, deep lines new-mooning around the corners of his lips, and a broad, incessant smile—a chocolate-faced Irishman.

While the quartette was singing one of the guitar strings worked down and out of tune, upon which one of the singers tightened it up, while the guitar man played on losing no pick. When the Captain asked for something "beside that church music" one of the songs was, in part:

"Dago, two-faced man,  
Made some money,  
Now he owns the lan'  
Oh, have a little pity,  
Open the door an' let me in."

It was the tone and the gesture and the rhythm and the place that made the singing memorable.

The daily allowance of food for the convicts is one pound of meat, three-quarters of a pound of flour, corn bread, beans, onions, tomatoes, molasses, etc. Beef is served twice a week, and occasionally bologna, but this is found not to agree with the men.

The levee work was some distance from the camp, and is done to reclaim some of the deep swamps. A right of way is cleared of trees and brush to the width of 300 feet. Down the center of this is heaped up the dirt ridge. The wheelbarrows are run on plank, and each man has a wheelbarrow and a shovel. The plank lead up the side of the levee at a gentle slope. Seven men are on each run—line of plank—and the levee is built up from seven to eighteen feet high, depending on the lay of the land. While they work the fifteen line guards are around them, with their double-barreled shotguns loaded with small buckshot—a size larger than swan shot, I believe.

"You see," I was told, "if you shoot small shot it cripples a man and breaks him down, but big shot either lets him get away or kills him, and you don't want to do that."

The spring previous six men made a break for liberty. Two of them were "stopped" at the line and were crippled for a month, and the others got into the swamp. The hounds brought two of them to bay, and two gained their freedom. One of these was brought back the night before I got there. Infractions of the rules mean lost good behavior time. A life man, like Joe the guitar player, had one hope. If he was good, at the end of fifteen years he might be set free by the State commission appointed to consider the cases of the convicts. Joe had been in twelve or thirteen years.

Minor infractions of rules for fighting, disobedience, malingering and the like were punished by whipping and bread and water. "He's got to be a pretty sick nigger if he gets out of working" in the convict camp. There are one or two deaths a year, which is no more, probably, than would happen if the gang was free. The prisons are commonly healthier than the country roundabout.

One thing that rather jarred on my nerves was the fact that prisoners were the camp barbers. Captain Barrow and his guards were shaved regularly by negro barbers who had come in contact with the law's grip. I couldn't help but wonder what would happen if some barber got a grudge against one of his customers there in the swamps.

"He's a glum nigger when he first gets here," Captain Barrow said. "He sits around pretty close to himself for a while, but after a time he gets used to it. Then he set-

ties down to the work and gets what's coming to him. They're niggers inside and out, and it's got to be an awfully serious business that'll keep a naturally cheerful nigger down at the mouth more than a week or two. Malaria is what they suffer from most, and toothache. 'Bridget' was the camp dentist. He pulls teeth. I don't know how the fellows stand it when he's bearing down on them, but he gets the teeth out."

It was a hot Sunday afternoon, but one of the convicts took an ax and built a fire in the middle of the yard. A dozen of the convicts crouched around it. The fire warmth and the sun heat were different, and the chill patients enjoyed the fire.

At night the three night guards sit down in the dormitory and watch. They do not change off with the line guards, but night after night sit there and wait for the coming of day. It would be easier for the man to break through the line guard than get out of the board shanty without calling down a charge of crippling small shot. Of course the line guards would rush out fully armed at the first alarm. One man has a rifle "for long range work."

For amusement the white men have deer hunting, and they keep six or eight hounds with which the hoofed quarry is hunted. The shotguns are good for rabbits and wild ducks and turkeys. But the whites find it no sinecure, living way back there in the swamps guarding some of the hardest and most desperate criminals in the country.

"If one of them comes to you, you've got to stand him off. If he don't stop when you tell him to, theh's only one thing to do, and that's shoot—and be mighty quick about hit."

The prisoners are brought in by steamer, and rarely a visitor comes to the place. Just one thing in the camp suggested the outside world, and that was a small letter box labeled "U. S. Mail." This is the one thing the convicts had to remind them of friends. Some of them write letters home, and more letters are sent away than are received by the convicts.

A tinge of ehill in the air and the slow fading of the sun, though it was still visible above the tree tops, reminded me that I would better move on. As I went to the boat I observed that the water had only five inches to rise before it would be against the artificial levee around the camp. Nevertheless, the convicts would be kept there until the water was well up on the walls. Then they would have to wade to the levee work, their buckle shoes sloshed full of water. Almost the first question asked me when I landed was put by a convict. He wanted to know if a "head-rise" was coming.

The wind had gone down and I shoved into the swift current wondering what was before me for the night. Captain Barrow said the convict camp was the "jumping off place." Beyond it were the swamps and the dense wilderness in which the river pirates of old had their dens, and in which the Acadians are found now in a state not greatly different from that in which they lived before the Revolution after the English found it necessary to transport them from Nova Scotia on account of their failure to appreciate the beneficence of England's rules. Between pirate descendants and Cajuns the outlook down Atchafalaya was rather promising as regards humanity and exceedingly so as regards unknown waters and wilderness impassable to men afoot.

The current was a seven-mile one, and it soon swept me beyond the jumping-off place, and at last I was really alone in a solitude about which one sometimes reads, but the fullness and beauty of which cannot be expressed in any common terms.

When I started from New York I supposed that when I passed Cairo I would enter into the land of morass and impassable thickets under which the slime quaked and the cotton-mouth snake drew back its muddy length to strike. For 600 miles I had come down the wide Mississippi with an unobserved feeling of disappointment because I hadn't found the damp gloom which my reading had led me to think was anywhere on the lower Mississippi. It was this feeling of disappointment which led me to go down the St. Francis, but this stream was so low that I had not seen the swamp feature of the St. Francis bottoms at its best—or worst. Now, however, there was no mistaking the significance of the things which I saw on both sides of me. This was swamp country. At intervals the water was running over the banks and pouring back under the trees with a loud noise. The land sloped back from the bank, down, instead of up, and when I looked into the shades and saw in the shadows a few yards distant gathering pools of water, and realized that on either side of me for miles and miles were these depths of water and mud, I knew that the swamp lands of my imagination were there before me. I could see them with my own eyes. It was unnecessary for me to go knock the brush in order to scare the snakes out of their hiding places and assure myself that the snakes were there. I felt it in my bones.

I passed Latannier City, an oil well, now disused and in the courts. It is said they drilled too deep and that the strata of oil was above the bottom of the hole. At any rate, the buildings were deserted, the boiler rusty, and the derrick beginning to darken with decay. At the head of Alabama Bayou was a fisherman's camp—a split board house on stilts, with water beginning to cross the ground toward it in serpentine course and darts. The two men eyed me with undisguised suspicion and cringing. They told me of a cabin boat down stream three miles, and at the cabin boat I found some river men who were in a small new cabin boat. They were cordial, but the boat was too small for me to remain there over night.

I passed houses on stilts, under which the water was gathered, and some of the buildings were deserted. At one place were two houses built close to the ground. Here were several men who watched the water flowing across the ground on either side of the buildings with a melancholy look that was pitiful. I swung the boat into an eddy. The water boiled in it, and the current roared on both sides the river, it was so swift. One of the group seized the bow chain and I went ashore, stepping on a high place which was nearly two inches higher than the surface of the water.

The men were Cajuns—Cajeans?—and spoke English in dubious tones. Did I know how much more water was coming? I didn't, and they lost interest in me. In

French they asked me could I speak French? When I said I couldn't they relapsed into silence. The land sloped so much toward the swamps at this place that the water ran rippling across the garden, the new growths of which were jerking in the current. The householder had tried to protect the garden by a tiny levee. He had shoveled up a ridge of earth ten inches high and five rods long between the river and the garden, and this had served its purpose for a time—would have kept the flood back entirely had not it been a big one. The water, however, came around the ends of the levee and was coming in from the swamps, and it appeared that Alabama Island would soon be entirely submerged. The men went about their work of loading their household goods in pirogues, and I dropped down to the next house. This was a new one, the home of a newly married couple, French to the core. Their home had only one room, and, besides, the gloom was fearful of the stranger.

It would make little difference where I slept that night, for my boat was supplied with everything needful, but I did want to talk to some one in those depths. The real natives, the Cajuns, were suspicious of a stranger. But I found an "Indiana Hoosier" at last, Bruce Lechner, ten miles below the convict camp. He was a tall, fifty-year-old man, who had lived in the swamps for more than twenty years. He had a fine, substantial house, with a big fireplace, a herd of cattle in the swamps and horses and goats and chickens. The year before thirty head of cattle he owned were drowned in the overflow. They were almost wild game, and it is necessary to hunt them with rifles at times. He thought likely this overflow would drown some more for him. He showed little enthusiasm over the matter one way or the other. It didn't seem to matter much—at least nothing could be done to help. He wasn't a farmer so much as he was a fisherman, anyhow.

"I was a Pennsylvania Dutchman, originally," he said. He had a small gray goatee, a lean brown face, and a lean look. Nevertheless, he was one of the rich men of the region.

I swung my hammock in a little cabin twenty rods below Lechner's house. This house, by the way, was not his real home, but just an overflow camp. His real house was one on stilts further up stream which I had noticed coming down, its yard full of water.

"I've got another place cleared below here for a house," he said. "I noticed last spring that the land was high there—six inches higher than anywhere else around here."

When Lechner first came to the swamps he was a stave worker and earned \$1 a day. He had had experiences up and down the Mississippi bottoms. On one occasion he was with a gang of men getting out stave timber on Ouchita River. They were in a swamp four miles from high ground and were camped on the highest ground in the swamp. There was a rise in the river and before the men knew it, they were wading in water. They had just time to get into their flat boats when another wave came. Had their boats been carried away they would have had to take to trees and starved until the river went down.

"While I was working for a dollar a day I laid out a trot line one night," Lechner said. "I put the line out Sunday, and on Thursday I took the fish to the camp and sold some to the boss and sold the rest to a nearby town. I got \$25 for that mess, and I wasn't feeling like stave working, either. I went to fishing right then and I've been fishing ever since. I was the first man who came down Atchafalaya fishing—in those days you could catch more fish on ten hooks than you could on a thousand now."

The reason is not ascribed to overfishing, which is worth emphasizing. "Sharks and gars come up in here and kill them off," Lechner said.

The Atchafalaya is probably one of the most remarkable rivers in the territory of the United States. It is not much over a hundred feet wide in many places, but its depth is 200 feet in pools. Always there is twenty feet of water throughout its length, and large steamers have followed its course without difficulty as to draft, but at the bends they were in imminent danger of bumping into the banks. The fish migrate up it in schools—carp and game fish. The gar, with a head like an alligator's, and the shark, with a scooping under jaw, follow them and sweep the waters of their prey. The fishermen find the gar and shark most troublesome co-fishers. They are useless water creatures to the swamp dwellers, though unquestionably their bodies would serve excellently for fertilizer. When a shark takes the hooked carp he rips up the trot line and yanks the cotton staging in two without much effort, tangling it up with the trot line and breaking the trot line itself if need be. Lechner says that the best trot line is wire clothesline, which does not corrode, or rot, as the common cotton trot cord does. Of baits, the little shad is best.

Hoop nets are fished, and so are long set nets. When the water is deep in the swamps—back in the woods—the fishermen go after fish with bush lines, run from tree to tree in the wilderness, following it with a pirogue, and getting lost sometimes. A submerged forest miles long and miles wide, with tangles of vines, trees so close together that the narrow boats are sometimes too wide to go between them, and undergrowth absolutely impassable, is no place for a man with soft palms to lose himself. Instead of watching the blow of the wind one must study the water currents, and hunt across them to Courtableau, Big Bayou Fordoche, Big Alabama or some other waterway leading a long way around, but finally home again.

Now and then one hears a Louisiana swamp man speaking of his homeland as "The American Venice." That an Old World city with water streets loaned its name to a forested swamp is a note worth making. The people of these swamps live far apart. The "French settlement" on Little Alabama Island has four or five houses in it, scattered along a mile of stream. Throughout the whole region of the bayous the only roads and highways are streams of water. The occasional team of lean, insect-bled horses but emphasizes this fact. The horses haul wood to the houses, but are moved about on flatboats when they go anywhere. The men are strong armed from paddling, but they are not walkers, naturally.

There is one negro who lives in the swamp depths willingly. He is a harmless old man. But others do not come. If one did "he wouldn't last long." That is to say, in these depths the negro is not wanted by many of the residents, and the colored man would be killed.

I wouldn't care to sleep on the ground anywhere in the

Louisiana swamps. There are crawling things which squirm along the ground, and would likely find the warmth of a human body tempting and repay inhospitality by vicious bites. I swung my hammock in the fish house clear of the ground a long ways, and slept well in it, but when I awakened in the night I shuddered at the sound of the river pouring past only six yards distant, and probably eighty feet deep only ten yards beyond that. It was astonishing to me that the current didn't wear the bank down, but apparently the bank was not of a dissolving sort of earth.

In the morning I drank coffee with Mr. and Mrs. Lechner, then watched him pull some hoop nets which contained six fish, say 50 pounds. Looking at them he shook his head mournfully. "I used to make \$10 before breakfast a few years ago," he said. He looked at the water for a moment as he returned to the house.

"The levees are to blame," he said. "They rush the water down here and pile it in on us like this—the floods come higher here than ever before. For a while it's going to be tough on us, but it's filling in these swamp lands so much that they'll be near the highest water level before long—then you'll see plantations down here as fine as any in the world. Cotton, sugar and fine houses will cover these lands. Forty years from now this'll be cleared land."

The Government has tried to open up the swamps. Uncle Sam spent \$25,000 on Courtableau Bayou clearing, out the drift which was shunted into the bayous by the Red River and Mississippi currents. The contractor drove flat dog spikes into the drift and tied the drift to trees along the bank of the bayou by means of wire ropes. It was in high water, and a fine clear way was made. When the water went down, however, the logs and other drift rolled down the bank, the dogs pulled out, and the drift went free again. Had the drift been shunted into the woods, or even pushed against the lower side of the bayou it would have remained put, and the sixty-foot channel called for would have been preserved. No boat goes into Courtableau now.

The fish boat from Mellville keeps Lechner in touch with the world. He takes three papers a week, Pennsylvania Grit, and the Semi-Weekly Times-Democrat of New Orleans. He was more familiar with names great in American and European politics than I was, and he was refreshingly unbiased on many topics which half-informed people decide and hold to regardless of the underlying truths. Alone, cut off from the world's enticing digressions, he had time to think for himself, and think well.

After breakfast of pork, eggs, flour biscuit and coffee, with condensed milk, we came down to the fish house. He said that he had another house underway down the river, and that I should notice it as I passed.

"I don't know how that place has been missed so long," he said. "Why last spring it was four inches above the water, and that was the highest water we've had in ten years. I built it six inches higher, and I'm going to live down there this spring when the water's up. Men been going up and down this river for years, looking for high ground, and they didn't notice that."

I asked was there any danger to be anticipated down the river?

"No, sir," was the reply. "If you're a man, you'll be treated like a man, but if you ain't, you'll be treated like what you are."

This seems to be the length and breadth and thickness of going among people said to be "dangerous." A frank statement of the listener, will take one safely through any class of people. A blue cotton shirt, and a pair of corduroy trousers is as good an introduction on the Mississippi as different raiment is in other places.

A minute after I hit the bank with my oar I was in the solitude again. I saw a couple of eagles, a few circling buzzards, a great ivory-billed woodpecker and heard the "white sucker, white sucker" of an oriole. The trees were well, if not fully, leaved out. The leaves hung in clusters among which the Spanish moss squirmed when the wind reached down from the soft-lighted sky. The forest seemed smitten by an epidemic of disease. The clusters of leaves seemed mere patches compared to the size of the ash trunks. Scars of sodden brown showed where the branches had broken down, unable to sustain their own weight. The wind rattled among the trees with a wispy, salty noise while the water hissed along the bank, tossing the overhanging branches and causing great skeleton limbs twenty feet long to pound the water and whip the branches round about—a dreaded sawyer, fit to cut my boat in two should I get carried under or over one. At intervals along either bank were eddies, narrow, boiling places where the water writhed, and hummocked up, as though live things were in them—and in one, I am not sure but what I did see a gar curve over, the sunlight shining green on its back—and suggesting nothing so much as one curve of a giant reptile.

At intervals there were bends so sharp that the water piled up against the bank beyond. Here the waters were fearful to look upon—not the boiling places, but the wide, saucer-shaped sucks toward the center of which things began to lift their heads and long sticks stood on end and dived out of sight were the more horrible things. Passing down this stream was like a poet's dream of the Styx—at least like going to the funeral of a forest, with dead things as mourners, and the dying trees as spectators.

I was now within eighty miles of Morgan City, where I would take the best way home. I came to an odd group held to the bank by a boy's arms. It consisted of a gasoline boat, a small rowboat, and a pirogue. The gasoline was towing the rowboat, and in the pirogue was William Young, taking a large pink mattress to Butte la Rose, on Grand River, to exchange it for groceries. The mattress was filled with Spanish moss, and he would get \$1 for filling it with the wiry stuff. Gathering black Spanish moss is one of the swamp occupations. The moss is plucked, put in a barrel and then boiling water poured over it to kill it. Then it is dried and packed into the bed mattresses and sent to market on fish steamers by the storekeeper. Young said he would show me the head of Little Atchafalaya, when we got to Grand River, this little stream being a part of my course to Grand Lake. We parted company with the gasoline, which was up bound, and floated down stream together, each curious to know the other's business, and each one in a fair way to being satisfied.

RAYMOND S. SPEARS.

## Camp Surgery.

Editor Forest and Stream:

There have been several articles of late in your valuable paper about Camp Medicine and Camp Surgery, and I know of a way to stop bleeding that is so easy of application that everybody should know of it; and I wish to call the attention not of campers only, but any one living out of town and miles from a surgeon, who may bleed to death before one can be got to them, when if they knew what to do and always kept the article or material on hand to do it with, they might stop the flow immediately. The blood from any flesh wound can be stopped so quickly that it would lead a person to believe that it was not much of a wound any way. Of course, this does not apply to jugular vein, nor a main artery. At least, I have never had a chance to try such; but if an artery does not throw a stream more than a tenth of an inch in size it will be closed up in a few seconds, and the remedy is simple and easy, but is unknown, at least I have never known any one else to make use of it, and it is something that can be applied by any person—without any knowledge of surgery.

If the wound has any foreign substance in it, wash it out with hot water, and if there is a syringe at hand it is a fine thing to do it with, but not essential; and if hot water is not obtainable, use other water. But if the wound is clean, use no washing, but have some one hold the wound (if it is a cut) as wide open as they can, and the dressing is nothing but just pulverized alum. It is to be put into the wound and tamped in, as you see men tamp gravel under a railroad tie; or until the wound is full. The tamping process is to make sure that the alum has reached the bottom of the wound.

Then press the wound together and hold it so for two or three minutes. Then sew it up. I have treated several bad wounds this way, and I never but once even had silk to use. My method of sewing is original, so far as I know. I simply knot the end of the thread and commence at one end of the wound and just sew over and over with the stitches about one-half inch apart, if it is a large wound and in a fleshy place; but if otherwise not more than one-quarter to one-eighth inch. At the last end of the cut put a knot in the thread close down. If the alum has got to all parts of the wound, it will have stopped bleeding before you have finished applying it; so you will have no bother from blood while sewing it together. Then bandage it with anything at hand. I generally have had to tear a cotton shirt into strips about three inches wide and shingle it on about three-ply and then sew it fast.

In two instances where a shirt was not to be had I folded a pocket handkerchief two-ply and then tore up a flannel shirt into strips and wound it on and sewed it fast. The bandage is only to keep the clothing from rubbing the parts.

I have never had to use any other dressing nor more than the one application, and there has been no sloughing, and almost no swelling. One vacation I had to practice on myself from my under lip having been torn from the jaw, I having been projected into a sandbank at such high speed that the sand was forced into my

mouth, and even into my lungs; it took me a week to cough the last of it up. Incidentally my under lip was turned down on my throat and my jaw unjointed. But as soon as I got the sand out of my mouth so I could breathe, and had forced my jaw back into place, I turned my under lip up to where it should be and went to the camp (I was at work for a logger) and cleaned the sand out of the pocket and then filled it up with alum; then after holding my hand against my chin for a minute or two, I tied a handkerchief across my chin and around my neck; and that was the only dressing that it ever required. It healed without any sloughing.

One time only have I had occasion to treat a gun shot wound, and that was when a man that was foolishly (no such shooting can or should be called accidental) shot by a comrade while hunting deer. He was a man of ample proportions, and the bullet went through the thigh just back of the bone. I heard the shot about 300 yards from me, and also heard the man who was shot yell, and I knew by the tone of his voice that he was hurt. I went to him as soon as possible, and found them (there were four in their party) at a standstill, expecting that the man would bleed to death in a few minutes. Of course there was considerable show of blood; but I found upon investigation that it was nothing but capillary bleeding, and I told him that he was in no danger, and that if he could walk (and that if he couldn't, we would rig up a stretcher and carry him, for it was not more than three-quarters of a mile to where we were camped), I could stop the bleeding so quickly after we got there that he would think that he was not hurt much. Well, when he came to try walking, he found he could go all right, and as soon as we got there I whittled out a small round stick and inserted a small tin funnel in the wound. I had an ounce bottle of the crushed alum, and had one of them pour the alum in the funnel and I kept poking it into the wound with the stick. I had previously rolled up a silk handkerchief and poked the end through with the stick until I could get hold of it, and then pulled it through, so that if there were any bits of clothing in the wound it would be likely to stick to the handkerchief. I kept ramming the alum in until it was full, and then I tore up a cotton shirt and made a bandage and bound it up. The wound healed without sloughing any, and was well in six days.

Several of the cuts that I have treated were unbandaged three and a half days after injury and were found to be healed all right. One of them was of a horse that got cut in the ankle; an artery was severed, and the blood spurted eight or ten feet. The man who owned the horse was going to pull the harness off and give him up for dead. This was in the logging woods in Wisconsin; but we were close to the camp—not more than a hundred yards—and I told him to take the horse to the stable, for I could stop the bleeding in fifteen seconds. I ran into the camp and got my bottle of alum, and was at the stable as soon as he was. I told him to grab hold of the hair at the edges of the cut (it was three inches long) and hold it open as wide as he could and with a lifting tension. I crammed it full and tamped in the alum until all of the onlookers laughed like idiots. They all thought that the horse would die anyhow, for in the excitement they had not noticed that it had stopped bleeding. Then I told the

man to let loose. I pressed the edges of the cut together and held it for a minute; and then told him to keep his hands on it and not allow it to gap open. Then I went back to the shanty and got a glover's needle and shoe thread, two-ply, and sewed it up with my over-and-over method stitches, five-eighths of an inch apart. This was just before dinner. The man was hauling logs on sleighs, and he had four horses, and after dinner he said, "Well, I can drive a spike team now for a while." I said that the horse was all right. "Yes," said he, "but it won't do to try to work that horse for several days, as it will start it to bleeding again, and perhaps two miles from camp, and then he would be a goner." I remarked that it would have to be another cut if it did. "Well," he said, "I gave him up once, and you said he was all right; so now if you say he can work all right, to work he goes." He took the horse out and he never limped a bit. For that matter he had not from the first acted as if he was hurt very much. Three days and a half after when I removed the bandage the cut was healed, and I cut and pulled the sewing. A white streak not more than a tenth of an inch wide was all the scar there was.

W. A. LINKLETTER.

HOQUIAM, Wash.

## Houseboats and Houseboating.

OUTDOOR people and above all city people will be greatly interested in the volume on Houseboats, which the Forest and Stream Publishing Company now have in press. The people of the United States are turning more and more toward an open air life in summer, yet the lands accessible to centers of civilization are being taken up and utilized so rapidly that they are each year growing more and more expensive. Besides that, the cost of running two establishments—of having a country place as well as a habitation in the city—is very considerable, and if possible is to be avoided.

Many of the problems of country existence are to be escaped by the use of the houseboat. For this no expensive ground is required, land need not be purchased nor rent paid; coachmen and gardeners can be dispensed with; one anchors his houseboat on the water which is free to all, and remains there as long as he pleases; or he makes an arrangement with some land holder, and for a very trifle may moor his houseboat to the bank, then when he likes he can up anchor and go away to some other place. The question as to whether the owner shall have his own motive power on a houseboat, or shall have an auxiliary vessel to tow it, will be decided by each individual.

Among the obvious advantages of houseboat life are economy, freedom to go where one pleases on the water, the delights of boating, bathing and fishing at all times, together with a privacy as great as one may desire. Such a life may be a judicious mixture of wild wood camp or city life. One may be alone or may have as many guests as he has room for. Then, too, in these days of automobiles, the car may be stored on the houseboat and land journeys of indefinite length may be taken. There are possibilities in houseboat life only to be realized by those who have tried it as thoroughly as have the English. They are enthusiastic in their approval of it, and it is sure to become popular in the United States.

# NATURAL HISTORY

## Sea Elephants on Kerguelen Island.

THE sea elephant, as stated in an article in the FOREST AND STREAM printed some weeks ago, was formerly very abundant in the Antarctic, and existed in some numbers on the coast of California. In both places it has been practically exterminated. When the animals became very scarce, it became unprofitable to send vessels to get the skins and oil, and freedom from pursuit enabled the species in the Antarctic to increase. About ten years ago, however, the killing was revived at Kerguelen Island by a vessel from New London, Conn., and again in 1897 a vessel from Boston visited the island and secured about 4,000 of the animals, which yielded 1,700 barrels of oil.

In the London "Zoologist" appeared an article by Mr. Robert Hall, who in the summer of 1897 and 1898 paid a visit to Kerguelen Island in the brig Edward, which may very likely have been one of the vessels above referred to. Mr. Hall's account deals solely with the sea elephant as he saw it, and not only gives an excellent notion of the size and habits of the animal, but also of their extraordinary inertia and of the difficulties and even dangers of this butchery. The sea elephant is probably nearer absolute extinction than any mammal in the world.

Kerguelen's Land is a large island of about ninety miles by forty miles, and full of fiords, on the coasts of which the sea elephants congregate in numbers, more especially on the west coast, where they are secure, owing to its ruggedness, dangerous winds and currents. It is thought they arrive to rear a family in August, and our observations lead us to believe the departure is timed for February and March. During these months they are very restless, and remain no longer the listless creatures of December. A sea elephant is contrary in nature to a sea lion, for, while the former on this island is docile and languid, the latter on the Auckland Islands is active and savage. The elephant, on observing a stranger, shows a restless eye, but quickly goes to sleep again. You may then walk through a herd of fifty sleeping animals, and merely disturb one or two for a moment. These hot-blooded creatures vary in size from 6 feet to 20 feet 6 inches, and we found a skeleton of a young one about 4 feet in length. The largest were exceedingly difficult

to handle; but as the enterprise of our ship was principally a commercial one, the business faculty was quickly brought to bear upon any awkward and unwilling customer.

Many of the animals would weigh approximately two to six tons. No five men could turn a large bull over without special levers, and it needed seven sealers to haul half a skin along the sand to the boat in waiting. As for dragging a whole skin, that was quite out of the question under the circumstances. For museum purposes we made a preparation of one, and this we feared would break the tackle while being drawn on board from the end of a towline. Its length was only 14 feet 9 inches, with a girth of 10 feet 10 inches about the pectoral girdle. From shoulder to shoulder it measured 5 feet 6 inches. The circumference at the base of the flippers was 3 feet 6 inches.

To the great bulk there was a mouth with a breadth at the angle of 9 inches only, and a tongue (which we found later to be excellent eating) quite filled it. Dr. Stirling has this specimen mounted in the South Australian Museum. While the blubber ranges from 2 to 6 inches in depth, it varies in weight. Six men were employed in changing the position of one fatty skin while on the skinning board. This is a fair example of a male, which is always larger than the female. The congregation in harbors was generally systematic. The bulls occupied one part of the beach and the cows formed a colony in another. There were always several colonies in a harbor, and they seldom appeared to intermingle. The young were not numerous. They had probably set out on their southerly migration before our arrival on Dec. 27, or were scattered promiscuously along the beaches.

It is the general impression that these mammals lie in their rookeries for days or weeks together, and do not feed otherwise than on their fatty tissue. With this view I do not altogether agree, for most of the seals are daily to be seen in the water, either coming in with the full flood or going out with the early part of an ebb tide. That a young sea elephant, 6 feet in length can live a month on its own fat was proved by one we brought to Melbourne, and which was lodged in the aquarium, but died a few months later.

One day, as many as eighty may be counted; the next day the same beach may only contain ten, with

other heads poking above the floating weed, and showing glassy round black eyes quite wide awake. Our men have often shot as many as sixty at one time, and found next day another twenty had come up among the dead, simply because it was their chosen lair. This species dislikes expending energy on land, and they will lie in a group of twenty to sixty in some grassy spot with a sandy landing. Some few will ascend to an inclined distance of 150 yards, and there they are not so active as those below, and probably do not go out daily. The energy would be too much for them, as they are slow crawlers, using only two flippers and the snake-like action of vertebrae and muscles.

The first anchorage of the brig was at Royal Sound, and before we removed from a beach of four miles in extent we had collected 426 skins. Our two anchors were lifted for a second harbor on Jan. 17 (Greenland Harbor).

During the first day sixty to seventy were killed, and similar results often followed. To shoot more at one time was inadvisable. An average of forty per day was considered good, and this allowed time to ship and "speck," i. e., take the blubber from the skin.

The finest herd we visited just before leaving the island. In all, there were twenty-four magnificent animals, roughly averaging 19 feet in length. Before introducing ourselves, I noticed one great "elephant" take a short cut over another, and a quarrel arose. Both growled and stood partly supported by their shoulder flippers. Another disagreement arose elsewhere, but it seems to me there is more bark than bite, as animosity is quickly lost in sleep. One unfortunate animal had a badly torn nose, in all probability a dental evidence of past troubles. One of the crew gave me a tooth some 7 inches in length, the greater portion of which lies within the gum (e. g., 4.9 inches). When disturbed the belching of each of these old bulls was objectionably strong, for it can scarcely be called a roar. So great is the exertion, that blood appears in the pharynx, and this occurred when I was engaged near its head, measuring the trough in which it lay. This lair along the convex part was 32 feet in length, the breadth 7 feet, tapering toward each end. The depth of these, mostly dry mud holes placed among the grasses, ranges to about 2 feet, seldom deeper; but they were placed in natural depressions—i. e., extra to the artificial ones.

Many of the troughs are continuous, and intersect each other, so that a large lair may appear netted, which is uncommon.\* This place soon showed an unfortunate change. Rifles were presented within 6 feet of each bull, and the bullet sped through the brain box, partly flattening on the blubber of the opposite side. Now, slits with sharp knives are run dorsally in the long direction, and out rushes venous-like blood to stain the little bay in a few minutes. From one seal some sixty fountains of blood rose in oblique directions to a height of 2 feet, and all from the single cut on the back. Against the skyline this miniature double line of fountains looked strange, and the spray of a city corporation water van is not to be compared to its delicate and colored sprayings. In the viscera I was surprised at the length of the small intestine, which I found to be 255 feet in length and capable of rough haulage. It stood the pulling over the grass from the carcass with only a small distension.

The method of procuring "elephants" is a simple, though not an easy one. Three boats, each with a crew of five men, row from the anchorage to the shore, haul up their boats, prospect the field, and with four loaded rifles drive the animals down to within a few yards of high-water mark and shoot them. There they lie for the coming of the tide, and get anchored temporarily in a few feet of water. Some of the seals give considerable trouble before they will leave the high lands (100 yards from the beach on a medium incline), and as many as three hours may be spent in annoying them with the lance before they decide to go. If the seals carry their own skins down it saves much labor and time of the men. The boating is quite enough trouble to bear, as the harbor winds are treacherous and strong; so powerful are they, that I have observed half the body of a "waterfall" blown back many yards before it could leave the ledge where gravity was strongest. Should a gale prohibit the boats leaving the ship, the crew will sleep in during the day, and with the lull toward midnight leave for the scene of operations. Many a time they have had to row miles against a tempest to save being out all night, and many hours it has taken. Under such conditions, boats have been swamped, the skins floated overboard, and a landing arranged for fresh efforts. I shall not be likely to forget one intensely cold night while going on board with my birds and cameras. The helmsman got a renewed attack of tropical fever, and almost collapsing, I was given charge of the helm. For three hours mittens and oilskins seemed like miserable calico, an then I fully sympathized with the men who had their wellingtons partly filled with icy water.

Daily the boats wend their way in much the same manner, and in exactly the same way the skins are taken from the bodies. Roughly speaking, each skillful man can skin the smaller seals—ten in two hours and a half, or fifteen minutes for each. This time is for animals which are not too large for a man to handle. The carcasses in our takings were generally of large size. The following is a case of quick work: After a 1 o'clock dinner (of plum duff) the boats were rowed three miles. Seventy-two seals were killed, and all but fourteen skinned. Twenty-three of the largest were taken on board, and the last was upon the windlass at 9:30 P. M. Two skins of fair size are enough for a small boat, or one of a large bull. The last trip in the above raid took two hours and a half in rowing three miles; this wasted time and much more was spent in endeavoring to get around a certain point. We agreed without a dissenting voice to call this headland Cape Horn of Royal Sound.

This uncharitable point is the type of many another. To leave a harbor for a second one is the event most trying to the constitution, for one never knows until the anchor is safely dropped where the howling wind will drive you. Altogether we tried six harbors, of which four were well worked. The fifth (Swains Bay) took us three days to enter, and after being ten minutes inside trying to get up the channel, our clever captain put his ship about, and thanked his lucky stars he had got safely out of the treacherous "hole." Down this fiord the wind without notice struck the foresails, while the wind astern drove her forward. Here the trouble started, but fortunately quickly ended by good management and good fortune. Had we touched the entrance island the ship would at once have been broken into matchwood. From this place I carried pleasant recollections, more on account of the bold contour and strangeness of the island than because it pleased my friends to chart it as a tribute to myself. Strange as it may read, among the finding of shipwreck remains there were letters and bottles from a sealing captain mentioned in Prof. Moseley's "Challenger Notes" twenty years ago. Capt. Fuller is an old hand at the business, and evidently has the indomitable pluck of the American in the making and losing of fortunes in rough waters! As for ourselves, we managed to quit the land safely on Feb. 18, although for a few hours we could not get over a severe loss we made at the last moment. Having on the 17th killed, skinned and anchored a batch of skins to the value of £250, all hands on board heaved anchors next morning to stand into a near bay to take them off. Two storms now showed their effects; one in driving all the skins ashore and burying them in the sand; the other in driving us off the bay altogether.

With a threatening sky our tight and dry little brig, the Edward, now headed for Melbourne, and we started a direct homeward course of 3,400 miles. This was duly accomplished in twenty-two days, and we experienced a phenomenal wind for the latter fourteen days, which was from the north instead of the prevailing one from the west, a circumstance of exceedingly rare occurrence.

\*In one trough there are very often two bulls or two cows, the broad part of one and the tapering part of another at one end, and the corresponding parts toward the opposite pole. This insures the trough being well filled.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## An Angler's Wild Flowers.

CHARLESTOWN, N. H., Aug. 23.—*Editor Forest and Stream:* I do not want to poach on Mr. Weed's "Wild-flower Manor," but on looking over the short letter I wrote you a few weeks since, I find one or two more words to say on the habit of wild flowers to group themselves in certain localities, and remain there. I omitted one flower which I have always found in what I called my "forest garden," viz., the little two-leaved Solomon's Seal (*Convallaria bifolia*), while along the roadside leading up the hill, I found a little later, two other varieties of the same genus, the "many flowered," with flowers drooping from the axils of the leaves, and a larger species, often two feet high, with a terminal spike of small white flowers. Along this hilly road also, were frequent patches of the Epigea, or May flower.

The Lady's Slippers, of which I spoke as being exterminated, were in quite a different locality, the valley, or gully, parallel to the channel of the mill brook, probably formed long ago by the changes in the current of the brook, or perhaps by springs from the hillside. Here the foundation soil is a thick bed of blue clay, on perfectly parallel strata, of different density and shades of color, probably deposited millions of years ago, when this section of the valley was the bed of a great glacial lake, held back by the converging hills at Bellows Falls. Here I found both the white and yellow Lady's Slippers, and on around the little hillock between this gully and the brook, the showy Orchis. The Orchis is still there, but a road to the meadow has been cut through the gully, and the flowers are gone.

The yellow Lady's Slipper I find now in a different locality, in a gorge on the hillside, where quite a brook comes down in the spring, from the melting of the snow in the pastures above, and where more or less water trickles unseen on the surface, among the stones at the bottom, keeping the gully always damp. At the foot of this, where it opens out on the pasture it has formed a long talus, which supports another group of flowers, entirely. At the upper end are the Lady's Slippers, the Purple William, the Arum, or Jack in the Pulpit, the Wild Ginger, the red-berried Actes, and the Skunk Currant, while the lower end of the slope bears a profusion of Columbine, and the round-leaved Wintergreen, mentioned by Mr. Weed, and which reminds me much, by its flowers and fragrance, of the cultivated Lily of the Valley. The other Wintergreen, the umbel-like, or long-leaved, the Indian Pipsissewa, mentioned by Mr. Weed, I used to find, when a boy, in a strip of old pine woods just beyond the gully where I found the white Lady's Slippers, being a continuation of the plateau on which the village stands, and which, as I have said, is in all probability the bottom of an old glacial lake; but the old pines have long since been converted into lumber, and I have not seen the flower of late years. Another flower which I still find on the corner of the bluff, where the plateau overlooks the river, is the tall yellow Girardia, a beautiful spike of straw-colored flowers, some three feet high, like a tall yellow Foxglove.

The Bottle Gentian is common along the river road, where the springs from the hillsides make little pools of clear water; but the Fringed Gentian affects the sides of the railroad cuttings or embankments, where its seeds take root easily, and is often scarce for a year or two, when the railroad company has made a cleaning up of their "right of way." So much for wild flowers; I hope that Mr. Weed will continue his delightful notes, with their admirable illustrations.

Now, let me change the subject to a different "Point of View." I think Mr. Kimball has rightly interpreted Flint Locke's problem as natural evolution. I have been through the same change of feeling myself, and, I think, have written to FOREST AND STREAM how I was so much delighted with the antics and graceful movements of a gray squirrel, some dozen or more years ago, when he came almost to my feet, searching for nuts, as I sat on a rock under a yellowing hazel, my tan-colored shooting suit harmonizing with the fading leaves, until I raised my hand to brush off a fly, when he vanished like a "blue streak," that I came home, put my old gun away in the case, and have not had it out for game since.

Mr. Kimball is right in quoting Haeckel. We are slowly passing through the various stages of creation, and being evolved from the savage into the perfect man. I well remember my first slaughter, when I knocked a chickadee out of our apple tree with my bow and arrow, and my sorrow afterward, when I picked up the dead body. I have killed much small game since, but it has all been edible, except a couple of porcupines, which I have shot by mistake for raccoons, and a few bluejays, for taxidermic purposes; but I have never had an opportunity to look for big game, when I could do it, and now that it is lawful to shoot deer in some parts of New Hampshire, I am physically incapable of the exercise involved in the sport. Still, I have had over half a century's enjoyment, and many a good dinner, what with upland plover, woodcock, ruffed grouse and gray squirrels, and am perfectly content to follow the dictates of nature, and let the old gun, which I bought in 1851, rest in "innocuous desuetude." The doctrine of evolution, which some of our theologians have opposed as being contrary to Hebrew tradition, has come to stay, and any observer of nature can see it in daily operation. We have but to change one word in the book of Genesis, and substitute "era," or "period," for "day," and the account of creation as there given, agrees with the "Testimony of the Rocks," as written by the hand of the Creator Himself, with the exception of the supposition, that the sun, moon and stars were all created for the special use and accommodation of the inhabitants of this planet. We may, without irreverence, assume, that the "day" on which the Creator rested, is like all the other days, a period of millions of years, and that he is still evolving the perfect man out of the first crude savage. Certain it is to the student of history that the human race is improving, though gradually.

Your other correspondent, Mr. Douglas, takes exception to Mr. Kimball, on the ground that man is

still fighting, and that war still prevails on the earth; but let him compare the wars of to-day, when every army that goes into the field is accompanied by its corps of Red Cross nurses, with the ambulances and surgeons, and foe, as well as friend, receive all needed assistance, with the *va victis* of the Romans, or the professedly divine slaughter of the Canaanites and Amalekites.

We have no repetition to-day of Cannæ, or of the inhuman massacre of Tamerlane, or Genghis Khan, no temples or palaces built of the skulls of the conquered. Leipsic and Waterloo have become memories of the past, Gettysburg is fading, and Liao Yang and Mukden will perhaps mark the close of the era of great battles, and the beginning of the one of peaceful arbitration. Let us hope so, at least, for we can but note the signs of the times.

And now from speculation to hard fact. I was saddened to see in last FOREST AND STREAM the death notice of Cabia Blanco, for of all your later contributors his simple, graphic narratives of life on the frontier have to me been the most interesting reading—and have given me a clearer conception of the habits and manners of the different Indian tribes inhabiting that part of the country. His writings remind me more of those of Nessmuk, than do those of any other of your more recent correspondents. I shall miss his letters from your columns very much. I am glad to see, speaking of Nessmuk, that Kelpie is yet in the land of the living. I had once hoped to be able to meet him on some northern trout stream, but those days are over, and I see he seems to be slowly drifting into a warmer climate. Good luck, and pleasant dreams to him and the rest of your contributors. VON W.

## A Burmese Snake Charmer.

HAVING always had a liking for snakes I went in search of a Burman snake charmer, by name Moun Lo, in the hope that he would be able to get me some specimens. Almost the only Burmese word I then knew was *myway*, that is a snake, but, with the aid of my interpreter, after a short time, the Burmese charmer was prevailed upon to produce a round basket, having opened which, a head with hood expanded and about 1½ feet of body, sprung up like a jack-in-the-box and remained motionless. The charmer was standing near the basket. Suddenly the snake struck at him by letting its body and head fall forcibly forward; in this strike the body was kept perfectly rigid, bending only where it touched the rim of the basket. The charmer did not move, knowing that he was at least eighteen inches away from the edge of the basket, and there was, as I have said, only eighteen inches of snake above the rim. His assistant now engaged the snake's attention in front, while the charmer deftly seized the reptile by the neck and hauled out and deposited on the ground about nine feet of hamadryad or giant cobra (*Ophiophagus elaps*), the most formidable and deadly snake in Burma. Then the two Burmans went through what the uninitiated would consider the most daring performance ever witnessed. The hamadryad lay with its head raised about two feet, the rest of its body at length on the ground, hood expanded and fangs ready to strike. One of the Burmans squatted down a few feet off. The snake, with a fierce hiss, glided rapidly toward him, head still erect. When it got within range, it again struck at him. The Burman swiftly parried the blow with his bare arm, letting the snake's body below the hood only touch the limb. The hood and body slid off his arm and fell flat on the ground. Before the snake had time to raise its head for another strike, the Burman had moved off a few feet, and from there went through the same performance.

Having intimated that I wished to see its fangs, the charmer again seized the snake by the neck and opened its mouth with a bit of wood. I could only see the fang on one side, the other appeared to be broken. When not ready to strike a loose bit of skin envelops these teeth. If the snake has its fangs pulled out it does not follow that it will be rendered innocuous, as there are auxiliary fangs behind the real one, and if the big ones are destroyed these often come forward and take their place. However, when I proved dissatisfied with this particular hamadryad's dental arrangement the assistant was dispatched, and presently returned with a similar basket, out of which another rather bigger serpent was produced. They went through a similar performance with this snake, and on inspection I found that both fangs were present.

The Burmese know much more about snakes than the natives of India, and seldom, if ever, extract the fangs of a cobra or hamadryad, which Indian charmers almost always do to their cobras, with the snakes they exhibit. After a little bargaining, during the course of which I rode away and the Burman ran after me to accept my offer, the giant cobra became my property, and I set off for my bungalow, followed by the Burman and the basket. Having arrived there, I had yet to learn the art of feeding the snake, and this my Burman friend taught me before leaving. A hamadryad, or cobra, when first caught, would sooner starve to death than eat anything. When used to captivity, however, it will feed well enough. Till then it must be fed by hand, and this is how it is done. The Burman opened the basket and seized the snake by the back of the neck with his left hand, the thumb and forefinger on each side of the head, the other fingers loosely round the throat. As he looked round for a bit of stick, I handed him a penholder, which he inserted between the hamadryad's teeth. Then I got him some raw beef, and he selected a piece looking just twice too big to go down. This he placed between the snake's teeth and slipped the penholder out. Then with the end of that instrument he gently pushed the beef till the snake gave a convulsive swallow, when he rammed the meat down as far as the penholder would allow him. It then appeared as a lump in the throat a few inches below the fingers of his left hand. This he worked a foot or two down the body with the thumb of the other hand. He told me that ten mouthfuls of this size were enough for one meal, and would last for a week. Small fish were also good for a change, and the snake wanted water every day.

I next had a large airy box made for my pet, with perforated zinc and a sheet of glass. Then came the rehous-

ing of the animal. Without having had any experience, I was not going to seize him in the same nonchalant way as my Burman friend. On the contrary, I took good care to have his head under a stick before catching hold of him. At first I began by gripping him very tightly, but I soon found it was not at all necessary unless he was wriggling. I have referred to the performance of the Burmese snake charmers as marvellous to the uninitiated. By that I mean that when one has had a little experience of the ways of this snake the feat does not appear so wonderful. The first thing required in any dealing with venomous snakes is a certain amount of self-confidence. If you want to seize a snake at a given moment, seize him; do not go as if to catch hold of him and then draw your hand away. When you have got him, hold him firmly, as close to the head as possible. Do not get alarmed and try to get rid of him quickly, but make sure that all his body is clear of you first.

The secret of the charmers' success is this, the hamadryad and cobra have only one method of attack, and that is as I have described it. This they never vary. Whether lying coiled up or otherwise they have to erect a certain length of body before they are able to strike, then you know that the strike is coming and ought to be able to avoid it. If you look at one of these serpents in its box it will rear up its head, expand its hood and remain motionless in this position for hours. This snake cannot make a snap at one like a viper.

The hamadryad has the reputation of being the only snake that will attack mankind of its own initiative without being molested. There certainly have been many authentic instances of such attacks, but I am inclined to think it is in only a few cases that the snake will do this. Probably the serpent has very good reason for its fierceness, viz., that someone has been close to where the female has just deposited her eggs, and it is for this reason that she attacks him. The constricting power of this snake has been greatly overrated, and in point of fact is practically non-existent. With a little practice I found I could feed my captive with ease.—G. Stigand, in London Field.

## A Late Singer.

WHEN the lightness and airiness of summer has departed and the swooning dog days have come, then the migrants that made the woods musical have all fallen into a melancholy silence—all but one. The exception is the red-eyed vireo, commonly called the preacher bird. Up among the dusty drooping leaves, with the August sun hot upon him he continues to hold forth. But is it really fair to compare his vocal efforts to preaching! For one I think not. It is true he phrases dogmatically, as it were, and iterates, but how sweet—how musical it really is—how free from gloom and uncomfortable suggestion.

If he is a preacher he is of the order of dryads—a voice from the pure, joyous heart of nature. Some writer on birds (I think it is Miss Mabel Osgood Wright) has said that he ought to be silent when late summer comes, as the whisper of leaves is then enough. But I cannot agree with this view. There is always something oppressive in silence, and the silence of the woods can hardly be said to be relieved by the whispering of leaves—this indeed only seems to emphasize it. At a little distance the warbling of the vireo might be mistaken almost for the gurgling of a brook, and its persistence would add to the illusion. Surely there is nothing in this to offend the ear of one disposed to contemplation or even slumber.

But every one to his taste. For my own part I am always happy to hear the vireo at the end of summer. Undoubtedly then a species of eclipse falls upon nature—the woods become sombre and drowsy, as it were—there is a presage of the fall—the season of decay and death. And the migrants feel it, for with the one excepted they not only fall silent but betake themselves to solitary thickets and mope the days away. How grateful we ought to feel to the vireo who does not fall a victim to the depressing influence of the season, but still remains in view and lifts up his voice as cheerily as he did in the buoyant days of June. Albeit his song is so different from that of the British robin he reminds me of the latter in his constancy and gay philosophy—not to the same extent, of course, for the British robin sings all winter long. "You see it, you know it; do you hear me? Do you believe it?" the vireo has been represented as saying by Mr. Wilson Flagg. I had this in mind one day strolling through the woods. Presently I espied my little friend up among the branches. I repeated Mr. Flagg's interpretation, when he following answer seemed to reach my ear: "The pulpit? Forget it! When you hear me, can you believe it?" "No," I said, "I cannot; I will not; I do not!"

*Vireo olivaceus* the learned ones call him, and the name at least indicates his prevailing tint—olive. This blends so well with the faded foliage that the gay sprite would hardly ever be detected were it not for his brisk movements, for even while he sings he keeps on the go, seeking his living. Happy the bird or the man who can sing while he works.

The distribution of this exponent of the cheerful life is very extensive. I have found him even on Nantucket, where birds are few. About the quaint old port of entry are clustered the only large trees on the island. Here in a hoary branching elm the familiar voice was to be heard at all hours of the day—morning, noon and evening—echoing over the slumberous village. It was a solitary voice of its kind and for that reason I studied it the more closely. I was surprised to find it possessed a note unheard elsewhere, viz., a shrill and more or less prolonged whistle. I puzzled over this for some time and finally arrived at this solution: Now, if song birds are few on Nantucket there is another variety which simply abounds there, and this is the "rooster." At dawn (to the woe of the sleeper) 'tis "Cock-a-doodle-do! Cock-a-doodle-do!" from near and far and east and west and north and south, fill the whole welkin rings. Perhaps, I reflected, the simple vireo, being here alone, thought that the final note of chancier would be an addition to his song and adopted it. If so, I am sorry for that vireo. A more depraved addition to his poetic little roundelay could not well be imagined.

It must be a sad day in our minstrel's life when he ceases to sing. I can imagine him get up of a morning about the middle of September and say to himself: "Funny, but I don't feel like singing this morning." He

mounts to the topmost branches of his abode (which he has rarely left all summer) and scans the world at large. There is a chill in the air, the sky is overcast and a dreary, gusty wind is tossing the woods, sending the first harvest of leaves a-flying. A change—a radical change. The summer is gone—the fall is here. The observer realizes it all instinctively and is filled with a strange feeling of unrest. The large spreading tree loses for him its fascination, its home-like atmosphere; he takes to wandering through the woods. Occasionally you will catch a glimpse of him sitting silent on a branch and peering at you with ruby eyes. Strange to see him at once still and silent! For a week or two you will meet him thus and then in a night, like the Arab, he will have stolen away.

FRANCIS MOONAN.

## The Wild Pigeons and Their Fate.

SQUAM LAKE, HOLDERNESS, N. H., Sept. 2.—*Editor Forest and Stream:* A batch of belated FOREST AND STREAMS has just reached me, and in the issue of Aug. 19 I find an article of very peculiar interest to me. It is entitled "The Pigeon's Fate" and is signed "Noynek."

The fate of the passenger pigeon has been to me for many years a problem of extraordinary interest and some readers of FOREST AND STREAM may recall that on several occasions I have through its columns stated my belief that the sudden going out of the countless hosts of that noble bird was due mainly not to the usually assigned causes—ruthless slaughter by man and beast at the breeding places—but some cataclysm of nature.

The slaughter referred to was a fact, of course; but having in my youth seen the pigeon flights of such extent as would be now quite unimaginable, I have steadfastly refused to believe that this vast aggregate of birds could have been destroyed so quickly by any of the agencies usually accredited with their destruction. I have several times, once I think within a year, in these columns propounded my theory that the main pigeon flight was destroyed by being caught by a cyclone in crossing the Gulf of Mexico, and I have vainly sought, not only in the public press but by inquiry of all ornithologists personally known to me and by correspondence with others for data as to the southern limit of the winter migration of the pigeon, assuming that if it could be proved that the pigeons did not cross the Gulf in their annual flight my particular theory must be abandoned.

In support of my theory I adduced other instances of the great reduction if not extermination of other species by the sudden action of natural causes and numerous instances of bird destruction by a tornado, and especially of the wholesale destruction of certain flights of pigeons by this very means. I cited the statement that Pigeon Cove, Mass., derived its name from the washing ashore there in the early time of a great mass of dead pigeons which had been killed by a tornado; of an account published in a Montreal paper of a similar happening many years ago when a flight of pigeons was whelmed by a tornado in the waters of Lake Michigan, the bodies of the drowned birds being thrown up in windrows on the lake shore above Milwaukee.

But the most significant thing and the one which long ago first set me to thinking on the subject was a newspaper item, unfortunately not preserved, to the effect that certain sailors coming into the port of New Orleans reported having sailed through leagues and leagues of water covered thickly with dead pigeons. Here, I said to myself, was at last an adequate cause for what we know has happened, viz., the so sudden termination of the annual pigeon flights that were the wonder of my boyhood when living on the shores of the Fox River in northern Illinois.

Singularly enough, I have never been able till very recently to find an ornithologist or even any scientific man who took any serious stock in this theory of cataclysm, the old idea of destruction by man and vermin being unquestioned and universally considered adequate.

Learning that Prof. Lynds-Jones, of Oberlin College, was one of the best authorities on bird migration, I addressed him a letter on the subject which seemed to me of sufficient biological interest to engage the attention of scientific men and propounded to him my theory.

To my delight he replied that the old explanations of the disappearance of the pigeon had always seemed to him utterly inadequate and he thought the data I adduced quite sufficient to warrant systematic inquiry and readily promised his co-operation.

Now comes the article of "Noynek" with its singular testimony in the very line of my theory and of peculiar interest to me in its suggestion that the great pigeon flight may not have been whelmed in a migratory flight across the Gulf, but have been forced into the Gulf from the Texas shore by the fierce "norther" described, which beat with such fury for several days upon the forest near the coast and, as stated in the dialect of the aged negro from whom "Noynek" got the story, "dun blowed de timber most to pieces."

Anyone who has encountered a genuine Texas "norther" has had such an experience as would make him quite capable of believing almost anything that might be told of its fell and destructive possibilities to anything caught unprotected in its course.

I earnestly hope that "Noynek" will give us more on this subject with fullest additional details possible. I can assure him that anything further from him on this subject will find one most interested reader, and I hope many more, and I believe he has hit upon testimony which may prove of great importance in the solution of the question which, as he says, "fairly nettles the thoughtful lover of nature."

If the cataclysm theory is the true one, and the particular occurrence narrated to him by the aged African was of sufficient extent to account for the sudden disappearance of the main pigeon flight, and if the old man's recollection be correct that it was "bout twenty-five years ago," there must surely be many persons living on that Texas coast who could corroborate the story and give details of the greatest interest. I hope, therefore, that "Noynek" will not fail to prosecute such inquiry as he will doubtless know how to make among his friends and acquaintances on the Gulf coast and will report to FOREST AND STREAM.

C. H. AMES.

## Horns Seven Feet Across.

IN FOREST AND STREAM of Aug. 5 we printed an item telling of the discovery in Kansas of a pair of horns which measured seven feet from tip to tip, and suggested that these horns belonged to one of the great bisons of Posttertiary time, having in mind *Bison latifrons*, described by Harlan. We are advised by Mr. F. A. Lucas, Curator in Chief of the Museum of the Brooklyn Institute, who has seen photographs of the specimen, that this is an example of *Bison latifrons* as supposed. He adds:

"It is one of the finest examples of this species ever discovered, and marks the westernmost range of the species. As is almost inevitably the case with fossil bison, the frontal bones only were present, but in this case they were united and the horns in their natural position. This is not the case with the Cincinnati specimen, in which the frontal bones had been separated. This species is by far the finest of North American bison, and must have been a magnificent animal."

Persons interested in American bison should read Mr. Lucas' pamphlet on the "Fossil Bison of North America," in one of the Bulletins of the National Museum, about 1887. This gives, so far as was then known, the number of species and their distribution.

From this paper we learn that there are half a dozen species of fossil bison in America, but that the remains are likely to be fragmentary and difficult of comparison with each other. It might thus well enough result that a species should be described from the tooth, another from a horn, another from a leg bone, all of which might have belonged to the same individual, or at least to the same species. In all the bison, however, the teeth are very much alike, and do not afford very good characters. A horn core described as bison by Mr. Rhoads appears to be a horn core of the muskox, while another species of "bison" described from a horn core, by Cope, seems to be founded on the horn of a species of bighorn sheep.

Fossil bison were found pretty much all over the United States, being very abundant in the ice cliffs of Eschscholtz Bay, and occurring southward of across the continent to Florida.

*Bison latifrons* (Harlan) was described in 1825, and the type we believe is now in the Academy of Natural Sciences in Philadelphia. It came, as already remarked, from the Big Bone Lick in Kentucky, and specimens have been found in a number of localities in Florida, as well as in Georgia, Mississippi, South Carolina, Ohio and Texas.

## Black Snake Charming a Catbird.

THE following description of such an occurrence is taken from the annals of the Jamestown expedition in 1607. A boat party of colonists were on their way up the James River to the village of Opechancanough, Chief Powhatan's first lieutenant.

This eminent aboriginal, it is stated, was not a native of Virginia, but came from a distant country to the southwest, possibly from some province of the Mexican empire. The fact is of ethnological and historical value as showing that an early intercourse was current between sections geographically wide apart. There is abundant other testimony to prove not only commercial but genital connection between tribes dwelling far apart.

The snake, which was about six feet long, was making a small continual hissing noise through his nostrils. The bird seemed to be in great distress, often coming within reach of the snake, who turned his head in every direction as the bird flew around him, although its mate endeavored by striking with its bill and wings to make the serpent lose its prey. Notwithstanding all this annoyance, which hurt the snake very much, as appeared from his wincing, he continued his spell till the bird, grown faint and weary, became much disordered, its feathers rising loose from its body, was seized with a tremor, settled down on its feet within reach of the charmer, its tail and wings being drawn forward before its head, and its head bowed as if resigned to death. By this time the bird's mate had flown away and the snake took the victim's head into his mouth without resistance.

This account would seem to furnish all the evidence needed as regards this much vexed question. It is very graphic.

CHARLES HALLOCK.

## The Food of Hummingbirds.

*Editor Forest and Stream:*

In a recent article on the hummingbird by Charles F. Holder I find the following: "When grown up the birds demand insect food, which is their normal diet. That they are drinking honey from flowers is a stretch of the imagination perpetuated by some one, as the minute birds, when poising before flowers, are searching for small flies, gnats and other insects which creep in between the petals and blossoms."

The best authority on hummingbirds and their habits was the late Didymus, and he has frequently told me that the birds do not touch insects, but live exclusively on the honey extracted from flowers. He was familiar with the habits of the bird as found not only in the United States but in both Central and South America, and had spent nearly three-quarters of a century in the study of the bird and was well equipped with information as to their food and habits.

CHAD.

## It Will Interest Them.

To Each Reader:

If you find in the FOREST AND STREAM news of discussions of interest, your friends and acquaintances who are fond of out-door life will probably also enjoy reading it. If you think of any who would do so, and care to send them coin cards, which, when returned with a nominal sum, will entitle them to one short-time "trial trip," we shall be glad to send you, without cost, coin cards for such distribution, upon receiving from you a postal card request. Or, the following blank may be sent:

Forest and Stream Publishing Co.,  
346 Broadway, New York.

Please send me.....FOREST AND STREAM Coin Cards to distribute to friends.

# GAME BAG AND GUN

## The Natural Enemies of Birds.

BY EDWARD HOWE FORBUSH.

From the "Special Report on the Decrease of Certain Birds, and its Causes, with Suggestions for Bird Protection," in the Fifty-second Annual Report of the Massachusetts State Board of Agriculture.

### The Red Fox.

Fifty-eight people regard the fox as one of the most injurious enemies of birds, thus placing it next to the cat in destructiveness. This is entirely at variance with my experience. I have followed the tracks of foxes for many weary miles through the snow about Wareham, where they seem to live, in winter at least, on mice, marine animals, an occasional muskrat, and such bones and dead marine and other animals as they can pick up; but I have never seen any conclusive evidence there that a fox had killed a bird. My son dug out a fox's burrow, but there was no sign that any live bird had been taken there. Foxes pick up all sorts of meat scraps, chicken legs, heads, etc., and kill some birds, as well as poultry; but, according to my experience, this is the exception and not the rule.

Mr. William Brewster, who has been in the woods more than most gunners or sportsmen, tells me that he has seen very little positive evidence of the destruction of birds by foxes, although occasionally they kill game birds. Mr. William S. Perry, of Worcester, says that foxes kill practically no birds. He has shot a great many foxes and examined their stomach contents, as well as those of foxes killed by others, and says he has never found the remains of a bird in a fox's stomach.

At a recent meeting of the Massachusetts Fish and Game Protective Association, Mr. A. B. F. Kinney stated that he had examined the stomachs of eighty-five foxes and found only two quail, one woodcock and one partridge. Mice, frogs, rabbits, berries and frozen apples were among the food material found.

Mr. H. W. Tinkham, of Touisset says that in his hunts this year he has observed only one case where a bird had been killed by a fox; the bird was a crow. Of thirteen fox stomachs he examined, only two showed any remains of birds; and out of ninety fox excrements, only one showed birds' remains. The food evidently consisted mainly of mice and other small mammals.†

This, however, is only negative evidence. There is convincing, positive evidence of the destructiveness of the fox to offer. Mr. C. L. Perkins, of Newburyport, writes: "Have made it a practice, when skinning foxes, to open the stomach, and have found, in seasons of bare ground, moles, field-mice, etc.; but when the earth is covered with snow, the stomach will generally contain remains of grouse or rabbits. This is, no doubt, due to the habit of the grouse to bury in the snow."

Mr. F. B. McKechnie, of Ponkapog, tells the following: "In May and June of the present year I was at a loss to account for the destruction of numbers of birds' nests found by a friend and myself about Ponkapog. Cat-birds, song sparrows, thrashers, black-billed cuckoos, ovenbirds, redstarts and other nests were robbed of their contents with astonishing rapidity. Red squirrels and snakes were very scarce in the pasture where these nests were found, and after some discussion we laid the destruction to foxes. It is well known that foxes will follow a man's track; but it was not for some time that we found out that they were deliberately following us, and taking the eggs and young of all the nests, either on or near the ground, which we had stopped to examine. In the first part of June we got the first clew, when a young fox, following Mr. Horton, walked to within a few yards of him in a swamp where he had stopped to watch a Canada warbler. In the morning of June 19 Mr. Horton again saw two foxes, nearly full-grown, skulking along behind him. He directed me to a song sparrow's nest with six eggs which he had found and photographed during the morning, but before I got there the eggs were taken. In fact, as many as twelve nests were robbed before we discovered the cause."

Mr. I. Chester Horton corroborates this. He writes: "I have spent some time the last two years in photographing birds' nests on, or near, the ground, and was sorry to find in 1904 that nearly all the nests I visited were robbed and destroyed. One song sparrow's nest was robbed a few hours after I visited it, apparently by some animal that had followed my track. One morning, while watching a bird, I concealed myself in the branches of a small pine tree. While watching there I heard a fox bark, and soon found he was coming in my direction. In a few minutes two foxes appeared, following my track, and came within fifty feet of where I stood, stopped as though they partly detected my presence, and, after playing a few minutes, made off into the woods. On another occasion a half-grown fox, following my track, came within fifteen feet of where I stood, perfectly motionless, in a swamp. I have no doubt that foxes discovered that I was seeking birds' nests, and followed me and robbed the nests I found.

"While photographing nests I found three ovenbirds' nests, within a radius of a few hundred feet, one being partly built, the other two with freshly laid eggs. I waited several days and visited them again. I should have stated that one of these nests was about five feet from a path, and, knowing that something was following me and destroying nests, I did not move out of the path in visiting this nest. The nest that I found partly built I photographed after it had eggs, as it was rather peculiar, being constructed entirely of, and lined with, pine

†The inadequacy of an examination of stomach contents alone to determine the character of an animal's food is seen, when we consider that we get, in this way, evidence of only one meal out of all that the animal has eaten during its entire lifetime.

needles. I also intended to photograph the third nest, with the bird on it, as she was very tame; but on my third visit it had been robbed, as was the one I photographed. I visited the one by the path several times, but never stepped out of the path, and did not photograph it, and was gratified to see the eggs hatch out and the young grow to be large enough to leave the nest. One nest I found, that of a brown thrush, two feet high in a blueberry bush, was robbed when it had young half grown."

If foxes follow the tracks of people who find birds' nests, then bird study and photography may prove dangerous to the birds.

Mr. C. E. Ingalls once intimated to me that he had some reason to believe that a fox had followed his tracks to a bird's nest. In response to a written inquiry he sends the following: "I had at one time under observation the nest of a meadowlark. One afternoon about sundown I passed the nest with its full complement of young a day or two old, with everything looking favorable for a successful development. I passed from the meadow where the nest was situated up to a hillside adjoining, and in full view of the location of the nest. I seated myself upon the ground to watch some spotted sandpipers that I felt sure were nesting beside the brook flowing through the meadow, when I saw a fox come to the lower end of the meadow and begin to hunt, as I supposed, for mice. In the course of his quartering over the ground he apparently stumbled on to my lark's nest, and, as he became aware of its proximity, he pounced sharply to one side right into it. I jumped to my feet and shouted to him, and ran toward the nest, while Mr. Fox loped airily and quickly to the woods. When I arrived on the scene, two of the young were gone and one other lay about a foot from the nest, dead.

"One pleasant evening in May I was sitting on a log near the edge of a piece of mowing land, where it joined some scrub on the edge of a wood. \* \* \* While waiting, I saw a fox on the edge of the grass land minding along, in no hurry, and evidently hunting for mice or grasshoppers, as he would thrust his muzzle into the grass, then dance around as if watching some moving object in the grass, make a grab, then move along, all the time coming nearer to my position, which was hidden from him so long as I remained motionless. Suddenly when the fox was within five or six rods of me, a big ball of feathers flew out of the scrub at him and drove him some distance into the grass land. I immediately sized the situation up. A partridge (ruffed grouse) was warning Mr. Fox that she had claims to that particular tract of land that he would be required to respect. But Mr. Fox was evidently hungry, so he followed the brave little mother back to her nest beside a stump on the edge of the scrub. Although the bird made one or more rushes, they were of no avail, and, although I did not at first intend to harm the fox, as at that time of year he would be of no use to me dead, I regarded it, in the light of recent developments, to be a case for armed intervention, so put a bullet where it would do the most good, and he died within his length of the nest, with his mouth and throat filled with egg contents."

Probably foxes kill some of the young of the smaller birds when they are learning to fly, catching them as cats do. Of this habit Mr. F. H. Mosher says: "I have seen but one instance of the fox catching a bird, and that was several years ago. I was standing on a rise of ground that overlooked a wet meadow. A fox came out of the woods and appeared to be hunting for mice in the grass. As he came opposite a small clump of bushes, a small bird flew out and started for the woods. The fox ran a few steps after it and gave a tremendous spring, and caught it on the wing. Probably it was a young bird."

If foxes quarter over the ground in summer, as they certainly do in winter, it would seem impossible for any nest on the ground to escape their notice, unless, indeed, they are unable to smell the sitting bird. Prof. C. F. Hodge told me in 1903 that he had found by experiment that trained pointer and setter dogs were unable to find a ruffed grouse sitting on her nest, even when, in one case, the bird had left her nest and walked about a short time previously. This seems to indicate that these birds leave no scent during incubation; but Mr. Brewster informs me that his dog on more than one occasion found a woodcock on her nest. It seems probable, however, that ordinarily dogs and foxes find only such nests as they happen to stumble upon; otherwise, what is to prevent them from destroying the broods of nearly all ground breeding birds?

In order to determine the value of the evidence against the natural enemies of birds, letters were written to nearly all who regarded crows, jays, foxes, squirrels and weasels as particularly injurious, inquiring what evidence had led to this conclusion. Some of the replies showed that the evidence was merely hearsay, others appeared to be the result of personal observation.

Regarding foxes, Mr. J. H. Wood, of Pittsfield, writes as follows: "I visited a swamp in the vicinity of Ashley Lake for the purpose of running the white rabbits with a hound. There had been a heavy snowfall a day or two before, and in following a bank on the edge of the swamp we noticed several holes in the snow at the foot of the bank under some spruce trees. We also noticed a fox track and some feathers about a hole. This led me to investigate, and I found that this one fox had killed four out of the seven partridge that had taken refuge in the snow from the storm of the previous day. We tracked this fox from where he had eaten the first bird to a ledge, where we succeeded in finding one of the birds that had been carried there by the fox. My next experience was in 1902, about the 20th of November, when I found a place where some men were getting out stone. They had uncovered a fox's burrow where there had been a litter of foxes the past summer, and if you could have seen the

parts and feathers of the partridge you would have been surprised."

Mr. W. J. Cross, of Becket, also in Berkshire county, a fox hunter himself, says: "Every hunter of the fox has found, when following a track, the circle of feathers telling the story of where the ruffed grouse made his last dive under the snow to furnish a meal for Mr. Fox the next morning."

Mr. W. H. Snow, of Becket, says: "I have seen where the foxes have killed and eaten the partridges when there is a snow storm. The partridges get under spruce trees to get shelter for the night, and they are caught by the foxes."

Mr. Thomas Allen, of Bernardston, Franklin county, asserts that he has found the remains of grouse partly eaten, or feathers alone remaining, where fox tracks showed plainly. Others have related to him similar experiences. One saw a fox eating a grouse.

Mr. George E. Whitehead, of Millbury, Worcester county, says: "Every observing hunter or trapper can tell you the story of the fox's attempt to ambush a partridge, as told by the tracks on the snow. One can plainly see how the fox took advantage of every bit of natural cover, while he sneaked to where he made his spring. The fact that a few feathers are left shows that he met with success."

Mr. Otis Thayer, of West Quincy, Norfolk county, says that after the Blue Hills Reservation was closed to hunters, game increased very rapidly, for foxes were scarce; but as the foxes increased, game decreased. Formerly, he says, this region was good hunting ground; now he finds no game, but always finds foxes. They are now so plentiful that they are becoming destructive to poultry as the game decreases.

Mr. W. H. Aspinwall, secretary of the Massachusetts Rod and Gun Club, writes as follows: "During the last few years I have twice, if I remember aright, found the place where a fox had very recently killed a partridge and eaten him. It was so recent an act that my setter pointed at the place, and I went up and found the remains of the partridge, and foxes' tracks all around. The only fox that I ever shot I ran on quite unexpectedly while working up a bevy of quail. It was a young dog fox, and he was on the same errand that I was, for the quail flushed when I killed the fox. I have made a great many inquiries among the native hunters in our country districts, and they all believe that foxes and skunks, especially in the breeding season, are very destructive to our game birds. I have been told by a number that in digging out foxes that have holed they have found the remains of partridges, and even of the smaller birds, such as robins etc. Only last week a friend of mine who is an extremely good observer and sportsman told me that he found the remains of a robin which a fox had just killed. I believe that the chief difficulty is in the breeding season, when it is quite easy for foxes to catch the hen bird on a nest. I think that most people agree that, as the foxes have increased tremendously in numbers in the neighborhood of our reservations, such as the Blue Hills Reservation, the partridges have decreased in about the same proportion. That foxes have increased in eastern Massachusetts is proved by the evidence that within the last few years a great deal of poultry has been destroyed, even in such a closely populated district as Chestnut Hill; and foxes have been seen quite frequently. I believe that the State should in some way make a decided stand in destroying the vermin in the reservations, if they desire to make this a favorite breeding ground for the birds."

Considerable further evidence of this same character was received. There is at least one reservation where foxes are not protected. Mr. Charles P. Price, superintendent of the Middlesex Fells Reservation, tells me that the foxes have been all killed or driven out of the reservation, and that game birds have increased there. About fifteen foxes per year were killed for three years.

Mr. Henry B. Bigelow, of Cohasset, says: "Foxes are particularly destructive to quail and partridges in this neighborhood; the entrance to every fox hole is strewn with their feathers, and to my certain knowledge one fox, in 1899, killed, during the autumn, six out of a covey of twelve to fourteen quail. Partridges also suffer, as shown by the presence of their feathers about the dens, as do also domestic fowls."

Mr. S. J. Harris, of East Dedham, writes: "I once shot at a fox having a partridge in his mouth. I did not know that it was a partridge when I fired at the fox, but he dropped it when I fired, and, of course, I got the partridge."

The limits of this report will not permit the printing of half the evidence received against the fox. Some evidence from other parts of the State is given in brief below. "A common occurrence to find where foxes have caught and eaten partridges, both on snow and bare ground." (Herbert A. Bent, Franklin, Norfolk county.) "Have never yet seen a section of country where foxes and partridges were plentiful at the same time." (H. R. Packard, Attleborough, Bristol county.) "Have seen feathers of birds around his burrow. Where the fox lives, the game disappears." (A. C. Southworth, Lakeville, Plymouth county.)

This evidence, like the rest, is largely circumstantial; but it seems sufficient to prejudice the case of the fox, somewhat, and leads to the belief that in some localities we may have too many foxes. The fox is well able to take care of itself. Its natural enemies have been nearly all extirpated, and it must be kept within bounds, or it may become a pest. Under ordinary conditions, however, there are fox hunters enough to hold the fox in check.

Keeps a gun clean and rustless, ready for use.—Adv.

## Big-Game Hunting in Africa.

BY EDOUARD FOA.

Translated for FOREST AND STREAM.

MR. EDOUARD FOA was dispatched by the Minister of Public Instruction of France to go to southern Africa on an exploring and investigating tour. In carrying out these instructions, Mr. Foa visited the Cape Colony, the Orange Free State, the Transvaal, a part of Matabule Land, the country of Gaza, and the lower and middle Zambesi country as far as Lake Nyassa. All these travels have been described in a book entitled "From the Cape to Lake Nyassa." As a part of his studies and his travels in the wilderness, Mr. Foa had a great deal of big-game shooting. Sometimes this was for pleasure, more often from necessity. The African explorer—especially if he visits lands where the terrible tsetse fly is abundant—is obliged to have all his supplies carried on the backs of native bearers. This may require for one or two men a retinue of 200 natives, and these natives must eat. Often therefore the explorer is obliged to spend most of his time in hunting, for it is his rifle which supports the people whom he has under him, on whom he depends for the success of his journey, and for whose comfort he must care. Thus travel through Africa is largely on foot, and during four years occupied by Mr. Foa in journeying in equatorial Africa, thirty-six months out of the forty-two which were devoted to travel were spent on foot.

The result of months and years of a life such as this cannot fail to bring one who endures it to a very high pitch of physical perfection. The life of constant exercise and hard work out of doors, of simple food, of freedom from the luxuries and the temptations of cities and civilizations, ultimately enables him to do an amount of work hardly to be comprehended by the feeble dwellers in the cities with whom we daily rub shoulders.

Mr. Foa has written a number of books on his African experiences, and especially on his hunting. One of the best of these is entitled "Mes Grandes Chasses Dans L'Afrique Centrale"—My Big Hunts in Central Africa.

Mr. Foa's armament consisted of an English express rifle, caliber .577, a double-barrelled 12-bore rifle and a double-barrelled 8-bore rifle. These arms carried astonishing charges of powder and balls of different weights and hardness, according to the need of the hunting. Besides this armament and the multitude of other implements necessary for such a trip, he carried a big 12-bore duck gun for use on birds or other small game. Mr. Foa went up the country and at last reached Crocodile River, where he believed himself to be on the borders of a country abounding in big game, and it is on his first hunt in this region that we shall now accompany him.

The natives of a little neighboring village had come to visit us, and one of them had agreed for a moderate payment to guide our caravan to the encampment of the morrow. Another had consented to go with me, to show me the big game and then to guide me to the camp.

In the morning when the sky began to show violet and the cocks of the neighboring hamlet were from here and there saluting the coming of the day, we hastily swallowed a little black coffee to warm us up, for after these cold and damp nights one feels the need of a certain reinforcement when he gets up; and set out.

As soon as we had left the camp, we separated; Hanner, my companion, taking one side and I the other. In hunting large game, the opportunities for shooting are so few that when two are together, one of the hunters must often yield the shot to his companion. It is better therefore not only to separate, but to be distant from each other for several miles; otherwise the shots of your neighbor frighten your game.

We went down to the shores of the river to look for tracks. It is there that the surest indications of game are usually found; the animals—in inhabited regions—commonly coming to drink at night. A part of the bank is passed over and the animal is chosen which seems most worthy of pursuit. On that morning we saw tracks of gazelles, kobs, zebras, guibs, and finally of elands. Of these last there must have been six or seven, and we had good hope of overtaking them. At once we began to follow their trail across the broken and brushy plains, always going ahead without stopping or resting up to 11 o'clock.

We were traversing some little woods peculiar to central Africa, composed for the most part of mopane trees. Growing irregularly and by chance, singly or in groups, the gnarled trees do not exceed four or five yards in height. Among them grow freely tall grass and plants of all sorts, and every year the fire sweeps away all this low, dry vegetation, scorching a little the trunks of the trees. It is this, perhaps, which keeps them from growing more.

The elands had been walking in this low forest for several hours, but suddenly our men saw them in front of us. The brush was thick, and still full of greenish color. The fire had not yet cleaned up the soil. We were making some noise without intending it, walking on the branches which strewed the soil, or rustling the foliage, and we now redoubled our precautions, so as not to let our presence be known. The elands were more than three hundred yards distant, and seemed still unaware of the danger which was threatening them. One of them had stopped under a tree; his back turned almost squarely toward us. A second, his head stretched up in the air, seemed to be eating the leaves. We did not see the others.

The men stayed behind, hiding themselves, except a single one, who came with me. We were very careful; bent almost double, going from one tree to another, by many zig-zags, not putting a foot to the ground save with the utmost care. The wind was in our favor. We were hardly 200 meters distant, when the eland, which was eating, stopped and looked fixedly toward us. His neighbor did the same; a third and a fourth eland showed themselves a little further off, and I hesitated to advance further. My black sign to me that we must hide more carefully; so I got down on all fours, making long steps, slow and silent, and shoving my

gun ahead of me as I advanced. The elands kept listening all the time, but could see nothing. Antelope in general look and listen thus for a long time when they cannot smell; but when the wind is wrong—that is to say, when it blows from the hunter to the game—their sense of smell warns them and they move off without ever turning back. However, our big animals were beginning to get uneasy, walking about and stopping from time to time to listen again. If they took flight they would escape us perhaps altogether.

I raised myself slowly behind a tree to be able to shoot. The distance must have been more than 180 meters. When I shot, I thought that I had missed, for the whole herd disappeared at a gallop among the trees. But when they saw one of the elands lagging behind, the hunters had called out to each other that it was wounded, and we began to run as hard as we could. As we passed over the distance which separated us from it we saw it drop from a gallop to a trot, then from a trot to a walk; then it violently threw up its head several times, described two or three circles, turned about and fell heavily in the grass. Its four feet were seen in motion for a moment, and we saw nothing more.

It was an enormous female, which measured over five feet from the sole of the forefoot to the withers, and must have weighed 700 kilograms. Its size equalled that of an ordinary ox, the head recalling that of a cow, but being more elegant. The tawney hide was marked with nine white cross bands on the back and little black cross marks behind the forearm. It was a beautiful beast.

The ball had made a little round hole just below and back of the elbow. The heart was pierced, and the lungs, torn to pieces, indicated that the bullet had expanded in this place. Nevertheless, the unfortunate beast had the strength to start off at a gallop and to cover about 150 meters. I shall often have occasion to call attention to this extraordinary vitality, which seems to increase in proportion to the weight, among the antelope and other savage beasts.

## Massachusetts Quail.

AUG. 25.—*Editor Forest and Stream:* One of the most competent observers of bird life in Massachusetts is Mr. M. A. Walton, known in Essex county as the "Hermit," on account of the isolated situation of his cabin home on the remote outskirts of Gloucester. He is quite well known as a writer on natural history subjects. He writes me that he fed a flock of eighteen birds through the winter, and counted fourteen in the spring. Some of them would have nested near his home, he says, had not hounds driven them away. The hounds were chasing deer almost every day in the week. This spring he found four partridge nests, but some of them were looted by crows. He has seen several young grouse and twelve old birds wintered near his house. He wishes crows might be exterminated, because they kill most of the young quail and grouse, besides destroying song birds. His opinion is that they "do more damage than all other bird enemies put together."

Kingbirds should be protected because they keep off crows and hawks; but in his section they have been nearly exterminated by foreigners.

Game laws not well observed, is his verdict for his neighborhood.

Mr. Leighton, of Hamilton, the home of Congressman A. P. Gardner, reports few quail and partridges. "More pheasants than anything else."

Mr. Russell, an experienced hunter of Colrain much interested in protection, expresses the opinion that if quail were planted in his region they would do well. This is a town in Franklin county, the whole of which is without the quail zone, as shown on the map of the Biological Department of the Board of Agriculture. In classifying Berkshire as not a quail county in a previous communication I was led into an error by reports sent in from several men of that county. I have now before me a reproduction of the Government map of our State and find fully three-fourths of the county is shown to be within the quail zone. Savoy, Florida and Monroe are not in the quail section. Franklin county is the only one lying entirely without the quail zone. About one-third of Hampshire, four-fifths of Worcester and five-sixths of Middlesex are included in the quail region on the Government map. All other counties not already named are wholly within the quail zone. Of the entire area of the State about five-sixths is within that zone. Possibly if a new map were to be prepared now it might differ somewhat from the one now in vogue on account of the loss of birds during the last two years.

The problem that is up to the sportsmen to solve just now is how to replenish the covers. Every effort possible to plant quail from outside the State should be made, and besides that great self-denial on the part of gunners should be practiced when the shooting season comes.

Several correspondents whose reports have just come in urge a hunter's license, and some of them urge the placing of restrictions on the number of birds per day to a gun.

Mr. Church, of Douglas, says to save the birds "we must catch all the foxes we can." A friend in Randolph complains that Brockton parties are cleaning up the rabbits by the use of ferrets. An active sportsman from Webster makes a similar complaint, and he has been told by a man he deems good authority that in his town and the adjoining town of Dudley there are as many as forty or fifty ferrets used in hunting. The result, he says, is that rabbits have been cleaned up. A similar complaint comes from Hudson. The destruction of birds by foreigners is the cause of loud complaints in Hingham.

Many correspondents declare more paid wardens are greatly needed, and one gentleman reports to me what he considers a "great indiscretion" on the part of a certain deputy which consisted in his telling a man in a town where snaring is going on that "he (the warden) was going to lay for the fellows that set the snares." Everybody in the town, says my informant, "knows all about it now."

Cleans grime and powder smoke from face and hands.—Adv.

## Ducks of Mexico.

TAPACHULA, Chiapas, Mexico, Aug. 7.—*Editor Forest and Stream:* The duck shooting on this coast is splendid during the months of November, December and January. We get a lot of migratory duck which, I presume, come down the coast from California, which is only 2,000 miles north of us. I have shot teal, widgeon, sprig, spoonbills and butterbills, besides our two varieties of native ducks, the pijije and Muscovy.

A large Muscovy drake will weigh six pounds. The first year they are coal black, and after the first year the wings are about half white. They are very nice eating. The pijije is about the size of a widgeon. I do not think that it is the Mexican wood duck, as I have never seen them in trees. But the Muscovy simply lives and nests in trees. The nests are built in some hollow and they bring the young down to the ponds.

There are some lakes and ponds down on this coast which a breechloader has never been fired over. An Indian does not shoot ducks, as there is too little result for him in such small game, and his little \$3 gun does not do much damage with small shot. He much prefers to load with either ball or buckshot and get a deer or a wild hog.

I have seen ducks in such numbers on one of these ponds that I am sure one could have fired five or six hundred shells in a day's shoot. The great drawback to this shooting is that it is a long way from civilization, and the heat is great. There is no ice, and game will not keep longer than twelve hours, so one has to limit his bag as there are no towns nor inhabitants near enough to use the game. I have at times and in suitable places given away as many as fifty to some Indian hunters and they then made a barbecue and just half cooked the birds. They tell me that they will then keep for days, but of course they are not very good eating after being singed and smoked over the fire.

I have an idea that more American ducks come down every year to these magnificent feeding grounds, where they pass the whole winter without ever having a shot fired at them. I was told by an American plume hunter that he had seen canvasback down on these lagoons, but I very much doubt it as I have had greater opportunities than he for having met with this duck. Nor have I ever seen a mallard. The varieties already mentioned are the only ones I have ever seen here on this coast.

I presume the more shooting done in the United States the more the birds will be driven down into these countries, where they have complete rest, and possibly there will come a time when some of them will stay here and breed, though they will have to learn to keep out of the way of alligators.

GUATEMALA.

[Tapachula is on the Pacific coast of Mexico, in the extreme southeastern part, on a meridian about midway between Galveston, Tex., and New Orleans, La.]

## The Maine Moose Law.

JERSEY CITY N. J., Aug. 30.—*Editor Forest and Stream:* In his article on the "Maine Moose Problem" Tsciennetto finds fault with the law of Maine allowing only bull moose of a certain age to be killed, and predicts their extermination for that reason, for, as he writes, therein the trouble lies.

Change the law, according to Tsciennetto, so that any hunter can take one moose, be it bull, cow, calf or what not, and you will equalize the killing so that nature can carry on her wonderful work.

Put his suggestion in the form of a game law and in a few years there would be precious little left for nature to work on.

If there is danger of extinction from the killing of bull moose only, how will the killing off of cows and calves prolong the existence of that noble game? Has the discreditable killing of does and fawns in different States saved our deer?

I think not, and the wail sent up to-day that deer are becoming scarce all over the country is proof conclusive.

It is quite certain that anyone hunting moose tries for as good a head as he can get, a state of affairs wherein there is danger, according to Tsciennetto. Nevertheless, he would allow this same hunter, in case he was not successful in getting a fair head, to kill cow, calf or what not, in the moose family, in order to save that noble animal from possible extinction.

If there are so few moose in Maine that there is danger from interbreeding, as Tsciennetto claims, why not establish a close season for an indefinite period? The female of the moose, caribou and deer should be protected at all times. Some day a wise Legislature will pass a law to protect doe deer.

Canada has a law this season to protect the cow caribou. In Canada I have seen antlered cow caribou, the heads of which I would prefer to some of the small two or three-prong moose heads that are taken in Maine every fall.

Stop the killing of moose in the calling season and allow them to be hunted only in November, when to kill one is a fair test of ability and endurance, and the moose will hold his own for years to come.

I was told by a noted guide in Canada that caribou outnumber the moose in New Brunswick, yet every year there are more moose killed, by a great majority, than caribou. The reason is plain, the moose falls an easy prey answering to the call of the twisted birch bark.

With the caribou it is quite different. To kill the wily caribou in New Brunswick you need something more substantial than birch bark to work on. Caribou in that country are not as obliging as the moose, they lead you a merry chase and give you a taste of the strenuous life, for that reason there will be caribou aplenty when the king of them all, the noble moose, will be no more, unless there is a change from the present conditions.

OTTO KEIM.

OSSINING, N. Y.—In a recent issue of the Daily Citizen of this place, the fact was set forth that George Sniffin, the Upper Dock fish dealer, had on exhibition an eight-foot Japanese redfin, and that the specimen was foreign to these waters, and that crowds had flocked to the Upper Dock to view it, which, indeed, they did. For the paper failed to state that the fish was made of paper inflated with air.

C. F. B.

## A Fishing Trip to Cumberland River

ONE bright, sunny morning in August I left the summer resort of Rockcastle Springs in Pulaski county, Ky., for a fishing trip to Cumberland River. My companions for the trip were Joe Thomas and Frank Hall, two commercial travelers from Cincinnati, O., who had been sojourning at the Springs during their "off" season, and Will and George Goodwin, broad-chested mountaineers, who had been hired to do duty as oarsmen. Thomas was a new hand in the field of angling, while Hall had in the parlance of his section, captured "quite a few" of the finny tribe in his time.

We took no provisions with us for the three days' trip we had arranged, outside the customary flask to recuperate the waning strength of the boatman after the day's exhaustive tire, expecting to spend the intervening nights in the comfortable log cabins of the natives residing along the banks of the river. Their hospitality was vouched for by the boatman and others, of whom we made inquiries. We found the reports absolutely true in every respect, attested by the fact that in numerous similar trips over Cumberland and Rockcastle rivers we were never refused a night's lodging, except in one instance where the wife of the owner of the house was seriously ill. Never, on asking for the amount of my bill for a night's lodging was a charge ever volunteered with one solitary exception. The exception was at the mouth of Rockcastle River, where my boatman and I slept one night in a cabin of one room in company with six other occupants, and for meals and lodging were charged a not unreasonable sum. But that was twenty years ago, before the natives had become acquainted with the wicked and wild fellows who claim to be fishermen to the great scandal of the honest craft. We were told that this wicked set were hilarious and rude, no respecters of persons or property, and as a consequence the natives are less hospitable, and when the freedom of the cabin is extended the proprietors have learned how to charge.

Two stout, flat bottomed skiffs had been engaged for the party, and as George Goodwin and I, taking the lead, pushed off from the shore into the placid pool near the famous spring. The others were expected to follow at once, when a yell from Thomas split the morning air before three oar strokes were taken.

"Hold on! Hold on!" said he, frantically. "Where's my rubber wading boots?"

Now, Thomas was an amateur whose knowledge of fishing was limited to the Miami, and a few inland creeks and shallow mud ponds, while Hall was an old-timer on the Cumberland.

"D—n your rubber boots!" savagely exclaimed Hall, who did not often swear, but when he did it was with force and meaning. "Do you suppose we are going to wade the Miami for goggle-eyes and snapping cats? Did you never troll from a boat?"

This apostrophe to his ignorance silenced Thomas, for if there was anything he despised it was to be considered ignorant on the matter of fishing. One day he was fishing with Kelpie, one of the old Kingfisher gang. Kelpie was catching fish and he wasn't.

"How in the world do you catch fish when I can't?" he inquired.

"Oh!" responded Kelpie, "that's easy enough. It's by the simple twist of the wrist." And he gave his wrist a quick turn. Thomas accepted the information without a murmur. The rubber boots were left behind.

It was a six-mile row to the mouth of Rockcastle over stretches of deep, transparent pools so clear the rocks at the bottom seemed within reach of the hand, and over rocky shoals and rapids where the natural channel in the low stage of water had been widened into zig-zag openings to permit the passage even of small rowboats. Down these narrow channels the boats rushed and grated and beat and bumped, guided by the oar blades in lusty hands until the deep, still waters at the foot were reached.

On either side the tall and craggy cliffs covered with virgin forest or clinging shrubbery, or rising into bold, bare rocks against the blue sky formed a gorge of picturesque grandeur for the passage of the beautiful river.

Aside from other features was noted, as we swept swiftly on, the deep pool of the Gulf, guarded by immense irregular blocks of limestone, twenty to forty feet in height above the water, as if some giant Titan had detached them from the adjacent cliffs and hurled them into the stream to block its path. This pool was said to be 100 feet in depth.

Next we course in sight of a rustic mill with the proprietor in full view feeding the hopper. The mill dam was composed of a wall of rough stones piled together, reaching diagonally down stream from either bank to a flood gate composed of two boards above a base log, held in place by parallel posts at each end. The water stage was thus raised about two feet to supply power to the mill. The latter was composed of a hopper, two mill stones and a shute into a box from which the meal was scooped into the waiting bag. This was strictly a low water mill, as at high tide the dam was washed out, the stones of the mill submerged and the mill was abolished till the next year, when a new dam was built, a new frame erected around the stones, and the good work resumed.

Emerging from the mouth of the river into the broader waters of the Cumberland, the boats were drawn together and preparations for sport began. Thomas pulled out his cigar box in which he had concealed from view with jealous care, "his rigging," as he called it. Revealed to light this consisted of a dozen or so of "bobs" of all sizes, from an ordinary bottle cork to the "stoppers" of a fruit jar, and as vari-colored as the rainbow. His lines were of cotton or twisted linen, his reel a single barrel "rattler," and his hooks varied from sunfish size to those suitable for snagging. Joe, as we familiarly called him, said

our smiles were out of order, as he always went prepared for anything that might turn up.

Hall exhibited a line that was new to me, made of braided silk, water-soaked, not too flexible, small and strong and free of that perplexing fault—a liability to kink. It was made, he said, by a workman in a Connecticut silk factory. I was so pleased with the work of this line that I later ordered and used no others, introducing them into the old Kingfisher Club, who patronized the maker to such an extent that they were afterward put on the market as the "Kingfisher" line, with a cut of the well known bird as a trade-mark. I may add, however, that the later lines do not appear to have the smoothness and finish of those originally manufactured, being a little too "sticky."

My own tackle was a No. 2 and a No. 3 Milan reel, with two of Abbie & Imbrie's best enameled water-proof braided silk lines and a couple of Mississippi cane rods. I had not then become acquainted with the elastic, strong and beautiful jointed Bristol steel rods.

Three kinds of fish are principally taken from the Cumberland—the wary small-mouth black bass, the salmon or wall-eyed pike, and the blue cat. The salmon, as they are commonly called, are of three varieties—the golden, the hickory and the lead colored. The blue cat was abundant but not desirable.

Our purpose was to ascend the stream, and it was agreed that each boat was to fish at will. Joe and Hall chose the right bank and I took the left, using both rods in trolling, resting the butt of one with click set on a board across the sides of the boat in front of me, and holding the other rod in hand ready for a strike. We trolled slowly, and if I had an alarm on the set rod I exchanged it for the one in hand and played the fish to a finish. Sometimes I had two captives to handle at the same time, in which event I put the drag on the reel in hand, laid the rod down, took up the other, hooked and landed the fish at the proper time and reeled both in in due succession, provided their valiant lordships did not bid me a disappointing good-by. There may be something of the "fish hog" in this style of fishing, but this was in the primitive days, and we had not read the FOREST AND STREAM much.

I was rounding a rocky point when a sudden yell from Joe attracted my attention. He was standing up in the boat, bare-headed and going through a series of contortions, jerking his rod from side to side, while Hall was swearing and shouting directions to him in Russian dialect. Thomas' antics evidently threatened to upset the boat. Joe was oblivious to all else except a vigorous turning of his "single multiplier" in the struggle to quickly get his fish on board. Wearying of turning the crank he finally yanked his fish on board with a powerful jerk of his rod. As it lay flapping on the bottom Joe shrieked out with both hands uplifted: "Come and learn of me, ye ignorant Waltonians, and I'll teach you how to catch fish by the simple twist of the wrist." Then he began to lecture Hall on the art of angling with the proper bait and the proper tackle.

The fish was a 2-pound bass, and Hall, though chagrined at the success of the amateur, was content in escaping an upset. A few moments later, while passing a rocky point, I felt a nibble, and giving line, saw the cork go under. Goodwin saw the bite and ceased rowing. The line slowly ran off the reel, then slackened, and winding in the slack, I felt a slight tug, gave it to him, and as he went out of the water the struggle began. His hair was evidently among the boulders close to shore, for he headed that way, and under the restraint of the bending rod he twisted and turned in and out among the rocky channels. Thwarted in this direction he darted toward deeper water. Yielding more line, but with tighter grip, he soon came to the top, leaping out and shaking his mouth to eject the hook, and then his strength waned, and with little effort he was led to the side of the boat and lifted in by Goodwin, a 2½-pounder.

Hall was also busy, landing at intervals, several bass, running from ½ to 2 pounds each. Going in behind some big rocks that obstructed the current in a narrow neck of the river, I got a strong bite, and after a short battle landed a golden salmon of 4 pounds. These fish are poor fighters in comparison with the gamy, bright-eyed black bass.

Trolling slowly up the river, trying a promising place here and there, and increasing our string with catches of bass of varying size of from 1 to 3 pounds, and an occasional salmon, we finally reached the long, deep pool at the foot of the salt shoals.

By this time the day was well spent, the sun hanging low over the hills, and the matter of finding lodging for the night very suggestive. Across the bottom near the hills a house was seen, and the boatmen having vouched for the hospitality of the owner, the boats were drawn up on a gravel bar near the shore, and George Goodwin dispatched for information. He soon returned saying it was all right.

Unloading our traps and fastening the boats securely for the night, and leaving the fish to be cleaned by the guides, we mounted the bank, and following a beaten path, soon reached the house. The owner—a plain, kindly-faced mountaineer of sinewy build—responded to our inquiry with, "I ain't got much, and my child is sick, but if you can stand it you are welcome."

The house was a long log cabin, divided into two rooms by a thin board partition reaching up to the square. One of these rooms was occupied by the owner, his wife and the sick child, and the other was set apart for our use. The fare consisted of corn pone, coffee, beans, roasting ears and potatoes, with fried fish as a centerpiece. We ate heartily, for we were hungry. After supper we sat by the big log fire and discussed the day's events. Our host listened with eagerness, especially when the talk touched on matters in the outside world.

Joe was sad. He had caught only the single bass that

had provoked his early hilarity. All day long he had been compelled to sit and see Hall taking them in, and his minnows were untouched, and there was no opportunity to exercise "that simple twist of the wrist."

We retired early, but not to sleep. That sick child had an extra touch of cramps and cried and cried and cried, as hour after hour rolled on. We turned in bed, we twisted, and as the wailing sound came over the partition and down among us, we wished for paregoric, and laudanum, and soothing syrup, and even for a chance to stuff its mouth with cotton.

Joe whispered that he could do the business by a simple "twist of the wrist." On and on through the night that wailing infantile cry went on, until about 3 A. M., when it suddenly hushed. How sweet! Then came sleep—oh, no! for just as the wailing ceased, a big rooster under the cabin began to crow and brazenly continued till day had fully dawned.

We rose next morning in no amiable mood. We were sorry for the child, but would have let Thomas cut that rooster's head off without shedding a tear. The breakfast was a duplicate of the supper of the night before, and our appetites as sharp as the edge of the brisk morning air of the mountains. Preparing to leave, we inquired the amount of our bill.

"You don't owe me nuthin'," was the host's reply. "I don't keep tavern, and if you are satisfied, I am."

We would not have it that way, and after some parleying, our host finally accepted a fair allowance for the night's lodging, with apologies for doing so.

As we walked down the path to the river Joe said he would have felt real mean if we had not paid for the music that child gave us; "beat a hand organ and a monkey," he added.

The second day's fishing was without notable incident save the trip through the salt shoals. After skirting the edges of the long pool at the base and picking up half a dozen bass ranging in size from ½ to 1½ pounds, we touched the foot of the shoals. The river at this point is quite wide and shallow for half a mile, and the main channel in low water a narrow, tortuous current, through which a rowboat has trouble in finding its way. The inexperienced navigator is often capsized and forced to wade out. Interspersed over the shoals are pockets of deeper water, where the hungry bass lies in wait for its prey. These scattered feeding grounds were glorious spots to delight the angler, for anchoring his boat in the shallow water beyond alarm distance, he could cast his minnow into the pocket and almost immediately find it seized by a ravenous small-mouth, and then the fight was on.

The surprised bass would dash into the shallow water and across to other pockets in its frantic struggle to escape, leaping above the surface and shaking its head as a dog would a rat in the effort to disgorge the wicked barb. There were no great rocks, and no sunken snags to give trouble, but an open field and a fair fight. No need to hurry, no need to fear unseen dangers, but if the hook held and the tackle was reliant, the battle was sure to end favorably to the skillful handler of the rod. In fishing these delightful places several hours were spent, and our strings grew heavy with the captives. Heavier laden, the skiff of Hall and Thomas occasionally became fastened on a ledge or in a bend of the current, and the guide was compelled to take to water to dislodge it.

Joe grew happier, for his luck to-day was better. When his red "bob" would go under he at first would lift a blood-curdling yell, until Hall threatened to throw him overboard. Then he compromised by postponing the whoop till the fish was in the boat. "You are not my friend," he said to Hall, "if you won't allow me so trifling an exultation as that." And Hall allowed it, for the opportunities for celebration were few.

Above the shoals the water was smoother and deeper, but we found the fishing better along shore or in the shallower places. At one point, a broad ledge of rocks projected from the left bank well into the stream, making a narrow channel with swift current. Tired of the narrow confines of the boats we stepped ashore on this ledge. Hall and I dropped our minnows in the swift water along the outer edge of the rocks, while Joe leisurely stretched his limbs on the ledge "to restore," as he said, "his equilibrium." The half hour temptation was fruitless of results, for not a fin disturbed our bait.

Late in the afternoon we reached the mouth of Laurel River. Our guides pointed out a road close by that led up the mountain side, saying that at the top we would find our night's lodging. It was a steep climb of a mile, the air sultry, and we were happy enough when the top was reached and Mr. Bunce's capacious cabin came in sight.

Mr. Bunce is a genuine down-East Yankee of the inquisitive type, and such a talker. Great Heavens! once set in motion it was down grade ninety miles an hour, track greased and no sidetracks or opposition trains allowed. Joe said he was a "s sextuple multiplier, without drag or click, and warranted to run on forever."

Bunce met us at the gate. "Come in, gentlemen, come in," he said, "make yourselves ter hum; nice day, fine luck, I see fish bite well; quite a few this year. Come from the Springs, I guess; lots of people there this year. Keep good Gravelly and Virginny twist at the Springs—got any? How's trade in the settlements," and he was going on, end without end, in this disconnected way when Joe interrupted him.

"Trade's fine, fine," he said, "day before I left I sold two yoke of oxen, a cow and calf, a blind horse, and would have sold a sow and ten pigs but fellow only wanted sow and nine pigs; sale broke off." This was uttered with all the solemnity of a mule waiting a chance to kick.

Hall and I glanced at each other quizzically, the two guides grinned broadly, and Bunce, glancing suspiciously at Joe, in a modulated tone, exclaimed: "Du tell, du tell, mister; be you a farmer?"

"No," responded Joe, "I sell saws and axes, knives and

forks, cheese and dried fruits, tubs and buckets sauerkraut and sausages—anything that's handy. I'm a commercial traveler."

"Du tell, du tell," said Bunce, and turning sharply to Joe he briskly asked: "Mister, won't you sell me a \$2 tombstone? Want to set it up over Hulda, my old cow, that died last spring?"

"I'll order it," replied Joe, and reaching out his hand to Bunce, he added: "Shake!"

They shook hands. Joe was beat at his own game, and we didn't let him forget it during the rest of the trip. A mild reference to tombstones would cause a twitch of pain to cross his face.

Bunce's cabin was spacious, porch in front, set of rooms, a middle and side porch and several rooms in the rear, all having the appearance of having been hitched on to the front from time to time as necessity required. The logs were well chinked, the doors hung on wooden hinges, the windows small, and the front and sides of the cabin roughly weatherboarded. The roof was covered with chestnut boards, the long rafters spanning the half-story above, and without ceiling to dull the sound of the rain pattering on the roof.

Bunce's table supply was ample; pork and beans, green corn, potatoes, corn bread, coffee and milk, butter and a molasses stand well filled with sorghum. To this was added a plentiful supply of fried fish of the day's catch.

When bed time came we were consigned to the front room with its two big beds and a pallet on the floor for the guides. The day had been unusually warm and the night was sultry for this mountain region. As we prepared to turn in it was found we were expected to repose on great big feather beds, a foot thick, soft and yielding, the best in the house. We sank in them with a restful feeling, but the warmth soon became suggestive, then oppressive.

Another discovery was made. The beds had been engaged before our arrival. The occupants were bugs of enormous size and marked activity.

"Oh, Lordy," said Joe, "have you fellows noticed anything?" We had. We were sure of it.

Hall bounced out on the floor. Joe and I quickly followed, and taking the top quilts we made a spread on the floor, where we spent the rest of the night. Loss of sleep the night before soon made us oblivious of the owl hoots outside and of the warm hospitality of our host.

After an early breakfast next morning we hastily gathered our traps and made ready to depart. Our bill was paid and the amount was accepted with thanks and a hearty invitation to "Come again. Glad to see you, latching string always hangs outside."

"Sure, sure," replied Joe. "I'll never forget you. If I get in twenty miles of here nothing can hold me back. Never had a livelier time in my life. Come and see me. Sell you a bunch of cattle," and seizing Bunce's hand he gave it a hearty shake. Both laughed and the laugh was catching.

We made much better speed going down the mountain than we had coming up the evening before, and were soon at the water's edge. Our boats were found all right, and we were soon heading up stream. The minnows, a lively set of the black sucker variety, had been submerged in running water the night before and were in good shape. They were originally caught in one of the mountain creeks with a minnow seine and had kept well.

A short distance above the mouth of Laurel River we entered the "Gulf"—a broad, deep basin of the Cumberland, reported to contain fish of fabulous proportions. It lay in the shadows of the adjacent cliffs, and the great forest trees along the banks. But we failed to lay hold on any of these fabulous monsters, and passed between the huge rocks guarding the entrances without so much as the sight of a fin.

But in the next reach above, from under the cavernous shadows of some overhanging rocks I caught a small-mouth black bass of about 1 pound weight, and of inky blackness in color. Goodwin, the guide, called it a "nigger fish." Outside its color there was nothing to denote a difference from the ordinary black bass. I presume the locality of its habitat—underneath the rocks in the darkness and shadows—had an effect, and probably only emerging at night to seek its food, it had become assimilated to its surroundings, somewhat as the eyeless fish of Mammoth Cave.

In one of the reaches higher up, where the swift current set in near the shore, I had the pleasure of "wiping the eyes" of my two friends. They had passed over the water ahead of me without a strike, but as my boat swung into the current the float of my set rod went under and the line began paying out rapidly. Laying down the hand rod I took up the other. There was no halt, no stop to swallow the bait, and as the line tightened I struck the moment his weight was felt. Out of the water he went, making the bubbles form and float away down stream in varying size. Again and again he broke from the water as the line checked his efforts to go down stream over the rapids. Then he varied his tactics by first running in shore and then darting under the boat. Goodwin turned the boat quickly and at the same time, standing up, I passed the rod over his head, so as not to entangle with the rod and line in the stern. As he cleared the boat and started toward mid-stream the reel click of the other rod caught my ear. The cork was under and the line moving out. Here was trouble, sure enough. Goodwin could not help me, for in the swift current his hands were full to keep the boat in position.

Quickly putting over the drag I laid the hand rod down on the cross-board, picked up the other rod, struck and fastened the fish, set the drag, replaced the rod, with reel handle up, and resumed the fight with the bigger one, as the first strike proved luckily to be. I cautioned Goodwin to pull slowly up stream, so as to keep the second fish clear. Releasing the drag, I resumed the fight with his royalty No. 1, and though he set the usual tricks in the open water, soon had him in short harness. After a few vain struggles he came to the surface, and floated submissively as I drew him to the boat—a good 3-pound small-mouth, trim and compact.

Taking up the other rod I found considerable line out, leading down stream, but this was soon recovered, and with it a bass of  $\frac{3}{4}$  pound, that was already tuckered out.

My two friends had halted their boat a short distance above to watch the fight. They expressed surprise that I should pick up two fish right in the track they had passed over. I suggested that as I had stirred the fish up they

should row back over the same ground and might do better. Sure enough, they circled back and caught several.

From the Gulf basin to the falls, the Cumberland narrows its channel very perceptibly, so that near the mouth of Bear Camp Creek it is difficult to get a rowboat over the riffles in low water. In this rougher part of the river we caught several salmon, running from 4 to 6 pounds.

We were headed this day for the Bee Spring, several miles above the mouth of Laurel River, and reached the place about noon. Stepping ashore we looked about for the waters so noted for their medicinal properties. An obscure path led up the wooded slope, following which we came face to face against an abrupt wall of rock over fifty feet in height. In the face of this rock, about three feet from the ground, was a circular hole, an inch in diameter, and from this opening, filling its capacity, gushed a stream of cold chalybeate water, possessing great virtue in restoring the wasted energies of the system.

There was no seam in the rock wall to indicate a break, but the hole seemed "made on purpose." The ground was red with the iron oxide precipitated by the water. The latter was cold and refreshing, with a slightly acrid taste. It was seemingly a great waste of medicine out here in the wilderness.

The afternoon was spent in descending the river, fishing as we went with varying success. By sunset we reached the mouth of Laurel River, and the question of lodging for the night came up. It would probably be dark before we could reach the Salt Shoals, with its dangerous channel, if we descended the river. The question was at us, whether we should climb the mountain and sleep with Bunce and his hot beds and nimble-footed bugs, or risk shipwreck in the Shoals with the crying child and crowing rooster to greet us if we escaped.

Joe gallantly voted for Bunce, while Hall said he would rather repose in a watery grave than be eaten alive by bedbugs. I agreed with Hall, and taking our lines and fish into the boat the oarsmen bent to their work with a will, so that by good luck we reached and passed the Shoals in safety during twilight, and that night the child and rooster were obligingly quiet, giving us a sleep that was sweet, sound and refreshing.

Next day, our minnow supply being exhausted, we made straight for the Springs. The night of our arrival Joe held an auction, with himself as auctioneer and disposed of his entire lot of fishing tackle, including his richly painted "bobs" and rubber boots, vowing his cup of angling joy was full, and he had only one other object in life, and that was to send Bunce his \$2 tombstone.

KENTUCKY.

OLD SAM.

## Godbout River Salmon Scores.

Editor Forest and Stream:

Such close tab has not been kept on the angling product of any other river in the world. This it is safe to say. For a period of nearly half a century, or since 1859, every salmon lifted out of that prolific Canadian stream has been scrupulously noted, and the record systematically printed. This was done by Allan Gilmour, of Ottawa, the owner of the river, while he lived, and since then has been continued by John Manuel, his nephew, also of Ottawa. Mr. Gilmour died in 1898, at the age of eighty. Mr. Manuel is now in his seventy-sixth year, but he never misses a season. Every June he runs down the St. Lawrence River several hundred miles in his steam yacht, the Cruiser, with a tender full of good things, and two or more friends, sometimes the full complement of five, and remains till near the close of the season, when he leaves his princely domain of 5,000 acres and its luxurious camp and appurtenances to his river guardian, Napoleon Comean, who often gleans out of the teeming water at the fag-end of the annual run more salmon than all of his predecessors put together. The scores show this. The limits of the season vary quite a little, but the extremes are from June 7 to July 28, as the printed records show.

This Napoleon Comean is a wonderful rodster, full of strategy, science, energy and endurance. He can fish all day and not tire. His maximum record in 1874 of 360 salmon and five grilse in eighteen days, or twenty salmon a day for each day during the whole time, is hardly credible to the craft who know what hardship and endurance is involved, taxing both brain and muscles. Napoleon is growing old and grizzly now, but he is still a very active, lusty man, and what he does not know about the natural history of the Godbout River fish is not worth mentioning.

Allan Gilmour's largest scores were 207 salmon in the season of 1866 (June 27 to July 21), 165 in 1867, 113 fish in 1868, and 139 in 1869. The heaviest fish caught during the period extending from 1859 to 1888 weighed 32 pounds. Three were caught of 30 pounds, six of 29 and quite a number of 28 pounds. The total number taken over 20 pounds each was 343. The year 1879 was notable for its large fish. There were a dozen that exceeded 23 pounds, and the total average was  $14\frac{1}{4}$  pounds. The year 1881 was phenomenal. The season was short and the fish heavy beyond precedent. In nine days, from June 14 to 23, thirty-two salmon were taken in all, and these averaged 20 pounds apiece, or 8 pounds above normal.

On June 22, 1880, John Manuel caught a notable string of six salmon, only one of which went below the 20-pound mark; the highest reading 27 pounds and the aggregate 120. Again, on June 6, 1881, he made another string of six fish whose aggregate reached 138, with the heaviest fish weighing 29 pounds, thus beating the record up to then. Mr. Allan Gilmour was high hook, having killed 1,413 salmon besides those taken during the years 1859-64. James Lord, of Montreal, killed 536 salmon in 1864-8. John Manuel, who succeeded his uncle, Allan Gilmour, made his maiden score of forty salmon in 1876. Next year he added 144 to that string, next year 120, and subsequently increased it to 1,423, making interim scores of 190, 127, 188, 134 and 133, but still leaving the old hero of the river champion at 207.

A summary of these unparalleled tabulated scores—the *ne plus ultra* in all the world's history of salmon fishing, shows an aggregate of 6,516 salmon caught with artificial flies, besides 109 grilse, the total weight of which was 85,297 pounds, or more than forty-two tons. There are seventeen pools in the river from tidewater to the Upper Pool, as it is called, where there is an impassable high falls. [This formation is characteristic of most of the rivers on the north shore of the St. Lawrence, and defi-

nitely ends the journey of anadromous fish, whether they be salmon or sea trout.]

The tab shows that fully one-third of all the fish taken were from this pool farthest up stream, and as the distance is not much more than two miles, it is evident that the fish, finding their journey at an end, felt more at leisure to investigate the little tufts of tinsel and feathers which they found playing about the surface of the water than when they were intent on reaching their spawning ground.

Very few grilse were tabulated, perhaps not more than twenty-three to as many as five rods during any one season's fishing. In the earlier years, up to 1876, grilse were not counted if taken. They were thrown out as a sort of supernumerary, or at least as an immature fish, lacking substance, flavor and weight. They were off color as well, and of little more account than the smolts which sometimes got hold of a line. River men and anglers were not looking for precocious fish in those days, which carried ova before their time, and if such precocity was even noticed no fishcultivist ever banked very high on establishing a prolific breed of adolescents, or upon being able to anticipate the function of maturity by imposing upon 3-pound grilse the onus of full-grown salmon.

A further analysis of this most complete and interesting statement shows a remarkably low average weight of fish of about 9 pounds for the first five years, with a progressive increase to 9 $\frac{1}{4}$ , 9 $\frac{3}{4}$ , 10.93, 11.23, 11.30, 13.23, 14.27 up to the climax of 20 in 1881. This latter figure has not been sustained, however, dropping back to about 13 pounds for the date given, and finally to a normal of 12 pounds, as the later tables show, being an absolute net gain of about 4 pounds in forty-six years. This result indicates betterment. It does not look like degeneracy or retrogression, or diminished numbers, whatever disaster may be predicated upon the failure of an occasional off year. Indeed, we find upon traversing the subsequent river records for the years 1889 to 1904 inclusive, that 4,967 captured fish have been added to the score, and that the maximum weight has been advanced from 32 to 39 pounds. This fish was caught on June 20, 1904. One fish was caught which weighed 33 pounds, one of 32, one of 31, four of 30, five of 29, six of 28, and one of 27 pounds. The aggregate weight for the fifteen years was 54,191 pounds, or twenty-six tons. Added to the product of forty-two tons for the previous thirty years, we have a grand total of about sixty-nine tons of salmon. A comparison of the figures show a catch of 3,613 fish per annum for the last fifteen years as against an annual catch of 2,975 for the previous twenty-nine years, or a gain approximating 19 per cent. This should be encouraging to those who deprecate the alleged inefficacy of artificial propagation.

In making this incisive sketch of a remarkable river, one who has been intimate with its leading spirit for many years cannot but note with sadness the gradual lapse of that lusty wielder of the two-handed rod, who ran up marvellous scores when he was in the prime of life, but hardly made his mark at the finish. Year after year for four years he made the long voyage down the St. Lawrence to his favorite resort, but he could not fish. His strength failed him. He came away empty, but at the very last, with that true heroism of his Scotch kinsman who cried "Lay on, McDuff!" he ran up a noble score of thirteen fish. The following year, 1886, he tried and failed. In 1887 he caught two. The next year he laid down his rod and came no more to the Godbout.

Since Mr. Gilmour died Mr. Manuel has distanced him by a record score of 234 salmon, and another remarkable score of 216. Altogether he has caught, since 1889, 1,929 salmon and 124 grilse, making a total catch of 2,091 fish.

CHARLES HALLOCK.

## Some Western Water Notes.

CHICAGO, Ill.—Editor Forest and Stream: Mr. Norman Fletcher, of Louisville, Ky., an angler who does a great deal of trout fishing in different Michigan streams, is quoted at some length in a newspaper published at Traverse City Mich., his remarks bearing upon the varieties of trout to be found in the Boardman River of that State. In a personal letter, which is at hand, Mr. Fletcher takes up the same question in the following form:

"After some investigation of the matter I have come to the conclusion that there are five different kinds of trout in the Boardman River, which discharges into Grand Traverse Bay at this place. They are the speckled trout, rainbow, steel-head, Loch Leven and the so-called German brown trout. Just why they should be called German brown I do not know, as they are the trout of the streams and rivers of England, and are known to scientists as the *Salmo fario*. I think it a mistake to put so many different kinds of trout in one stream. In the early days the Boardman River was a grayling stream. This fish was then locally called a 'gaper' or 'gapers.' Old inhabitants say that forty or fifty years ago the gapers were very abundant in the spring of the year. The speckled trout came into the Boardman and the grayling disappeared. After that came the rainbows and they seem to be monopolizing the stream. I am satisfied that when rainbow trout are introduced in streams containing speckled trout, the last named gradually decrease in numbers, why I do not know. I have examined the stomachs of many rainbows, and have rarely found a minnow or trout in them. The speckled trout spawn in the fall and the rainbows in the spring. Is it probable that the rainbows eat the spawn of the speckled trout when it is being deposited, or do they eat the very young speckled trout soon after they are hatched?"

## Maine's Largest Togue.

BANGOR, Me., Aug. 29.—The largest togue or lake trout that I have any knowledge of, as taken during the last five years, is the Saindon togue, caught this last spring in Cold Stream Pond, Enfield.

I saw the fish only after it was dressed and shipped to this city, but it was a whopper, and was alleged to weigh 31 pounds when taken out of the water, and 24 $\frac{1}{2}$  pounds after having the entrails removed. It was homely enough to have weighed almost any weight.

It was caught in early June by C. H. Saindon, of Bangor, keeper of a restaurant on Exchange street, just below my office, where it was on exhibition for a day before being served up to the woodsmen frequenting the hotel.

H. W. ROWE.

## Fish and Fishing.

### Atlantic Salmon in Lake St. John.

EXACTLY how much the ouananiche of Lake St. John are indebted for their preservation as a class to the fish-cultural operations of Mr. Beemer's hatchery it is extremely difficult to say, but it is quite safe to risk the assertion that in view of the enormous quantities of the fish that have been annually taken out of the lake in nets, in addition to those captured by anglers, it would have been quite impossible to have kept the supply of fish up to its present standard, were it not for the number of fry annually planted in its tributary waters for a number of years past. It is probably almost as safe to say that only for the work of the Roberval hatchery, the ouananiche of Lake St. John would now be as practically extinct, so far as sport is concerned, as would have been the salmon in many of our most wantonly netted coastal streams, but for the fish-cultural operations of the Dominion Government.

It is not alone, however, in the work of ouananiche hatching that the hatchery at Roberval has proved its usefulness. I have contended for many years past that the ouananiche, being the original form of the Atlantic salmon, the product of the development of the species, due to its acquirement of the anadromous habit, could equally well subsist in the ouananiche waters. Thanks to the work of the hatchery, this product now promises well to become firmly established in Lake St. John. I have reported from time to time during the last few years that smolt and grilse have been taken in different waters connected with the lake, since the planting of salmon fry in them. This season the capture has been reported of a small number of adult salmon. Some of them were taken on a fly in the Peribonca River and others in nets in Lake St. John itself. I am told that one of these weighed 16 pounds. I am sorry to say, however, that I did not see any of these fish, nor does it appear that they were brought under the observation of anybody capable of pronouncing scientifically and with accuracy upon their identification. The guides and others who saw them do not hesitate to proclaim them to have been true salmon, and they emphatically declare that they were not ouananiche; a fact which may be taken for granted in consequence of their larger size. I hope in the near future to be able to speak more definitely upon this interesting experiment, and also to be able to ascertain whether the adult salmon in Lake St. John, planted there as fry, have ever descended to salt water and succeeded in surmounting the falls of the Grand Discharge, or whether, like the former salmon of Lake Ontario, they have remained in fresh water all the year round.

### Netting in Lake St. John and Missisquoi Bay.

It will be good news to friends of the ouananiche, and, in fact, to all sportsmen who come to the Province of Quebec for their fishing, to learn that a number of very interesting reforms in regard to the inland fisheries of the Province are proposed by the new Minister of Colonization, Mines and Fisheries, the Hon. Jean Prevost. Mr. Prevost has just returned from a visit to Lake St. John and has seen for himself the large amount of netting which has been going on there. He assured those who brought the matter to his notice that this is the last year in which it will be permitted, and he is taking this action in direct opposition to the demands of the Member of Parliament representing the county, who, in order to secure the votes of the netters, is doing his best to obtain for them a continuance of the netting privileges. Mr. Prevost has made the further declaration that he will permit no further netting in any of the inland waters of the Province. This will mean, if Mr. Prevost is able to enforce his policy, that an end will be put next spring to the netting of pike-perch in Missisquoi Bay. The matter has already been brought to the notice of the Minister by the local officials of the North American Fish and Game Protective Association, who are leaving no stone unturned in the effort to put an end to the abominable practice.

The endeavor to have the Dominion Government declare the lake closed against netting has definitely failed. Had Mr. Prefontaine, the Dominion Minister of Fisheries, taken a different stand, the matter would have been satisfactorily settled. His refusal to do so leaves it optional with the Provincial authorities to issue licenses for netting or to withhold them. Mr. Parent granted them. Mr. Prevost, who succeeds him in charge of the fisheries of the Province, signifies his intention of issuing no more of these licenses, and I have every reason to hope that he is a strong enough man to withstand the pressure that will certainly be brought to bear upon him, in the interests of the netters, by the member for Missisquoi county and by at least one of his own colleagues in the Cabinet.

There are other reforms which the Minister has in view. He believes that the Department of Fish and Game of the Province of Quebec should produce a very much greater revenue than at present, and he will bend himself to the task of increasing it. He thinks that it ought to yield as much as the State of Maine. His policy will apparently be to bring about a much more efficient system of protection than at present, and then, when he can assure the best of sport to visiting sportsmen, to charge accordingly for it. With the object of improving the present system of protection, Mr. Prevost proposes to dismiss the hundreds of so-called fish and game guardians in different parts of the Province, who draw nominal salaries of \$50 to \$100 a year each, for which they do absolutely nothing in return, and to employ the money so saved in the payment of a dozen or twenty good men who will be required to give themselves up entirely to the work.

### Some Very Good Fishing.

The trolling for ouananiche in Lake St. John itself, where the fish seldom take the fly after the early part of the season, is very good at present, especially in the neighborhood of the Island House and of Isle Ronde.

An Indian guide who was in Quebec the other day from Pointe Bleue told of some splendid fishing which a party of Americans had enjoyed who have been out with him and a number of other guides in the country north of Lake St. John. They ascended the Ashuapmouchouan River for some distance, subsequently crossing, for a couple of days, a portage route which runs through a chain of small lakes and intervening country, and so

arriving at Lac à Jim. On the evening of the first day after leaving the Ashuapmouchouan River the party camped on the shore of Lac aux Brochets, where capital trolling was enjoyed. This lake, which is irregular in shape, and a mile and a half or so long, is very weedy. It fairly teems with pike, one of which frequently seizes the spoon almost as soon as it reaches the water. Here they caught a number of fish weighing from 12 to 17 pounds each.

Lac à Jim is a handsome body of water seven to eight miles long, which takes its name from the site, still visible, of the former camp of Jim Raphael, an old-time Indian hunter. Its waters teem with fish of various kinds. Its ouananiche are so large and dark that the Indians call them ouchachoumac or salmon. Seldom do they rise very readily to the fly in these waters. They more closely resemble the landlocked salmon of Maine than their congeners of Lake St. John. But the sport to be had by trolling is of a very high order. And the party which recently visited the lake found that it was not confined to ouananiche either, for large brook trout, and larger lake trout, as well as monster pike were captured by them.

Lac à Jim empties into the Mistassini by way of the Wassienska River—a heavy, rough, violent stream, whose rapids will bear comparison with those of the large main tributaries of Lake St. John. The run down this river in bark canoes is a very exciting experience. The Mistassini River was entered close to the tenth fall, and a few hours sufficed to run the remaining rapids and to portage the intervening falls until the camp at the Cinquieme Chute, or fifth falls, was reached. Just below this picturesque cataract the party found quite a school of large ouananiche, capturing several over 5 pounds each in weight, and one of which was not much short of 7 pounds. The entire trip occupied about ten days.

### Fine Sport on the Ristigouche.

Some of the fishermen on the Ristigouche did exceedingly well this season. Perhaps the best of the sport was had in the pools controlled by Mr. Archibald Mitchell, of Norwich, Conn., and Mr. Fred W. Ayer, of Bangor, Me. Their camp is a little above the Metapedia. The party of ten who fished these pools have an aggregate of 221 salmon to their credit, besides twenty-eight grilse; the total weight of the lot having been 3,106 pounds. Mr. Porteous, of Norwich, caught no less than forty-two salmon and ten grilse, and Mr. C. B. Brown, of New York, thirty-nine salmon and twelve grilse. Most of the others only fished for a portion of the time that Messrs. Porteous and Brown were on the river. One day, tired of the larger fish, Messrs. Porteous and Brown took their rods and went toward Campbellton, returning to camp that night with fifty-two trout.

Mr. Brown has traveled all over Europe and pried into every nook of Scotland, but says he has never seen a more wonderful view than that from the top of Morrissey Rock, looking down the Ristigouche, eleven miles above Campbellton.

Some of the Ristigouche fishermen were very much less successful this season than the Norwich party, and the fishing turned out very poorly upon the Bonaventure, the St. Marguerite and the Trinity rivers. In the Grand River of Gaspé the catch was a large one. The Natashquan and Moisie people also did well.

Capital sport has recently been had in Lakes Vermilion and Edward by Messrs. Barnes and O. A. Maxwell, of Chicago, and S. A. Farr and son of New Jersey. One day's catch included twelve brook trout weighing from 3½ to 5½ pounds each.

Mr. Gordon Renfrew, of Quebec, was surprised the other day while fishing for cod in the Lower St. Lawrence, to capture a halibut weighing 165 pounds and measuring six feet in length.

Dr. George Porter and Dr. Civilion Fones, both of Bridgeport, Conn., who have recently enjoyed some excellent tarpon fishing in the Gulf of Mexico, passed through Quebec a few days ago on their way to their fishing preserves in the vicinity of Kiskisink.

E. T. D. CHAMBERS.

## Izaak Walton and the "Compleat Angler."

A Lecture by Mrs. Comstock before the Chautauqua Assembly.

TO UNDERSTAND what his art and his companionship with nature meant to Izaak Walton we needs must glance over English history covered by the period of his life, beginning during the last years of Elizabeth's reign and ending during the last years of the reign of Charles II. The pages simply reek with bloody wars, black intrigue, religious persecution and rebellion, the horrors of the plague, and the stern excitements of regicide. These national tribulations find no mention in the serene, sweet, sunny pages of Walton; pages on which no shadows rest save those made by the foliage of trees or the pinions of a hawk climbing his skyward spiral above green English meadows. In Walton's book the sea was never made for armadas and ships seeking conquest of new countries and vast riches; nor yet for the Mayflower and religious freedom do his blue waters roll. But rather for ships that shall bring or carry the art of Italy and the learning of Livy and Tully; and above all does he prize the seas because of the teeming life in them and says: "The waters are nature's storehouse, in which she locks up her wonders." And adds: "An ingenious Spaniard says that rivers and the inhabitants of the water element were made for wise men to contemplate, and fools to pass by without consideration."

In the air which "The Compleat Angler" breathes there are no germs of pestilence and no roar of distant battle; instead it is the medium which the lark loves and which supports the falcon. It is the home of those little nimble musicians of the air, that warble forth their curious ditties, with which nature has furnished them to the shame of art. And thus he describes the lark and falcon:

"At first the lark, when she means to rejoice, to cheer herself and those that hear her, she then quits the earth and sings as she ascends higher into the air; and, having ended her heavenly employment grows then mute and sad that she must descend to the dull earth which she would not touch but for necessity."

Thus he describes the falcon: "In the air my troops of

hawks soar up on high, and when they are lost in the sight of men, then they attend upon and converse with the gods, therefore I think my eagle is so justly styled Jove's servant in ordinary; and that very falcon I am now going to see deserves no meaner title, for she usually in her flight endangers herself, like the son of Dædalus, to have her wings scorched by the sun's heat, she flies so near it, but her mettle makes her careless of danger; for she then heeds nothing but makes her nimble pinions cut the fluid air, and so makes her highway over steepest mountains and deepest rivers, and in her glorious career looks with contempt upon those high steeples and magnificent palaces which we adore and wonder at."

Little marvel that an atmosphere, thus peopled, should bring sweet scents from daisied meadows, and health and strength to those that breathed it.

And the earth over which "The Compleat Angler" wanders is not a place for contending armies or the foothold for bloody conquests, but is instead "a solid settled element; an element most universally beneficial both to man and beast; to men who have their several recreations upon it, as horse-races, hunting, sweet smells and pleasant walks."

When he speaks of great men they are not the great generals nor yet the struggling nor oppressive monarch, but instead are scholars who have known many things and have written books or they have lived the perfect life like "that undervaluer of money, the late Provost of Etón College, Sir Henry Wotton, a man with whom I have often fished and conversed, a man whose foreign employments in the service of this nation, and whose experience, learning, wit and cheerfulness made his company to be esteemed one of the delights of mankind. This man whose very approbation of angling were sufficient to convince any modest censurer of it, this man was also a most dear lover and a frequent practicer of the art of angling, of which he would say, 'twas an employment for his idle time which was then not idly spent; for angling was, after tedious study, a rest to his mind, a cheerer of his spirits, a diverter of sadness, a calmer of unquiet thoughts, a moderator of passions, a procurer of contentedness, and that it begat habits of peace and patience to those that professed and practiced it. Indeed, my friend, you will find angling to be like the virtue of humility, which has a calmness of spirit and a world of other blessings attending upon it."

And of all the turmoil betwixt Pope and Puritan there is naught mentioned by Izaak Walton except the following gentle allusion: "I will speak of a memorable man that lived near to our own time whom I also take to have been an ornament to the art of angling. Dr. Nowel, some time Dean of the cathedral church of St. Paul in London, a man that in the Reformation of Queen Elizabeth, was so noted for his meek spirit, deep learning, prudence, and piety, that the then Parliament and Convocation both chose, enjoined, and trusted him to be the man to make a catechism for public use, such a one as should stand as a rule for faith and manners to their posterity. And the good old man, though he was very learned, yet knowing that God leads us not to heaven by many nor by hard questions, like an honest angler made that good, plain, unperplexed catechism which is printed with our good old service book. I say this good man was a dear lover and constant practicer of angling as any age can produce; and his custom was to spend, besides his fixed hours of prayer, a tenth part of his time in angling; and also, to bestow a tenth part of his revenue, and usually all his fish, among the poor that inhabited near to those rivers in which it was caught, saying often that charity gave life to religion. And at his return to his house would praise God he had spent that day free from worldly trouble; both harmlessly and in a recreation that became a churchman."

It is only by comparing the history of England during Walton's life, and contrasting its turmoil with the serene peace of Walton's spirit, that we can understand Walton at all. History says he was persecuted for religious and political opinions more or less. That he felt deeply and lived keenly with his times. Thus it was that from sheer self-preservation he turned his back upon struggle and bitterness of civil strife, to nature and his art of angling, that made him forget that earth was less than paradise. To nature he turned for comfort and consolation.

### Walton's Attitude Toward Science.

Walton's attitude toward science was characterized by broad minded tolerance. He discriminates with nicety between what he knows from personal observation and what he has heard. Anything, whatever, may be true; he has no prejudices. This is especially noticeable when he discusses spontaneous generation of various animals: "And others say, that as pearls are made of glutinous dew drops, which are condensed by the sun's heat in those countries, so eels are bred of a particular dew, falling in the months of May or June on the banks of some particular ponds or rivers, adapted by nature to that end; which in a few days are by the sun's heat turned into eels, and some of the ancients have called the eels thus bred the offspring of Jove. I have seen in the beginning of July, in a river not far from Canterbury, some parts of it covered over with young eels, about the thickness of a straw, and these eels did lie on the top of that water, as thick as motes are said to be in the sun." The above exemplifies well his attitude; he tells what he has heard without comment on its probable truth or untruth and then simply adds his own observations; note how cautious he is about the motes in the sun.

He quotes Sir Francis Bacon: "That if you knock two stones together very deep under water, those that stand upon a bank near to that place may hear the noise without any diminution of it by the water." And this reason of Sir Francis Bacon has made me crave pardon of one that I laughed at for affirming, that he knew carps come to a certain place in a pond, to be fed, at the ringing of a bell or the beating of a drum; and, however, it shall be a rule for me to make as little noise as I can when I am fishing, until Sir Francis Bacon be confuted; which I shall give any man leave to do." And then he adds with pious humor, "All the further use that I shall make of this shall be to advise anglers to be patient, and forbear swearing, lest they be heard and catch no fish," a most cogent argument against the use of profanity by one who has evidently often experienced the exasperation of losing a fine trout at the critical moment.

But the raining of frogs, a cheerful theory that prevails in some parts of the United States to-day, excites his gentle sarcasm, he says: "And Cardanus undertakes to give a reason for the raining of frogs, but if it were in my power, it should rain none but water frogs, for those, I think, are not venomous, especially the right water frog which, about February or March, breeds in the ditches by slime and blackish eggs in that slime." (He knew these frogs hatched from eggs and were not rained down.)

Very free indeed is our "Compleat Angler" from the narrowness of many men of science who believes in the existence of only those things that their own eyes have seen. He says: "Nay, the Royal Society have found and published lately, that there be thirty and three kinds of spiders, and yet all, for aught I know, go under that one general name of spider." It would excite no wonder in a mind like that of Izaak Walton if he could have foreseen the thousand species of spiders that we know to-day "all under that one general name of spider."

It is to be expected that we should find the most careful natural history of the "Compleat Angler" devoted to the finny tribes. But the same quaint humor and delicious phrasing are to be found here as elsewhere. He says: "The pike is also observed to be a solitary, melancholy and bold fish; melancholy because he *always* swims or rests himself alone, and *never* swims in shoals or with company, as roach and dace and most fish do, and *bold* because he fears not a shadow, or to *see* or be *seen* of anybody, as the trout and chub and all other fish do. The pike is called by some writers the *tyrant* of the rivers or the fresh water *wolf* by reason of his bold, greedy, devouring disposition. A pike will devour a fish of his own kind that shall be bigger than his throat shall receive, and swallow a part of him and let the other part remain in his mouth till the swallowed part be digested, and then swallow that other part that *was* in his mouth, and so put it over by degrees."

Speaking of the edibility of old fish he puts it delicately when he says: "It is observed that the *old* or very *great* pikes have in them more of state than goodness." Very graphic is this picturesque description of the bleak: "There is also a bleak or freshwater sprat, a fish that is ever in motion, and therefore called by some the river swallow, for just as you shall observe the swallow to be, most evenings in summer, ever in motion, making short and quick turns when he flies to catch flies in the air, by which he lives, so does the bleak at the top of the water. Ausonius would have called him bleak, from his whitish color; his back is of a pleasant sad or sea water green, his belly white and shining as the mountain snow. And, doubtless, though he have the fortune which virtue has in poor people to be neglected, yet the bleak ought to be much valued, though we lack Allamont salt, and the skill the Italians have to turn them into anchovies."

#### On the Habits of Fishes.

In speaking of the habits of fishes he says: "And in the winter the minnow and the loach and bullhead dwell in the mud, as the eel doth, or we know not where; no more than we know where the cuckoo and swallow and other half-year birds, which first appear to us in April, spend their six cold, winter, melancholy months. The bullhead does usually dwell and hide himself in holes, or amongst stones in clear water; and in very hot days will lie a long time very still and sun himself, and will be easy to be seen on any flat stone or gravel; at which time he will suffer an angler to put a hook baited with a small worm very near unto his mouth; and he *never* refuses to bite, nor indeed to be caught with the *worst* of anglers."

The "Compleat Angler" evidently has not a high regard for women as devotees to the gentle art of fishing; thus he describes the stickleback as "a fish without scales, but hath his body fenced with several prickles. I know not where he dwells in winter, nor what he is good for in summer, but only to make sport for boys and women anglers, and to feed other fish that be fish of prey."

But though he liked not women anglers yet he lacked not appreciation of woman in her more successful spheres, as for instance, singing and milking cows. We all love his handsome milkmaid that had not yet attained so much age and wisdom as to load her mind with any fears of many things that will *never* be, as too many men too often do. But she cast away all care and sung like a nightingale.

He had a keen eye and a wise word to the medical side of nature. But he makes these suggestions impersonally and on the authority of learned men as "Rondeletius says, that at his being in Rome he saw a great cure done by applying a tench to the feet of a very sick man. But I will meddle no more with that; my honest, humble art teaches no such boldness; there are too many foolish meddlers in *physic* and *divinity*, that think themselves fit to meddle with hidden secrets, and so bring destruction to their followers. But I'll not meddle with them any farther than to wish them wiser."

#### Our Interest in Walton.

However, it is as a student of nature that we are to-day most interested in Izaak Walton in that he exemplifies in this respect an ideal. Led to a closer study of living creatures through the practice of his art, he oftentimes forgets his art in admiration for nature's cunning workmanship; nay, he even forgets for the moment that bait is what he is after. Listen to his description of caddice worms: "You are also to know that there be divers kinds of cadis or case worms, that are to be found in this nation in several distinct counties, and in several little brooks that relate to bigger rivers; as namely, one cadis called a piper, whose husk or case is a piece of reed about an inch long, or longer, and as big about as the compass of a twopence. There is also a lesser cadis-worm, called a cockspur, being in fashion like the spur of a cock, and the case or house in which he dwells is made of small husks and gravel; most curiously made of these, even so as to be wondered at but not to be made by man, no more than a kingfisher's nest can, which is made of little fishes' bones, and have such a geometrical interweaving and connection, as the like is not to be done by the art of man."

His discourse on flies and caterpillars is most alluring: "Now for flies you are to know that there are so many sorts of flies as there be of fruits; indeed too many for *me* to name or for *you* to remember. And some affirm

that every plant has its particular fly or caterpillar, which it breeds and feeds. And as it is observable that there be flies of prey, so there be others, very little, created, I think, only to feed them, and breed out of I know not what; whose life, they say, nature intended not to exceed an hour; and yet that life is thus made shorter by other flies or accident. Nay, the very colors of caterpillars are, as one has observed, very elegant and beautiful. I shall for a taste of the rest, describe one of them, which I will some time the next month show you feeding on a willow tree, and you shall find him punctually to answer this very description. His lips and mouth somewhat yellow, his eyes black as jet, his forehead purple, his feet and hinder parts green, his tail two-forked and black; the whole body stained with a kind of red spots which run along the neck and shoulder blade, not unlike the form of St. Andrew's cross, or letter X, made thus crosswise, and a white line drawn down his back to his tail; all which add much beauty to his whole body. And it is to me observable, that at a fixed age this caterpillar gives over to eat, and toward winter comes to be covered over with a strange shell or crust, called an Aurelia; and so lives a kind of dead life, without eating, all the winter. And as others of several kinds turn to be several kinds of flies the spring following, so this caterpillar turns to a painted butterfly."

The bee he describes as a creature of the air thus: "There is also a little contemptible winged creature, an inhabitant of my aerial element, namely, the laborious bee, of whose prudence, policy and regular government of their own commonwealth I might say much, but I will leave them to their sweet labor, without the least disturbance, believing them to be all very busy at this very time among the herbs and flowers that we see nature puts forth this May morning."

His enthusiasm for birds comes largely from the esthetic side of his nature. Though he describes them well they yet seem to belong to the realm of poetry and music in nature's book. "How do the blackbird and the thrasher, with their melodious voices, bid welcome to the cheerful spring, and in their fixed mouths warble forth such ditties as no art or instrument can reach to."

"But the nightingale, another of my airy creatures, breathes such sweet loud music out of her little instrumental throat, that it might make mankind to think miracles are not ceased. He that at midnight, when the very laborer sleeps securely, should hear, as I very often, the clear airs, the sweet descants, the natural rising and falling, the doubling and redoubling of her voice, might well be lifted above earth and say, 'Lord, what music hast thou provided for thy saints in heaven, when Thou affordest bad men such music on earth?'"

But, most of all, we are interested in Izaak Walton's ideals of life and manhood; we would know what these days out of doors pursuing an avocation which he regarded and practiced as an art did for his thought and character. It is this phase of him that we who live in overworked to-day need to consider with all seriousness. Too many of us have forgotten how to rest; we have no time for thought of contemplative sort; all our thought is the kind that leads to immediate action; it is the thought that guides the football player in the midst of the struggle; that animates the man in the turmoil of the stock exchange or that guides the automobile; it is the thought that takes cognizance of what lies before us in the next moment close at hand; there is no perspective in it, no possibility of far seeing; there is no alchemy in such thought to change the experience of life into true wisdom. Such thought simply accelerates our speed and makes us each a drive wheel in the activities of our complex civilization; it keeps us whirling ever more rapidly and we go on helplessly, not knowing how to stop. Even when we try to rest and take a much needed vacation we find we know naught of the sweet art of resting; we must still be doing things. Finally the misused nerves refuse to act and then we retire to some rest-cure and take our rest in one large lump and make wry faces at the medicine which is the forlorn hope of the sufferer from nervous prostration.

For those who must work when they rest there is probably no diversion to-day so popular or helpful as fishing. It is fortunate that the number of fish caught does not materially affect this sport, else our streams depleted as they are of their finny inhabitants, would soon preclude its possibility. However, all true devotees of angling agree, from Walton down, that the fascination of the experience is not so much in owning fish as in fishing. Walton says: "For you know there is more pleasure in hunting the hare than in eating her"; and he says to his pupil: "It is a good beginning of your art to offer your first fruits to the poor, who will both thank God and you for it."

Unfortunately, not all anglers understand the advantages of going fishing as did Walton, and here is where the "Compleat Angler" preaches us a much needed sermon to-day, for it shows that our greatest angler was given to sane, wholesome thinking and was possessed with a true love of nature, and the keenest appreciation of the beautiful, and that he had good judgment in all things, especially in the values of the things this world has to offer.

Living in a country wherein the traditions of aristocracy prevailed everywhere, he says: "But, my worthy friend, I would rather prove myself a gentleman by being learned and humble, valiant and inoffensive, virtuous and communicable than by any fond ostentation or riches, or, wanting those virtues myself, boast that these were in my ancestors."

[TO BE CONCLUDED.]

#### Pennsylvania's Frog Work.

In response to some of the inquiries for further particulars regarding Pennsylvania's work in frog culture or frog farming, I might say that all the frogs which were hatched last year and this year at the State hatcheries were planted mainly in other waters than those from which the spawn were gathered. Last year, of the 30,000 which were planted, about 10,000 were placed in the marshes from which the eggs were gathered, and the remainder sent to swamps and waters in different parts of Pennsylvania. The 60,000 hatched this year at the Wayne hatchery were all sent to different sections of the State, all the eggs having been gathered on the hatchery grounds.

The frogs were from one inch to one and a half inch long and some of them traveled two days before they reached their destination. In one case, through a blunder of the railroad company, five cans, or nearly 2,000 frogs, were taken from the Wayne hatchery in the northeastern part of the State to Washington county, in the southwestern part of the State, and brought back again. The period being nearly five days, and on the return to their home quarters not a single frog was found to have died, though it must be confessed they were very hungry.

Thus far the Department has not taken any particular pains to separate the great western frogs from the green frogs, but have hatched them all together in the same ponds. The reason why there has been no separation is because of the extraordinary demand for the creatures from all parts of Pennsylvania, which has rendered it necessary for the superintendent of the hatcheries to gather wild spawn wherever they could to supplement that from the frogs in captivity. W. E. MEEHAN, Commissioner of Fisheries of Pennsylvania.

#### A Reading Lesson.

It is a well established fact that the average school teacher experiences a great deal of difficulty when she attempts to enforce the clear pronunciation of the terminal "g" of each present participle.

"Robert," said the teacher of one of the lower classes during the progress of a reading exercise, "please read the first sentence."

A diminutive lad arose to his feet, and amid a series of labored gasps breathed forth the following:

"See the horse runnin'."

"Don't forget the 'g,' Robert," admonished the teacher. "Gee! See the horse running!"—Lippincott's.

#### Man's Ready Wit.

A YOUNG man entered the drawing room of the girl whom he was soon to marry. The girl came down to meet him with a severe frown on her pretty face. "John," she said, "father saw you this morning going into a pawnbroker's with a large bundle." John flushed. Then he said in a low voice: "Yes, that is true. I was taking the pawnbroker some of my old clothes. You see, he and his wife are frightfully hard up." "Oh, John, forgive me!" exclaimed the young girl. "How truly noble you are!"—St. James' Gazette.

#### Meenanery.

THERE'S some that love the mountain and some that love the sea,  
But the brown bubbling river is the dearest thing to me,  
And sweeter than all waters in all the lands I know,  
Is the stream by Meenanery in the county of Mayo.

'Tis there the plunging torrents spread and slacken to a curl,  
And in below the fern-clad rock the dimpled eddies swirl;  
'Tis there in blue and silver mail the fresh-run salmon lie,  
While overhead goes dancing the dainty-feathered fly.

Oh, to hear the reel go singing, to feel the rod a-strain!  
But still the days are passing and I'll be back again  
To brush through dewy heather in the myrtle-scented air,  
With the freshness of the morning, it is then I will be there.

Here on the gritty pavement I'm pent in London town,  
But on the smoke-grimed elm-trees yon swollen buds are brown—  
And with the leaf's unfurling I'll say good-bye and go  
To airy Meenanery in the county of Mayo.

—Stephen Gwynn in the Spectator.

#### The Kennel.

##### Brunswick Foxhound Club.

TO THE members of the Brunswick Foxhound Club: Article XIV., Section 5, of the Constitution and By-Laws, provides that, "A special fund for use in defraying the extraordinary expenses of the club shall be raised by subscription. The fund shall be subject to the orders of the Executive Committee."

Among the purposes of this special fund are the following: 1. To provide certain prizes for competition in the annual hound show and field trials. 2. To pay the expenses of judges from a distance who could not otherwise be present. 3. To provide for some kind of an entertainment for the men, women and children of Barre, who for ten years have welcomed us to their town and allowed us to ride and walk over their farms. 4. To pay for items which are considered by your Executive Committee to be essential to the proper conduct of the trials and hound show.

This special fund was started in 1903, and for two years has been used for the above purpose. It is now necessary to ask the members of the club, and any friends who are interested in what the club is trying to accomplish, to contribute again to the special fund. Any sum, no matter how small, will be gladly received and duly acknowledged by Mr. L. W. Campbell, Woonsocket, R. I., the treasurer of the club.

The Brunswick Foxhound Club stands for the development, improvement and best interests of the English hound as hunted in America, as well as for the American hound, and it is hoped that the masters of English packs will join the club and co-operate with the management of the Brunswick Foxhound Club to this end. Mr. F. S. Peer will probably judge the English hounds at Barre in October next.

The management of the club will gladly receive suggestions as to the best way of controlling the spectators at the field trials. It is not an easy matter to formulate rules for this purpose, but at our meeting in October we propose to attempt a more definite plan of campaign, with a view to obtaining the best results. These rules will be printed in due time, and it is hoped that the members will abide by them during the trials as closely as possible.

ROBERT F. PERKINS, Pres.

BOSTON, Aug. 11.

# YACHTING

## Yachting Fixtures for 1905.

MEMBERS of Race Committees and Secretaries will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future:

### SEPTEMBER.

7. Country Club (Detroit), club.
8. Sea Side, power boat races.
9. National Power Boat Carnival.
9. Knickerbocker, one-design power boats.
9. Bristol, open.
9. New York, autumn cups, Glen Cove.
9. Royal Canadian, Prince of Wales Cup.
9. Chicago, club.
9. Sea Side, club.
9. Beverly, club.
9. Corinthian, club.
9. Boston, club, Hull.
9. San Francisco, interclub.
9. Larchmont, club.
9. Corinthian of San Francisco, interclub.
10. Rendezvous, M. Y. R. A., Hull.
10. Bristol, open.
10. Middletown, power boat races.
11. Detroit, sweepstakes.
16. Knickerbocker, power boat races.
16. Royal Canadian, club.
16. Chicago, cruise.
16. San Francisco, cruise.
17. Lakewood (Cleveland), club.
24. Morrisania, open.
24. San Francisco, cruise.

## AMERICA'S CUP AND THE NEW RULE.

THE New York Y. C. has now at hand a rare opportunity to declare itself unequivocally in favor of the new rule of rating. A definite statement to the effect that under it all future contests for America's Cup shall be sailed, would be taken by the world as a final stamp of approval. Continued silence on the subject will be construed as a lack of confidence in regulations which have been adopted in good faith by the leading yachting organizations of the country. Not until the new rule is applied to the blue ribbon contest of the seas will foreigners and many of us at home believe that any profound convictions as to its efficiency exist. It is not pleasing to contemplate the deadening effect on enthusiasm now prevalent, which another International series held under old conditions would have. Yachtsmen would be called upon to view the spectacle of intelligent men fostering an event, the conditions of which they had previously declared were radically wrong. If the new method of obtaining racing length is worthy of unflinching support it is certainly suited to govern any contest of any degree of greatness, wherever held. The rejuvenating effect which would result from the introduction of a more healthy type of boat in races for the America's Cup has never been questioned. It would open for future competitors a new channel to possible success and no doubt bring closer contests than have resulted under old conditions. It would also provide a medium by which the rule would be put to test in no uncertain manner. Weak points, if they existed, would be brought to light and a world-wide lesson in type development follow. It seems to be a question of only a short time when the desired declaration must be made unless the custodians of the cup are willing to go on record as considering the new rule still in experimental stages. No move at the present time would bring greater satisfaction to the yachting world than a final clearing up of the cup situation.

## THE DRIFTWOOD NUISANCE.

THE unusual amount and dangerous character of the driftwood now in New York harbor and the Lower Bay is causing protests from boatmen who have occasion to use those waters. Piles, string pieces and girders of large dimensions are encountered on every hand. While more or less easily avoided in the daylight, these pieces of derelict timber are a serious menace to navigation at night. Extensive terminal alterations and dock repairs now in progress are said to be responsible for the great amount of cast-off material afloat. It has not been an uncommon custom in years past, however, to leave abandoned piers to the ravages of wind and tide. Thus gradually reduced the structures give off whole sections often covered with projecting spikes which are a source of constant danger to small craft of any kind. There appears to be a necessity for much greater diligence on the part of the proper authorities in handling the driftwood nuisance. Although it can never be entirely abated, a careful supervision over all improvements along the water front would go a long way toward bettering conditions.

**YACHT MAGRUDER BURNED.**—The steam yacht Magruder, owned by Mr. T. P. Shonts, of the Panama Canal Commission, was destroyed by fire on the night of Aug. 24. The boat was considered one of the finest in Southern waters, and had been cruising in the Gulf of Mexico for some time. She was not insured.

## British Letter.

**COWES WEEK.**—The real racing of the Royal Yacht Squadron began on Aug. 9, for although the race for the King's Cup takes place on the first day, the contest is confined to yachts belonging to the club, and the cream of the big class is by no means represented. On Aug. 9, however, the race for the German Emperor's Cup for yachts exceeding 40 tons brought out a splendid fleet of seventeen fine vessels of which four were German owned and the rest British. As this is the biggest fleet that has started in any race this season it may be interesting to give the list, which is as follows:

	Tons.	M. S.
Navahoe, yawl, Herr Watjen.....	232	scratch
Hamburg, sch., Hamburgischer Verein Seefahrt.....	331	5 29
White Heather, Mr. M. B. Kennedy.....	153	17 14
Satanita, yawl, Sir Maurice Fitzgerald.....	300	18 01
Susanne, schooner, Herr O. Huldinsky.....	154	23 30
Brynchild, yawl, Sir James Pender.....	153	35 16
Zinita, cutter, Messrs. Connell.....	92	36 02
Cetonia, schooner, Lord Iveagh.....	295	42 18
Valdora, yawl, Dr. J. Douglas Kerr.....	106	47 00
Merrymaid, cutter, Mr. R. Young.....	107	47 47
Therese, yawl, Herr Felix Simon.....	114	50 08
Creole, cutter, Col. V. Bagot.....	54	62 40
Rosamond, yawl, Mr. A. K. Stothert.....	63	64 14
Vendetta, cutter, Mr. W. Abbott.....	75	65 01
Betty, yawl, Mr. J. H. Brun.....	92	75 59
L'Esperance, yawl, Mr. E. W. Ingleby.....	76	82 15
Fiora, cutter, Mr. H. M. Rait.....	80	84 36

The start was postponed until 1 P. M., owing to the naval festivities occasioned by the presence of the French fleet. They had a long turn to windward down the West Channel to the Hymington Spit Buoy, and the 65-footer Zinita, sailing wonderfully well, led the fleet to that mark, as she also did in the subsequent run back past Cowes. It was not until they were well on their way to the Bullock Patch Buoy—the lee mark—that the scratch boat passed her. White Heather also got by her, but Zinita kept third place. Therese, with her big allowance, won the cup, Zinita taking second prize and Rosamond the third. In the 52ft. class Moyana went to the front soon after the start and won by 2m. from Britomart. Maymon third and Sonya last, nearly 6m. behind the leader.

On Aug. 10 the big boats were split into two classes. Those exceeding 100 tons T. M. sailed for the Cowes Town Cup in a fresh breeze. Eight boats started, including the two large German schooners, Meteor and Hamburg. Navahoe, which was at scratch, led throughout, but failed to get a flag, the Town Cup going to Brynhild and the second and third prizes to Therese and Merrymaid. In the smaller handicap Betty was the winner, Vendetta taking second prize and Creole the third.

On the final day, Aug. 11, the Royal Yacht Squadron made the fatal mistake of adopting the Yacht Racing Association's time allowance in the race for yachts exceeding 100 tons for their cup. The result was that four boats remained at their moorings, and the race may be termed a farce, as Meteor was set to give Navahoe 11m. 22s. over a forty-six-mile course—a moral impossibility. In point of fact, Meteor got so hopelessly out of the race in the turn to windward that she gave up, and the issue lay between Navahoe and White Heather, the latter losing her chance through having to make a short tack near the finish. The winners were Navahoe, White Heather and Valdora. The 52-footers had a very close race for the Countess of Dudley's challenge cup. Maymon was first boat home and Sonya second. The former was protested against by Moyana and Britomart for forcing a passage and the destination of the cup is not yet known, but will probably be with Sonya.

**RYDE WEEK.**—The four days' racing under the burgee of the Royal Victoria Y. C. did not bring together such an imposing fleet as had been seen the previous week at Cowes. This was chiefly owing to the absence of the four German owned yachts—the schooners Meteor, Hamburg and Susanne, and the biggest loss of all the yawl Navahoe. The owner of the last named vessel made it known that he left because he was dissatisfied with the handicaps, but as Navahoe had a string of seventeen flags she has not done so badly this season.

The principal race on the opening day, Aug. 15, was for yachts exceeding 100 tons for the vice-commodore's cup. White Heather was scratch boat, and she led Brynhild, Therese, Merrymaid and Valdora to settle with. White Heather sailed well in the light wind but was unfortunate in getting ashore once, and was badly treated by the fickle breezes, and at the finish of one round, when they were stopped, Brynhild was close to her and easily saved her time for the cup, the second prize going to Merrymaid, and the third to Valdora. In the 52ft. race Sonya showed improved form, and although recalled at the start for being over the line, she pressed the winning boat Maymon very hard during both rounds in the turn to windward, and nothing but a succession of weather lowers prevented her from getting into first place. Moyana was close to Sonya at the finish, but Britomart did not like the wind journey and was 7m. astern of the leader.

The principal race on the following day was for yachts not exceeding 100 tons. Vendetta, an old 40-rater, found the fresh breeze to her liking and with the aid of a liberal handicap was an easy winner, Creole taking second prize.

On Aug. 17 the two handicap classes combined in a race for the Ryde Town Cup. It was a paltry day and the race was rendered less interesting by the fact that White Heather was over the line at the start and did not see her recall number. The winners were Zinita, Valdora and Creole. Britomart won the 52ft. race by a big margin, chiefly through good seamanship. Moyana was second, 7m. later, then came Maymon and Sonya in the order named.

Racing finished at Ryde on Aug. 18 in a hard south-westerly breeze, which made it a reach all round the course. Under these circumstances White Heather had

no chance of wiping off her time allowances, although she averaged nearly 12 knots round the course. The old cruiser Lorna won the Commodore's Cup, Therese taking the second prize and Valdora the third.

**ROYAL SOUTHERN Y. C.**—The yachts finished up the week with the regatta of this club, the starts and finishes being made at Calshot, at the mouth of Southampton water. It was a hard weather trial and there were many accidents. The chief race was for yachts over 50 tons for the King's Cup. White Heather carried away her main halyards and gave up. Creole and Merrymaid also gave up. Therese was first home, but Vendetta won the cup easily on time, Therese taking second prize and Valdora the third. In the 52ft. race Moyana carried away her bowsprit when leading and Britomart went ashore, leaving Maymon to finish alone.

**END OF SOLENT REGATTAS.**—The Solent racing was brought to a conclusion on Aug. 21 and 22 with the usual two days' regatta of the Royal Albert Y. C. The principal trophy on the first day was the Albert Cup for yachts exceeding 50 tons. The wind was light at the start and freshening later, but the course was all reaching, and in these circumstances White Heather had no chance of taking her time off the others. Valdora won the cup, Creole taking second prize and Rosamond the third. Maymon scored an easy win in the 52ft. class, Sonya taking second prize after a splendid fight with Moyana. The entries were poor on the second day, only three boats starting in the race for yachts over 100 tons. Of these White Heather had to give up, and Valdora saved her time from Brynhild. In the second handicap Creole, although over the line at the start, saved her time from Zinita by 43s., and the latter took second prize from Rosamond by the same margin.

**WEST OF ENGLAND REGATTAS.**—Racing will finish at Dartmouth this year, instead of Plymouth, as has been the case for some years past, and by the end of next week the boats will have finished up. There is one day's racing at Weymouth, two days at Torquay, and one at Dartmouth. The handicap classes are thinning out already, and will not be strongly represented, but it is hoped that the 52-footers will all go west and fight out their battles to the end. Making allowance for the fact that Maymon is in the hands of an experienced professional skipper it seems pretty clear that Moyana is the best all round boat of the fleet, although now completing her third season. Maymon is the best purely light weather boat and has been improved by her alterations in fresher breezes. Sonya is not yet tuned to concert pitch, and from her in-and-out sailing it would appear that she suffers in the matter of handling. Britomart is distinctly not a success, as she is a bad boat to windward. She is what may be termed a "one-day" boat. Give her a course all reaching and just as much wind as she likes and she will show the others the way, but over ordinary courses she is not a leader.

E. H. KELLY.

## First Tournament Racing.

Indian Harbor Y. C.—Aug. 30 to Sept. 1.

THE first tournament racing ever given in this part of the country was sailed among seven of the New York Y. C. monotype 30-footers on Aug. 30 to Sept. 1, under the auspices of the Indian Harbor Y. C. Commodore E. C. Benedict offered a cup for the winner, which proved to be Adelaide, owned by G. A. and P. H. Adee. The idea on which the competition was based was to race the contestants in pairs until only two were left in the final struggle. The success of the initial event will undoubtedly lead to other tournament matches.

Wednesday, Aug. 30.

The drawings for the first day brought together Cord Meyer's Atair and C. O'D. Iselin's Ibis; Hanan Brothers' Nautilus and W. Butler Duncan, Jr.'s Dahinda; Adee Brothers' Adelaide and A. H. and J. W. Alker's Alera. W. D. Guthrie's Maid of Meudon drew a bye. The boats were sent away in a light S.W. wind. The course was to windward from Great Captain's Island to Execution Light and return, a distance of 14¾ nautical miles. The finish was very late, none of the boats crossing the line before 8:20 P. M. Ibis and Nautilus made no effort to come by the committee boat. Atair, Dahinda, Alera and Adelaide being the only ones timed, Alera led Adelaide at the finish. A clause in the condition governing the series was to the effect that no times would be taken later than half an hour after sunset. This was forgotten by some of the racers. When found to be correct, however, the struggle of the first day was declared "no race" and the first finished contest was slated for Thursday.

Thursday, Aug. 31.

Pairings for the first round of the tourney on Thursday were the same as on the preceding day. A course from Oak Neck and return, to be sailed twice, was selected. The wind was light from N.N.W. when the start was made, and had it held true, would have afforded a run out and a beat home. It hauled to N. by E., however, enabling the racers to reach back. Atair and Ibis were given the gun at 2:25. The first named led all the way, finishing a victor by 36s. Of the second pair, which got away at 2:35, Nautilus beat Dahinda by 4m. 14s. Ten minutes later Adelaide and Alera started, the former winning by 3m. 55s. The summaries of the first round follow:

	First Pair—Start, 2:25.	Finish.	Elapsed.
Atair, Cord Meyer.....	4 54 04		2 29 04
Ibis, C. O'D. Iselin.....	4 54 40		2 29 40
Second Pair—Start, 2:35.			
Nautilus, Hanan Bros.....	4 48 50		2 13 50
Dahinda, W. B. Duncan, Jr.....	4 55 04		2 18 04
Third Pair—Start, 2:45.			
Alera, A. H. & J. W. Alker.....	4 53 49		2 08 49
Adelaide, Adee Bros.....	4 49 54		2 04 54

Friday, Sept. 1.

The drawings for the second round on Friday brought together Nautilus and Atair, Adelaide and Maid of Meudon. The course chosen was from a quarter of a mile south of Great Captain's Island to Matinnick Point and return, a distance of 9 1/2 miles. Nautilus and Atair started at 11:10. At the end of the outward journey, which was to windward, the first named led by 3m. 25s. On the run home Nautilus increased her lead to one of 5m. In the struggle between the second pair, which was sent away at 11:20, Adelaide won by 1m. 51s. At the outer mark the winning craft had a lead of 2m. 39s. Maid of Meudon making her gain on the run home. The summaries of the second round follow:

First Pair—Start, 11:10.		
	Finish.	Elapsed.
Nautilus, Hanan Bros.....	12 42 02	1 32 02
Atair, Cord Meyer .....	12 47 02	1 37 02
Second Pair—Start, 11:20.		
Adelaide, Adee Bros.....	12 59 47	1 39 47
Maid of Meudon, W. D. Guthrie.....	1 01 38	1 41 38

For more than one reason it was decided best to finish the series on Friday, and so the final race between Adelaide and Nautilus was started at 3:15 P. M. The course was a beat to windward from the gas buoy off Great Captain's Island to Matinnick Point and return, 11 nautical miles. Adelaide was 58s. ahead at the turn of the outer mark. Nautilus picked up on the run home, and at one time was in the lead. By laying a good course, however, Adelaide managed to finish a winner by 14s., securing the Benedict cup, valued at \$100. Nautilus got a prize from the Indian Harbor Y. C. for being second boat of the series. H. Wilmer Hanan and Frank Bowne Jones made up the committee handling the match. The summary follows:

N. Y. Y. C. 30-footers—Start, 3:15.		
	Finish.	Elapsed.
Adelaide, Adee Bros.....	5 47 05	2 32 05
Nautilus, Hanan Bros. ....	5 47 19	2 32 19

**Interclub Series.**

Atlantic Y. C., New York Harbor—Aug. 29 and 30.

A most interesting interclub contest between two of the Larchmont raceabouts and a like number of Class Q boats built under the new rule for Atlantic Y. C. members, was held on Tuesday and Wednesday, Aug. 29 and 30, over courses in the Lower Bay. The Class Q boats scored new honors for the rating rule, winning the series on points by 12 to 8, and giving the raceabouts a fair beating in the closing event of the series. The two boats selected to represent the Atlantic Y. C. were More Trouble, designed by C. D. Mower, and Cockatoo II., a production from the board of Clinton H. Crane. The raceabouts were Adrian Iselin 2d's Nora, also a Crane creation of this year, and Macy Willetts' Cricket, built in 1902 by Crownshield.

The series grew out of the equality shown between the two types of boat on actual elapsed times during the Larchmont race week. Invader, Jr., and Rana, were expected to accompany the other Sound boats, all coming at a later date, to meet besides More Trouble and Cockatoo II., Quest and Sactta, the other new Class Q boats in the Atlantic Y. C. A mixup of plans occurred, but although the visitors were not expected until a later day, final arrangements for the series were made in time to start the first event on Tuesday. The Class Q boats are of good displacement, rating under the new rule below the class limit of 22ft. The raceabouts have much less displacement and measure in the 27ft. class.

Tuesday, Aug. 29.

The first race on Tuesday was won by Nora, which defeated Cockatoo II. by 8s., More Trouble by 38s. and Cricket by 10m. 26s. A fresh N.W. wind was blowing, which kicked up an unusual sea in Gravesend Bay. It was thought best not to sail a course which would take the boats across the channel, so a triangle was laid out within the bay, with marks at the start off Sea Gate, at Fort Hamilton and Ulmer Park. This course was covered four times, aggregating 11 miles.

All of the boats started with two reefs. The first leg to Fort Hamilton was a dead beat, the next to Ulmer Park, a spinnaker run, and the last leg home a reach with booms to port. At the end of the first round More Trouble led Nora by 30s., Cockatoo II. by 1m. 46s. and Cricket by 4m. 44s. On the second round reefs were shaken out. Difficulty was experienced in getting the mainsail of More Trouble to set well. Nearly three feet had been cut from the mast

the day before, and the halyard blocks were left unchanged. Nora passed More Trouble on the run to Ulmer Park and led at the end of the second round by 13s. Cockatoo II. was third, 2m. 39s. away. Cricket was 6m. 18s. behind the leader. At the end of the third round Nora was 35s. ahead of More Trouble, 2m. 42s. in front of Cockatoo II. and 8m. 20s. in front of Cricket.

The wind flattened on the last round just after the boats had turned the Fort Hamilton mark. Cockatoo II. brought up a fresh breeze, passing More Trouble and nearly doing the same trick by Nora. The two boats had it nip and tuck to the finish, the visitor finally crossing the line 8s. to the good. Nora was sailed by Ralph Law. Hendon Chubb sailed Cockatoo II., Charles D. Mower had the stick on More Trouble, while F. W. Vulte was the skipper of Cricket. In the point system employed a boat got one for entry and one for every craft defeated. The summary follows:

Interclub Race—Start, 3:05.		
	Finish.	Elapsed.
Nora, Adrian Iselin, 2d.....	5 49 34	2 44 34
Cockatoo II., Hendon Chubb.....	5 49 42	2 44 42
More Trouble, W. H. Childs.....	5 50 12	2 45 12
Cricket, Macy Willetts.....	6 00 00	2 55 00

Wednesday, Aug. 30.

A S.W. breeze, with a spirited freshness about it, prevailed when the start of the last race of the Interclub match was made on Wednesday. A course was selected, which took the boats three times from Sea Gate to Fort Hamilton, thence across the channel to the bell buoy off Craven Shoal and home, an aggregate distance of 12 miles, leaving all marks to port. The first leg was a reach with boom to starboard, the next brought one or two close-hauled hitches and the last was a run home with spinnakers set to starboard. At the end of the first round the wind hauled to the W. and gave the boats a close reach to the first mark and one long fetch to the second.

More Trouble made a runaway race of it, gaining at every turn. At the end of the first round she was 1m. 11s. ahead. When the second journey had ended she was 1m. 58s. in the lead and at the finish she was 3m. 13s. ahead of Cockatoo II., which led Cricket by 24s. and Nora by 8s. more.

The exciting part of the contest was the manner in which Cockatoo II., after being fourth boat at the end of the first round, closed up on Nora and Cricket on the run from the bell buoy and passed them, drawing out a lead in the freshening breeze as soon as on the wind. Cricket was sailed much better than on the first day. The summaries follow:

Interclub Race—Start, 3:05.		
	Finish.	Elapsed.
More Trouble, W. H. Childs.....	4 55 55	1 50 55
Cockatoo II., Hendon Chubb.....	4 59 08	1 54 08
Cricket, Macy Willetts.....	4 59 32	1 54 32
Nora, Adrian Iselin 2d.....	4 59 38	1 54 38

Points for series:	
Atlantic Y. C.	Larchmont Y. C.
More Trouble.....2 4-6	Nora.....4 1-5
Cockatoo II.....3 3-6-12	Cricket.....1 2-3-8

**Frontenac Y. C.**

Frontenac, N. Y.—Aug. 29-31.

INTERESTING power boat races were held on the St. Lawrence on Tuesday, Wednesday and Thursday, Aug. 29, 30 and 31, under the auspices of the Frontenac Y. C. A number of boats which attended the American Power Boat Association gold cup series were entered. C. M. Hamilton's Simplex, from the New York Y. C., outclassed the other starters in the 20-mile free-for-all. The first heat in this event which was run off on Tuesday, went to Louis Hunt's Roma, competing in the colors of the Frontenac Y. C. Simplex was second and T. Z. R. failed to finish. The three boats entered the second heat, Simplex winning by 12s. from Roma. Geo. Hasbrouck's So Long broke down. Starting in the last event of the series were Simplex, Roma, T. Z. R., and Comanche, the latter three being enrolled in the club giving the races. Simplex was a mile ahead of T. Z. R. at the end, the boats finishing in the order named. Roma got second prize on points for the series.

F. H. Wesson's Invlese, of the Riverton Y. C., won the 20-mile handicap series, while Canard, of the Clayton Y. C., and owned by J. H. Morgan, of New York, got the prize for the best average corrected time for the three days of racing. In the first heat of the handicap on Tuesday, Invlese won from W. H. Beers' Navajo, of the Chippewa Bay Y. C. The other entries finished in the following order: Roma, Louis Hunt; Skeeter, C. H. Tangeman; Rochester, W. J. Graham; Canard, J. H. Morgan; T. Z. R., A. B. & W. H. Richardson; Durno, J. H. Durno. In the second heat on Wednesday, Invlese beat the Clayton Y. C. boat Teal, Navajo, Roma, Canard, and Rochester in the order named. T. Z. R., Durno, and Skeeter did not finish. In the final heat were Invlese, again a winner, Canard, Navajo, and Rochester. Roma did not finish. Invlese was awarded first prize and Navajo second for the series on points.

**Indian Harbor Y. C.**

Long Island Sound—Saturday, Sept. 2.

THIRTY-SEVEN boats started in the annual fall regatta of the Indian Harbor Y. C., held over Sound courses on the afternoon of Saturday, Sept. 2. The winners were Mineola, Nautilus, Memory, Mimosa III., Rascal II., Rascal, Thelema, Paumonak, Ace, and Kenoshi. A fine S.E. breeze kicked up quite a sea, and the racing proved spirited. The 70-footer Mineola met Yankee for the first time since the cruise of the New York Y. C., on which the former had to retire at Newport because of a weak place in her mast. These big sloops sailed a course from starting point off Great Captain's Island to Center Island, thence to Long Neck Point and return, 20 1/4 miles. The starting gun was fired at 12:15, Mineola crossing the line with better headway than Yankee. She soon drew clear, and led by about 1m. at the end of the first leg, which was to windward. Yankee gained slightly on the reach, and kept picking up until the end. Mineola finished 37s. in the lead.

The New York Y. C. 30-footers, the 33ft. sloops, and the yawls sailed a 15-mile triangular course, with the first leg to windward and the other two reaches. Eight of the thirties started, Addison Hanan sailed Nautilus to victory, taking the lead at the end of the first leg to windward. At the finish W. Butler Duncan, Jr.'s Dahinda was 1m. 50s. away. Cara Mia was third by 9s. Mimosa III. had her usual success in the 33ft. class for sloops, winning out from Regina and Nike by a big margin. The fight for second honors was a hard one, Regina getting it by 16s. from Nike. Memory had no difficulty in winning from Cherokee in the yawl class.

The other racers of the fleet covered a ten-mile triangle with the same relative sailing as the larger members of the fleet. Four of the raceabouts started, Rascal II. winning by 1m. 14s. from Mystral. Rascal was returned the victor in the regular 27ft. class, while a special match in the same division between Thelema and Montauk, went to the former. Paumonak got the race for the Class Q boats. Ace scored another one of her numerous victories in Class R, while Kenoshi beat Wa Wa in a match for Indian Harbor knockabouts. Frank Browne Jones, Charles F. Kirby and Charles E. Simms, officiated as Race Committee. Commodore E. C. Benedict's steam yacht Oneida was used as judges' boat. The summaries follow:

**Belle Harbor Y. C.**

Rockaway Beach—Saturday, Sept. 2.

THE new Belle Harbor Y. C. held an invitation regatta on the afternoon of Saturday, Sept. 2. Because of conflicting dates, very few of the invited clubs responded with entries. Avocet, Ariel, and Baby Roger were the winners. The course lay across Beach Channel to a markboat opposite the club house; thence down the channel to and around a mark near Block House Point and return to the starting line, three times over. The summaries follow:

Open Catboats—Under 20ft.—Start, 3:40.		
	Finish.	Elapsed.
Avocet .....	5 35 00	1 45 00
Highball .....	5 33 30	1 43 30

Open Catboats—20 to 25ft.—Start, 3:45.		
	Finish.	Elapsed.
Ariel .....	5 29 30	1 44 30

Psyche .....	5 38 30	1 48 30
Jennie .....	Did not finish.	

**GAS ENGINES AND LAUNCHES.**

Their Principles, Types, and Management. A Complete and Practical Manual.

BY F. K. GRAIN, M. E.

Bound in cloth, with 123 pages and 20 illustrations. Sent, postpaid, for \$1.25.

THIS compact and comprehensive handbook contains all the information essential to users of the marine gasoline engines, and will be welcomed by the thousands of men now owning and running power boats. Laymen and experts will alike find the book invaluable. It treats of the various types of marine gasoline engines, points out the good in each, and tells how to run them. A knowledge of the contents of this book will help to overcome difficulties and avoid accidents. The most complete book of its kind ever published.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

## Duxbury Y. C.

Duxbury, Mass.—Friday, Sept. 1.

A SERIES of two races was given by the Duxbury Y. C. on Duxbury Bay on Friday and Saturday, Sept. 1 and 2, thus completing the South Shore circuit of Y. R. A. open races. The first race, on Friday, was sailed in a light S.W. breeze. Three 22-footers—Nutmeg, Rube and Medic—started in a bunch and kept together on two leeward legs, but on the beat to windward Medic took the lead and held it to the finish. On the second round Rube passed Nutmeg for second place. In the 18-footers Again led on the first round, but was passed by Dorchen on the second round, Dorchen leading to the finish. Marvel led all the way around in the Cape cat class. Eclipse won in the first handicap class and Winnepuxet won a close race in the second handicap class. The summary:

Class E, 22-footers.		
	Elapsed.	Corrected.
Medric, George Lee.....	2 12 25	2 12 25

Saturday, Sept. 2.

Light and fluky southerly airs prevailed in the second Y. R. A. open race of the Duxbury Y. C., sailed on Saturday, Sept. 2. It was so light that the 22-footers could not get over from Plymouth. There was a mixup among the 18-footers at the start, out of which Menace was first to get away with Dorchen and Again following. Menace led on the short leg to the first mark, but was soon passed by Dorchen, which kept the lead to the finish. In the Cape cats Hustler got the start and led until the first round had been completed, when Marvel took the lead and finished first, losing to Hustler on corrected time. Eclipse won easily in the first handicap class. Nautilus finished first in the second handicap class, but lost to Pokonoket on corrected time. The summary:

## Corinthian Y. C.

Marblehead, Mass.—Saturday, Sept. 2.

THE last of the championship races of the Corinthian Y. C. was sailed on Saturday, Sept. 2. Times were taken on only two classes, as one of the marks on the outside course could not be found. Boo Hoo led all around in the 18ft. class and Cigarette won a close race in the 15ft. class. The summary:

18ft. Class.		
	Elapsed.	Corrected.
Boo Hoo, R. Boardman.....	1 28 11	1 28 11
Moslem, John Tyler.....	1 31 19	1 31 19

Nebulung, E. G. Loring.....	1 46 57	1 46 57
Little Misery, A. P. Loring.....	1 52 48	1 52 48

## Winthrop Y. C.

Winthrop, Mass.—Saturday, Sept. 2.

SIX yachts competed in the last race of the Winthrop Y. C. for the season on Saturday, Sept. 2. The breeze was light from the S.W. Alpha finished first in the 25ft. class, but lost to Hermis in corrected time. Harriet won in the 18ft. class. The summary:

25ft. Class.		
	Finish.	Elapsed.
Hermis, C. A. Henry.....	5 06 40	1 54 40
Alpha, Leary & Jenkins.....	5 05 05	1 55 05
Kit, H. B. Whittier.....	5 06 31	1 55 37
15ft. Class.		
Harriet, L. T. Whittier.....	Scratch	1 56 44
Elf, B. E. Wells.....	5 27 42	1 57 12
Madelyn, G. A. Nash.....	5 35 32	2 05 02

## Edgewood Y. C.

Open Regatta, Narragansett Bay, Sept. 2.

THE last regatta of the season for the Edgewood Y. C. an open event, was sailed Sept. 2. There was a good sized entry list, but owing to light winds the racing was slow, and some of the boats did not finish until long after dark. In the evening a smoker was held at the club house, at which a good entertainment consisting principally of boxing bouts and wrestling amused a large crowd. On the whole the afternoon and evening furnished a successful wind-up to the racing season.

A good S. wind prevailed at the start, but it soon flattened out into a very gentle breeze, and the boats crawled over the long course. There were seven classes, comprising twenty-one starters. Dazzler won in the sloop class, Pinafore putting up a fairly good contest and Nixie, distanced, withdrawing. The race of the 30ft. cats was close between Wanderer IV. and Elizabeth, the latter winning on corrected time by a trifle over a half minute. Wanderer IV., however, is to be remeasured and the result may be changed.

In the 21ft. class Trinket and Netor put up a close contest, the former winning by 1m. 42s. On the first round there was only 5s. between the two. The old-fashioned cats also made a fairly close race, while in the 25ft. class Ina had a walkover, as did Edith in the dory class. The summary:

25ft. Sloops—Start, 2:30—Course, 16 Miles.			
	Finish.	Elapsed.	Corrected.
Dazzler, C. D. Reynolds.....	8 01 00	5 31 00	5 30 42

## Plymouth Y. C.

PLYMOUTH, Mass., Sept. 1.—Editor Forest and Stream:

THE first race of the Plymouth Bay series of the Massachusetts Y. R. A. was sailed Aug. 31 in a heavy N.E. gale, the severity of which may be judged from the fact that, although these were in the harbor many of the Cape cat class, which have claimed they were the more seaworthy and better heavy weather boats than the racing machines of some of the other classes, only one of that class (class D) entered the race. It rained the first part of the morning but had nearly stopped before the hour for the race, although the wind did not appear to let up. The sporting blood of two of the skippers of the 22-footers furnished the race of the day and seldom will there be seen so close a race as there was between these two boats. Owing to their draft they had to be sent down the channel and out a mile beyond the Gurnet to the whistling buoy and return, a distance of 12 miles, the last mile to the outer mark exposing the boats to the full force of the gale and the heavy sea which was running. Pluckily keeping their boats to their course, the outer mark was reached and the return made, the time over this course for this class being only 1h. 42m. 30s. for Nutmeg, while Rube was only 7s. behind her rival on crossing the line, Nutmeg getting the gun. The boats presented a very fine sight for those on shore, especially on the return as they rounded the point of the beach, as they set balloonjibs, and at the last, for the run to the judges' boat, breaking out spinnakers. The wind by this time had moderated slightly and by the middle of the afternoon had cleared quite a little.

There were only two entries in the 18ft. class, and one entry in the Cape cat class, but as these boats had the inside course to sail over and being protected by the beach for a good part of the course, made very good weather of it. Through making the wrong turn by mistaking one of the marks, the boats had to be sent over this course three times instead of twice in order to make the race. It was a trying day in which to race and those skippers who so pluckily entered in spite of the brisk gale blowing at the time showed good sporting blood and certainly deserve much credit for their efforts. The summary:

Class E, 22-footers.		
	Elapsed.	Corrected.
Nutmeg, A. C. Jones.....	1 42 30	1 42 30
Rube, H. L. Bowden.....	1 42 37	1 42 37

## Carolina Won Match Race.

A SPECIAL match race between the New York Y. C. 30-footer Oriole and Mr. Pembroke Jones' old champion Newport 30-footer Carolina for a cup offered by Vice-Commodore Henry Walters, of the New York Y. C., was sailed Sunday afternoon, Aug. 27, off Newport. The race was sailed in a half gale, and while all other craft in the bay were reefed the two little sloops carried full sail in the heavy northeaster, but made hard work of it and were enveloped in spray most of the time. Carolina won by a margin of nearly 2m.

The race was something of a society event in that the steam yacht Narada followed the boats over the course with a large party of Newport guests. On Carolina with Mr. Jones were Messrs. Elisha Dyer, Jr., Harold Vanderbilt and Oliver Harriman and Miss Delano and Miss Sadie Jones were aboard Oriole with Mr. Delano.

The start was in Brenton's Cove and the course was up the bay about 5 miles to Gould Island and return, this giving a beat to the outer mark and a run home with spinnakers. The boats made an even and pretty start, but at the mark Carolina had secured a good lead and increased it a little on the run home. The summary:

Start, 2:30—Course, 10 Miles.		
	Finish.	Elapsed.

## Eastern Y. C.

Marblehead, Mass.—Saturday, Sept. 2.

THE last of the power boat races, given by the Eastern Y. C. was sailed off Marblehead on Saturday, Sept. 2. Fog prevailed to such an extent as to delay the start for an hour. The boats sailed over a course of 12 miles. Blink sailed alone in the second class and Tai Kun might as well have in the third class. The summary:

Second Class.		
	Elapsed.	Corrected.
Blink, C. W. Esterbrook.....	1 31 38	1 31 38
Third Class.

Magnolia, E. T. Enos.....	2 01 07	2 01 07

## Wellfleet Y. C.

Wellfleet, Mass.—Monday, Aug. 28.

THE first of the series of Y. R. A. open races, given by the Wellfleet Y. C., was sailed off the Chequeset Inn on Monday, Aug. 28 in a brisk N.E. breeze with a smooth sea. In the 22ft. class, Medic II. got the start, followed by Nutmeg, Tyro, Medic I. and Rube, all breaking out spinnakers as they crossed the line. At the first mark Rube had gone up to second place, the others maintaining their relative positions. On the next leg a luffing match between Tyro, Rube and Medic II., gave the lead to Nutmeg, and she held it until after the first mark had been rounded the second time, when Tyro took the lead and held it to the finish, with Medic II. second. Only two 18-footers entered, and Mirage II. withdrew after vainly chasing Hayseed around the course once. Marvel won in the Cape cat class, with Arawak a close second all around the course. Mildred II. won easily in the first handicap class, and Vim in the second handicap class. The summary:

22-Footers.		
	Elapsed.	Corrected.
Tyro, W. H. Joyce.....	1 53 00	1 53 00
Medic II., H. H. White.....	1 54 22	1 54 22

Peggy.....	Withdraw.	Withdraw.

Tuesday, Aug. 29.

THE second race of the Wellfleet Y. C. A. open series was sailed on Tuesday, Aug. 29, in a moderate to light S.W. breeze. Medic I. got the start in the 22ft. class, with Tyro, Nutmeg and Rube following. Nutmeg and Medic II. were in a mixup at the start, in which Medic's bowsprit was broken and a couple of planks were stove in, necessitating her withdrawal from the race. Tyro at once took the lead and held it all around the course. Nutmeg was second until the third time around the triangle, when Rube passed her and held second to the finish. Hayseed took the start in the 18ft. class and easily led around the course. In the Cape cat class, Hustler led on the first round, but on the second, Marvel got the lead and held it to the finish, Stranger winning on corrected time with Hustler second. Peggy won in the second handicap class, Agnes in the working boat class and No Name in the power boat class. The summary:

Class E, 22-footers.		
	Elapsed.	Corrected.
Tyro, W. H. Joyce.....	1 58 52	1 58 52
Rube, H. L. Bowden.....	2 06 13	2 06 13
Nutmeg, A. C. Jones.....	2 07 12	2 07 12
Medic, George Lee.....		

Marine and Field Club.

Bath Beach, L. I.—Saturday, Sept. 2.

THE annual fall regatta of the Marine and Field Club proved to be one of the best held on Gravesend Bay this year. Twenty-six boats started in seven classes, the winners being Vivian II., Lizana, Phantom, Ogeemah, Spots, Chicokee and Gamma. Lizana got the special trophy offered for the best corrected time over the longer course and Ogeemah scored like honors among the craft taking the inside journey.

The first division was sent away at 3:05. This included sloops in Classes N and P. Lizana and Vivian II. were the only boats going over anywhere near the gun, Anona, Tabasco and Bobtail being between three and four minutes late. On the second signal at 3:10 the yaws started. Lotwana was late. Phantom led, followed by La Cubana and Kate in the order named. The course for these boats was from the start off the Marine and Field Club to a mark boat off Fort Hamilton, thence to the bell buoy three-quarters of a mile to the northward of West Bank Light and home, twice around, aggregating 15 miles. The first leg was a reach, the second brought close-hauled work, and the last was a reach home with ballooners set to port.

The boats in other classes sailed the regular inside Association course, traveling the first leg with the larger boats. After that it was a beat to Sea Gate, a reach to Ulmer Park and a spinnaker run home. More Trouble led the inside division home at the end of the first round, while Vivian II. secured like honors among the racers going outside.

Bobtail, Anona and Miss Judy withdrew before the finish, all having gotten away to belated starts. Lizana secured victory in Class P on time allowance from the N. Y. Y. C. 30-footer Tabasco, while Ogeemah defeated More Trouble, first boat to finish in Class Q, on corrected time. In the other classes first boats were winners. The summaries follow:

Table with columns: Sloops, Class N—Start, 3:05. Finish. Elapsed. Includes entries for Vivian II., S. E. Vernon, Bobtail, E. F. Luckenbach, Tabasco, J. B. O'Donohue, Lizana, D. S. Wylie, Anona, Menton Bros., Yaws—Start, 3:10, Phantom, H. G. S. Noble, Lotwana, E. E. Malcom, La Cubana, J. H. Ives, Kate, John S. Negus, Corrected times—La Cubana, 1:56:04; Lotwana, 1:57:36; Kate, 1:56:34, Sloops, Class Q—Start, 3:15, Sactta, George H. Church, Cockatoo II., Hendon Chubb, Quest, F. J. Havens, Ojigwan, George E. Reiners, Ogeemah, Alfred Mackay, Miss Judy, D. D. Allerton, Class Q, Special—Start, 3:20, Spots, R. C. Veit, Careless, Richard Rummell, Mary, Max Grunder, Wraith, Calvin Tompkins, Trouble, W. A. Barstow, Karma, J. C. Erskine, Manhasset Bay Special—Start, 3:25, Chicokee, W. J. O'Neill, Bab, T. A. Hamilton, Sloops, Class RR—Start, 3:25, Gamma, A. H. Platt, Delta, J. J. Mahoney.

Beverly Y. C.

THE Beverly Y. C. sailed its 374th regatta from its club house on Saturday, Aug. 26. The event was the second club and sweep-stake race of the season.

The wind throughout the day was from the N.E., varying greatly in velocity and direction, and must have reached as high a velocity as 20 miles an hour in the puffs.

Three 25-footers again appeared, and a good race in their class resulted. These boats and the 21-footers were both sent to Bow Bells and back. As the 25-footers carried no spinnakers, the 21-footers, which started 5m. after them, gained rapidly on them on the run down the bay, and at the lower mark had nearly overtaken them. On the beat home Barnacle, the leading 21-footer, soon passed the leading 25-footer, Thorana, just before that boat reached the finish line. Nokomis was second in the 25-footers, and Amanita III. second in the 21-footers.

The 18-footers were sent to Bird Island and back. Mr. Sargent's Wizard took first place, and Hindoo second place.

The 15-footers were sent to Abiel's Ledge, Mosher's Rock, and return. Miss Warren again took first place in her Seeps, and Miss Codman took second place in her Yalu.

Judges: L. S. Dabney and Chas. H. Taylor. The times in detail follow:

Table with columns: 25-footers—Course 14, 11 1/4 Miles. Elapsed. Includes entries for Thorana, T. B. Wales, Nokomis, A. Winsor, Jr., White Heron, R. E. Forbes, 21-footers—Course 14, 11 1/4 Miles, Barnacle, W. E. C. Eustis, Amanita III., Joshua Crane, Radiant, Mrs. C. M. Baker, Terrapin, L. S. Dabney, Edith, Clark King, 18-footers—Course 18, 8 3/8 Miles, Wizard, F. W. Sargent, Hindoo, N. F. Emmons, Jap, G. P. Gardner, Jr., Wanderer, A. S. Whiting, 15-footers—Course 24, 5 3/8 Miles, Seeps, Miss C. M. Warren, Yalu, Miss Codman, Fiddler, Miss C. M. Dabney, Jub Jub, Howard Stockton, Flickamarow, Miss E. B. Emmons, Vim, F. W. Sargent, Jr., Fly, Miss Williams.

Larchmont Y. C.

Long Island Sound—Saturday, Sept. 2.

THERE were nine starters in the special races of the Larchmont Y. C. on the afternoon of Saturday, Sept. 2. It was the ninth event of the series for the raceabout point prizes. The last one was scheduled to occur on Labor Day. The winners proved to be Tartan, Hourii, and Pup. The boats twice covered a triangular course of 5 1/4 miles. The first leg was dead to windward, to a mark boat anchored in the middle of the Sound. The second leg was a reach to the red spar buoy off Scotch Caps, and the last another reach home. The wind blew strong from the S.E., and rain squalls were frequent. Tartan beat Indian by 3m. 30s. Hourii led the Larchmont 21-footers, beating Vaquero 2m. 5s. Pup defeated Arizona in the Manhasset Bay one-design class by 8m. 38s. The standing of the raceabouts at the end of the event for the point prizes was: Nora 56, Tartan 55, Invader, Jr., 45, Rana 38, Pretty Quick 32, Cricket 25, Mystral 25, Circe 22, and Indian 7. The summaries follow:

Table with columns: Raceabouts—Start, 12:10. Finish. Elapsed. Includes entries for Tartan, A. H. Pirie, Indian, W. Gardner, Invader, Jr., R. A. Rainey, Nora, A. Iselin 2d., Larchmont 21-footers—Start, 12:15, Hourii, J. H. Esser, Vaquero, H. Stump, Dorothy, L. C. Spence, Manhasset Bay Knockabouts—Start, 12:20, Pup, W. Ratsey, Arizona, J. W. Kear.

Atlantic Y. C.

New York Harbor—Saturday, Sept. 2.

THE first qualifying race for the trophy offered by S. E. Vernon, open to competition for boats of any recognized yacht club, in Classes N, P and Q, was sailed on the morning of Saturday, Sept. 2. The winner of the event proved to be the new Class Q boat Quest, which defeated Ogeemah on corrected time by 39s. The boats were started on their handicaps much the same way as power boat races are now conducted.

A course was sailed with the start off Sea Gate and turning marks, the black can buoy off Swineburn Island and a stakeboat at Fort Hamilton, twice around aggregating 11 nautical miles. The first leg was a reach, the second a fine spinnaker run to Fort Hamilton, and the last a beat home, all marks being left to starboard.

Ogeemah, being the first craft to start, the interesting part of the struggle finally centered in the overhauling of her in the second round by the other Class Q creations. Quest was sailed by Clement Negus and got the lead of the other new boats starting at the same time by standing out into the tide more on the first round, when coming home to windward. This lead was ably maintained until the end, Ogeemah being finally passed on the last tack for the finish.

The four boats securing the greatest number of points in two qualifying races are to meet in the final event for the trophy. Just at the finish of the first race Sactta fouled More Trouble, not allowing the latter boat enough room to round the buoy. She was in consequence disqualified. The summaries follow:

Table with columns: Sloops—Classes N, P and Q. Start. Finish. Includes entries for Quest, F. J. Havens, Ogeemah, Alfred Mackay, More Trouble, W. H. Childs, Cockatoo II., Hendon Chubb, Vivian II., S. E. Vernon, Tabasco, J. B. O'Donohue, Sactta, George H. Church, Bobtail, E. F. Luckenbach.

\*Disqualified. †Did not finish. Finish of Sactta, 1:13:58. Points, first race: Quest 12, Ogeemah 9, More Trouble 6, Cockatoo II. 3, Vivian II. 1, Tabasco 0, Bobtail 0.

Bensonhurst Y. C.

Gravesend Bay, L. I.—Friday, Sept. 1.

THE third and last race of the season for the W. H. Childs perpetual challenge trophy, for Classes M and under, was sailed on the afternoon of Friday, Sept. 1. Three boats entered the event, which was won by the New York Y. C. challenger Ogeemah, on corrected time, from the Marine and Field Club boat, Quest, by 3m. 27s. Ogeemah got an allowance of 10m. 52s. for the 12-mile course sailed. Quest finished first, beating More Trouble, the Bensonhurst Y. C. defender, on elapsed time by 1m. 30s. Temporary possession of the trophy is secured in one race. The New York Y. C. will thus keep the beautiful piece of the silversmith's art until lost through a challenge series. Ogeemah gets a miniature of the trophy to keep for all time.

The course selected for the boats was from the start off Ulmer Park, to can buoy No. 13 off Fort Wadsworth, thence to buoy No. 7 down the bay and home. The first leg was a reach, across the channel with booms to starboard, the second was a beat and the third a spinnaker run until within a half mile of the finish, when ballooners were carried alone. Quest and More Trouble had it hard from the start, the former keeping to windward at all times and sailing in splendid form. The summaries follow:

Table with columns: Classes M and Under—Start, 3:05. Finish. Elapsed. Includes entries for Quest, F. J. Havens, More Trouble, W. H. Childs, Ogeemah, Alfred Mackay. Corrected time, Ogeemah, 2:05:03.

Plymouth Y. C.

Plymouth, Mass.—Thursday, Aug. 31.

THAT part of the south shore circuit of Y. R. A. open races confined to Plymouth and Duxbury Bays, was opened on Thursday, Aug. 31, by the Plymouth Y. C., with slim attendance. A howling N.E. kept many boats in all classes from entering. Two 22-footers started, Nutmeg and Rube, each carrying a double-reefed mainsail and storm jib. Rube got the start, but Nutmeg took the seas better and at once went ahead, leading all around the course. Rube stuck to her, however, and forced the setting of light sails, a spinnaker on the last leg reducing Nutmeg's lead at the finish to only 7s. In the 18-footers Dorchen led from start to finish. Stranger was the only starter in the Cape cat class. The summary:

Table with columns: Class E, 22-footers. Elapsed. Includes entries for Nutmeg, A. C. Jones, Rube, H. L. Bowden, Class I, 18-footers, Dorchen, A. W. Finlay, Again, John Noble, Class D, Cape Cats, Stranger, F. E. Dawes.

Canoing.

Officers of A. C. A., 1905.

Commodore—C. F. Wolters, 14 Main St. East, Rochester, N. Y. Secretary—H. M. Stewart, 85 Main St., East Rochester, N. Y. Treasurer—F. G. Mather, 164 Fairfield Ave., Stamford, Conn.

Armstrong, Sec'y. Oct. 10-11.—St. Joseph, Mo.—The Missouri and Kansas League of Trapshooters. Dr. C. B. Clapp, Sec'y. Oct. 11-12.—Dover, Del., Gun Club tournament; open to all amateurs. W. H. Reed, Sec'y. Oct. 18-19.—Ossining, N. Y., Gun Club shoot, \$50 added. C. G. Blandford, Capt.

(Trapshooting continued on page 222.)

Rifle Range and Gallery.

Ohio Rifle Notes.

THE Twin Valley Rifle Club, of Lewisburg, had the hottest contest of the year for the medal on Aug. 26. Jesse Johnson won with a score of 47 out of 48 possible, the highest score made in this match for over eight months. If he wins the September match the medal will become his property. He won the other medal earlier in the year. The medal match is at 100yds., off-hand, 4 shots, possible 48, three moneys, Creedmoor target. A. U. Clemmer was second, to-day, with 46, C. W. Matthews 44. In the five, 4-shot matches, possible 48 in each, and 240 in the aggregate, Johnson and Clemmer tied for first on 213. In the first shoot-off each scored 9. In the second Johnson won, 10 to 9. Clemmer took second money. The match was shot on animal targets, 100yds. offhand, two moneys in each event and two in the aggregate. Izor was second with 212, Matthews 207, McBride 202, Leshar 199. This is the fifth 20-shot match of the season, and Johnson has won four, as follows: April, 222; May, 223; July, 213; August, 213. The June match was won by G. W. Izor, with 222.

The Greene County Deer Hunters' Association held their annual reunion on Aug. 30. This is the first reunion of the year, and was held in Hawkin's grove, between Lucas grove and Greene county, the rifle range being in a large meadow across the road with a high hill for a background. The affair is made a picnic, and was attended by a large number of hunters and their families. After a few sighting shots, the contest opened at 150yds. The target was a life-size representation of a deer, running on a wire stretched across the range at a varying height from the ground. Out of 130 shots fired 18 struck the target. Of these, Ed. G. Sander, of Dayton; Byron Stedman and Lew Anderson each scored two hits, either of which would have killed a deer. O. W. Linkhart and Andy Fisher also scored hits in a vital part. The long distance match, at 300yds., was disappointing, as no records could be kept, owing to the confusion arising from an attempt to keep the score at the targets as well as at the firing point. A better system is promised for next season. Ed. G. Sander, of Dayton, won the hunting knife given as first prize in the 100yd. contest, one shot, possible 10. His score was 9. Thirty hunters took part in this contest. Several of the ladies made good scores in a 100yd. match, 3 shots, possible 30, the best score being 18. All shooting was offhand.

It has been agreed by the Dayton Sharpshooters that the first annual reunion of deer hunters shall be held on the Dayton Gun Club's grounds on Sept. 14. This will be an all-day contest and open to the world.

The first competition for the diamond studded gold medal, offered by Chief of Police Milliken, of Cincinnati, will be held about the middle of September, at the pistol range on the top floor of the City Hall. Each contestant will have 20 shots, using the regulation revolver. The winner holds the medal for thirty days, when he can be challenged and must accept. The medal becomes the property of the officer winning it three times.

Cincinnati Rifle Association.

THE following scores were made in regular competition by members of this association at Four-Mile House, Reading road, Aug. 27. Conditions, 200yds. offhand, at the 25-ring target. Payne was champion for the day, with the good score of 227. He was also high on the honor target, with 67 points. A 10 to 1 o'clock wind blew rather unsteadily all day. The scores:

Table with columns: Name and scores. Includes entries for Payne, Roberts, Hasenzahl, Odell, Hofer, Nestler, Bruns, Freitag, Coleman, Leux.

National Rifle Association.

THE Bulletin of the National Trophy Match (team), showing the totals at each range of each team. Held at Sea Girt, N. J., Aug.

29, 30, 31 and Sept. 1, 1905. Brigadier-General W. P. Hall, Military Secretary, U. S. Army, executive officer in charge:

Table with columns for State/Team, Slow Fire (200yds, 600yds), Rapid Fire (200yds, 600yds), Skirmish (800yds, 1000yds), 1st Run, 2d Run, and Total. Lists various states and military units.

The Bulletin showing the standing of the first sixty-four competitors in the National Individual Match, which took place at Sea

Girt, N. J., Aug. 24, 25, 26 and 28. Brigadier-General W. P. Hall, Military Secretary, U. S. Army, executive officer, in charge:

Table with columns for Name, Slow Fire (200, 300, 500, 600 Yards), Rapid Fire (200, 500 Yards), Skirmish (Aggte. 1st. run, 2d run), and Grand Aggte. Lists individual competitors.

der Co., on Sept. 1, after an active connection with the Dupont Co. covering a period of twenty-seven years. Mr. Rice extends thanks to the powder buyers of the Middle West for the patronage extended to the Dupont Co., and bespeaks a continuance of their favor for his successor.

The Interstate shoot at Colorado Springs, Col., Aug. 29-31, was one of the greatest and most successful of the year. The mechanical arrangements for holding the shoot were complete to the most minute detail. The Denver Post trophy, shot for on the last day, was won by Mr. J. Appleman, of Oklahoma. The general averages, highest for the three days, were as follows: Amateurs, first, Mr. C. M. Powers, 477; second, Mr. Joe Rohrer; third, H. G. Taylor, 473. Professionals, first, W. R. Crosby and Fred Gilbert, tie on 481; second, C. T. Callison, 471; third, Harold Money, 470.

At the thirteenth annual tournament of Progressive Gun Club of East St. Louis, Aug. 27, forty shooters took part. The trade was represented by C. G. Spencer, H. W. Cadwallader, H. W. Vietmeyer, C. F. Sundry, Leslie Standish, A. L. Cummings and H. E. Winans, among whom average honors were divided as follows: Spencer first, Cadwallader second, Winans third. The honors for amateur average resulted in a tie for first place between W. H. Clay and C. F. McCloughan. Second honors went to J. E. Scott while J. A. Groves and "Jim" Scott tied for third. A beautiful cup was the trophy up for high amateur average, and to which ownership will be decided by a shoot-off, between the two tied, next Sunday. Spencer's work in professional class was very brilliant, 159 out of 160.

BERNARD WATERS.

Mount Kisco Gun Club.

Mr. Kisco, N. Y., Aug. 26.—The tenth annual tournament of the Mt. Kisco Rod and Gun Club was held on Aug. 23. There was a good attendance. About twenty-five shooters were present.

The trade was represented by Messrs. J. A. R. Elliott, Neaf Apgar, Sim Glover, H. S. Wells and Gus Grief. The programme called for ten events, a total of 180 targets. The best average by professional was made by J. A. R. Elliott. He broke 177 out of 180, missing only three targets. He received the first professional prize, a pair of field glasses, value \$15. The second average was made by Messrs. Neaf Apgar and Sim Glover, 172 out of 180. Second prize was a silver berry spoon, value \$7.

The best average for the amateurs was made by Messrs. L. L. Stever and McMurtry, 170 out of 180. They received the \$5 gold piece. Capt. A. Betti, from the home club, was a good second, 169 out of 180. Cox and Blandford, 162 out of 180; Dr. Gardiner, 160 out of 180; Manchester, 159 out of 180. In the merchandise event McMurtry won first prize, a silver box. He broke 24 out of 25. In the 23 class, the following prize, a silver berry dish, was won by Mr. A. Betti.

Other prizes won were: R. W. Gorham, clock; D. D. Stever, bon-bon silver basket; Manchester, a pair of pants; 22 class, Chas. Blandford, stop watch; 21 class, Dr. Gardiner, fern silver dish—Cox, cake basket; 20 class, G. E. Sutton, pearl-handled knife—H. Smith, fishing rod; 19 class, E. Martin, pearl knife; 18 class, A. Burham, silver fob—Dr. Dunn, 150 Ballistite shells; 17 class, G. Wood, fountain pen.

After the programme was over, there was one extra merchandise event for the home club. The following won: First, G. E. Sutton and R. Gorham, 50 cigars; second, A. Betti, 100 cigars. Several other prizes were won by Martin, Smith, Carson, Dr. Dunn and Burham.

Capt. A. Betti deserves great credit for this tournament. Valuable articles in the merchandise were donated mostly by the members of the club, and from the townspeople. Scores:

Table with columns for Events, Targets, and Shot. Lists scores for various events and shooters.

Event No. 8 was distance handicap. \*Extra merchandise event.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Aug. 26.—Tripp and Abe Martin tied for high guns for the Dupont trophy; score 46 out of 50. Moller won Peters Badge.

Table with columns for Events, Targets, and Shot. Lists scores for various events and shooters.

INDIANAPOLIS, Ind., Sept. 2.—Morris won Peters badge; Bell was high gun for cup.

Table with columns for Events, Targets, and Shot. Lists scores for various events and shooters.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The shoot of the Bound Brook, N. J., Gun Club has been postponed from Sept. 16 to Sept. 23.

E. M. Smith, Secretary, informs us that a fall tournament will be held at Atlantic City, N. J., on Sept. 22-23.

Mr. Gus Habich, Secretary, writes us that October 6 and 7 have been granted the Crawfordsville, Ind., Gun Club for a fall tournament.

A correspondent writes us that Mr. H. E. Winans has taken up his domicile at Upper Alton, Ill. and that he is endeavoring to organize a gun club there.

The Palisade Gun Club, of Edgewater, N. J., will not hold any shoots on the first Tuesdays of the months of September, October, and November, but will hold all-day tournaments on the fourth Thursdays of above months.

The Morris Gun Club, Morristown, N. J., are arranging to hold a two-day shoot, Sept. 27-28, in connection with the Dover-Morristown match of the North New Jersey League series. F. A. Trowbridge is the Secretary.

A. A. Schoverling, Secretary, has issued a notice that an all-day tournament of the Palisade Gun Club, of Edgewater, N. J., will be held on Thursday, Sept. 28. Programme will begin at 11 A. M.; \$50 added money and \$30 in merchandise.

By way of correction, Mr. O. N. Ford, Fort Leavenworth, Kan.; writes us that he was second high amateur on the first day, Aug. 16, of the Interstate shoot at Kansas City, instead of Alva Wilson. Mr. Ford's total score for the day was 185.

Mr. George S. Oliver, General Agent, has issued a card as follows: "Having succeeded Mr. E. S. Rice in the management of the Chicago office of E. I. Dupont Company, I wish to assure all patrons of the past that any business entrusted to my care will have prompt and careful attention and be fully appreciated."

The shoot of the Rahway, N. J., Gun Club, owing to the rainy weather of Sept. 4, was postponed to Sept 16. The Bound Brook Gun Club cancelled their shoot, fixed for that date, in deference to the Rahway Club. This shoot is to raise a fund for church purposes, and deserves the friendly support of all shooters.

In the five-man team contest, the ninth of the series of the North New Jersey League, the Montclair team defeated the Mountainside team by a score of 102 to 93. This match was held on the grounds of the Montclair Gun Club on Saturday of last week. The next match of the series is between Montclair and Morristown, Sept. 16, on the grounds of the former.

A card from Mr. E. S. Rice, Chicago, announces his retirement from the management of the Chicago office of the Dupont Pow-

## Interstate Association at Colorado Springs.

The eighth Interstate Association tournament for 1905 was held here under the auspices of the Colorado Springs Gun Club, Aug. 29, 30, 31; and aside from the Grand American Handicap itself, it was the biggest success of the year's work. And when we say this, we are using the word "success" in its broadest significance.

First, it was conspicuous in the completeness of the appointments of the grounds, which left nothing to be desired or suggested. Not even at the Grand American Handicap were the arrangements more complete, and the entire credit for this is due to the local tournament committee, Messrs. John W. Garrett, J. Lawton and D. C. Sanderson. The traps were placed in the most approved manner, with low houses, and the score lines accurately outlined, with handicap marks from 16 to 22 yds., the walks being paved with fine granite dust. The club house furnished every appointment. Shell stands and gun racks were conveniently arranged. The shells on sale were all handled by one dealer on a profit-sharing arrangement between the local firms. Luncheon was served all day, and shelter was provided for the shooters and visitors in any kind of weather.

As conveying this idea fully and clearly we quote Secretary Elmer E. Shaner as he expressed himself when he walked upon the grounds Saturday morning:

"I take off my hat," said he, "to the tournament committee of the Colorado Springs Gun Club.

"Every detail has been looked after by the committee, and I don't believe I ever came to a ground where arrangements had been made so completely and perfectly as here; there is not a thing for me to do but stand around and see that all goes right, whereas often I have to do all the work.

"The club grounds at Broadmoor are as fine as any in the country, and the background is one of the best to be found anywhere.

"Barring heavy winds, I look for some phenomenal scores.

"And I will also say that, with very little additional work—that is to say, placing two or three extra sets of traps, for which here is ample room, and providing more shelter and office room—the Grand American Handicap could well be pulled off here.

"Again I say, this tournament justifies the wisdom of the action taken by the Interstate Association in 'going West,' with its work of encouraging and promoting trapshooting."

Never has there been in the West, such a gathering of shooters as at this tournament. Mr. Shaner said there were nearly a hundred men on the grounds, either participating or deeply interested in the game, whom he did not know, and it has been said that Elmer knew them all. The trade was represented as follows: Tom A. Marshall, Rolla O. Heikes, C. W. Budd, F. C. Riehl, L. B. Adams, Fred Gilbert, W. R. Crosby, Chris. Gottlieb, Harold Money, H. C. Hirsch, C. A. Young, A. H. Hardy, Cal. Callison, J. S. Fanning, C. D. Plank, D. W. King, all of whom participated as shooters in the programme. And yet other trade representatives were Jas. L. Head, A. J. Ricker, J. A. Frazer and W. P. Markle.

With such a bunch of the representatives who are the good fellows booming and boosting the game in all parts of the land, and nearly a hundred amateurs from all points of the compass, the people of the beautiful Colorado city had an attraction second to none that has visited the West in years, and they showed their appreciation and interest by coming out in crowds to the number of three to six or eight hundred every day. It was an event that, taken all in all, did indeed foster and promote interest in the great sport of trapshooting, and this is in a territory that is new and therefore peculiarly susceptible to good impressions.

Many of the visiting shooters were accompanied by their wives and families, and every hour of available time during the tournament and the days intervening between this and the Grand Western Handicap, the following week at Trinidad, was pleasantly employed visiting the many natural wonders that have made Colorado Springs famous the world over.

The programme presented was particularly attractive. There were in all 500 targets on the regular programme, and in addition the Denver Post trophy handicap contest at 100 targets the last day. There were four 15 and two 20 target events in each hundred shots, with \$2 entrance and \$20 cash added to each event. In addition to this, there were five daily averages to high guns, ranging from \$12.50 to \$5. There was \$100 added in the Post trophy contest, and for amateurs fifteen general average purses ranging from \$25 to \$10. Then also, as a special compliment to the trade representatives, the management hung up a purse of \$50 for general average work to the ten high guns, which made the competition among the "old guard" especially spirited and interesting. Percentage system of dividing moneys was used in regular programme events, and the G. A. H. high gun system in the Post trophy handicap.

Many interesting features were noted in connection with the journey, chief among which were the little placards, neatly printed on white enameled cardboard, and posted at every point of vantage, such as the following: "Be cheerful"; "Forget your troubles—smile"; "Smoke up—be happy"; "Build up—don't tear down"; "Get busy"; "We are trying to please you"; "A kind word begets kindness"; "Don't knock—the echo isn't pleasant"; "Think, so many reasons why you should be happy." It was this spirit of good fellowship that characterized the week throughout, and more than one amateur was heard to remark that he never enjoyed himself more thoroughly at a shoot.

But the greatest degree of success attaching to a tournament is the attendance and interest, representing the endorsement both of the citizens locally and of the shooting public. Herein this meet has passed all previous records of the Interstate Association of the present season. On preliminary day, the 28th, ninety shooters appeared and shot 200 or less targets for practice. This was a surprise to the management, but more was to come on the morning of beginning the programme, when 118 men went to the place and tendered Secretary Fred C. Whitney their entrance. It was expected that the attendance would reach 70, with a maximum estimate of 85, but by 10 o'clock Tuesday morning it was apparent that the two sets of blackbird traps would not suffice to handle the events on schedule time, and arrangements were started to place another trap.

The weather was fine until late in the afternoon, when a thunder shower came up, accompanied with severe gusts of wind that played havoc with many good scores. Everything ran along

beautifully, with Mr. Shaner ever at the helm, and finding plenty to do, notwithstanding his complimentary remarks reflecting his first impression of the grounds. This, because even with the most perfect appointments and management of details, there is always more than enough for one head to look after at a shoot as big as this. But even at this, only eight of the twelve events were finished by 6 o'clock, when Mr. Shaner thought it advisable to stop and arrange for the third trap, and an early start the next day.

The four events of the first day's programme which could not be pulled off on that day were finished early the morning of the second day, the third trap being installed and in working order by 9:30 A. M. Among the amateurs, Joe Rohrer, Geo. Maxwell, the one-armed crack shot, and H. G. Taylor tied for first place by breaking 190 out of the 200 shot; A. J. Lawton, R. R. Barber and E. F. Confarr tied for second place with 189, and Ed. O'Brien was third with 188. Among the manufacturers' representatives, Fred Gilbert was first with 194; W. R. Crosby was second with 193, and C. T. Callison third with 190.

In addition to the four events of the first day's programme, eight events of the second day's programme were finished before darkness put an end to the shooting for the day. The four events that were carried over were finished shortly before 11 A. M., the third day, everything moving like clockwork. Among the amateurs, C. M. Powers was in first place with 194 out of the 200 shot. Joe Rohrer was second with 189, and John W. Garrett, R. R. Barber and H. G. Taylor were tied for third with 188. Among the manufacturers' representatives, W. R. Crosby was first, with 193; R. O. Heikes was second with 192, and Fred Gilbert third with 191.

The tournament came to a close the third day with every event on the programme finished. The closing event was the Denver Post trophy, which was won by J. Appleman, of Oklahoma, a 16yd. man, with the high score of 97 out of a possible 100; Ed. O'Brien was second with 96, with J. A. Patterson and G. K. Mackie tied for third with 95.

Among the amateurs the third day, C. M. Powers was again in first place with 97 out of a possible 100; Joe Rohrer and Ed. O'Brien tied for second place with 96, and R. R. Barber and H. G. Taylor tied for third with 95. Among the manufacturers' representatives, C. T. Callison was first with 97; Fred Gilbert was second with 96, and W. R. Crosby third with 95.

For general average among the amateurs, C. M. Powers was first with 477; Joe Rohrer was second with 475, and H. G. Taylor third with 473. Among the manufacturers' representatives, W. R. Crosby and Fred Gilbert were a tie for first place with 481; C. T. Callison was second with 471, and Harold Money third with 470.

The scores of the three days follow:

Derryfield Gun Club.

MANCHESTER, N. H., Aug. 30.—In one of the most interesting and closest shoots ever held at the present grounds of the Derryfield Gun Club, the Pequoters' cup was yesterday for the first time in the history of the organization successfully defended against the challenger.

The Reed-Goss contest was at 100 birds. Goss, during the first dozen pigeons, was shooting slightly better than the holder of the cup, but at 20 birds the contest stiffened, and when the shotguns had spoken their 100 times, Reed had smashed just one more pigeon than Goss.

There were a number of events following the regular shoot, and the most exciting was a close battle between Mayor Eugene E. Reed at 18yds. and C. A. Allen at 18yds. In the first event they tied with 24 birds out of a possible 25.

Charles J. Darrah was the official scorer, and Bert Davis served at the desk, keeping the records and supplying sheets.

All the contestants stood at 16yds. The scores were as follows:

Table of scores for Derryfield Gun Club events, listing names like W. C. Goss, Henniker, E. E. Reed, Manchester, etc., and their scores.

The scores in the extra events, shot after the regular programme, were as follows:

Independent Gun Club.

EASTON, Pa., Aug. 29.—The second of a series of three matches between the Allentown Rod and Gun Club of Allentown and the Independent Gun Club of Easton for a silver loving cup representing the championship of the Lehigh Valley, was held Saturday Aug. 19 on the grounds of the latter at Cedarville and resulted in a victory for the home club by the score of 210 to 190.

Each club having won one match, the third and deciding match will be held at the Duck Farm Hotel, at Allentown, on Sept. 9. Team match, ten men on a side, 25 targets each man; the men were sandwiched in, a member of each club alternately.

Allentown Rod and Gun Club; H. Schleicher 18, L. Straub 16, J. Englert 20, M. Desch 20, M. Brey 23, A. Desch 18, O. H. Acher 13, C. Kramlich 22, A. Heil 22, W. Desch 18, total 190.

Independent Gun Club; W. H. Maurer 22, J. Pleiss 24, E. Leidy 22, H. Snyder 19, J. Sommers 17, O. Skeds 21, H. Housman 24, E. Markey 22, J. E. Maurer 23, E. Hellyer 16, total 210.

Below are the scores made in sweepstakes:

Table of scores for Independent Gun Club sweepstakes, listing names like I. Harn, Leidy, O. Skeds, etc., and their scores.

North River Gun Club.

EDGEWATER, N. J., Aug. 2.—Events 5 and 6, 50 targets, were for the Hunter Arms Co. medal. Conditions to win, greatest number of wins out of ten shoots; won this Saturday by Mr. Wynne from the 17yd. mark.

Table of scores for North River Gun Club events, listing names like Town, McMurry, Staples, etc., and their scores.

Queens County Gun Club.

LONG ISLAND CITY, N. Y.—On Saturday, Sept. 23, 1905, the Queens County Gun Club will hold an all-day tournament on its grounds at Long Island City, programmes of which will be ready in a few days.

A feature of this tournament will be a special 100-target event, all scratch; entrance \$5; targets to be deducted at 2 cents. If there are five entries, there will be one money; five to ten entries, two moneys, divided two-thirds to high gun and one-third to second high gun; over ten entries, three moneys, divided 50 per cent. to high gun, 30 per cent. to second high gun, and 20 per cent. to third high gun. Ties to be shot off, miss-and-out.

In order to make this event of special interest to the shooting fraternity, contestants are requested to forward their entry to the secretary not later than Sept. 16, 1905, so as to give the management an opportunity to publish the list of entries.

Practice shoots will be held every Thursday and Saturday afternoons during the fall and winter. Targets trapped at 1 1/2 cent. Visitors are welcome. Clubs wishing to secure the use of these grounds for the coming season should communicate with the secretary without delay.

RICHARD H. GOSMAN, Sec'y.

WESTERN TRAP.

Cincinnati Gun Club.

THE attendance on Sept. 2 was small. The dove season opened on Sept. 1, and the attractions of field shooting proved stronger with many of the boys than trapshooting. The day was fine, the wind a little too strong for some of the shooters.

Shooting at 13 pairs Bill broke 13, and Maynard broke 15 out of 10 pairs.

Peters' new gun is responsible for his poor shooting. He has not got the hang of it yet.

The contest for the Ackley trophy will begin about Oct. 1. Shooting hereafter will be over the trap to be used at the tournament. Programmes will be ready on Sept. 6, and any shooter can obtain a copy of Supt. Arthur Gambell.

Williams starts for Portland, Me., on Sept. 15, where he will spend a couple of weeks and enjoy himself shooting ducks on the Cape.

Very little practice shooting was done to-day, and at 4 o'clock every one was through. Several of the boys got a few doves just outside the grounds. The scores:

Table of scores for Cincinnati Gun Club events, listing names like Lytle, Maynard, Randall, etc., and their scores.

Lytle did not compete. Team race, 50 targets:

Table of scores for team race at Cincinnati Gun Club, listing names like Randall, Barker, Pickles, etc., and their scores.

Ohio Notes.

There was a large attendance at the shoot of the Columbus Gun Club on Aug. 26, twenty men taking part in the sport. In spite of the strong wind, some good work was done. Webster's shooting was the feature. He broke straight in six of the events and finished first with 166 out of 190; Bassell, 140 out of 180; J. H. Smith, 116 out of 150; Blue Bell, 103 out of 140.

Dayton will probably send a team to Newark, O., on Sept. 27 and 28 to compete for the Phellis trophy.

Capt. Ben Bowns will announce the date of the fall tournament of the Springfield Gun Club very soon.

President Gus A. Hodapp told his friends to "Just watch my smoke," as he started for the Rohrer's Island Gun Club's grounds on Aug. 30 to take part in the medal shoot. Sure enough he won the event after a hot contest.

President Gus A. Hodapp told his friends to "Just watch my smoke," as he started for the Rohrer's Island Gun Club's grounds on Aug. 30 to take part in the medal shoot. Sure enough he won the event after a hot contest. Hodapp, Cain and Oldt tied for first on 25 straight or better. In the first shoot-off, Oldt dropped out on 8 out of 10, the others tying on a full score of 10.

The Preble County Gun Club held their regular monthly medal shoot on Aug. 31. Although the weather was fine, the attendance was not up to the mark, but those taking part made some good scores. In the medal event, 25 targets, 16yds., C. W. Matthews and Eli Peters tied on 22, the former winning the shoot-off. D. M. Swibart and A. Leisk were second with 21 each.

Garfield Gun Club.

Chicago, Sept. 2.—The appended scores were made to-day on our grounds, on the occasion of the sixth trophy shoot of the third series. In the club trophy shoot Dr. Meek won Class A on 24; Al. Smedes won Class B on 22; Wilson won Class C on 14. In Dupont cup shoot Dr. Meek won Class A on 16; Al. Smedes won Class B on 16. No Class C man in contest.

Events: 1 2 3 4 5 6 7 8

Table of scores for Garfield Gun Club events, listing names like McDonald, Stone, Thomas, etc., and their scores.

No. 1 was the Dupont cup. No. 2 was the Hunter trophy. No. 3 was the trophy event.

DR. J. W. MEEK, Sec'y.

Rochester Rod and Gun Club.

ROCHESTER, N. Y.—The semi-annual tournament of the Rochester Rod and Gun Club, scheduled for Sept. 4 and 5, has been indefinitely postponed.

The following scores were made in the third contest for the Lakin & Rand trophy, Aug. 30:

Table of scores for Rochester Rod and Gun Club events, listing names like Kershner, Borst, Weller, etc., and their scores.

Re-entry scores:

Table of re-entry scores for Rochester Rod and Gun Club, listing names like Weller, Kershner, etc., and their scores.

Back scores:

{ No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

**The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.**

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

### THE SEASON.

THIS is the season when the blood of the sportsman courses more quickly. He is more alert, buoyant, vigorous, purposeful. The game season has arrived.

The ripening harvests, the beautiful autumn tints of matured vegetation, glorified here and there with bright purples, yellows and reds where Jack Frost has touched his chilly, sharp brush on the landscape, denote that the game birds are ready for the gunner, and that the game laws for a season will not long bar him whose pleasure afield is with bird dog and gun.

The prairie chicken is the early bird of the season. It serves admirably to tune up the shooter's eyes and nerves which, at first, are likely to be slow and dull from prior weeks of disuse of the shotgun.

In the early season, the chicken is slow of wing and short of flight. Then, the shooter who cannot score well with the shotgun, is a bungler indeed. Its abode is in the open, hence the chicken is denied the opportunity for strategy afforded by a timber habitat, and has not the consequent immunities as enjoyed by its confrere of the timber, the ruffed grouse.

Yet even with its slow and uniform flight opposed to the skill of the shooter, the novice and the nervous gunner find that the problem is of abounding difficulties. They become hurried and flustered at the rise, aim badly or not at all, shoot too quickly, then descant eloquently on their ill-luck, resolving to do better next time. Next time they repeat the panicky performance. After a time, nerves become steady from familiar associations, and skill is acquired from practice.

While the chicken is an easy mark in the early season, it is one of the most difficult birds to kill awing later after true fall weather has set in. A few frosts, a steady cold wind for a few days, and the tame bird of the early season is transformed into one of the wildest. It then will flush yards ahead of the trailing dog, often out of gun shot. At best it affords then the hardest of shooting. Wild and heavily feathered, strong and swift of wing, it is a bird with powers to test to the utmost the skill of the most clever shot. When the high winds of fall set in, it congregates in large packs, and the shooting of it is practically over for the year.

On Sept. 16 the ruffed grouse season opens in New York. In some of the neighboring States the open season begins earlier, in some later.

The ruffed grouse is justly esteemed as being the superlative of the game bird family, the *ultima thule* of sport and of epicurean titbits.

However skillful one may be as a wing shot in the open, such is no index whatever in respect to his expertness in ruffed grouse shooting.

Strategic, infinitely cunning and courageous, swift and strong of wing, the ruffed grouse is a prize only for him who is quick and sure in the use of the shotgun. In the heavy cover which is its choice of habitat in the open season, only the briefest glimpse of it is afforded when it takes wing. The successful shot must snap it on the instant or mourn a lost opportunity. Let there be a tree, a ledge, a fence available, and it strategically swings behind it, shielded from the shooter and from danger.

Yet in the open, where at rare times it is discovered, tempted to forsake, briefly, dense cover while seeking berries, or other appetizing food, it is as easily bagged as is the prairie chicken. Deprived of trees, ledges, etc., its cunning avails nothing, and in fair, open shooting it falls an easy prey.

He who aspires to succeed well in the pursuit of the ruffed grouse, should eschew the chokebore. A short-barreled gun which will make the widest pattern, consistent with even and proper distribution, is the gun for the successful grouse shooter.

The quail, as a bird for the sportsman's consideration, is a happy compromise in attributes between the prairie chicken and the ruffed grouse. It makes its habitat both in cover and open. It has a much wider distribution throughout the United States than has the prairie chicken or the ruffed grouse. Though less in size, it vies with its confreres of timber and prairie in beauty of color and in delicacy when prepared for the table.

While the quail has not the wonderful cunning of the ruffed grouse in cover, it nevertheless has such swiftness that the skill of the best shot is taxed. He who is successful then needs to be quick and accurate, a difficult combination in snapshooting.

In the open, the quail is not extremely difficult to bag over points of setter or pointer. Yet, even in the open, the successful sportsman must need be skillful.

The full-choke gun is frequently used on quail. A more improper selection could not be made. A modified cylinder is by far the better. The greater number of quail are picked up within thirty yards of the shooter, and many birds are killed in the air within twenty yards of him. One need target a full choke gun at twenty yards to demonstrate its unfitness for the close shooting of quail or ruffed grouse.

### THE PLANK IN NEW ZEALAND.

THE principle of the "Platform Plank" has made its way around the world as far as New Zealand, where a proposition embodying it is now under consideration in the form of an amendment to the game act providing that "the sale and export of native or imported game shall be prohibited for a term of three years." As the shooting resources of the country are for the most part due to the enterprise of the Otago Acclimatization Society, which has been for the past thirty-nine years engaged in stocking the covers with foreign species, we may feel the heartiest sympathy with their present contention that a non-sale system should be adopted to have its part in game preservation. Thanks to the work of the Society, California quail have become an established species; and Virginia quail have been introduced. What strikes us as a more notable achievement than any other with wild birds, is the successful introduction of wild geese and wild ducks, which are now fairly established and quite able to take care of themselves. Last year for the first time they were allowed to be shot, and it is said that under antipodean conditions they are displaying all the wariness and circumspection shown by them in the rest of the world. A consignment of Canada geese has been added to the stock this year.

### IN A CITY CHURCHYARD.

THE parks of Manhattan Island attract a multitude of birds during the spring and autumn migrations and many species remain to breed. Even the churchyards have their feathered visitors. Mr. B. S. Bowdish has recorded in the Auk some interesting statistics which are the results of observations made by him in St. Paul's Churchyard. The churchyard attached to St. Paul's Chapel is in the lower part of the city and in the very midst of the turmoil and uproar and hurly-burly of the town. The plot comprises an area of 332 x 177 feet; 120 x 78 feet are occupied by the church edifice, and another structure 30 feet wide, across the yard, is occupied by the school building; the open space thus left being but a tiny bit of green for the birds of passage to spy out amid the mass of masonry and metal surrounding and overtopping and inclosing it. The churchyard lies between Broadway on the east, with its vast volume of traffic, and Church street on the west through which runs the elevated railway. It is bounded on the sides by Vesey and Fulton streets, both crowded and busy thoroughfares.

There are many trees—among them the noble Washington elm, a survivor of eight trees planted in 1766, the year when the church was completed—and much shrubbery; but for all this one might fancy that the shy wood dwellers would not venture to pause here where the hub-bub is rarely stilled and where the sights and sounds alike must be both unaccustomed and alarming. In this

restricted and unpromising field Mr. Bowdish has in three seasons' observations noted no less than forty species, comprising 328 individuals. The observations have been made for the most part in the few moments of the noon lunch hour, and occasionally in the morning.

This is manifestly an instance of one's finding what he is looking for and making the most of one's opportunities. It is not more interesting as an ornithological record than as an admirable illustration of intelligent seeing; for this bird lover here in the midst of New York's turmoil and bustle has seen more of bird life intelligently and appreciatively, and with the reward which comes of intelligence and appreciation—more than ten thousand others have noted who, constantly surrounded with an abundance of bird life, have not the eye to see it.

### TO BANISH GLOOM.

HE was grouchy, as was plainly to be seen when he came into the car, and what he said to his wife was unheard by others, but that it was ugly was evident from his face, and not less from hers, for she assumed the expression one sometimes sees on a woman's face in public, when she is stung to the quick by a brutal remark, but by reason of her pride tries to brave it out and smile and make others believe that she is happy. "That man ought to have a month in jail," commented the younger of two fishermen. "No," said the elder one, "what he wants is not jail, but a week in the woods. That is the thing to straighten him out, and make the world look pleasant to him and to make him look pleasant to the world."

In which there is much of truth. If a man is not glumpy by nature, if ugliness and sourness and a tendency to scowl are not ingrained in his constitution, the woods treatment is likely to eradicate the sourness and send him home a changed man. What appears to be innate meanness of spirit and ugliness of disposition may be nothing more than an abnormal condition brought about by being too long in a rut. The remedy is simplicity itself—a change of scene and association. There is no more complete and engrossing change than to revert to the simple life of the woods; no more engrossing occupation open to the average man than the luring of fish from the water or the hunting of game. When one is absorbed in the scheming to land his fish he is not just then thinking of anything else. The rest of the world is blotted out, the attention is devoted to that one thing. The change of thought is complete, and that change is rest, the most wholesome rest, and recreation the most efficacious and lasting. Camp is a place of restoration and readjustment. With such results assured, to go fishing or shooting as one's taste may incline, is sometimes a moral duty. No one has the right to be disagreeable to family and friends and associates because he is out of health, for by taking a week or a month off shooting or fishing he could become himself again and dispense smiles instead of scowls; and cheery greetings in place of surly grunts, and show a smiling presence instead of throwing a wet blanket over the company.

THE steady decrease of the prairie chicken is not entirely due to the destructiveness of the shotgun. The plow is a contributory destroyer. While agriculture, within certain limits, is a benefit to the chicken inasmuch as it furnishes a food supply, if carried beyond those limits it is a harm. The chicken needs a certain amount of wild land in which to nest and find shelter. If the plow in a certain locality is worked so thoroughly as to appropriate all the soil to agriculture, the balance between a food supply, breeding ground and shelter is destroyed, and the chicken has to face a sterner problem of existence in consequence, one which year by year tends to the extermination of the chicken in such locality. The plow and the shotgun combined, under the present liberal use accorded the latter in a long open season will exterminate the chickens in time to a certainty. The restrictions legally imposed by a close season and a limited bag are far short of the restrictions necessary to establish a proper balance between reproduction and destruction.

The reproductive powers of the chickens are relatively unequal as opposed to the long open season and the destructiveness of the modern skillful sportsman. Hence, in the years of the future the chicken will progressively decrease in number as it has in the years of the past, if more stringent and greater protection is not accorded it,

## The Colorado Desert.

"WHEN God finished the world He had left a double handful of material. This He gathered up and tossed away; where it fell there lies the desert of the Colorado," runs the legend; the poet says, "God made thee in His anger and forgot."

A strip of country lying immediately west of the Colorado River, probably 250 miles long and from 100 to 150 miles wide; from Death Valley on the north to the Mexican boundary on the south, and from the Sierra Madre Mountains on the west to the Colorado River on the east. That is, geographically speaking, the Desert of Colorado; if one wants more desert one has only to continue north into western Nevada and south on the Peninsula of Baja, or Lower California, 500 or 600 or 700 miles further. But northward the desert takes other names—the Mojave, Death Valley and the Humboldt. South is the desert of the Cocopahs in Mexico, and beyond that—well, just more desert. Just east of the Colorado River is the Arizona desert and the desert of the Gila; practically the same arid country with some slight differences in vegetation and reptiles; there are no Gila monsters in the Desert of the Colorado. The Chemihueva, Apache and Coahuila Indians that roam the Desert of the Colorado will trade one fresh meat for flour, coffee, sugar and bacon, while the Cocopahs on the peninsula of California will take it if one or two prospectors happen to be alone; a tribe that yet clings to their long bows and cloth yard arrows that can knock a silver quarter from a cleft stick at fifty yards. However, there is nothing to attract one to the Desert of Cocopah, except the natural phenomena; prospectors have so far decided that the Cocopah range is not worth the danger incurred and generally have given it a wide berth. If they go in there, it is generally in parties of not less than three, but four is better, and each should carry a rifle.

The Desert of the Colorado lies almost wholly within three counties in Southeastern California; the eastern edge of the counties of San Bernardino, Riverside and San Diego. A territory 250 miles long, with an average width of 125 miles seems rather large to be only a strip along the line of three counties, but it must be remembered that I am writing of California, the land of big things, and the three counties named are larger than many single eastern States and almost as large as the entire State of New York.

Unfortunately for the tourist the railroads cross the desert in its most unattractive parts. The railroad to the south crosses a dead flat, sandy plain, and the Salton basin and old sea bed 250 feet below the present level of the sea. The road to the north, nearly 200 miles away, crosses the northern tip of the Desert of Colorado and then plunges into the dreary, sandy, gravelly wastes of the Desert of Mojave; between these two lines of road lies the most attractive part of the desert. I say "attractive" advisedly, for I know the desert and was schooled in it by my partner, J. S. Crawford, a Texan, who has lived on it for fifteen years and knows its every mood, for it has its moods both pleasing and terrible. The readers of FOREST AND STREAM have already made the acquaintance of Crawford, honest as the day is long, "as steady as the sun" and not afraid of anything that talks, walks, bawls, bleats or crawls. Together we have prospected over a good part of the desert, and that part of it I have not visited he has. We were out there when there was not another white man within fifty miles of us in any direction. He is out there now, this July, and writes that he is alone, for the dozen or more miners and prospectors have gone "inside," to the coast, for the summer.

The term "desert" implies a flat, sandy plain; not so with the Desert of the Colorado. The country of which I write is diversified by mountain ranges from 2,500 to 6,000 feet high, and some isolated peaks are even higher. These ranges are, generally, from six to eight or ten miles apart, mostly barren, rocky, precipitous ridges with occasional spots of decomposed granite soil on which grow stunted shrubs and bunch, or giata, grass. From a distance the mesas and valleys seem to be remarkably fertile so covered are they with desert growth, greasewood, sage, cactus, chemisal; in fact, many different kinds of vegetation that, I believe, have not yet been classified. As yet the interior of the desert is a little too far off the route of Pullman cars to be visited by scientists. The timber consists principally of stunted mesquite, ironwood, palo verde and a thorny white wood that grows in the form of short poles, which, for a better term, we have designated as needlewood, from the needle-like thorns; it is remarkably light when dry. Ironwood is so dense and heavy that it will sink in water; it is a species of the mahogany family, only heavier and harder, makes excellent charcoal, and ton for ton is a better fuel than coal.

The medicinal herbs on the desert are seemingly without limit. As Crawford says: "It seems like God didn't put anything here that would hurt a man without putting a cure right alongside of it." There is the rattlesnake plant, a tiny little vine growing flat on the sand, having a small blue flower, which the Indians use for rattlesnake bites. They pound up the tops for a poultice and bind it on the bite and make a tea of the roots. Then there is mandrake in plenty; the tops of

a peculiar species of sage. When boiled and the body bathed with the decoction, it will cure sciatica or other rheumatism. Then there is a peculiar woody shrub that has no leaves, only short, stem-like rushes; these boiled for ten minutes taste almost like store tea, the difference can hardly be detected, and for kidney remedy it has no equal; it beats turpentine a city block. Greasewood tops boiled down and mixed with lard, cottolene or tallow make an excellent healing salve. Then there is another small shrub that has a small oval, smooth-edged, pulpy leaf; we do not know its name, but we designate it as "deer ears," that proves an excellent remedy for bowel complaints. The desert is almost entirely a granite country, but there are frequent changes in the water; one may be strongly alkaline, the next similar to Glauber salts, while the next may be impregnated with some other mineral. To a tenderfoot this frequently proves very annoying, and at times causes a serious dysentery. In that event all one has to do is to chew a little handful of "deer ear" leaves and swallow the juice. This and some of the other remedies I have tried; in fact, I know of no ailment to which flesh may be heir to, except a broken bone, in that locality, that has not the remedy at hand. As an illustration of the efficacy of the "deer ears" I may be permitted to cite the case of a newcomer to the desert. He had developed a tolerably bad case of dysentery owing to the change of water. One evening Crawford and I returned to camp and found him drinking from a can containing a thick, brown-colored liquid.

"What is that you are drinking?" Crawford asked.

"Tea made out of them deer ears."

"Holy smoke, man, stop it; don't you know what you are doing?"

"Bet your life I do; but you do not know how sick I am."

In his case we were obliged to resort to powerful cathartics or the remedy would have been more disastrous than the malady. He had been told to chew only a few leaves at a time and to swallow the pulp. Some day an herbalist, botanist, or whoever does that kind of work, will go to the desert and analyze and classify those plants and herbs for the benefit of humanity at large; there are many plants there that I have never seen elsewhere.

There are what is termed two rainy seasons on the desert, one in the middle of winter and the other in the latter part of July and along in August, though I have seen several seasons pass without sufficient water falling to lay the dust.

In the spring after the light rains of winter, if any, the desert presents a scene, a landscape, that no painter has yet put on canvas, nor can he hope to equal. I have seen the mesas stretching away for miles and miles, dotted with magnificent rugs, acres in extent, of the most beautiful flowers. All the primal colors and their varying shades in the most vivid colors, from the great ochotilla cactus with its cluster of poles fifteen or twenty feet high without branch or twig, but covered thickly with great scarlet or deep red blossoms as large as a tea plate, down to tiny little star-shaped blossoms as humble as the daisy, and growing close to the ground. Acres and acres, miles and miles of them, but the greatest peculiarity is that almost without exception they are without odor. These last for only a short time, a week or two of the hot sun and they are dried, whipped out of the sand by the wind and scattered broadcast. A broad valley between the northern spur of the Chuckawalla Mountains and the southern spur of the Eagle range is known as the Meadows. The wash of ages has carried to the center of this valley a rich and very fertile soil, a strip two or three miles long and about a mile and a half wide. After the light summer rains a rich and nutritious grass springs up and matures in from four to five weeks. I have seen nothing like it elsewhere, but it resembles the old "red-top" of back East. It makes an excellent hay as demonstrated by one camp that had two teams of mules and brought out a mower to mow and put it up. Hay delivered at the camp costs about \$45 a ton, so the desert grass was like finding money. But the rattlesnakes; how they would flock to that spot. The desert rats, ground birds, quail and other small fry would congregate there; and there came the rattlesnakes in great numbers and the mower wheels and sickle bar crushed and cut many of them. Thick boots took the place of the customary brogans in that meadow. If water could be brought to the country it would make a remarkably fertile territory, and reclaim a vast amount of arid land; but the rainfall is so slight that catchment basins are out of the question, and the country lies so high above the Colorado River that it does not seem possible to irrigate it from that source, so it will probably remain for ages as it has in the past—forgotten.

The desert has never been fully surveyed nor mapped. There are correct maps of the country, but they are seared on the brains of a few hardy prospectors. Look on the published maps and you will see a few zigzag lines that in any other country would denote water courses; for the desert they stand for nothing but dry cañons; they mean nothing, their locality is not correct, for there are thousands of cañons, one just beyond each "hogback" or sawtoothed ridge, and why they were put on the map I do not know, unless it was to

fill up a blank space. Through the heart of the Colorado Desert, from the river to Dos Palmas, a distance of over 100 miles, there is no running water and only two places at which one may be certain of finding water, one at Chuckawalla Wells and the other at Cañon Springs, the first about thirty miles from the river and the other about ninety. Between Chuckawalla Wells and the river water may sometimes be found at Mule Spring, and between the Wells and Cañon Springs water may generally be found at Coyote Holes, but they have been known to go dry. No man on the desert leaves one water hole without a sufficient supply of water to do him to the next water and back; to do otherwise would be inviting a lingering and horrible death.

That which most impresses the tenderfoot on the desert is its vastness and its absolute and overpowering silence. There is no song of birds, no rustling of branches by the wind, no rippling of water. Miles and miles as far as the eye can carry there is no sign of life nor motion, nothing but a grewsome, fearful, horrible silence, which, if alone, one fears to break. It is there in that vast solitude that one feels what an insignificant atom he is in the scheme of the universe. If alone one must busy himself, concentrate his mind on something other than his condition. To be alone out there is not good for one with nerves, if he permits his mind to dwell on his loneliness.

The hottest place on the surface of the entire earth is said to be at Mammoth Tank, a station on the railroad, fifty or sixty miles west of Yuma, Ariz., and practically in the middle of the Colorado Desert. A number of years ago the Government sent out expeditions to test the temperatures at several widely separated points; I have forgotten where all were, but one was on the Equator in South America, the other was some point on the Persian Gulf and another was at Mammoth Tank. The temperature reached the highest point at the latter station, 120, I believe, and it was two degrees hotter than the next hottest place, that on the Persian Gulf. Salton was not on the map then, a station about fifty miles further west than Mammoth Tank. It is located in Salton Basin and is 265 feet below the present level of the sea, also, I believe, the lowest natural point on the earth's surface. There in the heat of summer, day after day, I have seen the thermometer register 125 and 130 degrees, and sometimes higher, in the coolest place we could find in the shade. At the same time the thermometer would register from 120 to 125 degrees at an altitude of from 1,000 to 2,000 feet. The burning rays of the sun so infused the bare granite mountains that they did not become cool at night, and after the going down of the sun the temperature still remained high, often 112 at midnight.

With the thermometer registering 125 in a cool spot in the shade, what must it be in the glare of the sun; I will not tell you, for you would not believe it. I have plodded all day across the burning sand and among the blistering hot mountains, on foot with our pack mules. Heavy, hob-nailed brogans are the only serviceable articles of footwear on the desert. Boots are too hot, and the ordinary light calf-skin shoe and sole would be cut to pieces in one day by the sharp rocks and gravel.

The word "tenderfoot" probably had its origin in the desert, for if ever a man becomes "tenderfooted" it is there, and the term is applied to newcomers. Even in cool weather the stiff, heavy shoes, or brogans, rub and blister their feet; and in summer the hot sands and rocks heat the big-headed nails in the soles until the bottom of their feet are fairly blistered. Until such time as their feet become calloused and impervious to such little inconveniences they are known as "tenderfeet."

I will not enlarge on the horrors of thirst at such a time—mid-summer—or at any other time, for that matter, although I believe I am qualified to write on the subject, having once been for twenty-two hours without water on the Mojave Desert in July. That was sixteen years ago this month, but I have not forgotten it, and there is nothing pleasant in the remembrance. My partner and I have picked up men on the desert suffering and nearly dead from thirst, and have seen others whom the coyotes and the buzzards had found—ugh! One man we picked up was well known to both of us, but he was so burned by the sun and his features were so distorted that we did not recognize him until we got him to camp and somewhat reduced the swelling and his sufferings. He had become partially demented from his thirst and imagined he was being pursued by Apaches. The first thing we did after getting him to camp was to hide our weapons. Our six-shooters we hid in our clothes bags and our rifles we hid in our mine. We nursed him all that day, Sunday, and the next morning he appeared somewhat rational; in fact, so far on the road to recovery that we went to work on our claim about half a mile away. When we returned at noon for dinner he was not to be found. We made a search for him and eventually found him hidden away under a bunk and armed with the ax, the only weapon he could find.

"Sh—sh, st—st, ssst," was his warning. "Apaches all around us, the rocks are full of 'em."

We were some time in coaxing him out, and after that we did not leave him alone. He stayed a week,

or until the wagon from a camp twenty miles beyond us came by on the way to the station, nearly forty miles away, when we sent him in to a hospital, where he soon recovered.

A tenderfoot without water on the desert in the summer will go mad in eight hours, a result partly due to his imagination and the horrors of his position. In such condition nine out of ten of them will strip stark naked and go running wildly across the desert in any direction and at times will flee from their rescuers and show fight when overtaken. Sometimes it is necessary to "lass" and tie them down before they will submit to treatment. There are plants with a pulpy leaf containing an acrid juice that might keep them alive for a few hours, but it is useless to describe them; one must see them and taste them to know them. Of course, there is the "bull" or "niggerhead" cactus; I have seen them nearly as large as a twenty-gallon barrel. Chop into one of those and one will get juice enough to sustain life; but, they do not grow everywhere nor in great plenty, and one really needs an ax or a hatchet to cut into them, though one may gouge into them with a stout-bladed hunting knife.

The absence of all humidity from the atmosphere makes the heat endurable; giving the degrees of humidity in the Middle West and Atlantic States and neither man nor animal could endure the heat of the desert. But the air is absolutely dry and the evaporation is very rapid. One perspires very freely; perspiration literally runs from every pore; and drink—it is nothing for one man to drink two or more gallons of water in a day. If one stops sweating he had better take means to start it again at once. It is this evaporation that keeps our drinking water cool, even on the hottest days. We use zinc canteens, tin is worse than useless; it is liable to rust and spring a leak at a time when your life depends on its contents. We cover the zinc canteens with several thicknesses of old wool blankets and over that a thickness or two of gunnysacking. This we keep wet all the time and hang in the shade of our packs if traveling. At a permanent camp we used Indian ollas, a squat, wide-mouthed, porous earthen jar that may hold from one-half to ten gallons. These jars we cover in the same manner as the canteens and hang in the shade. The evaporation keeps the water cool and refreshing without the dangerous chill of ice-water.

This absence of humidity makes the atmosphere remarkably clear, and the range of vision is phenomenal. A range of mountains or a landmark that appears to be no more than an hour away may be distant a hard day's travel. With the naked eye I have seen a man walking on the desert ten miles away. Of course I was on an elevation, the side of a mountain, and I could have distinguished him, if moving, much further than ten miles. The pureness and dryness of the air is not surpassed anywhere, and north or south there is nothing between the poles to pollute it.

[TO BE CONCLUDED.]

## Hunting Bears and Indians.

On April 3, 1870, our troop was sent out from Fort Griffin—it is now the town of Griffin—Texas, to scout southeast of it and hunt for any stray Indians that might have come down from the Territory on a horse-stealing expedition. We had not long to hunt for them, we found them; or rather they found us, a few hours after we had started to look for them. The Indians would walk down here, bringing bridles; then when they had got horses they would ride back again. That is, they sometimes did; but not if we found them before they had found the horses.

We camped this afternoon on Hubbard's Creek, only a few miles from the fort, and soon after camp was made, the captain and surgeon went off up the creek to fish, taking no arms with them. It was the last time that either of them ever went fishing without arms.

The camp had been made on the second bottom, a wide flat place above the creek, which had on it a number of mesquite bushes, and our horses were tied out on grass among the bushes. About an hour before sunset, while I was out at my horse changing him on fresh grass, I happened to look off to my right, where a low bank led up to the prairie beyond, and noticed several Indians on foot coming down the bank as if they were in no hurry to get down.

It never for a moment occurred to me that they were hostile Indians. We had several of our Tonkawa scouts with us, and I took these Indians to be some of them; the deliberate way that they were coming made me think so, but not for long. One of them fired at me, the ball just going above my head, and now I knew who they were. I had about thirty yards to go to get to my saddle, and it took me just about thirty seconds to get there. Picking up my carbine, I slung the little leather pouch that held my cartridges over my shoulder and ran out among the horses again. A young Tonkawa boy, named Anderson, a pet of mine, overtook me. He had his carbine but no cartridges and I gave him some of mine.

No Indians were in sight here now. If they were down in the bottom, the bushes hid them, and we could not fire here anyhow, for our horses were in the road. Our men were stringing out now, each man by himself; but none of them came where we were.

Just now two Indians ran out from among the horses and started to climb up the bank in front of us. Anderson and I both fired and one of them dropped; the other kept on. We fired again and the second one fell, got up, and was out of sight before we could shoot again. Going up to where the first one lay we found that both of us had hit him and he was as dead now as he ever would be; and Anderson proceeded to scalp him. I saw that this one was a Kiowa; had he been a Comanche I would have stopped Anderson; I was supposed to do it anyhow, but did not want to interfere with any of these Indians' customs, not in the present case.

This was not the red brother who had been shooting at me, this one had only a bow and arrows on him. Anderson seized hold of his scalp lock, cut a circle around

it on his scalp, then giving it a jerk, brought it off and swinging it around his head, brought it down on the dead Indian's face and was about to mutilate him after a custom that these Tonkawas had when I stopped that. The scalping only delayed us a minute, and then we kept on out in the direction the other Indian had taken. I knew he had been hit and could not go very far. He would probably be found lying out in the bushes somewhere waiting for a chance to shoot one of us before he took his departure for the happy hunting grounds. Although both of us were looking for him, we did not see him until we had passed him; then he fired a shot at us out of some bushes he was lying in. Anderson and I dropping flat on the ground now, opened fire on the bushes, but after we had wasted half a dozen shots, getting no reply, we went to them and found the man dead. He had only been hit once, when climbing the hill; all the shots we had sent in here had been misses, the ball that killed him had gone clear through his body. I wondered how he had lived to get this far. This was another Kiowa. His tribe seemed to be on the warpath to-day. This was no doubt the one who had tried to put me off it. He had a Colt's pistol so tightly clasped in his right hand that I had to twist it around to get it. This pistol, a powder and ball Colt's just like mine, was empty; he had fired his last shot, and had no more to load with. The cowboy he had stolen this pistol from had cut his initials, "J. A.," in the stock; had he added the B., they would have been my initials. I added it and carried the pistol, for I wanted two. Anderson dragged the Indian out of the bushes now, then asked if I wanted to scalp this one.

"No," I told him, "if I did and the Major heard of it I would walk and lead my horse for the next week. You can scalp him."

Just now the trumpet in camp half a mile away sounded the recall. The captain had got into camp but had to hunt a trumpeter next; the boy was out after Indians like the rest of us; he shot two, or said he did. Maybe he did, for others were shot as we afterward found out. A month after this some cowboys told me that they had found the bodies of three more dead Indians several miles from the scene of the engagement. When the Indians were coming down here they passed within thirty yards of the captain and doctor but never saw them, the Indians being up on the bank while the officers were below the bank fishing. Had they been seen there would have been vacancies for a captain and assistant surgeon in the army in the next few minutes.

We rode all over this country as long as we had any light to see by, but I saw no more Indians, nor did we see any of these afterward, the few that escaped alive walked home. I did not know then what this battle would be called, or whether it would be called anything or not, but nearly four years after this, when I had my next discharge handed me, I turned to the back of it to see if I had been credited with the correct number of Indian engagements and found that I had been in the fight of Hubbard's Creek, Tex., April 3, 1870. These Indians had taken us to be a party of cowboys when they first saw our camp. Had they known who we were, they would not have come within a mile of us. Some of us did look as much like cowboys as anything else.

We kept on hunting Indians, and after a day or two, when we were sure that those we had hunted last had gone home, we headed west. The captain meant to go as far as the Mountain Pass country where the Cohatties had had me corralled a few years before this at the time they chased me, and a day or two after we had turned west, while riding across the prairie one afternoon, a small black bear was seen making quick time across the prairie going south. He had been on the trail we were now on, and had just seen us.

I got permission to follow him. Anderson, who had not asked any permission, was already after him. The prairie was as level as a barn floor, just the place to run a bear or anything else on. The bear had 600 yards the start of us, and he kept it for the next mile, too. Any man who has seen the black bears in a menagerie and thinks that the clumsy animal cannot run need only to try to catch one of them when the bear is in a hurry to go home, to find out his mistake.

I rode a horse that would never be mistaken for a cart horse, I had run buffalo with him, and Anderson had a good pony. I passed Anderson at the end of a mile and he pulled up and stopped; but I kept on and at the end of another mile ran the bear down and shot him. Anderson came up while I was examining the bear and said:

"Mebbe so some Comanches go that way to-day," pointing west. "I see heap trail back there." That was what he had stopped for.

"How many are there?" I asked.

"Mebbe so ten ponies and a heap cows."

Jumping on my horse I said: "Come and tell the major about it right away."

I would lose my bear; I might as well have let him go; I never saw him again. We took a course across the prairie that would bring us out on the trail the troop was on, and when crossing the Comanche trail I saw it plain now. Had I not been too busy trying to overtake the bear I might have seen it when Anderson did. We came up with the troop just as they had turned off to go into camp, and reported the Indians.

Getting over on their trail we followed it mounted until dark, then on foot, leading our horses all night, going now at the rate of a mile an hour while the scouts felt for the trail.

Feeling for it just describes it. The scouts would have to get down on their knees every once in a while to see whether they were on the trail or not. Just at daylight we came across one of the Indians seated alongside the trail holding his pony and fast asleep. He had been left here on picket and had gone asleep on post.

A Tonkawa shot him, using his gun to do it with. Had he used his bow or a knife we might have got all his party, as it was he was the only one we did get. His friends who had halted below here, taking the alarm dropped their cows and left. We mounted and charged across a wet bottom after them; but their ponies had all the advantage here; they could cross this swamp anywhere, while our heavy horses would have to hunt solid

ground, and when we found it the Indians were out of sight. We might kill our horses now and not overtake them. Whether any of the balls we sent after them reached them we never knew. I do know, though, that on their account I was out a bear skin. Some coyote got it; he did not go after it, though, before he was certain that the bear was dead.

CABIA BLANCO.

## Cabia Blanco.

Editor Forest and Stream:

It was with sincere regret that I read that Cabia Blanco is dead. His tales of adventure in the old West were full of touches and grips which brought one next to the wide open lands. When he, a real outdoor man, spoke, it was to tell some fact unfretted by conventional theory or notion. His calm narrative of the pedantic Easterner who wanted the scientific names for everything, and how gladly he helped the tenderfoot to an ample supply of "hog Latin" cognomens was one of the funniest things I ever read. Coahoma's phrase, "the air of verity pervading" Cabia Blanco's writings strikes the keynote of the tales. In every one of these stories one finds groupings of words which any writer might envy. In "My First Black Bear" he says of his Indian boy friend:

"He taught me to handle and ride their ponies, and when we got to the buffalo country, taught me to kill buffalo."

There is nothing better than that anywhere. Every paragraph he wrote has a sentence like this one, running over with hints of things untold, but telling all that should be told at the time.

No one with the love of nature in his heart could do otherwise than rejoice in the kindly heart which shows through Cabia Blanco's Indians. "The chief gave our horses a critical examination. Had he not been a Crow I should have been right at his heels lest one of these horses might get stuck to his fingers; but I did not go near him." "When I took charge of these two team horses I began to make pets of them right away. They had no names. I named one John and the other Charley. They soon knew their names and would answer to them." In his pocket was always something good for his "pet," and his pen wrote only kindly words. The good humored tolerance for his officers is shown in countless naive sayings.

Such a surprising variety of experiences were described or hinted at in his stories. In a sentence or two, an aside in "another story," he reveals the fact that Cabia Blanco is no mere nom de plume, but one bestowed by one of the tribes of Indians whom he had met somewhere in the Louisiana Purchase.

What a pleasure it is to turn back and read the stories Cabia Blanco wrote for us. They are the real thing. He was no mere onlooker. He made those long rides himself, not thinking that they were for publication. He loved them for themselves, and remembered his Indians, his tenderfeet, his buffaloes, his horses and his rifles because they were all true friends, each one of whom had given him a delight—something it was not in Cabia Blanco's heart to forget.

LITTLE FALLS, N. Y.

## A Narrow Escape.

SARATOGA, Wyo.—Editor Forest and Stream: I have been reading a story in FOREST AND STREAM written by Emerson Carney, an old friend and fellow angler of mine. It reminds me of old times, and a feeling to write has got hold of me. Most of my life has been spent upon the frontier, first in the northern part of Michigan, then in Texas and the Indian Territory. In 1879 I landed in Colorado and did nothing but hunt and act as guide for English outfits for twelve years. I say that I did nothing else; well I did try to ranch but made a sorry job of it. There was too much game close to the ranch, and I always took it upon myself to get the meat, and when the cook had plenty of meat I put in my time walking in the mountains and looking at the deer and elk as they fed along the creeks or in the small upper parks.

I always kept a good man or two at work on the ranch—at least they worked some of the time; and if they looked up to notice the antelope or deer in the meadow I never blamed them. All I wonder at is how they did so much as they did. My partner and I killed in fifty-one days in January and February, 1881, 356 antelope, 106 elk, twelve mountain sheep, ten deer and one mountain lion. We took the meat from the bone and salted it in vats made of bull elk hide. After it had become well salted we made a large smoke house and smoked the meat about four days, then let it dry.

We killed this meat 225 miles from Denver, where we hauled it, together with the hides. We got fifteen cents per pound for the meat, sixteen cents per pound for the antelope hides, nineteen cents for the elk hides, and twenty-two cents for the deer and mountain sheep. I can honestly say that I have never killed a split-hoofed animal for its hide, and never had any use for people who did.

After reading some bear stories in your paper I hate to say anything about bear, and will not, excepting to say that since coming to Colorado I have killed twenty-three, some very large; but I never saw one that put up any kind of a fight at all. The only animal I have ever seen in the Rockies that was strictly on the bad was the wolverine; and I tell you they are always ready to "scrap."

I once had a very narrow escape from being killed. Let me tell you how it happened. There were three Eastern ministers who came to see me. I was told of this by my partner while putting up my saddle horse one evening, and to make matters worse he informed me that there was no meat on the ranch. Of course I had to get meat. He slipped my gun and cartridges out to me and I hiked to a place not very far up the creek, where I was almost sure to find elk. When I peeped over a rocky ridge I saw an old and very large bull just on the point of turning around. A frightened bull elk can turn a little quicker than anything, but just as he made a start to turn I pulled the trigger and the old .45 ball took him in the center of the forehead. He finished turning and did it so quickly that the ball came out behind and hit me between the eyes, and came very nearly doing me up, but the preachers had meat to eat.

LUKE WHEELER.

# NATURAL HISTORY

## Some Nests of the Wildwood.

It is a mistake to suppose that nest hunting is all roses. True, for the most part it is a pleasure, and there are times when the bird lover is fairly thrown into transports; but it also has its difficulties and annoyances. Do you think it merely pastime to trudge for hours through a tangle of weeds and thickets until your limbs ache and the perspiration streams from every pore without finding a single bird domicile, or to sit in a damp, bosky place for a long time watching a shy bird and scarcely daring to move, or, worse yet, to scratch, while the gnats, mosquitoes, woodticks and chiggers enter a cabal to make your life as miserable as they can? No; nest hunting is work, not play. It demands so much effort and patience that only the real bird student will persist in its pursuit after a few fruitless attempts. Whatever else it may be, bird study is no sinecure.

Generalizations aside, however, during a recent spring in eastern Kansas I gave special time and effort to the finding of the nests of a number of shy wood warblers. There were the beautiful Kentucky warblers, breeding in the woods of my neighborhood, and yet their nests had hitherto escaped me. Perhaps it was my own fault, however, for in their breeding time the woods of eastern Kansas are infested with ticks and chiggers, whose attentions are superlatively offensive, and I have felt shy of lengthy visits to their haunts. I could tell you stories of these pests that would surprise you, but I forbear. Now, I heroically determined to brave their assaults and put up with the consequences. It may be said here as an *obiter dictum* that the consequences were abundant to the point of nausea.

In the latter part of May and the first of June I spent many hours prowling about in the woods. For several weeks my quest for warblers' nests was in vain, although it seemed to me that I covered every foot of the wooded area. Most of the time Kentucky warblers were singing their blithe arias in the bushes and trees, varying their concerts by pursuing one another pell mell through the weeds and copses, chipping at the top of their shrill voices, doubtless settling questions hymenial according to the social codes in vogue in the warbler realm. On a bushy hillside a little male, already clad in his wedding suit, would approach his lady love, twinkling his wings and chirping in an appealing way, when she would dash at him and drive him down the slope with as much fury as if she despised the very bushes he stood on. Sometimes the Kentuckies would set up a vigorous chirping as if I were growing "hot" in my quest of their nests; then they would pretend to be utterly indifferent to my presence, as if they were saying, "Cold, cold"; but no matter where I sought, no nests were to be found.

This was in a woodland about a half-mile from the suburbs of the town. One day I extended my excursion to a breezy hilltop something over a mile farther away. It was a wild tangle of weeds and bushes, interspersed with a few small oak trees, the undergrowth and second growth of an old clearing. Here a Kentucky warbler was seen with a bunch of worms in his bill—at all events, I took him for a male because of the brilliancy of his plumage. He flitted about on the dead twigs of some bushes for a few moments, chirping nervously, then scuttled down into the weeds and disappeared. Nor was he seen afterwards on that day, although I tarried around the place for a couple of hours, making a toilsome but fruitless search for his nest. A few days later he performed the same maneuver, puzzling me not a little. What nonplussed me was that he could disappear so completely and that no nest could be discovered at the place where he went down with his morsel. Subsequent events proved that he was a master of finesse in his own sphere.

The 4th of June again found me on the breezy hilltop. Only a few minutes elapsed before the handsome male warbler began to chirp in a tree nearby, while he held a luscious tidbit—a green worm—in his bill. Then he flew to another tree down the slope a short distance, and presently flitted down into the weeds and disappeared. This was about three rods from the place where he had descended on the two previous occasions. A few moments later I was seated in the path in the shadow of the tree where the bird had last been seen. A wait of some minutes was rewarded by the appearance of the little mother holding a morsel in her bill. It was curious that she had kept out of sight on my previous visits. She expressed her disapproval of my presence in a series of fine chirps, quite different from the loud, full-toned calls of her mate, who soon joined her on the tree, also bearing some worms in his beak. The two kept up a chorus of chirping for a long time, the male remaining stationary on a twig at a safe distance, his crest feathers erect, while his more nervous spouse flitted about with a good deal of agitation. Presently the male swallowed his bunch of worms, evidently feeling that he could protest more vigorously with them in his crop than in his bill. Plainly the mamma was very anxious to feed her babies, but did not want to betray their hiding place, which surely must be close at hand. Thinking I might be so near the nest as to prevent her going to it, I moved a rod or more up the path. It must have been fully an hour and a half that I watched the devoted pair. At length the little madam dropped down to some twigs, then dived into the weeds below and ceased her chirping. At the same time her mate flew to a more distant tree, and tried by loud calling to divert my attention from the mother's proceedings.

But I have been studying birds too long to be victimized by such artifices. A few moments later I went to the charmed spot where the little lady had last been seen and was looking down into my first Kentucky warbler's nest, which was in plain sight amid the weeds, not more than three feet from the path. Its holdings were four infants, a little more than half-fledged, the fleshy corners of their mouths showing light yellow. It was a pretty bird home,

rather bulky for so small a bird, its foundation consisting of dry leaves, the superstructure of grasses and other fibres, and its concave floor carpeted with finer material. Wise in the ways of the world for their age, the bantlings did not open their mouths as I stooped to touch them with my finger, but snuggled close to the bottom of the nest, so early had they learned through the tutelage either of instinct or of their parents, that the world is peopled with foes that hurt and destroy. What a wonderful thing is intuitive fear in the heart of a wild creature even from its tender infancy.

Well might these birdlings be afraid, as the sequel proved. Having inspected the cosy domicile and counted the noses it contained I walked away some distance to scrawl some notes. This occupied about ten minutes. Then, wishing to look once more on the little group before leaving the hilltop for other fields, I quietly went down the path toward the nest. As I approached the little mother was chirping in an agitated way. "She thinks I am coming this time in the character of a kidnapper," was my thought. But she had other cause for perturbation, and cause enough, too. Bending over the spot and looking down into the opening among the weeds, I was horrified to see a huge blacksnake coiled over the nest, his head swaying this way and that, in the act of gobbling down one of the warbler infants. There was no time for second thought. My cane—a good-sized oak club—was brought down upon the serpent with a death-dealing blow that broke his spinal column and ended his earthly career. Of course I was careful to aim in such a way that the blow would not fall upon the innocent bantlings. For a few minutes all the primeval savagery of my nature was aroused. I tossed the snake into the path, beat him again and again with my club, crushed his head with my heel, thereby obeying the Scriptural injunction, and, lastly, held him up in the air as an example of warning to all his serpentine kith and kin and an exhibition to the birds of my readiness to avenge their wrongs as far as lay in my power. How much I wondered whether the little Kentuckians appreciated my timely rescue of their helpless offspring.

One of the youngsters, however, had been swallowed by the marauder while the rest seemed to be unharmed. A few days later, I regret to say, the nest was empty and no Kentucky warblers, old or young, were to be seen on the hilltop. After all, in spite of my humane intentions, I had simply prevented one tragedy to afford opportunity for another.

On June 14 the rambler was again in the woods of which mention was first made, the one nearest the town. It was not the first time I had been there between the 4th and the 14th, but in the interim no nests had been found. One day a hooded warbler came down to the little stream in the ravine to drink and bathe. She had the air of a brooding bird, and I watched her closely. Her ablutions done and her feathers well preened and dried, she disappeared in the tanglewood, giving me no chance to note the spot to which she had gone. A long and what I deemed a thorough search of the area above the ravine for several rods brought no results, much to my disappointment and mystification.

Now, on the 14th, I was strolling about on the copsy hill side a considerable distance above the ravine. While going up a steep place along an obscure woodland path I was brought to a standstill by a sharp chirp. It came, as I presently observed, from the throat of a female hooded warbler, which began at once to smooth her ruffled plumes, a sure sign of her having recently left her nest. In a little while she flew into some low bushes above me at the side of the path, slipped out of sight, and her chirping ceased. An examination of the locality revealed no nest; so I turned back down the path, having gone only a few steps when the bird began to chirp again, this time below me. She had surreptitiously slipped around her pursuer through a dense thicket at the side of the path, meaning to steal upon her nest in my rear. Creeping down the hill I espied a tiny nest in a small bush not more than an arm's length from the path. Its contents were two eggs, one a cowbird's, and a wee birdling just from the shell. Was it right to lift the intruded cowbird's egg from its place and fling it away? I think it was.

What a tiny structure the nest was. One is almost tempted to coin a word and call it a nestlet. And the egg and chick were proportionately diminutive. Everything about the domicile, from the mother bird to the unhatched egg, was cast in a Lilliputian mould. The dainty white egg, its shell so fine and delicate as to be almost translucent, was prettily flecked with rufous brown at the larger end, and was quite pointed. It would have delighted the eye of an oölogist. To make absolutely sure the nest belonged to the hooded warbler I took a turn of fifteen or twenty minutes through another part of the woods and then returned to the charmed spot, finding the little madam sitting in the cup looking up at me with wild, inquiring eyes, as if she were saying, "Would you really hurt a little bird, or rob her of her precious babies?" One cannot help speculating as to the causes that impel the hooded warbler to build her nest in the fork of small bush in the woods, while other members of the family, also denizens of the same sylvan retreats, set their nests on the ground, and at the same time the redstarts build in a sapling or tree. But, for that matter, who can declare the final cause of anything?

The 14th of June brought me another surprise. That rare little bird, the worm-eating warbler, was trilling in the thick woods a little farther down the hill, just above the bottom of the ravine. Presently his mate appeared with a large white moth or worm in her bill, chirped about in the bushy tangle for about fifteen minutes, then dropped to the ground and got rid of her morsel; I could not tell how. At first I decided that she had swallowed it herself, but on second thought, deemed it best to look

closely, when, lo, a little bob-tailed, worm-eating warbler was discovered perched on a twig near the leaf covered ground. It surely was not more than a few hours from the nest, and still too young to fly more than a few feet, could not have come far.

There is something odd about this case at least worthy of note. In all my previous prowling through these woods I had never seen or heard a warbler of this species or even suspected the presence of one. I had been here again and again, spending hours in beating the bush, right at the spot, too, where the youngster was found. Yet the parents had built their nest, brooded their eggs, and hatched their young, without my once having so much as suspected their presence. How could they escape me? Why had the brooding bird never sprung up from her nest on the ground while I was tramping about? Above all, why had the little husband never trilled his sylvan tune until this morning? This was certainly reducing wariness and secrecy to a fine art.

There are red letter days in the bird lover's calendar, and the 14th of June was one of them in mine. "One more round in these woods before I leave them," was my mental resolve at about 10 o'clock; and a fortuitous "round" it was. As I trudged down the slope my eye fell on a nest set at the foot of a bush—and, yes, there sat a Kentucky warbler in the cup, craning up her neck and looking at me with wild, dilated eyes, her yellow, de-curved superciliary band and golden throat showing plainly and revealing her identity. What a sweet sylvan picture it was, the olive, black and amber of the bird in a setting of gray and green and brown. A too close approach drove her from her nest. She scuttled in a zigzag line over the dead leaves like a golden mouse, gliding so quietly that I doubt if I should have heard her had I not first seen her. The nest's holdings were one Kentucky warbler's egg and three of the cowbird—which meant that there would be no warbler reared in that family, but three feathered parasites, unless I interfered with the natural course of things.

The afternoon found me in another deep, wooded ravine something better than a mile to the south. I pressed my way up into the dense woods, where another pair of worm-eating warblers were unexpectedly encountered, the husband trilling among the trees and bushes, the wife feeding a strapping youngster whose ruffled plumage made him look larger than his purveyor. Why had I never seen or heard the worm-eaters in my previous visits to this haunt?

The most gratifying find of the day came last. More than once a creeping warbler had been seen and heard in this part of the woods, and many a weary search had been made for its nest. Now, I was beating about a somewhat open space, looking for the hidden domiciles of various birds, when at length I climbed a slope to the edge of the thick timber. The presence of some scattered fibers on the ground caught my eye. As I stretched out my hand toward the spot a creeping warbler—a female—leaped from the ground, gave a frightened chirp, and darted into some bushes near at hand. It was a charming nursery that greeted my eyes—an elfin nest set in a tiny hollow at the foot of a little bank, slightly roofed over by the leafy twigs of a small bush. Like tiny oval pearls four eggs studded the bottom of the cup, their ground color being white and the larger end prettily wreathed with spots of umber and cinnamon.

A pretty picture she made a week later—June 21—as she sat in her dainty cup, her beak and tail pointed upward, her striped back bent in an arc, and her little wings spread out over the rim. She did not fly up till my cane was stretched out close to her nest. Her four eggs were like tiny pebbles.

I regret to have to say that the nests of the Kentucky, the hooded and the black and white warblers were all robbed. The hooded warbler's nest bore no signs of violence; it was simply left lone and empty. One day I found the three cowbirds' eggs of the Kentucky warbler's nest converted into squirming bantlings, while the one Kentucky's egg was not yet pipped. The latter had slipped into the broken shell of one of the larger eggs, about two-thirds of its surface being covered by it. I removed the encasing shell to give the chick within a better chance to break through its prison walls. Whether it ever did so or not I do not know, for when I visited the place a few days later the nest was despoiled.

The same fate overtook the black and white warbler's nest in the distant woodland. The little cup was empty and the owners were nowhere to be seen. Let a nest be ever so well concealed, it seems that there are sharp-eyed enemies able to find it. Still, when you see the vast army of young warblers flitting about in the woods in the autumn you are comforted in the reflection that hundreds of birds are successful in their efforts to rear families, even though you cannot help thinking of the many tragedies that occur.

LEANDER S. KEYSER.

## Insect That Sits on Eggs.

A REMARKABLE case of an insect sitting on its eggs is recorded by F. P. Dodd in the Transactions of the Entomological Society of London. This strange departure from the normal habits of the insect race is exhibited by a species of bug. The female sits in a brooding attitude over her eggs for a period of three weeks. When the young begin to break through she retires an inch or so from the eggs, and remains there for some hours until the last egg is hatched. She then departs, leaving the young ones to take care of themselves. During the whole time of brooding, and till all the young are hatched, the mother eats nothing. It is thought that this brooding habit may be a means of protection against the attacks of ichneumon flies.—London Globe.

# GAME BAG AND GUN

## The Little Scatter Gun.

LONG unseen and forgotten, yet safely stored in a small sure box brought from other days, came to light a r. . . Laboriously written with great nicety, in the bold l just learned through the patient labors of the new er, the younger brother has written from home to oter, but lately gone into the outer world to conquer mpire. It is of the time when the pen traces openly impulsively the inmost thoughts and ambitions of the and there is this sentence of much import: "You at to have seen Tommy and I jump and shout when heard that my gun was coming!"

hich gun can it have been? Back along the list, y slowly and carefully treads, stopping at this one, ing over another, in an effort to locate the member se advent caused this ebullition of bold pennmanship. he list is not so long, nor otherwise imposing, in the of modern practice in gun making; but if some lost of the chain could be restored it would not again broken

ere was the little single muzzleloader, a present from ll youthful uncle. He had hunted through the spar- peckerwood, jaybird and robin age, and even into of the rabbit (for I myself saw him kill a large one, re I had ever pulled trigger); then he had shown elf not of the fraternity, for the little gun was cast so to speak) and fell into willing hands, while Uncle ined the chase no more, from that day to this.

en, for another, there was the learning to shoot, first a rest on a low fence rail, aiming carefully under nal direction (when actually, some part of the shot e pattern on a barrel at twelve paces—good long es); then there was practice without the rest, and at er targets. Afterward father and son repaired to woods, where squirrels fell to the aim of Coahoma, the first wild thing—an "Indian hen"—rewarded the ess of the little gun's new owner. The gun was d on the railing of a bridge, and the aim was long careful.

ter this much slaughter was done of sparrows in ets and hedge rows on Saturdays and school holi- Slowly the standard was raised, first to "jorees," sapsuckers and bluebirds—sparrows were now com- place; to kill them was unспортсmanlike.

ain, a day came when jaybirds were the climax of odic ambition. "Jorees" only for target practice— rows no more! So the little gun did brave execu- always striving to gratify the owner's rising ambi- until on a day this ambition took a leap so wild that gun saw ahead many disappointments. On this day oma had placed high bounty on the first successful shot. His well trained double muzzleloader was to e prize. Powder was burned extravagantly, for that and shot were sent to penetrate many winds, in the uit of this wild ambition; but the younger brother grown sturdy upon his legs, and of sufficient stature level a gun (with a rest) before the wingshot was

other uncle came to the rescue of the situation, and eathed a gun which had won some glory—a double hloader of the old pinfire tribe. Redheads and flick- ere now considered the goal of true sportsmanship— ys with a lingering hope for the wingshot—while the her fell heir to the little single-barrel, and went along oot the sparrows and "jorees" that the pinfire dis- ed.

ere came a day when a 16-gauge double "center fire" ough from a neighbor's boy. The first wingshot d other wingshots—had been made. The first was a ird. But muzzleloaders were going out of style, and oma had traded his away for a watch, and bought -gauge Scott. The 16-gauge was a compromise, but e recipient was not, for a long time, reconciled out of belief that the muzzleloader would have "hit better." en the pinfire went to the brother, and the little gun et another brother, designated as Tommy in the old that was quoted from.

ime, the first quail was killed. They were then are now, by many) called partridges in the South- being the only substitute here for a real partridge. old negroes call them "pat'idges," while some of the ger negroes who can read in books now call them s.

ter several years the Scott was passed down, and e series of guns already described was handed e next boy below, in point of age—the little muzzle- r, dilapidated and time worn, going into disuse and oblivion. Where are its sacred ashes now? If even all fragment could be found, it would be preserved gh life with tenderest care. The pinfire, too, and 6-gauge are gone.

ere were other guns bought, sold and exchanged. gun that made Tommy and me jump may have been of these interlopers, but was more probably one of four of "direct lineage." As memory reveals, the rence was of about their time.

ere was also nobler game. The second brother wiped rst one's eye for a woodcock, and the third, memory did the same in the matter of a few quail. Honors about divided on snipe. Rabbits had come to be dis- ed. The relative bags on squirrels marked which e trio held position on the lucky side of most trees. s came later, then a few 'coons, a 'possum or two, -ecstasy of ecstasies!—a wild goose!

TRIPON.

## Extracts from Experience.

### Some Practical Suggestions.

EXPERIENCE is a thorough and successful teacher, and its lessons are long remembered. They are the diamonds among precepts, and never wear away. Possibly a few paragraphs drawn from an extended period of life in the woods may prove of interest with the reader.

If you wish to command the respect of an "old-timer," always take good care of your gun. Any firearm that is worth taking afield at all is worth treating well. Nothing jars upon the nerves of a true lover of the gun worse than to see a fowling piece all pitted up with the "rust pox," as if it had but just come through a plague, all battered and scarred, but nevertheless alive. A little oil is the antidote that is a sure preventive against such attacks; what possible excuse can there be for not applying it!

When going afield, take a little pains with your dress. Some wear "any old duds" on their excursions, on the ground that they are not to be seen, and it does not matter. But this is not so. They are seen, and misjudged by their appearance to the detriment of the whole sportsman fraternity. The farmer confounds them with tramps, and gets the idea that hunters are "hoboes," a dangerous class, one that he does not want about under any circumstances, and consequently he warns them off without provocation. A man will be estimated from his appearance as quickly afield as in a drawing room. A suitable outing rig can be had at a very modest price, a canvas helmet and coat costing but very little. Always keep up a good appearance when you go afield, and so maintain our reputation.

Don't make so much noise as you usually do, while in the woods, if you are hoping for any degree of success. There is something peculiar about the woods in this respect; every noise-echoes and re-echoes through them after such a fashion that it always seemed to the writer that it carried twice as far as in the open. Is there anything that can be heard at a greater distance than a picnic party in the woods? Some hunting parties sound exactly like picnics. You could scarcely tell the difference. How they can possibly expect the game to wait for their approach is certainly a mystery.

As a matter of fact the wild animals of the woods have their sentries, their out-flanking scouts and picket system, as complete as any of man's devising, by which they are warned of the enemy's approach. The crow from his perch on the top of a dead pine sees you coming, takes flight with a few sharp, quick calls, and all the neighborhood knows the meaning of the signal, and is put upon its guard. The jay and the squirrel, even the smallest birds, understand this "secret service" of the woods, and all have a hand in it. They know, usually, when any one is coming, while yet he is a great way off. Silence is the only passport to the woods.

When going and coming through the fields, close the gates after you, replace the rail that topples from its post, and above everything else, leave boundary post and stones alone. You are not on a foraging expedition through the country of the enemy, bent on crippling him as far as possible, but are passing by the courtesy of the owner over private grounds, where really you have no right. Do not abuse your privilege.

Have your dog well enough trained and in hand, so that you will not be compelled to be shouting after him at the top of your lungs all the time, till your temper is nettled beyond control, and you are black in the face with rage. If he cannot be brought to mind except under such circumstances, leave him at home. He is of no value afield.

Make every shot count. Each discharge of the gun means just so many birds warned out of the neighborhood. The true hunter does not resemble a gatling gun, but more frequently spends the entire day without once discharging his piece, because a satisfactory aim could not be secured.

Count your success by the skill you have displayed and the benefit you have derived from the outing. The size of the bag does not always count. The man who has "potted" a grouse from a tree skulks home with a bird in his bag, but there is none of the air of the successful huntsman about him. His own estimate of himself is reflected in his walk. His day has not profited him.

And finally, if you are so fortunate as to know the whereabouts of birds, while your associates do not, if you have been successful in locating some favored nook, unknown to all but yourself, share your good luck with others, rather than keep it to yourself. To be sure, there is a certain satisfaction in being able to bring in bird after bird, while others are unable to as much as locate a feather, but it is a satisfaction far inferior to the whole-souled, genuine joy of contributing to the happiness of others, and of being generous and open-handed. Add in so far as you can to the pleasures of the season with your companions, and the gain will be yours in the end.

RUPE BARNABY.

Two boys of Santa Fé, N. Mex., have been killed by the explosion of a box of dynamite. The boys were rabbit hunting, but found the game scarce. When they reached the powder house of the Denver & Rio Grande Railway Company, near Chama, they set up a box of dynamite as a target. The dynamite exploded and set off four tons of powder.

## Wild Rice.\*

BY J. W. T. DUVEL, ACTING BOTANIST IN CHARGE OF SEED LABORATORY, WASHINGTON, D. C.

Bureau of Plant Industry—Bulletin No. 90.

THE seed of wild rice, sometimes called Indian rice or water oats (*Zizania aquatica* L.), has always been a very valuable food among the Indians, especially those of the upper Mississippi Valley. Of recent years wild rice has found a place on the menu cards of some of our best American hotels. The rich and highly nutritious grains, together with the slightly smoky flavor it has when properly prepared, make it an extremely palatable article of diet. It were not for the difficulties of harvesting the seed and preparing the finished product for market it is probable that wild rice would find a place in many American homes.

At present, however, the greatest interest in wild rice is created by the value of the seed as a food for wild waterfowl, particularly wild ducks. As a result of this interest the propagation of wild rice from seed has become a question of considerable importance, especially to the members of the gunning clubs throughout the United States and Canada.

### Distribution.

The distribution of wild rice is now reported from New Brunswick and Assiniboia south to Florida, Louisiana, and Texas. There are, however, comparatively few localities in which it grows abundantly. Good reasons exist for assuming that this area can be extended to include all fresh-water lakes, as well as swamps and river bogs, where the water does not become stagnant, throughout the whole of North America south of latitude 55° north. Wild rice also grows luxuriantly along the lower parts of many of the rivers of the Atlantic Coast States, the waters of which are affected by the action of the tide to a considerable degree, and consequently contain an appreciable quantity of salt. It has been shown† that the maximum degree of concentration of salt-water in which wild rice plants can grow successfully is equivalent to a 0.03 normal solution of sodium chlorid. This concentration corresponds to 0.1755 per cent. by weight of sodium chlorid, which is sufficient to give a slight salty taste to the water.

### Habitat.

While it is well recognized that the habitat of the wild rice plant is in shallow fresh water, it is now known that it will grow luxuriantly in water containing little less than two-tenths of 1 per cent. of sodium chlorid. Occasional plants have been found growing in water which contained, for short periods at least, nearly double that amount of salt. These facts indicate the possibility of a much wider range of conditions to which this plant may be subjected without hindering its development. It is not beyond the range of possibility—indeed, it is quite probable—that by careful selection plants may be obtained which will thrive on soil that is comparatively dry, at least in places in which the water can be drawn off gradually during the latter part of the growing season.

In September, 1904, Mr. G. C. Worthen, of the Bureau of Plant Industry, collected a cluster of wild rice plants which were growing on the Potomac Flats, near Washington, D. C., in soil which was sufficiently dry to permit the use of a 2-horse mowing machine for cutting down the rank growth of vegetation. This was newly made land, and in all probability the seed giving rise to this cluster of plants was pumped in with the dirt from the Potomac River the year previous.

This amphibious type once established, it will undoubtedly carry with it a strain of seed which can withstand considerable drying without any marked injury to its vitality. Such being true, the methods and difficulties of propagation from seed would be greatly simplified.

Simultaneous with establishing an amphibious type should come the selection of seed plants which are capable of retaining their seed until the larger part of it has reached maturity. These two steps once made, the future of wild rice as a cereal will be assured.

### Germination of the Seed.

The greatest difficulty to be overcome in extending the area for growing wild rice is the poor germination of the commercial seed. Inasmuch as wild rice constitutes one of the most important foods of wild ducks and other wild waterfowl, many individuals and most of the gunning clubs east of the Rocky Mountains have been asking the question, How can we propagate wild rice from seed in order to establish better feeding and fattening grounds for our game birds?

The many failures in the propagation of wild rice from seed have been due to the use of seed that had become dry before sowing, or to the fact that the seed when sown fresh in the autumn had been eaten by ducks or other animals or was carried away by heavy floods before germination took place.

It is now very generally known that the seed of wild

\*Wild rice is considered one of the most important foods for wild ducks and other water fowl, and a large number of inquiries have been received from members of gunning clubs throughout the United States, asking where good, germinable seed can be secured. It is quite generally recognized that wild rice seed loses its vitality if allowed to become dry, and better methods of storing the seed during the winter have long since been demanded.

†The results of investigations begun two years ago show that wild rice seed can be handled without any deterioration in vitality if it is harvested and stored according to methods outlined in the present paper.

‡The Salt Water Limits of Wild Rice. Bulletin No. 72, Part II., Bureau of Plant Industry, United States Department of Agriculture, 1905.

rice, if once allowed to become dry, will not germinate, save possibly an occasional grain. In its natural habit the seed, as soon as mature, falls into the water and sinks into the mud beneath, where it remains during the winter months, germinating the following spring if conditions are favorable.

Heretofore the plan generally followed, and the one usually recommended by those who have given some attention to the propagation of wild rice, was practically that of natural seeding; that is, to gather the seed in the autumn, as soon as thoroughly mature, and, while still fresh, to sow it in 1 to 3 feet of water.

#### Fall Seeding Versus Spring Seeding.

It must be remembered that the bulk of the seed remains dormant during the winter, germinating first the spring after maturing; consequently, with but few exceptions, fall seeding is unsatisfactory and unreliable. Fall seeding is likely to prove a failure for three reasons: (1) Wild ducks and other animals of various kinds eat or destroy the seed in considerable quantity before it has had time to germinate the following spring; (2) much of the seed is frequently covered so deeply with mud that washes in from the shore during the winter that the young plants die of suffocation and starvation before they reach the surface; (3) in some cases a large quantity of the seed is carried away from the place where sown by the high waters and floating ice prevalent during the latter part of the winter and early spring.

In exceptional cases these difficulties can be overcome; under which circumstances autumn sowing may be preferable to spring sowing. In the majority of cases, however, much better results will be obtained if the seed is properly stored and sown in the early spring, as soon as the danger of heavy floods is passed and the water level approaches normal.

In sowing the seed considerable care must be exercised in selecting a suitable place, securing the proper depth of water, etc. Good results can be expected if the seed is sown in from 1 to 3 feet of water, which is not too stagnant or too swiftly moving, with a thick layer of soft mud underneath. It is useless to sow wild rice seed on a gravelly bottom or in water where the seed will be constantly disturbed by strong currents.

Previous to this time, save in a few reported cases, the seed which was allowed to dry during the winter and was sown the following spring gave only negative results. It is now definitely known that wild rice, if properly handled, can be stored during the winter without impairing the quality of germination to any appreciable degree, and that it can be sown the following spring or summer with good success.

#### Directions for Storing the Seed.

The vitality of wild rice seed is preserved almost perfectly if kept wet in cold storage—nature's method of preservation. This method of storage implies that the seed has been properly harvested and cared for up to the time of storage. The seed should be gathered as soon as mature, put loosely into sacks (preferably burlap), and sent at once to the cold-storage rooms. If the wild rice fields are some distance from the cold-storage plant the sacks of seed should be sent by express, and unless prompt delivery can be guaranteed it is not advisable to send by freight even for comparatively short distances. It is very important that the period between the time of harvesting and the time when the seed is put into cold storage be as short as possible. If this time is prolonged to such an extent as to admit of much fermentation or to allow the seed near the outside of the bags to become dry during transit, its vitality will be greatly lowered.

It is not practicable to give any definite length of time which may elapse between harvesting and storing, inasmuch as the temperature, humidity and general weather conditions, as well as the methods of handling the seed, must be taken into consideration. Let it suffice to say, however, that the vitality of the seed will be the stronger the sooner it is put into cold storage after harvesting.

As soon as the seed is received at the cold-storage plant, while it is still fresh and before fermentation has taken place, it should be put into buckets, open barrels, or vats, covered with fresh water, and placed at once in cold storage. If there is present a considerable quantity of light immature seed or straw, broken sticks, etc., it will be profitable to separate this from the good seed by floating in water preparatory to storing. The storage room should be maintained at a temperature just above freezing—what the storage men usually designate as the "chill room."

When taken from cold storage in the spring the seed must not be allowed to dry out before planting, as a few days' drying will destroy every embryo.

Seed which was stored under the foregoing conditions from Oct. 19, 1903, to Nov. 15, 1904, 393 days, germinated from 80 to 88 per cent. Another lot of seed, which was stored on Oct. 6, 1904, and tested for vitality on April 17, 1905, germinated 79.8 per cent.

#### Packing for Transportation.

Too much care cannot be given to the matter of packing the seed for transportation, for unless the packing is properly done the vitality of the seed will be destroyed during transit. What is here said applies to fresh seed which is to be sown in the autumn, as well as to seed which has been kept in cold storage during the winter. It must not be forgotten, however, that the vitality of cold storage seed is more quickly destroyed on drying than that of fresh seed.

For transportation the seed should be carefully packed, with moist sphagnum, cocoanut fiber, or fine excelsior, in a loosely slatted box. If the time of transportation does not exceed five or six days no special precautions need be taken as to the temperature. During the period of transportation it is quite probable that some of the seed will germinate, but if sown at once growth will not be retarded and the roots will soon penetrate the soil and anchor the young plants.

If the time of transportation is necessarily long, it is recommended, if the best results are desired, that some provision be made for a reduced temperature. The nearer the temperature approaches that of freezing the better. It has been demonstrated, however, that a fair percentage of seed will remain germinable for a considerable time if packed as above described.

On Oct. 10, 1904, Mr. C. S. Scofield sent a small quantity of wild rice, packed in moist sphagnum moss in a well-ventilated box, to Dr. De Vries, of Amsterdam, Holland. On Oct. 14 or 15 this box was placed in cold storage on the steamer in New York harbor. The box of seed was received by Dr. De Vries in good condition on Nov. 2, twenty-one days after the seed was packed for shipment.

#### Summary.

(1) Under no circumstances should wild rice seed which is intended for planting be allowed to dry. Dried seed will germinate but rarely and should never be sown.

(2) Wild rice seed can be stored without deterioration if it is gathered as soon as matured, put into barrels or tanks, covered with fresh water, and, before fermentation has set in, stored at a temperature of 32 to 34 degrees Fahrenheit. Seed treated in this way germinated as high as 88 per cent. after being in storage 393 days. Fresh seed seldom germinates better, and usually not so well.

(3) After the seed is taken from cold storage it should not be allowed to dry. The vitality of cold storage seed is destroyed on drying even more quickly than that of fresh seed.

(4) For transportation the seed should be packed in moist sphagnum, cocoanut fiber, or fine excelsior. If not more than five or six days are required for transit, no special precautions need be taken for controlling the temperature; but if the time for transportation exceeds six days, provision should be made for a temperature sufficiently low to prevent marked fermentation. A temperature approximately freezing will give the most satisfactory results.

(5) Wild rice can be sown either in the autumn or in the spring. Spring sowing is preferable, thus avoiding the danger of having the seed eaten or destroyed by wild ducks or other animals during the fall or winter, or of its being buried or washed away by the heavy floods of late winter or early spring.

(6) Wild rice should be sown in the spring in from one to three feet of water which is neither too stagnant nor too swiftly moving, as soon as the danger of heavy floods is passed.

(7) Wild rice is of the greatest importance as a food for wild waterfowl, likewise a delicious breakfast food for man, and the area in which it is extensively grown should be extended. It will grow luxuriantly in either warm or cold water; furthermore, it can be grown successfully in water which is slightly salty to the taste.

(8) In determining the vitality of any sample of wild rice seed the germination tests should be made in water—the condition under which the self-sown seed germinates.

(9) The seed will germinate well at temperatures ranging from 15 to 30 degrees C. The maximum temperature of germination is above 35 degrees C. (95 degrees F.), but better results are obtained at lower temperatures.

## In Maine Game Woods.

BANGOR, Me., Sept. 4, 1905.—*Editor Forest and Stream:* With the approach of the season for hunting big game in this State there are appearing many misleading items in various publications regarding the privileges allowable to non-resident sportsmen who come into this State to hunt during the coming open season. In view of the fact that there have been many efforts, more or less successful in the past, to get around the non-resident hunters' license law, the last Legislature in session during the winter of 1904-5 added to the license law an amendment which provides that every hunter who is a non-resident must purchase a license, whether he be in search of big game or small, protected or unprotected, in feathers or fur. That this might aid the wardens in the detection of illegal hunting still more than the old method, the law provides that these licenses for bird hunting, and for wild animals other than those protected by law during certain close seasons, shall expire when the general open season for all game goes into effect, so that sportsmen who hunt birds and other wild animals during the respective open seasons prior to October 1, shall pay therefor a license fee of \$5, and if they desire to remain beyond that date to hunt, may add the other privileges of the season to their licenses for \$10. But sportsmen should not make the mistake of thinking that they may take out a bird hunting license and hunt for deer, to return to the agent and secure a big game license when they have killed and secured the quarry. The newly enacted license clause does not permit the non-resident to kill any more game prior to Oct. 1 than in preceding years, nor in general open season; but it does permit him to take, or ship to his home without the State, ten each of partridges or ruffed grouse, woodcock and ducks, affording him thirty birds to regale his home friends on in addition to the two deer and one bull moose heretofore the sole objects of his trip in this State. Formerly, by paying 50 cents, the non-resident as well (as the resident) might ship to his home or to any hospital within the State, a pair of game birds; but now he has no need to use that privilege, since his license permits him to ship his ten birds of each kind, an advantage that the sportsman will not be slow in availing himself of. Those hunters who have hitherto come into Maine for the sole purpose of hunting birds and have not gone to the expense of a license, must now pay \$15 for their fun if they indulge in it after the first of October, and as most of the bird hunting worth coming after is possible between Oct. 1 and Dec. 1, all hunters will endeavor to avail themselves of all the privileges of the entire license, and take home thirty birds, two deer and a moose. It is noticeable, too, that the non-resident may not kill so much as a crow in this State under the new law, at any time, without first taking out one of the licenses. The outlook for big game hunting during the general open season from Oct. 1 to Dec. 1 is excellent, and it

now looks as if the season were going to be one of the best in the history of the State, so far as the supply is concerned. Should hunting conditions prove as bad in many sections as they were throughout the season of 1904, there is no forecasting what the results shall be. There was a positive abundance of big game in the woods last fall, and in many sections their signs and workings were all around one, while the utmost skill failed to bring the hunter within shooting distance of his quarry, which dashed past him in the woods at safe distance, or crept gently away without giving the anxious hunter a chance to raise his rifle to his shoulder. Late snowfall and very dry days made hunting difficult, except for the few brief minutes the morning sun struck the frosted leaves in the park and were consequently slightly softened. The lucky hunters were most generally those who found a good place to sit down, and sat there until their game came their way. Still hunting, particularly in certain sections was positively out of the question. In other portions of gameland the weather conditions were good, and they knew nothing of the difficulties that beset the hunters in most of the State for two-thirds of the season. It has been so exceedingly dry throughout Maine for the past month that October is likely to be wetter than last fall, with consequently better sport, though it is of course far too early to make any forecast that can be relied upon.

Speaking of the dry weather of the past month I minds your correspondent of a vital question that is sure to come up before long, and may be settled in way far from satisfactory to the hunters. It is the question of forest fires. For years there have been from time to time, enormous losses to the timberland owners by fire, and with the increasing army of summer camping and canoeing parties, these fires have appeared to show a tendency to increase; but whether this is due to the presence of these parties or not is a question still undecided. It would appear almost certain, however, that many of these disastrous fires could have been avoided if camping parties had used caution, or had spent a little time in putting out fires already started by others.

Less than two weeks ago the writer came down the west branch of the Penobscot, and at camp one evening one of a party of three, who had been over a part of the same route, spoke of his surprise to find how readily the ground took fire. He said that he had noticed the extreme dryness everywhere, as indeed on his journey over a waterway that was such in name only the rapids could but show him, and when he lighted a pipe at the noon camping place he took particular pains to break his match into small pieces before throwing it away, to be sure that no fire was left in it. Having finished his smoke and waited several minutes with the bowl of exhausted tobacco, or better ash in his hand, he shook out the supposedly dead ash upon the ground at his feet, watching it carefully to be sure that no blaze was started by it. Before he embarked in the canoe he was obliged to put out a fire which started from that very bowl of ashes, but of course, as he had given the matter such close attention the fire was slight and easily extinguished.

On the same river, further down, the writer's party had fortunately to walk a carry, while the canoes in the rapids, and a hundred yards below the putting place discovered a fire in full blaze, where a party must have camped shortly before. There was only one party to go down the river ahead of ours, and we had no other party on our way to this point, so that circumstantial evidence pointed direct to them as authors of this fire, which in an hour or two furth with a high wind blowing straight into the woods must have been beyond control. As it was, our party of five worked nearly two hours to undo the mischief which the carelessness of others had created. Although there were large stones handy to use in building a fire these had been rolled aside and the fire built on the bare ground, and every evidence went to show that no effort had been made to extinguish the fire, leaving, but it had been left to spread, and a brisk wind had kept it to the task only too well. On the same trip it was common report, at one point, that a certain party of campers had left a camp-fire burning near a cabin they had occupied at a lumberman's depot camp and but for the prompt and heroic efforts of others who chanced upon the blazing hut, \$2,000 worth of lumbering outfit must have been destroyed, and an enormous amount of standing timber. From the summit of Katahdin extensive forest fires were observable, well beyond the smoke of others was discernible in the distance. Not all of these were caused by sportsmen, of course, but if sportsmen do not take some responsibility upon themselves and see to it that their guides put out these fires, the timberland owners are liable to their wrath and demand a law that shall shut sportsmen out of the Maine woods during the most delightful season of the year.

An interesting question came up during the trip a party of canoeists, incidental to the discovery of one of these neglected fires, which was: "Whose business is it to put out these fires, anyway?" It was an interesting and important question and most pertinent since the party, guides and all, had been hard at work fighting fire set by others, and for a moment there was a dead silence—not one of the whole party but accepted the individual responsibility thus thrust upon him of doing his best to stop the fire, without a question as to whether it was his particular duty or not. The writer is glad to say that, so far as he has discovered, the great majority of the guides, and most of the sportsmen, are not only careful about fires, but their utmost to put out fires when found, and will continue their trips to devote hours and perhaps entire day to fight that which threatens the forest. Guides who are in the service to-day have been known by the writer to paddle back thirty miles to a camp place, to put out a fire left by another member of same party; but so strong is the first-class guide's sense of his responsibility that, as head guide for a party, feels personally liable for every fire kindled by sportsmen or their individual guides, even though they may never have seen the fire in question; and he

Wild Rice: Its Uses and Propagation. Bulletin No. 50, Bureau of Plant Industry, United States Department of Agriculture, 1903.

dle all night and half the day to fight fire as long as can endure to undo such a blunder.

However, Maine has adopted a plan of raising money license instead of a direct tax for the preservation of the game, when if she had made every game warden a warden too, with certain territory to be responsible for and in which to look after fires, as well as game law violators, with heavy penalties for those who were careless about fires, several of the disastrous fires of the present season, and of last year, might have been avoided by discovery in season, and the responsibility promptly fixed. Weeksboro on the Bangor & Moosehead is reported to have suffered the same fate as did Sherman a year or two ago, while vast timber territories have been rendered valueless by the fire fiend. During the last two days a steady downpour has aided in checking the fires, and at this writing it is expected to have quenched all the fires in the woods. There may be still dry times ahead, and there are other seasons coming, so that the sportsman who camps in Maine should have his eyes open to see that no fires are chargeable to his door. If Maine is so generous in regard to permitting sportsmen to travel over her borderlands and enjoy them, without a cent of revenue exacted therefor, they certainly ought to be sportsmen enough to refrain from damaging her standing timber, one of the State's principal sources of revenue, and on which several of her chief industries rely for material.

HERBERT W. ROWE.

## A Rainy Day Hunt.

AWOKE at 3 o'clock and heard the patter of rain. I thought there would be no hunting that day, so I crawled back to bed without awakening Tom. Two hours later I awoke again, and when I went to the window I saw that there were signs of clearing. I called Tom, and we were soon dressed and sat down to lunch. While on our way to get the team which was to take us to our hunting grounds for the day, the rain suddenly descended again in drenching form. We decided it would stop till we reached our destination, so we set out on our way. A drive of seven miles brought us to the desired place, and we put the team in a hurry. It was drizzling somewhat, but otherwise we did not mind that. What is it that a true sportsman will not brave?

The territory over which we expected to hunt lay in a high wooded hills and deep valley. Since the night before was wet it would be quite natural that rabbits would be mostly under cover. So we made our way to a hill woods, full of low brush. We looked carefully and found every tree and stump and rock. Tom came to a pile of dead brush, and said: "Here is where we get our first rabbit." He put his foot on top, gave a good kick, and sure enough out came a rabbit. Tom let him run about twenty yards, when he shot it. A few minutes afterward I was looking around a big stump expecting a rabbit to sit backed up against it, and was just on the point of leaving it, when lo, and behold! a rabbit jumped out of the top of the stump, which was somewhat decayed, and made a nice hiding place. Before that I never would have thought of looking at a place for a rabbit, but since then I have kept my eyes peeled for hollow tops of stumps, and have found a half dozen hiding there. If that bunny had been sitting I would have passed it unnoticed. As it was I fired two shots at it in quick succession, and it was rabbit No. 1 for my pocket.

We searched out that woods without finding any more. To our right was another woods, and between it and the one where we were was a narrow field, covered with a luxuriant growth of weeds. As I stepped on the fence to enter the field the top rail broke, and I took a tumble. I landed almost on top of a stump. If it had kept sitting, I could have reached it with my hand. It made a quick turn through the fence into the woods, and Tom emptied both barrels at it. The bit had a leg broken by one of the shots, so Tom stepped up and killed it with another shot. But we found that field of weeds what we did not expect—a covey of quail. There must have been about fifteen of them; after Tom and I had each fired two shots at them, there were just four of them left. If we had gotten better else that day we would have felt satisfied with these four birds. They were so big and plump, and what a potpie they made. I can taste it yet. In fact, we would have been content if we had to return empty-handed. You know this going gunning is not in the game you get. The anticipation is often more than the reality, but how can any man be disappointed in having a pleasant day in the fields.

The field yielded nothing more, so we went into the woods. The tall oaks and chestnut trees suggested turkeys. We had gone scarcely ten rods when we heard the barking, and saw a grey making a leap from one tree to another. Tom and I fired at the same time, and the squirrel fell. We could not make out which one hit it or whether we both did. We finally agreed that Tom would take it, and the next one we would take we would kill together, and I should take it.

A shower came up, and we took refuge under an overhanging ledge of rocks. We ate our lunch, and enjoyed it highly as the hard morning tramp had whetted our appetites. Corn-cob pipes had to do service, and we sat there in the dry, smoking and joking, exchanging yarns, for we had not seen each other a year. About forty yards from our rendezvous was a low clump of bushes, and several times we thought we saw something move there. We concluded to investigate. Half way toward the bush we passed a low stump, and away went a rabbit directly toward the bush, and as he bounded into it, it scared up a pheasant. The last thing we expected to see in the locality. I had won a good bead on the rabbit, and when Tom saw he pulled up on the bird. I downed the object of my aim on the second shot, and Tom was lucky—no, not lucky, but skilled—enough to get his pheasant on his first shot. To say that we were simply elated would be putting it very mildly; we were simply overjoyed. In an occurrence had not taken place before in our hunting lives. I believe I would have given many dol-

lars for a picture that would have taken in the whole scene of action.

The shower seemed to turn in a heavy, steady rain, and we concluded to start for home. On the way back to our team, we went along a steep hillside, at the foot of which was a narrow but swift creek. A rabbit bounded away in front of us and made straight down the hill. Tom was the nearer and he sent two barrels after it. Four or five feet from the bank of the stream the rabbit took a jump into the air, turned a somersault, and landed in the water. He was killed, and the current quickly took it away from reach from shore. There was nothing left to do but to wade in after it. It was not too pleasant a thing to do, for the water was cold at that season. But I went in up to my arms and got it out. The extra clothes we had taken along for emergency cases came in handy.

On our way home and often since then Tom and I have congratulated ourselves on our luck on that rainy day. Frequently we had been out on the pleasantest of days and did not get one-third as much game. The rain had not been enough to dampen our ardor, and the game we got amply repaid us for all the discomfort we had to endure.

KILLDEER.

## Minnesota Moose Protection.

NILWOOD, Ill., Sept. 8.—*Editor Forest and Stream:* Maine is not the only State that will have to make a study of the moose problem, and do it before long. I do not know the situation in Maine, but do know something about what is going on in the nearer State of Minnesota, where the great game still abounds to quite an extent, although the moose are quite scarce where they were plentiful less than ten years ago. The scarcity was not caused by the killing of bulls, but on the contrary, by killing of any old moose that showed its head at any old time or place. I know of instances where section house keepers who fed from ten to fifteen men all summer did not buy \$10 worth of fresh pork or beef during the summer months; at the same time they served fresh meat at each meal. I can also name several men who do nothing but be around near the lakes and streams and kill moose and deer, take them to town in packsacks and sell or trade for groceries and whiskey. This kind of business is carried on every day in the year, and right under the noses of the deputy game wardens, who either do not know or do not care, and who are afraid to go into the woods and locate these destroyers of game. This state of affairs will continue to exist so long as a deputy warden's position is secured by political preferment.

Just so long as an applicant for such a position must show what he can do for the administration, just so long will things be as they are.

When it becomes necessary for an applicant for such a position to prove to the appointing officers that he has qualifications both as to ability to discharge the duties of the office and honesty of purpose to do it, regardless of who the offending party is, then we may look for an enforcement of the law that will amount to something, and the moose will be seen in places that have long since ceased to be his haunts.

There are other things that cause the disappearance of the moose from districts where they were plentiful. For instance, disease will get among them and scatter them in a dying condition all over the country. One fall I went, as usual, to a part of St. Louis county to do my hunting. I found plenty of deer, but not a sign of moose, where they had been quite plentiful the year before. I was greatly puzzled over this for a few days, when I met an Indian, who had been an acquaintance for several years. I asked him his opinion as to the moose having left the neighborhood. He told me they had been sick all summer, and that he had seen several dead ones; among them a sick one that he found unable to get up. He killed it and cut it open to see if it had been wounded, but found that it had what he called "big sores on its lungs." He also said he had examined no less than seven he had found dead, and that they were all affected the same way. I at once came to the conclusion that the disease was tuberculosis, and that what moose had not died had gone away from the place where the sickness prevailed. The next season they were back, but were not and never have been so plentiful.

Another thing that makes them scarce is the destruction of their winter food by fire or its dying off. I have seen several acres in a bunch where they had eaten the tops of a red-barked willowish appearing bush, down to a height of about four feet. Each year the new growth is eaten down and when this browse is destroyed they find some other place to spend their winters; and any moose seen in the territory is a transient, and if followed the tracks will show that he has kept right on his way in almost a direct line, to some other place of abode. After their natural feed has again grown they gradually work back, but hardly ever are so numerous.

I think there is no way to regulate the killing so that the destruction can be kept down to what it should be; as there will always be infringements which will keep the killing at a maximum rather than a minimum; and when killing is permitted the cow suffers with the bull. I have no doubt that there are numbers of cows killed each season and left in the woods, or turned over to some homestead or logging camp.

How would it do to have a closed season of five years, then allow killing twenty days each fall, after rutting season is over, for two or three years, then close again for five years? This would give the moose a chance to get ahead of the hunters and also have a tendency to keep them in parts of the country from which they are slowly being driven. Let sportsmen who know about the subject express themselves, and out of several suggestions a form of a law may be patched up that will be acceptable to the legislators of the State concerned.

Let it be understood that game wardens and a game and fish commission are not the whole thing, and while they may work hard to see the laws enforced, they sometimes get the black end of the stick. Some justice courts are pretty poor places to prosecute offenders of the game laws, and jury trials are often a farce, as I have seen to my own satisfaction, or rather dissatis-

faction. Also, there are many cases where some one high in authority fails to back up the local warden, especially when they get their hooks in the hair of people who have pulls, and don't want to be disturbed in their pursuit of game, peace and happiness. It would not be hard to find a case of a local game warden who prosecuted, or tried to, a large lumber company for having a camp full of moose meat which they were dishing up to their men every day. The prosecution went about as far as the lumber company wanted it to and was not heard of again.

Another case was of a local warden who was doing fine work and making violation of the game law almost certain to get the offender into trouble. This man was paid a salary by the State. Just when he was doing the best of work, he received a notice that he was taken off the pay roll and in future would be paid a per cent. of the fines collected. When it is known that a great many of these fines are paid by the offender spending a certain number of days in the county jail, it will also be known that a warden paid on this basis don't get much for his services.

Let us, who like a few days' sport each fall, agitate the question until something is done that will make it possible for other generations to have the same pleasure.

J. P. B.

## Two Days on the Marshes.—I.

AUG. 10 had come around, that memorable date which usually marks the arrival of the vanguard of the great flight of plover and other shore birds from the Far North. I had arrived with my friend on the afternoon of the 9th at a little semi-public house which was located a short distance from one of the most extensive ranges of marsh lands in Massachusetts, and after supper we made a short tour of inspection of the marshes to select a place for our stand. There was a sort of road or causeway traversing the great waste over which we made our way, and about a mile from the house we found what my friend pronounced to be an ideal spot for a decoy blind.

This was a narrow, sandy ridge that had been thrown up, probably many years ago, by a high course of tides. Its greatest elevation was not more than three or four feet above the level of the marsh, and it was covered with a rather luxuriant growth of reeds and beach grass. Below it on the farther side was the flat and muddy shore of a wide creek, and on the other side was a great stretch of marshes which seemed to melt into the far distant horizon.

In this vast plain were scattered numberless patches of naked sand and hard, dry clay in which shallow pools of greater or less extent were to be seen on every hand. The banks and borders of these basins were usually muddy, but they had, now and then, a covering of fine sand.

The hours of the night must have flown rapidly, for it seemed to me that I had hardly fallen asleep when we were aroused by a knock at our door. After eating a hearty breakfast we started out, accompanied by our host's man-of-all-work, with shovel on shoulder and our heavy ammunition box in his hand. The man was an adept in using the shovel, and it did not take him long to sink a trench that was amply large enough to accommodate my friend and myself and permit us to be effectually screened from view of approaching birds. In each end of the trench he piled some sods for seats, and these he covered with a cushion of dry seaweed. The ammunition box and luncheon basket were placed in the middle of the excavation.

While the pit was being dug my friend and I busied ourselves in putting out our decoys, some of which we grouped along the muddy flat on the side of the creek, and the others, yellowlegs, plover, etc., were placed within easy gunshot on some of the bare spots on the marsh. So expeditiously had the whole work been done, the sun had not appeared above the eastern horizon, when we took our places in the trench and prepared for the coming of the birds, whose calls we could occasionally hear high in the heavens above us.

To the sportsman who is accustomed to shooting over his trained pointer or setter, moving constantly from one cover to another, traversing now the vistas of the grand old forest in pursuit of that noblest of our game birds, the ruffed grouse, or anon threading the intricacies of a growth of young birches, alders and maples for that other princely species, the woodcock, or ranging over the stubble fields, brier patches and bush-covered pastures in quest of the bird which is one of the great favorites among sportsmen everywhere, the Virginia partridge or quail, to be concealed in a trench the livelong day awaiting the coming of bay birds to his decoys seems dreary sport indeed. He obtains his enjoyment largely from the rapid changes of environment, by the constant motion and by the almost human intelligence of his well trained dog; he is continually on the move, and one charming scene, one beautiful surrounding follows another in rapid succession, and "blind" shooting is, in his estimation, so deadly dull he cannot understand how men can be induced to follow it.

But shooting shore birds over decoys is not by any means as monotonous as may be believed; in fact, when birds are flying in considerable numbers there is a degree of excitement in it such as is awakened very rarely in cover shooting; and not only that, it requires no little knowledge in the gunner of the characteristic notes and flight of the different species to achieve success. All the bay and marsh birds have notes peculiar to themselves, and to arrest them in their course and call them down to his decoys is a faculty that is acquired only after considerable experience.

A bunch of Eskimo curlews will not very often stool at the imitation of a yellowleg's whistle; neither will a flock of golden plover change their course on hearing the call of another species. The blackbreast or beetlehead plover, although not, perhaps, so sociable in habits as the other, is usually less fastidious and will come to almost any whistle that is uttered.

But, generally speaking, the "blind" gunner must be able to identify any species he sees, either high in the air or hovering above the marshes, and must be so well educated in imitating their notes that he can repeat the requisite call promptly and with effect. All these things being considered, the neophyte in blind shooting would

have but moderate success compared with that achieved by the veteran gunner.

The great stretches of marsh lands which occur in various portions of Massachusetts, particularly on Cape Cod and on Long Island and in many sections of New Jersey, are frequented during their autumnal migrations by many species of so-called shore birds or waders, many of which make their journey from the north in easy stages, but some, such as the golden plover, do not linger on their way but make an uninterrupted stage from Newfoundland and Prince Edward Island to the West Indies, and this long flight is often accomplished far out at sea; but sometimes a heavy northeast storm comes on which diverts the birds from their course and forces them to the shores, where, wing-weary and bewildered, they linger a day or two, gleaning such food as can be obtained until their southern journey is resumed.

It is on these occasions that gunners reap a rich harvest. More than once have I seen the great areas of open lands, pastures, etc., on Nantucket and Martha's Vineyard covered with flocks of these plover, and have had many a day's sport among them. Even on the Canton Fowl Meadows, which lie along the Neponset River a few miles from Boston, have I found large numbers of these storm-bewildered birds.

But if there is no storm at the time of flight of the golden plover, which occurs usually between Aug. 10 and 20, the average gunner does not have the opportunity to secure many of these beautiful birds unless he goes to the northern shore of Prince Edward Island, which is the first point at which they touch after leaving their nesting places in the Far North.

My friend was a keen sportsman, and when the proper time arrived he usually managed to get in a number of days in the season in shooting over his dogs, of which he had a magnificent pair of Gordon setters; but he also enjoyed shore-bird shooting, and the summer rarely slipped by in which he and I did not put in a day or two together. He was well educated in the peculiarities and ways of the bay birds, and could perfectly imitate the call of every species which frequent the Atlantic coast.

Although the sun rose brightly on the morning of Aug. 10 the sky soon became overcast, and before a couple of hours had elapsed a heavy fog drifted in from the eastward and this bade fair to spoil our sport, during the earlier portion of the day at any rate. It was one of those thick, almost impenetrable fogs such as occur on the coast during the dog days, one of those fogs which seems just ready to turn into a drizzle and then rain.

Although it annoyed us for a while it had the good effect of setting the birds in motion, for the air soon became filled with their notes as the scattered flocks flew about at random, calling to each other as if for the purpose of obtaining their bearings. They did not stoop well, however, for the fog seemed to make them more cautious and suspicious than they usually were, and noon had passed without our securing anything but two or three brace of summer or lesser yellowlegs.

"This is a poor showing for a half day's work," exclaimed my friend as he smoothed the plumage of the birds and laid them carefully in one corner of the trench, where he covered them with some damp seaweed, "but if the fog lifts by and by we'll have some sport; there's a lot of birds moving, and when the air clears they'll come to the stools right merrily. A large share of them are yellowlegs, for we can hear them whistling in all directions."

Of all our so-called marsh birds these are among the greatest favorites with sportsmen, and their numbers do not seem to be decreasing as rapidly as are those of the plover, curlew, etc. I suppose one reason for this is their breeding places are widely scattered throughout the continent, and in their migrations they usually move in small parties rather than in immense flocks, like the plovers.

This snipe is one of the most widely diffused of all the waders, its range extending from the most northern points, such as Alaska, Labrador and Greenland in summer to South America in the winter, traveling as far south as Patagonia before it comes to a halt.

This species is almost the exact counterpart of the winter or greater yellowlegs, but is considerably smaller in size and is much more numerous.

After partaking of the generous lunch that had been put up for us we took our guns and stretched our legs in a short walk along the causeway, hoping we might possibly come up on a bunch of the birds that were feeding; the fog was so dense, however, we could do nothing. Occasionally a small bunch of birds would appear and then disappear like so many phantoms, but nothing save a few sandpipers gave us an opportunity for a shot, and we did not care to waste our ammunition on them.

Disgusted with our ill-success we returned to our stand and waited with as much patience as we could command for the mist to clear away. At length it seemed to grow less dense, and by the middle of the afternoon it lifted, and condensing into great clouds, began to move away before a brisk breeze from the westward that had now begun to blow.

"Three o'clock," said my friend, consulting his watch, "and not a shot fired since noon. Well, we must take things as they come. It will be high tide at a little after 5, and that will start the birds off the bars and flats, where many of them are now feeding and resting, and we may yet get a good bag before dark."

Another hour passed before any birds presented themselves that we cared to shoot; now and then a little whisp of "peeps," sanderlings or grass birds came along, but they were in such small parties we did not bother with them.

At length we heard the piping notes of two or three flocks of larger species, and presently a number of yellowlegs and ringnecks approached our stools, and we succeeded in dropping with our four barrels over a dozen from the ranks of the two species.

The discharge of our guns seemed to be the signal that was needed to arouse the birds into action. Up into the air in considerable numbers they sprang and began skurrying about after the manner of their kind, and uttering their peculiar calls and gathering into flocks the single birds which were darting about aimlessly. These augmented flocks approached our stand with more confidence than did the smaller bunches, and responding to the whistling invitations that were sent to them, came to the stools unsuspectingly.

"This is something like sport," I exclaimed on returning to the pit after gathering up a couple of dozen of yellowlegs, grass birds and ringnecks. "Your prediction proves true, and it's more than likely we'll get good bags after all."

"Yes," he replied, smoothing the plumage of each bird as was his habit and depositing them with the rapidly accumulating pile. "We have three hours ahead of us, and the three best hours of the day. Here comes quite a bunch of yellowlegs," he continued, "and I can hear the whistle of the dowitcher among them. They are coming straight to the stools and we'll give them a warm welcome."

The flock that was approaching us was a heterogeneous collection of species, for from its ranks came the shrill whistle of the dowitcher, the three piping notes of the yellowlegs and the more twittering call of the grass birds and plaintive whistle of the robin snipe. It was one of those medley collections that every gunner occasionally meets and it seemed to have been got together chiefly for society's sake, for all these species are sociable in their natures. We whistled them down and as they came in a compact body just as they were about to drop to the decoys we sent among them a leaden shower with deadly effect, at least two dozen birds dropping to our four barrels.

Away the survivors darted, but before they had gone thirty rods they swung back in response to our calls and returned to the stools, among which a number of wing-tipped birds were fluttering. The contents of another four cartridges were sent among them when the remnant of the flock skurried away and disappeared in the distance. When the dead and crippled had been gathered up we counted twenty-nine, of which three were dowitchers, or "quail snipe," as they are often called; two were "robin snipe," or redbreast plover, as New Jersey gunners call them, and the balance consisted of yellowlegs.

"That's a good showing from a bunch like that," said my companion as we carried our spoils into the trench. "This seems to be a yellowleg day, and no mistake. Let us hope there will be a few plover along by and by. I like to get these quail snipe; they have some of the ways of my favorite, the Wilson snipe, one of the best birds to shoot over a dog we have."

"You are right. I have walked up these dowitchers more than once and shot them as they were darting away like so many English snipe."

During the remainder of the afternoon we were kept pretty busily employed, but none of the larger bay birds came to our stools; two or three small flocks of Eskimo curlew passed over us high in the air, but they would not yield to our blandishments and come down. We also heard, though from a great height, the whistle of the beetlehead or blackbellied plover, or blackbreast, but these birds also refused to descend to the earth, and we had to content ourselves with the smaller varieties, but our score was a good one, for we more than filled our luncheon baskets when we prepared to return to the house.

Our genial host joined us as the sun was sinking below the western horizon. "I heard you banging away," he said, lifting the hamper, "but by the great horn spoon I'd no idea of your having such luck as this. Why, the basket's full! We'll have to get them in the icebox right off, for these fat shore birds soon spoil in dog day weather. You'll have company enough on the marsh tomorrow, for four more gunners have just arrived."

On reaching the house we found the arrivals to be old acquaintances, and loud were the congratulations when our basket of birds was exhibited to them.

Selecting a dozen of the best ones my friend requested that they might be dressed and broiled for supper, to which our friends were invited to join us, which invitation they were not slow to accept. The meal having been disposed of we cleaned our guns, and when this necessary work was completed we joined the other sportsmen on the veranda and followed their example in burning a little tobacco for a go to bed smoke. E. A. SAMUELS.

[TO BE CONCLUDED.]

## Coon Hunting in Indiana.

*Editor Forest and Stream:*

A correspondent in your Sept. 2 number calls up memories of early days in this eastern Indiana by discussing 'coon hunting. From my earliest recollection up to about the year 1870 the older sportsmen in this section kept one or more 'coon dogs. A good 'coon dog had a money value of from \$10 to \$25. This was estimated not alone on his trailing qualities, or reliability in always locating the 'coon, and ignoring cats, rabbits, skunks, porcupines or foxes, but partly on account of his musical voice. The long-eared hound with his long drawn note and his ability to follow a cold trail rated as the most valuable.

This kind of a dog would follow a trail late into the morning. I have known them to find scent in damp spots in the middle of a forenoon though the 'coons ran in the night time. 'Coons were hunted for their pelts of course, for in those days a few dollars was an item to a poor man living in a cabin in a clearing with few opportunities for making money with which to pay the doctor and buy his necessaries. But there was another stimulant. I have known two or three settlers to gather at one place with all their dogs, at least one each, and sometimes there would be four or five hounds in the party. They usually started soon after nightfall, so that the trail when struck would be fresh. Then there was music. Three, four or five hounds bawling in chorus and running at top speed made an animated picture, though shrouded with darkness.

From a commercial point of view the long-eared hound was not the most valuable kind, as your correspondent points out. The silent dog caught more 'coons than the noisy one, but the sport, the musical features, were absent, and that took much of the zest from the play and made work of it.

The last dog I hunted with walked at my heels much of the time. He was a large shaggy fellow of uncertain breed, with pendant ears, and as intelligent look as I ever saw in a dog's eye. He would leave me like a quarter horse and a few sharp yelps told the story of a trail. Usually only a few moments elapsed until either the 'coon squealed or old Hal was barking at a tree a quarter of a mile away.

G. W. CUNNINGHAM.

## Oklahoma Quail.

OKLAHOMA, Aug. 26.—*Editor Forest and Stream:* I have been a constant reader of your journal for almost a year now and cannot say enough in praise of it. I carefully peruse every edition and have found it an indispensable source of information in the line of outdoor life. I have not noticed any correspondence from anyone from my neck of the woods, and take it for granted that a few lines from Oklahoma would be acceptable.

I am a sportsman on a small scale, but have unlimited fields which are full of quail. We have them here in vast numbers, and I hope they will always be kept so. I have a non-sale law and an open season of four months which gives us ample shooting. I have two fine dogs, one an English setter, the other a pointer, both good on quail having never worked on any other game. The quail here made an excellent hatch this year, some having their third brood off now. I have counted seven coveys, full-grown birds with over thirty birds each on one forty-acre tract of land. There is excellent cover for the birds and few people hunt them very much. The farmers in our township are complaining that the birds will become a nuisance if more are not killed during the hunting season. One farmer tells me the quail have stripped three-acre tract of caffer corn for him. However, I think he is mistaken as to the quail; they eat considerable caffer corn, but I have always noticed in my observations that large flocks of English sparrows frequent the caffer patches in this locality, and I have no doubt that they are the ones that do the damage.

Last Sunday, in walking across a half section of prairie, I flushed thirteen coveys of quail, and I had no doubt this will give you some impression of the number of birds there are here. We are looking forward to a fine season's hunting this year. It is not far away and so of us have already started making preparations for the season's shoot.

B. J. YOUNG

## Vermont Game.

SHELDON, Vt., Sept. 1.—The crop of ruffed grouse in most localities be a good one, though the birds will be small, as many of the young chicks were not hatched until about July 1, the wet weather or some other cause evidently destroying the first nests of eggs. Very few woodcock have been seen along the alder thickets, as the extremely wet season has kept much of the low ground overflowed. Deer are, if anything, more numerous than they have been since the open season for this kind of sport, though without doubt there has been a large amount of illegal deer shooting, and so far but few convictions. The deer running foxhound tribe are less numerous in numbers. Very few foxhounds are now allowed to run at large in this part of the State. There is an occasional claim put in for damage done to crops by deer. One farmer in Lamoille county recently put in a claim of \$10 for a few hills of beans that he claimed had been damaged by a wandering doe and fawns, but in most instances of this kind the farmers are ready to sacrifice something for the sake of seeing the beautiful animals about their premises.

From the sign seen about the streams we believe that the crop of mink pelts will be a good one this season and will be an important one, for a prime mink skin will bring a few dollars this year. Fox and 'coon are scarce but there is a large number of black duck in the marshes near the mouth of the Missisquoi River. This will mean good shooting out in the open waters of the bays, where the lease holders of the marshes cannot control. M. STANSTEAD.

## "Old Whale."

A SAN RAFAEL, Cal., report dated Aug. 4, records the "Old Whale," the big buck of the Lucas Valley, so-called for years past, on account of his great size, fell to the rifle of County Treasurer T. J. Fallon Wednesday. The old fellow made a great fight and killed a valuable hound belonging to Henry W. Collins, of Sausalito, and nearly placed Collins hors du combat. "Old Whale" has roared in the Lucas Valley for many years. For season after season he has been the prize sought for by many a party of hunters. Pounds and pounds of lead were whizzed at him, but he seemed to bear a charmed life. Until yesterday a bullet never even creased his hide. He is the largest buck brought to this city within the last twenty years. To-day, dressed and dried out, he weighed 155 pounds. The old monster was a coast deer, or what is called Pacific buck. These deer are found almost exclusively in the coast mountains. Their distinguishing feature is that their antlers never have more than two points each side. The deer was killed on the grounds of the Victor Club at the head of the Lucas Valley and about seven miles from this city. Those participating in the hunt were T. J. Fallon, S. A. Pacheco, H. W. Collins, Desella and Henry Martens.

## Less Game But More Law.

OPELOUSAS, La., Aug. 25.—The game is not nearly so plentiful as in the days gone by, nor do I believe that it will ever be again. The snipe are practically a thing of the past, and also ducks and woodcock. We have some quail, but not more than half what we used to have; if a man bags twenty-five or thirty in a day's shoot he is doing well. A person has to travel a good distance from town to find any shooting, and sometimes he is not successful. I think, though, this season there will be more than last, for I hear the birds whistling in every direction and several times I have heard and seen them right in the corporation of the town. We have more stringent game laws than formerly, and there seems to be a general regard for their provisions. This is passing strange, the people of this country were never known before to respect a game law; but I think that a good deal of respect has been brought about by "bluff" on the part of others.

It keeps boots and all leather soft and water-proof.—447.

# SEA AND RIVER FISHING

## Routing in Ontario.

SEA GULL, Ontario, Can., September, 1905.—The gentle art is a very old theme, coming to us from a date we little dream of. Ælianus has clearly demonstrated that fly-fishing was practiced in a rude way upward of fifteen hundred years ago. In England, thirteen centuries later, Dame Juliana Berners was the first to teach that angling inculcated patience and good will. But by far the most attractive treatise on the science, previous to Walton's, if indeed it is not the equal of the "Complete Angler," is the poetical idyl entitled "The Secrets of Angling," by John Dennys, of which four editions were printed between 1613 and 1632. The possessor of a still more rustic touch than Gay, and reeling off his piscatory fancies at far greater length than either Gay or Thompson, he is the Spenser of the water side, and has been justly termed the laureate of the craft. From his smoothly-flowing lines one may become familiar with all the secrets of the sport as it existed then, and find in him the bond par excellence of the joys of running brooks.

The poetic and thrilling sport of the angler is now sung throughout the entire land, and in such stately and graceful manner as to command the admiration of every lover of the pliant rod and singing reel. What more tender and beautiful piscatorial character is drawn than that of Kit North, the author of "Noctes Ambrosianæ," when he was a helpless invalid. His devoted daughter limned the charming picture, and it is a gem that should always endure. It thus sings its way into your heart:

"And then he gathered around him, when the spring morning brought joy jets of sunshine into the little room where he lay, the relics of a youthful passion, one that with him never grew old. It was an affecting sight to see him busy, nay quite absorbed, with the fishing tackle about his bed, propped up with pillows, his noble head, yet glorious with its flowing locks, carefully combed by attentive hands, and falling on each side of his unlined face. How neatly he picked out each elegantly-dressed fly from its little bunch, drawing it with trembling hands across the white coverlet, and then replacing it in his pocketbook, he would tell, ever and anon, of the stream he used to fish in of old, and of the deeds performed in his youth."

If any student of nature, or lover of the contemplative man's recreation, after realizing on the above, is now alive to the delicious tenderness and mild, soothing peace that hangs over the most delicate and most exquisite romance, I will endeavor to enlist his earnest attention to my piscatorial pursuit of the loveliest and most game fish that cleaves the mountain or valley stream. It is unquestionably the purest and most priceless gem of life that earth can show. No bird can compare with it, though some may surpass it in intensity of color, but none in beauty. Nowhere is there such another condensation of equal energy and quickness in equal compass. He is evidently *sui generis*.

This elevating recreation, the impassioned luxury and elixir of perpetual youth, of which the idolized beauty with resplendent stripes of orange and blazing stars is the crown jewel, I recently enjoyed along the serrated shores of a picturesque and poetic brook some eight miles from "The Rainsmere" at Sea Gull, Ontario. Its pelucid waters ran and rippled in graceful curvatures and fanciful wanderings, like a soulful rhythm of exquisite melody.

"By many a field and fallow  
And many a foreland set  
With willow, weed and mallow."

I intuitively knew what patient toil lay in wait for me, and what rare fascinations would delight both vision and heart in thus practically exemplifying the gentle art. Dense and shadowy woodlands where the blue sky is shut out and the grasshoppers' drone is faint and where tangled thicket and savage slashings had to be confronted and conquered, while the open fields, bathed in sunshine and dotted with wild flowers and alive with satin-winged butterflies and silver-throated warblers, would compensate me for all toil and loss of vigor in so earnestly seeking the finny spoils.

I was advised long before starting that the alluring fly would cut no figure on the stream, but that the ophidian of the moist earth would be the tempting tid-bit that would delight the dainty palate of the gallant knight of the spangled jacket, so emphatically the sportsman's idol of the crystal pool and the epicure's dainty dish. Glorious were the traveling joys in prospect for me; but as I had had much experience with the trickling trout stream, I was ever ready to discount at a big figure the luxurious lay-out of roseate paths and golden victims.

My guide, whose baptismal name was Albert, who was to convey me to this paradise, was an adolescent of some fifteen years, and he also sweetly sang the praises of the far away troutland as if he were an idyllic of wild-wood life and shared the secrets of nature. He presented himself with all the dash of a Cossack and a most familiar air that savored somewhat of devilry and wildness. His adjuncts were an aged roadster that undoubtedly would not be taken for the winged beast of the Apocalypse and a demoralized and creaky buggy of a by-gone period, in which I was to luxuriate as I realized on the meadows and the fields, together with their flora and fauna. Our route was over a dusty roadway that ran as straight as a fleeting arrow before many vine-covered cottages and a few ornate dwellings of more pretensions that presented a charming air in their ample and lovely flower gardens that were really a joy forever and a day. The morning was a pure delight with a soft breeze, the gentle warmth of a passing

caress that set the leaves to whispering and the yellow flags in the ditches to nodding, while the dome above was serenely azure and fleckless.

Cattle and sheep, horses and hogs, geese and turkeys, with cawing crows on wing, and a hawk with a sun-burnt breast on a fence rail, and other loitering occupants that gave animation and diversity to the scene lined the road and protestingly proclaimed in their dumb and dead language against disturbance by our wild steed of Arab breed. They were evidently of a fraternal spirit, but our youthful generalissimo, who was full of expedients, gave them to emphatically understand that they could not have the privilege of the double parlor or the front steps, or even crowd his Buccphalus out of his usual line, for a severe cut of the whip lash impressively taught them the ethics of the road. There was little of the picturesque along the drive, but you could see, if your vision was not impaired, the goldenrod and the wild carrot, the vervain and the tansy all erect on their slender stalks, as if to give greeting to admiring eyes. Butterflies with silken and velvet wings fluttered in clouds, hummingbirds in exquisite colors of blue and pink and citrine hurriedly kissed the dainty wild flowers, while a thrush, and a hermit one, sang sweetly in the shady brush. Such animation of nature's subjects was ever a delight; but my guide did not take to natural history with the eagerness of a student, for he was either whistling or humming, or artfully taking a feather with his whip out of some indolent and gapping goose, or making a beauty spot on some "purple cow" that exhibited a strong desire to block the road. I chided him for his unreal sportiveness, but he replied quite naively that "The mail must not be delayed."

"You must temper the wind to the shorn lamb," I responded.

"Haven't touched a lamb."

I then had my smile, and it somewhat mystified him; but he still slashed right and left and sang and whistled, but his reverence for Mary's little lamb was supreme.

We had now gone about four miles and came to our first brook, which ran like a silver ribbon about half a mile along the public road and then fairly lost itself under and within a riotous tangle of criss-crossing logs, snarled vines and spreading vegetation of every sort. During the few opening days of the season some generous catches are here made of the spotted dudes, and thus another realism of the early bird and worm is wove into nature's volume.

The ambitious knight of the whip, like a Hannibal in battle, sped his racer along the rough and rutty road with the cool air laden with the fragrance of pine gently blowing in our faces, as if he were in great haste to open the crusade against the tattooed tribe. The remaining four miles were soon gone over, and then we halted and stabled the perspiring steed in a barn nearby, with his manger well filled with new-mown hay and instructions given for watering the weary piece of horse flesh during our absence. The brook upon which the slaughter of innocents was to commence was at our very feet, and as we took in the introductory part of it we realized every thing but its extolled loveliness, but were confident and comforted with the idea that when we had left the old mill behind, where we had halted, that new delights, where roses and lillies bloomed and big sunflowers turned with the sun, would gratify and please beyond measure. My rod, a tough and very pliable bamboo, was soon in readiness, as also that of my attentive attendant. As the stream was entirely too brushy and snaggy to admit of using a tempting fly, which would permit the highest development of the gentle art, we each filled our bait box with worms, and after belting it around our anatomy where the vest terminates, we started through a net work of shadows, through which a partridge occasionally fluttered, and began to ruthlessly tramp down with our heavy boots the dainty wild flowers and delicate ferns that made fragrant and fascinating our untrodden path, and which at any other time would have been idolized as precious floral treasure trove. We, by agreement, took divergent paths, and then when either of us struck an inviting pool, where the coveted red fins poised, we had undivided pleasure. Sighting an intensely blue-crested and defiant-looking kingfisher that was eyeing the stream below from a dead limb of a once spreading and majestic oak, I was positive from the presence of this fish-loving bird that the spangled beauty was in staturesque poise in some pool nearby.

The idyllic stream that "sparkled out among the fern" gently tinkled by a tangle of drift and just the habitat for the princeling of the purling brook. Here some tenebrous thickets and dense alder brushes cast a grateful shade near where the deeper part of the pool shone up and where a few twittering birds gave animation to the inspiring scene, as well as additional beauty to the basin of the dotted delights, which on such a glorious morn would make a poet rhapsodize or a painter go into ecstasies. I concluded after carefully approaching the nearby sunny ripples a trifle below their silver flashes to proffer the illusive banquet with the concealed thorn. It quietly struck the rippling surface when I sent it on its deceptive mission, and scarcely had it sunk a foot or two before it was snapped up by some hungry knight of the tribe beautiful. The bite was very sudden and savage, the response quick and gentle, and then for a brief time there was an earnest struggle for supremacy and, as usual, the foeman with pliant wand and singing reel overcame the spotted and rose-tinted denizen of the crystal pool who proved the first victim of the morning's tragedy. He slowly and sadly ebbled his precious life away on the glittering sands of the meandering brook and was a very respectable representative

of the gameful tribe, as his weight came near being a pound, and I assure you a large one indeed for the small stream from which it was taken. No sooner was it laid away in shade and leafage before I heard a loud shout from the little ranger of ferny lanes and thicket avenues, that it was manifest that he had either captured a big victim or made a victim of himself by stumbling into the icy water. The dashing youth I thought too active for immersion, and thence I did not think it necessary to unduly alarm the ruby-throated warblers, or scare up a bogie, in striving to solve the problem of the echoing shout. It would assuredly explain itself soon enough, when a Robin Hood raid on the lunch basket came.

Again I strove for another dandy of the dots as the continued presence of the persistent kingfisher was evidence of more maculated trophies. The response to my tempting menu was quickly telephoned and another but smaller one was consigned to the creel as a close companion to the one already laid away in honored sepulture. This was indeed encouraging, and to make complete the piscatorial record of the generous pool, I will briefly record that five more scarlet-robed divinities worthy an epic writer's pen were rapidly consigned to the tomb of the red-coated fontinalis. The wand of Walton was evidently in hand, and nature in addition was showing the eye-pleasing beauty of foliage and flowers and the subtle charm of the rippling little stream as if it ran between banks of pearl and emerald. The vernal musicians, so numerous here, seemed to vie with one another in concert, while the flashing tints of the sunbeams painted each separate wild rose a different tint and each fern a different shade, while every single secrete of grass had its diamond drop at the end of it.

Under such a flood of music and enchantment and radiance the gentle art was being most happily exemplified by many a delightful interview with the gameful warriors of mottled sides and shapely mold. It was not all serenely glowing, for I frequently had to breast and beat my way through briars and brambles and many a slashing and tangled thicket, and only reached the rippling stream that babbled into eddying pools after much strenuous toil and physical exhaustion. Then when comfortably seated by some cool and babbling spring that was creeping into the tuneful brook, where I realized the fragrance of peace and contentment as if distilled from some golden censor, did I soulfully enjoy sweet converse with nature, who so grandly frescoes the great dome of the heaven with sunsets and the lovely forms of clouds and flying vapors.

I had taken quite a number of the idolized beauties while quietly treading the wandering brook, and at infrequent intervals when not a glimmer of sunshine was to be seen, and then where the radiance of the orb was freely falling through barred limbs with the limping water disclosing radiating bars of silver as it moved "the sweet forget-me-nots for happy lovers." Here the trout freely leaped for the myriad insects, and the beetles in their steel blue mail skimmed o'er the surface with surpassing swiftness and dainty lightness, all uniting in forming a wild and vernal picture of intense beauty and repose, where the carpet of lichens and moss that riotously runs to decay are of such wonderful beauty and softness which invariably gives that soulful impressiveness to the scene which exalts to grandeur and sublimity. It was really a pleasant paradise of solitude and solace.

"Ever pleasing, ever new,  
When will the landscape tire the view."

The sun was now blazing hot, and as I had toiled hard, my appetite was as keen as a woodchopper's and crying out for appeasement. Taking up my creel of sunset trophies, which was about half full, I commenced a hasty advance for that particular lunch basket, where both I and my youthful guide were to meet at an appointed hour. I first made my advent, as I had rapidly forged through the stubborn obstacles which every dense forest naturally presents, but when the little premier of rodcraft made his entree soon after he was a pitiful sight to behold. His face and hands and clothes were completely briar-torn, but the radiance of his countenance and the fire of his eye told a tale of triumph and felicity. No sooner had he reached my side than he impatiently began to interrogate me as to my catch. I desired him to restrain his impetuosity until he had taken lunch and then I would give him the mathematics of my morning's sport.

My little diplomatic cicerone impressed me with the idea that he had already won the iron cross in the angle that morning, and was therefore eager for the insignia. The raggedy, tattered and torn aspirant for honors in the guilt-edge guild was ravishingly hungry, and as a consequence the inviting lunch soon took on a reductive form, much like the rapid melting of a snow bank under a meridian sun. As the last crumb of the toothsome edibles gave mitigation to his rejoicing salivaries he opened his well-worn basket and emptied his glittering victims—the rodsters' cruel spoils—on the green sward, where the effulgent sun, which then prevailed, made them glitter like the precious jewels of a queen's tiara, which, to him just then, were far more precious than a pinkish pearl, or a lavender lilac from the enchanted gardens. His nimble fingers soon had the numerals, but, "ye gods and little fishes," the best half of them were fingerlings and came under the ban of the law. Pointing to those I had selected as illegal, I told him "they are not to be counted as being in the swim, as they simply will have to be discarded and dishonored."

"Oh, my! they are all right and the choicest of the lot for the table, for you can eat them head, tail and all."

he responded with great surprise at my condemnation strictures.

Not deserving comparison with such tid-bits of deliciousness, I simply uncovered my lovely samples, which were reposing on a bed of green leaves in my creel, and let him feast his eyes on the golden-finned and crimson-stained fontinalis as if they were as sacred as an image in Joss temple and should evoke the same idolatrous treatment. He was surprised at their proportions, and when I told him that I had returned to the stream as many more undersized ones, he was still greater surprised. By way of an apology for his lack of discrimination in statutory sizes, he stated that "little or no regard is here paid to size, as every trout, big or little, is here considered an honest trout and then the game warden is near sighted and carries no scale of inches and the best of all lives fifteen miles away and don't fuss over little things anyhow. But kill a deer during close season and up you go." The little briar-torn pleader's presentation of the case in question was very artful, as well as amusing, but nevertheless, it expounded to a nicety the principle that custom makes laws, and that self-defense is the oldest law of nature.

I was content with the catch we had made, as enough is as good as a feast, I thought, and suggested our return; but as the ambitious neophyte of the gentle art was greedy for more, I gave way to his earnest desires. No Virgil was ever so enraptured with his Æneas as this mischievous little imp of the angle. Opportunities presenting, he will soon become a stellar light in ye ancient craft, and then the barnyard hackle with him will be a thing of the past. I will here state in justice to my efficient aide de camp that my piscatorial success was solely attributed to my having unknown and fortunately chosen the correct route that led to the best pools, where in generous numbers these lovely Narods grow golden and gameful.

After a good rest, I arose quite refreshed, and as I had planned, started on a detour so as to avoid the part of the stream I had already angled, leaving the youthful devotee to select his own waters. I, however, repented of my afternoon's exploit long before I had reached the desired locality, for it had thorns as well as roses. I was, however, repaid in a measure by my woodland walk, as there was much to delight the eye and please the fancy.

My tramp was through thick bushes and grasses and tangles of wild flowers crowding the open spaces where the sunshine fell, while ever and anon the poetry of the scene was all lost when I had to conquer a slashing or two that forbade my approach to the bank of the babbling brook I sought. I persevered in my just endeavor, and after affrighting a red squirrel that was barking in a slanting sunbeam on a tall elm and disturbing the soprano notes of a catbird, I caught a glimpse of the rippling rivulet that sparkled like a stream of liquid diamonds, and was soon at its grassy marge lifting out marvellous fish of rainbow hues and graceful symmetry. It would be a twice told tale to give every rapture and thrill that possessed me as I coaxed, impaled and landed these red and gold rovers that came from the mountain streams, where they caught the initial imprint of the sun's early rays and the first drops of the crystalline water of the cloudburst ere they were tainted with the soot and grime and dust of the lower regions. Its birthright evidently savors of the celestial.

I took one among the dozen I had captured on my second raid that weighed over a pound. He was poising in a big and deep pool and had just leaped for an insect that was skimming over his trysting place as happy as a lover when he was suddenly taken from his beautiful world. Honors, however, were even when I played a similar game on the iridescent denizen of the flower-lined pool. He had anticipated a toothsome banquet when he saw my down dropping bon-bon of deceit, but in lieu read his death warrant when he closed his blood red paws upon it. This is the sweetness of life burned in stogyian darkness while the little stream sang and rippled on as cheerily as though no tragedy had been consummated, where the air is sweet with the fragrance of flowers.

Having captured all I desired of these lovely creatures that beautify the tinkling stream, I prepared for beating and breasting my way back, and, I assure you, that regardless of all floral life that beset my path, I hastened on to overtake the juvenile piscator who had doubtless ere this made another invoice of lilliputs or tom-tits of the stream for me to condemn and for him to eulogize for the spit.

When I had at last reached our base I there found the youthful rodster idolizing a pound and a half brook beauty, the colors of which no painter's brush ever matched, nor did a sculptor's chisel ever trace such perfect symmetry. He had, he excitedly stated, caught it on the "yank 'em out" principle with the result of a broken rod, though not a very costly one, and which he immediately replaced by one from nature's vast storehouse, which, he declared, would land anything from a minnow to a maskinongé. I showered generous adulations upon him for the blue ribbon capture, and as a peroration to my eulogy stated that he was really deserving of a crown of gold. After the blushing effects of my panegyric had passed away he turned to me, and with a significant look and opera bouffe mannerism, announced: "If I did catch the smallest fish I also caught the largest." And then he felt the sweetness of piscatorial glory and his sparkling eyes and swelling pride proclaimed it to the warbling birds, the whispering pines and the fragrant flowers which so lavishly environed us.

The long silent shadows were now changing the brightness of the earth and Phœbus was putting on her royal robes for her luxurious couch, and as we had a long drive over the highway we hurriedly prepared for our departure. Our road was solely through a pastoral country in which the woodman's ax had almost eliminated the forest. A few small groves, however, were left standing that gave shelter to the cattle in hot and stormy weather and also served most happily as a nesting place for birds. The roadway was dusty, but the sky which had enriched itself since morning with the colors of a painter's palette, was now supremely magnificent.

These were marvels in grays and white, and blues were never wrought in such matchless splendor, while the gold and crimson, never inseparable from a western horizon

when there is no entire obliteration of sunshine, were just ravishingly lovely. Such pinks and bronzes never tinged the ragged edges of the rolling clouds, and never did the snow banks ever look so intensely white and so transparent and ethereal. They were an absorbing study for anyone who possessed the slightest love for the fascinations of cloud life, even the adolescent angler would frequently take his keen eye from the roadway and the innocent game he was always looking for and gaze in raptures upon the grand *mise en scene* that nature was then so enchantingly presenting in the arched dome.

The few trees that we saw along the road looked in the declining sun as if they had a sash of gold and crimson wound about their rugged loins, the bushes that clustered here and there where some son of the toil had kindly spared them, stood in silent beauty with quiet tents, a field of daisies and buttercups would suddenly enchant with impressive seas of color which boldly defied imitation, and then a tiny purling brook in shimmering silver that ran between grassy banks would flash upon you, and to give poetic enchantment to the truly pastoral scene some wood sparrow would start his sweet vesperian chant while the locust's song filled the measure of melody.

After we had gone quite a distance I noticed Albert, the alert, looking very eagerly in advance as if he were fairly aching to shoot off that stinging whip he held so firmly in his clenched hand. By way of admonition I here said to him in as solemn a tone as a divine: "That man is born barbarous, and ransomed from the condition of beasts only by being cultivated and obeying the laws of both God and man; and I sincerely hope that you will bear this in mind and endeavor to check your evil propensity for striking at every living thing you pass on the road." The brief sermon amounted to nothing and was as sounding brass and tinkling cymbals, for he at once responded:

"Certainly, but bear in mind that the mail must not be delayed."

This bon mot was the Alpha and Omega of all his witi-cisms. He doubtless had picked it up on the road when his spavined and rheumatic steed was carrying some humorist who valued time as money.

Amid the deep tranquils which prevailed we made meritorious advancement, as the steady pace the equine was going was doubtless the result of the vesperian banquet of oats and hay which awaited him at the final termination of our drive: The whip and wit (?) and guide, and so on, kept his musical oleo in full blast, as if run by a threshing machine, as we sped along, as he was ever whistling, humming or snapping his long-lashed whip with which he affirmed he could hit either a fly or pin-head at a reasonable distance, and to convince me of his assertion, he at once snapped off the head of a dainty daisy that charmingly enriched the roadside. Cæsar had his Brutus and Charles I. his Cromwell, but to the irrepressible Albert it was given to pose as the royal cracker-jack of the empire of the far-reaching highways, and that without fear of dethronement or assassination.

Coming to a very comfortable and neat cottage that had an air of prosperity about it, we noticed at the front door a sweet looking girl of tender years, with the sunshine playing with her auburn curls and creeping down her dress like a caressing hand of light. Her cheeks—the very ideal of symmetry—were in a deep and roseate glow, and would have won the admiration of a praxitiles, while her pinkish lips rivalled the coral of the south seas. It was an exceptional picture, really a vision in a desert. Albert, who had doubtless seen the innocent figure long before I had, with the ardor of a Romeo threw her a graceful kiss and then immediately after excitedly exclaimed: "I know that girl."

"Your sweetheart?"

"Can't say yet."

On looking around I saw the sudden tell-tale radiate on the lovely maiden's face, and that was surely the affirmation.

As we again ran across the fateful purple cow who had got a stinger from the whipster on our trip out, he quickly gathered himself together for a repetition of the same shameful act. Coming abreast of her he raised his whip on high to give her a gentle reminder relative to the mail, and as it was about to descend on its cruel mission, I alertly caught it on the fly and then laughed in his surprised face, thus spoiling his prospective tableau. He cheerfully joined in the laugh, saying:

"That cow has been pestering me for a long time, and I never meet her but what I feel like making a red mark on her. Hang a purple cow, anyhow, I say."

We finally brought up at the hotel and on parting the reckless and audacious little lad who, despite his idiosyncrasies of the whip, I learner to like so much on the trip, turned, and with glowing pride on his expressive face and a mischievous twinkle in his eye, piquantly inquired: "Who caught the biggest trout?"

"Who caught the most fingerlings?" was my significant response, and then with simultaneous laughter that loudly and cheerfully rang out, the song of the brook and the trout was ended, and the picture of the old angler and his young and frolicsome guide in the piscatorial exploit completed and so concludes one of the most delightful trouting trips I ever experienced on St. Joseph's Island.

ALEX. STARBUCK.

### Salmon on a Spoon.

Editor Forest and Stream:

The anglers who fish the Ristigouche and tributaries are beginning to find out that salmon will take a spoon. A friend of mine constructed a copper spinner this summer and caught a salmon, in the Matapédia. He uses it generally for sea trout fishing, but thought he would try the salmon, which he did with the above result. I have often thought of trying a spinner in the channels of Bathurst Harbor when the salmon are coming in, and I believe it would take. I understand grilse have also been taken in the St. John River, below Fredericton, with bait and spinner. This is another confirmation of Hallock's "Salmon Fisher."

C. H.

THE current edition of the *Game Laws in Brief*, sold everywhere, contains all the fish and game laws a sportsman ought to know. It is complete, accurate and up-to-date.

### Newfoundland Experience.

ON returning from an outing of two months from Newfoundland last Saturday, and on buying FOREST AND STREAM, I saw on your title sheet "Report your luck to FOREST AND STREAM," so it is up to you to do what you wish with this article, written for the benefit of brother sportsmen intending to shoot and fish in that almost uninvaded country, where it costs nothing for the privilege of catching all the fish you can, only paying for your guides and camp outfits (including food and boat) about \$6 a day, viz., two guides \$1.50 each per day, \$3 per day for camp outfit and grub for three. This is the price asked by the Bay St. George Hotel, Stephenville Crossing, and the Log Cabin, Spruce Brook, either by the day or week. I found by a month's camping out I could cut down the grub account by buying it at St. Johns, or at Stephenville Crossing, or the Bay of Islands, by less than one-half, as canned stuff cost about \$1.35 a dozen and most of the guides will procure you a camping outfit with cooking utensils at a small cost, or none, if they have their own. I should advise taking your own tent, say 7x9, in your personal baggage. It will do nicely for two or three, as in my case. I had only one tent of this size and two guides. Get a fly with your tent, as it is warm in the middle of the day and the fly is most useful in heavy rain storms. Also I should recommend taking a piece of canvas, 4x7, with grummet holes on edge, so it can be attached by a lacing cord to poles raised from the ground on forked sticks, which insures you a dry bed.

This is also useful in doing up your stores. It might be made double and could then be used as a bag for your blankets and extra traps. Take a rubber pillow. Only warm, thick woolen clothes are needed; also rubber coat, wading stockings, and canvas shoes with nails to tie over same. A good salmon rod, 14 feet, weighing about 1½ pounds, I found suitable for both grilse and salmon, and light enough to handle most of the day without exerting any extra muscles. A good reel, holding 100 yards of line, and about four dozen small-sized salmon flies—none larger than a good-sized trout fly.

I do not advise the use of the double hook fly, as I found, on the fish working against the rod, one hook was apt to back upon the other and break off or work out. The flies most successful on all the rivers this year were the old patterns, Jock-Scot, silver-doctor, black-dose, black and brown-fairy, Durham-ranger, silver-gray. If the fish will not take these, ask some friend to give or lend you one of his special kind, and if you keep them you will have a dozen unknown and mostly unnamed varieties to the good or bad, as you find them. The fact of the matter is when grilse are taking, more so than the full-grown salmon, the fish rushes the fly as if he wants it, call it Jock-Scot or silver-doctor; otherwise he will come and take a pick at the feathers, which I have seen him do on a change of three flies with no better success. I took several large salmon by changing and putting on a fly of the same kind, a size smaller than the one I was using, after having had several swirls or breaks with no take. It is no use fishing with flies the size of those generally used on the Restigouche River, or in New Brunswick waters.

I was camped on the Dump Pool, Harry's Brook, and had to leave three days prior to Capt. Gillet's kill of the 25-pounder. I was after that fish for weeks, and while seeing him frequently, could never get him to take, although I rose him several times. I killed one of 22½ pounds, which measured 38¾ inches long and a girth of 22 inches. Also one 39½ inches long by 18 inches girth, which weighed just under 16 pounds, and was much the gamiest and handsomest fish. I killed the first in 22 minutes and took half an hour to land the other. How about guessing the weight of salmon from measurements? I was fortunate in killing thirty-six salmon, fourteen of which were large ones.

As to rivers to fish and best time to fish them, making allowance for wet spring after heavy falls of snow like last winter, or dry season like 1904, I found them by accounts given by gentlemen sportsmen and guides on the west coast, to be as follows: The Grand Cordroy, the earliest, commencing June 1 in the lower pools from the tidewater pools to the overfull pools. After July 1 the big salmon pool, the forks pool, and others higher up, are good until Aug. 1. Get off at Doyle's Station, about an hour's ride by rail from Port au Basque. Mr. Doyle has a comfortable farmhouse, and either he or his sons will give you reliable information as to fishing and guides. Little River, three miles south from Doyle's, is the best Aug. 1. It is a good sea trout river in June. There is a fair house, Tompkins', on Little River, which is generally filled with sportsmen. Two hours further north by rail you come to Crabs, on Crabs River; good grilse, sea trout and some salmon here; time, June 15 to July 15. Next above on the railroad is Fishel's, then Robinson's, both good rivers, July 15 to Aug. 1, with sea trout, grilse and some salmon. Then comes Stephenville Crossing, at the head of Bay St. George. Here the Bay St. George Hotel is good and comfortable, Martin proprietor. From this point you have the choice of Harry's Brook, Bottom River, Southwest River, and others emptying into St. George Bay. Guides and camp outfit may be secured at Bay St. George Hotel or Martin's. The fisherman can make private terms with local guides for two or three weeks' trip on these rivers at a much reduced rate.

Next comes Log Cabin, Spruce Brook, twenty miles further up, on Harry's River, Chas. Dodd, proprietor. The Log Cabin contains about sixteen rooms, very home-like, good food, and host who is most energetic in getting you good sport. It is at this station that the caribou hunters find their paradise—best time to hunt, Sept. 15 to latter part of October. The license for visitors to hunt deer is \$50, which allows the hunter to kill or take out three stags only. The proprietor guarantees, in a week's hunt, to give the shooter a chance to kill his three stags, or no charge for outfit. Duck and snipe are plentiful about St. George Bay from Sept. 15 to Nov. 1. I saw quite a number of bay snipe in August, and understand that the English or Wilson snipe are found in large numbers on the bar-

rens in September, when salmon fishing is ended, the fish seldom taking a fly after that period, but lay sluggish in the pools. So I advise taking gun if one wishes to continue on in September or later.

Two hours still further upon the railroad you reach the beautiful Bay of Islands, on the Humber Basin, into which empties the Humber River, most justly celebrated as the best of all Newfoundland rivers, as its record has never been beaten as to size and number of fish taken in its water, as is proven by our fellow countrymen who make their summer camps on its banks, especially about the falls, where almost any hour of the day in August one can see salmon leaping that obstruction, and I have heard of eight being taken in the forenoon by one rod. It did not fish well early this season, as the river was over its banks and very dirty. There are a number of good rivers near the Bay of Islands, but one must camp if he goes afield. Fox Island River and the Serpentine, both easily accessible from Petrie's Hotel, about a mile from the station, and commanding one of the most attractive views in the world. One could easily imagine oneself in Norway, the high mountains running down into a vast fjord. It is a good small hotel; but do not forget you must walk, as there is only one trap, like a training sulky, in the town. At the Bagg Bros.' everything can be procured, guides, camp outfits, etc., thoroughly reliable. From here one can go 300 miles by rail through a wilderness to St. Johns, the capitol, but a wilderness interlaced with rivers, streams and lakes all filled with the gamiest of the fish family—the *fontinalis*. There are Deer Lake, Indian, Grand, the Terranoveau River, and others, too numerous to mention.

I will give a few tips to brother sportsmen, which may be useful.

The fare from New York to Halifax and return via Red Cross Line is \$24. Halifax to Bay of Islands via Sidney, Cape Breton Island, eleven hours train, thence steamer Bruce, six hours, to Port au Basque; no charge for berth; then by rail six hours to Bay Island and return to Halifax, \$23.50. Stop-overs are allowed on this ticket at all stations. The fisherman must remember that on arriving at Newfoundland he must leave a deposit of 20 per cent. of the value of his rods, guns, cameras, canoes, etc., which will be returned to him on his return, if he has the articles which he brought into the country still in his possession. Ordinary hotels and farmhouses \$1 a day or \$5 and \$6 a week. C. DuB. W.

## Izaak Walton and the "Compleat Angler."

A Lecture by Mrs. Comstock before the Chautauqua Assembly. (Concluded from page 217.)

That the opportunity for thought was one of the chief attractions that angling had for Izaak Walton no reader of "The Compleat Angler" can doubt. He says: "It remains yet unresolved, whether the happiness of man in this world doth consist more in contemplation or action. Concerning which two opinions I shall forbear to add a third by declaring my own, and rest myself contented in telling you, that both these meet together, and do most properly belong to the most honest, ingenious, quiet and harmless art of angling. And first I shall tell you what some have observed, and I have found to be a real truth, that the very sitting by the riverside is not only the quietest and fittest place for contemplation, but will invite an angler to it. Peter Du Moulin observes that when God intended to reveal any future events or high notions to his prophets, he then carried them either to the deserts or the seashore, and having so separated them from amidst the press of people and business, and the cares of the world, he might settle their minds in a quiet repose and there make them fit for revelation. And of the apostles of our Saviour, of which twelve we are sure he chose four that were simple fishermen, and it may be noted first, that he never reproved these for their employment or calling, as he did the scribes and money-changers. And secondly, he found that the hearts of such men by nature were fitted for contemplation and quietness—men of mild, and sweet, and peaceable spirits as indeed most anglers are. And it is observable that it was our Saviour's will that these our four fishermen should have a priority of nomination in the catalogue of his twelve Apostles. And it is yet more observable that when our blessed Saviour went up into the mount, when he left the rest of his disciples and chose only three to bear his company at his transfiguration that those three were all fishermen."

"Ven. Sir, though I am no scoffer, yet I have, pray let me speak it without offense, always looked upon anglers as more patient and more simple men than I fear I shall find you to be.

"Pisc. Sir, I hope you will not judge my earnestness to be impatient, and for my simplicity, if by that you mean harmlessness, or that simplicity which was usually found in the early Christians, who were as most anglers are, quiet men and followers of peace—men that were so simply wise as not to sell their consciences to buy riches, and with them vexation and a fear to die, if you mean such simple men as lived in those times when there were fewer lawyers, when men might have had a lordship conveyed to them in a piece of parchment no bigger than your hand, though several sheets will not do it safely in this wiser age—I say, sir, if you take us anglers to be such simple men as I have spoken of, then myself and these of my profession will be glad to be so understood."

Another important fact in Walton's enjoyment of angling was that with all his mind he believed it to be a true art and practiced it as such. We find everywhere in his lines this belief suggested or openly expressed, and as the practice of any art is uplifting if done worthily, so was Walton ever on a higher plane because his angling was a true art. Much testimony of this do we find in "The Compleat Angler."

"As to angling it is an art, and an art worthy the knowledge and practice of a wise man. O, sir, doubt not but that angling is an art. Is it not an art to deceive a trout with an artificial fly; a trout, that is more sharp-sighted than any hawk, and more watchful and timorous than your high-mettled Merlin is bold? Doubt not, therefore, sir, but that angling is an art, and an art worth your

learning; the question is rather whether you be capable of learning it, for angling is somewhat like poetry, men are to be born so; I mean with inclinations to it, though both may be heightened by discourse and practice, but he that hopes to be a good angler must not only bring an inquiring, searching, observing wit, but he must bring a large measure of hope and patience, and a love and propensity to the art itself, but having once got and practiced it, then doubt not that angling will prove to be so pleasant, that it will prove to be like virtue, a reward to itself."

Again he says impressively: "For I tell you, scholar, fishing is an art, or at least, it is an art to catch a fish."

But it is not because he says so that we believe his angling an art but because as we read we are profoundly impressed with his technique, all knowledge, whether gained from books or experience, is made to minister to his art. Take his directions for making flies: "I confess, no direction can be given to make a man of dull capacity able to make a fly well, and yet know this, a little practice will help an ingenious angler in a good degree, but to see a fly made by an artist in that kind is the best teaching to make it. And then an ingenious angler may walk by the river and mark what flies fall on the water that day, and catch one of them, if he see the trouts leap at one of that kind. And then having always hooks ready hung with him, and having a bag also always with him, with bear's hair, or the hair of a brown or sad-colored heifer, hackles of a cock, several colored silks and crewels to make the body of the fly, and the feathers of a drake's head, and black or brown sheep's wool, or hog's wool or hair, thread of gold and of silver, silk of several colors, especially sad-colored to make the fly's head, and there be also other colored feathers both of little birds and speckled fowl. I say, having those with him in a bag, and trying to make a fly, though he miss it at first, yet at last shall he hit it better, even to such a perfection as none can well teach him. And if he hit to make his fly right and have the luck to hit also where there is a store of trouts, a dark day, and a right wind, he will catch such store of them as will encourage him to grow more and more in love with the art of fly-making."

When Walton describes the making of a minnow we see another phase of him which gives us the opinion that he found women better skilled in the manufacture of bait than in using the same to catch fish; though the lady in question evidently caught the fisherman with her minnow with small trouble and true skill, he says: "I will show you an artificial minnow that will catch a trout as well as an artificial fly, and it was made by a handsome woman, that had a fine hand, and a live minnow lying by her." Then follows a detailed description of the cunning workmanship and he adds: "The eyes were of two little black beads, and the head was so shadowed and all of it so curiously wrought, and so exactly dissembled that it would beguile any sharp-sighted trout in a swift stream."

Evidently he was sometimes nettled by people who had little appreciation of scientific fishing. Hear him: "'Tis an easy thing to scoff at any art or recreation; a little wit, mixed with ill-nature, confidence and malice will do it."

A lesson is here, and that is to make an avocation mean much to us, do it well. Have a fad and enjoy it. We do a little here and a little there and none of it too well. See how Walton made his recreation a perfect thing and all enjoyment.

Walton's long and happy communion with nature taught him that many things were to be desired rather than great riches. "And for you that have heard many grave, serious men pity anglers let me tell you, sir, there be many men that are taken by others to be serious and grave men whom we condemn and pity. Men that are taken to be grave, because nature hath made them of a sour complexion, money-getting men, men that spend all their time, first in getting, and next in anxious care to keep it; men that are condemned to be rich, and then are always busy or discontented; for these poor rich men, we anglers pity them perfectly. Nay, let me tell you there be many that have forty times our estates, that would give the greatest part of it to be healthful and cheerful like us; who with the expense of little money have eat and drank, and laughed and angled, and sung and slept securely, and rose next day and cast away care and sung, and laughed, and angled again; which are blessings the rich man cannot purchase with all his money. Let me tell you, scholar, I have a rich neighbor, that is always so busy that he has no leisure to laugh, the whole business of his life is to get money and more money; he is still drudging on, and says that Solomon says, 'the diligent hand maketh rich,' and it is true indeed, but he considers not that 'tis not in the power of riches to make a man happy, for it was wisely said by a man of great observation, 'there be as many mysteries on the other side of riches, as on this side of them.' And yet, God deliver us from pinching poverty and grant that, having a competency, we may be content and thankful. Let us not repine or so much as think the gifts of God unequally dealt, if we see another abound with riches, when as God knows, the cares that are the keys that keep those riches hang often so heavily at the rich man's girdle, that they clog him with weary days and restless nights, even when others sleep quietly. We see but the outside of the rich man's happiness. Let us, therefore, be thankful for health and a competence, and above all, for a quiet conscience."

That his scholar is an apt pupil in this philosophy we see in the following: "I sat down under a willow tree by the water side, and considered what you had told me of the owner of that pleasant meadow in which you then left me; that he had a plentiful estate and not a heart to think so; that he had at this time many lawsuits depending and that they both damped his mirth and took up so much of his time and thoughts that he himself had not leisure to take the sweet content that I, who pretend no title to them, took, in his fields, for I could sit there quietly and, looking on the water, see some fishes sport themselves in the silver stream, looking on the hills I could behold them spotted with woods and groves; looking down the meadows could see here a boy gathering lilies and ladysmocks, and there a girl cropping culverkeys and cowslips, all to make garlands suitable to this present month of May. These and many other field flowers so perfumed the air that I thought that very meadow like that field in Sicily of which Diodorus speaks. As I thus sat joying in my own happy condition, and pitying

this poor rich man that owned this and many other pleasant groves and meadows about me, I did thankfully remember what my Saviour said, that the meek possess the earth, or rather they enjoy what others possess and enjoy not. For anglers, and meek, quiet-spirited men, are free from those high, those restless thoughts, which corrode the sweets of life. There came to my mind at that time certain verses in praise of a mean estate and an humble mind. They were written by Phineas Fletcher, an excellent divine and an excellent angler:

"No empty hopes, no courtly fears him fright,  
No begging wants him middle-fortune bite,  
But sweet content exiles both misery and spite.  
His certain life, that never can deceive him,  
Is full of thousand sweets, and rich content;  
The smooth-leaved beeches in the field receive him  
With coolest shade, till noonday's heat he spent;  
His life is neither tossed on boisterous seas,  
Or the vexatious world, or slothful ease:  
Pleased and full blest he lives, when he his God can please."

Much and close association with nature did not serve to make Walton a recluse or hermit but rather served to make him discriminating in the choice of his companions. We need never fear that there was aught to shock the delicate sensibilities in the conversation of those who gathered in "that honest ale house, where we shall find a cleanly room, lavender in the windows, and twenty ballads stuck about the wall." Walton was fastidious in his selection of comrades, but once he found them congenial he was the prince of good fellows. He says of a man: "To speak truly, he is not to me a good companion, for most of his conceits were either Scripture jests or indecent jests, for which I count no man witty. But a companion who feasts the company with mirth and wit and leaves out the sin, he is the man."

Again he says: "Well sung, Coridon; this song was sung with mettle, and it was choicely fitted to the occasion. I shall love you for it as long as I know you. I would that you were a brother of the angle, for a companion that is cheerful, and free from swearing and scurrilous discourse is worth gold. I love such mirth as does not make friends ashamed to look upon one another next morning, nor men that cannot well bear it, to repent the money they spend when warmed with drink."

Omar says: "See that thou drinkest not thy wine in the company of some clown, riotous, having neither wit nor manners. Naught but dissensions can come of it. In the night time thou wilt suffer from his drunkenness, his clamor and his folly. On the morrow his prayers and his penitence will cause thy head to ache."

Many a fisherman of our time who finds in Walton the injunction to "Go to yonder sycamore tree and hide your bottle of drink under the hollow root of it" pays little attention to his constant teachings to drink from that bottle with moderation and restrain its use to the meal time. He is a believer in true temperance and says he would "rather be a civil, well governed, well grounded, temperate, poor angler than a drunken lord."

### Walton's Respect for Law.

He believed in obeying all laws, and like the true sportsman of to-day he was the bulwark of the game laws, for these be the usual months that salmon come out of the sea to spawn in most fresh rivers and their fry would about a certain time return back to salt water if they were not hindered by weirs and unlawful gins, which the greedy fishermen set and so destroyed them by thousands.

That which is everybody's business is nobody's business; if it were otherwise there could not be so many nets and fish that are under the statute size sold daily among us, and of which the conservators of the waters should be ashamed.

It is, however, when we realize how profound was Walton's appreciation and enjoyment of the beautiful in nature that we can understand that his angling meant not only the practice of an art but that the field of this art was a gallery of ever changing, ever more beautiful pictures painted by nature's hand, a hand whose technique has never been questioned. I have always felt very sorry for those of my acquaintance who found their most beautiful pictures in an art gallery; I always felt that those people were trying conscientiously to love beautiful things which is about as hopeless an effort as I know, and about as futile in its results. The one who best appreciates the painted picture is the one who has seen it and felt it and loved it a thousand times before in nature. Izaak Walton was a true artist even though he never saw a painted picture and never painted one with aught save words. Here are some of his word pictures.

Walton's wit is subtle; it is rather an undercurrent of quaint humor that now and then touches the surface, but is always felt to lie underneath his discourse: "I will give you some observations on how to dress a carp, but not till he is caught." Again he consoles his scholar: "Nay, the trout is not lost, for pray take notice, no man can lose what he never had."

"But turn out of the way a little, good scholar, toward yonder high honeysuckle hedge, there we'll sit and sing while this shower falls so gently upon the teeming earth, and gives yet a sweeter smell to the lovely flowers that adorn these verdant meadows.

"Look, under that broad beech tree I sat down, when I was last this way a-fishing, and the birds in the adjoining grove seemed to have a friendly contention with an echo, whose dead voice seemed to live in a hollow tree, near to the brow of that primrose hill, there I sat viewing the silver streams glide silently toward their center, the tempestuous sea; yet sometimes opposed by rugged roots and pebble stones, which broke their waves and turned them into foam, and sometimes I beguiled time by viewing the harmless lambs, some leaping securely in the cool shade, while others sported themselves in the cheerful sun. As thus I sat, these and other sights had so fully possessed my soul with content that I thought, as the poet hath happily expressed it, I was for that time lifted above earth.

"I tell you, scholar, when I sat last on this primrose bank and looked down on these meadows, I thought of them as Charles the Emperor did of the city of Florence, that they were 'too pleasant to be looked on, but only on holy days.'"

Nor does Walton lack an eye for details and the genre picture, as is evidenced by the following description of

the trout: "Their bodies are adorned with such red spots as give them such an additional natural beauty as I think was never given to any woman by the artificial paints and patches in which they so much pride themselves in this age. \* \* \* Trust me, scholar, I have caught many a trout in a particular meadow, that the very shape and the enamelled color of him hath been such as hath joyed me to look on him, and I have then with much pleasure concluded with Solomon, 'everything is beautiful in his season.'"

It is to be expected that a man with so much artistic feeling had great appreciation of music and poetry. Song is one of the chief enjoyments of "The Compleat Angler," and its pages overflow with the quaint and beautiful verse of Herrick, Marlowe, Raleigh, Donne, Davison, Drayton and Wotton, some of these poets whose lines would never be known to us to-day had they not been preserved in the amber of Izaak Walton's classic book.

Through the dust of changing centuries there has trickled down to us a brook of purest water—sometimes meandering and doubling itself in green meadows and sometimes dashing over rocks and plunging over falls. From this brook many a weary soul has quaffed a refreshing drink, and has paused to hear the throble sing, and see the graceful creatures that people it. It is a brook that has gained as the years went on, and has lost none of its waters or its freshness. It is the brook on whose banks wanders a man whom we lovingly call old Izaak Walton—old because he is eternally young, and always a happy and delightful companion.

## Where Anadromous Fishes Winter.

*Editor Forest and Stream:*

The question has been put to me by parties engaged in the tedious sea trout controversy (which seems to have been happily shifted from FOREST AND STREAM to other publications) as to whether these much disputed fish, the sea trout, do not in part winter at sea while another part admittedly remain in the rivers, as salmon are known to do.

Now, it occurs to me that a general statement which will cover the known movements of several species of migratory and anadromous fishes will help most decidedly to settle this mooted point. To begin with, we know for instance, that in the distribution of marine fish fauna a great many species are found south of Cape Hatteras which are seldom seen north of it. The same may be said of the ichthye representation between Cape Hatteras and Cape Cod, and between Cape Cod and the Bay of Fundy, while in the higher latitudes the number of species is restricted to comparatively few types, of which the *Salmonidae* are the most abundantly represented. Now, these various species, wherever found, as soon as their seasonal migrations begin, are first seen in the lower latitudes. The shad, for example, first appears in Florida waters, sometimes as early as Jan. 1; then in the Savannah River, then in the Cape Fear, then in the tributaries of the Chesapeake, then in the Delaware, Hudson, Housatonic, Connecticut, Merrimac, and so on up to St. John, N. B. Striped bass show up in like manner, moving northward, and meeting a run of yearlings which have spent the winters in the rivers; in the Hudson River as early as February.

Bluefish begin to appear in the waters between Cape Hatteras and Long Island Sound in mid-summer, and in July, when shrimp are running, they meet the yearlings, locally known as snapping mackerel, coming out of the Quinipiac at New Haven. Weakfish begin to appear in North Carolina waters in December (they have been caught all through the fall months in the warmer waters further south), and by June they are at New Haven, after having successively passed the Virginia Capes and New Jersey coast. Likewise we have the seasonal movements of the menhaden, Spanish mackerel, tunas, etc. They all come in from the sea first at points below Hatteras, and afterward at points north of it successively up to the Maine coast.

The question would be, where have these fish wintered? All fish breeders know by experience how essential warmth is to fecundity, and the fish know it by instinct. With the Gulf Stream convenient, is it not reasonable to suppose that all these migratory and anadromous fishes resort to it for its agreeable temperature and abundant food? It is not only a logical hypothesis, but it has been sufficiently proven by the presence upon its deep blue surface of multitudes of fishes of various species which have been seen foraging among the beds of seaweed which accumulate in the lateral eddy that sets back along the edge of the current. These marine algae carry a great variety of minute crustacea and other forms, and spars covered with barnacles are often seen among the drift. On one occasion, on a voyage from Halifax to Bermuda, a lot of sea bass were noticed which had been tempted from the depths below.

Coming now to salmon, whose habitat is hyperborean, we find that they first appear in the rivers of Maine and Nova Scotia while the fluvial ice is yet running; then gradually working up the north shore of New Brunswick to the Bay Chaleur and onward, finally appear in the rivers of the lower St. Lawrence in June. Following these are the sea trout, known commercially as such from earliest date, and close imitators of the salmon movements, commencing with the "strawberry run" (or when strawberries blossom) on the southeastern coast of Nova Scotia and moving northward as the season advances until they reach the Belle Isle Strait, detachments dropping off as the main body advances, into the numerous rivers along the coast, and, like the salmon, shad, bluefish, rockfish and other species, encountering a considerable quota of their kind, most of them lean, spent, and ill-favored, which have wintered under the ice in the rivers after spawning. Do not these fresh-run sea trout likewise come in from the sea? or, to be more precise, from the nurturing Gulf Stream where their congeners have quartered? Is there any negative?

*Mem.*: It is a wise provision of nature that fish food should not be all in one place at the same time. Boreal residents require subsistence as well as those under the tropics. The great ichthy armies are divided and apportioned so as to provide all the inhabitants of the globe with a modicum of provender, and this explains the "whyness of the what" more nearly probably than an extruse scientific paraphrase. CHARLES HALLOCK.

## The Gang Hook.

*Editor Forest and Stream:*

A gentleman writes in the following terms regarding the practice of using a gang or a number of gangs in connection with angling lures: "During the past five years I have noticed a large increase in the number of kinds of lures placed on the market, for the capture of game fish. Most of them have gangs of hooks on them numbering from nine to fifteen hooks. These lures are largely sold to a class of people who go out to see how many fish they can catch and then boast of it. Anyone who can drag a hand line through the water can catch fish with these infernal contraptions. I would rather be found dead at a dog fight than to be caught with one of these baiting contraptions."

The practice of using gang hooks seems to have originated in England and to have come from that country to this. Indeed, I have often found cause for wonderment, in perusing the English angling papers, at the seemingly utter unscrupulousness of the angler of that country as to means of catching his quarry. It seems to me that the angling tackle of old England is brutal, domineering and overbearing. The angler uses, commonly, an extremely heavy rod, it being his evident purpose to get fish at any cost and to give the fish as little show as possible. One frequently reads stories of an angler going out and using the fly, worm, live minnow and spinner with gangs, on a day's fishing for trout, each lure being used when it seems to be most effective. Some of the English gang baits which are advertised are certainly ferocious looking things, and I may say that the whole tenor of sport as practiced in Great Britain seems to be one in which the animal pursued is given as little chance as possible.

The English idea of sport is one of results, of big bags, of large counts, and everything seems to be bent to that end both in fishing and in shooting, as witness the slaughter of game birds on the English shooting preserves. Englishmen who come to this country very often bring with them at first this same spirit for unrestricted slaughter at any cost and by any means. It takes them a time to get used to the new American idea of sportsmanship, which concerns itself with moderate bags and with what we call sportsmanlike tools. We do not care to use punt guns in duck shooting, 16-ounce rods in trout fishing, or 8, 16 or 24 hooks in a bass or pike bait.

Yet, in fact these deadly looking contrivances are not so popular as they would seem. Many of our best bass fishers in this country use a single hook below the spoon. Many of our best trout fishermen would scorn to use a spoon-hook under any consideration, and many go yet farther and will not employ bait at all, no matter what the conditions, confining themselves to the use of the artificial fly and the employment of a rod suited to the weight and power of the fish pursued.

There is another side to the gang hook question, which robs it of much of its sting. Maskinongé, pike and bass live, in this part of the country, very largely in waters too weedy for the successful use of a flying gang of hooks. The man who sticks to a spoon with a single hook will fish more comfortably and perhaps kill more fish, if it comes to that, than the one who greedily wants to get hold of everything which comes within sight. As a matter of fact, a single hook spoon, baited with frog or pork rind, is far more nearly weedless, and about as deadly, as the terrible gang, and it is a much sweeter thing to fish. Under the circumstances, you cannot blame the tackle dealer for selling these many-barbed contrivances, for the people will not after all do so much destruction with them. And, moreover, they want them, or think they want them.

(A friend who has seen the above begs leave to disagree with certain of the statements therein. He says that, in his opinion, it is far more sportsmanlike to use live bait than to use the artificial lure of any sort, and more humane as well. If you catch a fish on a fly or spoon, the poor creature gets no run for its money at all, says he. Now if you catch him on a worm or a minnow, he at least can chew on that while you are playing him and until he gets out on the bank. If you are going to kill the fish anyhow, at least give him some comfort and consolation in his last moments. They do that much for a fellow when they are going to hang him.)

## The Vermont Six-Inch Law.

SHELDON, Vt., Sept. 1.—*Editor Forest and Stream:* The trout season, which has now become a thing of the past, was on the whole a very satisfactory one. The long continued rains kept the waters well up in the brooks, which caused the fish to run up from the larger streams. The trout here in northwestern Vermont average small, not over one in five run the legal length, six inches. It is quite evident that to protect these fish one of two things must be done, either pass a law compelling the fishermen to use needle-pointed hooks, so that the small trout could be easily removed from the hook, or make a law giving the county wardens under the supervision of the commissioner the power of leasing for a nominal sum from the owners of the lands about the head waters and tributaries of our streams the fishing rights on these streams, then stock and close these streams against all fishing. If a person is found near these streams with any kind of fishing tackle arrest him as a violator of the law; then make the waters of the main streams open waters and do away with the six-inch law. As it now stands, it is making violators of the protective trout law, for forty-nine out of every fifty trout fishers, when they have seen that it was almost an impossibility to take a small trout off a bearded hook without either killing it outright or so injuring it that it would soon die, have counted the fish in with the larger ones. At first they did so with fear and trembling, but they soon became calloused and would take these small fish without any reproach of conscience. Then it is but one step on to begin to shoot game birds during the close season, and then on to larger game, deer without horns, etc.

In the backwoods in this section of the State it is almost impossible for a game warden to catch these trout fishers, and in fact most of the wardens have given up trying to catch them, while they are sharp after the violators of the game laws.

Among those who own land about the headwaters of our trout streams there are but a very few who would

not gladly for a mere nominal sum give the State a long lease of the fishing rights on their properties. Now, as the law stands, the six-inch trout law is the most unpopular law on our statute books, and consequently the hardest to enforce.

The trout season for brook fishing closed Aug. 1, or rather July 31, and now that the open season is closed for pond and lake trout fishing, we must put away our tackle or use it on coarser fish.

STANSTEAD.

## Courtesies of Salmon Fishing.

H. M. S. RINGDOVE, ST. JOHNS, N. F., Sept. 4.—*Editor Forest and Stream:* My attention has been drawn to an article in your issue of Aug. 19, signed by Mr. A. St. J. Newberry, and, at the desire of my captain, I beg you to insert my reply to it. Mr. Newberry in his article, casts a slur on the courtesy of English officers and gentlemen. I wish, for the credit of British naval officers to state the facts of the case in question.

My captain pitched his camp near the mouth of a river in Newfoundland. On the same day he met Mr. Newberry, who had his camp some distance up river. The captain not only invited Mr. Newberry to fish the pool near his camp, but lent him a rod to do so.

Next day I joined the captain, who informed me that there was an American gentleman camped up river, and I started fishing up stream with the idea of paying a visit, and talking over the season's fishing. While in the act of landing a fish, Mr. Newberry approached me very angrily, and asked me if I considered it fair to fish on his water. When he added that my friend (the captain) had agreed to keep below a certain mark, while he kept above, I at once apologized and retired. When I discussed this matter with the captain he informed me that he had made no such agreement as Mr. Newberry had mentioned.

As to the "cap-sheaf" mentioned in the article under discussion, we are clearly not responsible for that, as our camp was struck the next morning after my meeting with Mr. Newberry.

Now, I deny that anybody establishes a right to the fishing of a whole river by simply camping upon it. And I consider that Mr. Newberry has made a very unfair attack upon us, who treated him with the greatest courtesy, and, as I hoped, parted with him on good terms. I inclose my card, and beg to remain,

A. BRITISH NAVAL OFFICER.

## Salmon on Lake St. John.

MR. H. J. BEEMER, the well known contractor, who built the railway to Lake St. John, and who is the proprietor of the beautiful summer hotel at Roberval, has had the enterprise to establish at his own expense, a fish hatchery near that point, similar to the Government hatchery at Tadoussac. From this hatchery during the last seven years he has sent out no less than 2,625,000 young ouananiche and 1,275,000 sea salmon. This year the fruits of this enterprising experiment commenced to make themselves apparent, and a few days ago a magnificent sea salmon weighing 18 pounds was caught in the River Peribonca and another weighing 15 pounds in Lake St. John. The fame of this will soon spread, and the opportunity of catching salmon in a fresh water lake will prove an attraction without precedent, which will bring to Lake St. John thousands of fishermen from all over the world. This will mean a great deal of money brought into the Province, because the expenditure of sportsmen and the earnings of the army of guides to whom they give employment are proverbial. It seems hardly credible, but we believe it to be true, that while a private individual is thus carrying out at his own expense an experiment of a kind usually undertaken by a Government, which bids fair to be of inestimable value to the Province, the Government itself has been giving netting licenses to catch these fish and thus enabling a handful of short-sighted people to undo all the good which the hatchery is doing. However, if we may judge from the utterances of the new Minister in charge of this department, Mr. Prevost, this ill-advised policy will now cease, and fishing will be restricted to ordinary and legal methods. If Mr. Beemer's hatchery enterprise results in the stocking of Lake St. John with sea salmon, it will attract sportsmen in thousands who will spend unlimited money in the district.—Quebec Chronicle.

## Hair Lines.

MONTREAL, Can., Sept. 1.—*Editor Forest and Stream:* Among the numerous fish lines used by the grand army of the N. O. F.'s (Noble Order of Fishermen) there is one that is at present unfashionable and which in these times of constant changes in the fashions simply amounts to a crime. The hair-line, well made, washed and stretched, is equal to any in the market. Not by any means as strong as that excellent line the Cuttyhunk; it possesses the advantage of stretching when wet, virtually becoming a rubber string, relieving the strain of the tip of the rod. It also has the advantage of never rotting. These lines have been in use for generations on the sea coasts of Great Britain and other parts of the world. It is a popular superstition that the hair of a mare's tail is inferior to that of the horse. This is quite true, owing to the fact that the horse hair is round, while that of the mare is flat. Another argument in the favor of this ancient line is the freedom with which it runs through the guides.

The interesting essay on silk woven gut, published in your columns lately, and of which I have made crude samples in my younger days, also reminds me that horse hair makes most admirable leaders made in five or ten feet, without a knot and a loop at each end. Black hair alone is tabooed, but white hair with a strand or two of black makes the line or leader invisible in the water. There is no glitter on a hair leader, which is a fault on the polished gut as used. Chestnut and white hair makes an exceedingly pretty line, and I used one for seven years, captured many a lordly small-mouth black bass, and best of all, the line is as good as the day it was made.

It polishes and preserves Stock, Barrel and Case.—Adv.

### Bitten by a Shark.

ST. AUGUSTINE, Fla.—A correspondent of the Jacksonville Times-Union says: David Curry is a patient at the Railway Hospital here, suffering from a badly lacerated leg caused by a peculiar accident. He, with G. J. Hopkins, was fishing at Fort Pierce yesterday afternoon from a small boat near shore, when a large shark was hooked. After playing the monster for some time they towed it in toward shore. Upon reaching shallow water Mr. Curry stepped out of the boat and started to haul the prize in shore when with an effort it turned and seized him by the right leg, tearing the flesh badly. His companion immediately hurried the injured man away for medical attention, leaving the monster shark on the shore. Mr. Curry was placed aboard the north-bound train and brought to this city. He is now at the Railway Hospital and is reported as resting easy to-day.

### Camping Song.

HAS your dinner lost its savor?  
Has your greeting lost its cheer?  
Is your daily stunt a burden?  
Is your laughter half a sneer?  
There's a medicine to cure you,  
There's a way to lift your load,  
With a horse and a saddle and a mile of open road.

Is your eyeball growing bilious?  
Is your temper getting short?  
Is this life a blind delusion,  
Or a grim, unlovely sport?  
There's a world of health and beauty,  
There's a help that cannot fail,  
In a day behind the burros,  
On a dusty mountain trail.

Come out, old man, we're going  
To a land that's free and large,  
Where the rainless skies are resting  
On a snowy mountain marge.  
When we camp in God's own country,  
You will find yourself again,  
With a fire and a blanket and the stars upon the plain!  
—Bliss Carman in the Reader.

## Adirondack State Land Sales.

From the Brooklyn Eagle.

ALBANY, N. Y., Sept. 6.—In its issue of Saturday last the Eagle reviewed an article from FOREST AND STREAM, calling attention to the fact that a tract of land belonging to the State Forest Preserve had been conveyed to a wood pulp company in violation of the provisions of the Constitution, which forbids the sale of any forest lands belonging to the State in the Adirondack or Catskill counties. Inquiries at the office of the State Land Board have elicited the following official defense to the charges:

The tract in question consists of 170 acres, situated in Lot 79, Remsenburg Patent, in the Town of Ohio, Herkimer county. The State obtained title to this land through the foreclosure of a mortgage by the United States Loan Commissioners. In each county of the State there are persons designated as Loan Commissioners who loan United States funds on landed property. On the foreclosure of any of these mortgages the Land Board at Albany has been in the habit of reselling the land to recover the amount of money thus loaned, and to keep this United States fund good and intact. In accordance with their custom the Land Board sold this tract of 170 acres at a meeting held Oct. 25, 1902, the conveyance being made to the Finch Chemical Company.

The Board of Land Commissioners is composed of the Lieutenant-Governor, Secretary of State, Controller, State Treasurer, Attorney-General, State Engineer and Surveyor, and the Speaker of the Assembly. The Governor of the State is not a member of this board. The law defining the Forest Preserve includes all lands owned by the State in the sixteen Adirondack and Catskill counties, with the two following exceptions:

1. Lands within the limits of any village or city, and
2. Lands, not wild lands, acquired by the State on foreclosure of mortgages made to loan commissioners.

In accordance with the latter exception, the Land Board would have the right to sell any lands acquired through the Loan Commission, provided they were cleared or farming lands; but they would not have the right or power to sell or convey any lands thus acquired which would answer the description of wild or forest lands. In nearly every case the properties thus sold consisted of farms which included not only cleared fields and pastures, but wood lots or areas of timber land.

Col. William F. Fox, superintendent of State Forests, in his annual report to the Legislature, Jan. 30, 1903 (eighth annual report, pages 65-67), called attention to this conflict of authority between the Land Board and the Forest Commission, and recommended an amendment to the forestry law, which would provide for the survey of all Loan Commission lands, in which the lines of the forest areas on them should be run out and such lands made a permanent part of the preserve. The Forest Commission, however, failed to obtain the necessary legislation.

In the case of this 170 acres, Lot 79, Remsenburg Patent, it is very doubtful whether the conveyance of the Land Board is a valid one, and it has been intimated by the superintendent of forests that an action will be commenced to set aside this conveyance, through which the State will not only recover the land, but will also obtain the full value of the timber that was cut, together with such penalties as the court may adjudge. The superintendent stands now, as he always has done, for the rigid enforcement of the forestry clause in the State Constitution in accordance with the strictest letter of its requirements. Any person cutting even a single tree on State land will be prosecuted and punished to the fullest extent of the law. Although not generally known, yet it is a fact, that for several years the care and custody of the preserves has been in the hands of the fish and game protectors instead of in the Forest Department; but at the last session of the Legislature a special act was passed putting the care and custody of the preserve back into the hands of the superintendent of forests. The news of this legislation was circulated quickly throughout the woods, and to-day there is not an ax in motion in the forests of the State preserve.

### Game Butchers.

EARL DE GREY, the heir to the Marquis of Ripon, has probably accounted for more game than any other living sportsman, says the Yorkshire Post.

Four years ago the German Emperor had in the course of nearly thirty years bagged about 40,000 head of game. But so far back as 1895 Lord De Grey had eclipsed this record eight times over, having in twenty-nine years bagged 316,699 head. Of this enormous total the chief items comprised 111,190 pheasants, 89,400 partridges, 45,500 grouse, 26,500 hares and about the same number of rabbits. In Ireland a few years ago he brought down sixteen geese with one gun (two barrels). In 1893 alone he accounted for 19,135 head, including 8,732 partridges, 5,760 pheasants, 2,611 grouse, 837 hares, 914 rabbits and 300 beasts of the field.

The record for grouse shooting is, however, held by Lord Walsingham. During one day's shoot on the Blubberhouse Moors, in Yorkshire, in August, 1872, with the expenditure of 1,100 cartridges, he brought down 421 brace of grouse. On Aug. 30, 1888, he was shooting for fourteen hours eighteen minutes, and by firing an average of 108 shots an hour he succeeded in bringing down 1,058 birds.

### THE MANY-USE OIL

Protects cold, frosty, wet Guns from Rust.—Adv.

### Deer Damages Awarded.

PLAINFIELD, Mass., Sept. 11.—The open season on partridges begins on Oct. 1 in these parts, but there are literally no birds. I have traversed the east and west forested ridges several times for miles, through field, swamp, meadow and woods without starting a feather. Yesterday I took a seven-mile walk to Cummington and back without seeing a jay or a chipmunk. I heard one red squirrel, but its voice was weak. The haunts of the small game are deserted, but deer are in evidence on all sides in Hampshire and Franklin counties, and the hounds are yelping to be turned loose. If the number of deer is not soon lessened farmers will have to give up horticulture. Some idea of the amount of damage done to crops may be gathered from the published statement that the Franklin county commissioners at their meeting Tuesday approved the regular monthly bills, and in addition bills from various towns for losses caused by deer. Joseph Legate, of Charlemont, had 350 peach trees damaged and was paid \$110. Other losses paid are: F. R. Ford, of Charlemont, \$10; R. E. Lillie, C. F. Williams, \$10 each, and A. G. Bugbee \$5, all of Montague; Charles McGee, of Colerain, \$10; Asahel Sawyer, \$10, and F. B. Streeter, of Northfield, \$6.

In Hampshire county the depredations in Windsor, Cummington, Worthington and Hawley are serious. If farmers were permitted by law to kill deer during the rest of this year the price of meat would drop. Venison would be likely to take the place of beef and mutton.

CHAS. HALLOCK.

In connection with the speed in the pigeon-flying contest in France, an Antwerp financier tested the speed of the swallow, with a remarkable result. He captured one nesting under his roof and sent it to Campiegnie, where it was placed among the pigeons. It flew off at 7.05 o'clock, and reached its nest at 8.22 o'clock, having traveled at the rate of 128¼ miles an hour. The best time made by the pigeons was 35½ miles an hour.

## The Kennel.

### National Beagle Club of America.

At a meeting of the National Beagle Club of America, held in New York city on Aug. 31, 1905, it was ordered that the sixteenth annual field trials of this club be held at Stevenson, Baltimore county, Maryland, and that the headquarters of the club during the trials be at Avalon Inn.

At the same time, Mr. C. Staley Doub, of Frederick, Md., was made chairman of the committee on arrangements, the other members of this committee being Messrs. A. J. Purinton, Palmer, Mass.; Henry Dickson Bruns, M.D., New Orleans, La.; Ernest Gill, Govans-town, Md.; T. Dudley Riggs, Stevenson, Md., and Charles F. Brooks, of Sandy Springs, Md.

A new class, to be known as Class G, pack stakes for dogs and bitches 15 inches and under, to bona fide property of the party making entry at the time of entering and starting the class, eight dogs constituting a pack, was ordered to be added to the premium list. Fee to start, \$10. First prize \$40, second prize \$25, and in case of five or more entries in this class a third prize of \$15 to be given.

In Classes E and F, open pack stakes, four dogs constituting a pack, the fee to start was changed to \$10, and the prizes were changed as follows: First prize \$40, second prize \$25, and in case of five or more entries, a third prize of \$15.

CHARLES R. STEVENSON, Sec'y.

### Yachting Fixtures for 1905.

MEMBERS of Race Committees and Secretaries will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future:

#### SEPTEMBER.

16. Knickerbocker, power boat races.
16. Royal Canadian, club.
16. Chicago, cruise.
16. San Francisco, cruise.
17. Lakewood (Cleveland), club.
24. Morrisania, open.
24. San Francisco, cruise.

### THE RATING RULE—PROBABLE REDUCTION OF TIME ALLOWANCE.

THE new formula for obtaining racing measurement, which is now in force at all the prominent yacht clubs of the East, has of itself proven satisfactory. The tests made possible by a season of general use have demonstrated that the methods of taking length and sail area are far ahead of any heretofore adopted. The introduction of displacement as a divisor in the formula has proven a wise move and opened many a new channel of thought as to just how far speed is affected by reducing the underbody of a boat. Some results of the year hint that designers have perhaps gone to unnecessary extremes under old conditions and that it is possible to build a boat of good model and draft which will perform fully as well as one in which the ends have been abnormally lengthened and displacement reduced to a marked degree. These de-

velopments, although not exactly in line with accepted theories, appear to be nevertheless true. The introduction of the displacement factor when considered in connection with the other restrictive elements of the rule, appears also to have insured a certain degree of equality among class competitors of good model.

There is a feature of the racing this year which had not been entirely satisfactory. That is the table of time allowances. The honors of the season in events decided on corrected time have generally gone to the smaller competitors. This would indicate that too much allowance is being given by one craft to another. Time allowance tables are based on the theory accepted by naval architects that, within economic limits, opportunities for speed vary in different vessels as to the square roots of their respective lengths. It is conceded that as strong winds are required to give large vessels the full extent of their advantage in size, and that as such conditions do not exist in ordinary summer racing, a certain percentage of the full table should be taken. Differences of opinion have come about as to the amount of reduction necessary. Last year the New York and Eastern Y. C.'s, working under a rule practically the same as the one now in force, took 80 per cent. of what the full allowance would be. This was found too great. The Atlantic and Larchmont Y. C.'s and those in the Long Island Sound Association proved that 60 per cent. gave satisfactory results.

When delegates from the different organizations had adopted the rating rule formula the question of time allowance was taken up. Those who had conducted their racing under the larger amount were loath to make a reduction great enough to bring it to the lower level. A compromise at 70 per cent. was finally effected, and on this basis the sport of this season has been conducted. In New York and Eastern Y. C. events 10 per cent. less time is now being conceded, while competitors in regattas at the other prominent clubs are allowing an increase of the same amount. A boat at the top of the 27ft. class this year under the 70 per cent. table has to allow a 22-footer 52.29 seconds to the mile. Under the New York and Eastern Y. C. tables of 1904 this would have been 59.77 seconds, while at the Atlantic, Larchmont and other clubs it would have been 44.82 seconds.

A reduction to the 60 per cent. basis is likely to be demanded and made before another season. This will mean that a 27-footer will have to allow a craft in the 22ft. class 7.47 seconds less a mile than this year. Such a concession means a handicap of nearly a minute and a quarter in ten miles of sailing, and the effect of the change would naturally be to give the larger craft a greater chance of winning than is possible under the present table. According to available data 60 per cent. of the full allowance will bring much closer results than have been the rule this year under the 70 per cent. table.

THE NEXT TRANSATLANTIC RACE.

YACHTING gossip of late has clung more or less to the possibility of holding in 1906 a transatlantic race for schooners. Both Emperor William of Germany and Sir Thomas Lipton have been mentioned as possible donors of trophies for such an event. Another long journey to the other side next season would not receive half the support that would prevail if the event were postponed until at least one more year has elapsed. It is extremely doubtful if the large entry which graced the struggle for the Ocean Cup, won by Atlantic, would be received for another similar event coming so soon. American competitors in the former struggle will be quite content to remain at home. Their presence is needed to stimulate our own off-shore racing, which has gone almost wholly by the board because of the absence of the best cruising schooners in foreign waters. The Cape May, Brenton's Reef and other cups offered to encourage long distance events on the open seas should give Americans all the strenuous work they care to undertake during the next yachting season.

It would be a mistake to start another transatlantic event from this side of the world before 1907. The plan of racing British, English and American boats which may be abroad at the time, to our shores next year is a far more desirable one from the standpoint of the sport on this side of the Atlantic.

William H. Childs Perpetual Challenge Trophy.

A PERPETUAL challenge trophy for boats in classes M and under was offered early in the season through the Bensonhurst Y. C. by Mr. William H. Childs. Any recognized organization of good standing may challenge for the valuable memento, the privilege of competing in the event, under conditions agreed on by the challenging and defending parties being extended to other clubs so desiring. The club represented by the winning yacht secures temporary possession of the trophy in a single race, and holds the same until lost to some challenging organization. Not more than three races are allowed in any one season. Each club is permitted to nominate not more than two boats, all entrants competing in one class on time allowance, according to the new rule of rating.

In selecting the trophy, the donor was guided by a desire to obtain something different from those usually offered for yachting events. The result is a very unique creation, which is likely to be generally adopted. A well executed steering wheel of mahogany, two feet in diameter, forms the basis. The center space is occupied by a plaque of sterling silver, on which is shown a start in Class Q, the scene being etched into the metal. On the outer edge of the mahogany view is a garland design of great beauty. Beyond this, reaching to the mahogany rim, is a plainer surface, on which are given in relief the name of the trophy and the donor, the latter's private signal, and the burgee of the Bensonhurst Y. C. The owner of a boat winning a race receives outright a miniature reproduction of the large prize, while the name of the craft and the club represented is engraved on the challenge plate itself.

Three races have been held for the trophy, the first being sailed on July 3. Bensonhurst Y. C. nominated More Trouble, owned by W. H. Childs, to defend the trophy. The other contestants were: Saetta,

from the Atlantic Y. C.; Ojigwan, from the Brooklyn Y. C.; Miss Judy from the New York C. C., and Quest and Beta from the Marine and Field Club. The race was won by More Trouble, and the trophy held by the Bensonhurst Y. C.

The second race was sailed on July 23. Bensonhurst Y. C. nominated More Trouble, owned by W. H. Childs, and Tabasco, New York Y. C. 30-footer, owned by J. B. O'Donohue, to defend the trophy. The Atlantic Y. C. sent the Class P boat Lizana and the Class Q boat Cockatoo II.; Marine and Field Club was represented by the Class Q boat Quest, and Class RR boat Beta. Brooklyn Y. C. sent Ojigwan, and the New York C. C., Ogeemah. Race was won by More Trouble, and the trophy still remained with the Bensonhurst Y. C. subject to challenge.

The third and last race of the season, which was sailed on Sept. 1, went to the New York Canoe Club challenger Ogeemah, on corrected time. The Marine and Field Club representative Quest was second and the Bensonhurst Y. C. defender More Trouble third. The trophy remains with the New York Canoe Club subject to challenge for the season of 1906.

Larchmont Club.

Long Island Sound—Monday, Sept. 4.

A VARIETY of weather marked the annual fall regatta of the Larchmont Y. C., held over courses on Long Island Sound on Labor Day, Sept. 4. Light, fluky winds and rain at several stages of the contest robbed the racing of almost all interest. Starters in the classes for New York Y. C. 30-footers and raceabouts were unable to finish their respective courses. Under the trying conditions encountered the winners proved to be Mineola, Mimosa I., Vaquero, Rascal, Paumonak, Mist, Owatonna and Pup. Fannie and Dod scored sailovers.

The 70-footers Mineola and Yankee went once over a triangle of 15½ nautical miles. It required more than two hours to cover the first six-mile leg, showing how near a calm the conditions were. The second leg was of the same distance along the Long Island shore. The first part of the journey of the race would have been a reach had not the wind hauled in all directions, finally making it for the most part a drift in a light head wind. Mineola won out by 7m. 57s.

When the raceabouts had completed the first round the breeze fell flat any many of them were obliged to anchor hoping for a returning zephyr with the ebb tide. The New York Y. C. boats got into the doldrums over on the Glen Cove shore and withdrew without completing the round. The different courses were covered only once for many of the classes. Mimosa I. had the unusual pleasant time of defeating Mimosa III. on allowance. The summaries follow:

Sloops, 70-footers—Start, 12:10—Course, 15½ Miles.		
	Finish.	Elapsed.
Mineola, W. R. Proctor.....	5 50 27	5 40 27
Yankee, J. R. Maxwell.....	5 58 24	5 48 24
Sloops—Class M—Start, 12:15—Course, 11½ Miles.		
Mimosa III., T. L. Park.....	5 53 09	5 38 09
Mimosa I., T. M. T. Raborg.....	5 57 29	5 42 29
Memory, F. F. M. Raborg.....	6 16 04	6 01 04
N. Y. Y. C. 30ft. Class—Start, 12:20—Course, 15½ Miles.

Saturday, Sept. 9.

Light weather conditions were again in order for the Larchmont events on Saturday. The wind was from the westward at the start and soon fell to almost a calm, making it possible to cover only half of the courses. Elmina, Corona and Invader started for the schooner cup. After anchoring over near Glen Cove at the end of the beat across the Sound on the first leg, Elmina managed somehow to get home and win by a large margin. Corona, as soon as possible, drifted over the line for second prize, but the process had no appearance of a race. Invader withdrew. It took Elmina 4h. 19m. 55s. to cover the 9½ miles.

There was a faint breath of air out in the Sound at times which helped the smaller boats. In the raceabout class Tartan beat Nora by 6m. 59s. The two boats were thus tied on points for the series prizes. The deadlock will be sailed off. Hourly led the Larchmont 21-footers and the little Herreshoff mahogany scow Opossum won from the 22-footers. The other victorious boats were Hamburg, Fritter, Gracie and Rascal. The summaries follow:

Schooners—Start, 12:35—Course, 9½ Miles.		
	Finish.	Elapsed.
Corona, Arthur F. Luke.....	6 45 32	6 10 32

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

YACHT GOVERNORS ELECTED.—Members of the Newport Y. R. A. held their annual dinner on Sept. 4 and elected the following governors: Max Agassiz, John R. Drexel, Royal Phelps Carroll, Henry F. Eldridge, Ralph N. Ellis, Elbridge T. Gerry, Woodbury Kane, Arthur T. Kemp, Charles L. F. Robinson, William G. Roelker, Frederick P. Sands, Frank K. Sturgis, Henry A. C. Taylor and Henry O. Havemeyer, Jr.

RACES FOR NEW YORK Y. C. 30-FOOTERS.—The regatta committee of the New York Y. C. announces four days of racing for the 30ft. monotype boats on Sept. 19, 20, 21 and 22. The events are to be sailed over the Glen Cove courses. Special prizes have been offered by Commodore Frederick G. Bourne, Vice-Commodore Henry F. Walters, Rear Commodore Cornelius Vanderbilt and C. L. F. Robinson. The club will also offer prizes for the winner of each race.

TROPHY FOR YANKEE AND GERMAN YACHTS.—Mr. Henry Howard, chairman of the Regatta Committee of the Eastern Y. C., who is now at Kiel, Germany, reports progress in the arrangements for an international trophy open to American and German boats not over 30ft. rating measurement. It is likely that the first struggle for the trophy will be held on this side of the water. At present it is the intention for three boats to represent each country and for the half dozen to compete in a series of three races on the point system.

RECENT SALES.—The well known sloop Effort, formerly

WILLIAM H. CHILDS PERPETUAL CHALLENGE TROPHY, NOW HELD BY THE NEW YORK CANOE CLUB.

owned by Mr. F. M. Smith, has been sold to Mr. George W. Dorr, of Greenwich, Conn. Mr. John D. Sanborn, New Rochelle, N. Y., has purchased the sloop Flosshilde from Dr. W. D. Hennen, of the New York A. C. Col. David E. Austen has bought the sloop Ondawa. He will have the boat entirely refitted next year and race her throughout the season.

**SALES AND CHARTERS.**—The following sales and charters have been made through the office of Mr. Stanley M. Seaman: Mr. E. A. Bennett, New York C. C., has sold his hunting launch Rosella to Mr. Edward H. Hooley, Plainfield, N. J. Auxiliary catboat Ensign has been sold by Mr. T. Hayes, of Stamford, Conn., to Mr. H. A. Ohm, of New York city. Mr. A. F. Bowen, of Newport News, Va., has sold his knockabout Elise to Mr. C. W. Grandy, of Norfolk, Va. Knockabout Nirvana has been sold by Mr. C. A. Morse, of Boston, Mass., to Mr. P. T. White, of New York city. Mr. A. C. Fiske, of Columbia, S. C., has purchased the hunting launch Adria from Mr. F. W. Green, Norfolk Downs, Mass. Col. D. E. Austin, Brooklyn Y. C., has purchased the 40ft. sloop Ondawa from Mr. N. J. Roberts, Atlantic Y. C. Mr. E. Lillie, of New York city, has purchased a 25ft. auto hull from the Auto Boat Co., West Mystic, Conn. The cutter Indria has been chartered by Mr. E. T. Birdsell to Mr. F. W. Horn. Mr. Rudolph Oelsner, of the New Rochelle Y. C., has chartered his auxiliary yawl Penelva.

**New York C. C.**

Bensonhurst, L. I.—Saturday, Sept. 9.

The fifth and last regatta for the class championship of Gravesend Bay was held on the afternoon of Saturday, Sept. 9, under the auspices of the New York Canoe Club. Twenty-one craft started and the winners proved to be Vivian II., Lizana, Saetta, Mary and Foggy Dew. Class championship honors of 1905 have been won by Vivian II., Lizana, Ogeemah and Beta.

A light wind from the S. blew throughout the race. Regular association courses were sailed. On the inside journey it was a broad reach to the Marine and Field Club from the start off Ulmer Park, another reach to Fort Hamilton, a beat to Sea Gate and a reach home. Boats in Classes P and above went out across the channel to the bell buoy at Craven Shoal and to Sea Gate instead of making one leg from the fort to the latter mark. The first leg of their extra route was a beat and the other a reach. Saetta and Cockatoo II. had a hard tussle for the honors in Class Q, the former finally winning out by 7s. The summaries follow:

Sloops, Class N—Start, 3:05.		
	Elapsed.	Corrected.
Vivian II., S. C. Vernon	5 28 00	2 23 00
Bobtail, E. F. Luckenbach	5 31 51	2 26 51
Corrected time, Bobtail, 2:26:48.		
Sloops, Class P—Start, 3:05.		
Lizana, D. S. Wylie	5 31 23	2 26 23
Tabasco, J. B. O'Donohue	5 34 10	2 29 10
Anona, Menton Bros.	5 44 18	2 39 18
Corrected time, Lizana, 2:20:00.		
Sloops, Class Q—Start, 3:10.		
Saetta, George H. Church	5 06 07	1 56 07
Cockatoo II., Hendon Chubb	5 06 14	1 56 14
More Trouble, W. A. Childs	5 06 52	1 56 52
Ogeemah, Alfred Mackay	5 14 18	2 04 18
Quest, F. J. Havens	5 16 28	2 06 28
Ojigwan, Geo. E. Reiners	5 17 22	2 07 22
Miss Judy, D. D. Allerton	5 19 01	2 09 01
Corrected time, Ogeemah, 1:56:46.		
Class Q, Special—Start, 3:20.		
Mary, Max Grundner	5 33 22	2 23 22
Spots, R. C. Veit	5 35 30	2 25 30

Sloops, Class RR—Start, 3:15.		
Delta, J. J. Mahoney	5 54 10	2 39 10

**Beverly Y. C.**

Wing's Neck, Buzzard's Bay—Monday, Sept. 4.

The Beverly Y. C. sailed its 376th regatta from its club house on Sept. 4. The event was the second open race of the season. The bay on the previous day had been swept by a fierce storm from the S.E., and on Monday morning the wind was still S.E. and strong. The race was started at 2 o'clock. Only two 25-footers appeared, and Thorana won an easy victory. In the 21ft. class, Barnacle won. Amanita III. defeated Terrapin in a hard-fought race for second place. Three 15-footers started. Chico won.

25-footers—Course, 12½ Miles.		
Thorana, T. B. Wales	1 36 33	
Nokomis, A. Winsor	1 39 25	
21-footers—Course, 8½ Miles.		
Barnacle, W. E. C. Eustis	1 25 04	
Amanita III., Joshua Crane	1 30 02	
Terrapin, L. S. Dabney	1 30 12	
15-footers—Course, 5½ Miles.		
Chico, E. C. Choate	1 04 58	
Ranzo, W. H. Richardson, Jr.	1 05 03	
Compress, S. M. Weld	1 05 07	

**THE MANY-USE OIL.**

Cleans out smokeless powder and keeps bore bright.—Adv.

**Atlantic Y. C.**

New York Harbor—Monday, Sept. 4.

LABOR DAY was one of light and failing breezes for the Atlantic Y. C. men. In the morning of the holiday seven boats started for the Havens cups of 1904 and 1905. The first-named is open to boats in Classes M and under competing in one division on time allowance, and the other for Class Q creations. Three victories are necessary for permanent possession of either trophy. The Class P boat Lizana and the Class Q craft Saetta were the only ones finishing the event. The latter defeated Lizana on corrected time for the old Havens trophy. It was her third victory, and the cup now goes to skipper Church outright. The other races won were held on June 3 and Aug. 12.

The boats sailed a course from Sea Gate to the Black Can buoy off Swinburn Island, from there to Fort Hamilton and then home. Covered twice, this aggregated 11 nautical miles. Before the first mark was reached all of the racers were becalmed and most of them anchored. Vivian II., Bobtail and Quest withdrew at this stage of the race. The breeze died down after the first round. The summary follows:

Sloops—Class M and Under.		
	Start.	Elapsed.
Saetta, Geo. H. Church	10 15 00	1 40 37
Lizana, D. S. Wylie	10 10 00	1 39 59
Cockatoo II., Hendon Chubb	10 15 00	Did not finish.
More Trouble, W. H. Childs	10 15 00	Did not finish.
Quest, F. J. Havens	10 15 00	Did not finish.
Bobtail, E. F. Luckenbach	10 05 00	Did not finish.
Vivian II., L. E. Vernon	10 05 00	Did not finish.
Corrected time, Saetta, 3:21:17.		

Sloops, Class Q.		
	Start.	Elapsed.
Saetta, Geo. H. Church	10 15 00	1 40 37
Cockatoo II., Hendon Chubb	10 15 00	Did not finish.
More Trouble, W. H. Childs	10 15 00	Did not finish.
Quest, F. J. Havens	10 15 00	Did not finish.

In the afternoon an attempt was made to start the second qualifying race for the Vernon trophy open to Classes N, P and Q. The boats got away from the line and, although all were becalmed before reaching the first mark, a little breeze finally enabled them to finish the first round of the same course sailed in the morning. The competitors got very little further and were finally towed home by launches, some of them arriving at moorings very late in the evening. The old Class Q boats were sent once over the course for points on the Chubb trophy, Trouble winning. The summary follows:

Class Q, Special—Start, 3:35.		
	Elapsed.	Corrected.
Trouble, W. A. Barstow	5 26 10	1 51 10
Spots, R. C. Veit	5 27 36	1 52 36
Wrath, Calvin Tompkins	5 28 04	1 53 04
Mary, Max Grundner	5 33 44	1 58 44

Saturday, Sept. 9.

Better luck attended the efforts of the Sea Gate club to run off the second qualifying event for the Vernon trophy, which was held on Saturday morning, Sept. 9. Six craft started on their handicap times. The first boat home was thus the winner. This proved to be W. H. Childs' Class Q creation, More Trouble, which beat Hendon Chubb's Cockatoo II., 1m. 1s. The course was twice over a triangle from Sea Gate to Fort Hamilton, from there to the Black Can buoy No. 11 off Swinburn Island and home. The initial leg was to windward, while the other two were reaches. Ogeemah was the first boat to get away on her handicap time 10m. before the new Class Q creations. It was not, however, until the second leg on the second round that More Trouble passed her and took the lead. The boats qualifying for the final race on points are More Trouble, Cockatoo II., Quest and Ogeemah. The summary follows:

Sloops, Classes N, P and Q.		
	Start.	Finish.
More Trouble, W. H. Childs	10 45 00	12 57 29
Cockatoo II., Hendon Chubb	10 45 00	12 58 30
Lizana, D. S. Wylie	10 48 00	12 59 03
Quest, F. J. Havens	10 45 00	1 02 56
Ogeemah, Alfred Mackay	10 35 00	1 08 24
Bobtail, E. F. Luckenbach	Did not finish.	

Points for Two Qualifying Races.

Cockatoo II.	3	8-11	Uvian II.	1	—	1
Ogeemah	9	0-9	Bobtail	0	0-0	0
Lizana	5	—	Saetta	0	0-0	0
More Trouble	6	11-17	Tabasco	0	0-0	0
Quest	12	2-14				

**Indian Harbor Y. C.**

Greenwich, Conn.—Saturday, Sept. 9.

THE Indian Harbor Y. C. held a race for boats sailed by women on Saturday, Sept. 9. The course led from Greenwich Harbor out around Great Captain's Island and return. The winner proved to be Acushla, sailed by Mrs. E. C. Ray. The summary follows:

Handicap Race—Course, 5 Miles.		
	Finish.	Elapsed.
Acushla, Mrs. E. C. Ray	3 00 00	5 05 49
Montauk, Miss Mary J. Rowland	2 50 00	5 07 12
Robin Hood, Mrs. Geo. E. Gartland	2 55 00	5 08 56
Arden, Mrs. Morton	2 45 00	5 35 00
Sirene, Mrs. R. Outwater	2 43 00	6 34 30
Lucile, Miss Emma Day	2 35 00	6 40 00
Mingo, Mrs. T. M. Guild	2 30 00	6 45 00

**Seawanhaka Corinthian Y. C.**

Oyster Bay, L. I.—Saturday, Sept. 9.

The sloop Nike, owned by Victor I. Cumnock, won the first of a series of three races sailed on Saturday, Sept. 9, under the auspices of the Seawanhaka Corinthian Y. C. for the Alfred Roosevelt Memorial cup and a trophy offered by Commodore W. K. Vanderbilt, Jr., valued at \$250. Mimosa I., the only other boat was defeated by 6m. 26s. Regular courses were sailed in a light southerly wind. The summaries follow:

Alfred Roosevelt Memorial Cup—Start, 2:00.		
	Finish.	Elapsed.
Nike, Victor I. Cumnock	7 22 04	5 22 04
Mimosa I., T. M. Raborg	7 28 30	5 28 30

**Bristol Y. C.**

Open Regatta—Narragansett Bay, Sept. 9.

THE last open regatta of the season in Narragansett Bay was held by the Bristol Y. C., on the afternoon of Saturday, Sept. 9, with a list of twenty-one starters. There was a light S. wind at the start, not promising enough to indicate good racing, so the regular courses were shortened. Later, however, the breeze freshened, and the contestants finished in good time.

The Garland cup, offered for the 15-footers by Mr. James A. Garland, of the New York Y. C., for which this was the final race in a series of three, was won by Wenonah, owned by H. Wetherell, of Jamestown. The series was decided on points, and Wenonah won two first and one second. Mr. Garland's sloop Hera, in the light wind could do nothing in her class, and did not finish the course, the race being won by Commodore C. F. Tillinghast's Little Rhody, which defeated Priscilla by about 8m. In the 21ft. sloop class, Micaboo defeated Nixie by more than 15m., but in the 18ft. class there was very close work, Francis Herreshoff's Kildee winning by about a minute on corrected time. Only two of the 30ft. cats entered, and there was a close contest, Flint Bros' Wanderer IV. defeating Elizabeth by only 50s. on corrected time.

In the 18ft. class it was also close, Trinket winning by only 18s. The courses for all classes were less than 5m. The summary:

25ft. Sloops—Start, 2:13.		
	Elapsed.	Corrected.
Little Rhody, C. F. Tillinghast	1 53 19	1 53 15
Priscilla, Wood Bros.	2 01 29	2 01 29
Hera, J. A. Garland	Did not finish.	
21ft. Sloops—Start, 2:16.		
Micaboo, W. R. Tillinghast	2 01 08	2 00 59
Nixie, J. Fales	2 15 43	2 15 43
18ft. Sloops—Start, 2:19.		
Kildee, F. Herreshoff	1 53 41	1 50 32
Bohemia, D. Woodward	1 51 39	1 51 39
Oriana, F. Pardee	1 53 49	1 52 26
15-footers—Start, 2:25.		
	Elapsed.	Corrected.

**New York Y. C.**

Long Island Sound—Saturday, Sept. 9.

THE annual autumn races of the New York Y. C., which were scheduled to occur off Glen Cove on Saturday, Sept. 9, were called off because of calm conditions. The date for sailing them will be decided soon. At the starting line, off Mott's Point, were the 70-footers Yankee and Mineola, the sloop Mimosa III., Heron, Gloria, Busy Bee, Rana, and Cricket, and the N. Y. Y. C. 30-footers Neola II., Nautilus, Banzai, Oriole, Adelaide II., Alera, Atair, Ibis, Phryne, and Dahinda. The Regatta Committee waited until 4 o'clock for a breeze before declaring the event off for the day.

**Canoeing.**

**New York C. C.**

Bensonhurst, L. I.—Saturday, Sept. 9.

THE annual fall regatta of the New York C. C. was sailed on the afternoon of Saturday, Sept. 9. The events for decked and open canoes proved a feature of the day. Frank Palmer won the first-named and J. E. Plummer the second. The summaries follow:

Decked Sailing Canoes—Start, 3:20.		
	Finish.	Elapsed.
Frank Palmer	4 07 40	6 47 40
D. B. Goodsell	4 08 55	6 48 55
F. C. Moore	4 15 35	6 55 35
Open Sailing Canoes—Start, 3:20.		
F. Speidel	5 02 10	1 32 10
R. S. Hawthorne	5 06 50	1 36 50
C. E. Dunn	5 11 27	1 41 27
C. A. Robinson	5 12 04	1 42 04
H. S. McKeag	5 11 53	1 41 53
W. Carmalt	5 06 10	1 36 10
R. S. Foster	5 06 34	1 36 34
A. M. Poole	5 11 00	1 41 00
K. G. Rea	5 03 40	1 33 40
I. M. Dean	5 19 30	1 49 30
W. Yelland	5 10 58	1 40 58
J. E. Plummer	5 01 50	1 31 50
E. J. Wright	5 09 34	1 39 34
A. Bigelow	5 22 15	1 52 15
A. Wilmarth	5 19 30	1 49 30

Single paddling, ½ mile—Won by S. King, Knickerbocker C. C.; second, George S. Morrisey, N. Y. C. C.  
Tandem paddling, single blades, ½ mile—Won by Hattenbrun and Danberg, Undercliffe C. C.  
Tailend race—Won by K. G. Rae, N. Y. C. C.  
Club fours, ½ mile—Won by Plummer, Poole, Bigelow and Taylor.  
Tilting tournament—Won by Taylor and Poole.

**GAS ENGINES AND LAUNCHES.**

Their Principles, Types, and Management. A Complete and Practical Manual.

BY F. K. GRAIN, M. E.

Bound in cloth, with 123 pages and 20 illustrations. Sent, postpaid, for \$1.25.

THIS compact and comprehensive handbook contains all the information essential to users of the marine gasoline engines, and will be welcomed by the thousands of men now owning and running power boats. Laymen and experts will alike find the book invaluable. It treats of the various types of marine gasoline engines, points out the good in each, and tells how to run them. A knowledge of the contents of this book will help to overcome difficulties and avoid accidents. The most complete book of its kind ever published.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

## Rifle Range and Gallery.

### Revolver Shooting.

DEEP RIVER, Conn.—*Editor Forest and Stream:* It is one of the seven wonders in the shooting and sporting world that while we have so large a number of crack shots with the rifle and shotgun we have so few good revolver marksmen. The popularity of the revolver for target shooting is advancing, and although many rifle clubs hold regular revolver meets, the average non-sporting citizen is ignorant of this weapon and its use.

In almost every issue of our daily papers we read of the accidental shooting with the pistol. Accidents of this character would be greatly lessened if every owner of small firearms understood its working mechanism. Ignorance and carelessness are the cause of most of these sad casualties.

Never point a firearm at anything you do not intend or wish to shoot. Never mind if you know it is empty. Remember the many accidents arising from "I didn't know it was loaded."

Few houses are without a revolver for protection purposes, and it is, or rather it ought to be, the duty of every owner to thoroughly post himself in the care and use of the chosen weapon. That universal excuse, "I am too busy," is by no means a pardon for neglecting a duty, and even if you are the busiest of all busy men, you still have ample time to acquire a knowledge of self-defense, so far as it lies within the field of the revolver. It is an old saying, "that when you need a pistol you need it mighty bad," which expresses in a few words the desirability of this knowledge.

No great amount of practice is necessary to enable one to become sufficiently expert to hit a tolerably small figure at twenty paces, nor does one require exceptionally good eyesight or cast-iron nerves. In fact, the average man or woman is in possession of enough good, raw material to make a first-rate shot, and by continued practice may become an expert, or, in the parlance of the gun room, a "crack shot."

A revolver with a long barrel is the easiest to shoot accurately, because the recoil is counteracted by the extra weight of the longer barrel. With a two-inch barrel revolver—which size is most generally used—the recoil is so great, owing to the lightness of the barrel, that the wrist is kicked up, causing the bullet to fly high. This tendency may be corrected almost entirely by holding the sight lower, i. e., aiming below the mark. It is much better, however, to purchase a revolver with at least a four-inch barrel, as the greater accuracy more than balances the slight inconvenience of the extra length and weight.

For target shooting, hunting or where weight and compactness are only secondary points, a longer barrel should be selected. The happy medium is found in the six-inch barrel, double-action hammer revolver.

The caliber or size of the bullet is important. When firing upon a living object the bullet must be of a size sufficient to so shock and disable such object that it will be incapable of injuring the shooter. The larger the caliber the more powder is required, and, of course, more recoil is felt. Where nitro or smokeless powder is used a much higher velocity is obtained and less recoil is felt than when using black powder. The high velocity developed by these newer powders produces a great shocking or paralyzing effect upon the tissue of animate beings, and it is in this smashing power of the nitro powders that have given small caliber rifles their high power and popularity.

In the endeavor to become a good revolver shot almost all beginners are handicapped by their own particular notion of how this practice should be conducted. They go ahead and rapidly acquire a certain degree of skill, but beyond the mediocrity stage they seldom advance. This is because of a too eager and hasty desire to become a crack shot in a very short time and overlooking the cause and effect of their wild shots. In their hurried method they make the same mistakes over and over again, when if they used little thought and asked themselves, why do I shoot high, what makes my bullets invariably go to the left or right of the target? they would correct these mistakes and improvement would rapidly come to them.

Another common mistake of the novice is to commence shooting with an arm of large caliber. This practice cannot be too strongly condemned, for it encourages a vice altogether too common with the beginner, and this is flinching. Many persons shut their eyes or make a startled motion just at the moment of pulling the trigger, which throws the sight from the mark and makes the bullet fly wild. Nervousness is the principal cause of this unsteadiness, which may be cured by using a very light powder load, a small caliber arm, or both.

It is surprising what a little judicious revolver practice will do toward steadying a person's nerves, and by training the eye in harmony with the hand, greatly develop that cool, calculating faculty so desirable in every department of human endeavor. The embryo marksman will do well to proceed with deliberation, and for the preliminary tuition strictly follow the few easy directions I have outlined. A bit of personal history may make my idea more comprehensive. Several years ago I bought a revolver, and residing then in a city where lack of space forbade actual firing, I adopted a plan for my own instruction which may or may not be original. This method consists in simply hanging up a bit of straw board—say an inch in diameter—pacing off fifteen or more feet, and going through the several firing motions.

Practice first in a slow, deliberate manner, and when the sight exactly covers the pasteboard center, press the trigger. After becoming familiar with this style try shooting quickly, discharging all the chambers in as many seconds. Gradually increase the rapidity of your shots, and try shooting from the hip and the elbow. These snapping methods will, if carefully followed, greatly assist in developing a quick "snap shot" style, and by going over the different motions it is possible to become a fair shot without firing a single cartridge.

When some little progress has been made by the above methods a ball cartridge, preferably with a slight charge of powder, may be used. Right here the novice usually stumbles, and if the error is allowed to pass uncorrected

no very great skill can be afterward expected. I refer to the aiming of the revolver, which should demand your serious attention. Remember that one must firmly grasp the stock and discharge the arm with a firm and steady closing of the forefinger. The chief difficulty of the learner is in the liability of his bullet to go to the left or the right of the mark. The principal cause of this error lies almost wholly in the manner of pulling the trigger. No hurried movement must be made, and unless the finger is compressed free from a jerky motion any consistent degree of accuracy is impossible to obtain.

To always hold under the mark may be regarded as one of the few rules governing successful revolver shooting. As remarked elsewhere, the recoil of the powder force throws up the pistol's muzzle, and to offset this tendency the sight should just touch the bottom of the target's center. Pistols and revolvers expressly constructed for target shooting are made with a light trigger pull and with a long barrel. This mode of construction, i. e., muzzle heavy, practically overcomes any deviation from the sighted object when the weapon is fired. For general service and pocket use a heavy trigger pull is used, which is, of course, necessary for safety, obviating the chance of an accidental discharge.

The use of the target arm is, of course, confined to shooting matches, and as only the practical and useful side of revolver shooting lies within the mission of this article, my remarks are understood to apply to the regulation arm. Almost all of the large caliber military and service revolvers have a trigger pull of more than a pound, while a pound and a half and two-pound pull is usually more often found. This means that to discharge the arm the finger must actually lift a pound or two-pound weight, as the case may be.

I must caution the beginner against a too zealous following of target shooting, in that the deliberate aim makes the shooter slow. The good revolver marksman should be able to hit with equal sureness a moving as well as a stationary object. While this ability to hit a reasonably small object when either you or the object is in motion, demands more skill than the foregoing target mode, a little practice will do a great deal to increase the quick aim so necessary for its accomplishment.

This rapid shooting style is known as "snap shooting," and by following the hints here given I am confident the reader can form an accurate and rapid style.

Procure a hollow rubber ball of four inches diameter—such as children amuse themselves with—and attach a length of string to it. By swinging the ball as a pendulum a simple moving target is made, which is of more benefit to promote quickness in the shooter than any other target I have used. As one's hitting capacity improves the distance from the moving target is increased until it is possible to hit with some regularity the object at thirty feet. By lengthening or shortening the string the ball may be made to move slower or quicker at will, and by this means it is possible to use almost any size of room available for shooting purposes.

Many other devices, for increasing and developing the skill of the marksman, will no doubt suggest themselves to the reader. I know that if you have faithfully followed the hints given you will now be in a position to carry and use the revolver in an efficient, safe and satisfactory manner.

CHARLES S. TAYLOR.

#### National Rifle Association.

IN the Cadet match, open to teams of five from the U. S. Military and Naval Academies, or any male university, competitors to be undergraduates in good standing, only one team, that of Princeton University, appeared, and won the match by default. The distances were 200, 300 and 500yds. Positions, kneeling at 200yds., prone with head toward target at 300 and 500yds.

The weather on Sept. 4 was wet and dismal. In the Hale match, squadded competition, open to all comers, distance 600yds., 10 shots, Capt. A. E. Wells, of New York, won, with a total of 48 out of 50. The other winners were: Lieut. Tewes, New Jersey, 47; Capt. R. Emon, Ohio, 47; Lieut. Sheppard, New York, 47; Lieut. Shaw, United States Infantry, 45; Capt. Price, New Jersey, 45; Pvt. Simon, Ohio, 44; Capt. Martin, New Jersey, 43; Corp. Wright, Maryland, 43; Lieut. Benedict, Ohio, 43; Sergt. Benedict, Ohio, 42. There were forty-three contestants.

In the all-comers' squadded revolver match, 15 shots, 50yds., deliberate fire, weapon Smith & Wesson .38 military or Colt .38 army and navy revolver, 4lbs. trigger-pull, the winner was Pvt. Le Boutillier, Squadron A, New York. He scored 122 out of a possible 150. Second was won by Thomas Anderton, Manhattan Rifle Club, 122; Corp. Putnam, Squadron A, New York, 120; Lieut. Smith, 7th Regt., New York, 120; Lieut. Ranney, 71st Regt., New York, 119.

The carbine five-man team match, military, distances 200 and 500yds., 7 shots, was won by the second team of the First Troop, of the Newark, N. J., National Guard. Their score was 281. The Second City Troop, of Philadelphia, was second, with a score of 277. Third was won by the first team of the First Troop, Newark.

The interclub match was for the Rifle Club championship of the United States, five-man teams from organizations affiliated with the N. R. A. Ten shots per man at 200yds. Any military rifle and any ammunition. The highest score was made by the Manhattan Rifle and Revolver Association of New York, 226 out of a possible 250.

The scores of the winners were: Capt. W. G. Hudson 45, Capt. Cook 44, Thomas Anderton 46, W. H. French 48, C. F. Armstrong 43; total 226.

The inspectors' match, 10 shots, distance 600 and 800yds., was won by Lieut. K. K. V. Casey, of the 71st New York. The eighteen contestants made scores as follows:

	600yds.	800yds.	Total.
Lieut. K. K. V. Casey, New York	47	48	95
Lieut. Clark, Minnesota	41	49	90
Capt. Winder, Ohio	47	43	90
Capt. Martin, New Jersey	50	40	90
Lieut. South, Ohio	45	44	89
Capt. Seaman, Ohio	45	42	87
Capt. Cannon, New Jersey	35	49	84
Col. Carlton, Florida	39	45	84
Lieut. Benedict, Ohio	43	41	84
Capt. Bowie, Maryland	42	41	83
Lieut. Cookson, District of Columbia	43	40	83
Lieut. Richardson, Ohio	44	39	83
Capt. Bell, New Jersey	35	45	80
Lieut. Shaw, U. S. A.	42	38	80
Capt. Evans, New York	43	35	78
Lieut. Dennison, District of Columbia	40	37	77
Major Bell, District of Columbia	46	13	57
Capt. Graff, New Jersey	36	w	w

There were seventy-six contestants in the Leech cup contest, open to all, distances 800, 900 and 1,000yds. Capt. W. H. Richards, of Ohio, won with a score of 92 out of 105. Sergt. Leushner, of the 74th New York, was second with 89. Other scores were: Capt. Martin, New Jersey, 88; Sergt. Dittmer, U. S. Infantry, 88; Sergt. Major Evans, New Jersey, 87; Lieut. Simon, Ohio, 87; Sergt. Wayne, Ohio, 87; Lieut. Reese, U. S. Infantry, 87; Capt. Winder, Ohio, 86; Lieut. Tewes, New Jersey, 85; Capt. Bell, New Jersey, 85; Sergt. Sayre, U. S. Infantry, 85; Capt. Hudson, 84; Capt. Gannon, New Jersey, 83; Corporal Doderlein, New Jersey, 83; Sergt. Doyle, New York, 80; Capt. Wells, New York, 80; Lieut. Casey, New York, 80; Lieut. Cookson, District of Columbia, 80.

The Wimbledon cup match, open to citizens and residents of the United States, distance 1,000yds., 20 shots, any rifle, any ammunition, was won by Lieut. William A. Tewes, of the First New Jersey Regiment, with a total of 84. There were ninety-five contestants. Lieut. K. K. V. Casey, of the 71st New York, was second with 79. Capt. Winder, of Ohio, was third, with 77.

The regimental team match, six-man teams, 10 shots at 200 and 600yds., was won by the team of the First Regiment of New Jersey. The score was 516. This contest was for the interstate trophy.

The regimental skirmish match, six-man teams, had seventeen contestants. Conditions, two skirmish runs of 20 shots each. Prize, the Dupont cup, value \$250. The U. S. Marine Corps won. On their first run they scored 469; on the second, 464.

The President's match, for the military championship of the United States, was open to all members of the Army, Navy, Marine Corps, Naval Reserve, State Militia or National Guard. Rifle, U. S. Army service, any ammunition. Distances, 200, 500, 600, 800 and 1,000 yards, slow fire; 7 shots at each distance. One skirmish run of 20 shots. This match was won by Sergt. C. F. Orr, of Ohio, with a total of 292.

#### Ohio Rifle Notes.

THE annual reunion of the Preble County Deer Hunters' Association and the Preble County Rifle Club, held at Eaton on Sept. 1, was a big success. Over 100 riflemen were present, and over 700 shots were fired. All the rifle clubs for fifty miles around were represented. The shooting began at 10 A. M., and lasted until 6 P. M. Abner N. Clemmer won the greatest honor of the day, the high aggregate score in the eight matches, 85, possible 96. In the Preble County Rifle Club medal match, Geo. W. Izor made the remarkable score of four straight centers, making the possible 48, and winning the medal. The shooting was on the Creedmoor target. This score has been made but once before on the range, the first time by Ed. Vance. Mr. Izor wears seven medals won in other matches on this range. Other high scores, 100yds., offhand, 4 shots, were: J. Johnson and M. Pence, 44 each; Lieut. Platt, A. N. Clemmer, B. W. Jones, L. Leiber, J. Poss, S. Lee and M. T. Hampton, 43 each; Omar Parker and G. O. Chrismer, 42 each. The twenty-nine cash prizes ranged from \$4.50 to 40 cents. At the business meeting the following were elected officers: A. N. Clemmer, President; Alonzo N. Eikenberry, Vice-President; Ed. Wysong, Treasurer; Joseph Poos, Secretary. The next meeting will be held on the range at Eaton, Friday, Dec. 1.

The annual reunion of the Preble County Deer Hunters' Association was held at Eaton on Sept. 1. The shooting was at 100yds. offhand, animal targets, one shot on each, possible 48. Seventy-one riflemen took part. E. W. Davies was high with 44; A. N. Clemmer, second, 42; A. Rhodes and F. L. Burr, 40 each; L. Leiber, G. E. Garreth and L. Eikenberry, 39 each; G. R. Decker, L. Platt and C. J. Chrismer, 38 each. Then merchandise prizes were given in the contests on each of the animal targets. A business meeting was held at noon, when the Secretary's and Treasurer's reports were read and the following officers elected: Abner N. Clemmer, President; Abe Charles, Vice-President; T. N. Leach, Treasurer; Joseph Poos, Secretary. The next reunion will be held on the first Friday in September, 1906. The first prize of the day was given to A. N. Clemmer, who made high aggregate score of 85 out of a possible 96 in the shoots of the Deer Hunters and Rifle Club. Among the well known rifle shots present were "Uncle" Joe Wilson, of Lewisburg; J. F. Beaver, Wm. H. Ont, C. W. S. Sander, Less Leiber, W. H. Kerr, D. W. Jones, M. T. Hampton, W. L. Jay, Lawrence Mull, of Dayton; Geo. W. Izor, G. O. Chrismer, Silas Lee, Jacob W. Leshner, C. C. Pitman, Isaac M. Stiver and John Bochner.

#### Zettler Rifle Club.

THE programme of the thirty-first annual shooting festival of the Zettler Rifle Club, to be held at Union Hill, N. J., Sept. 27 and 28, can be obtained on application to the Secretary, Lieut. W. A. Tewes, 98 Chambers street, New York. Any rifles, with any sights (telescopic and magnifying sights included) will be allowed. High power ammunition or jacketed bullets not allowed. Shooting will commence at 10 o'clock, and will close at 6 o'clock.

#### Organization Meeting.

NEWARK, N. J., Sept. 6.—*Editor Forest and Stream:* A meeting will be held Sept. 13 at 26 Waverly avenue, Newark, for the purpose of starting a rifle club. All persons who are interested are cordially invited to be present. Meeting at 8 P. M.

F. VALLENTINE, Sec'y.

#### THE MANY-USE OIL.

The perfect lubricant for locks and magazine action.—*Adv.*

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

#### Fixtures.

- Sept. 13-14.—Allentown, Pa.—The John F. Weiler and Allentown R. and G. C. tournament.
- Sept. 15-17.—San Francisco, Cal.—The Interstate Association's Pacific Coast Handicap at Targets, under the auspices of the San Francisco Trapshooting Association. A. M. Shields, Sec'y.
- Sept. 16.—Rahway, N. J., G. C. shoot.
- Sept. 18-20.—Cincinnati, G. C. annual tournament. Arthur Gambell, Mgr.
- Sept. 20.—Dover, N. H., Sportsmen's Association prize shoot. D. W. Hallam, Sec'y.
- Sept. 23.—Long Island City, N. Y.—Queens County G. C. tournament. R. H. Gosman, Sec'y.
- Sept. 22-23.—Atlantic City, N. J.—Fall shooting tournament. E. M. Smith, Sec'y.
- Sept. 22-23.—Medford, Ore., tournament.
- Sept. 27-28.—Bradford, Pa., G. C. tournament.
- Sept. 28.—Edgewater, N. J.—Palisade G. C. all-day tournament.
- Sept. 29-30.—Broken Bow, Neb., G. C. tournament. F. Miller, Sec'y, Berwyn.
- Oct. 3.—Kansas City, Mo.—Afro-American Trapshooters' League tournament. T. H. Cohorn, Sec'y.
- Oct. 3-4.—Baltimore, Md., Shooting Association tournament. J. W. Chew, Sec'y.
- Oct. 3-4.—Louisville, Ky.—Kentucky Trapshooters' League tournament, under auspices of Jefferson County G. C. Frank Pragoff, Sec'y.
- Oct. 2-3.—Hyannis, Neb., G. C. tournament. L. McCauley, Sec'y.
- Oct. 3-5.—New London, Ia., G. C. shoot; \$500 added. Dr. C. E. Cook, Sec'y.
- Oct. 4-5.—Pittsburg, Pa.—Herron Hill G. C. tournament. T. D. Bell, Sec'y.
- Oct. 6-7.—Alliance, Neb., G. C. tournament. L. A. Shawrer, Sec'y.
- Oct. 9-10.—Indianapolis, Ind., G. C. tournament. Wm. Armstrong, Sec'y.
- Oct. 10-11.—St. Joseph, Mo.—The Missouri and Kansas League of Trapshooters. Dr. C. B. Clapp, Sec'y.
- Oct. 11-12.—Dover, Del., G. C. tournament; open to all amateurs. W. H. Reed, Sec'y.
- Oct. 18-19.—Ossining, N. Y., G. C. shoot, \$50 added. C. G. Blandford, Capt.
- Oct. 21.—Plainfield, N. J., G. C. merchandise shoot.

## DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Secretary, A. A. Schoverling, writes us that the Palisade Gun Club, of Edgewater, N. J., has cancelled the date, Oct. 3, of their tournament recently announced.

At the shoot of the Newark, Del., Gun Club, Sept. 4, Mr. Edward Banks, who recently was champion of Delaware, was high average, with a total of 137 out of 145, an average of about 94.5 per cent.

Mr. H. P. Vosseller informs us that the Plainfield, N. J., Gun Club will hold a merchandise shoot on Oct. 21.

Mr. E. J. Loughlin, Utica, N. Y., writes us that "Owing to heavy rains causing flood conditions our Labor Day shoot was declared off."

At the shoot of the Phillipsburg, N. J., Gun Club, held on Labor Day, Mr. Edward F. Markley made a new ground record, breaking 97 out of 100, and making a run of 54 straight. Mr. N. Clark was second with 94.

The Afro-American Trapshooters' League tournament, to be held in Kansas City, Mo., Oct. 3-4, will have an attractive programme. The first day will be devoted to the Grand Afro-American handicap. T. H. Cochran, Pleasant Hill, Mo., is the Secretary.

The No. Caldwell, N. J., Game Protective Association and Gun Club was organized recently. President, Ralph Bach; Vice-President, Fred Kusmall; Treasurer, R. Pfizemayer; Secretary, T. A. Quackenbush. The club is open for a team match with other clubs.

The Bradford, Pa., Gun Club announces a "green corn roast and clambake shoot" Sept. 27-28. An incident of this attraction is a programme of ten events at 15, 20 and 25 targets; \$1.80, \$2.40 and \$3.00 entrance; \$100 added. Jack Rabbit system. Ammunition shipped prepaid to T. F. Conneely will be delivered on the rounds free. Jos. Le Compte is the Secretary.

Capt. C. G. Blandford, of the Ossining, N. Y., Gun Club, writes us that "The prize shoot of his club, Sept. 16, at 2 P. M., has for prize the Weskora cup, value \$25; two distances, Class B start at 14yds, go back 2yds. for each win; 25 targets, entrance 50 cents; two barrels allowed. Bedell prize, a rifle, 25 targets, added birds handicap; entrance, price of targets."

Mr. C. W. Feigenspan, the well-known and popular sportsman and amateur trap shot, who, a few years ago, won the Brooklyn Eagle sterling silver cup against all comers on two separate occasions, also defending it against J. S. S. Remsen, of the Crescent Athletic Club, of Brooklyn, and who is abroad, was recently heard from in Luzerne, Switzerland, where, lover of nature that he is, he was enjoying to the full the beautiful scenery for which that country is famous.

The programme of the Queens County Gun Club tournament, to be held Sept. 23, provides nine events, 10, 15, 20 and 25 targets, a total of 175 targets, \$10.25 entrance. To the amateur breaking highest number in programme a handsome silver cup; to the amateur breaking least, \$2. Events 1 to 5 are sweepstakes, all scratch; Rose system, 5, 3, 2, 1. Events 6 to 9, 25 targets each, are merchandise, sliding handicap, four prizes in each event, ranging in value from \$2 to \$8. Shooting will begin at 10:30. A special feature is the 100-target event for amateurs at 1:30 o'clock; all scratch, \$5 entrance. Contestants in this event are requested to forward their entries to the Secretary, Richard H. Gosman, 134 Fourth street, or the President, John H. Hendrickson, 130 Twelfth street, Long Island City.

Each day of the Herron Hill Gun Club tournament, Pittsburg, Pa., Oct. 4 and 5, has a like programme, namely, ten events at 20 targets, \$2 entrance. The entire profits of the shoot will be given to the amateurs who shoot through the programme and fail to win the amount of their entrance. The club will guarantee such shooters their money back. If there is any money left, it will be divided among the high guns, \$5 to each as long as it lasts. Lunch will be served on the grounds each day. Everybody will shoot from 16yds. Targets will not be thrown over 50yds. Rose system, 6, 5, 4, 3, 2. Shooting will commence at 9 o'clock. Guns and ammunition prepaid, marked in owner's name, care of Sportsmen's Supply Co., 623 Smithfield street, Pittsburg, will be delivered free of charge. Mr. T. D. Bell is the Secretary.

The programme of the Cincinnati, O., Gun Club tournament is a work of artistic taste and skill. It is an excellent production, as was to be expected from the hand of Mr. Arthur Gambell, who had it in charge. The programme for each of the three days, Sept. 19, 20 and 21 is alike, ten events at 20 targets, \$2 entrance, with an optional sweep of \$1. Totals for each day, 200 targets, \$21 entrance, \$10 for optional sweeps. One dollar additional is charged to each contestant for the average money, and any balance of it will be added to the special purse to be divided among the amateurs. The entire profits of the shoot will be given to the amateurs who shoot through the programme. One cent from each target thrown will be set aside as a special purse, to be divided to the amount of their losses among the amateurs who shoot through the programme and do not win their entrance back. The club expects that this purse will amount to \$800. The purses in the regular events will be divided Rose system, 5, 3, 2, 1. Optional, class shooting, 40, 30, 20 and 10 per cent. Less than thirty entries, 50, 30 and 20 per cent. Average money each day will be divided, \$10, \$9, \$8, \$7, \$6, \$5 and \$5 high guns. Average money for the three days will be divided \$10, \$9, \$8, \$7, \$6, \$5, high guns. The balance of the special purse, if there is any in excess of the amateur losses, will be given to the high guns of the three days, one money for each \$10. Each day, \$50 average money and \$50 general average money. Dupont silver cup for high amateur general average. Shooting will begin at 9 o'clock. Sept. 18 will be practice day, commencing at 1 o'clock. Handicaps 16 to 20yds. Targets 2 cents. Only manufacturers' agents will be permitted to shoot for targets only. Dinner served each day in the club house by Mrs. Gambell. Address mail to Arthur Gambell, Station P, St. Bernard, O. Telegrams in care of G. W. Schuler, 626 Vine St., Cincinnati, O. Telephone number is Park 167 R, and may be used for long distance. Guns, ammunition, etc., forwarded, must positively be prepaid. They will be delivered at the grounds if sent to the following firms: Roll-Crawford-Brendamour Co., 28 East Fifth street; Peters Arms & Sporting Goods Co., 119 East Fifth street; The Powell & Clement Co., 410 Main St.

BERNARD WATERS.

Montclair Gun Club.

Montclair, N. J., Sept. 2.—The Montclair Gun Club held its opening shoot for the fall season to-day. Event No. 1 was a team race between the Mountainside, of Orange, and the Montclair Club, the ninth match of the series of team races among the clubs of the North Jersey League, and resulted in a victory for Montclair, with a score of 102 to 93. The first five men in order named belong to the Orange team, the second five to Montclair.

Events Nos. 2 and 6 were for silver prizes, among the winners being Allen, Leomans, Bush, Gardener, Cockefair, Whitehead, Newcomb and Winslow, Allen being the winner of the first prize for general high average.

The club shoot for a Daly gun on Sept. 9. The Morristown Club visit Montclair on Sept. 16. The scores for Sept. 2:

Table with columns for Events, Targets, and names of shooters like Dr Gardener, Yeomans, Mosler, Baldwin, etc.

Event No. 6, handicap, missed birds in previous event added. Ties shot off in the succeeding event.

Sept. 9.—Event No. 1 was for practice. Events 2 and 3, 50 targets, for the Daly Gun (July event postponed) was won by Howard, with a score of 46. Event 4, for practice.

On next Saturday, Sept. 16, the Morristown Club will visit Montclair and shoot the eleventh match in the series of team races of the North Jersey League. Some five other events will be run off for over twenty silver prizes. A big crowd is expected in the afternoon.

Table with columns for Events, Targets, and names of shooters like G Boxall, C L Bush, P H Cockefair, etc.

EDWARD WINSLOW, Sec'y.

Dover Shooting Association.

DOVER, N. H., Sept. 4.—It rained to-day much more than we would have it. We waited and shot between times and took a little wetting. We had ladies who braved the elements to watch us shoot, and who stayed until the game was over, and saw the prizes distributed—mere minor ones, of course, but something for competition. Nat Wentworth showed the path, and his promising son Irving followed the leader. The scores are as follows:

Table with columns for Events, Targets, and names of shooters like Lombard, Corson, Blake, White, Durgin, etc.

Marion Haley came down to visit us from away in that terrible country where Bertolph Jarvis and the rest of that heroic band of patriots made their famous journey in the Bear, overland and seaward, to rescue the sailors imprisoned at Point Barrow by arctic ice a few years ago. He came and left behind him his mine and his claims to visit his relatives and friends at the town of his birth, so we made up to give him a good time in his vacation.

We gave him a shoot—he was formerly an active member of our club—and he was delighted and enjoyed himself, and so did we—we that took part in the contest for the prizes that were offered. The scores:

Table with columns for Events, Targets, and names of shooters like Beard, Nat, Irving, Mason, Blake, etc.

D. W. HALLAM, Sec'y.

Rahway Gun Club.

RAHWAY, N. J., Sept. 4.—The weather was stormy and unpleasant for shooting. The main shoot of the club, fixed to be held to-day, was postponed to the 16th inst., the Bound Brook Gun Club very kindly cancelling their date to favor the Rahway club.

Some events were shot, and merchandise prizes were awarded the victors. The scores follow:

Table with columns for Events, Targets, and names of shooters like Geo Piercy, Dr Gardiner, Yeomans, Mosler, etc.

Fifteen targets in each event:

Amakassin Heights Gun Club.

YONKERS, N. Y.—The Amakassin Heights Gun Club held a holiday shoot on the afternoon of Sept. 4. There were five events on the programme, four at 15 and one at 25 targets. The 15-target events were for merchandise. The 25-target event was for the club cup, which is shot for monthly until won by a member three times, when it becomes his.

The attendance of members was fair when we consider that it did not cease raining until the time set for the tournament to start.

All of the events on the programme were handicaps. Prizes were won by Bruce, Johnson, Carey, Mallinson and Phillips. The scores, which follow, are the net scores, no handicaps included:

Table with columns for Shot at, Broke, Per Cent, and names of shooters like Siebert, Johnson, Pye, etc.

H. W. MALLINSON, Sec'y.

Riverside Gun Club.

OSWEGO, N. Y., Sept. 9.—The following shows the result of a local tournament of the Riverside Gun Club, held Thursday, the 7th inst.:

Table with columns for Events, Targets, Shot at, Broke, and names of shooters like Ebbbie, Gokey, Guilds, etc.

E. H. STOWELL, Sec'y.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Sept. 4.—Bell won high average, score 191 out of 200. Scott won low average. Longest run, Bell, 104.

Table with columns for Events, Targets, and names of shooters like Moller, Michaelis, Spencer, etc.

Table with columns for Practice, Events, Targets, and names of shooters like Moller, Finley, Bell, etc.

Table with columns for Events, Targets, and names of shooters like Moller, Finley, Bell, etc.

Sept. 9.—Hunter won the Peters badge. Abc Martin won the Dupont cup by breaking 117 straight.

WM. ARMSTRONG, Sec'y.

K. and K. Tournament.

AUBURN, N. Y., Sept. 4.—Our Labor Day tournament was a pleasant affair, with twenty-five shooters present. The trade was represented by Messrs. Geo. Ginn, J. G. Heath and Jack Hull.

In event 7, merchandise, Mr. Lamphere, of Weedsport; Mr. Carpenter, of Syracuse, and J. N. Knapp, of Auburn, divided on a \$25 Smith gun. C. J. Dalley, of Baldwinsville, won second, a handsome Hunter Arms Co. badge. James Montgomery, of Syracuse, third, a rug, and A. E. Conley, of Cohocton, a sweater. R. G. Wheeler, of Jamesville, won first average. J. N. Knapp won second average. C. J. Dalley won third average.

Table with columns for Events, Targets, and names of shooters like Wheeler, Dalley, Kennedy, etc.

KNOX & KNAPP, Mgrs.

Pleasure Gun Club.

ENGLEWOOD, N. J., Sept. 8.—Rain in the morning prevented many shooters from attending our shoot on Labor Day. Several members from the North River, Fairview, and Westwood gun clubs faced the early morning storm and were on hand for the first event.

The rain ceasing and weather clearing in the afternoon, made the shooting much more pleasant.

Programme consisted of twelve events, events 13 and 14 being extras. Events 6 to 12 were at 10 pairs each.

First amateur high average went to James Morrison, of the North River Gun Club. Second to Dr. Carl Richter, of same club.

The Banta trophy for members of home club shooting at 100 or more birds, was won by Frank Westervelt.

Table with columns for Events, Targets, and names of shooters like Eiehoff, Richter, Morrison, etc.

C. J. WESTERVELT, Sec'y.

WESTERN TRAP.

Dayton Gun Club Tournament.

The annual autumn tournament of the club was held on Sept. 4 and 5. The attendance was not quite what had been expected.

The club has put in three new trap-pits, getting a clear sky background. They have also erected a large shooting shed close to the firing line at No. 2 set of traps, which contained ample room for the office force and shooters.

The referees were R. Hendrickson and C. Baker. Scorers: Geo. Birk and Geo. Wells.

The trade was represented by Messrs. Taylor, Reid, Heer and Viemeyer.

A nice hot dinner was served in the Sharpshooters' club house each day.

The programme consisted of ten 20-target events each day; \$2 entrance in each; money divided 35, 30, 20 and 15 per cent. The club added \$100, which was divided among the five high guns shooting through both days, \$30, \$25, \$20, \$15 and \$10. All ties divided.

On the first day twenty-eight shooters faced the traps, twenty-three shooting through. L. H. Reid, of New Paris, broke 97 out of his first 100, and 95 out of his second, finishing high with 192.

Heer was second with 190. He broke 97 out of his last 100. Lindemuth was high amateur with 189, missing only 6 in his first 100. Partington and Watkins tied for second high amateur on 187.

The day was cool. The bright light of the sun was obscured by clouds. There was little wind. The scores:

Sept. 4, First Day.

Table with columns: Events, Targets, Shooter Name, Shot, Broke. Lists scores for various shooters like L. H. Reid, W. Heer, Lindemuth, etc.

Sept. 5, Second Day.

The weather on the second day was similar to that of the day before. The attendance was not so good, nineteen men taking part and seventeen shooting through.

Heer shot a splendid gait all day, breaking 95 out of his first 100 and 99 out of his second, finishing high with 194. Bowen, an amateur, was second with 190, missing only 4 in his first 100.

L. H. Reid was third with 189. Clark and Kirby next with 186 and 185 respectively.

Heer was high man for the two days with 384. Reid second with 381. Lindemuth third with 372.

The programme was finished soon after 1 o'clock, and most of the shooters left. Some of the ladies present then took a hand in the game, and made things lively for a while, but no scores were given out. The scores:

Table with columns: Events, Targets, Shooter Name, Shot, Broke. Lists scores for various shooters like Heer, Bowen, L. H. Reid, etc.

Cincinnati Gun Club.

An enjoyable special shoot was held on Labor Day. Many of the members were out of the city. The programme was therefore cut in half, only 100 targets being thrown instead of 200, as intended.

This left half the prizes still on hand, and they will be shot for at some of the regular club shoots soon. Five merchandise prizes were given in each event, and \$2.50 in gold to each of the five high and five low guns.

Sixteen shooters took part. The day was cold and cloudy, with a strong wind, which made the shooting difficult. Miss F. Alther's work was one of the features of the afternoon, and she was congratulated on her good score of 81.

Ties in all the events were shot off at 10 targets at the close of the shoot, the winners then drawing envelopes in order, each envelope containing the name of the prize.

Table with columns: Events, Targets, Shooter Name, Shot, Broke. Lists scores for various shooters like Trimble, Pohlar, Barker, etc.

Sept. 9 had good conditions for shooting, and the scores show it. A number of the regulars are still away. In the 100-target race Gambell did fine work, breaking 97. Pohlar broke 92.

Grunewald, of New Orleans. Mr. Nelson is an old hand at the game, though a little out of practice now, while the others are new at the sport.

Table with columns: Shooter Name, Score. Lists scores for various shooters like Gambell, Pohlar, Ahlers, etc.

Match, 100 targets: Gambell 20 18 20 19 20-97 Pohlar 17 17 18 19 20-92

Match, 100 targets: Gambell 19 18 17 17 20-91 Barker 18 18 19 17 18-90

Ohio Notes.

At the Dayton, O., Gun Club's grounds, Sept. 1, eight 20-target events were shot. Buck being high gun with 144; Dickey second with 119.

The New London, O., Gun Club was organized four years ago and good will and harmony have prevailed among its members throughout its history.

The Cleveland Gun Club held a shoot on Labor Day. Thirty shooters took part and twenty-six shot the entire programme of 150 targets.

The Forest, O., Gun Club was organized this year and has about twenty members. On Sept. 14 and 15 they will hold their first annual tournament.

Garfield Gun Club.

CHICAGO, Sept. 9.—The appended scores were made on our grounds to-day on the occasion of the seventh and last trophy shoot of the third series.

In the club trophy shoot, W. Einfeldt won Class A trophy on 24; Al. Smedes and George tied for Class B on 22; Wilson won Class C on 14.

In the Dupont cup shoot, Dr. Meek won Class A on 19 out of 20; George won Class B on 19 out of 20; Wilson won Class C on 18 out of 20.

In the Hunter Arms Co. event, 10 singles and 5 pairs, W. Einfeldt won Class A on 19; George won Class B on 16. No Class C men in contest.

The day was a fine one for target shooting, barring a slight head wind which blew the powder residue back into the face, and a peculiar hazy atmosphere, which made the light uncertain, but was pleasantly cool and there was practically no wind. Scores:

Table with columns: Events, Targets, Shooter Name, Shot, Broke. Lists scores for various shooters like Morrell, Thomas, Dr. Meek, etc.

In Other Places.

The Janesville, Wis., Gun Club will conduct a series of shoots for the powder company trophy. The contests will consist of 50 targets with a handicap of from 14 to 20yds.

The Essna Park, Ill., Gun Club held their initial shoot last Tuesday. The charter members are: A. P. Smith, C. C. Amster, Barney Boers, D. E. Meyer, W. C. Fleming, C. Steiner, Carl Engelbrecht, F. G. Wenger, John F. Steiner, W. H. Heist, George W. Baier, Chris. D. Baier, E. L. Wiese, Calvin Bobb, John F. Schmitz, J. Gieger, Wm. Bevans and John Riencke.

A big shoot, to which all were invited, was held Sept. 1. Wednesday, at the Limited Gun Club shoot, Indianapolis, Ind., Henry Lewis, Martinsville, Ind., made high score.

The officers of the St. Cloud, Minn., Gun Club are live and able men for the place, making special efforts to bring the shooters to the grounds. They are not satisfied with an attendance of less than twenty members.

At the late shoot of the Helena Gun Club, Tecumseh, Neb., Ed. Varner, of Sterling, was high with 96 out of 100.

In giving notice of the coming shoot, an enthusiastic secretary states: "That it takes a pretty mean man to be disagreeable when he has a stomach full of hot dinner. This will be furnished on the grounds at a reasonable price."

If the shooters could realize what a big dinner does to their scores, they would cut it out. A cup of tea and a small piece of bread is the best.

The Nee-Pe-Nauk Shooting Club, Portage, Wis., has been chartered, the incorporators being Byron C. Meacher, C. H. Smith and F. O. Grand.

A new club hails from St. Paul, Minn. It will have the name of Yellow Hammer Gun Club of Dayton Bluff. The first shoot will be held Sunday morning. Ole Johnson was elected President.

S. Goll, President of the North Shore Gun Club, was in Kirkland, Ill., last week looking for a reserve for fishing and hunting. The club has a membership of 150 and wishes to erect a club house.

No tournament has been held by the Houghton, Mich., Gun Club this year, but the members are warming up over the contests for the trophy that is now up for competition.

W. F. Hurst was the winner of the West Duluth Rod and Gun Club trophy, M. J. Filatrout won second prize.

Last Friday the Greensburg, Pa., Gun Club held a picnic in the woods near the city. A royal good time was reported.

The Duluth, Minn., trapshooters carried away the prize money at the Grand Rapids shoot on last Friday. T. J. Stoney was high with 272 out of 320, and J. W. Nelson was close with 270.

Nelson never fell out of the money. Jackson finished fourth, and Loud and Berry were sixth and seventh.

The fourth annual tournament of the Warren, Minn., Gun Club was held Wednesday. More than a dozen shooters took part in a varied programme. W. O. Braggans proved the best of the band with 120 out of 140, making 21 straight in a miss-and-out.

Club were: W. D. Stannard first professional, then in the amateur class Schultze, of Tomah, and Halverson, of Rio, were tied on the first 100; but in the final wind up J. Rump, of Portage, was first with the above-mentioned second and third.

Prospects for good shooting at the Georgetown Flats, Montana, were reported fine, as many ducks were hatched there. Many boats were sent there, and by this writing the ducks are being disturbed.

At the tournament held at London Mills, Ill., the report states that the attendance was limited, no doubt owing to not being mentioned in the sporting press.

The Titusville, Pa., Gun Club held a good shoot Saturday, Robertson winning the walk-up match. Dr. Hugh Jameson made 7 out of 10. There were several beginners who took part, and the management was much encouraged.

The Faribault and Owatonna, Minn., gun clubs held a shoot last Tuesday, in which some thirty shooters took part. Joseph Fredette made high, 85 out of 100.

Mr. Fred Evans has donated to the La Mars, Iowa, Gun Club a beautiful silver cup. It will likely be awarded to the member making the highest score for the season. It will be put up each succeeding year for competition.

On Sept. 23, the shooters meet at Media, Pa., to compete for a repeating shotgun.

The members of the Richland, Pa., Rod and Gun Club spent a week at Fricks' Mills, where they caught suckers, catfish, carp and eels, cooking and eating same. They report a good time.

There is a movement on foot to organize a gun club at Parrall, Mexico. Several enthusiasts there think trapshooting would be the right sport.

The Muscatine, Iowa, trapshooters have purchased new traps and taken up regular practice.

At the Bellevue, Ill., tournament, held last Sunday, there were fifty shooters present. Gus. Joffray was the manager, and he carried it to a success. William Thompson was winner of first prize.

The Akron, O., Gun Club held a shoot Wednesday, in which C. J. Schlitz, of New Berlin, was high. He won a badge and a rifle. Joy came next with 85. The attendance was large.

The Salt Lake, Utah, Gun Club has been presented with a fine silver cup by one of the prominent cartridge companies.

The Scranton, Pa., Gun Club invite all who can shoot or who think they can shoot to join them in practice at the trap.

The Twin City Gun Club, of Peoria, Ill., will hold a two days' tournament during the latter part of September. Trapshooting is taking on new life both in Peoria and in Pekin, and being the most centrally located of any in the State, it should be a big shoot.

Announcement is made by the Monmouth, Ill., Gun Club that weekly practice matches will be held, and a few hundreds of targets will be broken on each occasion.

The Yellowstone Gun Club, Omaha, Neb., held an outing at Bennington last week. There were team races and plenty of amusement. All report having spent a very enjoyable day.

The Marietta, O., Gun Club are quite elated over winning almost everything in sight at the meeting of the Ohio Valley Association. With the purses in their pockets, they also brought back the cup. The members of the victorious team were Messrs. Speary, Decker, Nelson, Beebe, and Slichter. The scores for the cup were: Speary 25, Decker 24, Nelson 22, Beebe 22, Schlichter 20.

Parkersburg and St. Marys tied for second with 100. The day was ideal, and conditions were all favorable. The next shoot will be held in Marietta.

The Greensburg, Pa., Gun Club held a picnic in the woods near town on last Friday.

L. Holverson, of Rio, Wis., is getting to be a regular attendant at tournaments. He made a record of 182 out of 200 at Grand Rapids; besides he attended the Jonesville and other tournaments.

Members of the Tule Hunting and Gun Club, Marysville, Cal., are enthusiastic, and will soon erect a club house costing \$5,000, and when completed and furnished will be second to none in the West. The building will consist of social hall, dining room, gun room, toilet, and kitchen on the first floor, and bed rooms on the second. There is fishing as well as hunting on the grounds, and the ladies will arrange fishing parties during the season. Also there will be picnics, and all forms of amusements will be theirs to enjoy.

Programme for the first annual tournament of the Forest Gun Club, Upper Sandusky, O., to be held Sept. 14 and 15, announces eleven events.

The Phoenix Gun Club, El Paso, Tex., is getting ready for a big trapshooting event. It will be the annual tournament of the Arizona Club Association.

The Sleepy Eye, Minn., Gun Club visited Springfield last week and in a friendly team race were beaten 17 targets.

The Merrill, Wis., Gun Club held an enjoyable meeting last Sunday. An auto party came up from Wausau, viz.: P. Miller, Jesse Sipes and Sam Schneider.

There was a meeting Saturday at the grounds of the Chicago Heights Club. The weather was bad, and the attendance limited. Another shoot will be held in September, at which time a gold medal will be offered.

R. E. Shearer states that the Carlisle, Pa., Gun Club will hold several big shoots this fall. Many of the local sportsmen will participate.

The officers of the South Tacoma, Wash., Gun Club, are: John Cooper, President; O. W. Cooper, Vice-President; G. W. Turnbull, Secretary; Committee on Arrangements, Roy Rowe, B. B. Lipscomb, L. S. Dahl, and E. B. Lanning.

H. Drows, of Lake Mills, Wis., won the Jefferson county trophy at the last tournament of the Watertown Gun Club with 24 out of 25. This being his third win, he is now the permanent owner.

At the last shoot of the Forney, Tex., Gun Club there was \$100 raised and given as added money.

All Western shooters should keep their eyes on Dr. Cook's shoot at New London, Ia., Oct. 3, 4 and 5. Five hundred dollars in gold added.

After a lapse of many moons, the report comes to us that the Sioux Falls, S. D., Gun Club have started practice events.

At Lead City, S. D., the gun club keeps up regular weekly shoots. The invitation is always open to all who love the game to take part.

During the September days there will be no trapshooting in the great States of Minnesota, North and South Dakota. The prairie hen and the wild duck will be too inviting.

N. C. G. P. A. and G. C.

No. CALDWELL, N. J., Sept. 6.—I beg to advise you that a gun club has been organized at North Caldwell under the name of the North Caldwell Game Protective Association and Gun Club, with the following officers: Mr. Ralph Bach, President; Mr. Fred Kussall, Vice-President; Mr. B. Pfitzmann, Treasurer, and Mr. T. A. Quackenbush, Secretary.

The club ran off a very successful shoot on Labor Day, and is anxious to meet other gun clubs in a shooting tournament. We are open for engagements.

T. A. QUACKENBUSH, Sec'y.

# U. S. Government Ammunition Test.

Accuracy test of Krag-Jorgensen .30-Caliber Cartridges held at Springfield Armory by order of the Ordnance Department, United States Army.

**TESTED**—Ammunition of all the American Manufacturers.

**CONDITIONS**—10 and 20 shot targets, muzzle rest.  
10 and 20 shot targets, fixed rest.

**RESULT and OFFICIAL REPORT: U. S. Cartridges excelled all others**

**MANUFACTURED BY UNITED STATES CARTRIDGE CO., LOWELL, MASS., U. S. A.**

**Agencies: 497-503 Pearl St., 35-43 Park St., New York.**

**114-116 Market St., San Francisco.**

### Analostan Gun Club.

WASHINGTON, D. C., Sept. 6.—The Analostan Gun Club held a very successful shoot on Labor Day, Sept. 4. The Labor Day shoots of this club are always very attractive to the members, and have become famous. The programme on this occasion was particularly attractive, and drew a large crowd of spectators and shooters. The programme was commenced with two sweepstake events of 15 birds each, \$1.30 entrance, and were followed by the regular events, open to the members only. The first prize event was for an Ithaca 60-grade shotgun, which was won by Dr. W. C. Barr, who scored 44 out of 50 targets. In this connection, it is proper to state for the information of your readers that all the prize events were shot under the distance handicap system. All the Class A men were started at the 18yd. mark; the Class B men at 16yds., and the Class C men at 14yds. The events were shot in strings of 10 birds each, and a shooter moved back to his limit whenever he made a straight, which was 20yds. for Class A men, 18yds. for the Class B men, and 16yds. for the Class C shooters.

The second event was at 30 birds for a Marlin 16-gauge shotgun, and was won by Mr. Brown on a score of 27 out of 30. The last event was a merchandise affair at 50 birds. Dr. Barr also won first in this event, scoring 46 birds, and also won the high average for the day, for which he was awarded the championship cup presented by Mr. Ralph Nutting.

Mr. Joseph Hunter and F. N. Bauskett tied for second high average—the handsome gold medal presented to the club by the Hunter Arms Co.

In the merchandise event at 50 birds, every member received a prize, there being over \$100 to distribute among the shooters, which were allotted to the high guns. Following are the scores:

SECRETARY.

### Phillipsburg Tournament.

PHILLIPSBURG, N. J.—The first annual Labor Day tournament of the Alert Gun Club was a very successful affair, when measured by the satisfaction so generally evinced by those who participated.

The contestants, numbering twenty-two, are individually of a class which cannot be excelled in true sportsmanship, and the Alert boys will take a keen delight in affording them a similar opportunity to meet again in the future.

The day opened with heavy showers, which caused some delay in starting the shoot, and prevented the attendance of many amateurs who had previously signified their intention of being present.

The trade was represented by Mr. H. S. Welles, of New York city.

The record in 100 targets over this trap, set for a 50yd. target, was 93 breaks, and was held by Mr. Markley, of Easton, Pa. For more than a year this record had not been equalled, although numerous other amateurs of high ability have attempted to sur-

pass it. At this shoot, Mr. E. F. Markley and Mr. N. L. Clark, of Doylestown, Pa., were both successful in accomplishing the feat, the former making the very remarkable score of 97 breaks, and Mr. Clark following closely with the creditable score of 94 breaks. Mr. Markley further displayed grand form by making a straight run of 54 breaks, which is in itself a new record here, eclipsing Mr. J. Mowell Hawkins' record of 53 straight breaks made at a previous Alert tournament. The three highest amateur cash prizes were awarded as follows: First, Edward F. Markley; second, Mr. N. L. Clark, and third, Mr. J. F. Pleiss, of Easton, Pa., and Mr. James Ogden, of Warwick, N. Y. The programme totaled 180 targets. The following are the scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	Total.
Targets:	10	15	20	25	10	15	20	10	20	10	25

GEO. STUBBLEBINE.

### Trap at Henniker.

HENNIKER, N. H., Sept. 6.—A delegation of the Derryfield Gun Club members went to Henniker yesterday on the invitation of the Henniker Gun Club, and with them participated in a most enjoyable shoot at the traps.

Mayor Reed had broken 55 out of 60 shot at when he ran out of ammunition, and from then to the completion of the programme was compelled to use a light load, that being the only thing the club had in stock. Goss is a steady shooter, and a hard man to beat; but had Reed been equipped for the race, the result might have been different.

Ten events were contested with nine shooters facing the traps. W. C. Goss was high gun on the average for the day, with Mayor Reed just one bird behind him. The race between these two men was a pretty one, as both men were shooting in good form. Goss used Mullerite powder in his shells throughout the entire match, while Mayor Reed did not have enough shells of any one kind to shoot out the programme with.

W. C. Goss broke all the birds in one 15-bird event, and Mayor Reed made a clean record in the 20-bird event. Dr. Cole, Mayor Reed and W. C. Goss each broke all the birds in 10-bird events. Messrs. French and Sanborn alternated in the position of scorer and referee, and gave satisfaction.

Refreshments were served at the shooting house. Scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	Total.
Targets:	15	10	15	20	15	20	15	20	10	15

SECRETARY.

### Staunton Gun Club.

STAUNTON, Ill., Sept. 4.—Owing to bad weather, the fourth annual shoot of Staunton Gun Club, held to-day, was not as largely attended as in former years. High average honors went to the following three gentlemen in order named: N. Camp, J. Victor, A. Wyckoff. The trade was represented by L. A. Cummings, L. J. Standish and H. E. Winans. Scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Total.
Targets:	10	15	20	15	20	15	20	15	20	15	10	15	
Schiess	7	10	13	15	13	11	17	22	12	13	12	6	153

Camp	9	15	18	15	16	14	18	25					

Springfield (Mass.) Shooting Club.

WHAT promised to be the largest trapshooting tournament ever held in New England was somewhat marred by the wet weather of Labor Day, Sept. 4. However, seventy water-proof advocates of the scatter gun attended the tournament of this club, held on their grounds at Red House Crossing. While the forenoon was very moist, it cleared up during the early part of the afternoon, so that the extra set of traps could be put to work, after which the events were run off in short order. The light was very good for shooting, the dull gray of the background causing the targets to look very large, while the absence of any wind made shooting conditions perfect.

Forty-two shooters shot the entire programme of 200 targets, 25 being in the sweeps all day, something unusual at tournaments around here this year. During the day seventy different shooters took part in the several events, and 10,040 targets were trapped, a record day for us. The trade was represented by J. A. R. Elliott and Hood Waters. If it had been a pleasant day probably one hundred shooters would have attended.

Among the noted amateurs present were Barstow, F. E. Metcalf and Harry Metcalf, of Rockville; Smith, of Boston—he with the "guess" machine; McMullen and Arnold, of Somerville, Conn.; Prest, of New London; Adams, of Plainfield, N. J.; Rausenhausen, of Pittsfield; Mack, of New Haven; Hicks, of South Manchester; Head, of St. Albans, Vt.; Herbert, of Boston; Finch, of Thompsonville; Bradley, of Bridgeport; Hebbard, of Boston, and I must not forget to mention Schorty, of New York city. We couldn't run a big shoot without having Schorty on hand.

That so many shooters attended was a big surprise to us, considering the weather. The added money and valuable merchandise prizes must have been a big attraction to get so many shooters out on such a day. The traps worked to perfection, and there was not a halt all day, except when the awning blew down on a squad of five, and there was lively hustling for a dry spot. Elliott broke 196 out of 200 targets, a record for the grounds. For several reasons the prizes got somewhat mixed; first, it was too dark to shoot off ties after the programme was finished; second, several shooters took the wrong prize due them, caused by the hurry in getting away.

The list of winners and the prizes won by them will be furnished by the secretary, and any one having a prize that doesn't belong to him is requested to send same to its rightful owner, prepaid, and the secretary will remit the amount of expressage paid on same. As there was no other way to decide ties other than the club doing so, as several shooters who were tied left before the programme was finished, the ties were decided by high gun system (drawing matches), members of the committee taking the places of the shooters tied, under the circumstances there was no other way of doing, and we hope it will be satisfactory to all.

Table with columns: Events, Targets, Scores (1-12), Shot, Broke, Av. Lists names like Elliott, Herbert, Barstow, etc.

Notes.

Herbert, of Boston, shot fine, and lost only seven targets all day. Barstow has a standing invitation for all shooters to stop and call on him and listen to his new graphophone. Le Noir shot poorly for him, due to the new gun he was using. Better stick to the pump, Fred; it will make your scores look nicer in print. Several umbrellas that were left at the club house will be sent to their proper owners by notifying the Secretary and giving description. "Where was you when the cyclone struck?" was the question asked after the wind blew the canopy down on the shooters, and there was a wild scramble for the club house. We all missed Dr. Newton. Suppose he was eating clams at Greenfield, and incidentally shooting, as I noticed that he won the cup up there at the shoot Labor Day. Must have had something to wash the clams down with to do such good shooting. Mack, of New Haven, came up to shoot with us. Said he couldn't bear to have the New Haven club not represented at so fine a shoot, although there was a shoot on at home. Sept. 2.—Eighteen shooters attended the practice shoot of this club, held on the afternoon of Sept. 2, and in spite of the rain, some fair scores were made. Part of the events were shot over the new set of traps until the rain drove the shooters under the canopy of the old shooting stand. The tie of last shoot between Cady and Andrews for a hunting coat was shot off at 15 targets, Andrews winning. Score, Andrews 13, Cady 10. In the prize event of this shoot, the prize being a shell case, there were four ties on 15 each between Cady, Snow, Andrews and Bagg. On the shoot off at 10 targets, Andrews and Cady again tied on 10, and on the shoot-off of this tie Andrews won. Score, Andrews 9, Cady 4. The Peters cup contest and the merchandise race have one more shoot to run. Added target handicap in cup event, and in the merchandise race the shooters are divided into three classes, there being three prizes up of equal value. Scores in these handicap events follow:

Event No. 4, 15 targets, weekly prize event: Brk. Hdp. Tot'al. Lists names like Snow, E Cady, Bagg, Andrews, Kites, L Mysterly.

Worcester Sportsmen's Club.

WORCESTER, Mass., Sept. 7.—The scores of the Worcester Sportsmen's Club shoot, Sept. 5 and 6, are appended:

Sept. 5, First Day. The events were at 15 targets: Lists names like Eager, Dr Hoyt, W H Buck, H Waters, Hebbard, etc.

Sept. 6, Second Day.

The veteran squad, each member over sixty years old, was composed of Dr. Gerrish, Messrs. E. T. Smith, A. B. F. Kinney, Webber and Rugg. Mr. Smith won the cup, events 5 and 6. Lists names like Elliott, Wheeler, Griffith, Chapin, etc.

Bergen Beach Gun Club.

BERGEN BEACH, New York, Sept. 9.—Delightful fall weather favored the shooters at the weekly shoot of the Bergen Beach Gun Club. Messrs. Southworth and Griffith led in the shooting. Lists names like Dreyer, Bergen, Southworth, Craft, etc.

Lowell Rod and Gun Club.

THE Lowell Rod and Gun Club held their annual Labor Day shoot Sept. 4, and considering the weather conditions, was well attended. Thirty shooters from all parts of New England were present, and a gamier lot of shooters never met in New England, as the steady downpour of rain made it anything but pleasant for them. Nearly every one who entered finished the programme, which consisted of 180 targets each.

Shooters were present from New York city, Boston, Manchester, Concord, Haverhill, Lawrence, and Amesbury, nearly all of whom were in the expert class.

The Manchester shooters were led by the chief executive of their city, Hon. E. E. Reed, and the Mayor and his brother captured the first and second high individual prizes.

The team shoot of five men per team, 30 targets per man, was won by the Manchester team, with Lowell second and Haverhill third.

Team scores: Manchester—Mayor Reed 22, Elmer Reed 23, A. J. Reed 21, C. A. Allen 21, Bowen 26; total 113. Lowell—Climax 23, Rule 13, Dean 22, Fletcher 21, Edwards 25; total 103.

Haverhill—Miller 21, George 21, Childs 24, W. Allen 16, Tozier 23; total 105.

Team prizes were \$15 to first, \$10 to second. Events 6 and 7 were the team race.

Events: Lists names like Mayor Reed, Elmer Reed, Climax, Rule, George, etc. with scores.

The individual cash prizes of \$15 were divided among the four high averages, and went to Elmer Reed, first; Mayor Reed, second; Edwards, third, and Climax, Kirkwood and Bowen divided fourth. Cole, of Haverhill, won low average prize of \$3.

EDW. J. BURNS, Sec'y.

Newark Gun Club.

SEPT. 7.—The Newark, Del., Gun Club held a merchandise and sweepstake shoot on Labor Day. Owing to the opening of the season on rail and reed birds, the attendance was naturally small, twenty shooters in all taking part in the events on the programme. Among the amateurs, W. Torpey, of Radnor, Pa., was high man, and carried off most of the cash, as well as pretty nearly all the first prizes. J. Hossinger, of the local club, was second high man among the amateurs, with W. Edmunson in third place.

The cashier's department was well looked after by H. Linn Worthington, from Rising Sun, Md. The only other representative present was Mr. Edward Banks, of Wilmington, Del., who took first honors in the shoot, but did not participate in the purses or in the division of the merchandise. The scores were as follows:

Events: Lists names like Edw Banks, W Torpey, J Hossinger, W Edmunson, etc. with scores.

Sheepshead Bay Gun Club.

SHEEPSHEAD BAY, L. I., Sept. 4.—The day was a poor one for shooting, being rainy and cheerless. The attendance was light. T. W. Tallman, son of ex-Judge Tallman, from the South, was a visitor. It was his first experience at target shooting. Messrs. Ira McKane and Eugene Carolan are rapidly recovering from severe colds. Scores:

Events: Lists names like Montanus, Dreyer, Fransiola, etc. with scores.

No. 3 was at 3 pairs. First team race: Capt. Montanus 16, Tallman 14, Spinner 15; total 45. Capt. Dreyer 11, Fransiola 9, G. Remsen 17; total 37. Second team race: Capt. Dreyer 18, Fransiola 12, Remsen 21; total 51. Capt. Montanus 22, Tallman 16, Spinner 11; total 49.

PUBLISHERS' DEPARTMENT.

Gettysburg and Washington.

Personally-Conducted Tour via Pennsylvania Railroad. THE battlefield of Gettysburg and the National Capital are attractions so alluring that few would feel like refusing to visit them, especially in the cool fall days. It is to place these two attractions within easy reach of every one that the Pennsylvania Railroad Company announces a tour over the interesting battlefield, through the picturesque valleys of Maryland, and an entertaining stay at Washington.

The tour will leave New York, West Twenty-third street, 7:55 A. M., and Philadelphia 12:20 P. M., Saturday, Sept. 23, in charge of one of the company's tourist agents, and will cover a period of six days. An experienced chaperon, whose special charge will be unescorted ladies, will accompany the party throughout. Round-trip tickets, covering transportation, carriage drives, and hotel accommodations, will be sold at the extremely low rate of \$22 from New York, \$21 from Trenton, \$19 from Philadelphia, and proportionate rates from other points.

For itineraries and full information apply to ticket agents: Tourist Agent, 263 Fifth avenue, New York; 4 Court street, Brooklyn; 789 Broad street, Newark, N. J.; or address Geo. W. Boyd, General Passenger Agent, Broad Street Station, Philadelphia.

A Great Catalogue.

THE Iver Johnson Sporting Goods Co., of 163 Washington street, Boston, send us their new catalogue of essentials and luxuries for the sportsman. The 500 pages describe and illustrate several thousand articles, and is a veritable encyclopedia of the appurtenances of sport.

Wild Rice.

MESSRS. NORTHRUP, KING & Co., of Minneapolis, announce in our advertising columns that they have adopted an improved method of keeping and shipping wild rice which insures its germination.

Is the only Sure Rust Preventive on Guns, -Adv.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

NEW YORK, SATURDAY, SEPTEMBER 23, 1903.

VOL. LXV.—No. 13  
No. 346 BROADWAY, NEW YORK.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, \$2.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

## THE ADIRONDACK LANDS.

THAT Adirondack lands belonging to the State, and included within the classification of lands which the Constitution declares shall not be sold, have been surrendered to private ownership is believed by persons who have been cognizant of Adirondack land deals. In a communication to this journal the other day Mr. Raymond S. Spears cited two cases in which the transaction appeared to require explanation. Commenting on these in a statement printed elsewhere to-day, Commissioner Whipple says that so far as he has been able to ascertain the latter place transfer was in violation of law, and he declares that he will take steps to set aside the sale and recover damages. As to the Ampersand Pond land, Commissioner Whipple says that he has learned that the State's reclaimed title was set aside by a competent court, but the affair will be investigated.

These transactions are by no means the only Adirondack State land deals which demand explanation. There are other lands once held by the State, but now in the possession of individuals and of sportsmen's clubs, which, it is believed, have been transferred in violation of the constitutional prohibition of the sale of State lands in the Forest Preserve.

It was high time that the reign of intrigue which has prevailed in the North Woods should end. The people of the State cannot but hail with warm satisfaction and hearty approval Commissioner Whipple's declaration that he stands for a clean and open administration of the trust given him. The story, as told in the World, of the good beginning he has made through the agency of Deputy Attorney-General Ward, will be taken as an earnest of his purpose. To clean the robbers out and punish the thieves who have been enriching themselves after the manner of thieves and robbers since society was organized, by preying on the property of the community.

## THE SLOTHFUL LIFE.

IN every city or town, be it humble or great, there is a large percentage of dwellers who, from the necessities imposed by their occupations, lead sedentary lives. In particular, the large cities abound in sedentary occupations. Each has its thousands of brain workers—in the aggregate of all the great cities, such workers number millions.

Day in and day out the sedentary worker's chief exercise consists in walking a short distance to a street car, riding to and fro from their offices, all devoid of any physical exertion worthy of the name. When at work the field of vision of the sedentary man is limited by the inner walls of his office, his field of physical activity is limited to his chair. Such habits of life result in weak, flabby muscles, a loss of physical stamina, with in time a disinclination for physical exercise, whether light or arduous.

In a limited way, there are some exceptions to the general inaction of office workers. Some engage in games which impose physical competition more or less, as bowling, billiards, etc. From them they derive some exercise, inadequate, yet far better than none at all. Some take up gymnastics. Yet, relatively to the whole, those who take systematic physical exercise are few. And those who, being office workers, take systematic exercise, are generally in the early years of their business life. As a rule, when a sedentary worker approaches middle age, he gradually avoids all physical activities separable from the mere journeyings to and fro between home and office chair. In many instances, obesity sets in, with its consequent heaviness, clumsiness, thickness of wind, and inertia. The organs of the body lose their vigor, and there is a general lowering of vigor and vitality.

Under such conditions, the mere taking of a vacation once a year, though beneficial, is far from meeting the requirements of the case. Indeed, the sedentary worker,

long habituated to bodily inaction, is not in physical condition even to enjoy a vacation if it contemplates any of the active sports of land and water. Nevertheless, he takes his vacation without any preliminary physical preparation, and enters into the sport of hunting and fishing with boyhood ardor. Many bodily discomforts forthwith ensue. If he engages in quail shooting, his feet, being weak from lack of exercise, are strained and sore; being tender, they are well blistered. His arms are so muscle weary that they feel as if they would drop off from their own weight. The whole body is sore and over fatigued. If he rides horseback, many unused muscles are brought into action, to their consequent straining and soreness. If the sedentary one fishes, there is the same bodily sufferings from weak feet, weak hands, weak limbs, with the added inefficiency of bodily clumsiness, heaviness of movement, and incapacity of action. All this discomfort and incapacity could be avoided by taking every day regular exercise which would comprehend the physical culture of the whole body. Much time is not required. Ten minutes of exercise morning and night, will accomplish wonders. The whole muscular system thereby is kept in tone, the vital organs are vigorous and perform their functions healthfully, and the sedentary worker then seeks the physical activities of life instead of avoiding them.

Before going on an outing which contemplates active bodily powers, two or three weeks of physical preparation, in the form of walks to and from the office, and more exercise each day with gymnastic appliances will add immeasurably to the comforts of an outing, to the capacity and enjoyment of him who engages in it, besides the general every-day benefits of a strong mind in a strong body.

## INDIVIDUAL EFFORT.

THE history of the early years of game and fish protection in this country has been a record of the efforts of individual workers, men who have had the intelligence to recognize the necessity of action, and who have had also the public spirit to put forth new personal exertions for the general good. Here and there and everywhere, the individual has agitated the subject, enlisted the cooperation of his fellow citizens, organized clubs, societies and associations to carry on the work, and by his own example and inciting enthusiasm and executive action promoted the cause. This is true not of any one section alone, but of the country at large. Wherever those lines may be read, in localities however remote, the reader will recognize the truth of the assertion that but for the interest and activity and foresight displayed by these individual apostles of protection, the field would be to-day more barren of game and the waters of fish. Of such men it may be said with truth that in their active promotion of the preservation of fish and game they exemplified the qualities of good citizenship; they were in a very substantial way public benefactors; the world is better for their having lived in it; and for what they have done they deserve to have their memories honored.

## PENNSYLVANIA FISHCULTURE.

THE Department of Fisheries of Pennsylvania is still making a good showing among the States engaged in fish-culture. According to the report of Commissioner of Fisheries W. E. Meehan, just made for the quarter ending Aug. 31, the following fish were distributed from the State hatcheries from June 1 to Sept. 1: Frogs, 70,000; California trout, 30,000; large brook trout, 100; yellow perch, 500; catfish, 2,100; calico bass, 35; black bass (fingerlings), 1,800; rock bass, 86; cutthroat trout, 75,000; shad, 554,000; herring, 2,754; total, 736,375. Adding to this, 145,157,918 fish distributed from Jan. 1 to June 1, the total output for the nine months ending Aug. 31, was 145,894,293. There are still remaining in the various hatcheries 1,043,800 fish still to be distributed, not including a large number of sunfish, goldfish, yellow perch and rock bass at the Corry hatchery, the number of which could not be estimated at the time the report was made. With the fish distributed and those yet to be distributed, the fish quarterly work of the State will surpass 147,000,000 fish. During the last three months thirty-four new ponds were built in the different hatcheries, making a total number of ponds in the five hatcheries now in operation 115, an increase of 82 since the Department took charge in 1903.

During the quarter the wardens made 170 arrests for illegal fishing, of which 33 were acquitted. The amount of fines imposed was \$3,655. Of this amount \$2,305 was the work of six wardens—Criswell, Shoemaker, Nesley, Albert, Shannon, and Benning. During the quarter about twenty-seven acres of land were added to the existing hatcheries. Two new hatcheries of the four new hatcheries authorized by the last Legislature have been located, the land, aggregating about sixty-eight acres, having been presented to the State by citizens of the counties in which the hatcheries were located. Extensive repairs and additional buildings were constructed in the hatcheries.

A noteworthy feature of the report was the announcement of the Commissioner that he had found an act under which proprietors of certain types of industrial establishments could be arrested, convicted and fined for allowing poisonous substances from flowing into streams in sufficient quantities to kill fish. Backed by the advice of the Attorney-General's department, but preceding a case at the time under the same advice, three successful arrests and convictions were secured during the quarter, the offending industrial establishments being each fined \$100. Suits have been begun against four others.

IN our angling columns is a very practical and very enticing paper by Mr. W. E. Meehan on the wall-eyed pike fishing of the Susquehanna, or, as it is locally termed, Susquehanna salmon fishing. To its devotees, as Mr. Meehan tells us, there is no other fishing in America to compare with it. This is only another illustration of the boundless resources of the angling waters of the United States; of the quality of our various game fishes, and of the zest and satisfaction the fishermen of the continent may find in their own home waters.

We are not inclined to quarrel with the Pennsylvania anglers who miscall the wall-eyed pike a "salmon"; though in the past, when more sanguine than now of accomplishing great reforms, we have striven hard toward a universal nomenclature, believing in one name for one fish and one fish for one name, and have objected to some fish commissioners, who know better, calling the pike-perch a "salmon," in their reports. We hold that it counts for nothing that the majority of their readers call the fish "salmon" and will continue to do so. It is their business to lead the public in the right direction, not to follow it. The name of salmon has been applied to a certain fish for centuries in many parts of the world, and it is as much entitled to it as a cow is to her name, and we have contended that no people have a right to apply it to a fish not remotely related to it. But "Susquehanna salmon" it is; and will be to the end.

The great confusion in common names of fish and game in America has arisen from the fact that the country was settled in different parts by Europeans who brought their names with them and applied them to the first fish or bird which bore a fancied resemblance to those at home. Hence, as they had the name of salmon, and no fish in the Susquehanna, Mississippi and Ohio rivers to match it, they applied the name to perch. So in the South the names of trout, chub and bream, all well known fishes of England, and all of which have fins with soft rays, have been applied to entirely different fish, and, strangely enough, all to fishes which have fins with spinous rays. In Virginia the name "chub" is applied to the black bass, while in Georgia and Florida the same fish becomes a "trout." In Georgia the name of "bream" is used to designate a fish which is one of the family which includes the black bass and the sunfishes. In Massachusetts a little spiny sunfish is also called "bream."

THE Maine non-resident shooting license law is creating much dissatisfaction among visiting sportsmen who are seeking not big game but birds. According to the terms of the law the shooter from without the State may have the privilege of shooting birds prior to Oct. 1 on payment of \$5, but for the same shooting after that date he must pay an additional \$10, a total of \$15. True, for the additional payment he receives also permission to kill big game; but there are many gunners who want birds only, and they are unable to reconcile the second payment with any consideration of equity or justice. If a \$5 fee is reasonable for shooting up to Oct. 1, it is quite as reasonable for the rest of the season thereafter, and the injustice lies in making the bird shooter pay the extra \$10 for a big game hunting privilege which he does not care to avail himself of.

## Stories of Some Sea Dogs.\*

### II.—"Nip," the Sailors' Friend.

In the many years I was officer and master of sailing vessels I do not remember that I ever made a voyage without having a dog for a companion on board ship, and strange as it may seem, I never bought one in those days, for I had the good fortune always either of being presented with one, or of picking up a canine waif on the wharf or in the street that pleaded as only a dog can for a master and a home. I have always been a lover of dogs from childhood up, for the dog's sake, and in later years the love has grown into admiration and respect begotten of my knowledge of his great value as a to be always trusted friend. Few men living have more reason to be grateful to the canine race than I, for repeatedly has my life been saved by a dog. In every instance but one—that of a fire in the house—the dogs to whom I owe so much have been far from being of recorded pedigree or champions that have won their distinction at bench shows. My dogs invariably belonged to the class "mongrel," but in their class they have in every instance been worthy of the championship and all the cups and medals that could be given to a bench champion. My dogs often were of much mixed breeds, and when they came to me were in need of conditioning to make them fairly presentable even on the quarter deck of a ship. But it was my good fortune to have picked up dogs who were intelligent enough to know that I would make a good master, and that with me they would secure a good home and such treatment as brings out the best traits of their character.

The individual dog of whose record I shall write at this time, followed me one evening when I was returning to the ship from the theater. It was a bitter cold night. The poor fellow fell in with me and at first followed at a respectful distance; but as I spoke to him kindly he came nearer, and at last I patted his head and he licked my hand. That settled his fate with me, and we jogged along to the West India Dock gates, for we were in London at the time, and it was not long before we were in the warm cabin. I went to the pantry and gave him a good square meal and a drink of good clean water and then went to my room. The dog followed me and I pointed out a place for him to lie down, and turned in for a comfortable night's rest. As the crew came strolling on board after their evening on shore he would growl, as he evidently was not quite familiar with his surroundings, but made no further outcry.

When I awoke in the morning he was sitting up ready to greet me, and was profuse in his salutations. When the steward turned out I introduced the dog to him as I did the two mates when they came into the after cabin where I lived. When breakfast had been served I felt sure that the dog then knew who belonged aft, and that they would be treated accordingly. After the breakfast was cleared away the steward and I gave the dog a thorough cleansing, and his improved appearance was ample reward for our expenditure of time and soap. The next thing was to introduce him to the cook and the men forward so that he might familiarize himself with their faces, and when he became watchman that there would be no trouble in the men getting on board or in moving about the vessel at night. I had always done this when I adopted a new dog, and found the trouble taken to bring about this acquaintanceship was worth the time expended, besides the dog invariably received better treatment from the men for the early introduction.

We were in London for several weeks, and daily the dog, whom I had named Nip, grew in favor fore and aft, for he was a mild mannered fellow, very affectionate, and best of all was remarkably observant of what was going on and could readily distinguish between a stevedore, who had a right to come on board, and the sneak thief who lost no opportunity to carry off anything he could lay his hands on. He acquired his name before he had been on board a week from nipping one of these gentry, and nipped him so well that we secured the fellow and handed him over to the police, who recognized in him one of the cleverest fellows of his fraternity and whom the police had long been anxious to catch in some flagrant act for which they could transport him to a penal colony. Nip the dog was his undoing, and his cleverness was the direct means of sending this fellow on a long journey over the sea to remain away from his native land for many years; however, he probably in due time secured a ticket-of-leave and eventually died out in the colonies a respected citizen like many of his predecessors whose passage had been paid by the Queen.

I am half inclined to believe that Nip had been at sea before, and that this was not his maiden voyage, as he took so naturally to the ocean and ship's affairs; at any rate, he was quite at home in any part of the ship and did not mind a heavy squall, or a protracted gale of wind. Weather was all the same to him, be it sunshine or storm, and he was the best lookout on the ship. He could smell a passing vessel when no one on board could see it, and would smell the land hours before it came in sight, and in many ways was a valuable aid to navigation. As a member of the "anchor watch" when in port his equal was not to be found among the twenty men who composed the crew. No boat could come near the ship but Nip would give us timely notice; and once while lying at

Barbados he showed his splendid qualifications as a night watchman by keeping away from us the harbor thieves, who were very daring in plundering the ships that lay in the harbor. We lay in that harbor for twenty days and never a penny's worth of stuff was taken from us. The lookout man might go to sleep, and he often did, but Nip was never known to have slept after the anchor watch was set at eight bells. He even on one occasion, when a very heavy squall was coming down on us, gave us timely warning so that we had time to let go a second anchor and saved the ship from dragging her single anchor and going on shore, as four vessels did that night because the human anchor watchers were asleep, and when the squall struck their vessels it was too late to have the second anchor bite before the vessel was on the beach.

Nip's champion record, however, was made on a voyage from Demarara to New Haven. We were heavily laden with sugar, rum, and a lot of scrap iron which had been taken on board the last thing, and was the cause of much trouble to me, as it affected the compasses and kept me on the anxious seat all the voyage. In those days we did not know so much as is known at the present day how to correct the errors due to local attraction. We had some twenty-five passengers on board, most of them ladies who were going north to visit friends, and some others journeying to England by the way of the States, so that my cares and responsibilities were unusually large this voyage. Nothing marred the early part of the trip save the bother with the compasses; the weather was fine, the winds favorable and everything went smoothly until we crossed the Gulf Stream, where we fell in with a succession of gales varying in intensity and duration, and for days at a time the weather conditions were such that the sun failed us—no observations could be made, and we were trusting to dead reckoning. This, coupled with the vagaries of our compasses, rendered certain navigation a puzzling problem. I was convinced that besides local attraction I was being bothered by unusual sets of currents, and life was miserable in the extreme. However, I kept pressing the ship to the northward as opportunity offered, but was never sure of my western position. The bad weather had reduced my chance of making a reasonably quick run home, and as I had to double Montauk Point to get into Long Island Sound, I could have no assistance by picking up my position from landmarks like Barnegat, or floating marks like Sandy Hook Light Ship. When I got on soundings they did not agree with our supposed position, and I confessed to myself that I was "all at sea" as to where we really were. I was getting well up with my northing, and became doubly anxious, and somewhat exhausted from the lack of sleep, and was brain tired with anxiety, but nerved myself up for the strain and tried not to let the passengers particularly see that I was worried in the least, for if they became the least panicky then my troubles would be increased fourfold.

I had calculated that I was some thirty miles off the Long Island coast on Sunday morning and had several casts of the lead which seemed to verify my calculations, but I resolved that nothing should be left undone to safeguard the ship and her valuable freight of life and property. Early in the day I sent a man to each masthead to see if he could see over the fog and mist, and if possible to catch a glimpse of land, but nothing could be seen. When we went down to dinner at noon the only one of the after guard that did not put in an appearance at the table was Nip, who always sat on the floor at my right hand side, but I did not miss him at the time. True to his nature he was on the lookout on the topgallant fore-castle, where the mate and two men were peering into the fog. We had just finished our soup when I heard Nip barking furiously; I could not resist the temptation to find out what had attracted his attention, and dropping my knife and fork rushed on deck and went forward. Nothing could be seen, but Nip could not be pacified, and with my previous experiences under like circumstances with dogs, it flashed into my mind that Nip smelt land, and it was best to heed his warning. I instantly ordered the ship to be put about, and we headed off to the eastward and I felt easier, and returned to the dinner table feeling assured that no harm could come to the ship on her altered course. We had not progressed far with our meal before there was a sudden shift of wind, the fog was blown to the leeward of us and with a gentle breeze from the northward the vista which opened up before us was the lowland of Long Island, and close on board. But for Nip's timely warning and my quick understanding of a dog's capabilities as a reliable lookout, we would have undoubtedly been in the breakers with a great loss of life.

Nip received an ovation from the passengers and crew that would have crushed any human being, but he did not seem to mind it, and seemed more anxious to secure a belated dinner than the caresses of his human friends. Several of the passengers wanted to buy him, but the combined passenger list did not have money sufficient to induce me to part with my canine friend.

I left the ship at New Haven after she was discharged, and took Nip with me to New York, where I had secured another command, and we started off for a voyage to Jamaica. I told my new officers and men of the record of Nip, and bespoke for him kindly consideration. The story I told won for him a most kindly reception and he evidently felt that his new shipmates were his friends, for he was soon mingling with them as freely as he had done

on the other vessel. He was frequently to be found with the lookout at night, and the men considered it a great treat to have Nip as a companion in their lookouts. So far as Nip was concerned, the outward voyage was bare of incident; we discharged our cargo and Nip had a few scraps on shore with Kingston dogs, in which he generally came off the victor.

On our homeward run nothing of importance occurred until we were in the latitude of Charleston. The wind was light, the sky somewhat overcast, and the sea was quite smooth. Nip was forward on the topgallant fore-castle sitting on his haunches listening to the chattering of the lookout man who was talking dog to the noble fellow, when he suddenly jumped up and began barking and making a great noise about something he had either scented or seen on the surface of the water. The lookout could see no sign of sail, boat or even big fish; but the action of the dog made it clear to the man as well as to the watch on deck that something unusual had attracted Nip's attention, and all eyes were strained to see if anything was in sight. But no one could discover that there was any visible warrant for the dog's behavior. He suddenly leaped off the fore-castle and ran along aft barking more strenuously than ever, and as he came up on the poop deck I came up out of the cabin. Just then the man at the wheel shouted out: "There is a man overboard; I hear him crying out 'help!'"

The helm was put hard down and the main topsail laid to the mast and as quickly as possible a boat was cleared away and manned, and was soon putting in the direction from which the cry came. In perhaps ten minutes we saw the boat returning and received a hail from it: "We have got him." When the boat was hoisted up even with the rail there was lifted from her a fine strapping fellow who was then unconscious. We got him on deck and found him without any clothing. From the boat was taken a large oaken draw bucket which had served as the man's life preserver.

It was not long before he had recovered sufficiently to tell us that he was one of the crew of a small whaling schooner. At the time he fell overboard he was drawing water in the waist, and losing his balance had fallen into the sea unobserved by any of his shipmates. This occurred at about 7 o'clock the evening previous, and he had been afloat nearly thirty hours with nothing to support him but that oaken bucket. After he had been in the water for some hours he had divested himself of all of his clothing, and being a good swimmer, had no difficulty in keeping himself afloat, although he was fast losing strength and had about given up hope of being able to last much longer. He had suffered terribly from the lack of water and from the rays of the mid-day sun, but said he had hoped to be picked up by his own vessel, which he saw twice during the day on the horizon and once she was within about two miles of him, but they failed to see him. He had relieved his hand grasping strain on the bucket, by making the lanyard of the bucket into a loop in which he sat and maintained his upright position by using a portion of the rope for a girth which kept the upturned bucket close to his chest. The compressed air in the bucket was sufficient to insure his safety so long as his strength held out and the sea continued smooth. He saw our running lights as soon as they were visible above the horizon, and his greatest fear was that we might run over him, but he had hoped by husbanding his voice to warn us in time and also to enable us to locate his position and rescue him. He heard Nip's barking and felt sure that the dog had discovered him, and said to himself: "Would to God that dogs could talk." When we passed him slowly by, his spirits began to droop, but when he saw the ship come up to the wind with her maintopsail to the mast, he knew that he was saved, and managed to keep his voice till the boat reached him, when he fainted away. His recovery was rapid, and in a few hours he was about the decks, little the worse for his thirty-hour swim. To Nip he ascribed all the credit of his rescue, and it was willingly accorded to the clever dog.

From the hour the man and Nip met they were inseparable, while to me dear old Nip was a treasure worth his weight in gold, and no money could have induced me to part with him. A couple of days after we arrived in New York Nip was missing, and we searched high and low for him. I advertised for him, but no replies came, although I promised a handsome reward to him who returned the dog. Just before I sailed on my next voyage a letter post-marked Belfast, Me., reading as follows:

"My Dear Captain—I will to my dying day remember, and thank you for picking me up at sea, and for your kindness to me while on board your ship. I know you are grieving over your loss of Nip, but he is with me and will be till he or I dies. That he will have a good home I can guarantee, better than he ever could have on shipboard. I have had enough of the sea for my lifetime; so has Nip. I send you my best wishes. Nip would if he could. Good-by. God bless you.—Harry."

I could hardly blame him for wanting Nip for a companion, but did not exactly like the manner in which he acquired possession of my dog. But who could blame the man? I consoled myself that Nip would have a kind master and a good home. So I sought out another canine companion, but he never ranked as high in my estimation as did dear, good, clever, honest old Nip. B. S. OSBORN.

## The Colorado Desert.

(Concluded from page 227.)

Game animals are few on the desert; Rocky Mountain sheep are the most numerous, and, with a few deer around isolated water holes, comprises the list, with the exception of the ever-present and numerous jack-rabbits. Coyotes, big, rangy brutes, are plentiful; there are no bears nor mountain lions, save now and then one of the latter may be met with crossing from the breaks of the river to the Sierra Madres, 100 or more miles to the west. There are a few bobcats and any amount of little reddish-gray foxes, the worst little camp thieves on the desert. Among the smaller four-footed pests are the kangaroo rats and the chipmunks, nuisances around camp. The kangaroo rats are miniature kangaroos in shape, with the exception of their long, rat tails and that they do not pouch their young. They will steal and carry, or drag, away anything that attracts their attention whether edible or not. Knives and forks, buttons, spools of thread, anything; one of the boys lost his old silver watch one night and the next day, after digging out a number of nests among some rocks, we found the watch uninjured. Back of the old, tumbled down and abandoned stage station at Cañon Springs we dug into one of their nests one day and the inventory of what we found there would fill nearly a column. Cañon Springs was an eating station on the old Southern Overland route fifty years ago. Sometime, maybe, I will tell you more about those rats and their tricks.

I have seen many quail on the desert, generally within a mile or two of water, but I have found them ten or fifteen miles from the nearest water. They live in localities where the stunted trees are covered thickly with mistletoe and find sustenance in the berries. The rats and chipmunks I have seen many miles from water; they get their liquid nourishment from the sap of plants and roots.

Rocky Mountain sheep have fled from the long-range repeating rifles of civilization to the fastnesses of the desert mountains, where they find good forage in the little meadows, moss, chemical and the unnumbered thousands of acres of bunch, or giata grass. I have seen thirty of these timid animals in one band. In the winter time they will go two days without water, but in the summer time they will go to water at least once a day. They are protected by statute, but the Indians kill them and will trade the meat for sugar, flour and coffee. The meat is darker than that of venison, but, in my opinion, the flesh of a fat, two-year-old buck is sweeter and better than that of a deer. I have always regretted that I could not bring out the head and horns of a big buck that a Coahuila Indian killed not far from our camp. The horns were almost a complete circle and measured just four feet in length on the outer circumference; around the butt each horn measured 24½ inches. Such a pair of horns would weigh about fifty pounds, and it seems strange that the animal could carry them and run with such incredible swiftness until one sees a big buck throw back his head until the horns rest on his shoulders, and then the mystery is solved.

Two Indians came to our camp at Cañon Springs one day and tried to beg, borrow or buy some .44 caliber cartridges, they had only nine; but we would not let them have one. They left, and the second day after they returned with the meat of seven sheep and one cartridge; they had only missed one shot, and an Indian is not worth a bean as a shot at over 100 yards or a point blank range. Their rifles were old, black powder carbines.

The old fable about mountain sheep jumping from precipices and alighting on their horns is all nonsense; a story good enough to entertain and interest a tender-foot around the camp-fire, but as a fact it may go into limbo along with Alex Badlam's sidehill bear that had legs on the down-hill side longer than the others. Alex never would tell how it worked when the bear turned and went the other way, he always worked that bear around a hill in the same direction. I have experimented with mountain sheep, have chased them over steep places that I could not descend unless I jumped over, and have come upon them suddenly where their only escape was over a seemingly precipitous cliff. Their sight is remarkably keen, and they are more surefooted than the proverbial goat; they look where they are going to leap and go bounding from one point to another like a ball. If it is absolutely straight up and down and too smooth for even the slightest foothold they will not chance it, but will stampede past you to a safer route. Going from you they resemble no animal so much as an antelope, only they are heavier. Sheep suggests wool, but mountain sheep have no wool, except in the winter time, when they take on a fine fuzzy coat close to the skin, but are covered with a coat of hair like that of a deer or antelope, and there is not the slightest hint of a mutton taste about the meat.

The Cocopah Desert lies just south of the Mexican line, and is really a continuation of the Desert of the Colorado; the old stage route between Yuma and San Diego tipped the northern end of it. It lies between the Sierra Madre Mountains on the west and the Cocopah range on the east, from which it takes its name, and extends on down the eastern shore of the Peninsula of California as far as one cares to go. From a spring in a cañon southeast of the little trading post of El Campo one must take water for the trip across the Cocopah. From that spring one may see the saddle in the mountains that mark the Cañada de los Muertos, Cañon of the Dead, in which is the next water. It is only sixty miles, and with the landmarks in plain view all the way some might think that if necessary one might make it without water. Yes? Other white men have thought the same, and out on that trap-door of hell are little mounds of stones or piles of bleaching bones, mute witnesses to their errors of judgment. The Cocopah range of mountains, bare and treeless, is inhabited by the Cocopah tribe of Indians, the majority of which still cling to their bows and arrows as weapons of war or the chase. This is presumably due to the fact that they have never had enough money or goods to trade for a rifle. Now and

then one may be seen with an antiquated musket or an old model magazine rifle. Do not ask where they got them, they would lie to you, but more than one man has gone into the Cocopah range and never came out. My partner, Crawford, and a companion, J. C. Brown, lay behind the rocks with their rifles all one afternoon and shot against volleys of arrows until an aged chief, whom they had succored a week or so before, came on the scene and put an end to the fight by telling his tribesmen how the white men had saved his life. The Indians did not especially want the lives of Crawford and Brown, but they did want their provisions and guns—which they did not get.

At the foot of the western slope of the Cocopah range is a long, narrow laguna salado or salt lake. It is thirty or more miles from the Gulf of California, and a range of high mountains intervenes, yet that lake is said to have a tidal ebb and flow at the same time with the tides in the gulf. This would seem to indicate that there is a subterranean channel connecting the two. The shores of the lake are fringed with marine vegetation, and the green-bordered, sparkling water has raised more than one hoarse cry of joy from parched throats—but, oh, the horror of it when the thirsty ones tried to drink.

Almost anything might be under the surface down there. On the mesa between the eastern slope of the mountains and the Gulf are the mud volcanoes, bubbling up like nothing so much as great pots of mush with the accompanying "pooh-h" of steam and gas. For several miles around the surface of the earth is quivering and the footing is insecure; it is a ticklish place to travel, for a false step might drop one into an old cauldron. Never try to get your burros to go out to them, the long-eared, patient beasts have an instinctive horror of the place, and are gone the moment they get a whiff of the sulphurous gases.

The backbone of the peninsula of Lower California, a high mountain range about 700 miles long, is yet a paradise for sportsmen. There are no bears there, not quite enough water for them, for they like a wallow; but there are deer of nearly every species, especially the big mule deer, and mountain lion too numerous for comfort. There are also mountain sheep that are not protected by statute, and quail—well, they are about the most common bird down there. I may tell you more about that country some time—how to get in there, what to take, and where to go; but mind you it is no holiday excursion. The mountains are not the barren mountains of the desert, but are a continuation of the Sierra Madres, and are in many places heavily timbered with forests which the ax of the woodsman has not yet devastated. But I started to write about the Desert of the Colorado, and here we are away down in the San Pedro Martir range.

That the sand of the Desert of the Colorado is very fertile has been demonstrated by the irrigation system down near the Mexican line, where water has been brought from the Colorado River by a system of canals. The Indians first proved the fruitfulness of the land. During the spring and summer rise of the Colorado the flood waters would break through the sandy bank south of Yuma, and in past ages there had been cut a tortuous channel a hundred miles or more in length to the Salton Basin, which it would frequently flood to a depth of two or three feet. Although the basin is three hundred or more feet below the level of the river, yet the thirsty sands and the rapid evaporation drank so much of the escaping flood water that only a comparatively small amount of it found its way to the basin. The long channel, wide and shallow, came to be known as New River, and as the flood in the main river subsided, so did the overflow in the channel. Desert Indians would follow the receding waters and plant beans and melons and corn, and in six weeks their crops would mature. This first gave the white men the idea of irrigating the desert and the new city of Imperial is the result. This is south of the railroad in San Diego county. North of the railroad begins the desert mineral country, except in the extreme southeastern part of the county, where there are some placer and gravel mines. The desert parts of Riverside and San Bernardino counties are said to be at too great an elevation to irrigate from the Colorado River, and hence will remain as always, only a mineral country.

Gold, silver and copper are the minerals for which prospectors now brave the dangers and hardships of the desert, principally gold and copper. As yet but little silver has been found except that in the gold. There are other valuable substances out there, of which but little account has yet been taken—gypsum, mica, marble, cinnabar, lead, kaolin, iron, antimony, and, in fact, I do not know all of them—gold was the object of my search. The country is all unsurveyed Government land, and oh, what a relief it is to travel a country 150 miles wide and 1,000 miles long with never a sign "Private grounds, keep out," to stare one in the face. No signs of any kind, in fact, and no roads for that matter; one makes his own roads, and there is a certain amount of satisfaction in feeling reasonably certain that one has been in certain cañons or on certain mountains where never a white man had been before.

It is this that attracts some men to the desert; and, while its vastness and solitude are awe-inspiring at first, one soon grows accustomed to it, and it becomes a magnet, to which he will return sooner or later, if only on a visit. The absolute freedom and primitiveness of it all is the lodestone; no papers, no mail, except for weeks; no whistles, no trains, no rush, no women, no worry—nothing but camp when one gets tired, without a permit from any man, and stay in camp until he gets rested. Of course, it is not a pleasure resort, with beautiful groves and trout streams; one must rough it in the literal sense of roughing it—sleep on the ground and live on beans and bacon as a certainty, but if fresh meat comes your way accept it as a special act of a munificent and watchful Providence, and take courage.

In touring that country, if one has the money, the most comfortable method is to get a light, strong, wide-tired wagon, drawn by two stout Spanish mules that have been broken to pack. One may drive all over the mesas, tablelands and valleys, leave the wagon

at some water hole, and pack the mules and climb the mountains on side trips. However, it is well to pack two or more burros and take them along; they will, if good burros, follow like a dog. A burro will pack 125 pounds twenty or twenty-five miles in a day without distressing him, although we have packed 150 pounds on an animal and crowded them thirty miles in a day, but the case was one of necessity. The weight of the pack depends, of course, on the size of the burro; some of the larger ones can pack 175 to 200 pounds with comparative ease. I say Spanish mules or burros because they are acclimated, do not have to be shod unless one wishes, and can hunt their own forage, though it is well to take along a sack or two of barley.

Prospectors, as a rule, do not bother with wagons. Two men will pack from three to five burros with several months' supply of bacon, flour, beans, coffee and dried fruit, and say good-by to civilization. If they are well outfitted they may each have a saddle burro, but that is considered a luxury, although \$10 is an average price for a desert burro.

Did you ever take into consideration that all the gold in the world comes out of the ground? Almost since time began, men have been trying to make the metal, but have failed; its manufacture is God's secret. That thing that moves all the wheels in the world and gives all nations the sinews of war, is searched out by a comparatively small number of men, who cut loose from civilization and comfort, and drift out into nature's wilderness, where they face danger and hardship in every form in order that the wheels of the world may move. Some time I may tell you how they do it, for I know.

E. E. BOWLES.

## Recollections Aroused by Wood Smoke.

CONVALESCING from a three months' siege of illness (right through the trout and bass season and into the days that are open for prairie chickens and ducks), some smoke from a bonfire of birch flooring cuttings, refuse from a new house under construction across the street, floated into my bedroom window. That smell of birch wood smoke at once aroused dormant memories of over thirty years ago. All the incidents connected with my first trout fishing experience crowded in upon me. I went through once more the important and absorbing ordeal of the selection and purchase of my outfit. I made no mistakes in my selection of rod and other impedimenta, for at my side one who knew advised and counselled. And everything being ready, we made tracks for the good old State of Maine, and in the afternoon of the following day, when the Boston and Maine dropped us at a spur, we waited but a few moments before a busy little engine with a single car backed up to the platform. The engine engrossed our attention, because of the cavernous smoke pipe that belched out sparks and volumes of smoke. How fresh and savory that wood smoke smelt in the cool September air! And as the train jogged along to its destination, we smelled the hard-wood smoke and accepted it as a not unpleasant concomitant of our journey.

And the next day, when we trudged into camp at the Carey Ponds about noon, the breeze blowing our way, once more the odor of hard-wood smoke was waited toward us, but this time it was not the plain, simple smoky article, but with it came blended the odor of frying trout and baking beans, for it was dinner hour in camp.

The beans, trout, biscuit and coffee disposed of, we joint and string up our rods and cross over to the trail that leads us to the second pond. How clearly everything comes back to me! We enter the boat moored to the shore and row within casting distance of a great bed of lily pads. The way the trout assailed our flies led us to believe that there must be millions of them sheltered under those green shadowing leaves. We saw at once that only those trout badly hooked should be kept and began to throw the others back. A trout on each one of the three flies seemed to be the rule. A little of this fishing went a long way, and we floated along the surface of the lake, trying a sheltering rock or sunken log, and here and there picking up a stray trout.

For me it was my first trout, and to be introduced to the spotted individuals under such pleasant circumstances was something to be remembered.

And all this because a puff of hard-wood smoke floated into my bedroom window.

CHARLES CRISTADORO.

## More Camp Remedies.

I WANT to "butt in" with my remedy for cuts, bruises, scratches and other injuries incident to boating, hunting, camping, and other outdoor doings. It is a small box of boric acid, a roll of absorbent cotton, and another of antiseptic bandage. Then I don't need to wait to tear up a shirt, handkerchief, or anything else when I get hurt. These I always take with me, even when on a railway journey. With the numerous railway accidents so frequently occurring, a fellow never knows when he may get hurt.

Boric acid is a powder, a cleaner, germ killer, and cooling to a wound. When I get cut, I immediately fill the wound with the powder, bind it with the bandage, and leave it without further attention. If the cut was deep, I would cram it full of the powder, but not sew it up. I want a deep cut left open to heal from the bottom outward. Should there be any pus form down there, I would want to cleanse it. For this purpose I carry also a small bottle of dioxogen, and a small glass dropper. A drop of the liquid will destroy the pus, or any infections. But for surface cuts, one application of the boric acid, properly bandaged, is enough.

I cut myself with a sharp knife across a knuckle joint on my left hand, where there is a vein. It bled like a stuck pig. I put a thick gob of the powder on it, a piece of absorbent cotton over it, and wrapped with bandage. In four days the skin had healed without a scar. If I should run a rusty nail into my flesh,

I would at once plug it with boric acid, pushing it in as tightly as I could with a blunt stick. Then I would have no fear of lockjaw. No greasy ointments, or any fat bacon, to put on my wounds. I have remembrances of the small boy with a sore toe, or heel bruise, or a nail hole in his foot, tied up with an immense greasy rag.

One of the liabilities of a fisherman is to get snagged with a hook in his hand or other part of his anatomy. In my kit I have a small pair of nippers, with which I would cut the hook above the wound and pull it out, instead of cutting around the barb to get it out that way. Treat with the boric acid. SENEK.

DES MOINES, Ia.

## Adirondack State Lands.

ALBANY, N. Y., Sept. 14.—*Editor Forest and Stream:* Upon the return of Commissioner Whipple last night from a tour of inspection in the Adirondacks, Mr. Spears' article in the FOREST AND STREAM concerning sales of State lands, was shown to him, and to it he made the following reply:

Commissioner Whipple said: "You ask for some statement from me in relation to an article written by Raymond S. Spears, of Little Falls, N. Y., Aug. 24, and published in FOREST AND STREAM Sept. 2, 1905. My attention has not been called to the subject matter of this article before, neither have I seen the article until now.

"Mr. Spears is entirely mistaken in the statement in the first paragraph of his article where he says: 'Now the State is going to charge \$2 per cord apparently, for that is what the State is suing for.' I know of no such charge and no action in which such a claim is made, and there will not be by my consent.

"The Land Board is a separate and distinct Board from the Forest, Fish and Game Department, and has certain authority under the law in certain cases. So far as I have been able to ascertain, the facts in relation to Lot 79, Remsenburg Patent, 170 acres, which Mr. Spears calls the Hatter place, the Land Board had no authority to dispose of that property, and if I am right in this, I shall immediately institute an action to set aside the sale and recover such damages as may have accrued to the State by the action of that Board.

"In relation to the Ampersand Pond land, Township 27, mentioned by Mr. Spears, I learn that it was by a judgment of a competent court that the claimed title of the State was disposed of or annulled. That case I will examine at the earliest possible moment. The Hatter property, as the records in this office show, was disposed of against the protest of the Department of Forests in this Department. All of these matters were before my time of service in the Department.

"The law defining the Forest Preserve includes all land owned by the State in the sixteen Adirondack and Catskill counties with the two following exceptions:

"First. Lands within the limits of any village or city.  
"Second. Land, not wild-land, acquired by the State on foreclosure of mortgage made to the Loan Commission. Under the last exception the Land Board would have the right to sell any lands acquired through the Loan Commission provided they were cleared or farm lands.

"The map of State lands is made up by Mr. Fox from the records of the Comptroller's office. Therefore, where the Land Board has disposed of a piece of land, he has no authority except to indicate it on the map by making it white instead of red. This explains the changes in the map mentioned by Mr. Spears.

"Whether the Land Board had authority or not to make sales, I propose to find out.

"I do not believe Mr. Spears wishes to apply the statement, 'Well, you know what money will do in politics, was the pessimistic answer,' to this Department or to me personally. If he, or any other man believes he can get a tree or a foot of State land by political maneuvering or money considerations, let him try it.

"Personally, I am much obliged to Mr. Spears for his article, and I will be obliged to any man who will call my attention to any irregularity in the past which I may have the authority to correct, or any which may occur during my administration."

LITTLE FALLS, N. Y., Sept. 16.—*Editor Forest and Stream:* In my letter about the sale of Lot 79 of the Remsenburg Patent, my introductory paragraph said that "the State is going to charge \$2 per cord, apparently" for pulp wood. Commissioner Whipple says in regard to this statement: "Mr. Spears is entirely mistaken in the statement in the first paragraph of his article where he says: 'Now the State is going to charge \$2 per cord, apparently, for that is what the State is suing for.' I know of no such charge and no action in which such a claim is made, and there will not be by my consent."

Doubtless I was wrong in what I said as regards the pulp wood. I made the accusation on a paragraph which appeared in a newspaper some time ago. I withdraw it in view of Mr. Whipple's declaration.

Mr. Whipple says further: "I will be obliged to any man who will call my attention to any irregularity in the past which I may have the authority to correct, or any which may occur during my administration."

That is the most cheering statement that I have ever read in anything that ever came from the Adirondack commission, and while I have sent Mr. Whipple a long list of lands from the use of which the public may have been swindled in part, or to a great extent, I shall not carelessly make statements likely to cause the Forest, Fish and Game Commission extra work. Anyone who realizes that the Adirondack region is nearly, if not quite as large as the State of Massachusetts, and that to police this region only two score of "policemen" are available, will understand that the task is a tremendous one.

My objections have been all made because of the principle that appeared to underlie the whole Adirondack system of protection. I do object to making the great playground of the State a place for deals and barter, traffic and scoundrelism.

The reports which Col. William F. Fox publishes, nearly all of them contain urgent appeals to the public to permit lumbering on State lands, or swapping of State

lands for other lands. His latest scheme is to exchange the State forest lands outside the Adirondack and Catskill forests for lands inside the park area. An amendment to the State Constitution has already passed the State Legislature making this possible.

It is a fact well known to men who frequent the forest region that in the depths of the wilderness few ruffed grouse, and rarely a woodcock, are found. But in the outskirts of the wilderness the ruffed grouse are found in numbers that give thousands of sportsmen opportunity to enjoy their favorite recreation, not to mention trout streams and lakes.

According to Colonel Fox, there are 134,571 acres of State land outside the Adirondack Park area, and 10,027 acres outside the Catskill Park—144,598 acres in all.

Of this land more than 135,000 acres is "forest." A great part of it is the finest covert in the world for ruffed grouse, woodcock, rabbits and hares and other animals often shot for sport. If the State sells it a large proportion of it will be made into private parks immediately, and the sportsmen will find themselves shut out of tracts of land where they have hunted for years, probably without realizing that the land was a part of the State domain. RAYMOND S. SPEARS.

(Albany Correspondence New York World.)

THE efforts of Forest, Fish and Game Commissioner Whipple to punish the poachers in the Adirondack forests have stirred up the Republican bosses in that section, who for years have dictated the terms of settlement in cases of trespass and illegal hunting. Their influence being no longer of any account, they threaten to exterminate, politically, the men in control of the department at Albany. They already have demanded the dismissal of several forest, fish and game protectors because the latter refused to compromise or smother cases of violation in which the friends and business agents of certain leading Republicans were involved.

Commissioner Whipple investigated the complaints, and in the end complimented them for performing their duty without fear of the bosses. He told them that so long as they did their work faithfully and without favoritism they need have no fear of dismissal. This note of defiance gave the politicians, whose influence has always been uppermost in the settlement of cases, a severe jolt.

When Mr. Whipple was placed at the head of the department to reform it he decided to clean out the political gang that had brought it into disrepute. It was one of the strongest cliques that ever did business at Albany, and he realized that it was no ordinary undertaking. In the ring were State Senators, Republican leaders and big business men. The Commissioner's first move was to wipe out the system of special attorneys employed to prosecute violations; for it was through these attorneys that the politicians and their friends in the lumber and pulp companies did business. In many instances the same counsel that served the companies also served the State.

In place of the special counsel, a single attorney was appointed, with the title of Deputy Attorney-General, to devote his whole time to prosecuting cases of trespass on forest lands and to defend the State's right to land now in dispute. The man selected for this place is J. K. Ward, of Cattaraugus, the home county of Governor Higgins and Commissioner Whipple. Lank, keen-eyed, aggressive to the point of hostility, Mr. Ward has spread more fear through the regions of the poachers in one month than all the prosecutors spread heretofore in a decade.

"I wish," remarked Commissioner Whipple the other day, in discussing the recent victories of his attorney, "that I had more men like Mr. Ward. He isn't afraid of anything. He works every day in the week and on Sundays. He's the best prosecutor, I'm told, the department has had in many years."

Mr. Ward knows all the tricks of the trade. He knows, too, that he has some of the sharpest men in the country to deal with in prosecuting poachers and in fighting attorneys for the wrongdoers. When he first went into the woods, a few weeks ago, to punish several woodsmen for cutting burnt timber on State lands, the Deputy Attorney-General was "sized up" for a tenderfoot. The men began to spin yarns of how the wood was taken.

"Look here," snapped Mr. Ward. "You can't flim-flam me. My father was born in a wagon and I first saw light of day in a log cabin. Now get behind that woodpile and make up a story that you wouldn't be ashamed to tell your neighbors." The Deputy Attorney-General made the poachers pay \$2 a standard for the wood, several times its market value. That was the law and he meant to enforce it.

"I want you fellows," he said, addressing the wrongdoers, "to understand that you have no right to cut burnt timber. When you get to know that there won't be so many fires in these forests."

In the majority of trespass cases the trees cut down are sold to a lumber or pulp company. The poachers are said to be in the employ of the companies. While they have never been accused of having forest land set on fire so that the burnt timber may be cut, the fact is noted that burnt areas usually adjoin tracts where lumbering operations are going on.
